**Email:** neelamsharma.sharma6@gmail.com, rahulboadhmsc26@gmail.com, ravendraibs@gmail.com

**Abstract:** Accurate simulations of surface meteorological variables are important for the transport and dispersion of air pollutants and air quality in the lower atmosphere. In this study, the surface meteorological variables over Gurgaon region were simulated using the Advanced Research Weather Research and Forecasting (WRF-ARW) mesoscale model. To study the evolution of PBL parameters and the thermo dynamical structure, the sensitivity tests were conducted with five different planetary boundary layer (PBL) schemes (Yonsei University, Mellor–Yamada–Janjic, Asymmetric Convective Model v. 2, Mellor-Yamada Nakanishi and Niino Level 2.5 PBL and Quasi-Normal Scale Elimination) and three different horizontal grid resolutions (27, 9 and 3 km) by using the  $1 \times 1^\circ$  NCEP Final Analysis meteorological fields for initial and boundary conditions. After carefully examination of the simulated parameters with the available in situ data, the present results suggest that PBL schemes, namely YSU and ACM2 performed better on behalf of the boundary-layer parameters and may useful for pollutant dispersion studies.

**Keywords:** Planetary boundary layer, WRF, mesoscale, thermo dynamical structure

## Analysis of Average Rainfall Phailin Cyclone by using Double Integration Technique

Agnivesh Tiwari<sup>1</sup>, Yogendra Kumar Rajoria<sup>2</sup> and Rahul Boadh<sup>2</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** rampoonam1994@gmail.com, yogendrarajo@gmail.com, rahulboadhmsc26@gmail.com

**Abstract:** India's eastern coastline is one of the most violent wind inclined regions on the planet. Despite the fact that the coastline of Orissa has been just about 17% of the Indian eastern coastline, yet Orissa has been influenced by about 35% of all cyclonic and serious cyclonic tempests that have crossed the eastern coastline and related tempest floods that have been regularly immersing huge areas along the coasts. A Cyclone is an enormous scale air mass that turns around a solid focal point of low climatic weight caused due to low atmospheric pressure over oceans resulting in rainfall at coastal region. We will calculate average rainfall during the cyclone Phailin using Double integration

## Optimization of Some Transportation Problem by Proposed Method

Dipti Yadav<sup>1</sup>, \*Yogendra Kumar Rajoria<sup>2</sup> and Ravendra Singh<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** diptiyadav48@gmail.com, yogendrarajo@gmail.com, ravendraibs@gmail.com

**Abstract:** The transportation model is a typical case of LPP (Linear Programming Problem) in which the main objective is to transport people or goods from multiple origins to different points at minimal cost, like air, water and land transport including railway and road transport. In this paper, a method for finding an optimal key solution in short iterations is proposed and obtained result is compared with Vogel's approximation method. This method is used for both cases of large and small size transport problem. A numerical example is also given to examine the validity of the transport model.

**Keywords:** Transportation, Linear Programming Problem, Vogel's approximation method

## A Mathematical Model to Solve the Huxley Equation by New Homotopy Perturbation Method

Ravendra Singh<sup>1</sup>, Yogendra Kumar Rajoria<sup>2</sup> and Dinesh Kumar Maurya<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** ravendraibs@gmail.com, yogendrarajo@gmail.com, dkmupc@gmail.com

**Abstract:** In this paper, New Homotopy Perturbation Method (NHPM) is introduced for obtaining solutions of non-linear Huxley equations. The approximate solutions of the Huxley equations are compared with the solution by using Adomian's decomposition and variational iteration method as well as with the exact solutions. The present method is very simple, effective and convenient analytical method with small computational overhead. The capability and reliability of the method, several examples are provided and MATLAB used to calculate the series obtained from NHPM.

**Keywords:** Adomian's decomposition method, Homotopy Perturbation Method, Huxley equation.

## Health Risk Assessment by using Fuzzy Logic Application

Gunjan Kalra<sup>1</sup>, Rahul Boadh<sup>2</sup> and Yogendra Kumar Rajoria<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** gunjankapoor089@gmail.com, rahulboadhmsc26@gmail.com, yogendrarajo@gmail.com

**Abstract:** The fuzzy logic (FL) application has been used first time in thirty six year ago (1982) for purpose of insurance. In present, the insurance industry has several areas with latent applications for FL. In this paper involved to diagnosis the health risk which is related to Blood Pressure and Kidney function. The Glomerular Filtration Rate (GFR) has been used for investigate the level of the blood pressure with the help of kidney function. For this purpose, in this study FL control system has been used to represent the factors which may cause the hazard for human health and analysis by using rule base factor which was implemented in MAT Lab. The present study, advocates that FL may be suitable to take appropriate decision at the right time for giving treatment to the patients immediately and it may be monitoring from the treatment in future.

**Keywords:-**Fuzzy logic, Blood Pressure, Kidney Function, Diagnosis, Health risk

## Analysis of Aircraft activity by using method of Numerical Integration

Kabir Chaudhary<sup>1</sup>, \*Yogendra Kumar Rajoria<sup>2</sup> and Ravendra Singh<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** kabirchaudharykirthal@gmail.com, yogendrarajo@gmail.com, ravendraibs@gmail.com

**Abstract:** The takeoff and landing of an airplane are the most perilous periods of flight in real environment. So, the investigation regarding takeoff and landing performance play a vital role for airplane structure and security. In the paper, a high-accuracy numerical calculation for takeoff and landing execution by force analysis to develop dynamic equations, which sets up and tackles the conditions of elements during departure and landing process. The proposed strategy is equipped for figuring departure and landing execution under various situations. The impacts of height, temperature, departure and landing weight and wind speed are analyzed.

**Keywords:** departure execution, landing execution, Numerical integration

---

## Use of Fuzzy Expert System for Investigating the Child Anaemia-A Case Study

Rahul Boadh<sup>1</sup>, Meena Rawat<sup>2</sup> and Yogendra Kumar Rajoria<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** rahulboadhmsc26@gmail.com, rawatmeenasu@gmail.com, yogendrarajo@gmail.com

**Abstract:** In present, the fuzzy logic applications are mostly using to investigating medical disease. In this study the Fuzzy Expert System (FES) has been introduced to define the child anaemia. Anaemia is haematological disorder and the most common identifying in children. The fuzzy expert system has been designed to investigate the level of iron paucity in children. For this propose, the laboratory records have been obtained for child anaemia patients, the applicable factors have quantified. The FES for disease risk, child anaemia was shortly described. This system help to physician in the decisions risk. This study advocate that, in many cases FES can help to the doctors in diagnostics, treatment of sickness and etc. The number and the other disagreement that support our claim can be found in this study.

**Key words:** Fuzzy expert system, medical disease, Child anaemia, diagnostics, treatment.

## Application of CFD Numerical Modeling in Air Quality Assessment and Executing Mitigation Measures

A N Sinha and V N Bartaria

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** directoracademics@lnct.ac.in, vnbartaria@lnct.ac.in

**Abstract:** Air quality primarily describes the pollutants contained in the air. As it appears to have grave pollution problems, real time air quality index (AQI) in most of the major cities of the world has now become a major concern to know the transient air quality levels. Various indices for measurement of air quality have been developed and are being used by different countries. The measurements are indicative of concentrations of air pollutants quantitatively. Air quality assessment indicative of various quantities may either involve the direct measurement of these quantities or deterministic of the impact of pollution and possible hazards. Fractional concentration of criteria pollutant species such as volatile and semi-volatile organic compounds and natural or anthropogenic aerosols determine the quality of air.

Apart from the measurements, air quality estimations may also be performed using Gaussian plume model and Solution of three dimensional Navier-Stokes equations and pollutant transport equations. The Computational Fluid Dynamics (CFD) modeling needs the identification of the relevant physical process describing the pollutants dispersion into the atmosphere. These processes involve the emission and transport of pollutants which may take place by bulk convection, turbulent dispersion and gravity effects. Adhesion among other forces and factors cause the settling of particle pollutants on the physical surfaces. Recombination reactions and electrostatic precipitation may also contribute in the pollutant deposition. Numerical modeling of air pollution problems with the help of CFD provides the detailed description of physical sources of pollutants, meteorological processes and changes occurring in physical and chemical behavior of pollutants effectively when the governing equations based on the assumptions of the mass, momentum, energy and pollutant species conservation of the mathematical model are in the appropriate form. The solution is obtained by solving the mathematical equation numerically.

This paper deals with the possible solution of the most concerned pollution problem and especially in dealing with the problems of smog forming in major cities and threatening the human life. It is suggested to perform a real time modeling of the smog problem by 3D modeling of the smog field using CFD and if coupled with the real time measured environmental data, simulation results will provide the severity of the pollution in the form of contours, plots and quantity in order to execute appropriate mitigation measures.

## Increase network lifetime optimisation efficiency and increase the stability period using the Gravitational Energy Sensitive Energy Hierarchy Protocol

Mohit Singh Tomar<sup>1</sup>, Deepak Jain<sup>2</sup>, Ankur Pandey<sup>3</sup>

<sup>1</sup>Shri Jagdish Prasad Jhabarmal Tibrewala University, Jhunjhunu (RAJ.)-India

<sup>2,3</sup>Sagar Institute of Research & Technology Bhopal (M.P.)-India

**Email:** mohitishere7@gmail.com

**Abstract:** The need for wireless sensor networks has been increased day by day, but when we work on it we find two well-known major problems that are cluster head selection and routing for this purpose decreasing their lifespan and increasing the number of dead nodes. The energy savings of each Node sensor are associated with high computational complexity, which depends on the monitoring of algorithms. This study developed a community base algorithm called "A Gravitational Energy Sensitive Energy Hierarchical Protocol," which increases its value but decreases the network life of dead network nodes. Technique where each node has heterogeneity-ordained energy levels of a protocol that selects a (cluster head) CH separately on the basis of their initial energy relative to the other nodes in the selected network. We provide some test results together with plotted results in this paper. In addition, analysis and simulation was performed with the implementation of the internal energy node 0.5, 1 J, 1.5 J, and 2J in different cases. After the analysis results have been achieved we have found that our algorithm provides the best results compared with other results of different algorithms. This is an important task, and in small and large networks our GESEHP protocol can produce improved results. All of this simulation work was carried out in Matlab.

**Keywords:** Gravitational, Efficiency, Throughput, IEEE 802.11, unicast and broadcast packet, network, L-LEACH, Quality of Service, W-LEACH, routing protocol, Energy Sensit.

### About Families of Pairwise Connected Sets

Anjali Srivastava<sup>1</sup> and Rohit Gaur<sup>2</sup>

<sup>1</sup>School of studies in Mathematics, Vikram University, Ujjain (M.P.)- 456010- India

**Email:** anjalivuu@gmail.com r.gaur0710@gmail.com

**Abstract-** The notion of connectedness in bitopological spaces was introduced and studied by W.J. Pervin and I.L. Reilly. Continuing the study we prove a few results concerned with a family of connected sets in bitopological spaces.

**Key Words-** Pairwise connected spaces, Connectedness in bitopological spaces, Pairwise mutually separated spaces.

**AMS Subject Classification-** 54A05, 54A99, 54D05

## Dual Cryptography with Mobile GPS location Mechanism

Dinesh Kumar Moriya and Sharad Pathak

Govt. MLB Girls (Autonomous). PG College, Bhopal (M.P)- India

**Email:** dinesh.moriya@gmail.com

**Abstract:** Cryptography is the type of security which internet usually uses and in today's world its not sufficient to safeguard our data and account. Here we come with a new concept of Dual Cryptography (DCPT) for the user and the communication channel as well. By the time its mandatory to use Location (MGPS) wise security which is possible through Mobile Computing. Location and Cryptography both are used in such a different way to provide internet security. Location Based Cryptography (LBDC) is the work which actually works on today's scenario.

**Keywords:** Cryptography, DCPT, MGPS, LBDC.

## Feeling Detection dependent on Images and Captions on Social Media

Aditya Patel

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** adityap@lnct.ac.in, adityapatelmail@gmail.com

**Abstract:** Nowadays, Internet has grow to be an crucial element in every person's lifestyles. Social networking has regularly grow to be a recurring for people to submit their photos, opinions and remarks. People percentage their emotions on line in a completely casual language. Thus, it is very tough mission to research actual sentiment hidden inside the text of natural language. Emotion detection is the sphere of study that analyses people views and feelings. Human emotion can be expressed through numerous approach which include speech, facial expressions, gestures and textual facts. This paper proposes the gadget which makes use of present emotion detection thru facial features using deep mastering and supports it with the evaluation of textual information received thru captions of pics on social networking websites to ensure greater accurate outcomes. There is no characteristic on social networking sites to kind feelings of photos which motivate us to classes posts based on emotions. Emotion detection from each captions and photos collectively is efficient due to the fact most effective text isn't always enough to apprehend the feelings of customers. This hybrid approach offers promising results in both the class of feelings as well as in acting emotion detection.

**Keywords:** Emotion detection, Convolutional Neural Networks, Social Networks, Deep Learning, Sentiment Analysis

## Content Based Facial Emotion Recognition Model utilizing Machine Learning Algorithm

Aditya Patel

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: adityapatelmail@gmail.com

**Abstract:** Emotion reputation or sentiment analysis is recognized as a critical studies topic in pc vision community. The challenges include identity of face, popularity of accurate emotion, suitable database and so forth. We have proposed and implemented a fashionable Convolution Neural community (CNN) building framework for emotion popularity. The model is formalized by means of developing a coincident gadget which fulfills the duties of face detection and emotion classification the usage of our proposed CNN structure. The version is verified using the FER-2013 dataset. In the proposed paintings, we talk the applicability of the proposed CNN model. This model lays a valuable evaluation of the effect of changing the network size, pooling, and dropout. For a given model, the very last accuracy at the validation facts is round 63%.

## Survey on Photoluminescence of Some Recent Work on Silicate Based Phosphors

Anjali Yadav<sup>1</sup> R.K. Kuraria<sup>1</sup> and S.R. Kuraria<sup>3</sup>

Govt. Science College Jabalpur, India 482001

Govt. M.H. College of Home Science and Science Jabalpur, India 482001

Email: rkkuraria@rediffmail.com, s.anjaliyadav.s@gmail.com

**Abstract:** Photoluminescence is the process, in which the excitation is accomplished by the absorption of photons. The radiation sources may be infra-red, visible, ultraviolet or X-ray. The fluorescent lamp used in household and general lighting is the principal example of this type of luminescence. The silicate matrix is a typical melilite. Phosphors based on silicate material are usually low cost and are chemically and physically stable. They have been studied widely with Eu<sup>2+</sup> doping, which shows that a blue emission and long persistent luminescence by co-doping with some other rare earth ions. We focus on the development of new silicate phosphors for a white LED. In the europium doped silicate system, four LED phosphor candidates found luminescent properties under near UV and visible excitation were investigated for the new Eu<sup>2+</sup> doped LED silicate phosphors. These new phosphors have a relatively strong absorption band in a long wavelength region.

## Common Fixed Point Results in Menger Spaces

Prashant Namdeo and Subhashish Biswas

Kalinga University, Raipur (C.G.) India

Email: prashantnamdeo75@gmail.com, deb12rishika@gmail.com shubhb@yahoo.co.in

**Abstract:** The purpose of the paper is to prove a common fixed point theorem in Menger spaces by using five compatible mappings.

**Keywords:** Menger space, t-norm, Common fixed point, Compatible maps, Weak - compatible maps.

## Application of Graph theory in operations Research

Priyanka Swanker<sup>1</sup> and Richa Gupta<sup>2</sup>

Sarvepalli Radhakrishnan University, Bhopal (M.P)-India

**Email:** priyankasoni071987@gmail.com

**Abstract:** One of the common themes in operation research is the modeling approach, many accurate model of operations research. Problems turn out to be intractable when subjected to standard technique this research paper show that how graph theory and networks may be profitably used to model certain discrete operations research problem from a different view-point effective algorithms.

**Keyword:** Graph, Direct graph, Graph networks, Simple graphs

**Abstract:** The present work deals with the blood flow through the stenosis assuming that flowing blood is represented by a two layered model. We considered a two-layered blood flow model to study the axisymmetric flow of blood by assuming the core layer as Bingham plastic (non-Newtonian fluid) and the peripheral layer (Newtonian fluid) in through the stenosis in the arteries. The analytical expressions for flow rate, resistance to flow and wall shear stress have been developed in this model. We have depicts the effect of stenosis on resistance to flow and wall shear stress. This study gives an insight into the effects of slip velocity on the volumetric flow rate, resistance to flow and wall shear stress.

**Keywords:** Stenosis, blood flow, core layer, peripheral layer and Bingham plastic

**AMS Subject Classification (2010):** 76Z05, 92C35

## A non-Newtonian fluid flow model for the slip condition on blood flow through a stenosed artery using power-law fluid

Ajay Kumar<sup>1</sup>, R.S. Chandel<sup>2</sup>, Rajesh Shrivastava<sup>3</sup>,

**Abstract:** In this paper, the effects of boundary conditions on power-law fluid through an artery with stenosis have been studied. We considered the blood as power law fluid in this model. Numerical and computational models are developed to analyze the variation of resistance to flow, yield stress and wall shear stress across the stenotic region. The analytic expressions for flow resistance, wall shear stress with mild stenosis are derived by using this model, which shows that resistance to flow  $\lambda$  increases with increasing of stenosis height and wall shear stress  $\tau$  increases as stenosis size increases. The results have been shown graphically at different flow characteristics.

**Keywords:** Physiological flow, stenosed artery, wall shear stress, resistance to flow, Power-law fluid model and slip velocity

**AMS Subject Classification No. (2010):** 76Z05, 92C35

## Mathematical Modeling of Linear and Nonlinear Equations

Jyoti Gupta & Gurusharan Kaur

Sri Sathya Sai College for Women, Bhopal (M.P.)-India

Career College, Bhopal (M.P.)-India

Email: [jyoti.gupta1709@gmail.com](mailto:jyoti.gupta1709@gmail.com), [kgurusharan@gmail.com](mailto:kgurusharan@gmail.com)

**Abstract:** This paper reviews some of the recent research and notes that plays an important role in mathematical modeling of linear and non linear equations. The process of developing a mathematical model is termed mathematical modeling. Mathematical models are used in the [natural sciences engineering](#) disciplines as well as in the [social sciences](#). This paper is taught that introduce the basic principles and methods that helps to explain a system and to study the effects of different equations and behavior. If all the operators in a mathematical model exhibit [linearity](#), the resulting mathematical model is defined as linear. A model is considered to be nonlinear otherwise. The definition of linearity and nonlinearity is dependent on context, and linear models may have nonlinear expressions in them. a differential equation is said to be linear if it can be written with linear [differential operators](#), but it can still have nonlinear expressions in it. In a [mathematical programming](#) model, if the objective functions and constraints are represented entirely by [linear equations](#), then the model is regarded as a linear model. If one or more of the objective functions or constraints are represented with a [nonlinear](#) equation, then the model is known as a nonlinear model. Mathematical models can take many forms, including [dynamical systems](#), [statistical models](#), differential equations, or [game theoretic models](#).

## Fixed point results for contractive type mappings in Cone b-metric spaces

M.S. Chauhan<sup>1</sup>, Rajesh Shrivastava<sup>2</sup>, Rupali Verma<sup>3</sup>, Qazi Aftab Kabir<sup>4</sup>

<sup>1,3</sup>Institute for Excellence in Higher Education, (M.P.)-India.

<sup>2</sup>Govt. Science and Commerce College Benazir, (M.P.)-India

**Abstract:** In the present paper, we define F-contractive type mappings in Cone b-metric space and prove some fixed point theorem. Our main result unifies, generalizes and improves existing results in F-contractive mappings, b-metric space and Cone b-metric space in the literature.

**Keywords:** Fixed point; b-metric space; Cone metric space; Cone b-metric space; contraction

**AMS Subject Classification No. (2000):** 47H10; 47H09; 54H25

### IOT Based Smart Crop Monitoring in Farm Land

Shareya Naik<sup>1</sup>, Rajeev kumar<sup>2</sup>, Vivek Kumar<sup>3</sup> and Utkarsh Shrivastava<sup>4</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

**Email:** vivekk@lnct.ac.in

**Abstract:** As new technologies has been invented and utilized in modern world, there is a need to bring an elevation in the field of agriculture also. A lot of researches have been made to improve crop production. In order to enhance the crop productivity effectively, it is necessary to monitor the environmental conditions in and around the field. The motive of this paper is to propose an IOT based Smart crop monitoring system which aims in making use of progressing technology i.e. IOT and Smart Farming. Internet of Things (IOT) has become a trending technology nowadays which is being used in several real time applications. IOT is a system which consists of several sensors or actuators that provides connectivity to the internet directly or indirectly. IOT based smart farming improves the entire agricultural system. As it is well known, agriculture is the backbone of our Indian economy that contributes to the overall economic growth of the country. With the help of sensors and interconnectivity, IOT in agriculture has saved the time of farmers to a greater extent and has enhanced the traditional way of farming. Online crop monitoring using IOT helps the farmers to stay connected to his field from anywhere and anytime. Also with the innovation of IOT in farming there has been drastic reduction in extravagant use of valuable resources such as water and electricity. Various different types of sensors are connected to the field that monitors and collects information about the field conditions. Collectively all the captured farm conditions are sent to the farmer through GSM technology. Thus this way farmer is able to monitor his field without being there physically. Finally, based on this thorough review, we identify current and fore coming trends of IOT in agriculture and highlight potential research challenges.

**Keywords:** IOT, Sensors, GSM technology, Smart farming.

### Matlab A Fourth-Generation Programming Language of New Era: A Review

D. S. Saluja and Amarjeet Singh Saluja

Govt. M. V. M. College, Bhopal, (M.P)-India

Institute for Excellence in Higher Education, (M.P)-India

**Email:** drdssaluja@gmail.com

**Abstract:** MATLAB has evolved over a period of years with input from many users. In university environments, it is the standard instructional tool for introductory and advanced courses in mathematics, engineering, and science. In industry, MATLAB is the tool of choice for high-productivity research, development, and analysis. It features a family of application-specific solutions called toolboxes. Very important to most users of MATLAB, toolboxes allow as to learn and apply specialized technology. Toolboxes are comprehensive collections of MATLAB functions (M-files) that extend the MATLAB environment to solve particular classes of problems. Areas in which toolboxes are available include signal processing, control systems, neural networks, fuzzy logic, wavelets, simulation, and many others. It is an interactive system whose basic data element is an array that does not require dimensioning. This allows you to solve many technical computing problems, especially those with matrix and vector formulations, in a fraction of the time it would take to write a program in a scalar non interactive language such as C or FORTRAN.

## Some Fixed Point Results in $A$ -Metric Space and $A_b$ Metric Space

Suresh Nagle<sup>1</sup>, Rajni Bhargav<sup>1</sup>, Manoj Ughade<sup>2</sup>

Govt. MLB PG Girl's College, Bhopal (M.P) - India

Govt. J.H. Post Graduate College, Betul (M.P) - India

**Email:** snghelpyou@gmail.com

**Abstract:** Our goal of this article is to vindicate some fixed point theorems for contractive mappings in  $A$ -metric space and  $A_b$  metric space, which unify, develop and generalize most of the prevailing coherent fixed point results from the literature.

**Keywords:**  $A$ -metric space;  $A_b$  metric space, contractive mapping; fixed point

## Some Fixed Point Theorem Satisfying General Contractive Condition of Integral Type

Himanshu Tiwari and Subhashish Biswas

Kalinga University, Raipur (C.G.) India.

**Email:** himanshu.tiwari.ht@gmail.com, deb12rishika@gmail.com shubhb@yahoo.co.in

**Abstract:** In this paper, we establish a fixed point theorem for a pair of self maps satisfying a general contractive condition of integral type. This theorem extends and generalizes some early results of Boikanyo[4]. And Jaggi and Dass [12]

**Key Words:** Lebesgue-integrable map, Complete metric space, Common fixed point.

**AMS Subject Classification (2010):** 54H25, 47H10.

## CFD Modeling and Simulation in the Heat Transfer Studies in Solar Air heating

Dharam Singh and V. N. Bartaria

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** dharams@lnct.ac.in, vnbartaria@lnct.ac.in

**Abstract:** Solar air heater is solar energy collection device and this collected solar energy is utilized for low temperature heating purpose, agriculture drying purpose etc. The rate of conversion of solar energy to heat energy is low in solar air heater because of the nature of fluid which is air having poor thermal conductivity which influence the rate of heat transfer from the absorber plate to air. The value of heat transfer coefficient for this heat exchange is low and it can be increased by creating turbulence in flow field. The turbulence is created by providing artificial roughness on absorber plate of various geometries. In this paper the numerical modeling of heat transfer through the absorber plate has been discussed. The heat transfer in a rectangular duct of a solar air heater having trapezoidal rib roughness on the absorber plate is numerically studied by using Computational Fluid Dynamics (CFD). The effect on Nusselt number, heat transfer coefficient, velocity, and temperature parameter are analyzed. This CFD simulation is done using commercial software Fluent 6.3. The  $K$ - $\epsilon$  numerical model consisting of the governing mathematical equations based on the principles of conservation of mass, momentum and energy have been used.

## Time Synchronization using Hierarchical Clustering for reliable data service in MANET

Nidhi<sup>1</sup>, Kamlesh Chandravanshi<sup>2</sup>, Sushil Kumar<sup>3</sup>,

Lakshmi Narain College of Technology, Bhopal (M.P) - India

**Email:** nidhi1514@gmail.com, kamlesh.vjti@gmail.com, sushilk@lnct.ac.in

**Abstract:** Time synchronization in any network like wired and wireless is one of the crucial issue because of synchronized the communication in between sender and receiver. In Mobile ad hoc network nodes are continuously changing their situation in a surrounding environment. The data sending and receiving is performed without any supervision or centralized communication. In this research we proposed a new time synchronization technique with multicast routing in dynamic network. The multicast routing protocol is able to perform the group communication and in each group is made from some nodes with one group coordinator and each node has different clock time. The proposed research is synchronized the clock of each mobile node according to the average time beacon of all group in MANET. The proposed multicast Average Time Clock beacon Synchronization (Avg-SYN-CLK) communication performance is improves the network performance. The proposed scheme performance is compare with the Maximum Clock Time Synchronization (MAX-SYN-CLK) beacon broadcasting technique and Asynchronies Clock Time Performance (ASYN-CLK) and observe that the proposed technique is provides better performance with minimum end to end delay and packet loss.

**Keyword:** Clock Synchronization, MAODV, Mobile Ad hoc, Clock Detection, Multicasting, Average Clock Time.

## A smart way of Compression

Sushil Kumar

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** sushilk@lnct.ac.in

**Abstract:** The advancement of information technology has affected all walks of our life. Data base technology has also grown from a simple file system to data navigation system, and over a last two to three decades a majority of business institutions, organizations, industries etc. have adopted the computerization process and as a result have been flooded with data. In this report it is investigated that for experimental result shows the proposed scheme provides significant improvement in compression efficiencies. The main proposal of this report is to reduce the memory space and the transmission time and achieving good compression ratio. In this work proposed techniques manages the compressed database such that standard operations like retrievals, insertion, deletion and modifications are supported.

## A Digitalized Development Competency in Industrial Internet of Things

**Abstract:** The competences of IoT aidproducers or investors to gain superiorprominence and insights into their further actionsthrough the effectual use of data and the tighter amalgamation of disparate systems. This opens up the leeway for producers of moving away from merely selling goods to becoming a provider of services and firming the bond they have with the end users of their products. It goes in to the heart of how an industrial manufacturer perceives itself and the extent to which digital change will be central to its tactic and therefore requires that additional care is taken and better caution is exercised. This means that IoT can offer more than traditional process efficiency improvements on the factory floor. This paper will converse the impacts of IoT and other developing technologies in making a manufacturing system automated.It will include conversation on economy, cutting-edgetechnology.

**Keyword:** IOT, Automation of Industry.

**Abstract:** Electricity consumption grows up rapidly all over world during up-coming decades. Nowadays we can generate electricity through a smart way by using different techniques. By implementing a speed breakers on roads through roller mechanism. In this mechanism, by using a rack and pinion system we can generate electricity. And the second technique was traffic windmill which this method used on high ways. In this method by using a vertical axis blade we can generate electricity. And one more method was smart street lights on highways. In this method by using a sensor called LDR (light dependent resistor).

**Keywords:** Electricity extraction, Electricity utilization, Rack and pinion, Vertical axis wind mill.

## Glaucoma diagnosis using discrete wavelet transforms and Histogram features from fundus images

Nandini Kokate<sup>1</sup>, K.G. Kirar<sup>2</sup> and M.L. Jatav<sup>3</sup>

Samrat Ashok Technological Institute, Vidisha (MP) 464001-India

**Abstract:** Glaucoma is one of the main eye diseases; it cause progressive deterioration of optic nerve fibres due to increased fluid pressure. The existing methods of glaucoma diagnosis are time consuming, expensive and require practiced clinicians to understand the eye problems. Hence fast, cheap and more accurate glaucoma diagnosis methods are needed. This paper presents an innovative idea for diagnosis of glaucoma using third level two dimensional discrete wavelet transform (2D DWT) and histogram features from fundus images. The 2D DWT is used to decompose the glaucoma and healthy images and histogram features are extracted from 2D DWT decomposed sub band images. The least square support vector machine (LS-SVM) is used as a classifier which classifies the glaucoma and healthy images using the extracted features.

## Results on Multivalued Mappings in Intuitionistic Fuzzy Metric Spaces

Reema Tuteja<sup>1</sup>, Mayank Sharma<sup>2</sup> and RitujaNighojkar<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** reematuteja32@gmail.com mayank.math80@gmail.com, ritujanighojkar@gmail.com

**Abstract:** In this paper we obtain some common fixed point theorems for multivalued mappings in intuitionistic fuzzy metric space containing rational terms. Wegenerelizeand extend results.Of [I. Kubiacyk and S. Sharma, Common fixed point in fuzzy metric space, J. Fuzzy Math. 11(1)and [RezapourSh.:Common fixed point of self-maps in intuitionistic fuzzy metric spaces , Mat.Vesnik 60(4)(2008), 261-268] by contributing rationalization from their previous versions.

**Keywords:** Common fixed point, Multivalued map, intuitionistic fuzzy metricspace.

**Mathematics Subject Classification (2000).** 54A40, 54H25.

## An Application of Compatibility and Weak Compatibility in Intuitionisticfuzzy Metric Spaces

Mayank Sharma<sup>1</sup>, Ramakant Sharma<sup>2</sup> and Megha Kamble<sup>3</sup>

<sup>1,3</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email : Mayanks@lnct.in

**Abstract.** The object of this paper is to obtain some new results in intuitionistic fuzzy metric spacesby the applicability of the property ( $S-B$ ) and the notion of R-weak commutativity of type ( $Sp$ )and weakly compatible maps of type ( $Sp$ ) and prove the intuitionistic fuzzy version of Pantstheorem. Our results are substantiated with example. The established results generalize and extends several existing fixed point results in intuitionistic fuzzy metric spaces, metric spaces and fuzzy metric spaces.

**Keywords:** Intuitionistic fuzzymetric space, ( $S-B$ ) property, R-weak commutativity of type( $Sp$ ),Weakly compatible map, Common fixed point.

**Mathematics Subject Classification (2010):** 47H10, 54H25.

## Neural Network Approach to Predict Soaked CBR of Routine Subgrade soil

Anil Kumar Saxena

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: anils@lnct.ac.in

**Abstract:** This study presents the application of a method of artificial neural networks for the prediction of the California bearing ratio (CBR) with routine properties of subgrade soils. A database is developed containing grain size distribution, Atterberg limits, maximum dry unit weight and optimum moisture content of the soils. A set of 231 experimental results were used to construct the ANN model. The correlation between the basic properties of soil and CBR were obtained from the trained neural network. A Commercial software MATLAB-7.5 was used for trained the ANN models, Multilayer Perceptrons neural network(or LMB model). Three Levenberg-Marquardt Backpropagation ANNs models (LMB-4, LMB-5, and LMB-6) for predicting CBR, (in which the number of input variables is changed seven to four) were employed in the analysis. In these models, the input layer consists of maximum six nodes, one node for each of the independent variables, namely % fines (Silt and clay fraction) , % of Sand content(S),% of Gravel, optimum moisture content (OMC) ,Maximum dry density ( $\gamma_d$ ) , plasticity index (PI) , and liquid limit ( $W_L$ ) respectively . The output layer consists of only one node—CBR. The strengths of the developed models are examined by comparing the predicted CBR values with the experimental values with respect to the regression coefficient ( $R^2$ ) and Mean Square Error (MSE) values. In addition, the experimental results were compared to different LMB networks predicted results. It was concluded that the performance of the model with six inputs (LM-6) is better than other model.

**Keywords:** California bearing ratio (CBR), Neural Network, MLPN, Subgrade

## A Unique VLSI Primarily Based Structure for Computation of 2D-DCT Image Compression

Prashant Chaturvedi<sup>1</sup> and Soni Changlani<sup>2</sup>

LNCT University, Bhopal

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: prashantc@lnct.ac.in, sonis@lnct.ac.in

**Abstract:-**Statistics photograph compression is the deficiency, of redundancy in statistics illustration to attain deficiency, in storage cost. The implementation and optimization of FPGA primarily based 2D-DCT with quantization and zigzag with parallel pipe lining the usage of HDL. The 2-D DCT calculation is made using the 2-D DCT separability property, such that the whole architecture is divided into two 1-D DCT separability assets and calculations with the aid of the use of a transpose buffer. The coding is simulated using Xilinx 9.2i ISE synthesized the usage of spartan-3E XC3S250. The 2nd-dct structure makes use of 600 slices, 6 I/O pins, and 4 multiplier and working frequency 135 MHz and pipe lining latency 140 clock cycles.

**Keyboards:** JPEG, DCT, quantization, zigzag, FPGA, Xilinx 9.2i ISE.

## Human Area Networking using Red Tacton Technology

Ria Sharma<sup>1</sup>, Pratishtha Singh<sup>2</sup> and Prashant Chaturvedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

LNCT University, Bhopal (M.P)-India

**Email:** rias25344@gmail.com, pratishtha712@gmail.com, prashantc@lnct.ac.in

**Abstract:**-So far we've seen LAN, MAN, WAN, internet and plenty of extra networks. However now here is a new concept of "RED TACTON" which allows the communication via touching and makes the human body floor as a conversation network, this is referred to as human area community which is the rising fashion in the area of conversation. The Red Tacton takes a one of a kind technical viewpoint rather than counting on electromagnetic or light waves to hold facts it makes use of feeble electric powered discipline on the surface of the frame as a transmission medium. Verbal exchange with the aid of that is secure as the modern which flows via the frame is in very small voltage range with excessive pace network transmission direction and is viable the usage of any surface of the frame like hand, fingers, toes, face, legs or torso. It additionally works through footwear and clothing as nicely. Further to the human body, numerous conductors and dielectric may be used as transmission media and also they may be used in aggregate. Transmission velocity does no longer deteriorate in congested areas in which many people are communicating at the equal time with a maximum pace of 10mbit/sec.

**Keywords:** Red Tacton Mechanism, IEEE802.3, Human area network.

## Indoor Positioning System using Ultra Wide-band Technology

Pratishtha Singh<sup>1</sup>, Ria Sharma<sup>2</sup> and Prashant Chaturvedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

LNCT University, Bhopal (M.P)-India

**Email:** pratishtha712@gmail.com, rias25344@gmail.com, prashantc@lnct.ac.in

**Abstract:** An indoor positioning machine is a network of device used to locate humans or object wherein GPS and other satellite TV for pc technology lack precision or fail entirely. UWB (excessive bandwidth, low frequency) can skip signals thru a wide type of limitations, along with wall. It can also supply accurate positioning information in a high fresh charge. A area tag of UWB indoor positioning gadget can send area information for the tracked items as much as five times according to second and also can accumulate statistics for up to two years without recharge as a consequence it has low electricity intake which adds into decrease renovation value for indoor monitoring. It has minimum radio interference which permits it to exist in concord with other radio indicators inclusive of those emitted by means of smart phones, Wi-Fi gadget and bluetooth gadgets. A high consumer density isn't a trouble to localization of specific assets because the person can differentiate one song asset and consider the data for it the usage of a visible dashboard. It is vulnerable to interference with the aid of steel and different materials, which makes it a suitable option for asset monitoring in production side.

**Email:** rajeshraju0101@rediffmail.com, rkubey2004@yahoo.co.in, pankajvist@gmail.com

**Abstract:** The aim of this paper is to prove certain fixed point theorems for multi-valued and single-valued mappings in such spaces, by using altering distance function. Fixed point theory in partially ordered metric spaces has greatly developed in recent times. Our results improve and extend several recent results of fixed point theory.

**Keywords:** Common fixed points, Metric space, Partially Metric space, Altering distance function, Multi-valued and Single-valued mappings

## Numerical solutions of Schrödinger equations with Harmonic Oscillator describing motion of Quantum Oscillator

Amit Goswami<sup>1</sup> and Preetam Singh Gour<sup>2</sup>

Jagan Nath University, Jaipur-303901, Rajasthan, India

Jaipur National University, Jaipur-302017, Rajasthan, India

**Email:** optoamit@gmail.com

**Abstract:** In this paper, an effective, powerful analytical scheme, popular as Homotopy perturbation sumudu transform method (HPSTM) is employed to attain approximate solutions of nonlinear time fractional Schrödinger equations with Harmonic Oscillator. These nonlinear time fractional Schrödinger equations occurs in the many fields of physics and technology such as quantum mechanics, optics, fluid dynamics, nonlinear physics, nanotechnology and in many more. The nonlinear time fractional Schrödinger equations with Harmonic Oscillator describe the various phenomena such as motion of quantum oscillator, lattice vibration, propagation of electro-magnetic waves, fluid flow etc. The main objective is to apply an alternative method of solution, which do not require small parameters and avoid linearization and physically unrealistic assumptions. The results show that HPSTM is very efficient and convenient and can be applied to a large class of problems. This study shows that the approximate results obtained by the HPSTM are very accurate and effective for analysis the nonlinear behaviour of systems. This study also states that HPSTM is much easier, more convenient and efficient than other available analytical methods.

**Keywords:** Quantum mechanics, Schrödinger equations, Harmonic Oscillator, Sumudu transform, Homotopy perturbation method, He's polynomials.

## Binary Topological Space

Nazir Ahmad Ahengar<sup>1</sup>, Roshani Sharma<sup>2</sup>, J.K. Maitra<sup>3</sup> and Sujeet Chaturvedi<sup>4</sup>

R.D.V.V Jabalpur 482001 (M.P) India

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** nzhmd97@gmail.com, roshanisharma@gmail.com, jkmrdvv@rediffmail.com

**Abstract:** Topology is playing a key role in almost every field of applied sciences and several branches of mathematics. This is very useful concept especially in information system, particle physics, quantum physics, high energy physics etc. In 2002 Csaszar [4] introduced and studied the concept of generalized topology and generalized continuity. In 2011 Nithyanantha Jothi S and Thangavelu P, [18] have introduced the concept of binary topology between two sets and studied different properties. In this paper we introduce and studied  $\mu$ -binary topological spaces and investigate its basic properties

**Keywords:** Binary topological spaces, binary topological spaces, closure interior

## Mathematical Concept of Compound Redundant system with availability and reliability parameter under supplementary variable method

Sonendra Kumar Gupta

Oriental College of Technology, Bhopal, India

**Email:** sonendrag@gmail.com

**Abstract:** In this paper author has assume that a compound system have 2-subsystems selected as " and " connected in chain. Subsystem " consists of Nunlike units in chain and the subsystem " consists of 3- like components in parallel redundancy. In this system it is assume that the system goes to complete crash state if any unit of subsystem " fails or more than 1-unit of subsystem " is in the failed state. Also, the system works with degraded efficiency if 1-unit of subsystem " failed. The system may also fail due to environmental reasons.

**Keywords:** Availability, Reliability, Abel lemma, MTTR, Ergodic behaviour and Laplace Transform and Supplementary variable

## A Basic generalized properties of Transprocal Matrix and Transprocose Matrix.

Ram Milan Singh<sup>1</sup> and Manoj Ughade<sup>2</sup>

Govt. P.G. College Tikamgarh (M.P) India

J H Govt. P. G. College Betul (M.P) India

**Email:** rammilansinghlig@gmail.com, manojhelpyou@gmail.com

**Abstract:** In this paper we have to generalize some definition and properties of I-matrix, J-matrix Transprocal of certain matrix, transpose of transprocal matrix, can be represented by this matrix. On the other hand, the abstract treatment of linear algebra presented later will generalize a new sight into the structure of these matrices.

## Machine Learning Algorithms in WSNs: A Review Article

Pooja Lalwani<sup>1</sup> and Vasima Khan<sup>2</sup>

Sagar Institute of Research & Technology, Bhopal (M.P) India

Email: poo.lalwani06@gmail.com, aarish.azfar07gmail.com

**Abstract:** Wireless sensor network (WSN) is a recent leading technology that is used in realistic applications due to its variable size, cost-effectiveness and type of deployment. Sensor nodes battery in WSN cannot be recharge and nodes also cannot be replaceable due to which nature of WSN changes dynamically. The traditional approaches in WSN cannot adopt the changes dynamically. To overcome the drawbacks of traditional approaches, machine learning (ML) techniques are adopted to react accordingly. In this article, survey based on ML techniques with WSNs application is presented which covers from 2002 to 2018. In addition, drawbacks and advantages of each and every technique have been discussed. Finally, some open issues in WSN is mentioned for the future research direction.

## Iwalk- A Smart Blind Stick

Shiva Kuchya<sup>1</sup>, Sneha Wadhvani<sup>2</sup> and Vishal Patel<sup>3</sup>

Sagar Institute of Research & Technology, Bhopal (M.P) India

Email: skuchya99@gmail.com

**Abstract:** Independence is the building methodology in achieving dreams , goals and objectives in life . Visually impaired persons find themselves challenging to go out independently . There are millions of visually impaired or blind people in this world who are always in need of helping hands . Blind stick is an innovative electronic stick . Blind people have big problem when they walk on the street or stairs using white cane , instead of this white cane the electronic walking stick will help them by providing more convenient means of life . The main aim of this paper is to contribute our knowledge and services to the people of blind disabled society .

## Analysis of Triaxility Stress and Damage in Hot Extrusion Process of AL2024 using Finite Element Method

Shailendra Dwivedi<sup>1</sup> and Neeraj Dubey<sup>2</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: shailendrakdwivedi@gmail.com, dubeyneeraj2576@gmail.com

**Abstract:** Hot Extrusion process is a manufacturing process in which block of metal is reduced in cross section by forcing it to flow through a die orifice under high pressure. In general, extrusion is used to produce cylindrical bars or hollow tubes, but shapes of irregular cross section may be produced from the more readily extrudable metals, like aluminum. Heavy forces required in extrusion, most metals are extruded hot under conditions where the deformation resistance of the metal is low. However, cold extrusion is possible for many metals and has become an important commercial process. The reaction of the extrusion billet with the container and die results in high compressive stresses which are effective in reducing the cracking of materials during primary breakdown from the ingot. In this research work numerical simulation of hot extrusion process has been considered and carried out the finite element analysis has been carried out. Focused on the stress and strain behavior, triaxility stress and on the bases of deformation aiming on the damage and its behavior, taguchi method has been used for the validation of the design of experiment. For FEA DEFORM 3D software has been applied and for modeling of parts AUTOCAD has been used.

**Keywords:** Hot Extrusion, FEA, triaxility Stress, Damage.

## Finite Element Analysis of Hot Rolling for an Aluminium 2024 Plate

Shailendra Dwivedi<sup>1</sup> and Neeraj Dubey<sup>2</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** shailendrakdwivedi@gmail.com, dubeyneeraj2576@gmail.com

**Abstract:** Now a day numerical modelling an important tool in the manufacturing industry to analysis the all the parameters of machining and geometrical. The two dimensional rolling model is common in manufacturing industries. In the present research work is based on a two dimensional finite element model for hot rolling of aluminum (Al2024) plate has been used. This model is used to study the behavior of the material under different values of coefficient of friction, roller diameter and initial thickness of the plate for attaining a required dimensional thickness of the rolled plate. The effect of friction, initial thickness of plate and roller diameter on maximum stress, equivalent plastic strain and reaction force has been studied. The current work has been carried out using the Finite Element software ABAQUS 6.10

**Keywords:** Hot Rolling, FEA, Stress- Strain.

## Class(es) of Estimators under Non-Response and Measurement Error in Surveys

Diwakar Shukla<sup>1</sup>, Abha Tenguria<sup>2</sup>, Sharad Pathak<sup>3</sup> and Dinesh Kumar Moriya<sup>4</sup>

<sup>1</sup>Dr. Hari Singh Gour University, Sagar (M.P.), India.

<sup>2,3,4</sup> Govt. M.L.B. Girl's Auto. P.G. College, Bhopal (M.P.), India.

**Email:** abha.tenguria@gmail.com, sharadstatistics@gmail.com, dinesh.moriya@gmail.com

**Abstract:** While in sample surveys, it is expected to assume that respondents are obtainable to provide information correctly asked by interviewers. Unfortunately, in real circumstances it is rarely happens. Often respondents are not available; often do not understand to interviewer and often show unwillingness for correct answer. This causes a sample to be incomplete. According to theory of survey sampling, investigators are recommended to revisit those units found non-responded but even then the problem remains the same. Over the issues of personal respect and prestige bias, respondents often produce over or under estimated response instead of the true value. This causes appearance of measurement error in sample values. This paper presents method of mean estimation in the setup of non-response and measurement error together. It contains method to impute the values which are non-responded in sample containing measurement error on study variable. Expressions of optimized mean squared error are derived and theoretical results are supported by numerical illustration. This is an attempt for a most general approach for the problem of estimation in sample surveys.

**Key words:** Non-response, Measurement error, Bias, Mean squared error, Imputation, Auxiliary information.

## Lie Algebra and q Special Functions of Mathematical Physics

Ritu Sharma<sup>1</sup> and Abha Tenguria<sup>2</sup>

Govt. Maharani Laxmi Bai Girl's P.G. (Autonomous) College, Bhopal (M.P.)

**Email:** ritusharma327@gmail.com

**Abstract:** In this paper we will present important interrelationships between the theory of Lie groups and algebras, and special functions. We will study two specific Pseudo groups, namely  $SO_q(2)$  and  $SU_q(2)$ , and we prove that similar properties of Lie groups and study about the role of q special function in mathematical physics.

## Banach (E,1) Summability of the Derived Fourier Series

Kalpna Saxena<sup>1</sup> and Manju Prabhakar<sup>2</sup>

Govt. M.V.M. Bhopal (M.P), India

Email: manjuprabhakar17@gmail.com

**Abstract:** The aim of our paper is to study the Banach (E,1) product summability of derived series of Fourier series by generalizing the result of Tripathy and Pandey [9]

**Keywords:** (E,1) summability; Banach\_(E,1) summability; Banach summability.

**Mathematics Subject Classification (2010):** 42A24, 42A20 and 42B08

## Common Fixed Point Results for F-contraction in Complete b - Metric Spaces

Abha Tenguria<sup>1</sup> and Sarika Saxena<sup>2</sup>

Govt. M. L. B. Girls P. G. College, Bhopal (M.P.) 462001 India

Barkatullah University Institute of Technology, Bhopal (M.P.) 462026 India

E mail: abha.tenguria@gmail.com, sarika.s2011@rediffmail.com

**Abstract:** In this paper, we consider two F- contractive self mappings on a complete b- metric spaces. Object of this paper is to establish a unique common fixed point theorem for F - contractions. The results extend and generalize some results in the literature.

**Keywords :** Complete b- metric space, common fixed points, F-contractions.

## Some Fixed Point Theorems for Expansive Type Mappings in Dislocated Metric Space

Sarla Chouhan<sup>1</sup>, Prabha Chouhan<sup>2</sup> and Neeraj Malviya<sup>3</sup>

**Abstract:** The present paper extend and generalize fixed point theorems for expansive type mappings in Dislocated Metric Space.

**Keyword:** Dislocated Metric Space, Fixed Point Theorems,

**Mathematics Subject Classification:** 47H10,54H25

### On Ricci Quarter Symmetric Metric Connection

Teerathram Raghuwanshi<sup>1</sup>, Swati Jain<sup>2</sup>, Anil Goyal<sup>3</sup> and Manoj Pandey<sup>4</sup>

University Institute of Technology, RGPV Bhopal (M.P.) India

Email: teerathramsgs@gmail.com

**Abstract:** The object of the present paper is to study a type of Ricci quarter symmetric metric connection on a quasi-Einstein manifold and  $N(k)$ -Quasi Einstein manifold. We have shown that curvature tensor of the connection satisfies Bianchi's first identity and also that the conformal curvature tensor is an invariant of such a transformation. Apart from this, we have studied some more curvature conditions.

### A Taylor Series Method for the Solution of the Newman Boundary Value Problems for Partial Differential Equations

Chitra Singh

Rabindranath Tagore University Bhopal (M.P.)-India

Email: chitrasingh30@yahoo.in

**Abstract:** In this paper, a numerical method for solving the Neumann problems for partial differential equations with constant coefficients and analytic Neumann conditions in two and three independent variables is presented. The technique is based upon the Taylor series expansion. Properties and the operational matrices for partial derivatives for the Taylor series in two and three variables are first presented. These properties are then used to reduce the solution of partial differential equations in two and three independent variables to a system of algebraic equations. The procedure can be extended to linear partial differential equations with more independent variables. The Taylor series may not converge if the solution is not analytic in the whole domain, however, the present method can be applied to Neumann boundary-value problems for linear partial differential equations, when the solution is analytic in the interior of the domain and also on some open subsets for each distinct part of the boundary. The method is computationally very attractive and applications are demonstrated through illustrative examples.

### DSSSWMS: An Improved Approach For The Decision Support System In Solid Waste Management System

Narendra Sharma<sup>1</sup>, Ratnesh Litoriya<sup>2</sup>, Harsh Pratap Singh<sup>3</sup> and Deepika Sharma<sup>4</sup>

Mewar University Chittorgarh, India

Jaypee University Guna, (M.P) India

Shri Satya Sai University of Technology and Medical Sciences, Sehore (M.P.), India

Email: Narendra\_sharma88@yahoo.com, litoriya.ratnesh@gmail.com, singhharshpratap@gmail.com, deepikasharma190687@gmail.com

**Abstract:** India is a developing country, all the developing countries facing a sustainable waste management problem for a long time. The quantity of MSW is growing very rapidly and governments are not capable of disposal 100% of solid waste as per compare to generation. Improper waste management affects the environment and human being direct. Peoples suffer from many types of diseases due to improper solid waste management. To deal with this problem the Indian government makes policies and updates them from time to time. Now this time we need new technology that can be work of an integrate form with waste management models and help to improve the efficiency of the municipal solid waste management process. Decision support systems model such types of tools that can be the help of organizations or decision-makers to take proper decisions for a particular problem. A decision support system is a fully computerized system that can be work with the help of data mining technology.

## Mathematical Modeling of Indoor Air Pollutants: A Review

Sachin Kumar Khare<sup>1</sup>, Ravindra Randa<sup>2</sup> and V N Bartaria<sup>3</sup>

<sup>1,3</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India

<sup>2</sup>UIT RGPV, Bhopal (M.P) - India

**Email:** sachinkhare.2008@gmail.com

**Abstract:** With the global concern over the pollution, the indoor environment is also to be kept safe and within the prescribed air quality standards as most of the people spend their 80% of the time indoor whether it is at home, office or any other place. The pollutant concentration in indoor is more than in outdoor atmosphere and can affect negatively human health and productivity. Therefore, prediction of indoor pollutant concentration will help in making the necessary arrangements to improve indoor environment in order to keep the human health and productivity up to the desired levels. Several studies have been made over four decades in developing, testing, and evaluating the performance of mathematical models for predicting pollutant concentrations in the indoor atmosphere. These studies provide the data pertaining to risk assessment and enable the regulatory bodies to provide guidelines for the appropriate steps for a given level of smoking, Chemically Reactive Pollutants activity etc. This paper reviews the Balance-Based Model for Indoor Air Pollutant Concentration Modelling, Mathematical Modelling of Chemically Reactive Pollutants in Indoor Air and Mathematical Models for Predicting Indoor Air Quality from Smoking Activity.

## Generalized Fractional Kinetic Equations involving Generalized Extended-- $\tau$ Hypergeometric Function

Jai Prakash Patel

Madhyanchal Professional University, Ratibad, Bhopal (M.P.), India.

**Email:** jpnt.84@gmail.com

**Abstract:** Recently, introduced an extension of generalized  $\tau$ Hypergeometric function  ${}_3\Gamma_2^T(2)(z)$  (R. K. Gupta et al. [5]), [6]. In the present paper, authors have established further generalization of fractional kinetic equations involving generalized extended  $\tau$ -Hypergeometric functions. The solution of these generalized fractional kinetic equations were obtained in term of Mittag-Leer function using Laplace transform.

**Keywords:** Generalized extended incomplete Hypergeometric Function, Fractional kinetic equation, Laplace transforms, Mittag-Leer function, Fractional calculus.

**Mathematics Subject Classification (2010):** 26A33, 33B15, 33B20, 33C20, 44A10, 33E20.

## Global Stability Analysis of SITRS Model of Influenza

Trupti Barve<sup>1</sup>, Sandeep Kumar Tiwari<sup>2</sup> and Pradeep Porwal<sup>3</sup>

<sup>1,2,3</sup>Vikram University, Ujjain (M.P.) India.

**Email:** truptibarve23@gmail.com, skt\_tiwari75@yahoo.co.in pradeepratnawat@yahoo.com

**Abstract:** Numerous people all over the world are suffering from influenza every year. It is an acute respiratory infectious disease which is caused by influenza virus. The purpose of this paper is to study the spread of disease when individuals have tendency to become susceptible again after recovery. A SITRS deterministic model is proposed and analyzed. In this paper basic reproduction number  $R_0$  is obtained, local stability of disease free equilibrium and endemic equilibrium is studied and discussed global stability of disease free equilibrium. It is observed that disease free equilibrium is locally and globally stable when  $R_0 < 1$  and endemic equilibrium is stable when  $R_0 > 1$ . Numerical simulations are performed using MATLAB to check the effect of movement of individuals from recovery class to susceptible class and results are shown graphically.

## Coupled fixed-point theorem using E.A property in complex valued rectangular (generalized) metric space.

Mona Verma

Govt. P.G College Narsingharh- Rajgarh (M.P.) India.

Email : monaverma117@gmail.com

**Abstract:** In this paper coupled fixed point is obtain for four mapping using E.A property in complex valued rectangular (generalized) metric space.

**Keywords:** Complex- valued metric space, coupled fixed point, E.A property.

## Parametric excitation of high-frequency surface Plasma waves in Bismuth-Metal Interface

Ashim Prakash Jain and Sangeeta Kapoor.

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

Email: ashimj@lnct.ac.in, kapoorsangeeta1972@gmail.com

**Abstract:** The problem concerning the excitation of high-frequency surface Plasma waves (SPW) propagating across an external magnetic field at a plasma-metal interface is considered. A homogeneous electric pump field is applied in the direction transverse with respect to the plasma-metal interface. Two high-frequencies SPW from different frequency ranges of existence and propagating in different directions are shown to be excited in this pump field. The instability threshold pump-field values and increments are obtained for different parameters of the considered waveguide structure. The results associated with saturation of the nonlinear instability due to self-interaction effects of the excited SPW are given as well. The results are appropriate for both gaseous and semiconductor plasmas. A surface plasma wave (SPW) over bismuth-Metal interface has a signature of mass anisotropy of free electrons. For SPW propagation along the trigonal axis there is no birefringence. The damping rate of waves at low temperatures is low. The surface plasma wave may be excited by an electron beam of current 100 mA propagating parallel to the interface in its close proximity.

## Artificial Neural Network Modeling for Estimation of Carbon Monoxide Concentration

Sangeeta Kapoor<sup>1</sup>, Sudhir Nigam<sup>2</sup>, Rashmi Nigam<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

<sup>2</sup>Envirimental Consultant, (M.P)-India

<sup>3</sup>UIT, RGPV, (M.P)-India

Email: kapoorsangeeta1972@gmail.com

**Abstract:** The lack of environmental data is a common feature for many developing countries. Accurate estimation technique is highly required to overcome with this problem and the artificial neural network (ANN) is regarded as cost effective and better suited technique for estimation as compare traditional statistical techniques. In this paper an attempt is made to estimate concentration of CO gas based on historical data using artificial neural network (ANN). Eleven years (1996-2006), night time (22.00-06.00 Hrs.) CO emission data from ITO square of Delhi has been employed for modelling and simulation study. The results of ANN studies predicted CO concentrations with great accuracy and closer-to-reality which can be helpful to alleviate the excessive CO accumulations.

**Keywords:** Concentration, Artificial Neural Network (ANN), Real time analysis, Modelling.

## Intelligent Phishing Detection Classification Using Hybrid Approach

Shivani Goutam<sup>1</sup>, Rajeev Kumar<sup>2</sup> and Vivek Kumar<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

**Email:** rajeevcsemitb@gmail.com, vivekk@lnct.ac.in

**Abstract:** The so-called phishing attacks refers to an attacks in which a legitimate website is mimicked, in order to steal sensitive statistics from end-users. Phishing attacks are one of the significant threats to individuals and corporations on the Internet today. In recent years, this problem has been actively researched by academia and industry. There are two main approaches to try to provide an effective phishing solution: The first is to identify phishing attacks by comparing the similarities between phishing and the target site. The second method is to observe the underlying characteristics of the attack. This paper proposes a phishing technique based on web page uniform resource locator (URL) authentication. The proposed solution is able to distinguish legitimate web pages from fake web pages by verifying the Uniform Resource Locator (URL) of the suspicious web page. Check URLs against specific features to verify phishing pages. Prevention of detected attacks is reported. The performance of the proposed solution was evaluated using the Phistank and Yahoo Directory datasets. The obtained results suggest that the detection mechanism is deployed and can detect various types of phishing attacks while maintaining a low rate of false alarms.

**Keywords:** Phishing, malicious URL, KNN, machine learning, cybersecurity.

## Review on mathematical modelling of an Internal Combustion Engine

Rajeev Singh Chauhan<sup>1</sup>, Nitin Shrivastava<sup>2</sup> and Arun Kumar Wamankar<sup>3</sup>

<sup>2</sup>UIT-RGPV Bhopal (M.P) India

<sup>1,3</sup>Lakshmi Narain College of Technology, Bhopal (M.P) - India

**Email:** rajen5432@gmail.com

**Abstract:** In this article, we are focussed and discussed on different types of mathematical modelling and its application used in internal combustion engine. A mathematical model usually describes a system by a set of variables and a set of equations that establish relationships between the variables such as combustion, performance and emission parameters. By the use of mathematical modelling different parameter of internal combustion engine can be correlate and analyse the effect of one parameter to another. After developing a mathematical model different types of fuel blend can be easily analyse the effect on combust, performance and emission at different loads within the experimental domain. Author's analysed and found from previous published paper related to mathematical modeling and experimental output predicted should be closer to developed mathematical model.

## Kinetic Model for Performance Prediction of Anaerobic Digester

Arvind Kumar Mishra<sup>1</sup>, Prashant Baredar<sup>2</sup>, Anjaney Pandey<sup>3</sup>, Deepak Kumar Rathaur<sup>4</sup>,  
and Prashant Pandey<sup>5</sup>

<sup>1,4,5</sup>Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

<sup>2</sup>Department of Energy, MANIT Bhopal (M.P.)

<sup>3</sup>IPST Rural Engg. , MGCGV, Chitrakoot (M.P.)

**Email:** arvind686465@gmail.com

**Abstract:** Anaerobic Digestion (AD) is a biological process that happens naturally when bacteria breaks down organic matter in environments in the absence of oxygen. Anaerobic digestion (AD) is a microbial decomposition of organic matter into methane, carbon dioxide, inorganic nutrients and compost in oxygen depleted environment and presence of the hydrogen gas. Bacterial growth is a complex process involving numerous anabolic (synthesis of cell constituents and metabolites) and catabolic (breakdown of cell constituents and metabolites) reactions. Ultimately, these biosynthetic reactions result in cell division. Several distinct growth phases can be observed within a growth curve lag phase ,the exponential or log phase, the stationary phase, the death phase. During exponential growth the rate of increase of cells in the culture is proportional to the number of cells present at any particular time. One can mathematically describes cell growth during the exponential phase . Equation has been developed from a series of experiments performed. The results of these experiments shows that at low substrate concentrations, growth rate becomes a function of the substrate concentration .Thus, designed Equation to describe the relationship between the specific growth rate and the substrate concentration.The most important determinants of good living conditions for anaerobic bacteria and therefore efficient gas production. Acetogenic (acid forming bacteria) and methanogenic are naturally present in cow dung.However, their number is quite small. Acid forming bacteria proliferate fast and increase their number, while methanogenic bacteria develop very slowly. Therefore, for the initial reaction, small amount of sludge of another digester is generally used as seeding or inoculum.This sludge contains high concentration of acetogenic and methanogenic bacteria which could enhance the process of anaerobic digestion of organic materials. Some study has shown that the seeding materials can be mixed with the input slurry up to the ratio of 30 to 50 percent. If inoculum is increased further, less volume of gas is obtained due to reduced inputs fed to the digester. Anaerobic digestion occurs best within a pH range of 6.8 to 8.0.

## Emotion Detection based on Images and Captions on Social Media

Aditya Patel<sup>1</sup>, Hitesh Gupta<sup>2</sup> and Utkarsh Dwivedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** adityapatelmail@gmail.com, hitesh034@gmail.com, utkarshdwivedibtech@gmail.com

**Abstract:** Nowadays, Internet has grow to be an crucial element in every person's lifestyles. Social networking has regularly grow to be a recurring for people to submit their photos, opinions and remarks. People percentage their emotions on line in a completely casual language. Thus, it is very tough mission to research actual sentiment hidden inside the text of natural language. Emotion detection is the sphere of study that analyses people views and feelings. Human emotion can be expressed through numerous approach which include speech, facial expressions, gestures and textual facts.This paper proposes the gadget which makes use of present emotion detection thru facial features using deep mastering and supports it with the evaluation of textual information received thru captions of pics on social networking websites to ensure greater accurate outcomes. There is no characteristic on social networking sites to kind feelings of photos which motivate us to classes posts based on emotions. Emotion detection from each captions and photos collectively is efficient due to the fact most effective text isn't always enough to apprehend the feelings of customers. This hybrid approach offers promising results in both the class of feelings as well as in acting emotion detection.

**Keywords:** Emotion detection, Convolution Neural Networks, Social Networks, Deep Learning, Sentiment Analysis

## Content Based Facial Emotion Recognition Model using Machine Learning Algorithm

Aditya Patel<sup>1</sup>, Vijay Kumar Trivedi<sup>2</sup> and Utkarsh Dwivedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P) - India

**Email:** adityapatelmail@gmail.com, hitesh034@gmail.com, utkarshdwivedibtech@gmail.com

**Abstract:** Emotion reputation or sentiment analysis is recognized as a critical studies topic in pc vision community. The challenges include identity of face, popularity of accurate emotion, suitable database and so forth. We have proposed and implemented a fashionable Convolution Neural community (CNN) building framework for emotion popularity. The model is formalized by means of developing a coincident gadget which fulfills the duties of face detection and emotion classification the usage of our proposed CNN structure. The version is verified using the FER-2013 dataset. In the proposed paintings, we talk the applicability of the proposed CNN model. This model lays a valuable evaluation of the effect of changing the network size, pooling, and dropout. For a given model, the very last accuracy at the validation facts is round 63%.

**Keywords:** Convolutional neural network (CNN), Facial expression recognition, Deep neural networks.

## Role of SODAR in the Climate Observing and Predicting System

Anjali S. Nair<sup>1</sup>, Priyanka Singh<sup>2</sup>, Mamta Devi<sup>3</sup>, Kirti Soni<sup>4</sup>,

Mahavir Singh<sup>5</sup> and Sangeet Kapoor<sup>6</sup>

<sup>1</sup>Physico-Mechanical Metrology (PMM) Division,  
 CSIR-National Physical Laboratory, New Delhi, India,

<sup>2</sup>Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** soniks@nplindia.org

**Abstract:** Climate Change is our time's defining problem and we are at a defining moment. The effects of climate change are global in scope and unprecedented in scale, from changing weather patterns that threaten the human life and livelihood due to the rising risk of hydro meteorological disasters like flood, hurricanes, cyclones, drought etc. Without dramatic intervention today, it will be harder and more expensive to adapt to these hydro-meteorological effects in the future. Many methods have been created and are being developed for curbing the catastrophic effect caused due to hydro-meteorological disasters. Remote sensing was one of those techniques that had a huge effect on disaster management. This technology has been widely used in recent decades to explain the extent of the impacts of earthquakes, tsunamis, hurricanes, floods, wildfires etc. Remote sensing techniques have proved important effectiveness in quantifying post-disaster harm after major disaster through high resolution optical imaging and active sensors. Before these disasters happen and create a dreadful situation (humanly in terms of economy and socially), however, it is necessary to estimate and predict them. The present study focused to develop environmental models that enable prior prediction of these disasters via estimation of extreme climate change before it could cause detrimental effects. The research deploys Sound Detection and Ranging (SODAR) for collection of data in relation to wind speed and direction, atmospheric boundary layer for specific locations in India that are hit by hydro-meteorological catastrophe for evaluating the role of SODAR and environmental modelling in prediction of climatic trends, thereby avoiding the disaster hit consequences. The study also addresses the wider applications and advantages of using SODAR than other remote sensors and the models which uses wind speed and direction for the prediction of climate changes and thus helping in pre preparedness before the disaster. Therefore, there is an apparent connection between climate change and rising climate-related risks, generally suggesting the need to assert about the need for its predication through environmental modelling. This project will take the help of environmental modelling to ascertain about the upcoming climate change which will enable an estimation of climatic havoc leading to pre-precautionary measures before these disasters affect the people.

## Security Concerns, Matters and Methods for Wireless Sensor Network

Leena Jadhav<sup>1</sup> and Jitendra Sheetlani<sup>2</sup>

<sup>1</sup>SSSUTMS, Sehore (M.P)- India

E mail: leenavishal83@gmail.com

**Abstract:** A Mobile ad hoc networks (MANETs), a class of flexible and self-autonomous wireless networks that can be rapidly deployed and reconfigured without infrastructure support or centralized management, are highly promising to provide communication support [1]. The mobile nodes can move from one location to another. The mobile nodes are formed as a network without help of central management [1, 2, 18]. The Nodes in networks make use of an equivalent random access channel, cooperating in an especially friendly manner to contributing themselves in multihop forwarding. With the worldwide use of wireless sensor networks in different field and for various applications such as health care, military, ecological, and earth sensing, surveillance system monitoring. By reason the restrictions/ limitations of sensor nodes in terms of energy, storage and computational capacity, the use of insecure wireless communication channels concerns have ascended in these applications. To countermeasure the limitation various techniques and algorithm has been developed by the researchers. In this paper, we present the security issues, challenges occur and different techniques to overcome these security issues with their merits and demerits.

## Mathematical Modeling of Heat Exchange in the Under Ground Pipe of an Earth Air Heat Exchanger System

K. V. Rao<sup>1</sup>, V. N. Bartaria<sup>2</sup> and Prashant Bhawe<sup>3</sup>

<sup>1</sup>Research Scholar, LNCT University, Bhopal (M.P)-India

<sup>2</sup>Professor, Mechanical Engineering, LNCT, Bhopal (M.P)-India

<sup>3</sup>Environmental Engg, VJTI, Mumbai-India

**Abstract:** The tropical countries like India where heating and cooling of air is mostly required during particular season in a year. Conventional heating and cooling systems consume a great amount of energy reaching up to the level of almost one-third of the total energy consumption. As the current energy requirements are mostly fulfilled by the fossil fuel based energy generation systems, this extensive consumption of the energy contributes to green house emissions and affecting the environment adversely. A promising technology of heating and cooling of air by the earth air heat exchanger system has been becoming important in the present scenario of emphasis on reducing energy demand on space heating and cooling. This renewable and passive system of heating and cooling reduces the energy demand and thus protect the environment also. The design of the earth air heat exchanger system involves various parameters such as the thermo-physical properties of the soil, thermal and flow characteristics of the air in the pipe, material, orientation and dimensions of pipes buried in the earth and the heat exchange for the optimum performance. This paper presents the mathematical modeling of the heat exchange in the underground pipe. The mathematical model will provide the necessary input data for the design of an efficient earth air heat exchanger system. Thus the space heating and cooling can be more effectively done with the saving of energy and protecting the environment.

## Extreme Values Analysis for Finding Outliers Detection Using Machine Learning to Detect Predicted Data Points

Atul Kumar Gupta, Ashish Jain, Nikesh Tiwari

Jagran Lakecity University Bhopal (M.P)-India

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** atul.gupta@jlu.edu.in, jainashish1302@gmail.com, nikeshtiwari786@gmail.com

**Abstract:** An outlier is usually measured as an observation which is extensively found distant from the other well thought-out observations. In the era of modern machine learning analysis of n-dimensional datasets, data quality is essential for economists to guarantee robust results. Many machine learning algorithms are sensitive to the range and distribution of attribute values in the input data. Outliers in input data can skew and mislead the training process of machine learning algorithms resulting in longer training times, less accurate models and ultimately poorer results. Even before predictive models are prepared on training data, outliers can result in misleading representations and in turn misleading interpretations of collected data. Traditional techniques for outlier detection tend to exclude the tails of distributions and ignore the data generation processes of specific datasets. Various methods for detecting different kinds of outliers in high-dimensional data sets from two different perspectives, i.e. detecting the outlying aspects of a data object and detecting outlying data objects of a data set. N-dimensional data can be seen as part of the variety challenge of machine learning.

**Keywords:** Outlier detection, Machine Learning, High-Dimensional Data, Intrinsic Dimension (ID), k-Nearest Neighbour (k-NN)

## Review of Artificial Neural Network and Its Applications

Nikita Naik<sup>1</sup> and Jagruti Sohale<sup>2</sup>

<sup>1</sup>Seva Sadan Mahavidhyala, Burhanpur (M.P)- India

**Email:** jagrutisohale99@gmail.com

**Abstract:** In this paper, we are elaborating Artificial Neural Network or ANN, its areas of applications. An Artificial Neural Network (ANN) is an information processing paradigm that is inspired by the way biological nervous systems, such as the brain, process information. In our brain, there are billions of cells called neurons, which processes information in the form of electric signals. ANN works on this concept. ANN provides a very exciting alternatives and other application which can play important role in today's computer science field. This paper gives overview of Artificial Neural Network of ANN. It also explains the application and advantages of ANN.

**Keywords :** Artificial neural network, information, process, electric signal, biological nervous system.

## Role of AI in Designing Smart Homes

Ashi Jain<sup>1</sup> and Bhumika Lalchandani<sup>2</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** ashijain586@gmail.com, bhumikalalchandani321@gmail.com

**Abstract:** Smart Homes have become firmly established as an active research area with potential for huge social and economic benefits. The concept of a Smart Home refers to the enrichment of a living environment with technology in order to offer improved habitual support to its inhabitants and therefore an improved quality of life for them. In this research paper we purpose how advances from the device and technological side have not necessarily been matched with a similar level of development in processing of the information recorded within the living environment from an algorithmic or 'intelligent' perspective. We surmise how traditional areas in Artificial Intelligence can bridge this gap and improve the experience for the user within a Smart Home. Smart Homes offer many benefits to its inhabitants and people with special needs. ANN (Artificial neural Network) technology appear to have potential, especially in the automated monitoring and control of smart home devices and the relevant space as well as the well being of inhabitants. With the rapid advances in technology , especially in wireless sensors and sensor networks, it is expected that it is not far when many of the dreams of the smart homes will be realized.

## Application of Intuitionistic Fuzzy Soft Matrix Theory in Decision Making in Real Life Problem

Manoj Sharma<sup>1</sup>, and Dharendra Kumar Shukla<sup>2</sup>

Sagar Institute of Research & Technology, Bhopal (M.P)-India

RIE, Bhopal (M.P)-India

**Email:** sirtmns@gmail.com

**Abstract:** Soft set theory is a newly mathematical tool to deal with uncertain problems. It has a rich potential for application in solving practical problems in economics, social science, medical science etc. The concept of fuzzy soft sets extended fuzzy soft set to Intuitionistic fuzzy soft sets .In this paper we proposed intuitionistic fuzzy soft matrices and defined different types of intuitionistic fuzzy soft matrices and some operators. Finally a practical example that explains the best solution is analysed and demonstrate the application of the proposed decision making method.

**Keywords:** Soft sets, Fuzzy soft matrix (FSM), Fuzzy soft set (FSS), Intuitionistic fuzzy soft matrix (IFSM), Addition of IFSM, Complement of IFSM , Subtraction of intuitionistic fuzzy soft matrix.

## Generalized the Result on Common Fixed Point Theorem in Complex Valued b- Metric Space

Pradeep Kumar Dwivedi

Sagar Institute of Research Technology and Science, Bhopal (M.P.)

**Email :** pkdwivedi76@gmail.com

**Abstract:** In this paper we generalized a common fixed point theorem for four self-mappings satisfying rational contraction has been proved in complex valued b-metric space. Then, examples are provided to verify the effectiveness and usability of our main results. Finally, we validate our results by proving both the existence and the uniqueness of a common solution of the system of Urysohn integral equations and the existence of a unique solution for linear equations system.

**Keywords:** complex valued b-metric space, common fixed point, compatible mapping, weakly compatible mapping, integral equations, linear system.

**AMS Subject Classification No. (2010):** 47H10; 54H25

## **Big Data Analytics and High Performance Computing: Issues, Challenges and Paradigms**

**Swati Namdev and Sunil Phulre**

LNCT University, Bhopal (M.P.) - India

**Email :** swati.tailor@gmail.com, suneel.lnct@gmail.com

**Abstract:** Data has grown with the advent of technology, capture and store data and then analyze it. Big data is a primary concern with the management of computational models that require improvement. Big data and then later the rise of big data analytics which changed the whole perspective of data and data handling. Satisfied growing analytical needs for Big Data with extremely high performance computing models. As a result, a lot of research in this area has been seen in recent years, several paradigms for Big Data Analytics emerge. Simultaneously, the spread of Big Data Analytics in various domains, concerns about the effectiveness of the new analytical paradigm are also being seen. This paper highlights the major analytical models and concerns and challenges in High Performances Computing.

**Keywords:** Big Data, High performance computing, Computational Model

## **Review Analysis of IOT based Solar Energy System**

**Anand Singh<sup>1</sup> and Manish Khemariya<sup>2</sup>**

**Email:** manishk@lnct.ac.in, anand24883singh@gmail.com

**Abstract:** A smart solar photovoltaic system is an advent of innovation coherence of information and communications knowledge with power systems control engineering via the internet. This paper designs and demonstrates a smart solar photovoltaic off grid system that self-healing, ecological and consumer friendly, but also with the ability to put up other renewable sources of energy generation seamlessly, creating healthy spirited energy industry and optimizing energy assets efficiency. This work also discuss the modeling of an competent dynamic smart solar photovoltaic power system by exploring the most power point tracking efficiency, optimization of the smart solar photovoltaic array through modeling and simulation to get better the quality of design for the solar photovoltaic module. Using the Internet of Things Technology for supervise solar photovoltaic power generation can greatly enhance the performance, monitoring and maintenance of the plant. The discussion in this project work is based on implementation of new cost effective methodology based on IOT to remotely monitor a solar photovoltaic plant for performance evaluation. This will facilitate preventive upholding, fault uncovering, historical study of the plant in totaling to real time monitoring.

**Keyword:** Solar, IOT, Power System, Optimization

## Glaucoma diagnosis using discrete wavelet transforms and Histogram features from fundus images

Nandini Kokate<sup>1</sup>, K.G. Kirar<sup>2</sup> and M.L. Jatav<sup>3</sup>

SATI, Vidisha (MP) India

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

Email: kokate@gmail.com

**Abstract:** Glaucoma is one of the main eye diseases; it causes progressive deterioration of optic nerve fibres due to increased fluid pressure. The existing methods of glaucoma diagnosis are time consuming, expensive and require practiced clinicians to understand the eye problems. Hence fast, cheap and more accurate glaucoma diagnosis methods are needed. This paper presents an innovative idea for diagnosis of glaucoma using third level two dimensional discrete wavelet transform (2D DWT) and histogram features from fundus images. The 2D DWT is used to decompose the glaucoma and healthy images and histogram features are extracted from 2D DWT decomposed sub band images. The least square support vector machine (LS-SVM) is used as a classifier which classifies the glaucoma and healthy images using the extracted features.

**Keywords:** Glaucoma; 2DWT; LS-SVM.

## Some fixed point theorems for generalized Kannan type mappings in b-metric spaces

Motiram Likhitkar<sup>1</sup>, R. D. Daheriya<sup>2</sup>, and Manoj Ughade<sup>1</sup>

<sup>1,2,3</sup>Government J.H. Post Graduate College, Betul (M.P) - India

Email: jagdish\_pet@yahoo.co.in

**Abstract:** In this paper, we prove some fixed point theorems in b-metric spaces using subadditive altering distance function. Some of these results generalize many existing fixed point theorems for Kannan type mappings. The results are justified with suitable examples.

## Strong convergence of a general algorithm for nonexpansive mappings in Banach spaces

R. D. Daheriya<sup>1</sup>, Umesh Dongre<sup>2</sup> and Manoj Ughade<sup>3</sup>

<sup>1</sup>Government J.H. Post Graduate College, Betul, India

<sup>2</sup>Dr. B. R. A. Government College, Amla, India

Email: udhelpyou@gmail.com

**Abstract:** In this work, we consider a general algorithm for a countable family of non expansive mappings in Banach spaces. We proved that the proposed algorithm converges strongly to a common fixed point of a countable family of non expansive mappings which solves uniquely the corresponding variational inequality. It is worth pointing out that our proofs contain some new techniques. Our results improve and extend the corresponding ones announced by many others.

## Speech Recognition Application without Internet Connection

Aakarsh Singh Bais<sup>1</sup>, Meetoo Singh<sup>2</sup> Shreya Singh<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P.) - India

Email: singhshreya2511@gmail.com, meetoos@lnct.ac.in

**Abstract:** Artificial Intelligence, in all its forms is trying to make life simpler for humans, by utilizing the thinking power of man in creating machines which can think and do work for man. It is an area of computer science which focuses on developing intelligent, decision making machines which work and react like humans. There are millions of applications of Artificial Intelligence, one of them being: Speech Recognition. It is an area which enables translation of man-spoken words into machine readable format. Consequently, the machine understands the language, processes the words and responds depending upon the decision made by it. In this digital era, everyone knows how to use Google Assistant. Siri and Cortana have made everything easy for us. But still, these speech recognition softwares cannot work without proper internet connectivity. The research paper is entitled to demonstrate a solution to make use of artificial intelligence without internet. The main idea is to use integrated circuits as a medium to store the data required for processing of decisions. Also, computer's cache can be used to store frequently asked questions so as to deliver the solutions at a faster rate. This would make use of artificial intelligence in setting up of smart alarm clocks, in handling of event management, redirect users while travelling through frequent routes without using GPS system. This strategy would help make the speech recognition software a standalone application, and would provide reliability and faster response time as well.

**Keywords:** Artificial Intelligence, Speech Recognition, Response Time, Reliability

---

## AI based chatbot with the help of Image processing for Medical Assistance

Anmol Saxena<sup>1</sup>, Ajeyata Verma<sup>2</sup> and Anukul Kumar<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P.) - India

Email: vermajeyata05@gmail.com

**Abstract:** The aim of this paper is to present the idea of a chatbot which would give medical assistance to the patient at their home. It would also make use of image sensing to process image given by user and detect the disease. It would also be having a feature for emergency service. The chatbot would be user friendly and would communicate with user in natural language. The chatbot will be providing immediate home remedies which the patient could use at home to get quick and effective results.

**Keywords:** Chatbot, Artificial Intelligence, Image Processing, Dialog Flow

---

## A.I based Chat Bots for Providing Health Related Information

Deepanshu Singh<sup>1</sup>, Aashutosh Gujrati<sup>2</sup> and Arundhati Dube<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P.)-India

Email: thakurdeep077@gmail.com, aashutoshgujrati09@gmail.com

arundhati.dube617@gmail.com

**Abstract:** Chat bots in health care have the potential to provide patients with access to immediate medical information. Health Care chat bots could help patients better manage their own health, improve access and timelines to care. This can be done by using a conversational chatbot which will ask for various symptoms of a disease and will try to find out the type of disease along with it's home remedy using machine learning. It will also provide the details of the nearest hospital in case of an emergency.

**Keywords:** Chatbots, Machine learning, Dialogflow, Human-computer interaction.

## A Novel Technique to Early Detection and Avoidance of Congestion in MANET

Bhawana Pillai<sup>1</sup>, Deepak Singh Tomar<sup>2</sup> and Ashish Khare<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P.) - India

Email: bhawanapillai@gmail.com, tomar\_deepak01@yahoo.in, prof.khare@gmail.com

**Abstract:** MANETs have different features that make congestion management more difficult. This paper examines a similar approach to congestion solving situations and minimizing loss of packets in wireless networks. The method of using the concept of trust aware with Queue status for bandwidth aware routing is introduced. We use NS2 simulator and we have demonstrated our approach improves system performance and reduces the number of packets deposited on the network, so improving system performance.

**Keywords:** MANET's, Congestion control, Packet loss, Congestion controlling techniques.

## A Security Issues and Approaches in Cloud Computing

Virendra Kumar Tiwari<sup>1</sup>, Vishwa Gupta<sup>2</sup> and Pankaj Deoskar<sup>3</sup>

Lakshmi Narain College of Technology- MCA, Bhopal (M.P) - India

Email: virugama@gmail.com, vishwa.gupta80@gmail.com, pankaj\_78600@yahoo.com

**Abstract:** This paper discusses the data security in computing of cloud and also focuses on the study of information in the cloud and all aspects that are related to concerning security. It also discusses the probable fear of data security in the cloud environment and their solutions adopted by an assortment of service providers to defend security of data. Research paper will depart into details of defense for data rules with approaches used to ensure maximum fortification of data by decreasing risks as well as threats. Data availability in the cloud is advantageous for numerous applications. For the more perspective, research focus on confidentiality of data perpetuation which becomes more complex with flexible data sharing among a vibrant user group. It requires the concealment of outsourced data and a competent sharing of decryption keys between different certified users. For this reason a variety of methods are offered some of them focus on the use of attribute based cryptography ABC with AES.

**Keywords:** Data Security, Cryptography, Public key, Data Protection, Privacy, Risks and threats

## Common Fixed Point Theorem for Multivalued Generalized Fuzzy Mapping in b-metric space

Umashankar Singh<sup>1</sup> and Naval Singh<sup>2</sup>

<sup>1</sup>Sagar Institute of Research & Technology Excellence, Bhopal, India

<sup>2</sup>Govt. Science and Commerce PG College Benazeer, Bhopal, India

Email: umashankar\_singh1977@rediffmail

**Abstract:** In this paper, we are proving  $\alpha$ -fuzzy fixed point and common  $\alpha$ -fuzzy fixed point theorems for Multi-valued fuzzy mapping in complete b-metric space. Our result extends and generalizes the result of A. Shahzad with new rational expression.

**Keywords:** Multi-valued Mapping, b-metric space, fixed point, Common fixed point.

## Optimal solution method for Transportation problems of multiple variables

Aarti Borasi<sup>1</sup> and Brajendra Tiwari<sup>2</sup>

Govt. J.N.S., P.G, College, Shujalpur (M.P)- India

RKDF University, Bhopal (M.P)-India

Email: aarti237@gmail.com

**Abstract:** Transportation problem is considered a vitally important aspect that has been studied in a wide range of operation including research domain. As such it has been used in simulation of several real life problems. The transportation problem is a special class of model. It deals with the situation in which a commodity from several sources is shipped to different destinations with the main objective to minimize the total shipping cost .optimizing transportation problem of variable has remarkably been significant to various disciplines .It this paper , multiple variable will be optimized to reduce from-transportation cost using multiple method which will include. Northwest corners method, least cost method, Vogel method and mode method. This will mainly aim at finding the best and cheapest route on how supply will be used to satisfy demand at specific points,

**Keyword:** Optimization techniques, transportation problem, northwest corner, least cost, Vogel, model.

## Reliability of System with Two Repair Facilities

Anil Singh and Sanjay Chaudhary

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: anil291singh@gmail.com

**Abstract:** The aim of this paper is to present a reliability analysis of two unit cold standby system with repair facilities. The system consists of two units with each one with operable or failed state. At any time, one unit is operating while other is in cold standby. The failure has been divided into two parts major and minor. Minor failure requires minor repair facility and major repair requires major repair facility. Thus there are two repair facilities available. System has perfect switching for units .The system completely fails on the failure of both the units. The failure and repair times follow exponential and general time distribution. Partial Differential Equations and Laplace Transforms of various state probabilities have been obtained. Reliability of the system has been derived in the form state probabilities.

**Keywords:** cold standby system, major and minor repair facilities.

## Modelling of the Risk of Cancellation of Policies using Fuzzy Logic Approach

Gaurav Sharma<sup>1</sup> and Sanjeev Kumar

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: garv13sharma@gmail.com, sanjeevibs@yahoo.co.in

**Abstract:** The preventive avoidance of cancellation is a key problem facing insurance companies. A conversation with the client held prior to latter's decision to cancel a contract increases the likelihood of contract continuity. So companies are in need of reliable expert system that can help them to evaluate the risk of cancellation of the policies in future. With the help of fuzzy system it is possible to identify clients who may potentially cancel and take timely measure to safeguard the portfolio. Here a model is presented, which is designed by using fuzzy mathematics and expert system to provide indicative results on the risk of cancellation of the policies in future.

**Keywords:** Fuzzy logic, Insurance, Risk classification, Inference system, MATLAB, Index of vagueness.

## Availability Evaluation of 1-Unit System with 2-Warm Standbys

Kanta and Sanjay Chaudhary

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: singhkanta80@gmail.com

**Abstract:** This paper extracts the availability of a warm standby system with reboot delay and switching failures. The system is studied under the assumption that the time-to-failure and the time to repair of the primary and standby units are exponentially and generally distributed, respectively. There is a possibility of failures during the switching from standby state to primary state. Reboot delay happens in this switching procedure of a standby unit to primary unit. The reboot time is assumed to be exponentially distributed. It is assumed that there is a significant probability of a switching failure. Primary and warm standby units can be considered to be repairable. Using the supplementary variable technique we develop the explicit expressions for the steady state availability.

## Investigation about Stock Market Timing using Fuzzy Inference System

Manisha Dubey and SanjeevKumar

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: mdmanidubey@gmail.com

**Abstract:** To determine the buy and sell time is one of the most important issue for investors in the stock market. Stock investment has become an important investment activity and internet makes it easier exchange stock information and to make stock transaction. Trading in the stock market is full of uncertainly so there is vagueness in the market. Predicting the market is very difficult since it depends on several unknown factors. A person cannot observe that what is going to be happening and therefore investors often lose their money due to unclear investment objective. In this work a fuzzy approach to stock market timing is investigated. The proposed fuzzy model helps in identifying the stock market which is very bullish, bullish, neutral or very bearish, bearish. The four input factor are fuzzified to get a output using fuzzy logic, the stock market which is either very bullish, bullish, very bearish, bearish or neutral continues to some extent. For fuzzifying these input data, trapezoidal membership function is used, and center of gravity method is used for defuzzification of fuzzy output. The results found suggest that fuzzy modeling for this purpose is very promising.

**Keywords:** Stock market, fuzzy logic, timing, trapezoidal membership function.

## Fuzzy Logic Concatenation in Biometric Identification Systems

Monika Rathore and Sanjeev Kumar

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: monikarathore16sep@gmail.com

**Abstract:** Security of information is one of the most important factors of information technology and communication. So systems need strong procedures to protect data and resources access from unauthorized users. There are number of ways to prove authentication and authorization. But the biometric authentication beat all other techniques. Biometric-based authentication systems represent a valid alternative to conventional approaches. As Multimodal biometric identification system is more powerful, more accurate, less noisy data than the Single/Unimodel biometric system. This paper introduce three biometric techniques which are face recognition, fingerprint recognition, and iris recognition (i.e. Multi Biometric System) & aims at concatenating three biometric features namely face, fingerprint and iris to minimize False Accept Rate(FAR) and False Reject Rate(FRR). And shows using these biometrics has good result with high accuracy using fuzzy logic at decision level. In greater detail, fuzzy logic based approach at decision level is used for concatenation. Fuzzy logic is used for the effect of each biometric result combination. The proposed multimodel system achieves interesting results with several commonly used databases.

**Keywords:** Biometric, Multibiometric (face, fingerprint, iris), fuzzy logic.

## Reliability of Three Unit System with Two Type of Repair

Shiva and Sanjay Chaudhary

Institute of Basic Science,

Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: shivaarele@gmail.com

**Abstract:** This paper represents the reliability of a redundant system, which consists of three units with each one operable or failed. The failure can further divided into minor or major. Minor failure can be repaired by minor repair, but a major failure required a major repair. So two repair facilities are considered. The system completely fails on the failure of all units. Three similar units are in the system where one unit works as main and others in cold standby. An imperfect switch is used to on standby unit which takes sometime in switching. Failure rate and repair rate and repair rate are constant. Failure rate and repair rate follow exponential distribution. Differential equation and Laplace transformation are used. Hence reliability is obtained by the sum of the probabilities of all operable states.

## A New Common Fixed Point Theorem for Two Pairs of Mappings Satisfying Implicit Contraction Condition in Triangular Intuitionistic Fuzzy Metric Spaces

Manoj Ughade

Government J.H. Post Graduate College, Betul, (M.P) - India

Email: manojhelpyou@gmail.com

**Abstract:** Our goal of this paper is to prove a new general common fixed point theorem for two pair of mappings under a different set of conditions using the idea of weakly compatible mappings satisfying a general class of contractions defined by an implicit relation in the frame work of triangular intuitionistic fuzzy metric space, which unify, extend and generalize most of the existing relevant common fixed point theorems from the literature. Some related results and illustrative an example to highlight the realized improvements is also furnished.

**Keywords:** Triangular intuitionistic fuzzy metric space; common fixed point; implicit relation; weakly compatible mappings; contractions.

## A Survey on Development of Association Rule Mining Model for Gender Classification Over Fingerprint Database

Meena Tiwari and Ashish Mishra

RKDF, University, Bhopal (M.P.)-India

Lakshmi Narain College of Technology, Bhopal (M.P.)- India

**Email:** ashish.mish2009@gmail.com

**Abstract:** Each person's fingerprint structure is unique and is developed for biometric authentication system than others because fingerprints have advantages such as: feasible, differ from each other (distinct) permanent, accurate, reliable and acceptable all over the world for security and person identity. Fingerprints are considered as legal proof of evidence in courts of law all over the world. Fingerprint recognition for Gender classification method done through various techniques like Support Vector Machines (SVM), Neural Network(NN), Fuzzy- C Means (FCM). Comparatively a small number of machine vision techniques have been suggested for gender recognition and classification so identifying the gender from fingerprints is an important step in forensic anthropology to shorten the list of suspect search. Very few researchers have worked on gender classification using fingerprints and have gained competitive results. This paper presents Gender classification using association rule mining and classification approach. It is also proposed to combines the elaborate study of various methods and strategies with their comparative measures and to forecast results. This will help the researcher to undertake a comprehensive review and to carry out further research in association rule mining model for gender classification over fingerprint.

**Keywords:** Support Vector Machines , Neural Network, Fuzzy- C Means , Gender classification

## Different explicit rules of Combinatorics in ancient India

Nazida Shaikh and V. K. Gupta

School of Studies in Mathematics, Vikram University, Ujjain (M.P.)-India

Director, Ramanujan Research Centre of Mathematics,

Govt. Madhav Science P.G. College, Ujjain (M.P.) - India

**Email:** shaikhnazida@yahoo.in

**Abstract:** The topic 'Combinatorics' deals with counting problems, which are usually associated with selection of some objects from a given collection and their arrangements in a certain situation. The principles and methods of solving different combinatorial problems were well-known to the scholars of ancient India since the Vedic period. But no chronological account of contributions of Indian scholars in the field has been made available so far. In this paper author's mentioned some work of Combinatorics by ancient mathematicians, astronomers, ancient scientist and medical scribe. Author also highlighted various mathematical formulae and different explicit rule given by the ancient Indian mathematician time to time.

## Common Fixed Point Theorems in *Ab*-Metric Space

Neetu Sharma

Govt. P.G. College, Rajgarh, M.P., India

**Email:** neetu.vishu@gmail.com

**Abstract:** In this paper, I prove some Common Fixed Point Theorems satisfying new type of rational inequality in the  $n$ -dimensions *Ab*-Metric Spaces. In this paper, I modify new contractive conditions and give an application to verify the obtained results.

**Keywords:** common fixed point; *Ab*-Metric space; contractive mapping;

## Influence of Wind on Urban Atmospheric Boundary Layer characteristics at the Capital Region Delhi

Mamta Devi<sup>1</sup>, Anjali S. Nair<sup>2</sup>, Priyanka Singh<sup>3</sup>, Narender Lamba<sup>4</sup>, Kirti Soni<sup>5</sup>,  
Mahavir Singh<sup>6</sup> and Sangeeta Kapoor<sup>7</sup>

Physico-Mechanical Metrology (PMM) Division, CSIR-National Physical Laboratory,  
New Delhi, India

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** soniks@nplindia.org

**Abstract:** Remote sensing techniques play a significant role in understanding the dispersion behaviour of air pollutants with the study of Atmospheric Boundary Layer (ABL) height and characteristics. The vertical structure of the ABL plays an important role in meteorological and environmental prospect as it impacts the pollutant concentrations near surface and wind velocity. Acoustic Sounder (SODAR) technology employs the use of echograms to study the specific ABL parameters which includes the depth of ABL and its structure. Complex phenomenon associated with Atmospheric Boundary Layer can be better understood with the help of SODAR echograms and it can be better utilized for understanding the entire complex phenomenon happening in lower layer of atmosphere i.e., lower part of troposphere. The present study incorporates the SODAR echograms data for the analysis of the correlation between the parameters influencing the climate and the ABL height. The research also considers the variable structures produced by the SODAR during the month of January 2020. SODAR echograms represent different structures considering the atmospheric fluctuation due to the turbulence. This turbulence is mainly influenced by the wind gradient and wind shear. The sensors installed at the apex of the Acoustic & Vibration Metrology building, CSIR-National Physical Laboratory, New Delhi is taken into account for establishing the correlations between the variables.

**Keywords:** SODAR, Wind, Atmospheric Boundary Layer, Turbulence

## Characteristics Ventilation Coefficient over Delhi during summer

Priyanka Singh<sup>1</sup>, Mamta Devi<sup>2</sup>, Anjali S. Nair<sup>3</sup>, Narender Lamba<sup>4</sup>, Kirti Soni<sup>5</sup>, Mahavir Singh<sup>6</sup>  
and Sangeeta Kapoor<sup>7</sup>

Physico-Mechanical Metrology (PMM) Division, CSIR-National Physical Laboratory,  
New Delhi, India

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** soniks@nplindia.org

**Abstract:** The diurnal and seasonal variation of ventilation coefficient studied using a Remote sensing technique SODAR (Sound Detection and ranging); it gives real-time continuous ABL (Atmospheric Boundary Layer) height data and attached metrological sensors give metrological parameters data such as wind speed/direction, relative humidity and temperature. The diurnal variability is a dominant feature of the ABL, which plays an important role in the exchanges of heat, momentum, moisture, and chemical constituents between the surface and free atmosphere. The ventilation coefficient is calculated using ABL height and average wind speed. The ventilation coefficient is an atmospheric condition that indicates the air quality and pollution potential. This study is for the period of summer (April to June) 2019 over National capital Delhi and its outskirts. The height of the ABL during the different stages of its diurnal evolution, namely, the Stable Inversion layer, convective boundary layer (CBL), and Nocturnal boundary layer (NBL), are discussed and the effect of convection and wind speed on the ventilation coefficient is also analyzed. In this study, the correlation between the wind speed, temperature and relative humidity with the ventilation coefficient is determined. Diurnal and seasonal variation of ventilation coefficient gives knowledge about the day to day weather phenomena for air quality management. The result shows that the Temperature and wind speed are influencing positively to the ventilation coefficient during the summer seasons and convective boundary layer height growths and falls during the day time depending on the increase and decrease of temperature.

## A study of queuing model with the analysis of payment mode and waiting time in supermarket

Sadhna Singh<sup>1</sup>, R. K. Srivastava<sup>2</sup> and Amendra Singh<sup>3</sup>

<sup>1,2</sup> S.M.S. College, Jiwaji University, Gwalior (M.P.)

<sup>3</sup> Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

**Email:** sadhna20singh@gmail.com

**Abstract:** This paper deals with digital payments and cash payments in supermarkets. Initially we take two counters for comparison of digital and cash payments. The first counters for digital payments and the second for cash payments, and calculate billing times from both counters. Our aim is to reducing the customers waiting time by increasing the number of servers according to the conditions, both digital and cash payments. The analysis of various parameters of the queuing system, calculate utilization factor, service rate, arrival rate, calculate idle bill payment counter, customer satisfaction rates, and waiting time. After analyzing the parameters of the parameters of queuing system model, it is observed that digital payments save time.

## Diagnosis of ocular diseases by processing OCT images

Shweta Chouksey and Sunil Phulre  
LNCT, University, Bhopal (M.P)-India  
**Email:** sunilp@lnct.ac.in

**Abstract:** Optical Coherence Tomography (OCT) images is a current active area in medical image analysis to assist ophthalmologist in the early diagnosis of ocular diseases such as blindness due to diabetes. Machine Learning and Deep Learning algorithms are used to predict the disease occurrence using image dataset. The proposed work is integration of collection of OCT image dataset(online and offline), feature extraction and preprocessing of dataset, implementation of image processing and linear prediction model using python for data science. Feature-based HOG-LSVM is applied for the features like inner limiting membrane, Bruch's Membrane, retinal pigmented epithelium, geographic atrophy. The results will be demonstrated for the performance measures precision, recall, accuracy, AUC, average correlation coefficient, Cohen's kappa ( $\kappa$ ),and distance-based disagreement (DbD) factors.

# RAJIV GANDHI PROUDYOGIKI VISHWAVIDYALAYA, BHOPAL

Accredited with 'A' grade by NAAC

Rajiv Gandhi Proudhyogiki Vishwavidyalaya (RGPV), accredited with 'A' grade by NAAC, established in the year 1998 is truly a picture of modernization offering learner-centric programmes in Engineering, Pharmacy, Architecture & Management. University is sprawled over a vast campus of 241.4 acres, marching towards development into a center of excellence in the arena of Technical Education, Research and Innovations.

Under its umbrella there are 05 UTD's 188 affiliated Engineering Colleges, 69 Pharmacy Colleges, 25 MCA Colleges and 05 Architecture colleges imparting Graduate level instructions running 23 under graduate level courses & 84 post graduate level courses. Situated amidst an aesthetic and hilly surrounding the University is offering Ph.D. in eight faculties. RGPV has been selected by Ministry of Human Resource Development (MHRD) as one of the Affiliating Technical Universities (ATUs) among ten across the country for receiving TEQIP-III grant. The main objective of Faculty Development Programme (FDP) is to improve quality and equity in engineering teachers in order to up-grade the knowledge, enhancing research and teaching skills.

# JAWAHARLAL NEHRU TECHNOLOGICAL UNIVERSITY, HYDERABAD (TELANGANA)

Accredited with 'A' grade by NAAC

Jawaharlal Nehru Technological University, Hyderabad, was established on 2nd October 1972 by the Legislature of the State of Andhra Pradesh as the first Technological University in the country. After 36 years of existence it was restricted into 4 different Universities by the Government vide Government Ordinance No.30 dated September 2008 and this new University has been designated as Jawaharlal Nehru Technological University Hyderabad (JNTUH). It has been in the forefront for the past 44 years in providing quality technological education and situated in a sprawling 89-acre campus at Kukatpally,

Hyderabad. It has now Four Constituent Engineering Colleges and 15 other constituent units in Hyderabad campus.

JNTUH offers B.Tech. programmes in 21 disciplines and B.Pharm at UG level; Integrated 5-year dual degree Masters programme; M.Tech. Programmes in 68 disciplines, M.Pharm. in 11 disciplines; M.Sc. in 4 disciplines; MCA, MBA and Double Degree Programmes at P.G. level; in addition to M.S., M.Phil., Ph.D. Research Programmes in various disciplines of Engineering, Technology, Science, Management and Humanities. JNTUH has 300 affiliated colleges spread over the Telangana State. JNTUH has more than 3.50 lakhs students on rolls. The University has Memoranda of University with many National and International organizations. JNTUH is identified as TEQIP-III University under subcomponent 1.3ATU.

# LNCT GROUP OF COLLEGES

LNCT Group of Colleges is one of the oldest and largest educational group in central India. Founded in 1994 Lakshmi Narain College of Technology, Bhopal has the privilege of being the First Private (self financed) institute of M.P. , LNCT Group offers program from Diploma, Bachelor, Master's and Doctorate level programs. With campuses in five locations in Madhya Pradesh &

Chhattisgarh including the cities of Bhopal, Indore, Gwalior, Jabalpur and Bilaspur to meet the ever increasing demands of higher education in central India, LNCT Group is one of the largest Group central India to offer programs in field of study: Engineering, Management, Pharmacy, Medical, Homeopathy, Dental and professional studies. This includes the students a feeling of responsibility and concern and makes them comprehend the world a bit better. Each one is better endowed to face the world and the satisfaction of having fulfilled their social responsibility is an added bonus.

The L. N. Medical College & Research Centre located at Bhopal, MP. It is a part of LNCT Group of College, which are runs a hospital with 750 Beds and Medical courses affiliated with Barkatullah University, All group institutions have the finest relations among the industry and academics. Today, prospective students will find 58 undergraduate, graduate as well as post graduate programs. People who wish to pursue a career in Engineering, Management, Pharmacy, Medicine, Dentistry and Nursing.

## **ABOUT ORGANIZING INSTITUTE & DEPARTMENT**

Lakshmi Narain College of Technology & Science, Bhopal is devoted to excellence in teaching, research and innovation and to develop leaders who will make a difference to the world. LNCT&S, which is based in Bhopal since 2006. The record breaking placement at LNCT&S is an apt testimony to its focus on upholding the highest academic standards right from selecting top faculty, introducing world class pedagogical practices to personality development to the students.

The department of Engineering Mathematics, one of the vibrant department of the institution, established in the year 2006. Department functions as a service agency providing support to UG inculcate analytical skills in mathematical sciences so as to enable the students to apply and formulate in solution making approaches of their technical subjects. Definitely the learning of mathematics will enhance and widen the mathematical aptitude, analytical skills, logical reasoning and systematic thinking of the students.

## **ABOUT BHOPAL**

Bhopal, capital city of Madhya Pradesh, is known as city of lakes. Founded by Raja Bhoj, the city has many natural and artificial lakes and it is one of the greenest cities in the country. The main cultural center of Bhopal is Bharat Bhavan. The State Museum has fossils, paintings and rare Jain sculptures. Taj-ul-Masjid is one of Asia's largest mosques, with white domes, and minarets. Van Vihar National Park, located in the middle of the city, has many species of animals living in their natural habitat. A large number of institutes of national importance have been

established in Bhopal. Climate of Bhopal is pleasant in the month of November.

## ABOUT INTERNATIONAL CONFERENCE

The purpose of this international conference is to discuss recent findings and new emerging trends in the field. It is intended to promote fruitful collaboration between various communities and institutes by bringing together a small number of scientists in inspiring surroundings. Some priority is given to young scientists to orally present and defend their own work. This will be a great opportunity for budding researchers particularly in the local region to explore the new aspects and global relations.

They would get ample scope to exchange views and thoughts besides presenting their research. The conference aims to provide a common platform to researchers working in various sub-disciplines of the theme.

## Course Objective

The course objective of this international conference is to bring together leading researchers and academics in the field of applied mathematics and engineers in order to debate current and interdisciplinary topics in mathematical modelling and high performance computing and their applications in science. The aim of this conference is to promote the interconnection of mathematical modeling, and High performance computing used in solving complex (real-world) problems. The lectures will be prepared with a broad multidisciplinary audience in mind, and ranging from modeling to scientific computing, will be covered. All submitted papers will be peer-reviewed by referees and accepted papers with great quality will be published in **International Journal of Scientific Research in Mathematical and Statistical Sciences (UGC Approved, Journal No. 63061)**.

**Main topics:** Mathematical modelling and High-Performance Computing in Science and Technology is a premier international conference on topics at the confluence of high performance and large scale computing systems, their use in modeling and simulation, their design, performance and use, and their impact, and related issues.

- ◆ Mathematical modeling the future Internet and developing future Internet security technology
- ◆ High Performance Computing (HPC)
- ◆ Mathematical Models and Information-Intelligent Systems on Transport
- ◆ Computational Methods for Linear and Nonlinear Optimization
- ◆ Numerical Methods for Solving Nonlinear Problems
- ◆ Bio-mathematics
- ◆ Mathematical Models for Computer Science
- ◆ Industrial Mathematics
- ◆ Mathematical Models for Computer Science
- ◆ Computational Modeling in Engineering and Science
- ◆ Mathematical modelling of Man-made Natural disasters: forest fire & environmental pollution
- ◆ Numerical Linear Algebra Methods for Large Scale Scientific Computing
- ◆ Machine Learning Techniques in Bioinformatics
- ◆ Processing, modelling, and describing time series

## MESSAGE

It gives me immense pleasure to know that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing **"International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)"** sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) and in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on February 12-13, 2020.

A galaxy of scientists and mathematicians, not only in India but across the globe, are coming to attend the International Conference.

I extend my best wishes to participants, members of managing committee and organizers of the International Conference (ICMMHPCST-2020) a grand success and also for the successful publication of the Souvenir and in all its future endeavors.

### MESSAGE

It gives me immense pleasure to learn that Department of Engineering Mathematics, **Laxmi Narayan College of Technology and Science, Bhopal** under the sponsorship of TEQIP-III, Rajiv Gandhi Prodyogiki Vishwavidyalaya, MP is organizing an International Conference on "**Mathematical Modeling and High Performance Computing in Science and Technology (ICMHCST -2020)**" on February 12-13, 2020.

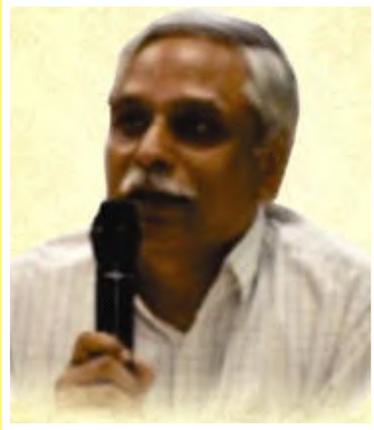

Mathematics is the backbone for the development of scientific and technical fields, scientific computing, the thrust area provides the basis for all round development of humanity and improvement of its well being.

I hope this Conference will provide a forum for interaction of researchers in the field of mathematical science, computer science and interdisciplinary researchers.

I am glad that **Laxmi Narayan College of Technology and Science, Bhopal** is providing the opportunity to large number of professional, academicians and researchers to generate high level of intellectual deliberations and would inspire younger scientists and faculty to go to greater heights.

My warm greetings to the organizers and wish the Conference all success to achieve its desired goals.

(Prof. Sunil Kumar)

**Dr. S.C Choube**

Coordinator TEQIP-III

Rajiv Gandhi Proudyogiki Vishwavidyalaya  
Bhopal (M.P.)

## MESSAGE

It's delightful to learn that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing “**International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)**” sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on February 12-13, 2020.

Mathematics is the backbone for the development of scientific and technical fields. Scientific computing, the thrust area provides the basis for all round development of humanity and improvement of its well being. This conference will provide a forum for interaction of Researchers in the field of mathematical science, computer science and Interdisciplinary Researchers.

I extend my best wishes to participants, members of managing committee and organizers of the **ICMMHPCST-2020** a grand success and also for the successful publication of the Souvenir and in all its future endeavors.

A handwritten signature in black ink, which appears to read 'S.C. Choube'. The signature is written in a cursive style and is positioned above a horizontal line.

**Jai Narayan Chouksey**  
Chancellor LNCT, University, Bhopal  
&  
Chairman LNCT Group of Colleges, Bhopal

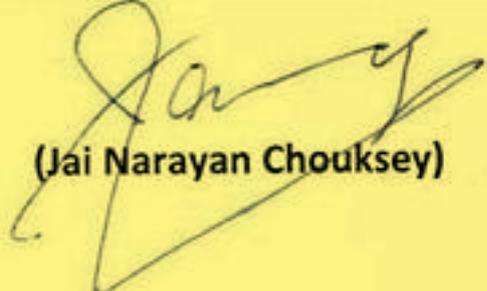

## MESSAGE

It's delightful to learn that the the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing **“International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)”** sponsored by TEQIP-III, Rajiv Gandhi Proudhyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on February 12-13, 2020.

**“ICMMHPCST-2020”** is successive efforts in the series of Mathematical Modeling and High Performance computing for the enhancement of knowledge and interest of one and all n research scholar and faculty members.

This conference is serving as an open platform for promoting and upbringing knowledge in the relevant area.

I heartily wish for the success of this conference and hope that all those are associated with this venture may achieve the most out of it.

(Jai Narayan Chouksey)

**Poonam Chouksey**  
Vice- Chair Person

## MESSAGE

I am pleased to know that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing **“International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)”** sponsored by TEQIP-III, Rajiv Gandhi Proudhyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on **February 12-13, 2020.**

The topics to be covered in this International Conference are comprehensive and will be adequate for developing and understanding about new developments and emerging trends in this area. I hope the goal of the conference is to update the knowledge of faculty members, young researchers and PG students. I shall be glad to receive a path forward drawn from the conference.

I congratulate the organizers for taking this initiative and extend my best wishes for the successful conduction of event.

  
(Poonam Chouksey)

## Dr. Ashok Kumar Rai

Director, Administration, LNCT, Bhopal  
Conference Convener (ICMMHPCST-2020)

### MESSAGE

It is the matter of great pleasure and pride that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing “**International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)**” sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) and in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on **February 12-13, 2020**.

This conference brings together leading academicians, scientists & researchers to exchange and share their experiences and research results in all aspects of Mathematical Modeling and High Performance Computing. It also provides a premier interdisciplinary platform for researchers, practitioners and educators to present and discuss the most recent innovations, trends and concern as well as practical challenges encountered and solutions adopted in the field of mathematical modeling and High Performance Computing.

We are grateful to all the delegates participating around the globe, the sponsors of this conference to help us in making this Endeavour a great success. On behalf of LNCT family, I wish all of you pleasant stay and fruitful participation in the conference.

A handwritten signature in black ink, appearing to read 'Ashok Rai'.

**(Dr. Ashok Kumar Rai)**

ICMMHPCST-2020 is going to be a premier forum for presentation of new research and advances in this field and attract the industry people to get associated with the Lakshmi Narain College of Technology & Science, Bhopal.

I would like to encourage the academics fraternity to make use of this opportunity for themselves and thus contribute for the benefits of students and society

I whole heartily wish for the mega success of conference

**(Dr. Sunil Singh)**

## Dr. Sanjeet Kumar

Professor & Head

Department of Mathematics, LNCT&S, Bhopal  
Conference Coordinator (ICMMHPCST-2020)

## MESSAGE

I feel so enthusiastic to share that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing “**International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)**” sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on **February 12-13, 2020**.

The combination of mathematical modeling and high performance computing is very often ignored in the scientific community although only the combination of these two technologies allows us to get better simulation results for many pressing problems in science and engineering.

The presence of large number of professionals, academicians and researchers would be able to generate high level of intellectual deliberations and would inspire younger scientists and faculty to go to greater heights.

I am sure the delegates and speakers will enjoy the Sessions and will carry with them pleasant memories of the Conference and the College Campus. I hope the Conference will create a strong group of specialists in the area of High Performance Computing and its Applications.

A handwritten signature in black ink, appearing to read "Sanjeet Kumar", with a long horizontal stroke extending to the right.

**Dr. Sanjeet Kumar**

## Mathematical Modeling: An application to Corrosion in a Petroleum Industry

Arihant Jain

School of Studies in Mathematics, Vikram University, Ujjain (M.P.)-India

Email: arihant2412@gmail.com

**Abstract:** Mathematical modeling is richly endowed with many analytic computational techniques for analyzing real life situations. Recent reports have confirmed that several billion dollars were lost to corrosion, in addition to environmental pollution and economic wastage in cleaning up the environmental mess caused by corrosion. This paper considers application of mathematical modeling to corrosion problems. It uses the mathematical modeling techniques to forecast the life expectancy of industrial equipment in the refinery, petroleum reservoirs and gas pipelines' distribution. The models considered in this direction are the heat-mass transfer equation, Zhim-Hoffman's equation, equations arising from electrolysis and finally gas pipeline distribution.

**Keywords and Phrases:** Mathematical models, corrosion, phase transition, heat equation, galvanic corrosion.

**AMS Subject Classification :** 73V and 80A.

## Evaluation of some parameters of $Gd^{3+}$ activated $Sr_2ZnSi_2O_7$ host lattices synthesized by sol-gel procedure

Vijay Singh<sup>1</sup>, S.Kokate<sup>2</sup>, Manoj K. Tiwari<sup>3</sup>, N. Singh<sup>4</sup> and R. Kokate<sup>5</sup>

<sup>a</sup>Department of Chemical Engineering, Konkuk University, Seoul, 05029, Korea

Lakshmi Narain College of Technology, Bhopal (M.P.)-India

MIET, Shahapur, Bhandara, 441906, India

Email: vijayjiin2006@yahoo.com, vijayjiin@gmail.com

**Abstract:** In this study, a series of  $Sr_{2-x}ZnSi_2O_7 \cdot xGd$  (where  $x = 0.01$  to  $0.11$ ) samples were synthesized using the sol-gel procedure. X-Ray powder diffraction (XRD), scanning electron microscope (SEM), and photoluminescence (PL) spectroscopy were employed to analyze the crystal characteristics, surface morphologies, and spectral characteristics of these samples. The dominant emission peak due to  ${}^6P_{7/2} \rightarrow {}^8S_{7/2}$  transition of  $Gd^{3+}$  was obtained for the prepared samples. The electron spin resonance (ESR) and PL analyses of the samples confirmed the presence of the  $Gd^{3+}$  in the  $Sr_2ZnSi_2O_7$  lattice. ESR studies suggested that  $Gd^{3+}$  ions occupy distorted  $Sr^{2+}$  sites in the host lattice. Photon interaction parameters in the photon energy range 1 keV–100 GeV for mixture of  $Sr_2ZnSi_2O_7$  and gadolinium (mass attenuation coefficients and effective atomic numbers) for have been calculated. These photon interaction parameters are varying largely for the energy range 1 keV–100 MeV with the compositions with a maximum for the highest gadolinium.

**Keywords:** Ultraviolet radiation; Sol-gel; ESR;  $Gd^{3+}$ ;  $Sr_2ZnSi_2O_7$ ; Gamma-ray

## Face Recognition from Surveillance using Sequential CNN-Model

Ashwin Perti<sup>1</sup>, Mukul Pratap Singh<sup>2</sup>, Harsh Panwar<sup>3</sup> and Harsh Tyagi<sup>4</sup>

ABES Engineering College, Ghaziabad (U.P)-India

**Email:** ashwinperti@abes.ac.in, mukul.16bit1033@abes.ac.in, harsh.16bit1096@abes.ac.in,  
harsh.16bit1062@abes.ac.in

**Abstract:** Now-a-days there is lot of research going on face recognition and identification, with the increase in computational power working on images became easy and many complex and deep neural networks are implemented on images. There are many applications which updates automatic attendance and face recognition, we just wanted to extend to super market problem. This paper solves the problem of identification of customer and employees in super market. We have used deep convolution network and Siamese network to train images to classify in to customers, important customers and employees from cameras. This also compares the results from different models.

**Index Terms:** Neural network, Siamese network

## Some Elliptic-Type Integrals and Their Hypergeometric Forms

Sanjay Sharma<sup>1</sup>, Richa Gupta<sup>2</sup>, Bhupendra Tripathi<sup>3</sup>, Roshni Sharma<sup>4</sup>

<sup>1</sup>Department of School Education, Bhopal (M.P)-India

<sup>2</sup>SRK University Bhopal(M.P)-India

<sup>3</sup>Lakshmi Narain College of Technology, & Science, Bhopal (M.P)-India.

<sup>4</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India.

**Email:** sanjaysharma3240@gmail.com, richasharad.gupta@gmail.com, bhupendrat@lnct.ac.in,  
roshnis@lnct.ac.in

**Abstract:** In the paper, we established Hyper geometric forms of different elliptic – type integrals have been studied due to their importance and applications in certain problems involving computations of the radiation field off axis from a uniform circular disc radiating according to an arbitrary angular distribution law.

## Mathematical Modeling of Man- Made Natural Disasters: Forest Fire & Environmental Pollution

Kirti Verma

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: kirtiv@lnct.ac.in

**Abstract:** Mathematics is an extraordinary exercise of the human mind in abstracting the results of observation to find similarities and differences between phenomena. These relations between phenomena make it possible to organize the natural world into discrete sets of objects that can be studied using similar mathematical objects and methods. Natural disasters cannot be prevented; scientists can use Mathematical Modeling to help limit the damage. Mathematical models are used to summarize relationships between the characteristics of natural disasters. They are ultimately used to answer questions that humans have about natural disasters, and predict the results of events that have not occurred, but may be possible or even likely. In this paper, Mathematical models of some problems related to Natural disaster are discussed.

## An analysis of Operational Efficiency of Major Airports in India

Sapna<sup>1</sup> and Ruchi Gupta<sup>2</sup>

Manav Rachna University, Faridabad (U.P)- India.

Email : chauhansap11@gmail.com, ruchigupta@mru.edu.in

**Abstract:** This paper deals with major airport's data of India for the year 2017-2018 and analysis for their respective efficiencies. This empirical study evaluates the operational efficiencies of 30 major India airports using data envelopment analysis and some of its recent developments. Various airport characteristics are evaluated to determine their relationship to an airport's efficiency. In this model, we have taken number of runways, number of passenger terminals and total expenditure as input variables and ASQ rating, aircraft movements, number of passengers, freight and logistics and revenue generated, as output variables.

The model focused in this paper is DEA model (Data Envelopment Analysis) and calculation is done using MS Excel.

**Index Terms:** Airport Efficiency, ASQ, ATQ, DEA Model.

## Common Fixed Point Theorem for Weekly Compatible Self Mapping in Menger Space

Geetanjali Sharma<sup>1</sup>, Richa Gupta<sup>2</sup>, Pankaj Tiwari<sup>3</sup> and Rajesh Shrivastava<sup>4</sup>

<sup>1,2</sup>Sarvepalli Radhakrishnan University, Bhopal (M.P)-India

<sup>3</sup>Govt. Naveen College, Lidhoura, Tikamgarh (M.P)-India

<sup>4</sup>Govt. Dr. Shyama Prasad Mukharji Science & Comm. College, Bhopal (M.P)-India

E-Mail: [ajaygeet@gmail.com](mailto:ajaygeet@gmail.com), [richasharad.gupta@gmail.com](mailto:richasharad.gupta@gmail.com), [pankajvist@gmail.com](mailto:pankajvist@gmail.com)

**Abstract:** In this paper, we prove the nation of Menger space and prove a common fixed point theorem for pairs of weakly compatible self mapping. Which generalize the well known results.

**Keywords:** Common fixed points, Metric space, Menger space, t-norm and Weakly Compatible mappings.

**AMS Subject Classification (2000)** – 45H10, 54H25.

## Common Fixed Points for a Pair of Self Mapping in Generalized Menger Spaces with a Graph

N. S. Rajpoot<sup>1</sup>, Brajendra Tiwari<sup>2</sup>, Pankaj Tiwari<sup>3</sup> and Bhupendra Tripathi<sup>4</sup>

<sup>(1,2)</sup>RKDF University, Bhopal (M.P)-India

<sup>3</sup>(G.F.) Govt. Naveen College, Lidhoura Tikamgarh (M.P)-India

<sup>4</sup>Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

E-Mail: [narendrarajput912@gmail.com](mailto:narendrarajput912@gmail.com), [brajendra16.tiwari@gmail.com](mailto:brajendra16.tiwari@gmail.com),

[bttripathirewa@yahoo.co.in](mailto:bttripathirewa@yahoo.co.in)

**Abstract:** In this paper, we prove the existence and uniqueness of points of coincidence and common fixed points for a pair of self-mappings defined on generalized metric spaces with a graph. Our results improve and extend several recent results of metric fixed point theory.

**Keywords:** Coincidence and common fixed points, Metric space, Menger space, self-mappings.

## Some Fixed Point Theorem Satisfying General Contractive Condition of Integral Type

Himanshu Tiwari<sup>1</sup> and Subhashish Biswas<sup>2</sup>

Kalinga University, Raipur (C.G.)-India.

E-mail: [himanshu.tiwari.ht@gmail.com](mailto:himanshu.tiwari.ht@gmail.com) [deb12rishika@gmail.com](mailto:deb12rishika@gmail.com) [shubhb@yahoo.co.in](mailto:shubhb@yahoo.co.in)

**Abstract:** In this paper, we establish a fixed point theorem for a pair of self maps satisfying a general contractive condition of integral type. This theorem extends and generalizes some early results of Boikanyo [4] and Jaggi and Dass [12].

**Keywords:** Lebesgue- integrable map, Complete metric space, Common fixed point

**AMS Subject Classification (2000):** 54H25, 47H10.

## Integral Relation of I-Function

Aradhna Mishra<sup>1</sup>, Neelam Pandey<sup>2</sup> and Jyoti Mishra<sup>3</sup>

<sup>1,2</sup>APS University, Model Science college , Rewa (M.P)-India

<sup>3</sup>Gyan Ganga Institute of Technology and Sciences, Jabalpur (M.P)-India

**Email:** jyoti.mishra198109@gmail.com

**Abstract:** I- Function formulae play an important role in special function. In this paper we aim to establish some new integral relation of I- function of one variable. Some special cases also presented in this paper.

**Keywords:** I- Function, Multivariable polynomial.

## Analytic Study of Fixed Point Theorems in a Soft Metric Space with Integral Type Mapping

Abid Khan<sup>1</sup>, Ramakant Bhardwaj<sup>2</sup> and Deepti Shakti<sup>3</sup>

<sup>1,3</sup>Amity University, Madhya Pradesh, Gwalior (M.P)-India

<sup>2</sup>Amity University, Kolkata (WB) -India

**Email:** abid69304@gmail.com

**Abstract:** In the present paper we established fixed point and common fixed point theorems in soft metric space with integral type mappings. Analytic results of fixed points will be established.

**Key-words -** common fixed point; rational conditions; compact metric spaces;

**AMS Classification:** 47H10, 54H25, 55M20.

## Bianchi Type-I Bulk Viscous Cosmological Models with Decaying Cosmological Term

Abhay Singh<sup>1</sup>, Bhupendra Tripathi<sup>2</sup> and Roshni Sharma<sup>3</sup>

Technocrats Institute of Technology and Science, Bhopal (M.P)-India

Lakshmi Narain College of Technology, & Science, Bhopal (M.P)-India.

**Email:** abhaysingh5784@gmail.com, bhupendrat@lnct.ac.in, [roshnis@lnct.ac.in](mailto:roshnis@lnct.ac.in)

**Abstract:** Bianchi type I cosmological models with varying cosmological term  $\Lambda$  and bulk viscous fluid are investigated. Exact solutions of Einstein's field equations have been studied by assuming the law for variation of Hubble's parameter that yields a constant value of deceleration parameter. Physical and kinematical properties of the models are also discussed.

**Keywords:** Cosmological term  $\Lambda$ , Deceleration parameter  $q$ , Hubble parameter  $H$ , Scale factor  $S$ .

## Fixed Point Theorem for $(\beta\alpha)$ -Admissible Mappings in Metric-like space with respect to Simulation Function

Shiv Kant Tiwari<sup>1</sup> and Lakshmi Narayan Mishra<sup>2</sup>

Jai Prakash Mahila College Chapra (Bihar) 804103 India

**Email:** shivkantmath@gmail.com

**Abstract:** In this paper, we have introduced some new type simulation function of  $(a,b)$ -admissible mappings with respect to  $Z$ -contraction in the complete metric-like space and our results improved several recent results in the metric-like space. Also, we supported example for justification of theorem.

**Keywords:** Simulation function, Admissible mapping, Fixed point, Contraction mapping

## A Formal Solution of Certain Simultaneous Quadruple Integral Equations Involving I-Functions

R. K. Sakale

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** rajeshs@lnct.ac.in

**Abstract:** The problem discussed is to obtain the solution of simultaneous quadruple integral equations involving I-functions. The method followed is that of fractional integration. The given simultaneous quadruple integral equations have been transformed by the application of fractional Erdelyi-Kober operators to four others simultaneous integral equations with a common Kernel. Here for the sake of generality the I-function is assumed as unsymmetrical Fourier kernel. Here with the help of theorems of Mellin transform, the solution of simultaneous Quadruple Integral equations is obtained. Some interesting particular cases have been derived.

## Dynamics and stability analysis in the population dynamics by introducing a vaccination strategy and computational simulation

Rachna Soni

Millennium Institute of Technology, Bhopal (M.P)-India

**Email:** rachnasoni2005@gmail.com

**Abstract:** In this paper, we have studied the dynamical behavior of the population due to the presence of demographic changes such as; fertility changes, population growth rate, mortality rate, mortality etc. This complication arises due to the environmental changes which are affected by pollution and the unavailability of the healthy food resources. To overcome from these difficulties, we can introduce the vaccination strategy to increase the immunity system of the body. The main aim of this study deals with the changes arise in the Malthusian growth model by including the vaccination rate in the equation of this model and obtained the stability conditions of all the existing equilibrium state of the proposed model. Some computational simulations are also performed to justify the results obtained.

**Keywords:** Equilibrium state, Malthusian growth model, stability analysis, vaccination

## On Vehicle routing Problem using Mixed Integer Non-Linear Programming

Mamta Raipuriya<sup>1</sup>, Richa Gupta<sup>2</sup>, Vivek Prasad Patel<sup>3</sup> and Sushma Jat

<sup>(1,2)</sup> Sarvepalli Radhakrishnan University, Bhopal (M.P)-India

<sup>3</sup> Oriental Institute of Science & Technology, Bhopal (M.P)-India

<sup>4</sup> Lakshmi Narain College

of Technology & Science, Bhopal (M.P)-India

**Email:** mamtaraipuriya@gmail.com, sushmaj@lnct.ac.in

**Abstract:** The family of (VRPs) has received remarkable attention in the field of combinatorial optimization after its introduction in the paper of Dantzig and Ramser. VRPs determine a set of vehicle routes in order to accomplish transportation requests at minimum cost. In this paper we develop a mixed-integer non-linear programming model for vrp and apply it in electric vehicle charging.

**Keywords:** Vehicle Routing Problems, mixed-integer non-linear programming, electric vehicle charging.

---

## The Two Contiguous Hypergeometric Function of the Some Linear Combination

Aradhana Mishra & Poonam Mishra

APS University Rewa (M.P)-India

**Email:** aradhanamishra04@gmil.com

**Abstract:** The aims of this paper are to give using some contiguous relations. The asymptotic behaviour of some linear combination of two symmetric contiguous hypergeometric functions under some conditions of their parameters. The hypergeometric function belongs to an important class of special function they are very useful in many fields of physical and astronomical researches in mathematical analysis and its application they have significant properties identities of special values. And transformation formula. These properties have many interesting application in combinational analysis and arithmetic geometric. The first systematic and thorough study of hypergeometric series was carried out. An hypergeometric function is called contiguous to the other function if one. Two. Or three of the parameter are increased or diminished by an integer;

## Variational Inclusion Governed By $H(\cdot, \cdot) - \varphi - \eta$ -Mixed Accretive Mapping

Sanjeev Gupta

GLA University, Mathura, (U.P) 281406-India

Email: gupta.sanjeev@gla.ac.in

**Abstract:** In this paper, we look into a concept of accretive mappings called  $H(\cdot, \cdot)$ - $\varphi$ - $\eta$ -mixed accretive mappings in Banach spaces. We extend the concept of proximal-point mappings connected with generalized  $m$ -accretive mappings to the  $H(\cdot, \cdot)$ - $\varphi$ - $\eta$ -mixed accretive mappings and study its characteristics like single-valued property as well as Lipschitz continuity. Since proximal point mapping play an important role to solve variational inclusion problem. Therefore, we frame an iterative algorithm to solve variational inclusion problem as an application of introduced proximal point mapping and show its convergence with considerable assumptions.

**Keywords:**  $H(\cdot, \cdot)$ - $\varphi$ - $\eta$ -mixed accretive mapping, proximal point mapping, iterative algorithm, variational-like inclusion

## Solution for Congestion Control and Challenges of Mobile Ad Hoc Network

Harsh Pratap Singh<sup>1</sup>, Divakar Singh<sup>2</sup>, Rashmi Singh<sup>3</sup> and Narendra Sharma<sup>4</sup>

<sup>1</sup>Sri Satya Sai University of Technology and Medical Sciences,  
Sehore (M.P)-India

<sup>2</sup>Barkatullah University, Bhopal (M.P)-India

<sup>3</sup>Radharaman Institute of Technology and Science, Bhopal (M.P)-India

E-mail: singhharshpratap@gmail.com

**Abstract:** Congestion is a serious problem in mobile ad hoc network. In such network each and every node behaves as the router and has the capacity to convey the packet from correspondent to respondent. Because of the limited capacity of the bandwidth every node may transmit the packet at the same time due to this congestion arises which incur long delay and high packet loss which degrades the performance of the network. This network has dynamic topology and has shared behavior, it automatically forms the network temporarily which helps in transmission earl. To overcome these difficulties many approaches has been suggested earlier. This paper, presents the overview of the existing approaches and also discussing difference between these congestion control techniques.

**Keywords:** Congestion, Mobile ad hoc network, Bandwidth, Shared behavior, Dynamic topology

## The Direct Method for the Optimal Solution of a Transportation Problem

Priyanka Malviya<sup>1</sup>, Sushma Jain<sup>2</sup> and Rina agrawal<sup>3</sup>

Govt. M.V.M., Bhopal (M.P.), India

**Email:** deepriyanka\_13@yahoo.com, sushmajain22@gmail.com, drrinaagrawal@gmail.com

**Abstract:** In this paper, we discuss a new approach for solving both balanced and unbalanced transportation problem. Here we present a paper entitled “The direct method for finding the optimal solution of a transportation problem”, which is proposed to find an optimum solution. The algorithm for proposed method discussed in this paper gives an initial as well as either optimal solution or near to optimal solution. Some numerical examples has been given to show the efficiency of the proposed methodology. Also the results of new approach are compared with the MODI's method and we can see that the proposed method gives either same or less optimal cost as compare to MODI's method within shorter time period and also it is easy to use.

**Keywords:** Balanced and unbalanced Transportation Problem, Basic Feasible Solution, Optimal Solution, MODI method, Proposed method.

## Coincidence Points & Common Fixed Points of Expansive Mappings in $Ab$ -Metric Space

Anil Bakhru<sup>1</sup>, Richa Gupta<sup>2</sup> and Manoj Ughade<sup>3</sup>

<sup>1</sup>S.V. Polytechnic College, Bhopal (M.P.), India

<sup>2</sup> Sarvepalli Radhakrishnan University, Bhopal (M.P.), India

<sup>3</sup>Government J.H. Post Graduate College, Betul (M.P) 460001 India

**Email:** anilbakhru@gmail.com

**Abstract:** In this paper, we prove some fixed point theorems for expansive mapping on  $Ab$ -metric spaces. Our results extend/generalize many pre-existing results in literature.

**Keywords:**  $Ab$ -metric space; expansive mapping; fixed point.

## Some Common Fixed Point Theorems in complete Fuzzy Metric Spaces

Ajay Soni<sup>1</sup> and Pooja Jain<sup>2</sup>

Lakshmi Narain College of Technology, Bhopal, India

**E-mail:** ajay.mvm01@yahoo.com

**Abstract:** In this paper we introduce the concept of common fixed point in the framework of L-fuzzy metric space and establish a fixed point theorem for self mappings. This result generalizes and extends the existing result et al. [3] on common fixed point on fuzzy metric space to L-fuzzy metric space using weak compatible mapping. In the support of our result.

## Projective Semi-Symmetric Connections on Almost Para-Contact Manifolds

S. K. Pal, M. K. Pandey and R. N. Singh

Govt., T.S.S. Naigarhi, Rewa (M.P.) India

Email: skpalmath85@gmail.com

**Abstract:** In this paper, we have extended the study of the projective semi-symmetric connections on almost Para-contact manifold. We have shown that the projective semi-symmetric connection on P-Sasakian manifold becomes a special projective semi-symmetric connection. We also prove that if curvature tensor of projective semi-symmetric connection vanishes, then SP-Sasakian manifold admits an  $\eta$ -parallel Ricci tensor.

**Keywords and phrases:** Projective semi-symmetric connection, curvature tensor, Para-cantact manifold.

**AMS Mathematics Subject Classification (2010):** 53C12.

---

## The Cosmic-ray Spectra at Spherical Termination Shocks

Brijesh Singh Chauhan

Govt. Arts and Commerce College Majhauri Sidhi (M.P.)-India

Email: s.brijesh3@gmail.com

**Abstract:** We discuss the nature of the steady-state spectra of particles accelerated at stationary spherical shocks, such as the solar wind termination shock. In addition to the two well-known spectral regions characterized by a power-law momentum dependence and a high-energy cut off, This consists of an enhancement of the cosmic-ray intensity just below the cut off similar features have been seen previously in multidimensional models and cosmic-ray modified shocks, where they were explained by acceleration and drift in the latitudinal direction along the shock face and decreasing effective shock compression ratio, respectively We show that a similar bump may be obtained in a purely spherically symmetric geometry with no drifts, and that this effect may also have contributed to the previous results. We attribute this effect to increased shock acceleration efficiency at certain energies. We also demonstrate that a one-dimensional planar shock with a reflecting wall upstream can give a similar effect. We conclude that care is necessary in interpreting observed bumps in any given situation.

## Computational Numerical Methods for Solving Nonlinear Problems

Gurusharan Kaur & Jyoti Gupta

Career College, Bhopal (M.P.)-India

Sri Sathya Sai College for Women, Bhopal (M.P.)-India

**Email:** kgurusharan@gmail.com, jyoti.gupta1709@gmail.com

**Abstract:** This paper will make it possible to tackle difficult non linear problems and deepen their understanding of problem solving using numerical methods. Multipoint methods are of great practical importance, as they determine sequences of successive approximations for evaluative purposes. The method involved here is beneficial to achieve the highest computational efficiency and accuracy of solution. It provides a deep understanding of the usefulness of each method which is supportive to a wide range of research areas along with many numerical examples. The rapid development of digital computers and advanced computer arithmetic have created a need for new methods useful for solving practical problems in a multitude of disciplines such as applied mathematics, computer science, engineering, physics, financial mathematics, and biology. In a clipped way, it enables to implement a wide range of useful and important numerical algorithms for solving research problems. It also illustrates how numerical methods can be used to study problems which have applications in engineering and sciences, including signal processing, control theory and financial computation. Further, it facilitates a deeper insight into the development of methods, numerical analysis of convergence rate and very detailed analysis of computational efficiency. It is a powerful means of learning by systematic experimentation with some of the many fascinating problems in science includes highly efficient algorithms convenient for the implementation into the most common computer algebra systems such as Mathematica, MatLab and Maple.

## A Review on Performance Analysis and Flow Features of Swirl Diffuser in a Floor Based Air Conditioning System

Deenoo Pawar<sup>1</sup>, Anil Chourasia<sup>2</sup>, Sandeep Mahore<sup>3</sup> and Sachin Kumar Nikam<sup>4</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** dinupawar2011@gmail.com, achourasia0112@gmail.com, sandeepm@lnct.ac.in, sachinn@lnct.ac.in

**Abstract:** An air diffuser is the mechanical device that is designed to control the characteristics of a fluid at the entrance to a thermodynamic open system. Diffusers are used to slow the fluid's velocity and to enhance its mixing into the surrounding fluid. Swirl diffusers can create better air mixing to enhance indoor air quality and help achieve compliance through air change effectiveness measure. Swirling vanes are used in air diffusers to create swirling outflow jet, so that more rapid mixing with ambient air can be achieved. The air change effectiveness calculation depends strongly on the flow characteristics produced by the diffuser outlet that vary considerably between different modelling set ups. Proper calibration and correct definition of performance related parameters are important to affect the radially diffusing flow pattern. This study demonstrates the common approaches, identifies the critical design parameters, analyses and discusses the differing outcomes in terms of flow pattern, air distribution.

**Keywords:** Air swirl, Diffuser, Effectiveness, Swirling Blades Angle, Air Flow

## Mathematical Modeling of Dilute Biphasic Fluid Flow in Industrial Aero-cyclone Dust Separators

A N Sinha<sup>1</sup>, V N Bartaria<sup>2</sup> and Rakesh Dwiwedi<sup>3</sup>

<sup>(1,2)</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India

<sup>3</sup>Chief Manager , CCL Headquarte ( Coal India Ltd.), Ranchi (Jharkhand)

**Email:** directoracademics@lnct.ac.in, vnbartaria@lnct.ac.in

**Abstract:** Cyclone is a device used for removal of dust in industrial complex having the biphasic fluid of air-dust mixture. A standard reverse flow cyclone with tangential inlet is the basic model based on empirical formulae derived by experiments which is exhaustively used in industry with comparatively less efficiency. Design analysis based on the governing equations of two phase dilute fluid flow will improve the efficiency of Cyclone. Though the operating principle of a cyclone is very simple, the turbulent flow-field in a cyclone is very complex due to presence of swirl and interaction between particles, fluid and walls. A tangential entry and cyclone geometry give rise to a strong swirling flow. The flow acquires a rotational movement along the cyclone wall (free or outer vortex) and it descends down to a certain axial location near the cyclone bottom where the axial velocity acquires a reverse flow (forced or inner vortex) towards the upward direction and finally exit through a central duct known as vortex finder. Particles entering the cyclone are rebound, re-circulated and re entrained all along the outer and inner vortex. Consequently, the variables controlling the centrifugal force become highly complex. The primary purpose of vortex finder (air outlet) is to guide the dust particles to a central point for easy handling and disposal.

The governing equation for the turbulent, steady, isothermal and incompressible fluid flow in a cyclone is given by the Navier Stokes equation. The integration of the force balance on the particle yields the trajectory of a particle and the same equates the particle inertia with the forces acting on the particle. Navier-Stokes equations for turbulence modeling of cyclone flow field uses Reynolds averaging ( time averaging) that yields the solution of exact Navier Stokes equations into the mean ( time averaging ) and fluctuating Components. , the discrete phase has been considered for modeling dilute phase industrial cyclone in this work.

The Finite volume technique is used in this work on the approach to satisfy the integral form of the Navier Stokes equations to suitable approximation for each of the many contiguous control volume which cover the solution domain. Based on FVM, CFD tool is used to understand the complex flow structures typical of cyclones for optimal design of it and make possible to exclude the need of experimental studies, a cumbersome ,inefficient, time consuming based on empirical formulae & thumb rules.

## Fuzzy EOQ Inventory Model Using Trapezoidal Fuzzy Number with Shortages

Sumit Pratap Singh

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: prof\_sps@yahoo.co.in

**Abstract:** In this paper, an EOQ inventory model with shortages has been considered by using Fuzzy. Our aim is to optimize the total cost and the order quantity for the proposed fuzzy EOQ inventory model. The Trapezoidal fuzzy numbers have been introduced in order to achieve this goal. The computation of economic order quantity (EOQ) is carried out through defuzzification process by using signed distance method. To illustrate the results of the proposed model, we have given examples and presented the computational results.

**Keywords:** EOQ, Fuzzy Inventory model, Trapezoidal Fuzzy number, Defuzzification, Shortages.

## Bayesian Approach for a Periodic Review Inventory Model with Emergency orders using Weibull Distribution for Demand Function

Sumit Pratap Singh

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: prof\_sps@yahoo.co.in

**Abstract:** In this paper we consider a periodic review inventory model. we consider demand function as a random variable which follows weibull distribution with two parameters  $\lambda$  and  $\beta$ . There is provision for placing order only at discrete time points in periodic review inventory system. If the time between two consecutive review is large in the presence of random demands, there could be heavy shortages, and the profitability of the system could suffer more so when the shortage cost is high. However it may not be feasible/profitable to carry a high level of stoke in anticipation of the uncertain demand especially if the holding cost is significant to meet the excess demand in such situation, one or more emergency orders can be placed before the end of review period. Taking into account the nature of the demand and the supply source, the timing and size of the emergency order can be determine optimally. Therefore for the optimization of the model an accurate estimation of demand is important.

## HR Management and Employee Performance Using Ethics: A Critical Analysis

Hema Rathore

Madhyanchal Professional University, Sehore (M.P)-India

Email: krati.h12300@gmail.com

**Abstract:** Recent corporate changing aspects have led to the developing attentiveness in business ethics, both in academia and in the professional practice. Nevertheless, ethical hiatuses endure to happen in human resource management activities, leading HR academics and professionals to reconsideration what to do to reinvent new strategies to successfully manage ethics in HRM functions. Performance is understood as achievement of the organization in relation with its set goals. It includes outcomes achieved, or accomplished through contribution of individuals or teams to the organization's strategic goals. The term performance encompasses economic as well as behavioural outcomes. The objective of this critical literature review therefore is to establish the role ethics can play in human resource management to improve organizational performance. The methodology used was critical review of relevant literature with the scope of the study encompassing qualitative research of theories and comparative nature of ethics in HRM.

**Keywords:** Employee Performance, Ethics, Human Resource Management, Ethical climate, HR academics.

**Email:** deepikabasedia@gmail.com, rajeshraju0101@rediffmail.com,

**Abstract:** Mathematical modeling is art of translating real world problems into mathematical problems, solving the mathematical problems and interpreting these solutions in the language of the real world. A mathematical model is a description of a system using mathematical concepts and language. Breast cancer is the second most commonly diagnosed cancer and leading cause of cancer death for women worldwide. Breast cancer (BC) is the main cause of cancer mortality in women. Breast cancer accounts for approximately 40% of all the cancer types in women. Computational and mathematical models are gradually being used to help us understand the breast cancer. The goal of this research is to improve the accuracy of predicting the breast cancer (BC) development and their accurate treatment using the ordinary differential equations, partial differential equation and interpolation formulas for mathematical model

keertyshrivastava@yahoo.in, rajeshraju0101@rediffmail.com, sanjeet\_418@yahoo.com

**Abstract:** The mathematical model is developed by considering blood as Casson fluid through the asymmetric artery with the stenosis. The non-Newtonian fluid behaviour is characterized by using Casson-fluid flow model. The analytic expression for flow rate, resistance to flow and skin friction are derived by using this model. We observed that the flow rate decreases when the yield stress and viscosity coefficient increases, the skin-friction increases with the increase of yield stress in presence of slip velocity for velocity coefficient parameter. The results are derived in detail with the help of graphs for the variation of different flow parameter. Flow rate, resistance to flow, and skin-friction and impedance analysis of the casson fluid have been shown graphically by varying the yield stress.

**Keywords:** Stenosis; artery blood flow, flow rate, blood flow and Casson fluids model

**Mathematics Subject Classification [MSC] 2010 No.:** 76Z05, 92C35

## Some Important Results on Fixed Point Theorem using Generalized Metric Spaces

Rakesh Kumar Verma

Sagar Institute of Research & Technology Excellence-Bhopal (M.P)-India

Email: rakeshvr54@gmail.com

**Abstract:** In this paper we shall study the some important results on fixed point theorem using the generalized metric spaces. Some important generalization in previous paper of Kannan's fixed point theorem in the ordinary metric space and Das's fixed point theorem in generalized metric space. We will work the paper of Ali Fora, Azzeddine Bellour and Adnan Al-Bsoul regarding generalized metric space.

**Keywords:** Fixed point, Generalized metric space.

## The Involving in I-Function of Two Variables and General Class of Polynomials

Aradhana Mishra<sup>1</sup>, Neelam Pandey<sup>2</sup> and Poonam Mishra<sup>1</sup>

<sup>1</sup>APS University Rewa (M.P.)

<sup>2</sup>Govt. Model Science College Rewa (M.P.)

Email: rewapoonamm@gmail.com

**Abstract:** This paper presents in the some derivative formulas of I- Function of Two variables involving general class of polynomials. The well known H-function of one variable defined and proved the H-function as a symmetric. The H-function is often called fox's H-function. Later on many researchers studied and developed H-function. Introduced a new function in the literature namely the I-function which is useful in Mathematics. Physics and other branches of applied mathematics. In the present paper we establish derivative of I-function of two variables involving general class of polynomials. The generalized derivatives of product of general class of polynomials and I- function of two variables transformed as I-function of two variables but expression involving more terms. Also one can find same formulae involving general class of polynomial, I-function of r variables. The special case of our derivatives yields interesting result;

**Keywords:** I-function; Rathie Arjun A new generalization of generalized hypergeometric function.

## Classification of Large Data Set for Social Websites using Hadoop

Rajendra Gupta and Meenakshi Dayal

Rabindranath Tagore University Bhopal (M.P)-India

Email: rajendragupta1@yahoo.com, mons.dayal@gmail.com

**Abstract:** Large data set is a kind of collection of **data** in a **huge size**. Large data set is a term used to define a group of data that is large in size and yet growing mounting with time. This data is so large and also complex that none of the conventional data management tools are able to store it or process it efficiently. From blogger post, there data to Google using online search to predict incidence of the Twitter, YouTube, Instagram and Facebook are using troves of information. Online and offline actions are being chased, gathered, and analyzed at dizzying rates. Facebook or Google retrieve the data like what application user install they verify and access with user permission allow contact, photo, video and if user connect with and check the demand of the user and notify, using various applications on our computer, can be recorded and analyzed. We can find this analyze to splurge on weekdays. We can be more efficient at work by realizing we spend time more than we thought on Facebook. These are stored in Data warehousing and retrieve data through data mining are connected terms, as is NoSQL. With data firmly in hand and with the ability given by large data set using flume in hadoop Technologies to effectively store and analyze this data, we can find answers to these questions and work to enhance every aspect of our behavior. Twitter, Facebook, Instagram, Google can know every post and searching you ever viewed by analyzing large data gathered over the years. Facebook can analyze large data and tell you the birthdays of people that you did not know you knew. With the initiation of many digital modalities all this data has grown to large data and is still on the rise. In the end large Data technologies can exist to improve decision-making and to provide greater vision faster when needed but with the downside of loss of data secrecy.

**Keyword:** Large Data Set, Twitter, Facebook data set, flume in Hadoop, MapReduce

## Incomplete Mittag-Leffler Function

Dharmendra Kumar Singh and Saurabh Porwal

UIET, CSJMU, Kanpur (U.P)-India

**Abstract:** This paper devoted to the study of incomplete Mittag-Leffler function and some of its properties in terms of incomplete Wright function.

**Keyword:** Mittag-Leffler function

Mathematics Subject Classification (2000): 33E12, 33B15, 11S80.

## Extreme Values Analysis for Finding Outliers Detection Using Machine Learning to Detect Predicted Data Points

Ashish Jain

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** ashishj@lnct.ac.in, jainashish1302@gmail.com

**Abstract:** An outlier is usually measured as an observation which is extensively found distant from the other well thought-out observations. In the era of ready-to-go analysis of n-dimensional datasets, data quality is essential for economists to guarantee robust results. Many machine learning algorithms are sensitive to the range and distribution of attribute values in the input data. Outliers in input data can skew and mislead the training process of machine learning algorithms resulting in longer training times, less accurate models and ultimately poorer results. Even before predictive models are prepared on training data, outliers can result in misleading representations and in turn misleading interpretations of collected data. Traditional techniques for outlier detection tend to exclude the tails of distributions and ignore the data generation processes of specific datasets. Various methods for detecting different kinds of outliers in high-dimensional data sets from two different perspectives, i.e. detecting the outlying aspects of a data object and detecting outlying data objects of a data set. N-dimensional data can be seen as part of the variety challenge of machine learning.

## Fuzzy EOQ Model for Deteriorating Items with Stock-Dependent Demand and Partial Backlogging

Yogendra Kumar Rajoria<sup>1</sup>, Anand Chauhan<sup>2</sup> and Preety Poswal<sup>3</sup>

KR Mangalam University, Gurugram, (Haryana)-India

Graphic Era University, Dehradun, (Uttarakhand)-India

**Email:** indiadrnanandchauhan81@gmail.com,  
yogendrarajo@gmail.com, preety2128@gmail.com

**Abstract:** In this paper, we have considered an economic order quantity inventory model with deteriorating items with stock-dependent demand and Partial Backlogging under fuzzy environments by employing trapezoidal fuzzy numbers. A fully-fuzzy inventory model is developed where the input parameters and decision variables are fuzzified. For this fuzzy model, an expected value method of defuzzification is employed to find the estimate of the profit function in the fuzzy sense. In addition, a rigorous methodology is constructed to examine for the optimal solution of fully-fuzzy inventory model. The optimal policy for the developed model is determined using the proposed algorithm after defuzzification of the profit function. Finally, a numerical illustration is provided in order to define the sensitiveness in the decision variables with respect to fuzziness in the components.

**Keywords:** Fuzzy, Deteriorating item, Partial Backlogging, EOQ

## Comparison of Wavelet and Fourier Transform-A Case Study

Amit Tanwar<sup>1</sup>, Rahul Boadh<sup>2</sup>, Yogendra Kumar Rajoria<sup>3</sup> and Mina Yadav<sup>4</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** amittanwar2190@gmail.com, rahulboadhmsc26@gmail.com, yogendrarajo@gmail.com, yadav.mina85@gmail.com

**Abstract:** The wavelet analysis is the advance based on Fourier transform and it is an innovation of the Fourier Analysis. Wavelet transforms are a mathematical means for performing signal analysis when signal frequency varies over time. Wavelet analysis is an exciting new method for solving difficult problems in mathematics, physics and engineering. Fourier transform is a powerful tool for analysing the components of a stationary signal. But it is failed for analysing the non-stationary signal whereas wavelet transform allows the components of a non-stationary signal to be analysed. Both the Fourier and wavelet transforms measure similarity between a signal and an analysing function. Both transforms use a mathematical tool called an inner product as this measure of similarity. A comparative study of Fourier and Wavelet transforms has been conducting in the present study and the main goal of this study is to find out the advantages of wavelet transform compared to Fourier transform.

**Keywords:** Fourier transform, wavelet transform, time-frequency, signal analysis, inner product.

## Customization of the WRF model over Gurgaon region by Sensitivity of PBL schemes for their application of Pollutant Dispersion

Neelam Sharma<sup>1</sup>, Rahul Boadh<sup>2</sup> and Ravendra Singh<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** neelamsharma.sharma6@gmail.com, rahulboadhmsc26@gmail.com, ravendraibs@gmail.com

**Abstract:** Accurate simulations of surface meteorological variables are important for the transport and dispersion of air pollutants and air quality in the lower atmosphere. In this study, the surface meteorological variables over Gurgaon region were simulated using the Advanced Research Weather Research and Forecasting (WRF-ARW) mesoscale model. To study the evolution of PBL parameters and the thermo dynamical structure, the sensitivity tests were conducted with five different planetary boundary layer (PBL) schemes (Yonsei University, Mellor–Yamada–Janjic, Asymmetric Convective Model v. 2, Mellor-Yamada Nakanishi and Niino Level 2.5 PBL and Quasi-Normal Scale Elimination) and three different horizontal grid resolutions (27, 9 and 3 km) by using the  $1 \times 1^\circ$  NCEP Final Analysis meteorological fields for initial and boundary conditions. After carefully examination of the simulated parameters with the available in situ data, the present results suggest that PBL schemes, namely YSU and ACM2 performed better on behalf of the boundary-layer parameters and may useful for pollutant dispersion studies.

**Keywords:** Planetary boundary layer, WRF, mesoscale, thermo dynamical structure

## Analysis of Average Rainfall Phailin Cyclone by using Double Integration Technique

Agnivesh Tiwari<sup>1</sup>, Yogendra Kumar Rajoria<sup>2</sup> and Rahul Boadh<sup>2</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** rampoonam1994@gmail.com, yogendrarajo@gmail.com, rahulboadhmsc26@gmail.com

**Abstract:** India's eastern coastline is one of the most violent wind inclined regions on the planet. Despite the fact that the coastline of Orissa has been just about 17% of the Indian eastern coastline, yet Orissa has been influenced by about 35% of all cyclonic and serious cyclonic tempests that have crossed the eastern coastline and related tempest floods that have been regularly immersing huge areas along the coasts. A Cyclone is an enormous scale air mass that turns around a solid focal point of low climatic weight caused due to low atmospheric pressure over oceans resulting in rainfall at coastal region. We will calculate average rainfall during the cyclone Phailin using Double integration

## Optimization of Some Transportation Problem by Proposed Method

Dipti Yadav<sup>1</sup>, \*Yogendra Kumar Rajoria<sup>2</sup> and Ravendra Singh<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** diptiyadav48@gmail.com, yogendrarajo@gmail.com, ravendraibs@gmail.com

**Abstract:** The transportation model is a typical case of LPP (Linear Programming Problem) in which the main objective is to transport people or goods from multiple origins to different points at minimal cost, like air, water and land transport including railway and road transport. In this paper, a method for finding an optimal key solution in short iterations is proposed and obtained result is compared with Vogel's approximation method. This method is used for both cases of large and small size transport problem. A numerical example is also given to examine the validity of the transport model.

**Keywords:** Transportation, Linear Programming Problem, Vogel's approximation method

## A Mathematical Model to Solve the Huxley Equation by New Homotopy Perturbation Method

Ravendra Singh<sup>1</sup>, Yogendra Kumar Rajoria<sup>2</sup> and Dinesh Kumar Maurya<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** ravendraibs@gmail.com, yogendrarajo@gmail.com, dkmupc@gmail.com

**Abstract:** In this paper, New Homotopy Perturbation Method (NHPM) is introduced for obtaining solutions of non-linear Huxley equations. The approximate solutions of the Huxley equations are compared with the solution by using Adomian's decomposition and variational iteration method as well as with the exact solutions. The present method is very simple, effective and convenient analytical method with small computational overhead. The capability and reliability of the method, several examples are provided and MATLAB used to calculate the series obtained from NHPM.

**Keywords:** Adomian's decomposition method, Homotopy Perturbation Method, Huxley equation.

## Health Risk Assessment by using Fuzzy Logic Application

Gunjan Kalra<sup>1</sup>, Rahul Boadh<sup>2</sup> and Yogendra Kumar Rajoria<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** gunjankapoor089@gmail.com, rahulboadhmsc26@gmail.com, yogendrarajo@gmail.com

**Abstract:** The fuzzy logic (FL) application has been used first time in thirty six year ago (1982) for purpose of insurance. In present, the insurance industry has several areas with latent applications for FL. In this paper involved to diagnosis the health risk which is related to Blood Pressure and Kidney function. The Glomerular Filtration Rate (GFR) has been used for investigate the level of the blood pressure with the help of kidney function. For this purpose, in this study FL control system has been used to represent the factors which may cause the hazard for human health and analysis by using rule base factor which was implemented in MAT Lab. The present study, advocates that FL may be suitable to take appropriate decision at the right time for giving treatment to the patients immediately and it may be monitoring from the treatment in future.

**Keywords:-**Fuzzy logic, Blood Pressure, Kidney Function, Diagnosis, Health risk

## Analysis of Aircraft activity by using method of Numerical Integration

Kabir Chaudhary<sup>1</sup>, \*Yogendra Kumar Rajoria<sup>2</sup> and Ravendra Singh<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** kabirchaudharykirthal@gmail.com, yogendrarajo@gmail.com, ravendraibs@gmail.com

**Abstract:** The takeoff and landing of an airplane are the most perilous periods of flight in real environment. So, the investigation regarding takeoff and landing performance play a vital role for airplane structure and security. In the paper, a high-accuracy numerical calculation for takeoff and landing execution by force analysis to develop dynamic equations, which sets up and tackles the conditions of elements during departure and landing process. The proposed strategy is equipped for figuring departure and landing execution under various situations. The impacts of height, temperature, departure and landing weight and wind speed are analyzed.

**Keywords:** departure execution, landing execution, Numerical integration

## Use of Fuzzy Expert System for Investigating the Child Anaemia-A Case Study

Rahul Boadh<sup>1</sup>, Meena Rawat<sup>2</sup> and Yogendra Kumar Rajoria<sup>3</sup>

K. R. Mangalam University, Gurugram, (Haryana) India

**Email:** rahulboadhmsc26@gmail.com, rawatmeenasu@gmail.com, yogendrarajo@gmail.com

**Abstract:** In present, the fuzzy logic applications are mostly using to investigating medical disease. In this study the Fuzzy Expert System (FES) has been introduced to define the child anaemia. Anaemia is haematological disorder and the most common identifying in children. The fuzzy expert system has been designed to investigate the level of iron paucity in children. For this propose, the laboratory records have been obtained for child anaemia patients, the applicable factors have quantified. The FES for disease risk, child anaemia was shortly described. This system help to physician in the decisions risk. This study advocate that, in many cases FES can help to the doctors in diagnostics, treatment of sickness and etc. The number and the other disagreement that support our claim can be found in this study.

**Key words:** Fuzzy expert system, medical disease, Child anaemia, diagnostics, treatment.

## Application of CFD Numerical Modeling in Air Quality Assessment and Executing Mitigation Measures

A N Sinha and V N Bartaria

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** directoracademics@lnct.ac.in, vnbartaria@lnct.ac.in

**Abstract:** Air quality primarily describes the pollutants contained in the air. As it appears to have grave pollution problems, real time air quality index (AQI) in most of the major cities of the world has now become a major concern to know the transient air quality levels. Various indices for measurement of air quality have been developed and are being used by different countries. The measurements are indicative of concentrations of air pollutants quantitatively. Air quality assessment indicative of various quantities may either involve the direct measurement of these quantities or deterministic of the impact of pollution and possible hazards. Fractional concentration of criteria pollutant species such as volatile and semi-volatile organic compounds and natural or anthropogenic aerosols determine the quality of air.

Apart from the measurements, air quality estimations may also be performed using Gaussian plume model and Solution of three dimensional Navier-Stokes equations and pollutant transport equations. The Computational Fluid Dynamics (CFD) modeling needs the identification of the relevant physical process describing the pollutants dispersion into the atmosphere. These processes involve the emission and transport of pollutants which may take place by bulk convection, turbulent dispersion and gravity effects. Adhesion among other forces and factors cause the settling of particle pollutants on the physical surfaces. Recombination reactions and electrostatic precipitation may also contribute in the pollutant deposition. Numerical modeling of air pollution problems with the help of CFD provides the detailed description of physical sources of pollutants, meteorological processes and changes occurring in physical and chemical behavior of pollutants effectively when the governing equations based on the assumptions of the mass, momentum, energy and pollutant species conservation of the mathematical model are in the appropriate form. The solution is obtained by solving the mathematical equation numerically.

This paper deals with the possible solution of the most concerned pollution problem and especially in dealing with the problems of smog forming in major cities and threatening the human life. It is suggested to perform a real time modeling of the smog problem by 3D modeling of the smog field using CFD and if coupled with the real time measured environmental data, simulation results will provide the severity of the pollution in the form of contours, plots and quantity in order to execute appropriate mitigation measures.

## Increase network lifetime optimisation efficiency and increase the stability period using the Gravitational Energy Sensitive Energy Hierarchy Protocol

Mohit Singh Tomar<sup>1</sup>, Deepak Jain<sup>2</sup>, Ankur Pandey<sup>3</sup>

<sup>1</sup>Shri Jagdish Prasad Jhabarmal Tibrewala University, Jhunjhunu (RAJ.)-India

<sup>2,3</sup>Sagar Institute of Research & Technology Bhopal (M.P.)-India

**Email:** mohitishere7@gmail.com

**Abstract:** The need for wireless sensor networks has been increased day by day, but when we work on it we find two well-known major problems that are cluster head selection and routing for this purpose decreasing their lifespan and increasing the number of dead nodes. The energy savings of each Node sensor are associated with high computational complexity, which depends on the monitoring of algorithms. This study developed a community base algorithm called "A Gravitational Energy Sensitive Energy Hierarchical Protocol," which increases its value but decreases the network life of dead network nodes. Technique where each node has heterogeneity-ordained energy levels of a protocol that selects a (cluster head) CH separately on the basis of their initial energy relative to the other nodes in the selected network. We provide some test results together with plotted results in this paper. In addition, analysis and simulation was performed with the implementation of the internal energy node 0.5, 1 J, 1.5 J, and 2J in different cases. After the analysis results have been achieved we have found that our algorithm provides the best results compared with other results of different algorithms. This is an important task, and in small and large networks our GESEHP protocol can produce improved results. All of this simulation work was carried out in Matlab.

**Keywords:** Gravitational, Efficiency, Throughput, IEEE 802.11, unicast and broadcast packet, network, L-LEACH, Quality of Service, W-LEACH, routing protocol, Energy Sensit.

### About Families of Pairwise Connected Sets

Anjali Srivastava<sup>1</sup> and Rohit Gaur<sup>2</sup>

<sup>1</sup>School of studies in Mathematics, Vikram University, Ujjain (M.P.)- 456010- India

**Email:** anjalivuu@gmail.com r.gaur0710@gmail.com

**Abstract-** The notion of connectedness in bitopological spaces was introduced and studied by W.J. Pervin and I.L. Reilly. Continuing the study we prove a few results concerned with a family of connected sets in bitopological spaces.

**Key Words-** Pairwise connected spaces, Connectedness in bitopological spaces, Pairwise mutually separated spaces.

**AMS Subject Classification-** 54A05, 54A99, 54D05

## Dual Cryptography with Mobile GPS location Mechanism

Dinesh Kumar Moriya and Sharad Pathak

Govt. MLB Girls (Autonomous). PG College, Bhopal (M.P)- India

**Email:** dinesh.moriya@gmail.com

**Abstract:** Cryptography is the type of security which internet usually uses and in today's world its not sufficient to safeguard our data and account. Here we come with a new concept of Dual Cryptography (DCPT) for the user and the communication channel as well. By the time its mandatory to use Location (MGPS) wise security which is possible through Mobile Computing. Location and Cryptography both are used in such a different way to provide internet security. Location Based Cryptography (LBDC) is the work which actually works on today's scenario.

**Keywords:** Cryptography, DCPT, MGPS, LBDC.

## Feeling Detection dependent on Images and Captions on Social Media

Aditya Patel

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** adityap@lnct.ac.in, adityapatelmail@gmail.com

**Abstract:** Nowadays, Internet has grow to be an crucial element in every person's lifestyles. Social networking has regularly grow to be a recurring for people to submit their photos, opinions and remarks. People percentage their emotions on line in a completely casual language. Thus, it is very tough mission to research actual sentiment hidden inside the text of natural language. Emotion detection is the sphere of study that analyses people views and feelings. Human emotion can be expressed through numerous approach which include speech, facial expressions, gestures and textual facts. This paper proposes the gadget which makes use of present emotion detection thru facial features using deep mastering and supports it with the evaluation of textual information received thru captions of pics on social networking websites to ensure greater accurate outcomes. There is no characteristic on social networking sites to kind feelings of photos which motivate us to classes posts based on emotions. Emotion detection from each captions and photos collectively is efficient due to the fact most effective text isn't always enough to apprehend the feelings of customers. This hybrid approach offers promising results in both the class of feelings as well as in acting emotion detection.

## Content Based Facial Emotion Recognition Model utilizing Machine Learning Algorithm

Aditya Patel

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: adityapatelmail@gmail.com

**Abstract:** Emotion reputation or sentiment analysis is recognized as a critical studies topic in pc vision community. The challenges include identity of face, popularity of accurate emotion, suitable database and so forth. We have proposed and implemented a fashionable Convolution Neural community (CNN) building framework for emotion popularity. The model is formalized by means of developing a coincident gadget which fulfills the duties of face detection and emotion classification the usage of our proposed CNN structure. The version is verified using the FER-2013 dataset. In the proposed paintings, we talk the applicability of the proposed CNN model. This model lays a valuable evaluation of the effect of changing the network size, pooling, and dropout. For a given model, the very last accuracy at the validation facts is round 63%.

## Survey on Photoluminescence of Some Recent Work on Silicate Based Phosphors

Anjali Yadav<sup>1</sup> R.K. Kuraria<sup>1</sup> and S.R. Kuraria<sup>3</sup>

Govt. Science College Jabalpur, India 482001

Govt. M.H. College of Home Science and Science Jabalpur, India 482001

Email: rkkuraria@rediffmail.com, s.anjaliyadav.s@gmail.com

**Abstract:** Photoluminescence is the process, in which the excitation is accomplished by the absorption of photons. The radiation sources may be infra-red, visible, ultraviolet or X-ray. The fluorescent lamp used in household and general lighting is the principal example of this type of luminescence. The silicate matrix is a typical melilite. Phosphors based on silicate material are usually low cost and are chemically and physically stable. They have been studied widely with Eu<sup>2+</sup> doping, which shows that a blue emission and long persistent luminescence by co-doping with some other rare earth ions. We focus on the development of new silicate phosphors for a white LED. In the europium doped silicate system, four LED phosphor candidates found luminescent properties under near UV and visible excitation were investigated for the new Eu<sup>2+</sup> doped LED silicate phosphors. These new phosphors have a relatively strong absorption band in a long wavelength region.

## Common Fixed Point Results in Menger Spaces

Prashant Namdeo and Subhashish Biswas

Kalinga University, Raipur (C.G.) India

Email: prashantnamdeo75@gmail.com, deb12rishika@gmail.com shubhb@yahoo.co.in

**Abstract:** The purpose of the paper is to prove a common fixed point theorem in Menger spaces by using five compatible mappings.

**Keywords:** Menger space, t-norm, Common fixed point, Compatible maps, Weak - compatible maps.

## Application of Graph theory in operations Research

Priyanka Swanker<sup>1</sup> and Richa Gupta<sup>2</sup>

Sarvepalli Radhakrishnan University, Bhopal (M.P)-India

Email: priyankasoni071987@gmail.com

**Abstract:** One of the common themes in operation research is the modeling approach, many accurate model of operations research. Problems turn out to be intractable when subjected to standard technique this research paper show that how graph theory and networks may be profitably used to model certain discrete operations research problem from a different view-point effective algorithms.

**Keyword:** Graph, Direct graph, Graph networks, Simple graphs

**Abstract:** The present work deals with the blood flow through the stenosis assuming that flowing blood is represented by a two layered model. We considered a two-layered blood flow model to study the axisymmetric flow of blood by assuming the core layer as Bingham plastic (non-Newtonian fluid) and the peripheral layer (Newtonian fluid) in through the stenosis in the arteries. The analytical expressions for flow rate, resistance to flow and wall shear stress have been developed in this model. We have depicts the effect of stenosis on resistance to flow and wall shear stress. This study gives an insight into the effects of slip velocity on the volumetric flow rate, resistance to flow and wall shear stress.

**Keywords:** Stenosis, blood flow, core layer, peripheral layer and Bingham plastic

**AMS Subject Classification (2010):** 76Z05, 92C35

## A non-Newtonian fluid flow model for the slip condition on blood flow through a stenosed artery using power-law fluid

**Abstract:** In this paper, the effects of boundary conditions on power-law fluid through an artery with stenosis have been studied. We considered the blood as power law fluid in this model. Numerical and computational models are developed to analyze the variation of resistance to flow, yield stress and wall shear stress across the stenotic region. The analytic expressions for flow resistance, wall shear stress with mild stenosis are derived by using this model, which shows that resistance to flow  $\lambda$  increases with increasing of stenosis height and wall shear stress  $\tau$  increases as stenosis size increases. The results have been shown graphically at different flow characteristics.

**Keywords:** Physiological flow, stenosed artery, wall shear stress, resistance to flow, Power-law fluid model and slip velocity

**AMS Subject Classification No. (2010):** 76Z05, 92C35

## Mathematical Modeling of Linear and Nonlinear Equations

Jyoti Gupta & Gurusharan Kaur

Sri Sathya Sai College for Women, Bhopal (M.P.)-India

Career College, Bhopal (M.P.)-India

Email: [jyoti.gupta1709@gmail.com](mailto:jyoti.gupta1709@gmail.com), [kgurusharan@gmail.com](mailto:kgurusharan@gmail.com)

**Abstract:** This paper reviews some of the recent research and notes that plays an important role in mathematical modeling of linear and non linear equations. The process of developing a mathematical model is termed mathematical modeling. Mathematical models are used in the [natural sciences engineering](#) disciplines as well as in the [social sciences](#). This paper is taught that introduce the basic principles and methods that helps to explain a system and to study the effects of different equations and behavior. If all the operators in a mathematical model exhibit [linearity](#), the resulting mathematical model is defined as linear. A model is considered to be nonlinear otherwise. The definition of linearity and nonlinearity is dependent on context, and linear models may have nonlinear expressions in them. a differential equation is said to be linear if it can be written with linear [differential operators](#), but it can still have nonlinear expressions in it. In a [mathematical programming](#) model, if the objective functions and constraints are represented entirely by [linear equations](#), then the model is regarded as a linear model. If one or more of the objective functions or constraints are represented with a [nonlinear](#) equation, then the model is known as a nonlinear model. Mathematical models can take many forms, including [dynamical systems](#), [statistical models](#), differential equations, or [game theoretic models](#).

## Fixed point results for contractive type mappings in Cone b-metric spaces

M.S. Chauhan<sup>1</sup>, Rajesh Shrivastava<sup>2</sup>, Rupali Verma<sup>3</sup>, Qazi Aftab Kabir<sup>4</sup>

<sup>1,3</sup>Institute for Excellence in Higher Education, (M.P.)-India.

**Abstract:** In the present paper, we define F-contractive type mappings in Cone b-metric space and prove some fixed point theorem. Our main result unifies, generalizes and improves existing results in F-contractive mappings, b-metric space and Cone b-metric space in the literature.

**Keywords:** Fixed point; b-metric space; Cone metric space; Cone b-metric space; contraction

**AMS Subject Classification No. (2000):** 47H10; 47H09; 54H25

### IOT Based Smart Crop Monitoring in Farm Land

Shareya Naik<sup>1</sup>, Rajeev kumar<sup>2</sup>, Vivek Kumar<sup>3</sup> and Utkarsh Shrivastava<sup>4</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

**Email:** vivekk@lnct.ac.in

**Abstract:** As new technologies has been invented and utilized in modern world, there is a need to bring an elevation in the field of agriculture also. A lot of researches have been made to improve crop production. In order to enhance the crop productivity effectively, it is necessary to monitor the environmental conditions in and around the field. The motive of this paper is to propose an IOT based Smart crop monitoring system which aims in making use of progressing technology i.e. IOT and Smart Farming. Internet of Things (IOT) has become a trending technology nowadays which is being used in several real time applications. IOT is a system which consists of several sensors or actuators that provides connectivity to the internet directly or indirectly. IOT based smart farming improves the entire agricultural system. As it is well known, agriculture is the backbone of our Indian economy that contributes to the overall economic growth of the country. With the help of sensors and interconnectivity, IOT in agriculture has saved the time of farmers to a greater extent and has enhanced the traditional way of farming. Online crop monitoring using IOT helps the farmers to stay connected to his field from anywhere and anytime. Also with the innovation of IOT in farming there has been drastic reduction in extravagant use of valuable resources such as water and electricity. Various different types of sensors are connected to the field that monitors and collects information about the field conditions. Collectively all the captured farm conditions are sent to the farmer through GSM technology. Thus this way farmer is able to monitor his field without being there physically. Finally, based on this thorough review, we identify current and fore coming trends of IOT in agriculture and highlight potential research challenges.

**Keywords:** IOT, Sensors, GSM technology, Smart farming.

### Matlab A Fourth-Generation Programming Language of New Era: A Review

D. S. Saluja and Amarjeet Singh Saluja

Govt. M. V. M. College, Bhopal, (M.P)-India

Institute for Excellence in Higher Education, (M.P)-India

**Email:** drdssaluja@gmail.com

**Abstract:** MATLAB has evolved over a period of years with input from many users. In university environments, it is the standard instructional tool for introductory and advanced courses in mathematics, engineering, and science. In industry, MATLAB is the tool of choice for high-productivity research, development, and analysis. It features a family of application-specific solutions called toolboxes. Very important to most users of MATLAB, toolboxes allow as to learn and apply specialized technology. Toolboxes are comprehensive collections of MATLAB functions (M-files) that extend the MATLAB environment to solve particular classes of problems. Areas in which toolboxes are available include signal processing, control systems, neural networks, fuzzy logic, wavelets, simulation, and many others. It is an interactive system whose basic data element is an array that does not require dimensioning. This allows you to solve many technical computing problems, especially those with matrix and vector formulations, in a fraction of the time it would take to write a program in a scalar non interactive language such as C or FORTRAN.

## Some Fixed Point Results in $A$ -Metric Space and $A_b$ Metric Space

Suresh Nagle<sup>1</sup>, Rajni Bhargav<sup>1</sup>, Manoj Ughade<sup>2</sup>

Govt. MLB PG Girl's College, Bhopal (M.P) - India

Govt. J.H. Post Graduate College, Betul (M.P) - India

**Email:** snghelpyou@gmail.com

**Abstract:** Our goal of this article is to vindicate some fixed point theorems for contractive mappings in  $A$ -metric space and  $A_b$  metric space, which unify, develop and generalize most of the prevailing coherent fixed point results from the literature.

**Keywords:**  $A$ -metric space;  $A_b$  metric space, contractive mapping; fixed point

## Some Fixed Point Theorem Satisfying General Contractive Condition of Integral Type

Himanshu Tiwari and Subhashish Biswas

Kalinga University, Raipur (C.G.) India.

**Email:** himanshu.tiwari.ht@gmail.com, deb12rishika@gmail.com shubhb@yahoo.co.in

**Abstract:** In this paper, we establish a fixed point theorem for a pair of self maps satisfying a general contractive condition of integral type. This theorem extends and generalizes some early results of Boikanyo[4]. And Jaggi and Dass [12]

**Key Words:** Lebesgue-integrable map, Complete metric space, Common fixed point.

**AMS Subject Classification (2010):** 54H25, 47H10.

---

## CFD Modeling and Simulation in the Heat Transfer Studies in Solar Air heating

Dharam Singh and V. N. Bartaria

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** dharams@lnct.ac.in, vnbartaria@lnct.ac.in

**Abstract:** Solar air heater is solar energy collection device and this collected solar energy is utilized for low temperature heating purpose, agriculture drying purpose etc. The rate of conversion of solar energy to heat energy is low in solar air heater because of the nature of fluid which is air having poor thermal conductivity which influence the rate of heat transfer from the absorber plate to air. The value of heat transfer coefficient for this heat exchange is low and it can be increased by creating turbulence in flow field. The turbulence is created by providing artificial roughness on absorber plate of various geometries. In this paper the numerical modeling of heat transfer through the absorber plate has been discussed. The heat transfer in a rectangular duct of a solar air heater having trapezoidal rib roughness on the absorber plate is numerically studied by using Computational Fluid Dynamics (CFD). The effect on Nusselt number, heat transfer coefficient, velocity, and temperature parameter are analyzed. This CFD simulation is done using commercial software Fluent 6.3. The  $K$ - $\epsilon$  numerical model consisting of the governing mathematical equations based on the principles of conservation of mass, momentum and energy have been used.

## Time Synchronization using Hierarchical Clustering for reliable data service in MANET

Nidhi<sup>1</sup>, Kamlesh Chandravanshi<sup>2</sup>, Sushil Kumar<sup>3</sup>,

Lakshmi Narain College of Technology, Bhopal (M.P) - India

**Email:** nidhi1514@gmail.com, kamlesh.vjti@gmail.com, sushilk@lnct.ac.in

**Abstract:** Time synchronization in any network like wired and wireless is one of the crucial issue because of synchronized the communication in between sender and receiver. In Mobile ad hoc network nodes are continuously changing their situation in a surrounding environment. The data sending and receiving is performed without any supervision or centralized communication. In this research we proposed a new time synchronization technique with multicast routing in dynamic network. The multicast routing protocol is able to perform the group communication and in each group is made from some nodes with one group coordinator and each node has different clock time. The proposed research is synchronized the clock of each mobile node according to the average time beacon of all group in MANET. The proposed multicast Average Time Clock beacon Synchronization (Avg-SYN-CLK) communication performance is improves the network performance. The proposed scheme performance is compare with the Maximum Clock Time Synchronization (MAX-SYN-CLK) beacon broadcasting technique and Asynchronies Clock Time Performance (ASYN-CLK) and observe that the proposed technique is provides better performance with minimum end to end delay and packet loss.

**Keyword:** Clock Synchronization, MAODV, Mobile Ad hoc, Clock Detection, Multicasting, Average Clock Time.

## A smart way of Compression

Sushil Kumar

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** sushilk@lnct.ac.in

**Abstract:** The advancement of information technology has affected all walks of our life. Data base technology has also grown from a simple file system to data navigation system, and over a last two to three decades a majority of business institutions, organizations, industries etc. have adopted the computerization process and as a result have been flooded with data. In this report it is investigated that for experimental result shows the proposed scheme provides significant improvement in compression efficiencies. The main proposal of this report is to reduce the memory space and the transmission time and achieving good compression ratio. In this work proposed techniques manages the compressed database such that standard operations like retrievals, insertion, deletion and modifications are supported.

## A Digitalized Development Competency in Industrial Internet of Things

Yedlapally Sreepada Surya<sup>1</sup>, Ramesh Chandra Panda<sup>2</sup> and Javalkar Dinesh Kumar<sup>3</sup>

<sup>1,3</sup>Lingaya's Vidyapeeth, Faridabad (Haryana), India.

<sup>2</sup>Synergy Institute of Engineering & Technology, Dhenkanal (Odisha) - India

Email: ramesh.panda.mech@gmail.com

**Abstract:** The competences of IoT aidproducers or investors to gain superiorprominence and insights into their further actionsthrough the effectual use of data and the tighter amalgamation of disparate systems. This opens up the leeway for producers of moving away from merely selling goods to becoming a provider of services and firming the bond they have with the end users of their products. It goes in to the heart of how an industrial manufacturer perceives itself and the extent to which digital change will be central to its tactic and therefore requires that additional care is taken and better caution is exercised. This means that IoT can offer more than traditional process efficiency improvements on the factory floor. This paper will converse the impacts of IoT and other developing technologies in making a manufacturing system automated.It will include conversation on economy, cutting-edgetechnology.

**Keyword:** IOT, Automation of Industry.

**Abstract:** Electricity consumption grows up rapidly all over world during up-coming decades. Nowadays we can generate electricity through a smart way by using different techniques. By implementing a speed breakers on roads through roller mechanism. In this mechanism, by using a rack and pinion system we can generate electricity. And the second technique was traffic windmill which this method used on high ways. In this method by using a vertical axis blade we can generate electricity. And one more method was smart street lights on highways. In this method by using a sensor called LDR (light dependent resistor).

**Keywords:** Electricity extraction, Electricity utilization, Rack and pinion, Vertical axis wind mill.

## Glaucoma diagnosis using discrete wavelet transforms and Histogram features from fundus images

Nandini Kokate<sup>1</sup>, K.G. Kirar<sup>2</sup> and M.L. Jatav<sup>3</sup>

Samrat Ashok Technological Institute, Vidisha (MP) 464001-India

**Abstract:** Glaucoma is one of the main eye diseases; it cause progressive deterioration of optic nerve fibres due to increased fluid pressure. The existing methods of glaucoma diagnosis are time consuming, expensive and require practiced clinicians to understand the eye problems. Hence fast, cheap and more accurate glaucoma diagnosis methods are needed. This paper presents an innovative idea for diagnosis of glaucoma using third level two dimensional discrete wavelet transform (2D DWT) and histogram features from fundus images. The 2D DWT is used to decompose the glaucoma and healthy images and histogram features are extracted from 2D DWT decomposed sub band images. The least square support vector machine (LS-SVM) is used as a classifier which classifies the glaucoma and healthy images using the extracted features.

## Results on Multivalued Mappings in Intuitionistic Fuzzy Metric Spaces

Reema Tuteja<sup>1</sup>, Mayank Sharma<sup>2</sup> and RitujaNighojkar<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** reematuteja32@gmail.com mayank.math80@gmail.com, ritujanighojkar@gmail.com

**Abstract:** In this paper we obtain some common fixed point theorems for multivalued mappings in intuitionistic fuzzy metric space containing rational terms. Wegenerelizeand extend results. Of [I. Kubiacyk and S. Sharma, Common fixed point in fuzzy metric space, J. Fuzzy Math. 11(1)and [RezapourSh.:Common fixed point of self-maps in intuitionistic fuzzy metric spaces , Mat.Vesnik 60(4)(2008), 261-268] by contributing rationalization from their previous versions.

**Keywords:** Common fixed point, Multivalued map, intuitionistic fuzzy metricspace.

**Mathematics Subject Classification (2000).** 54A40, 54H25.

## An Application of Compatibility and Weak Compatibility in Intuitionisticfuzzy Metric Spaces

Mayank Sharma<sup>1</sup>, Ramakant Sharma<sup>2</sup> and Megha Kamble<sup>3</sup>

<sup>1,3</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India

<sup>2</sup>Bansal college of Engineering, Mandeep Bhopal (M.P)-India

Email : Mayanks@lnct.in

**Abstract.** The object of this paper is to obtain some new results in intuitionistic fuzzy metric spacesby the applicability of the property ( $S-B$ ) and the notion of R-weak commutativity of type ( $Sp$ )and weakly compatible maps of type ( $Sp$ ) and prove the intuitionistic fuzzy version of Pantstheorem. Our results are substantiated with example. The established results generalize and extends several existing fixed point results in intuitionistic fuzzy metric spaces, metric spaces and fuzzy metric spaces.

**Keywords:** Intuitionistic fuzzymetric space, ( $S-B$ ) property, R-weak commutativity of type( $Sp$ ),Weakly compatible map, Common fixed point.

**Mathematics Subject Classification (2010):** 47H10, 54H25.

## Neural Network Approach to Predict Soaked CBR of Routine Subgrade soil

Anil Kumar Saxena

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: anils@lnct.ac.in

**Abstract:** This study presents the application of a method of artificial neural networks for the prediction of the California bearing ratio (CBR) with routine properties of subgrade soils. A database is developed containing grain size distribution, Atterberg limits, maximum dry unit weight and optimum moisture content of the soils. A set of 231 experimental results were used to construct the ANN model. The correlation between the basic properties of soil and CBR were obtained from the trained neural network. A Commercial software MATLAB-7.5 was used for trained the ANN models, Multilayer Perceptrons neural network(or LMB model). Three Levenberg-Marquardt Backpropagation ANNs models (LMB-4, LMB-5, and LMB-6) for predicting CBR, (in which the number of input variables is changed seven to four) were employed in the analysis. In these models, the input layer consists of maximum six nodes, one node for each of the independent variables, namely % fines (Silt and clay fraction) , % of Sand content(S),% of Gravel, optimum moisture content (OMC) ,Maximum dry density ( $\gamma_d$ ) , plasticity index (PI) , and liquid limit ( $W_L$ ) respectively . The output layer consists of only one node—CBR. The strengths of the developed models are examined by comparing the predicted CBR values with the experimental values with respect to the regression coefficient ( $R^2$ ) and Mean Square Error (MSE) values. In addition, the experimental results were compared to different LMB networks predicted results. It was concluded that the performance of the model with six inputs (LM-6) is better than other model.

**Keywords:** California bearing ratio (CBR), Neural Network, MLPN, Subgrade

## A Unique VLSI Primarily Based Structure for Computation of 2D-DCT Image Compression

Prashant Chaturvedi<sup>1</sup> and Soni Changlani<sup>2</sup>

LNCT University, Bhopal

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: prashantc@lnct.ac.in, sonis@lnct.ac.in

**Abstract:-**Statistics photograph compression is the deficiency, of redundancy in statistics illustration to attain deficiency, in storage cost. The implementation and optimization of FPGA primarily based 2D-DCT with quantization and zigzag with parallel pipe lining the usage of HDL. The 2-D DCT calculation is made using the 2-D DCT separability property, such that the whole architecture is divided into two 1-D DCT separability assets and calculations with the aid of the use of a transpose buffer. The coding is simulated using Xilinx 9.2i ISE synthesized the usage of spartan-3E XC3S250. The 2nd-dct structure makes use of 600 slices, 6 I/O pins, and 4 multiplier and working frequency 135 MHz and pipe lining latency 140 clock cycles.

**Keyboards:** JPEG, DCT, quantization, zigzag, FPGA, Xilinx 9.2i ISE.

## Human Area Networking using Red Tacton Technology

Ria Sharma<sup>1</sup>, Pratishtha Singh<sup>2</sup> and Prashant Chaturvedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

LNCT University, Bhopal (M.P)-India

**Email:** rias25344@gmail.com, pratishtha712@gmail.com, prashantc@lnct.ac.in

**Abstract:**-So far we've seen LAN, MAN, WAN, internet and plenty of extra networks. However now here is a new concept of "RED TACTON" which allows the communication via touching and makes the human body floor as a conversation network, this is referred to as human area community which is the rising fashion in the area of conversation. The Red Tacton takes a one of a kind technical viewpoint rather than counting on electromagnetic or light waves to hold facts it makes use of feeble electric powered discipline on the surface of the frame as a transmission medium. Verbal exchange with the aid of that is secure as the modern which flows via the frame is in very small voltage range with excessive pace network transmission direction and is viable the usage of any surface of the frame like hand, fingers, toes, face, legs or torso. It additionally works through footwear and clothing as nicely. Further to the human body, numerous conductors and dielectric may be used as transmission media and also they may be used in aggregate. Transmission velocity does no longer deteriorate in congested areas in which many people are communicating at the equal time with a maximum pace of 10mbit/sec.

**Keywords:** Red Tacton Mechanism, IEEE802.3, Human area network.

## Indoor Positioning System using Ultra Wide-band Technology

Pratishtha Singh<sup>1</sup>, Ria Sharma<sup>2</sup> and Prashant Chaturvedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

LNCT University, Bhopal (M.P)-India

**Email:** pratishtha712@gmail.com, rias25344@gmail.com, prashantc@lnct.ac.in

**Abstract:** An indoor positioning machine is a network of device used to locate humans or object wherein GPS and other satellite TV for pc technology lack precision or fail entirely. UWB (excessive bandwidth, low frequency) can skip signals thru a wide type of limitations, along with wall. It can also supply accurate positioning information in a high fresh charge. A area tag of UWB indoor positioning gadget can send area information for the tracked items as much as five times according to second and also can accumulate statistics for up to two years without recharge as a consequence it has low electricity intake which adds into decrease renovation value for indoor monitoring. It has minimum radio interference which permits it to exist in concord with other radio indicators inclusive of those emitted by means of smart phones, Wi-Fi gadget and bluetooth gadgets. A high consumer density isn't a trouble to localization of specific assets because the person can differentiate one song asset and consider the data for it the usage of a visible dashboard. It is vulnerable to interference with the aid of steel and different materials, which makes it a suitable option for asset monitoring in production side.

**Keywords:** Sensor Network, Positioning Algorithms, Wireless Positioning Techniques, Object Tracking

## Common Fixed Point Theorems in Partially Ordered Metric Spaces with Altering Distance Function

Rajesh Shrivastava<sup>1</sup>, R. K. Dubey<sup>2</sup>, Pankaj Tiwari<sup>3</sup>

<sup>1</sup>Govt. Dr. S P M Sci. & Comm. College, Bhopal (M.P.), India.

<sup>2</sup>Govt. Model Science College, Rewa (M.P.), India.

<sup>3</sup>Govt. College, Lidhaura, Tikamgarh (M.P.), India

**Email:** rajeshraju0101@rediffmail.com, rkubey2004@yahoo.co.in, pankajvist@gmail.com

**Abstract:** The aim of this paper is to prove certain fixed point theorems for multi-valued and single-valued mappings in such spaces, by using altering distance function. Fixed point theory in partially ordered metric spaces has greatly developed in recent times. Our results improve and extend several recent results of fixed point theory.

**Keywords:** Common fixed points, Metric space, Partially Metric space, Altering distance function, Multi-valued and Single-valued mappings

## Numerical solutions of Schrödinger equations with Harmonic Oscillator describing motion of Quantum Oscillator

Amit Goswami<sup>1</sup> and Preetam Singh Gour<sup>2</sup>

Jagan Nath University, Jaipur-303901, Rajasthan, India

Jaipur National University, Jaipur-302017, Rajasthan, India

**Email:** optoamit@gmail.com

**Abstract:** In this paper, an effective, powerful analytical scheme, popular as Homotopy perturbation sumudu transform method (HPSTM) is employed to attain approximate solutions of nonlinear time fractional Schrödinger equations with Harmonic Oscillator. These nonlinear time fractional Schrödinger equations occurs in the many fields of physics and technology such as quantum mechanics, optics, fluid dynamics, nonlinear physics, nanotechnology and in many more. The nonlinear time fractional Schrödinger equations with Harmonic Oscillator describe the various phenomena such as motion of quantum oscillator, lattice vibration, propagation of electro-magnetic waves, fluid flow etc. The main objective is to apply an alternative method of solution, which do not require small parameters and avoid linearization and physically unrealistic assumptions. The results show that HPSTM is very efficient and convenient and can be applied to a large class of problems. This study shows that the approximate results obtained by the HPSTM are very accurate and effective for analysis the nonlinear behaviour of systems. This study also states that HPSTM is much easier, more convenient and efficient than other available analytical methods.

**Keywords:** Quantum mechanics, Schrödinger equations, Harmonic Oscillator, Sumudu transform, Homotopy perturbation method, He's polynomials.

## Binary Topological Space

Nazir Ahmad Ahengar<sup>1</sup>, Roshani Sharma<sup>2</sup>, J.K. Maitra<sup>3</sup> and Sujeet Chaturvedi<sup>4</sup>

R.D.V.V Jabalpur 482001 (M.P) India

**Email:** nzhmd97@gmail.com, roshanisharma@gmail.com, jkmrdvv@rediffmail.com

**Abstract:** Topology is playing a key role in almost every field of applied sciences and several branches of mathematics. This is very useful concept especially in information system, particle physics, quantum physics, high energy physics etc. In 2002 Csaszar [4] introduced and studied the concept of generalized topology and generalized continuity. In 2011 Nithyanantha Jothi S and Thangavelu P, [18] have introduced the concept of binary topology between two sets and studied different properties. In this paper we introduce and studied  $\mu$ -binary topological spaces and investigate its basic properties

**Keywords:** Binary topological spaces, binary topological spaces, closure interior

## Mathematical Concept of Compound Redundant system with availability and reliability parameter under supplementary variable method

Sonendra Kumar Gupta

Oriental College of Technology, Bhopal, India

**Email:** sonendrag@gmail.com

**Abstract:** In this paper author has assume that a compound system have 2-subsystems selected as " and " connected in chain. Subsystem " consists of Nunlike units in chain and the subsystem " consists of 3- like components in parallel redundancy. In this system it is assume that the system goes to complete crash state if any unit of subsystem " fails or more than 1-unit of subsystem " is in the failed state. Also, the system works with degraded efficiency if 1-unit of subsystem " failed. The system may also fail due to environmental reasons.

**Keywords:** Availability, Reliability, Abel lemma, MTTR, Ergodic behaviour and Laplace Transform and Supplementary variable

## A Basic generalized properties of Transprocal Matrix and Transprocose Matrix.

Ram Milan Singh<sup>1</sup> and Manoj Ughade<sup>2</sup>

Govt. P.G. College Tikamgarh (M.P) India

J H Govt. P. G. College Betul (M.P) India

**Email:** rammilansinghlig@gmail.com, manojhelpyou@gmail.com

**Abstract:** In this paper we have to generalize some definition and properties of I-matrix, J-matrix Transprocal of certain matrix, transpose of transprocal matrix, can be represented by this matrix. On the other hand, the abstract treatment of linear algebra presented later will generalize a new sight into the structure of these matrices.

## Machine Learning Algorithms in WSNs: A Review Article

Pooja Lalwani<sup>1</sup> and Vasima Khan<sup>2</sup>

Sagar Institute of Research & Technology, Bhopal (M.P) India

Email: poo.lalwani06@gmail.com, aarish.azfar07gmail.com

**Abstract:** Wireless sensor network (WSN) is a recent leading technology that is used in realistic applications due to its variable size, cost-effectiveness and type of deployment. Sensor nodes battery in WSN cannot be recharge and nodes also cannot be replaceable due to which nature of WSN changes dynamically. The traditional approaches in WSN cannot adopt the changes dynamically. To overcome the drawbacks of traditional approaches, machine learning (ML) techniques are adopted to react accordingly. In this article, survey based on ML techniques with WSNs application is presented which covers from 2002 to 2018. In addition, drawbacks and advantages of each and every technique have been discussed. Finally, some open issues in WSN is mentioned for the future research direction.

## Iwalk- A Smart Blind Stick

Shiva Kuchya<sup>1</sup>, Sneha Wadhvani<sup>2</sup> and Vishal Patel<sup>3</sup>

Sagar Institute of Research & Technology, Bhopal (M.P) India

Email: skuchya99@gmail.com

**Abstract:** Independence is the building methodology in achieving dreams , goals and objectives in life . Visually impaired persons find themselves challenging to go out independently . There are millions of visually impaired or blind people in this world who are always in need of helping hands . Blind stick is an innovative electronic stick . Blind people have big problem when they walk on the street or stairs using white cane , instead of this white cane the electronic walking stick will help them by providing more convenient means of life . The main aim of this paper is to contribute our knowledge and services to the people of blind disabled society .

## Analysis of Triaxility Stress and Damage in Hot Extrusion Process of AL2024 using Finite Element Method

Shailendra Dwivedi<sup>1</sup> and Neeraj Dubey<sup>2</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: shailendrakdwivedi@gmail.com, dubeyneeraj2576@gmail.com

**Abstract:** Hot Extrusion process is a manufacturing process in which block of metal is reduced in cross section by forcing it to flow through a die orifice under high pressure. In general, extrusion is used to produce cylindrical bars or hollow tubes, but shapes of irregular cross section may be produced from the more readily extrudable metals, like aluminum. Heavy forces required in extrusion, most metals are extruded hot under conditions where the deformation resistance of the metal is low. However, cold extrusion is possible for many metals and has become an important commercial process. The reaction of the extrusion billet with the container and die results in high compressive stresses which are effective in reducing the cracking of materials during primary breakdown from the ingot. In this research work numerical simulation of hot extrusion process has been considered and carried out the finite element analysis has been carried out. Focused on the stress and strain behavior, triaxility stress and on the bases of deformation aiming on the damage and its behavior, taguchi method has been used for the validation of the design of experiment. For FEA DEFORM 3D software has been applied and for modeling of parts AUTOCAD has been used.

**Keywords:** Hot Extrusion, FEA, triaxility Stress, Damage.

## Finite Element Analysis of Hot Rolling for an Aluminium 2024 Plate

Shailendra Dwivedi<sup>1</sup> and Neeraj Dubey<sup>2</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: shailendrakdwivedi@gmail.com, dubeyneeraj2576@gmail.com

**Abstract:** Now a day numerical modelling an important tool in the manufacturing industry to analysis the all the parameters of machining and geometrical. The two dimensional rolling model is common in manufacturing industries. In the present research work is based on a two dimensional finite element model for hot rolling of aluminum (Al2024) plate has been used. This model is used to study the behavior of the material under different values of coefficient of friction, roller diameter and initial thickness of the plate for attaining a required dimensional thickness of the rolled plate. The effect of friction, initial thickness of plate and roller diameter on maximum stress, equivalent plastic strain and reaction force has been studied. The current work has been carried out using the Finite Element software ABAQUS 6.10

**Keywords:** Hot Rolling, FEA, Stress- Strain.

## Class(es) of Estimators under Non-Response and Measurement Error in Surveys

Diwakar Shukla<sup>1</sup>, Abha Tenguria<sup>2</sup>, Sharad Pathak<sup>3</sup> and Dinesh Kumar Moriya<sup>4</sup>

Email: abha.tenguria@gmail.com, sharadstatistics@gmail.com, dinesh.moriya@gmail.com

**Abstract:** While in sample surveys, it is expected to assume that respondents are obtainable to provide information correctly asked by interviewers. Unfortunately, in real circumstances it is rarely happens. Often respondents are not available; often do not understand to interviewer and often show unwillingness for correct answer. This causes a sample to be incomplete. According to theory of survey sampling, investigators are recommended to revisit those units found non-responded but even then the problem remains the same. Over the issues of personal respect and prestige bias, respondents often produce over or under estimated response instead of the true value. This causes appearance of measurement error in sample values. This paper presents method of mean estimation in the setup of non-response and measurement error together. It contains method to impute the values which are non-responded in sample containing measurement error on study variable. Expressions of optimized mean squared error are derived and theoretical results are supported by numerical illustration. This is an attempt for a most general approach for the problem of estimation in sample surveys.

**Key words:** Non-response, Measurement error, Bias, Mean squared error, Imputation, Auxiliary information.

## Lie Algebra and q Special Functions of Mathematical Physics

Ritu Sharma<sup>1</sup> and Abha Tenguria<sup>2</sup>

Govt. Maharani Laxmi Bai Girl's P.G. (Autonomous) College, Bhopal (M.P.)

Email: ritusharma327@gmail.com

**Abstract:** In this paper we will present important interrelationships between the theory of Lie groups and algebras, and special functions. We will study two specific Pseudo groups, namely  $SO_q(2)$  and  $SU_q(2)$ , and we prove that similar properties of Lie groups and study about the role of q special function in mathematical physics.

## Banach (E,1) Summability of the Derived Fourier Series

Kalpna Saxena<sup>1</sup> and Manju Prabhakar<sup>2</sup>

Govt. M.V.M. Bhopal (M.P), India

Email: manjuprabhakar17@gmail.com

**Abstract:** The aim of our paper is to study the Banach (E,1) product summability of derived series of Fourier series by generalizing the result of Tripathy and Pandey [9]

**Keywords:** (E,1) summability; Banach\_(E,1) summability; Banach summability.

**Mathematics Subject Classification (2010):** 42A24, 42A20 and 42B08

## Common Fixed Point Results for F-contraction in Complete b - Metric Spaces

Abha Tenguria<sup>1</sup> and Sarika Saxena<sup>2</sup>

Govt. M. L. B. Girls P. G. College, Bhopal (M.P.) 462001 India

Barkatullah University Institute of Technology, Bhopal (M.P.) 462026 India

E mail: abha.tenguria@gmail.com, sarika.s2011@rediffmail.com

**Abstract:** In this paper, we consider two F- contractive self mappings on a complete b- metric spaces. Object of this paper is to establish a unique common fixed point theorem for F - contractions. The results extend and generalize some results in the literature.

**Keywords :** Complete b- metric space, common fixed points, F-contractions.

## Some Fixed Point Theorems for Expansive Type Mappings in Dislocated Metric Space

Sarla Chouhan<sup>1</sup>, Prabha Chouhan<sup>2</sup> and Neeraj Malviya<sup>3</sup>

**Abstract:** The present paper extend and generalize fixed point theorems for expansive type mappings in Dislocated Metric Space.

**Keyword:** Dislocated Metric Space, Fixed Point Theorems,

**Mathematics Subject Classification:** 47H10,54H25

### On Ricci Quarter Symmetric Metric Connection

Teerathram Raghuwanshi<sup>1</sup>, Swati Jain<sup>2</sup>, Anil Goyal<sup>3</sup> and Manoj Pandey<sup>4</sup>

University Institute of Technology, RGPV Bhopal (M.P.) India

Email: teerathramsgs@gmail.com

**Abstract:** The object of the present paper is to study a type of Ricci quarter symmetric metric connection on a quasi-Einstein manifold and  $N(k)$ -Quasi Einstein manifold. We have shown that curvature tensor of the connection satisfies Bianchi's first identity and also that the conformal curvature tensor is an invariant of such a transformation. Apart from this, we have studied some more curvature conditions.

### A Taylor Series Method for the Solution of the Newman Boundary Value Problems for Partial Differential Equations

Chitra Singh

Rabindranath Tagore University Bhopal (M.P.)-India

Email: chitrasingh30@yahoo.in

**Abstract:** In this paper, a numerical method for solving the Neumann problems for partial differential equations with constant coefficients and analytic Neumann conditions in two and three independent variables is presented. The technique is based upon the Taylor series expansion. Properties and the operational matrices for partial derivatives for the Taylor series in two and three variables are first presented. These properties are then used to reduce the solution of partial differential equations in two and three independent variables to a system of algebraic equations. The procedure can be extended to linear partial differential equations with more independent variables. The Taylor series may not converge if the solution is not analytic in the whole domain, however, the present method can be applied to Neumann boundary-value problems for linear partial differential equations, when the solution is analytic in the interior of the domain and also on some open subsets for each distinct part of the boundary. The method is computationally very attractive and applications are demonstrated through illustrative examples.

### DSSSWMS: An Improved Approach For The Decision Support System In Solid Waste Management System

Narendra Sharma<sup>1</sup>, Ratnesh Litoriya<sup>2</sup>, Harsh Pratap Singh<sup>3</sup> and Deepika Sharma<sup>4</sup>

Mewar University Chittorgarh, India

Jaypee University Guna, (M.P) India

Shri Satya Sai University of Technology and Medical Sciences, Sehore (M.P.), India

Email: Narendra\_sharma88@yahoo.com, litoriya.ratnesh@gmail.com, singhharshpratap@gmail.com, deepikasharma190687@gmail.com

**Abstract:** India is a developing country, all the developing countries facing a sustainable waste management problem for a long time. The quantity of MSW is growing very rapidly and governments are not capable of disposal 100% of solid waste as per compare to generation. Improper waste management affects the environment and human being direct. Peoples suffer from many types of diseases due to improper solid waste management. To deal with this problem the Indian government makes policies and updates them from time to time. Now this time we need new technology that can be work of an integrate form with waste management models and help to improve the efficiency of the municipal solid waste management process. Decision support systems model such types of tools that can be the help of organizations or decision-makers to take proper decisions for a particular problem. A decision support system is a fully computerized system that can be work with the help of data mining technology.

## Mathematical Modeling of Indoor Air Pollutants: A Review

Sachin Kumar Khare<sup>1</sup>, Ravindra Randa<sup>2</sup> and V N Bartaria<sup>3</sup>

<sup>1,3</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India

<sup>2</sup>UIT RGPV, Bhopal (M.P) - India

**Email:** sachinkhare.2008@gmail.com

**Abstract:** With the global concern over the pollution, the indoor environment is also to be kept safe and within the prescribed air quality standards as most of the people spend their 80% of the time indoor whether it is at home, office or any other place. The pollutant concentration in indoor is more than in outdoor atmosphere and can affect negatively human health and productivity. Therefore, prediction of indoor pollutant concentration will help in making the necessary arrangements to improve indoor environment in order to keep the human health and productivity up to the desired levels. Several studies have been made over four decades in developing, testing, and evaluating the performance of mathematical models for predicting pollutant concentrations in the indoor atmosphere. These studies provide the data pertaining to risk assessment and enable the regulatory bodies to provide guidelines for the appropriate steps for a given level of smoking, Chemically Reactive Pollutants activity etc. This paper reviews the Balance-Based Model for Indoor Air Pollutant Concentration Modelling, Mathematical Modelling of Chemically Reactive Pollutants in Indoor Air and Mathematical Models for Predicting Indoor Air Quality from Smoking Activity.

## Generalized Fractional Kinetic Equations involving Generalized Extended-- $\tau$ Hypergeometric Function

Jai Prakash Patel

Madhyanchal Professional University, Ratibad, Bhopal (M.P.), India.

**Email:** jpnt.84@gmail.com

**Abstract:** Recently, introduced an extension of generalized  $\tau$ Hypergeometric function  ${}_3\Gamma_2^T(2)(z)$  (R. K. Gupta et al. [5]), [6]. In the present paper, authors have established further generalization of fractional kinetic equations involving generalized extended  $\tau$ -Hypergeometric functions. The solution of these generalized fractional kinetic equations were obtained in term of Mittag-Leer function using Laplace transform.

**Keywords:** Generalized extended incomplete Hypergeometric Function, Fractional kinetic equation, Laplace transforms, Mittag-Leer function, Fractional calculus.

**Mathematics Subject Classification (2010):** 26A33, 33B15, 33B20, 33C20, 44A10, 33E20.

## Global Stability Analysis of SITRS Model of Influenza

Trupti Barve<sup>1</sup>, Sandeep Kumar Tiwari<sup>2</sup> and Pradeep Porwal<sup>3</sup>

<sup>1,2,3</sup>Vikram University, Ujjain (M.P.) India.

**Email:** truptibarce23@gmail.com, skt\_tiwari75@yahoo.co.in pradeepratnawat@yahoo.com

**Abstract:** Numerous people all over the world are suffering from influenza every year. It is an acute respiratory infectious disease which is caused by influenza virus. The purpose of this paper is to study the spread of disease when individuals have tendency to become susceptible again after recovery. A SITRS deterministic model is proposed and analyzed. In this paper basic reproduction number  $R_0$  is obtained, local stability of disease free equilibrium and endemic equilibrium is studied and discussed global stability of disease free equilibrium. It is observed that disease free equilibrium is locally and globally stable when  $R_0 < 1$  and endemic equilibrium is stable when  $R_0 > 1$ . Numerical simulations are performed using MATLAB to check the effect of movement of individuals from recovery class to susceptible class and results are shown graphically.

## Coupled fixed-point theorem using E.A property in complex valued rectangular (generalized) metric space.

Mona Verma

Govt. P.G College Narsingharh- Rajgarh (M.P.) India.

Email : monaverma117@gmail.com

**Abstract:** In this paper coupled fixed point is obtain for four mapping using E.A property in complex valued rectangular (generalized) metric space.

**Keywords:** Complex- valued metric space, coupled fixed point, E.A property.

## Parametric excitation of high-frequency surface Plasma waves in Bismuth-Metal Interface

Ashim Prakash Jain and Sangeeta Kapoor.

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

Email: ashimj@lnct.ac.in, kapoorsangeeta1972@gmail.com

**Abstract:** The problem concerning the excitation of high-frequency surface Plasma waves (SPW) propagating across an external magnetic field at a plasma-metal interface is considered. A homogeneous electric pump field is applied in the direction transverse with respect to the plasma-metal interface. Two high-frequencies SPW from different frequency ranges of existence and propagating in different directions are shown to be excited in this pump field. The instability threshold pump-field values and increments are obtained for different parameters of the considered waveguide structure. The results associated with saturation of the nonlinear instability due to self-interaction effects of the excited SPW are given as well. The results are appropriate for both gaseous and semiconductor plasmas. A surface plasma wave (SPW) over bismuth-Metal interface has a signature of mass anisotropy of free electrons. For SPW propagation along the trigonal axis there is no birefringence. The damping rate of waves at low temperatures is low. The surface plasma wave may be excited by an electron beam of current 100 mA propagating parallel to the interface in its close proximity.

## Artificial Neural Network Modeling for Estimation of Carbon Monoxide Concentration

Sangeeta Kapoor<sup>1</sup>, Sudhir Nigam<sup>2</sup>, Rashmi Nigam<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

<sup>2</sup>Envirimental Consultant, (M.P)-India

<sup>3</sup>UIT, RGPV, (M.P)-India

Email: kapoorsangeeta1972@gmail.com

**Abstract:** The lack of environmental data is a common feature for many developing countries. Accurate estimation technique is highly required to overcome with this problem and the artificial neural network (ANN) is regarded as cost effective and better suited technique for estimation as compare traditional statistical techniques. In this paper an attempt is made to estimate concentration of CO gas based on historical data using artificial neural network (ANN). Eleven years (1996-2006), night time (22.00-06.00 Hrs.) CO emission data from ITO square of Delhi has been employed for modelling and simulation study. The results of ANN studies predicted CO concentrations with great accuracy and closer-to-reality which can be helpful to alleviate the excessive CO accumulations.

**Keywords:** Concentration, Artificial Neural Network (ANN), Real time analysis, Modelling.

## Intelligent Phishing Detection Classification Using Hybrid Approach

Shivani Goutam<sup>1</sup>, Rajeev Kumar<sup>2</sup> and Vivek Kumar<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

**Email:** rajeevcsemitb@gmail.com, vivekk@lnct.ac.in

**Abstract:** The so-called phishing attacks refers to an attacks in which a legitimate website is mimicked, in order to steal sensitive statistics from end-users. Phishing attacks are one of the significant threats to individuals and corporations on the Internet today. In recent years, this problem has been actively researched by academia and industry. There are two main approaches to try to provide an effective phishing solution: The first is to identify phishing attacks by comparing the similarities between phishing and the target site. The second method is to observe the underlying characteristics of the attack. This paper proposes a phishing technique based on web page uniform resource locator (URL) authentication. The proposed solution is able to distinguish legitimate web pages from fake web pages by verifying the Uniform Resource Locator (URL) of the suspicious web page. Check URLs against specific features to verify phishing pages. Prevention of detected attacks is reported. The performance of the proposed solution was evaluated using the Phistank and Yahoo Directory datasets. The obtained results suggest that the detection mechanism is deployed and can detect various types of phishing attacks while maintaining a low rate of false alarms.

**Keywords:** Phishing, malicious URL, KNN, machine learning, cybersecurity.

## Review on mathematical modelling of an Internal Combustion Engine

Rajeev Singh Chauhan<sup>1</sup>, Nitin Shrivastava<sup>2</sup> and Arun Kumar Wamankar<sup>3</sup>

<sup>2</sup>UIT-RGPV Bhopal (M.P) India

<sup>1,3</sup>Lakshmi Narain College of Technology, Bhopal (M.P) - India

**Email:** rajen5432@gmail.com

**Abstract:** In this article, we are focussed and discussed on different types of mathematical modelling and its application used in internal combustion engine. A mathematical model usually describes a system by a set of variables and a set of equations that establish relationships between the variables such as combustion, performance and emission parameters. By the use of mathematical modelling different parameter of internal combustion engine can be correlate and analyse the effect of one parameter to another. After developing a mathematical model different types of fuel blend can be easily analyse the effect on combust, performance and emission at different loads within the experimental domain. Author's analysed and found from previous published paper related to mathematical modeling and experimental output predicted should be closer to developed mathematical model.

## Kinetic Model for Performance Prediction of Anaerobic Digester

Arvind Kumar Mishra<sup>1</sup>, Prashant Baredar<sup>2</sup>, Anjaney Pandey<sup>3</sup>, Deepak Kumar Rathaur<sup>4</sup>,  
and Prashant Pandey<sup>5</sup>

<sup>1,4,5</sup> Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

<sup>2</sup>Department of Energy, MANIT Bhopal (M.P.)

<sup>3</sup>IPST Rural Engg. , MGCGV, Chitrakoot (M.P.)

**Email:** arvind686465@gmail.com

**Abstract:** Anaerobic Digestion (AD) is a biological process that happens naturally when bacteria breaks down organic matter in environments in the absence of oxygen. Anaerobic digestion (AD) is a microbial decomposition of organic matter into methane, carbon dioxide, inorganic nutrients and compost in oxygen depleted environment and presence of the hydrogen gas. Bacterial growth is a complex process involving numerous anabolic (synthesis of cell constituents and metabolites) and catabolic (breakdown of cell constituents and metabolites) reactions. Ultimately, these biosynthetic reactions result in cell division. Several distinct growth phases can be observed within a growth curve lag phase, the exponential or log phase, the stationary phase, the death phase. During exponential growth the rate of increase of cells in the culture is proportional to the number of cells present at any particular time. One can mathematically describes cell growth during the exponential phase. Equation has been developed from a series of experiments performed. The results of these experiments shows that at low substrate concentrations, growth rate becomes a function of the substrate concentration. Thus, designed Equation to describe the relationship between the specific growth rate and the substrate concentration. The most important determinants of good living conditions for anaerobic bacteria and therefore efficient gas production. Acetogenic (acid forming bacteria) and methanogenic are naturally present in cow dung. However, their number is quite small. Acid forming bacteria proliferate fast and increase their number, while methanogenic bacteria develop very slowly. Therefore, for the initial reaction, small amount of sludge of another digester is generally used as seeding or inoculum. This sludge contains high concentration of acetogenic and methanogenic bacteria which could enhance the process of anaerobic digestion of organic materials. Some study has shown that the seeding materials can be mixed with the input slurry up to the ratio of 30 to 50 percent. If inoculum is increased further, less volume of gas is obtained due to reduced inputs fed to the digester. Anaerobic digestion occurs best within a pH range of 6.8 to 8.0.

## Emotion Detection based on Images and Captions on Social Media

Aditya Patel<sup>1</sup>, Hitesh Gupta<sup>2</sup> and Utkarsh Dwivedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** adityapatelmail@gmail.com, hitesh034@gmail.com, utkarshdwivedibtech@gmail.com

**Abstract:** Nowadays, Internet has grow to be an crucial element in every person's lifestyles. Social networking has regularly grow to be a recurring for people to submit their photos, opinions and remarks. People percentage their emotions on line in a completely casual language. Thus, it is very tough mission to research actual sentiment hidden inside the text of natural language. Emotion detection is the sphere of study that analyses people views and feelings. Human emotion can be expressed through numerous approach which include speech, facial expressions, gestures and textual facts. This paper proposes the gadget which makes use of present emotion detection thru facial features using deep mastering and supports it with the evaluation of textual information received thru captions of pics on social networking websites to ensure greater accurate outcomes. There is no characteristic on social networking sites to kind feelings of photos which motivate us to classes posts based on emotions. Emotion detection from each captions and photos collectively is efficient due to the fact most effective text isn't always enough to apprehend the feelings of customers. This hybrid approach offers promising results in both the class of feelings as well as in acting emotion detection.

**Keywords:** Emotion detection, Convolution Neural Networks, Social Networks, Deep Learning, Sentiment Analysis

## Content Based Facial Emotion Recognition Model using Machine Learning Algorithm

Aditya Patel<sup>1</sup>, Vijay Kumar Trivedi<sup>2</sup> and Utkarsh Dwivedi<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P) - India

**Email:** adityapatelmail@gmail.com, hitesh034@gmail.com, utkarshdwivedibtech@gmail.com

**Abstract:** Emotion reputation or sentiment analysis is recognized as a critical studies topic in pc vision community. The challenges include identity of face, popularity of accurate emotion, suitable database and so forth. We have proposed and implemented a fashionable Convolution Neural community (CNN) building framework for emotion popularity. The model is formalized by means of developing a coincident gadget which fulfills the duties of face detection and emotion classification the usage of our proposed CNN structure. The version is verified using the FER-2013 dataset. In the proposed paintings, we talk the applicability of the proposed CNN model. This model lays a valuable evaluation of the effect of changing the network size, pooling, and dropout. For a given model, the very last accuracy at the validation facts is round 63%.

**Keywords:** Convolutional neural network (CNN), Facial expression recognition, Deep neural networks.

## Role of SODAR in the Climate Observing and Predicting System

Anjali S. Nair<sup>1</sup>, Priyanka Singh<sup>2</sup>, Mamta Devi<sup>3</sup>, Kirti Soni<sup>4</sup>,

Mahavir Singh<sup>5</sup> and Sangeet Kapoor<sup>6</sup>

<sup>1</sup>Physico-Mechanical Metrology (PMM) Division,  
 CSIR-National Physical Laboratory, New Delhi, India,

<sup>2</sup>Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** soniks@nplindia.org

**Abstract:** Climate Change is our time's defining problem and we are at a defining moment. The effects of climate change are global in scope and unprecedented in scale, from changing weather patterns that threaten the human life and livelihood due to the rising risk of hydro meteorological disasters like flood, hurricanes, cyclones, drought etc. Without dramatic intervention today, it will be harder and more expensive to adapt to these hydro-meteorological effects in the future. Many methods have been created and are being developed for curbing the catastrophic effect caused due to hydro-meteorological disasters. Remote sensing was one of those techniques that had a huge effect on disaster management. This technology has been widely used in recent decades to explain the extent of the impacts of earthquakes, tsunamis, hurricanes, floods, wildfires etc. Remote sensing techniques have proved important effectiveness in quantifying post-disaster harm after major disaster through high resolution optical imaging and active sensors. Before these disasters happen and create a dreadful situation (humanly in terms of economy and socially), however, it is necessary to estimate and predict them. The present study focused to develop environmental models that enable prior prediction of these disasters via estimation of extreme climate change before it could cause detrimental effects. The research deploys Sound Detection and Ranging (SODAR) for collection of data in relation to wind speed and direction, atmospheric boundary layer for specific locations in India that are hit by hydro-meteorological catastrophe for evaluating the role of SODAR and environmental modelling in prediction of climatic trends, thereby avoiding the disaster hit consequences. The study also addresses the wider applications and advantages of using SODAR than other remote sensors and the models which uses wind speed and direction for the prediction of climate changes and thus helping in pre preparedness before the disaster. Therefore, there is an apparent connection between climate change and rising climate-related risks, generally suggesting the need to assert about the need for its predication through environmental modelling. This project will take the help of environmental modelling to ascertain about the upcoming climate change which will enable an estimation of climatic havoc leading to pre-precautionary measures before these disasters affect the people.

## Security Concerns, Matters and Methods for Wireless Sensor Network

Leena Jadhav<sup>1</sup> and Jitendra Sheetlani<sup>2</sup>

<sup>1</sup>SSSUTMS, Sehore (M.P)- India

E mail: leenavishal83@gmail.com

**Abstract:** A Mobile ad hoc networks (MANETs), a class of flexible and self-autonomous wireless networks that can be rapidly deployed and reconfigured without infrastructure support or centralized management, are highly promising to provide communication support [1]. The mobile nodes can move from one location to another. The mobile nodes are formed as a network without help of central management [1, 2, 18]. The Nodes in networks make use of an equivalent random access channel, cooperating in an especially friendly manner to contributing themselves in multihop forwarding. With the worldwide use of wireless sensor networks in different field and for various applications such as health care, military, ecological, and earth sensing, surveillance system monitoring. By reason the restrictions/ limitations of sensor nodes in terms of energy, storage and computational capacity, the use of insecure wireless communication channels concerns have ascended in these applications. To countermeasure the limitation various techniques and algorithm has been developed by the researchers. In this paper, we present the security issues, challenges occur and different techniques to overcome these security issues with their merits and demerits.

**Keywords:** Wireless sensor network, Sensor node, Security, Health care, Energy

**Abstract:** The tropical countries like India where heating and cooling of air is mostly required during particular season in a year. Conventional heating and cooling systems consume a great amount of energy reaching up to the level of almost one-third of the total energy consumption. As the current energy requirements are mostly fulfilled by the fossil fuel based energy generation systems, this extensive consumption of the energy contributes to green house emissions and affecting the environment adversely. A promising technology of heating and cooling of air by the earth air heat exchanger system has been becoming important in the present scenario of emphasis on reducing energy demand on space heating and cooling. This renewable and passive system of heating and cooling reduces the energy demand and thus protect the environment also. The design of the earth air heat exchanger system involves various parameters such as the thermo-physical properties of the soil, thermal and flow characteristics of the air in the pipe, material, orientation and dimensions of pipes buried in the earth and the heat exchange for the optimum performance. This paper presents the mathematical modeling of the heat exchange in the underground pipe. The mathematical model will provide the necessary input data for the design of an efficient earth air heat exchanger system. Thus the space heating and cooling can be more effectively done with the saving of energy and protecting the environment.

## Extreme Values Analysis for Finding Outliers Detection Using Machine Learning to Detect Predicted Data Points

Atul Kumar Gupta, Ashish Jain, Nikesh Tiwari

Jagran Lakecity University Bhopal (M.P)-India

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** atul.gupta@jlu.edu.in, jainashish1302@gmail.com, nikeshtiwari786@gmail.com

**Abstract:** An outlier is usually measured as an observation which is extensively found distant from the other well thought-out observations. In the era of modern machine learning analysis of n-dimensional datasets, data quality is essential for economists to guarantee robust results. Many machine learning algorithms are sensitive to the range and distribution of attribute values in the input data. Outliers in input data can skew and mislead the training process of machine learning algorithms resulting in longer training times, less accurate models and ultimately poorer results. Even before predictive models are prepared on training data, outliers can result in misleading representations and in turn misleading interpretations of collected data. Traditional techniques for outlier detection tend to exclude the tails of distributions and ignore the data generation processes of specific datasets. Various methods for detecting different kinds of outliers in high-dimensional data sets from two different perspectives, i.e. detecting the outlying aspects of a data object and detecting outlying data objects of a data set. N-dimensional data can be seen as part of the variety challenge of machine learning.

**Keywords:** Outlier detection, Machine Learning, High-Dimensional Data, Intrinsic Dimension (ID), k-Nearest Neighbour (k-NN)

## Review of Artificial Neural Network and Its Applications

Nikita Naik<sup>1</sup> and Jagruti Sohale<sup>2</sup>

<sup>1</sup>Seva Sadan Mahavidhyala, Burhanpur (M.P)- India

**Email:** jagrutisohale99@gmail.com

**Abstract:** In this paper, we are elaborating Artificial Neural Network or ANN, its areas of applications. An Artificial Neural Network (ANN) is an information processing paradigm that is inspired by the way biological nervous systems, such as the brain, process information. In our brain, there are billions of cells called neurons, which processes information in the form of electric signals. ANN works on this concept. ANN provides a very exciting alternatives and other application which can play important role in today's computer science field. This paper gives overview of Artificial Neural Network of ANN. It also explains the application and advantages of ANN.

**Keywords :** Artificial neural network, information, process, electric signal, biological nervous system.

## Role of AI in Designing Smart Homes

Ashi Jain<sup>1</sup> and Bhumika Lalchandani<sup>2</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** ashijain586@gmail.com, bhumikalalchandani321@gmail.com

**Abstract:** Smart Homes have become firmly established as an active research area with potential for huge social and economic benefits. The concept of a Smart Home refers to the enrichment of a living environment with technology in order to offer improved habitual support to its inhabitants and therefore an improved quality of life for them. In this research paper we purpose how advances from the device and technological side have not necessarily been matched with a similar level of development in processing of the information recorded within the living environment from an algorithmic or 'intelligent' perspective. We surmise how traditional areas in Artificial Intelligence can bridge this gap and improve the experience for the user within a Smart Home. Smart Homes offer many benefits to its inhabitants and people with special needs. ANN (Artificial neural Network) technology appear to have potential, especially in the automated monitoring and control of smart home devices and the relevant space as well as the well being of inhabitants. With the rapid advances in technology , especially in wireless sensors and sensor networks, it is expected that it is not far when many of the dreams of the smart homes will be realized.

## Application of Intuitionistic Fuzzy Soft Matrix Theory in Decision Making in Real Life Problem

Manoj Sharma<sup>1</sup>, and Dharendra Kumar Shukla<sup>2</sup>

Sagar Institute of Research & Technology, Bhopal (M.P)-India

RIE, Bhopal (M.P)-India

**Email:** sirtmns@gmail.com

**Abstract:** Soft set theory is a newly mathematical tool to deal with uncertain problems. It has a rich potential for application in solving practical problems in economics, social science, medical science etc. The concept of fuzzy soft sets extended fuzzy soft set to Intuitionistic fuzzy soft sets .In this paper we proposed intuitionistic fuzzy soft matrices and defined different types of intuitionistic fuzzy soft matrices and some operators. Finally a practical example that explains the best solution is analysed and demonstrate the application of the proposed decision making method.

**Keywords:** Soft sets, Fuzzy soft matrix (FSM), Fuzzy soft set (FSS), Intuitionistic fuzzy soft matrix (IFSM), Addition of IFSM, Complement of IFSM , Subtraction of intuitionistic fuzzy soft matrix.

## Generalized the Result on Common Fixed Point Theorem in Complex Valued b- Metric Space

Pradeep Kumar Dwivedi

Sagar Institute of Research Technology and Science, Bhopal (M.P.)

**Email :** pkdwivedi76@gmail.com

**Abstract:** In this paper we generalized a common fixed point theorem for four self-mappings satisfying rational contraction has been proved in complex valued b-metric space. Then, examples are provided to verify the effectiveness and usability of our main results. Finally, we validate our results by proving both the existence and the uniqueness of a common solution of the system of Urysohn integral equations and the existence of a unique solution for linear equations system.

**Keywords:** complex valued b-metric space, common fixed point, compatible mapping, weakly compatible mapping, integral equations, linear system.

**AMS Subject Classification No. (2010):** 47H10; 54H25

## **Big Data Analytics and High Performance Computing: Issues, Challenges and Paradigms**

**Swati Namdev and Sunil Phulre**

LNCT University, Bhopal (M.P.) - India

**Email :** swati.tailor@gmail.com, suneel.lnct@gmail.com

**Abstract:** Data has grown with the advent of technology, capture and store data and then analyze it. Big data is a primary concern with the management of computational models that require improvement. Big data and then later the rise of big data analytics which changed the whole perspective of data and data handling. Satisfied growing analytical needs for Big Data with extremely high performance computing models. As a result, a lot of research in this area has been seen in recent years, several paradigms for Big Data Analytics emerge. Simultaneously, the spread of Big Data Analytics in various domains, concerns about the effectiveness of the new analytical paradigm are also being seen. This paper highlights the major analytical models and concerns and challenges in High Performances Computing.

**Keywords:** Big Data, High performance computing, Computational Model

## **Review Analysis of IOT based Solar Energy System**

**Anand Singh<sup>1</sup> and Manish Khemariya<sup>2</sup>**

**Email:** manishk@lnct.ac.in, anand24883singh@gmail.com

**Abstract:** A smart solar photovoltaic system is an advent of innovation coherence of information and communications knowledge with power systems control engineering via the internet. This paper designs and demonstrates a smart solar photovoltaic off grid system that self-healing, ecological and consumer friendly, but also with the ability to put up other renewable sources of energy generation seamlessly, creating healthy spirited energy industry and optimizing energy assets efficiency. This work also discuss the modeling of an competent dynamic smart solar photovoltaic power system by exploring the most power point tracking efficiency, optimization of the smart solar photovoltaic array through modeling and simulation to get better the quality of design for the solar photovoltaic module. Using the Internet of Things Technology for supervise solar photovoltaic power generation can greatly enhance the performance, monitoring and maintenance of the plant. The discussion in this project work is based on implementation of new cost effective methodology based on IOT to remotely monitor a solar photovoltaic plant for performance evaluation. This will facilitate preventive upholding, fault uncovering, historical study of the plant in totaling to real time monitoring.

**Keyword:** Solar, IOT, Power System, Optimization

## Glaucoma diagnosis using discrete wavelet transforms and Histogram features from fundus images

Nandini Kokate<sup>1</sup>, K.G. Kirar<sup>2</sup> and M.L. Jatav<sup>3</sup>

SATI, Vidisha (MP) India

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

Email: kokate@gmail.com

**Abstract:** Glaucoma is one of the main eye diseases; it causes progressive deterioration of optic nerve fibres due to increased fluid pressure. The existing methods of glaucoma diagnosis are time consuming, expensive and require practiced clinicians to understand the eye problems. Hence fast, cheap and more accurate glaucoma diagnosis methods are needed. This paper presents an innovative idea for diagnosis of glaucoma using third level two dimensional discrete wavelet transform (2D DWT) and histogram features from fundus images. The 2D DWT is used to decompose the glaucoma and healthy images and histogram features are extracted from 2D DWT decomposed sub band images. The least square support vector machine (LS-SVM) is used as a classifier which classifies the glaucoma and healthy images using the extracted features.

**Keywords:** Glaucoma; 2DWT; LS-SVM.

## Some fixed point theorems for generalized Kannan type mappings in b-metric spaces

Motiram Likhitkar<sup>1</sup>, R. D. Daheriya<sup>2</sup>, and Manoj Ughade<sup>1</sup>

<sup>1,2,3</sup>Government J.H. Post Graduate College, Betul (M.P) - India

Email: jagdish\_pet@yahoo.co.in

**Abstract:** In this paper, we prove some fixed point theorems in b-metric spaces using subadditive altering distance function. Some of these results generalize many existing fixed point theorems for Kannan type mappings. The results are justified with suitable examples.

## Strong convergence of a general algorithm for nonexpansive mappings in Banach spaces

R. D. Daheriya<sup>1</sup>, Umesh Dongre<sup>2</sup> and Manoj Ughade<sup>3</sup>

<sup>1</sup>Government J.H. Post Graduate College, Betul, India

<sup>2</sup>Dr. B. R. A. Government College, Amla, India

Email: udhelpyou@gmail.com

**Abstract:** In this work, we consider a general algorithm for a countable family of non expansive mappings in Banach spaces. We proved that the proposed algorithm converges strongly to a common fixed point of a countable family of non expansive mappings which solves uniquely the corresponding variational inequality. It is worth pointing out that our proofs contain some new techniques. Our results improve and extend the corresponding ones announced by many others.

## Speech Recognition Application without Internet Connection

Aakarsh Singh Bais<sup>1</sup>, Meetoo Singh<sup>2</sup> Shreya Singh<sup>3</sup>

Lakshmi Narain College of Technology, Bhopal (M.P.) - India

Email: singhshreya2511@gmail.com, meetoos@lnct.ac.in

**Abstract:** Artificial Intelligence, in all its forms is trying to make life simpler for humans, by utilizing the thinking power of man in creating machines which can think and do work for man. It is an area of computer science which focuses on developing intelligent, decision making machines which work and react like humans. There are millions of applications of Artificial Intelligence, one of them being: Speech Recognition. It is an area which enables translation of man-spoken words into machine readable format. Consequently, the machine understands the language, processes the words and responds depending upon the decision made by it. In this digital era, everyone knows how to use Google Assistant. Siri and Cortana have made everything easy for us. But still, these speech recognition softwares cannot work without proper internet connectivity. The research paper is entitled to demonstrate a solution to make use of artificial intelligence without internet. The main idea is to use integrated circuits as a medium to store the data required for processing of decisions. Also, computer's cache can be used to store frequently asked questions so as to deliver the solutions at a faster rate. This would make use of artificial intelligence in setting up of smart alarm clocks, in handling of event management, redirect users while travelling through frequent routes without using GPS system. This strategy would help make the speech recognition software a standalone application, and would provide reliability and faster response time as well.

**Keywords:** Artificial Intelligence, Speech Recognition, Response Time, Reliability

## AI based chatbot with the help of Image processing for Medical Assistance

Anmol Saxena<sup>1</sup>, Ajeyata Verma<sup>2</sup> and Anukul Kumar<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P.) - India

Email: vermajeyata05@gmail.com

**Abstract:** The aim of this paper is to present the idea of a chatbot which would give medical assistance to the patient at their home. It would also make use of image sensing to process image given by user and detect the disease. It would also be having a feature for emergency service. The chatbot would be user friendly and would communicate with user in natural language. The chatbot will be providing immediate home remedies which the patient could use at home to get quick and effective results.

**Keywords:** Chatbot, Artificial Intelligence, Image Processing, Dialog Flow

---

## A.I based Chat Bots for Providing Health Related Information

Deepanshu Singh<sup>1</sup>, Aashutosh Gujrati<sup>2</sup> and Arundhati Dube<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P.)-India

Email: thakurdeep077@gmail.com, aashutoshgujrati09@gmail.com

arundhati.dube617@gmail.com

**Abstract:** Chat bots in health care have the potential to provide patients with access to immediate medical information. Health Care chat bots could help patients better manage their own health, improve access and timelines to care. This can be done by using a conversational chatbot which will ask for various symptoms of a disease and will try to find out the type of disease along with it's home remedy using machine learning. It will also provide the details of the nearest hospital in case of an emergency.

**Keywords:** Chatbots, Machine learning, Dialogflow, Human-computer interaction.

## A Novel Technique to Early Detection and Avoidance of Congestion in MANET

Bhawana Pillai<sup>1</sup>, Deepak Singh Tomar<sup>2</sup> and Ashish Khare<sup>3</sup>

Lakshmi Narain College of Technology & Science, Bhopal (M.P.) - India

Email: bhawanapillai@gmail.com, tomar\_deepak01@yahoo.in, prof.khare@gmail.com

**Abstract:** MANETs have different features that make congestion management more difficult. This paper examines a similar approach to congestion solving situations and minimizing loss of packets in wireless networks. The method of using the concept of trust aware with Queue status for bandwidth aware routing is introduced. We used NS2 simulator and we have demonstrated our approach improves system performance and reduces the number of packets deposited on the network, so improving system performance.

**Keywords:** MANET's, Congestion control, Packet loss, Congestion controlling techniques.

## A Security Issues and Approaches in Cloud Computing

Virendra Kumar Tiwari<sup>1</sup>, Vishwa Gupta<sup>2</sup> and Pankaj Deoskar<sup>3</sup>

Lakshmi Narain College of Technology- MCA, Bhopal (M.P) - India

Email: virugama@gmail.com, vishwa.gupta80@gmail.com, pankaj\_78600@yahoo.com

**Abstract:** This paper discusses the data security in computing of cloud and also focuses on the study of information in the cloud and all aspects that are related to concerning security. It also discusses the probable fear of data security in the cloud environment and their solutions adopted by an assortment of service providers to defend security of data. Research paper will depart into details of defense for data rules with approaches used to ensure maximum fortification of data by decreasing risks as well as threats. Data availability in the cloud is advantageous for numerous applications. For the more perspective, research focus on confidentiality of data perpetuation which becomes more complex with flexible data sharing among a vibrant user group. It requires the concealment of outsourced data and a competent sharing of decryption keys between different certified users. For this reason a variety of methods are offered some of them focus on the use of attribute based cryptography ABC with AES.

**Keywords:** Data Security, Cryptography, Public key, Data Protection, Privacy, Risks and threats

## Common Fixed Point Theorem for Multivalued Generalized Fuzzy Mapping in b-metric space

Umashankar Singh<sup>1</sup> and Naval Singh<sup>2</sup>

<sup>1</sup>Sagar Institute of Research & Technology Excellence, Bhopal, India

<sup>2</sup>Govt. Science and Commerce PG College Benazeer, Bhopal, India

Email: umashankar\_singh1977@rediffmail

**Abstract:** In this paper, we are proving  $\alpha$ -fuzzy fixed point and common  $\alpha$ -fuzzy fixed point theorems for Multi-valued fuzzy mapping in complete b-metric space. Our result extends and generalizes the result of A. Shahzad with new rational expression.

**Keywords:** Multi-valued Mapping, b-metric space, fixed point, Common fixed point.

## Optimal solution method for Transportation problems of multiple variables

Aarti Borasi<sup>1</sup> and Brajendra Tiwari<sup>2</sup>

Govt. J.N.S., P.G, College, Shujalpur (M.P)- India

RKDF University, Bhopal (M.P)-India

Email: aarti237@gmail.com

**Abstract:** Transportation problem is considered a vitally important aspect that has been studied in a wide range of operation including research domain. As such it has been used in simulation of several real life problems. The transportation problem is a special class of model. It deals with the situation in which a commodity from several sources is shipped to different destinations with the main objective to minimize the total shipping cost .optimizing transportation problem of variable has remarkably been significant to various disciplines .It this paper , multiple variable will be optimized to reduce from-transportation cost using multiple method which will include. Northwest corners method, least cost method, Vogel method and mode method. This will mainly aim at finding the best and cheapest route on how supply will be used to satisfy demand at specific points,

**Keyword:** Optimization techniques, transportation problem, northwest corner, least cost, Vogel, model.

## Reliability of System with Two Repair Facilities

Anil Singh and Sanjay Chaudhary

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: anil291singh@gmail.com

**Abstract:** The aim of this paper is to present a reliability analysis of two unit cold standby system with repair facilities. The system consists of two units with each one with operable or failed state. At any time, one unit is operating while other is in cold standby. The failure has been divided into two parts major and minor. Minor failure requires minor repair facility and major repair requires major repair facility. Thus there are two repair facilities available. System has perfect switching for units .The system completely fails on the failure of both the units. The failure and repair times follow exponential and general time distribution. Partial Differential Equations and Laplace Transforms of various state probabilities have been obtained. Reliability of the system has been derived in the form state probabilities.

**Keywords:** cold standby system, major and minor repair facilities.

## Modelling of the Risk of Cancellation of Policies using Fuzzy Logic Approach

Gaurav Sharma<sup>1</sup> and Sanjeev Kumar

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: garv13sharma@gmail.com, sanjeevibs@yahoo.co.in

**Abstract:** The preventive avoidance of cancellation is a key problem facing insurance companies. A conversation with the client held prior to latter's decision to cancel a contract increases the likelihood of contract continuity. So companies are in need of reliable expert system that can help them to evaluate the risk of cancellation of the policies in future. With the help of fuzzy system it is possible to identify clients who may potentially cancel and take timely measure to safeguard the portfolio. Here a model is presented, which is designed by using fuzzy mathematics and expert system to provide indicative results on the risk of cancellation of the policies in future.

**Keywords:** Fuzzy logic, Insurance, Risk classification, Inference system, MATLAB, Index of vagueness.

## Availability Evaluation of 1-Unit System with 2-Warm Standbys

Kanta and Sanjay Chaudhary

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: singhkanta80@gmail.com

**Abstract:** This paper extracts the availability of a warm standby system with reboot delay and switching failures. The system is studied under the assumption that the time-to-failure and the time to repair of the primary and standby units are exponentially and generally distributed, respectively. There is a possibility of failures during the switching from standby state to primary state. Reboot delay happens in this switching procedure of a standby unit to primary unit. The reboot time is assumed to be exponentially distributed. It is assumed that there is a significant probability of a switching failure. Primary and warm standby units can be considered to be repairable. Using the supplementary variable technique we develop the explicit expressions for the steady state availability.

## Investigation about Stock Market Timing using Fuzzy Inference System

Manisha Dubey and SanjeevKumar

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: mdmanidubey@gmail.com

**Abstract:** To determine the buy and sell time is one of the most important issue for investors in the stock market. Stock investment has become an important investment activity and internet makes it easier exchange stock information and to make stock transaction. Trading in the stock market is full of uncertainly so there is vagueness in the market. Predicting the market is very difficult since it depends on several unknown factors. A person cannot observe that what is going to be happening and therefore investors often lose their money due to unclear investment objective. In this work a fuzzy approach to stock market timing is investigated. The proposed fuzzy model helps in identifying the stock market which is very bullish, bullish, neutral or very bearish, bearish. The four input factor are fuzzified to get a output using fuzzy logic, the stock market which is either very bullish, bullish, very bearish, bearish or neutral continues to some extent. For fuzzifying these input data, trapezoidal membership function is used, and center of gravity method is used for defuzzification of fuzzy output. The results found suggest that fuzzy modeling for this purpose is very promising.

**Keywords:** Stock market, fuzzy logic, timing, trapezoidal membership function.

## Fuzzy Logic Concatenation in Biometric Identification Systems

Monika Rathore and Sanjeev Kumar

Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: monikarathore16sep@gmail.com

**Abstract:** Security of information is one of the most important factors of information technology and communication. So systems need strong procedures to protect data and resources access from unauthorized users. There are number of ways to prove authentication and authorization. But the biometric authentication beat all other techniques. Biometric-based authentication systems represent a valid alternative to conventional approaches. As Multimodal biometric identification system is more powerful, more accurate, less noisy data than the Single/Unimodel biometric system. This paper introduce three biometric techniques which are face recognition, fingerprint recognition, and iris recognition (i.e. Multi Biometric System) & aims at concatenating three biometric features namely face, fingerprint and iris to minimize False Accept Rate(FAR) and False Reject Rate(FRR). And shows using these biometrics has good result with high accuracy using fuzzy logic at decision level. In greater detail, fuzzy logic based approach at decision level is used for concatenation. Fuzzy logic is used for the effect of each biometric result combination. The proposed multimodel system achieves interesting results with several commonly used databases.

**Keywords:** Biometric, Multibiometric (face, fingerprint, iris), fuzzy logic.

## Reliability of Three Unit System with Two Type of Repair

Shiva and Sanjay Chaudhary

Institute of Basic Science,

Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

Email: shivaarele@gmail.com

**Abstract:** This paper represents the reliability of a redundant system, which consists of three units with each one operable or failed. The failure can further divided into minor or major. Minor failure can be repaired by minor repair, but a major failure required a major repair. So two repair facilities are considered. The system completely fails on the failure of all units. Three similar units are in the system where one unit works as main and others in cold standby. An imperfect switch is used to on standby unit which takes sometime in switching. Failure rate and repair rate and repair rate are constant. Failure rate and repair rate follow exponential distribution. Differential equation and Laplace transformation are used. Hence reliability is obtained by the sum of the probabilities of all operable states.

## A New Common Fixed Point Theorem for Two Pairs of Mappings Satisfying Implicit Contraction Condition in Triangular Intuitionistic Fuzzy Metric Spaces

Manoj Ughade

Government J.H. Post Graduate College, Betul, (M.P) - India

Email: manojhelpyou@gmail.com

**Abstract:** Our goal of this paper is to prove a new general common fixed point theorem for two pair of mappings under a different set of conditions using the idea of weakly compatible mappings satisfying a general class of contractions defined by an implicit relation in the frame work of triangular intuitionistic fuzzy metric space, which unify, extend and generalize most of the existing relevant common fixed point theorems from the literature. Some related results and illustrative an example to highlight the realized improvements is also furnished.

**Keywords:** Triangular intuitionistic fuzzy metric space; common fixed point; implicit relation; weakly compatible mappings; contractions.

## A Survey on Development of Association Rule Mining Model for Gender Classification Over Fingerprint Database

Meena Tiwari and Ashish Mishra

RKDF, University, Bhopal (M.P.)-India

Lakshmi Narain College of Technology, Bhopal (M.P.)- India

**Email:** ashish.mish2009@gmail.com

**Abstract:** Each person's fingerprint structure is unique and is developed for biometric authentication system than others because fingerprints have advantages such as: feasible, differ from each other (distinct) permanent, accurate, reliable and acceptable all over the world for security and person identity. Fingerprints are considered as legal proof of evidence in courts of law all over the world. Fingerprint recognition for Gender classification method done through various techniques like Support Vector Machines (SVM), Neural Network(NN), Fuzzy- C Means (FCM). Comparatively a small number of machine vision techniques have been suggested for gender recognition and classification so identifying the gender from fingerprints is an important step in forensic anthropology to shorten the list of suspect search. Very few researchers have worked on gender classification using fingerprints and have gained competitive results. This paper presents Gender classification using association rule mining and classification approach. It is also proposed to combines the elaborate study of various methods and strategies with their comparative measures and to forecast results. This will help the researcher to undertake a comprehensive review and to carry out further research in association rule mining model for gender classification over fingerprint.

**Keywords:** Support Vector Machines , Neural Network, Fuzzy- C Means , Gender classification

## Different explicit rules of Combinatorics in ancient India

Nazida Shaikh and V. K. Gupta

School of Studies in Mathematics, Vikram University, Ujjain (M.P.)-India

Director, Ramanujan Research Centre of Mathematics,

Govt. Madhav Science P.G. College, Ujjain (M.P.) - India

**Email:** shaikhnazida@yahoo.in

**Abstract:** The topic 'Combinatorics' deals with counting problems, which are usually associated with selection of some objects from a given collection and their arrangements in a certain situation. The principles and methods of solving different combinatorial problems were well-known to the scholars of ancient India since the Vedic period. But no chronological account of contributions of Indian scholars in the field has been made available so far. In this paper author's mentioned some work of Combinatorics by ancient mathematicians, astronomers, ancient scientist and medical scribe. Author also highlighted various mathematical formulae and different explicit rule given by the ancient Indian mathematician time to time.

## Common Fixed Point Theorems in *Ab*-Metric Space

Neetu Sharma

Govt. P.G. College, Rajgarh, M.P., India

**Email:** neetu.vishu@gmail.com

**Abstract:** In this paper, I prove some Common Fixed Point Theorems satisfying new type of rational inequality in the  $n$ -dimensions *Ab*-Metric Spaces. In this paper, I modify new contractive conditions and give an application to verify the obtained results.

**Keywords:** common fixed point; *Ab*-Metric space; contractive mapping;

**AMS Subject Classification (2010):** Primary 47H10, Secondary 54H25

## Influence of Wind on Urban Atmospheric Boundary Layer characteristics at the Capital Region Delhi

Mamta Devi<sup>1</sup>, Anjali S. Nair<sup>2</sup>, Priyanka Singh<sup>3</sup>, Narender Lamba<sup>4</sup>, Kirti Soni<sup>5</sup>,  
Mahavir Singh<sup>6</sup> and Sangeeta Kapoor<sup>7</sup>

Physico-Mechanical Metrology (PMM) Division, CSIR-National Physical Laboratory,  
New Delhi, India

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** soniks@nplindia.org

**Abstract:** Remote sensing techniques play a significant role in understanding the dispersion behaviour of air pollutants with the study of Atmospheric Boundary Layer (ABL) height and characteristics. The vertical structure of the ABL plays an important role in meteorological and environmental prospect as it impacts the pollutant concentrations near surface and wind velocity. Acoustic Sounder (SODAR) technology employs the use of echograms to study the specific ABL parameters which includes the depth of ABL and its structure. Complex phenomenon associated with Atmospheric Boundary Layer can be better understood with the help of SODAR echograms and it can be better utilized for understanding the entire complex phenomenon happening in lower layer of atmosphere i.e., lower part of troposphere. The present study incorporates the SODAR echograms data for the analysis of the correlation between the parameters influencing the climate and the ABL height. The research also considers the variable structures produced by the SODAR during the month of January 2020. SODAR echograms represent different structures considering the atmospheric fluctuation due to the turbulence. This turbulence is mainly influenced by the wind gradient and wind shear. The sensors installed at the apex of the Acoustic & Vibration Metrology building, CSIR-National Physical Laboratory, New Delhi is taken into account for establishing the correlations between the variables.

**Keywords:** SODAR, Wind, Atmospheric Boundary Layer, Turbulence

## Characteristics Ventilation Coefficient over Delhi during summer

Priyanka Singh<sup>1</sup>, Mamta Devi<sup>2</sup>, Anjali S. Nair<sup>3</sup>, Narender Lamba<sup>4</sup>, Kirti Soni<sup>5</sup>, Mahavir Singh<sup>6</sup>  
and Sangeeta Kapoor<sup>7</sup>

Physico-Mechanical Metrology (PMM) Division, CSIR-National Physical Laboratory,  
New Delhi, India

Lakshmi Narain College of Technology & Science, Bhopal (M.P) - India

**Email:** soniks@nplindia.org

**Abstract:** The diurnal and seasonal variation of ventilation coefficient studied using a Remote sensing technique SODAR (Sound Detection and ranging); it gives real-time continuous ABL (Atmospheric Boundary Layer) height data and attached metrological sensors give metrological parameters data such as wind speed/direction, relative humidity and temperature. The diurnal variability is a dominant feature of the ABL, which plays an important role in the exchanges of heat, momentum, moisture, and chemical constituents between the surface and free atmosphere. The ventilation coefficient is calculated using ABL height and average wind speed. The ventilation coefficient is an atmospheric condition that indicates the air quality and pollution potential. This study is for the period of summer (April to June) 2019 over National capital Delhi and its outskirts. The height of the ABL during the different stages of its diurnal evolution, namely, the Stable Inversion layer, convective boundary layer (CBL), and Nocturnal boundary layer (NBL), are discussed and the effect of convection and wind speed on the ventilation coefficient is also analyzed. In this study, the correlation between the wind speed, temperature and relative humidity with the ventilation coefficient is determined. Diurnal and seasonal variation of ventilation coefficient gives knowledge about the day to day weather phenomena for air quality management. The result shows that the Temperature and wind speed are influencing positively to the ventilation coefficient during the summer seasons and convective boundary layer height grows and falls during the day time depending on the increase and decrease of temperature.

## A study of queuing model with the analysis of payment mode and waiting time in supermarket

Sadhna Singh<sup>1</sup>, R. K. Srivastava<sup>2</sup> and Amendra Singh<sup>3</sup>

<sup>1,2</sup> S.M.S. College, Jiwaji University, Gwalior (M.P.)

<sup>3</sup> Institute of Basic Science, Dr. Bhimrao Ambedkar University, Agra (U.P.)- India

**Email:** sadhna20singh@gmail.com

**Abstract:** This paper deals with digital payments and cash payments in supermarkets. Initially we take two counters for comparison of digital and cash payments. The first counter for digital payments and the second for cash payments, and calculate billing times from both counters. Our aim is to reduce the customers waiting time by increasing the number of servers according to the conditions, both digital and cash payments. The analysis of various parameters of the queuing system, calculate utilization factor, service rate, arrival rate, calculate idle bill payment counter, customer satisfaction rates, and waiting time. After analyzing the parameters of the queuing system model, it is observed that digital payments save time.

## Diagnosis of ocular diseases by processing OCT images

Shweta Chouksey and Sunil Phulre  
LNCT, University, Bhopal (M.P)-India  
**Email:** sunilp@lnct.ac.in

**Abstract:** Optical Coherence Tomography (OCT) images is a current active area in medical image analysis to assist ophthalmologist in the early diagnosis of ocular diseases such as blindness due to diabetes. Machine Learning and Deep Learning algorithms are used to predict the disease occurrence using image dataset. The proposed work is integration of collection of OCT image dataset(online and offline), feature extraction and preprocessing of dataset, implementation of image processing and linear prediction model using python for data science. Feature-based HOG-LSVM is applied for the features like inner limiting membrane, Bruch's Membrane, retinal pigmented epithelium, geographic atrophy. The results will be demonstrated for the performance measures precision, recall, accuracy, AUC, average correlation coefficient, Cohen's kappa ( $\kappa$ ),and distance-based disagreement (DbD) factors.

## **A Theoretical study on Buyers Preference in Purchasing the Attires of Universal Brands**

**Dr. Deepak Bhandari<sup>1</sup>, Dr. Javalkar Dinesh Kumar<sup>2</sup>, Dr. Savita Yadav<sup>3</sup>**

Professor <sup>1</sup>, Assistant Professor<sup>2, 3</sup>

Lingaya's Vidyapeeth (Deemed to be University), Faridabad, Haryana.

### **ABSTRACT:**

Apparel, being a more brand-driven category than, food & groceries, has already seen many international brand apparel retail outlets enter India over the past 15 years despite the restrictions in the FDI policy in retail sector. A lot of international brand Apparel retailers are most likely to look at India, as global markets have stabilized and the Indian economy has proved to be better than most other countries. This study was conducted to find out the factors that determine the shopper's inclinations for international apparel brand. The purpose is also to identify the predictors for internal brand apparels among consumers. From the study it was found that consumers are brand conscious now a days. To look more stylish they prefer branded apparels and branded apparels also depict the status of a person. Due to more durability, variety and quality and people prefer branded apparels. The study found out that price and media influence are strongest predictor for the consumer preference followed by quality and Land of original and style has less prediction towards the consumer preference. Overall, the survey shows that shoppers have positive attitude towards international apparel brands.

### **INTRODUCTION**

Globalization is vital sensation that is gaining attention worldwide, and lead the world to become a one combined market, an international market. In the era of pre-liberalization, consumers of India were acknowledged to have high preference towards foreign brands and imported goods. Though, after the decade of liberalization, Indian market, is highly served by the brands, which have their origin from the foreign countries. With the increased in popularity of international brands, market become a part of attractiveness and high competition. "Tastes and preferences of the consumers are the main base of fashion, to develop the brand popularity".

India has developed as third attractive market for apparel industry throughout the world. India is the nation which have different cultures and customs, and for each culture and customs they have

different dressing style. It has variation of dressing from “salwar-kameez to sari and from lungi to dhoti”. Indian market is increasing day by day through the branded garments. According to the past survey by various researcher, it has been noted that, in last ten years India is source of attraction for American and European brands because of high demands of apparel in India. And due to the preference over the brands by customers it becomes necessary of the companies to develop brand management so that they can gain competitive advantage worldwide. Brand management gain importance due to continuous change in the international market at global level, and due to the competition among the various international firms. Proper management of brands makes a clear differentiation among the products and give a proper information about the loyalty and preferences of consumers, which ultimately lead to increase the market share of the organization.

## **Brands**

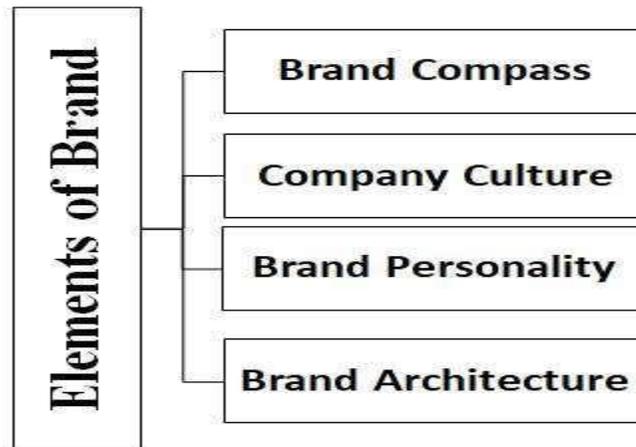

Brands is not a new concept to marketing. Earlier the concept of brand, firstly used by “Egyptian Brick-makers” who use symbols and signs on the bricks to make their product identical (Farquhar et. Al., 1990).

Branding is practice of marketing, which created by company as a “name, design or symbol” that is used by the consumer to identify the product and make the product different from the other products and services. Branding is vital for company because it makes a memorable impact on consumer’s mind as well as it allow consumers and clients to know what to be expect from the company. Brand should be a word, symbol or sign which represent a picture of your company.

Marty Neumeier defined brands as “*a brand is person’s gut feeling about a product, services or organization*”.

Fried lien defined Brand as “*Brand is the sum total of how someone perceives a particular organization*”.

## Element of Brands

- **Brand Compass:-**Brand Compass refers to abstract of the supreme fundamental facts about your brand. Brand compass leads to the directions, why branded is headed. Brand compass is outcome which company get through the work done in the stage of brand strategy plus in the stage of research and positioning. It contains five parts “purpose, vision, mission, values and strategic objectives”.
- **Company Culture:** - Company culture is inner self of motives, purpose and stimulus that drives brand of your company. If company have strong culture, it will create core value to brand, which defines how your product is engaged with the world by the name of your brand.
- **Brand Personality:** - Brand personality involves the individualist’s traits of brands. Brand personality of product is the reason that reveals the rational and loyal customers and build a cordial relationship between the customer and company.
- **Brand Architecture:** - Brand architecture is a combination of “name, color, symbol and visual language” that make brand identifiable. Brand architectures are highly purposeful and creative, founded by researchers through customers experiences. “Brand architecture systems are commonly categorized as either monolithic, endorsed, or pluralistic”. Monolithic brand architectures’ includes a single major brand and various sub brands. Endorsed and pluralistic includes parent brands which have different-different relationship with other divisions.

## Preference towards the Branded Apparels in India

In today's trend of fashion, people are switching on branded apparels form the non-branded ones. Brands are getting awareness throughout the world. There are various factors that are crating demand of branded apparel like "increase in the income of consumer, increase in literacy level among consumers, globalization, increase in purchasing power and consumer consciousness towards fashion".

Promotion and media is the main reason behind the increasing brand awareness among youth. This is the new era in which people are more aware about the brand and want to buy apparels which are related to reputed brands. People are becoming more brand conscious and it is new fashion trend which is gaining more attention now a days. People consider brand value as quality, price and style. Youths are preferring branded clothes due to the comfort level of clothing stuff and they also believes that branded clothes are recognized as a symbol of status.

International brands of apparels also capturing the attraction of people of India. Market of India is attracting various niche foreign retailers. Many International brands of apparels has been set up their stores and shops in India by using the franchisee route. Many International Brands of apparels are available in India which are as follows:-

➤ Lacoste	➤ Crocodile
➤ Benneton	➤ Reebok
➤ Dockers	➤ Lee
➤ Levi Strauss	➤ Zara
➤ Versace	➤ Mother Care
➤ DKNY	➤ Debenhams
➤ Wrangler	➤ Nike
➤ Mango	➤ Esprit
➤ Marks and Spencer	➤ Tommy Hilfiger
➤ Peter England	➤ Arrow

## Consumer Buying Preference

The most difficult issue for the manufactures of clothing is to identify the consumer's needs. Identification of need is not valuable until it is not transformed in to product and service. Before developing any product and service specially related to garments it is required to understand the full make up mind of consumers, it is known as the consumer behaviour.

Sproule's& Kendall (1980), defined consumer decision making as "a mental orientation characterizing a consumer's approach to making choices". They identify eight dimension, on which decision of consumer has depend whether to buy or not to buy apparels of particulars brands. These dimension are ass follows:-

- Quality Conscious
- Brand Trustworthiness
- Style Conscious
- Price Conscious
- Product Conscious
- Spontaneous and Careless Tendencies
- Jumbled by over varieties
- Amusing and pleasure-seeking orientation

## LITERATURE REVIEW

Stanforth (2009), states that shopper perceptions about the international brand fashion apparel are based on various factors, like "perceptual leadership and perceive role model in the society, matching attire status to employment and workplace ambience, socialization with peers and people they like, self-esteem and fun, and respectful treatment in the society (Stanforth, 2009).

Janson and Power (2010), found that fashion and latest design offers by global brands of apparels are the main actors which help in creating the good brand image and provides various myths that clear the consumers orientation to buy fashion apparels of global brands.

Tee, Gharleghi& Chan (2013), conducted a study, main purpose of this research to identify the factors which predict the preferences of buyer for choosing the foreign fashion brands. Result of study revealed that origin of a country, is a factor that play a vital role in making the buying

choice to buy branded clothes, which are followed by other factors like lifestyle, media influence and quality of the product.

Pandian, Varathani&Keerthivassan (2012), Conducted a study to know the most preferred international brands opted by Indian. Study reveals that “John player, Peter England and Raymond” are top most favorite brand which are preferred by the consumers of India, who are more brand conscious. It was found in the study that shopper decision about the brands mostly the man shoppers, has influenced by choice of color, design & style, price series, celebrity endorsers and stability.

Laskar& Abbas (2014), tried to find out the source of awareness among consumers about the brands of apparels and to know the level of awareness of brands among the buyers. It is found that the main source of awareness is advertisement and attentive mind of buyers towards the trend and market increases the level of awareness. International brands of clothing industry need to be invest huge amount of money on advertising to capture the attention of consumers.

## **OBJECTIVES OF THE STUDY**

1. To identify shopper inclinations in buying apparels of international brands.
2. To find out the elements that influences the purchasing choice of shoppers for the apparels of international brands.
3. To check whether Brand image affects the purchase intention of shoppers.

## **DISCUSSION/ ANALYSIS**

- It is found in the study that the majority of people go for the brands occasionally not always. People like to buy the branded apparels, it shows the likelihood of respondents towards the branded apparels and indicates that people are becoming brand conscious.
- Majority of shoppers have a medium level of priority towards the international branded apparels.
- Shoppers give importance to international brands of apparel, when the brands make them feel good it influences their buying decision.

- According to the respondents, the topmost factor that influences their preference is price after that media influence affect their decision. Media influences include advertisement, promotion and celebrity endorsement. Media influence and festival offers to carry equally according to the respondents. Whereas after the media and festival offer the next factor that affect the buying decision is the loyalty of the brand follows by the festival offers and quality of customer service. It shows that price is on the top most important factor for the shopper which influences their decision to go for the apparels of an international brand.
- It is found that attractiveness of logo is not so much important for the shoppers while taking the buying decision regarding the apparels.
- Majority of people among the respondents are agreeing the international brands are fashion focused which motives the shoppers to buy the apparels of the international brand.
- Consumers are agreed on the fact that variation in fashion in style provided by international brands in apparels and consider an important element of global brands covered by the apparel industry.
- Majority of people among the respondents are neutral on this element, that the international brands provide more comfortable apparels.
- It is found in the study that international brands of apparels have high impact on the mind of shopper, they wants to buy the apparels of international brands.

## RECOMMENDATIONS

- Consumers are becoming brand conscious. They prefer to buy the apparels on the origin of brand image and distinctiveness of the brands. So apparels manufacturer of the international brand can increase their profits and attract more consumers by providing the uniqueness in their apparels.
- Buyers get more influenced by price and loyalty factors, so companies may increase their sale by offering the apparels at low cost, this will also create loyalty among the consumers. Price can be reduced by reducing the tax prices so that consumers can afford easily the apparels of international brands.

- International brands of apparels can focus more media influence and promotional activities, it will lead to gain fame as well as attract more consumers.

## CONCLUSION

Consumer buying inclination has gained significant attention from the researchers. But, while reviewing the literature of shoppers' inclination towards the international brands of apparel, few studies have been found. The present study was conducted to identify the factor that affects the inclinations of customers while going for the apparels of international brands. Preference of consumers can be changed by the cultural effects also. Shoppers prefer international brands because they think that it relates to prestige and consider it as a symbol of status. From the analysis, it is found that store image, quality of product and customer services also reveals the inclination of shoppers. Study indicates that consumers are becoming more brand conscious and their decision was affected by the services given by the international marketers of apparels like style, location, store attribute, brand name, fashion and quality of stuff. The manufactures of the International brand must focus on all these factors to gain profit and to attract more consumers. If consumers have a high preference towards the international brands of apparels then, there will be higher the chances to go for the international brands.

# Design and Analysis of IOT based pollution control system

**Ghanraj<sup>1</sup>, Dr. Javalkar Dinesh Kumar<sup>2</sup>, Alok Singh Kushwaha<sup>3</sup>**

School of Electrical and Electronics Engineering,

Lingaya's Vidyapeeth, Nacholi, Faridabad, Haryana.

## ABSTRACT:

Air pollution affects our day to day activities and quality of life. It poses a threat to the ecosystem and the quality of life on the planet. The dire need to monitor air quality is very glaring, owing to increased industrial activities over the past years. People need to know the extent to which their activities affect air quality. This project proposes an air pollution monitoring system. The system was developed using the Arduino microcontroller. The air pollution monitoring system was designed to monitor and analyse air quality in real-time and log data to a remote server, keeping the data updated over the internet. Air quality measurements were taken based on the Parts per Million (PPM) metrics and analysed using Microsoft Excel. The air quality measurements taken by the designed system was accurate. The result was displayed on the designed hardware's display interface and could be accessed via the cloud on any smart mobile device.

**Keywords:** Internet of Things, Pollution, Air, Parts per Million, Quality and Metrics.

## INTRODUCTION:

Air is one of the essential elements of man's surroundings. The earth's atmosphere is full of air which contains gases such as Nitrogen, Oxygen, Carbon Monoxide and traces of some rare elements. Humans need an atmosphere of air that is free from contaminants. This is very crucial for human life and health. Any change in the natural composition of air may cause grave harm to life forms on earth. Air pollution is the presence of one or more contaminants in the atmosphere such as gases in a quantity that can harm humans, animals and plant. Air pollutants are measured in Parts per Million (ppm) or ug/m<sup>3</sup>. Primary pollutants are released directly into the atmosphere. Secondary pollutants are produced when the primary pollutant reacts with other atmospheric chemicals. Air quality affects public health. The effect of air pollution ranges from difficulty in breathing, coughing, aggravation of asthma and emphysema. Polluted air can also impair visibility. Air pollution is accountable for the death of 7 million persons worldwide each year or one in eight premature deaths yearly. Almost 570,000 children under the age of five die every year from respiratory infection linked to indoor/outdoor pollution and second-hand smoke. Children exposed to air pollution have an elevated risk of developing chronic respiratory problems such as asthma. In the monitoring of air pollution, several researchers worldwide have developed models to monitor many of the pollution gases such as Sulphur Dioxide (SO<sub>2</sub>), Carbon Monoxide (CO), Carbon Dioxide (CO<sub>2</sub>), Nitrogen Oxides (NO) etc. This paper focuses on the design and implementation of a smart air pollutant monitoring system. It discusses how the level of pollutants in the air can be monitored using a gas sensor, Arduino microcontroller and a Wi-Fi module. The main objective of this paper is to design a smart air pollution monitoring system that can monitor, analyse and log data about air quality to a remote server and keep the data up to date over the internet.

## RELATED WORKS:

A wireless distributed mobile air pollution monitoring nodes system using General Packet Radio Service (GPRS) and IOT sensors was reported in. Advancements in wireless communication and sensor technology is rapidly changing air pollution monitoring paradigm. Internet of things (IoT) also allows the creation of smart environments in which objects interact and cooperate with each other.

The lot of improvements have been made to existing air pollution monitoring systems. For example, proposed a system for monitoring air quality at home. The system transmits combination of address and data centric protocols. The system monitors the indoor air quality of a home and displays the sensor reading on a screen. The researchers in employed an Unmanned Aerial Vehicle (UAV) based system to monitor the air pollution in areas with poor accessibility. The system was equipped with a Pixhawk autopilot for UAV control and a Raspberry Pi for sensing and collating air pollution data. An adaptive algorithm was used to analyse the gathered pollution data. A participatory sensor system for monitoring air

pollution in Sydney was proposed by scientists in. In the proposed system, sensors were mounted on vehicles and a mobile application was used to upload data to a centralized repository. The system gave information to the user about their private vulnerability to pollution in the air. Recursive Converging Quartiles (RCQ) algorithm was utilized in to improve the efficiency of wireless air pollution monitoring system. Recursive Converging Quartiles (RCQ) algorithm aggregates and eliminates data duplicates by removing invalid readings. This saves energy. The system consisted of sensor nodes and wireless communication links to a server. The sensor nodes collated data automatically and passed it on through the network to the server. The sensor nodes automatically forwarded data measured to the server the moment they received instruction from the system to do so. The k-means clustering algorithm for analysing air pollution was proposed by the authors in. A comparative study was made between the proposed k-means algorithm and the probabilistic fuzzy c-means (PFCM) clustering algorithm in terms of exactness and process period.

The authors submitted that the proposed K-means clustering algorithm yielded exact values within a fewer process period in comparison to other existing techniques. The authors in proposed a model that showed the concentration of air pollutants in real-time. An optimal Wireless Sensor Network (WSN) was proposed in for monitoring the level of contaminants in the air. The system was enhanced by utilizing a flow concept that gave a combined formulation of coverage and connectivity. The probabilistic sensors taken into constraints to be formulated to ensure that the network remained conservative. A sensor-based system to monitor the air pollution in employed the use of Internet of Things (IoT) to enable data about air pollutants to be monitored online. When the pollutants' level in a locality exceeded the standard air quality index, the sensor-based system shared the information via SMS with the public. An ambient real-time air quality monitoring system that consisted of numerous distributed monitoring stations that were connected wirelessly to a backend server using machine-to-machine communication was explained in. The backend server assembled real-time data from the stations and reproduced them as information that can be delivered to users through web portals and mobile applications. However, cooperative, distributed, and energy-efficient communication protocols are required. Geographical search on social networks was used by the researchers in to gauge the level of pollutants in the air. The assumptions made were evaluated on three continents of the planet. A minimum increment in the number of air pollution related posts meant a rise in air pollution in that environment. Measured data was acquired online while processing and statistical analysis was performed offline. The use of Supervisory Control and Data Acquisition (SCADA) for air pollution monitoring was proposed in. It enabled the acquisition and statistical processing of measured data in real time. The smart SCADA made results available to users instantly. An air pollution and noise monitoring system that was IoT based was proposed by . Raspberry Pi was used to detect the noise and the level of air pollution in the environment. IoT based on metamorphic changes with a sensing device was proposed by . The system consisted of a Raspberry PI module and sensors connected to a computer system to monitor the fluctuation of two or three parameters of Carbon Monoxide (CO) and other gases from the normal level. The results showed that real-time air pollution

the parameters considered are not sufficient to give an accurate prediction of air pollution over a long time. The researchers in also designed an IoT based air pollution monitoring system over a web server that triggered an alarm whenever the air quality drops below the threshold. The model was able to show the air quality in parts per million on a Liquid Crystal Display (LCD) screen as well as on a webpage to achieve real-time monitoring. In, an IoT based air pollution technique using Single Board Computers (SBC) which integrates IoT with wireless sensor network (WSN). Processing complexity was reduced with the use of SBC and this made the alerting process smart and in real-time. Results showed that the proposed system offered a low-cost implementation that was very flexible and scalable. However, the model does not have a wide coverage area. Arduino microcontroller based on IoT technology to monitor air pollution was used in. The MQ135 gas sensor was used to sense different type of dangerous gases and the Arduino microcontroller controls the entire process. Software technologies like image processing and machine learning were used in to monitor some parameters and big data techniques was used to analyse sensor values for the prediction of future values. The system was very stable and effective. However, there was a need to make the system auto communicative to reduce processing time. The system can also be automated for real-time monitoring which will help to increase industrial output. A real-time air pollution monitoring system in employed IoT based on a large number of sensors. The obtained data was analyzed using neural network. The system achieved a better monitoring accuracy due to its use of a large number of sensors. The use of IoT devices enabled the air pollution monitoring system to be smart and scalable.

## METHODOLOGY

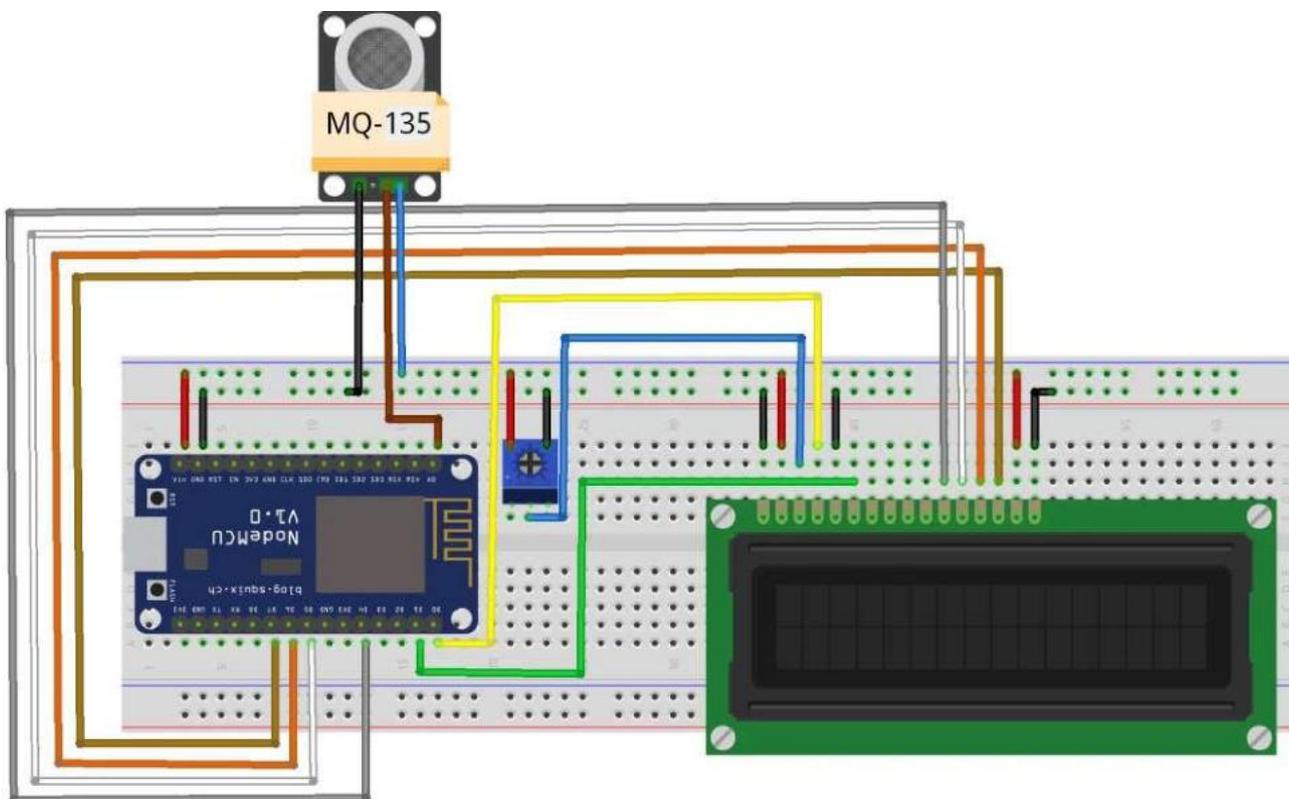

The model was designed using an Arduino Uno microcontroller, Wi-Fi module 8266, MQ135 Gas Sensor and a 16 by 2 liquid crystal display (LCD) Screen. Figure 1 shows the proposed system overview and the functional block diagram is depicted in figure 2. The proposed flow chart is presented in figure 3.

The system overview procedure was classified into Five (5) layers as shown in figure 1. The first layer was the environmental parameters which are obtained by measurement. The second layer was the study of the characteristics and features of the sensors. The third layer was the decision making, sensing, measuring, fixing of the threshold value, periodicity of sensitivity, timing and space. The fourth layer was the sensor data acquisition. The fifth layer was the ambient intelligence environment. The sensor collected data when operated by the microcontroller and forwarded it

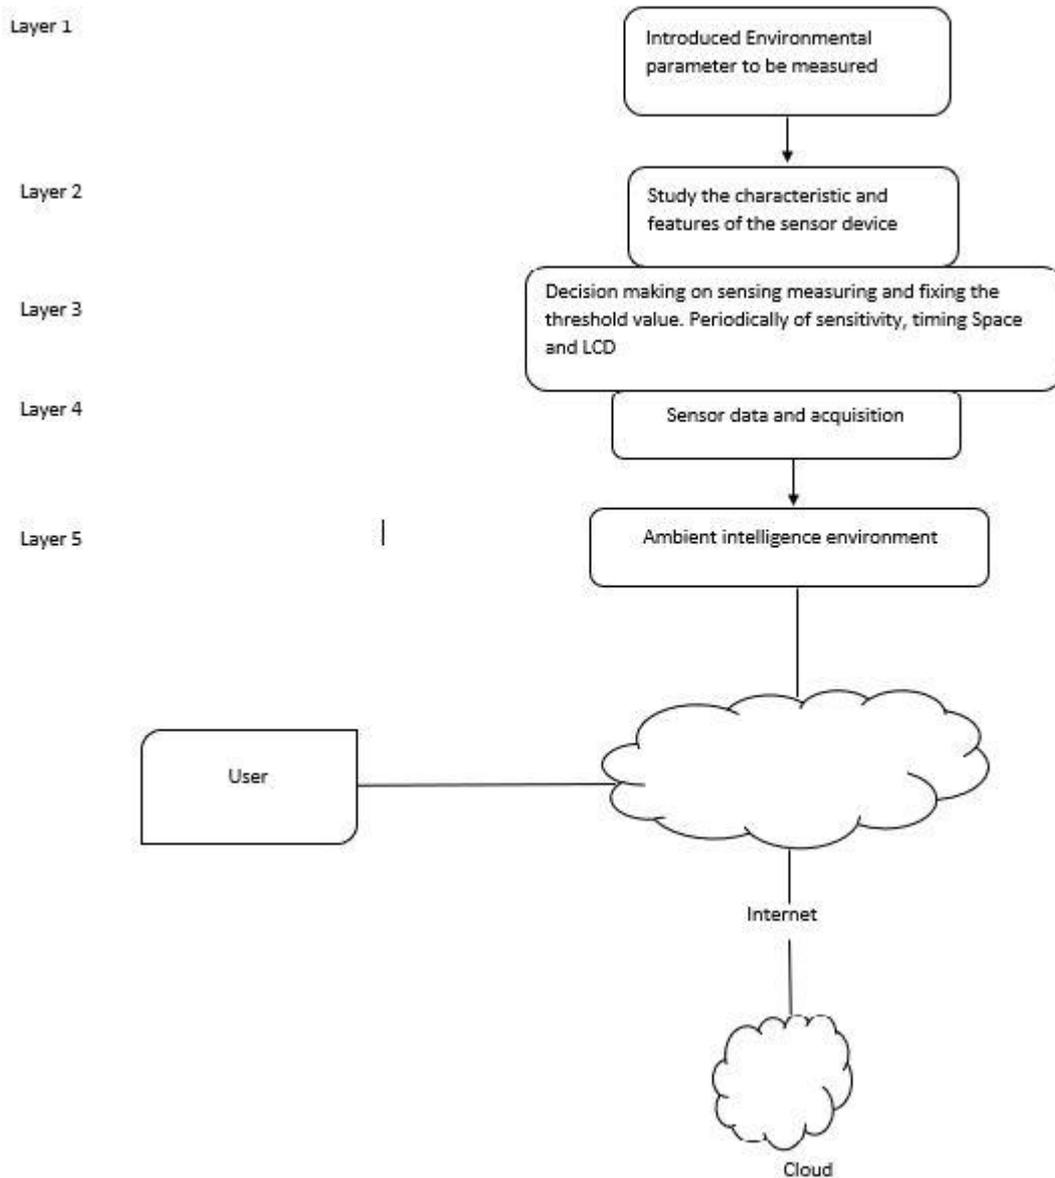

over the internet for analysis via the Wi-Fi module. Users were able to monitor measured parameters on their smartphones. The design specification of the proposed system is described in Table 1.

**Table 1** The Design Specification

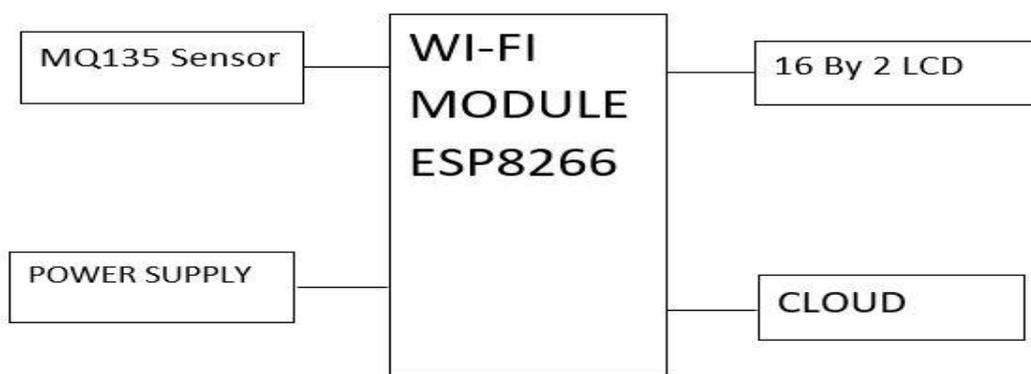

S/N	Component Required	Quantity
1	Arduino Uno	1
2	MQ 135 Sensor	1
3	16 by 2 LCD Screen	1
4	ESP 8266 Wi-Fi Module	1
5	Bread Board	1
6	10K Potentiometer	1
7	1k ohm Resistor	1
8	220 Ohm Resistor	3
9	Connecting Wires	Any Amount

**Figure (i)** Overview of the Projected System

**Figure 1** Overview of the Proposed System

**Figure 2** Block Diagram of the Proposed Air Pollution Measuring System

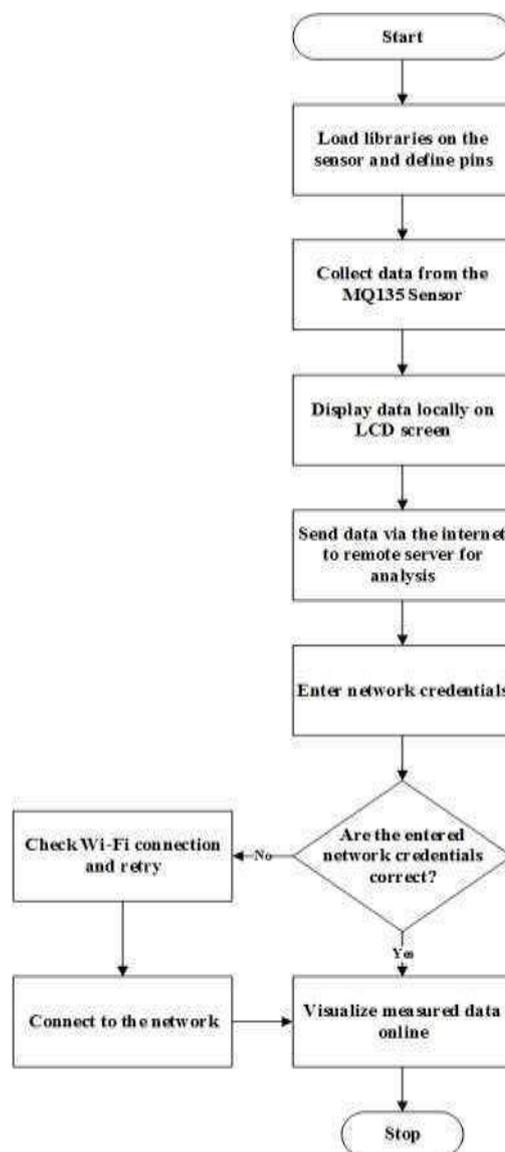

Figure 3 Flow chart of the proposed system

**Mathematical Analysis of Proposed Model**

The level concentration of pollutants in the air is measured in parts per million (ppm) or percentage. Conversion factors include the following:

- 1 ppm = 1.145 mg/m<sup>3</sup>
- 1 mg/m<sup>3</sup> = 0.873 ppm
- 1% = 1/100
- 1 ppm = 1/1000000
- 1 ppm = 0.0001%

Table 2 shows PPM to percentage conversion.

Table 2 PPM to Percentage conversion

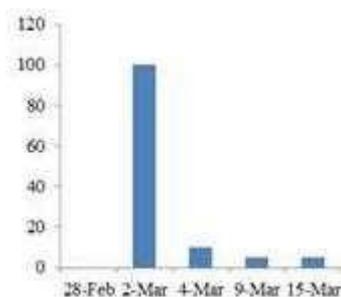

Parts per Million (ppm)	Percent (%)
0	0
5	0.005
50	0.005
500	0.05
1000	0.1

### Working Principle of Proposed Model

As described by Figure 3, the library in the Arduino was loaded and a message was sent to the LCD. Air quality data was collected using the MQ135 sensor. The calibrated sensor made the analog output voltage proportional to the concentration of polluting gases in Parts per Million (ppm). The data is first displayed on the LCD screen and then sent to the Wi-Fi module. The Wi-Fi module transfers the measured data value to the server via internet. The Wi-Fi module is configured to transfer measured data an application on a remote server called “Thing speak”. The online application provides global access to measured data via any device that has internet connection capabilities. Data collected from the sensor was converted into a string and used to update the information sent to the remote server.

### RESULTS AND DISCUSSION

The online application used to analyze air quality data got from sensors in this proposed system was “Thing-speak”. Thing-speak is an open source internet of things application programming interface used to store and retrieve data from interconnected things using the hypertext protocol over the internet or via a local area network. It also provides access to a broad range of embedded devices and web services. This enables the creation of sensor logging applications that can be updated regularly. Figures 5-10 show the results of various pollutants that were obtained.

**Figure 5** Air Quality on Selected Days with an Aerosol as Sample Pollutant

Figure 5 shows that there was a minimal level of pollutant before the sensor started reading the sample aerosol. However, when the sensor detected the aerosol, the air quality dropped rapidly from 0 to 100 ppm. After several readings on different days, it can be seen that there was significant reduction of the sample aerosol level in the air by the 15th of March.

**Figure 6** Air Quality on Selected Days with Dust as Sample Pollutant

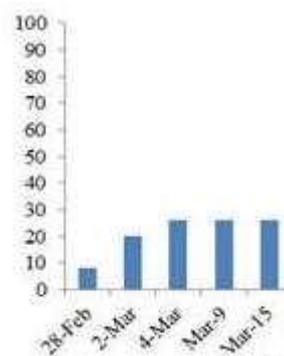

Figure 6 shows that the dust level in the environment was at the minimum on the 28<sup>th</sup> of February but increased gradually with each passing day. On some particular days, there was a

gradual and on other days there were no changes in the quality of the air. The level of the dust measured in the air is dependent on a lot of factors that are beyond the scope of this work.

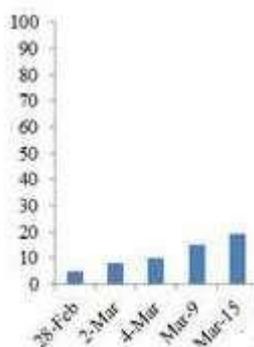

**Figure 7** Air Quality on Selected Days with a Gas as Sample Pollutant

The results from Figure 7 show the air quality level was significantly low in comparison to the previous pollutants used. It can be seen the air quality level dropped rapidly after only a few days of taking measurements. This is so because gases are high level air pollutants.

**Figure 8** Air Quality on Selected Days with Smoke as Sample Pollutant

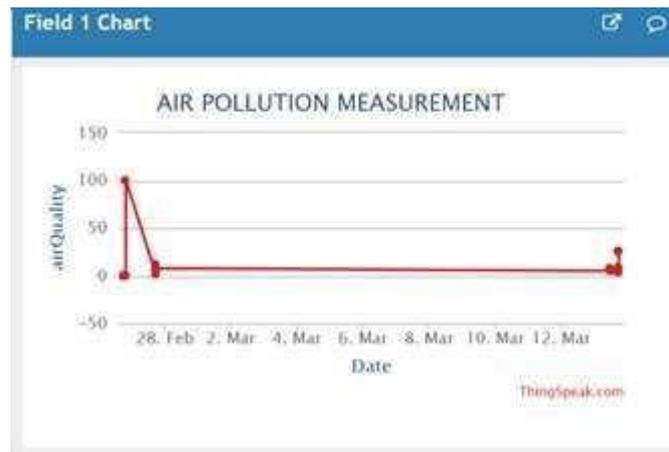

Figure 8 shows that the air quality decreased gradually from 8 ppm to about 70 ppm depending on the level of concentration smoke in the air.

**Figure 9** Air Quality on Selected Days with Biogas as Sample Pollutant

“Thing-speak” was configured to receive data from a remote system. The data was analyzed and published in the form of a scatter line graphs or bar charts on a channel. The channel corresponds to the air quality level as shown in Figure 10. The channel receives update every

time from the remote sensor via the internet and represents the data received as a scatter line graph online.

**Figure 10** Air quality measurement as seen online

The visual representation of data on “thing-speak” corresponded with the measured air quality. The rate at which data displayed on “Thing-speak” changes was dependent on the network traffic and speed of internet connection. The status of the air quality can be accessed at any time, with automatic updates occurring at defined time intervals.

## CONCLUSION

This research proposed a smart air pollution monitoring system that constantly keeps track of air quality in an area and displays the air quality measured on an LCD screen. It also sends data measured to the “Thing speak” platform. The system helps to create awareness of the quality of air that one breathes daily. This monitoring device can deliver real-time measurements of air quality.

### ABSTRACT:

A fuel gauge is disclosed herein characterized in having multiple modes for determining the quantity of fuel in a fuel tank. This gauge is characterized in having purely mechanical as well as electronic modes of visualization. A buoyant member is included for floating on the top surface of fuel in the fuel tank. The buoyant member is connected to a drive link having an arm the length of which is selected suitable to the depth of the fuel tank. The drive link is pivoted on to base of the main housing, which is below the tank's top surface yet therein ensuring that the resistive element remains above level of the fuel held inside the fuel tank. Motion of the drive link is converted into a mechanical reading via a wiper and scale combination, and in parallel, to an electronic reading via potential free output to an external display based on a special resistor design.

**Keywords:** A flange ; A housing and a top cover, a drive link connected to rotating member through pivot, A buoyant member, Mechanical visual indicative output, Resistive output, Potential – free output.

### Desired Goal:

To provide a Mechanical visual level Indication/ dial gauge which does not require an external power or any other instrument.

### The solution according to this Product:

Providing a fuel measuring device with multimode/multifunction gadget, having a mechanism which ensures that the fuel level sensor element, the resistive element, is placed in such a way that the liquid/fuel does not come in contact with the resistive element under normal usage, hence the reliability is ensured. It is also provided with multiple potential free contacts to give predefined level signals and it also has a simple mechanical visual indication.

### The product as sought to be covered:

**A fuel gauge with multiple modes for determining the level of fuel in a fuel tank, comprising –**

- a. a flange for being received on top surface of the fuel tank;

- b. a housing including a base and a top cover being mounted, via clamping means, on the flange in a manner allowing at least a substantial portion of said housing to be positioned outside the fuel tank so as to remain out of contact with fuel held in the tank;

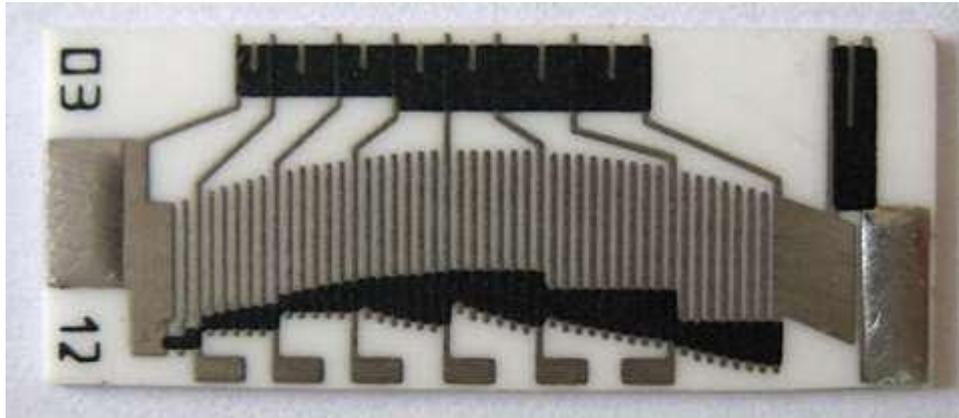

FIGURE 1. RESISTIVE COIL

- c. a member associated, rotatable via pivot, with base of the housing for receiving one end of a drive link leaving other end of said drive link free to extend inside the fuel tank in a manner freely pivot-able with the rotatable member;
- d. a buoyant member connected to the free end of said drive link therein allowing the buoyant member to freely float on surface of the fuel held inside the fuel tank and consequently displace the drive link through an angular motion as a function of change in residual level of fuel in the fuel tank;
- e. a first modality, to visually determine as to the residual level of fuel in the fuel tank, said modality being a mechanical assembly including-
- i. a wiper connected at one of its ends to the rotatable member to thereby allow an extended tapered tip of the wiper as a pointer at its other end, to translate in a corresponding measure to the displacement of the drive link.
  - ii. a visual scale placed on top of the housing and juxtaposed within path of translation of the pointer of the wiper to thereby visually determine the residual level of fuel in the fuel tank.
- f. a second modality, to determine as to the residual level of fuel in the fuel tank, said modality being an electronic assembly including-
- i. a wiper connected at one of its ends to the rotatable member to thereby translate along the resistance element in a corresponding measure to the displacement of the drive link to serve as a rheostat and thereby provide a linear resistive output;
  - ii. a terminal for conveying output from the resistive coil and the wiper, to any common art device capable of using said signal for determining the residual level of fuel in the fuel tank.

- g. a third modality, to determine as to the residual level of fuel in the fuel tank, said modality being an electronic assembly including-
- i. a set of magnets affixed onto the rotatable member to there by allow their radial translation in a corresponding measure to displacement of the drive link ;
  - ii. a set of Normally Open type magnetically actuated reed switches anchored on base of the housing to thereby allow generation of a switching.
  - iii. signal in response to magnetic field generated when the set of magnets are set in motion;
  - iv. a terminal for conveying output from the resistive coil and the signal generated by the reed switches and thereby act as a potential-free signal feed to any common art device capable of using said signal for indicating, as to the residual level of fuel in the fuel tank.

- i. a wiper connected at one of its ends to the rotatable member to thereby translate along the resistance element in a corresponding measure to the displacement of the drive link to serve as a rheostat and thereby provide a linear resistive output

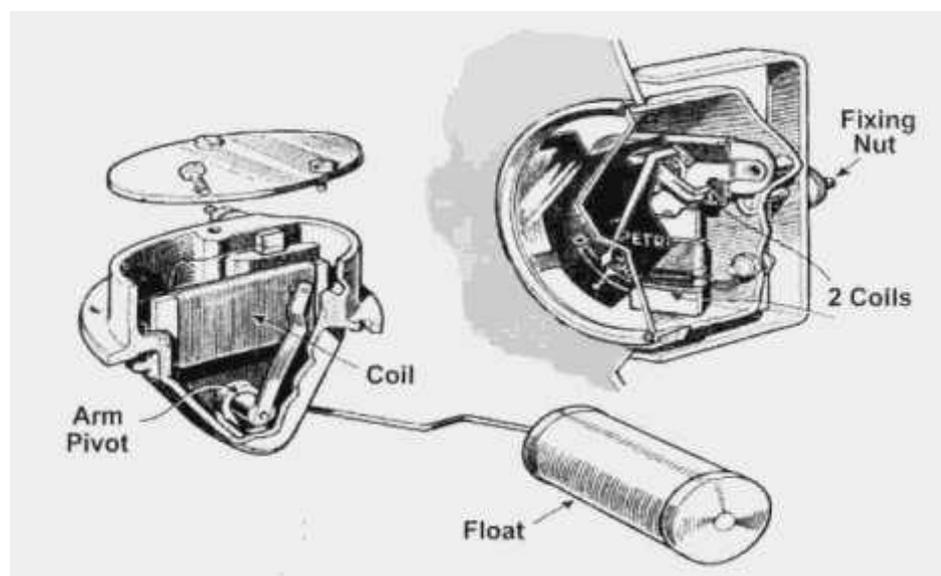

Figure 3. Internal Processing of a coil

- ii. a terminal for conveying output from the resistive coil and the wiper, to any common art device capable of using said signal for determining the residual level of fuel in the fuel tank.
- f. a third modality, to determine as to the residual level of fuel in the fuel tank, said modality being an electronic assembly including-
- i. a set of magnets affixed onto the rotatable member to thereby allow their radial translation in a corresponding measure to displacement of the drive link ;
  - ii. a set of Normally Open type magnetically actuated reed switches and anchored on base of the housing to thereby allow generation of a switching signal in response to magnetic field generated when the set of magnets are set in motion; and
  - iii. a terminal for conveying output from the resistive coil and the signal generated by the reed switches and thereby act as a potential-free signal feed to any common art device capable of using said signal for indicating, as to the residual level of fuel in the fuel tank.

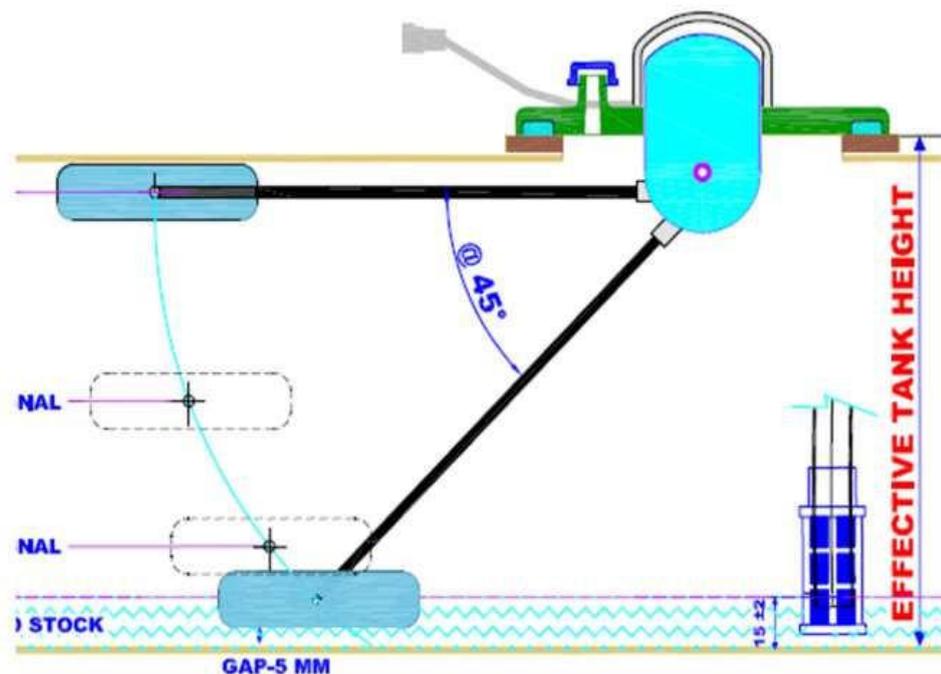

Figure 4. Proposed system

2. The fuel gauge with multiple modes for determining the level of fuel in a fuel tank wherein length of the drive link is proportioned as per depth of the fuel tank.
3. The fuel gauge with multiple modes for determining the level of fuel in a fuel tank as, where in geometry of flange is chosen as one conforming to that of the flange on the fuel tank on which said flange is to be received.
4. The fuel gauge with multiple modes for determining the level of fuel in a fuel tank as, wherein positions of the reed switches within base of the housing are permanently anchored using potting material chosen between polyurethane and epoxy resin to thereby protect said reed switches from environmental disturbances and handling impacts.
5. The fuel gauge with multiple modes for determining the level of fuel in a fuel tank as claimed in claim 1, wherein the base and the top of the housing has a notch parallel to the scale to serve as a guide for translation of the wiper.
6. The fuel gauge with multiple modes for determining the level of fuel in a fuel 10 tank as claimed in claim 1, wherein the housing is made from common art materials chosen among engineering plastics, sheet metal constructs, or metal casts.
7. The fuel gauge with multiple modes for determining the level of fuel in a fuel tank as claimed in claim 1, wherein the set of magnets translate radially along with rotation of the rotatable member in a plane above the reed switches.
8. The fuel gauge with, multiple modes for determining the level of fuel in a fuel tank as, further including a transparent protective cap for protecting the visual scale and path of translation of the tapered tip of the wiper arranged along said visual scale.
9. The fuel gauge with multiple modes for determining the level of fuel in a fuel tank as claimed in claim 1, wherein the base and top cover of the housing (26) are screwed together using screws.

**Type: Product + Method**

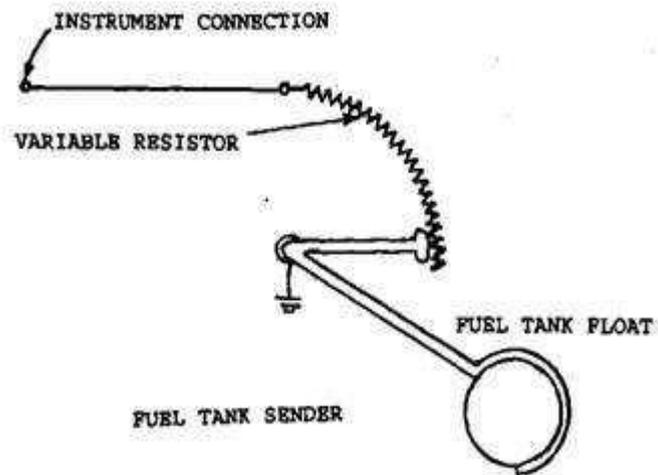

A fuel gauge with multiple modes for determining the level of fuel in a fuel tank,

- ✓ A flange ;
- ✓ A housing and a top cover;
- ✓ A drive link connected to rotating member through pivot ;
- ✓ A buoyant member ;
- ✓ Mechanical visual indicative output;
- ✓ Resistive output
- ✓ Potential – free output

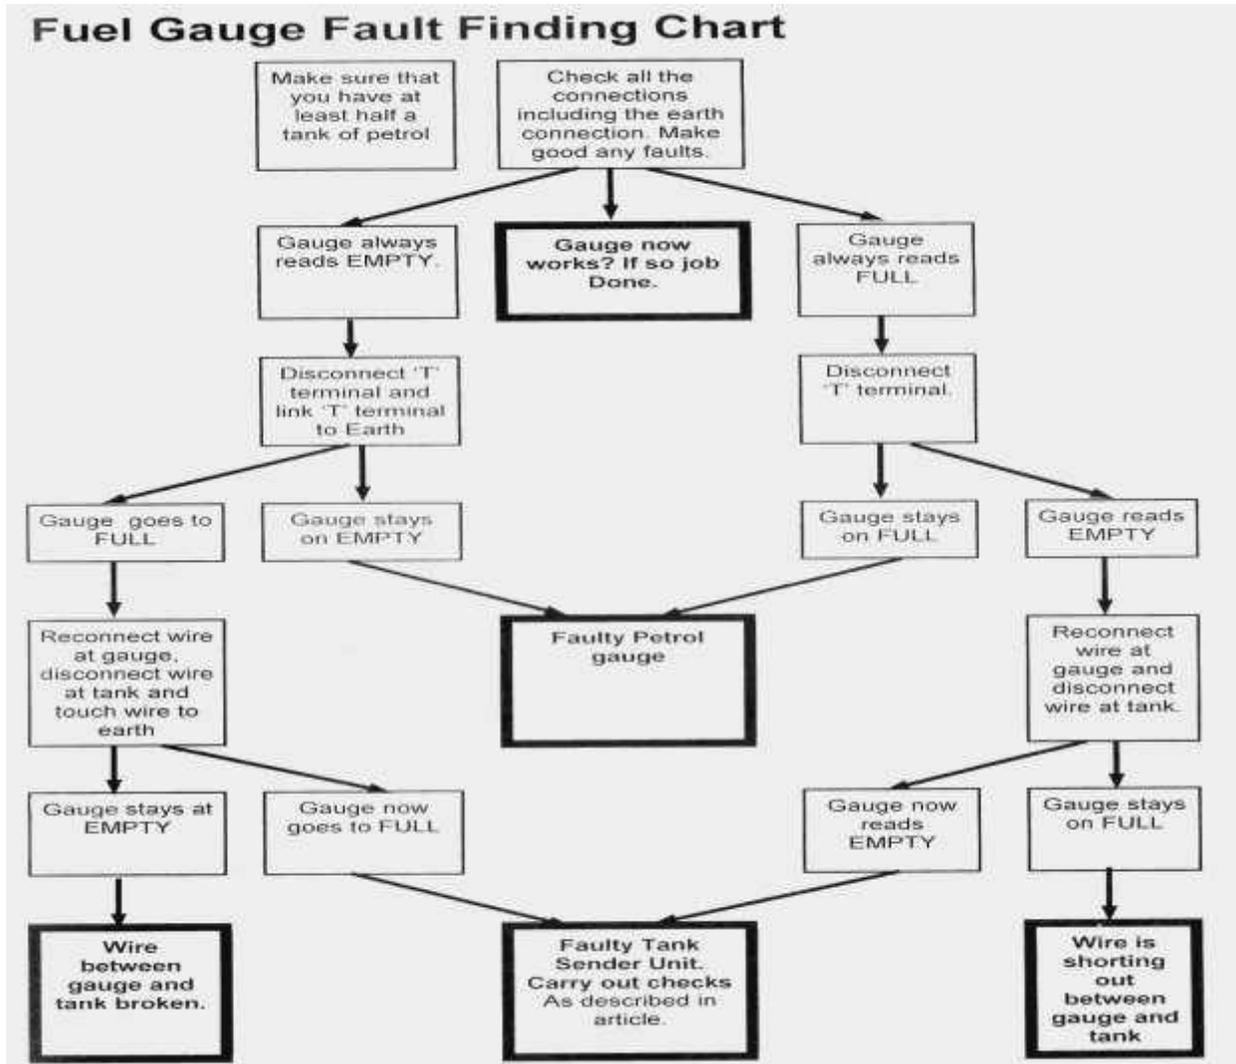

**The impugned patent describes a fuel gauge for determining the level of fuel in a fuel tank comprising:**

- A. A flange which is placed at the top of the fuel tank.
- B. A housing and a top cover placed in such a way that substantial portion remains outside the fuel tank to prevent damage from the contact of the fuel.
- C. A drive link where one end of drive link is free to extend inside the fuel tank and other end is connected to rotating member connected through the pivot joint .
- D. A buoyant member connected to the free end of said drive link which allows the buoyant to freely float on surface of the fuel held inside the fuel tank and displace the drive link through an angular motion and thus shows the change in residual level of fuel in the fuel tank;
- E. A wiper connected to the rotating member act as a pointer to translate the displacement of drive link on a visual scale to determine the visual level of residual fuel within the fuel tank;
- F. A wiper connected to the rotating member translates the displacement of drive link to the resistive coil to provide the resistive output.
- G. A set of magnets placed on rotating member are set in to motion due to displacement of drive link which radially translates signal to open type magnetically actuated reed switched which gets activated due to generated magnetic field and provides a switching signal to provide the potential- free signal output to terminal indicating the change in residual level of fuel in the fuel tank.

Figure 5. Working process of Resistance with float

**FUEL GAUGE FULT FINDING CHRT:-**

to provide resistive output; two sets of magnets are placed on to the rotating member are set in to motion due displacement of the drive link to allow their radial translation which activates the open type magnetically actuated reed switches which in response to magnetic field generated by the set of magnets gives a switching signal to provide a potential- free signal output.

**FEATURES ASPECT:-****FEATURES 1:**

Drive link

**Dependent Claim**

Length is adjusted as per depth of the tank

**FEATURES 2:**

Flange

**Dependent FEATURES**

Geometry preferred which fits to the fuel tank on which it is placed

**FEATURES 3:**

Reed switches

**Dependent FEATURES**

fixed within base of housing using Polyurethane or epoxy resin

**FEATURES 4,5 AND 6:**

Housing

**Dependent FEATURES**

has a notch parallel to the scale for translation of the wiper is made of engineering plastics, sheet metal constructs, or metal casts base and top cover screwed together using screws

**FEATURES 7:**

Set of magnets

**Dependent FEATURES**

radially translates over the reed switches

**FEATURES 8:**

Protective cap

**Dependent FEATURES**

protects translation path of wiper and of visual scale

**CONCLUSION:**

The Products describes about a fuel level gauge useful in determining the level of residual fuel in a fuel tank and providing with combination outputs for monitoring the level of residual fuel in said fuel tank. The main feature of the propose is to provide a dial gauge for visualization of residual fuel level in tank without any external power supply. Further, sensing device has multimode output modes where dial gauge to provide mechanical visual output where signals are provided by the rotating member connected to the wiper where extended tapered tip of the wiper act as a pointer to translate the displacement of the drive link; the displacement of the drive link signals are transferred to the resistive element by the rotating member which is connected to the wiper.

## ABSTRACT:

Diroximel fumarate (DRF) is an oral disease-modifying agent indicated for the treatment of relapsing-remitting multiple sclerosis (RRMS), which is taken twice a day. In EVOLVE-MS-1, Phase 3, a two-year safety study evaluating DRF in patients with RRMS, it is shown that the occurrence of flushing and gastrointestinal treatment-emergent adverse events is comparatively low. This results in a low rate of discontinuation due to treatment-emergent adverse events as compared to dimethyl fumarate (DMF). Monomethyl fumarate (MMF) is a common active metabolite of DMF and DRF. This active metabolite is responsible for the mechanism of actions of the drugs since it crossed the blood-brain barrier. Methanol is the primary metabolite of DMF metabolism but a minor metabolite of DRF metabolism, which results in a lower risk of gastrointestinal symptoms. Both DMF and DRF show similar T<sub>max</sub> and C<sub>max</sub>, which indicate similarity in the efficacy of both the drugs. Therefore, DRF has a similar safety and efficacy profile but better tolerability of treatment-emergent adverse events when compared to DMF. This article provides an updated overview of the pharmacological, therapeutic efficacy, and tolerability of DRF.

**KEYWORDS:** Sclerosis, Diroximel Fumarate, Monomethyl Fumarate, Gastrointestinal, Relapsing-Remitting Multiple Sclerosis.

## INTRODUCTION:

Multiple sclerosis (MS) is a demyelinating condition in which the myelin coating for nerve cells in the brain and spinal cord is impaired. It is categorized under the auto-immune disease. The pathogenic process involves the movement of self-reactive T cells across the blood-brain barrier to the central nervous system, causing damage to myelin, oligodendrocytes and nerve fibers and thus begin the immune cells recruitment.<sup>1</sup> This hinders the communication between the central nervous system and the rest of the body.<sup>2</sup>

It is pathologically described by inflammation, demyelination, and axonal and neuronal misfortune. Clinically it is characterized by intermittent backslides or movement, or both.<sup>3</sup> In individuals with MS, the natural equilibrium between pro-inflammatory and anti-inflammatory cells in the immune system is disturbed, which results in the inflammation of both CNS and PNS.

This inflammatory procedure causes injuries (overwhelmingly in the cerebellum, cerebrum stem, spinal rope, optic nerves and white matter of mind ventricles) that results in the occurrence of signs and symptoms of MS, including weak/hardened muscles, appendage deadness/shivering, balance issues, unsettling visual influences, and cognitive dysfunction.<sup>4</sup> The lesional inflammatory condition likewise adds to MS pathogenesis through the age of pro inflammatory cytokines and oxygen and nitrogen free radicals, building up a cycle of inflammation and oxidative pressure.<sup>5</sup>

Relapsing-Remitting MS (RRMS) is more frequently seen comparing to other MS forms. Approximately 85% of patients with MS are initially diagnosed with RRMS. In RRMS, attacks usually occur when symptoms are flared up which is called as relapse and followed by remission which is the period of recovery when few symptoms appear.<sup>3</sup>

Several disease modifying-therapies are used for the management of MS commonly via the parenteral route, for example, Interferon-beta and glatiramer acetate (GA) which are administered via injection while, natalizumab and mitoxantone administered via infusion.<sup>6</sup> Fortunately, some oral medications are recently developed which promote patient convenience and enhance therapeutic compliance. The oral drugs for the management of MS include fingolimod, teriflunomide, and dimethyl fumarate (DMF).<sup>7</sup> These medications are effective in slowing the progression of the disease by restoring the balance of immune cells.

Diroximel fumarate (DRF) is a novel oral fumarate with a distinct chemical structure approved in the U.S. which is in development to treat patients with RRMS, to include clinically isolated syndrome, relapsing-remitting disease and active secondary progressive disease.<sup>8</sup> DRF and DMF release similar active metabolite which is monomethyl fumarate (MMF).<sup>9</sup> The difference relies on the onset time in which DRF has a shorter time of onset in comparison to DMF because DRF undergoes esterase cleavage in the gut before reaching systemic circulation in the blood.<sup>10</sup> Unlike DMF, which is associated

with gastrointestinal side effects including nausea, diarrhea, vomiting, and upper abdominal pain, DRF has improved gastrointestinal tolerability because of production of less irritation and reactivity toward off-target receptors in the GIT.<sup>11-13</sup> GI adverse reactions are a common cause of discontinuation of DMF treatment.<sup>12</sup>

Apart from MMF, both DMF and DRF produce different metabolites. DMF is metabolized to MMF and methanol which is toxic while DRF is metabolized to MMF and inert 2-hydroxyethyl succinimide (HES).<sup>14</sup> Two primary metabolites, MMF and HES, and two minor metabolites, RDC-8439, and methanol are formed in the first step of DRF metabolism.<sup>14</sup> This is contrary to DMF, where MMF and methanol are produced as the primary metabolites by the first step of metabolism.<sup>14</sup> DRF and DMF produce bioequivalent systemic exposure to MMF at therapeutic doses, which is assumed to improve efficacy in MS patients.<sup>15</sup> Based on its chemical structure and associated metabolites, DRF is predicted to produce an effectiveness and safety profile comparable with DMF's experience but with an increased tolerability profile for GI.<sup>15</sup>

#### PHARMACODYNAMICS:

The neurological signs of RRMS, are reduced by diroximel fumarate with less digestive impact than its bioequivalent analog, dimethyl fumarate.<sup>13</sup> It must be remembered that angioedema, hepatotoxicity, anaphylaxis, flushing, lymphopeny, and progressive multifocal leukoencephalopathy (PML) may be induced by the administration of DRF.<sup>16</sup> DRF should be immediately discontinued when PML, anaphylaxis or angioedema is suspected. Liver function and total bilirubin should be checked before and during therapy with diroximel fumarate. A complete blood count (CBC) should be collected before beginning DRF, after the first six months of treatment, and at corresponding periods of 6 to 12 months after that time.<sup>16</sup> Stop the DRF therapy if the lymphocyte count is calculated to be less than  $0.5 \times 10^9$  /L for more than six months.<sup>16</sup> It is to be noted that, DRF does not prolong the QTc duration to any clinically relevant degree at a dosage two times the maximum recommended dose.<sup>16</sup> It is suggested that DRF does not increase the risk of experiencing ventricular arrhythmias even in high doses.

It is evident that the pharmacodynamics of DRF and MMF are similar with higher gastrointestinal tolerability in patients undergoing DRF therapy.

#### PHARMACOKINETICS:

Upon administration, diroximel fumarate, like its bioequivalent drug, dimethyl fumarate, is quickly absorbed in the gastrointestinal tract.<sup>17</sup> According to the EVOLVE-MS-1 Study, following oral administration, the median T<sub>max</sub> of monomethyl fumarate (MMF) varies from 2.5-3 hours, while the mean C<sub>max</sub> is of 2.11 mg/L.<sup>16</sup> A similar mean of T<sub>max</sub> and C<sub>max</sub> is also observed in the bioequivalent drug, dimethyl fumarate, given to healthy volunteers.<sup>17</sup> DRF metabolite's average steady-state concentration was reported at 8.32 mg.hr/L following twice-daily administration in MS patients.<sup>16</sup> Food tends to significantly reduce MMF, the active metabolite of C<sub>max</sub> DRF, when compared to fasted administration.<sup>16,17</sup>

The apparent volume of distribution of DRF varies from 72L to 83L.<sup>16</sup> The active metabolite of DRF, MMF, crosses the blood-brain barrier which is responsible for its effect.<sup>18</sup> While the plasma protein binding of MMF ranges from 27-45%.<sup>16</sup>

Esterases metabolize both DRF and DMF in the liver.<sup>17</sup> Throughout the gastrointestinal tract, skin, and plasma, these enzymes are found in high quantities. DRF's esterase metabolism releases the active metabolite, MMF, prior to moving into the systemic circulation.<sup>10</sup> Moreover, together with small amounts of methanol, the main inactive metabolite, 2-hydroxyethyl succinimide (HES), and another inactive metabolite, RDC-8439, are formed during the metabolism.<sup>16,19</sup> Following the esterase metabolism, the tricarboxylic acid (TCA) cycle further metabolizes MMF, which produces major metabolites including fumaric acid, citric acid, and glucose.<sup>16,17</sup> It is important to remember that methanol is the main metabolite of DMF metabolism, but a minor metabolite of DRF metabolism, that results in a lower risk of gastrointestinal symptoms.<sup>19</sup> Elimination of MMF, which is a major metabolite of both DMF and DRF, occurs through expired air as carbon dioxide. Negligible levels, lower than 0.3 percent of the absorbed dosage, are calculated in urine.<sup>16</sup> The 2-hydroxyethyl succinimide (HES), an inactive metabolite of DRF, which constitutes 58-63% of the ingested dose, is excreted in urine.<sup>16</sup> The half-life of MMF is estimated to be 1 hour. Monomethyl fumarate shows a mean apparent total plasma clearance of 1.54 mg/L following oral administration.<sup>17</sup>

#### GASTROINTESTINAL TOLERABILITY:

DRF was comparable in effectiveness to DMF but has a different chemical structure that may cause less gastrointestinal (GI) discomfort, as shown in the EVOLVE-MS-2 trial.<sup>19</sup> EVOLVE-MS-2 was a 5-week study comparing the gastrointestinal tolerability of DRF (462 mg twice daily) to DMF (240 mg twice daily).<sup>19</sup> The study hit its primary endpoint by demonstrating a statistically significantly lower number of gastrointestinal symptoms in patients taking DRF as compared to those who take DMF. The symptom intensity score of 2 or higher was observed with DRF on the Individual Gastrointestinal Symptom and Impact Scale (IGISIS) compared with DMF ( $P = 0.003$ ).<sup>19</sup> Both DMF and DRF show gastrointestinal symptoms including

than 700 calories and 30g fat.<sup>16</sup>

### POTENTIAL DRUG INTERACTION:

DRF is contraindicated for individuals currently receiving DMF, which is also metabolized to MMF. This increases the risk of toxicity for which it should be avoided.<sup>16</sup> DRF may be started the day after DMF is discontinued.<sup>16</sup>

### CONCLUSION:

DRF is an innovative oral fumarate in the treatment of RRMS patients with its distinct chemical structure. DRF and DMF produce similar pharmacologically active metabolites, MMF, which cause identical mechanisms of action of both the drugs. Consequently, efficacy and safety profiles are predicted to be identical for DRF and DMF. DRF has the potential to produce a better gastrointestinal tolerability profile when compared to DMF due to less production of methanol and decreases the reactivity with off-target receptors, which are the results of its distinct chemical structure. Therefore, DRF has a promising safety and efficacy profile and seems to be a well-tolerated alternative for the treatment of RRMS.

## ABOUT JOURNAL

Research Journal of Pharmacy and Technology (RJPT) is an international, peer-reviewed, multidisciplinary journal,

devoted to pharmaceutical sciences. The aim of RJPT is to increase the impact of pharmaceutical research both in academia and industry, with strong emphasis on quality and originality. RJPT publishes Original Research Articles, Short Communications, Review Articles in all areas of pharmaceutical sciences from the discovery of a drug up to clinical evaluation. Topics covered are: Pharmaceutics and Pharmacokinetics; Pharmaceutical chemistry including medicinal and analytical chemistry; Pharmacognosy including herbal products standardization and Phytochemistry; Pharmacology: Allied sciences including drug regulatory affairs, Pharmaceutical Marketing, Pharmaceutical Microbiology, Pharmaceutical biochemistry, Pharmaceutical Education and Hospital Pharmacy.

### **ABSTRACT:**

Due to nutrition distortions and energy metabolism, protein energy malnutrition (PEM) is triggered in liver cirrhosis (LC). Since PEM is directly related to the prognosis of LC, it has been postulated that supplementation of Branched Chain Amino Acids (BCAAs) which comprised of the amino acids valine, leucine and isoleucine is helpful in LC. Decreased BCAAs and increased Aromatic Amino Acids (AAAs) are typical abnormalities in the blood of individuals with liver cirrhosis, which play a function in the pathogenesis of hepatic encephalopathy and muscle loss. As the concentration of AAAs increased, it was hypothesized that the influx of AAAs into the brain increased, resulting in an imbalance of the neurotransmitter synthesis, particularly serotonin and noradrenaline. It may cause an aggregation of 'false' neurotransmitters such as octopamine, which may in effect be responsible for Hepatic Encephalopathy associative cognitive impairment. HE is a reversible disordered brain function condition that arises in people with progressive liver failure. BCAAs treatment significantly raises the BCAAs/AAAs ratio and reduces the grade of hepatic encephalopathy. Since the nutritional treatment focused on the administration of BCAAs, it resulted in an improvement in the clinical condition, which also led to an improvement in quality of live (QOL).

**KEYWORDS:** Branched Chain Amino Acids, Liver Cirrhosis, Hepatic Encephalopathy, Protein Energy Malnutrition, Aromatic Amino Acids.

### **INTRODUCTION:**

The liver performs a key function in the metabolism of the components of food like protein, fat and other nutrients for which any chronic liver disease results in different kinds of metabolic disorders<sup>1,2</sup>. The stage of protein-energy malnutrition (PEM) is triggered in chronic liver disease due to the disturbance in the nutrition and energy metabolism<sup>3,4</sup>. PEM is directly related to the prognosis of liver cirrhosis (LC) cases, independent of liver function<sup>5-7</sup>. Nutritional status has been documented to affect survival in patients with decompensated cirrhosis<sup>6, 8-10</sup>. Some studies reported a decline in mortality among these enteral feeding patients<sup>11, 12</sup>.

However, some criticism has been made of the hypothesis that the nutritional status is used as a survival factor or as a therapeutic strategy<sup>13,14</sup>. It has been reported that PEM occurs in 20% of patients with well compensated cirrhosis and in more than 60% of patients with severe liver disease<sup>15</sup>. In patients with cirrhosis, malnutrition of proteins, as manifested for instance in reduced skeletal muscle mass and hypoalbuminemia, may occur despite apparent adequate food intake<sup>6,7,16</sup>. Long-term BCAAs supplementation has been reported to raise or sustain nutritional status when used as a therapy for protein deficiency and to enhance the longevity of patients with decompensated cirrhosis<sup>17,18</sup>. These results, however, were not confirmed in more extensive studies, partly due to the lack of a BCAAs preparation suitable for long-term administration.

also regulates various nutrient metabolism pathways<sup>19-22</sup>. BCAAs were suggested to be linked to the hepatic encephalopathy (HE) developed by alteration in ammonia and energy metabolism. BCAAs are first catabolized by  $\alpha$ -ketoglutarate into glutamate and branched-chain ketoacids (BCKAs) via BCAAs aminotransferase (BCAT), mainly in skeletal muscles<sup>23-25</sup>. Patients with advanced cirrhosis experience a drop in branched-chain amino acid plasma concentration (BCAAs) and a rise in aromatic amino acids (AAAs) distinctively. Many clinical trials have shown that supplementation of BCAAs enriched oral mixture and BCAAs granules of dietary therapy may enhance not only hepatic encephalopathy (HE) but also PEM in LC patients<sup>13, 16, 26, 27</sup>.

### **Pathophysiology of Liver Cirrhosis and Hepatic Encephalopathy**

Liver cirrhosis results from the abnormal propagation of healing response increase fibro genesis characterized by connective tissue production and accumulation<sup>28</sup>. Cirrhosis is an advance stage of liver fibrosis that comes with hepatic vasculature distortion which cause distortion in the exchange between hepatic sinusoids and the adjacent hepatocytes due to the shunting of the portal and arterial blood supply directly into the central veins<sup>28</sup>. In liver cirrhosis, sinusoidal capillarization occurs in which the space of Disse is obstructed with scar tissues along with loss of endothelial fenestrations<sup>29</sup>. Sinusoidal capillarization and endothelial defenestration are the main factors of hepatic dysfunction in hepatic cirrhosis.

Hepatic encephalopathy (HE) is a reversible disordered brain function condition that arises in people with progressive liver failure. Mechanisms in liver failure which induce brain dysfunction are still unknown although some theories have been speculated regarding the influx of AAAs into the brain.

### **Decreased concentration of BCAAs in liver cirrhosis (LC)**

Decreased BCAAs, valine (Val), leucine (Leu), isoleucine (Ile) and increased AAAs, phenylalanine (Phe), tyrosine (Tyr) and tryptophan (Trp) are typical abnormalities in the blood of individuals with liver cirrhosis, which play a function in the pathogenesis of hepatic encephalopathy and muscle loss<sup>30, 31</sup>. Changes in the level of amino acid in liver disease patients are influenced by a variety of causes, such as dietary condition, age, associated illness, and the form and level of occurrence of injury. The changes in the concentration of BCAAs and AAAs results in the decrease of BCAAs/AAAs molar ratio which is also known as Fischer ratio. As the concentration of AAAs increased, it was hypothesized that the influx of AAAs into the brain increased, resulting in an imbalance of the

neurotransmitter synthesis, particularly serotonin and noradrenaline. It may cause an aggregation of 'false' neurotransmitters such as octopamine, which may in effect be responsible for HE-associative cognitive impairment<sup>32, 33</sup>.

The metabolisms of BCAAs and AAAs differs in such a way that BCAAs are metabolised in the peripheral tissues such as muscles, adipose tissue and brain while AAAs are metabolised in the liver. There are several mechanisms that explained the decrease of BCAAs concentration in LC patients. In LC patients with elevated blood ammonia concentrations under which the urea cycle is disrupted, ammonia detoxification can be intensified in the muscle and BCAAs may be used primarily for detoxification<sup>34-37</sup>. In LC patients, due to the disruption of insulin metabolism in the liver and the formation of portal-systemic shunt, insulin concentrations in plasma are elevated. Since insulin is responsible for the controls of BCAAs in the muscles, rise in insulin concentration leads to the increased in BCAAs uptakes which eventually decrease the BCAAs levels in the plasma<sup>38, 39</sup>.

### **Effects of Zinc and Amino Acids to Oral BCAAs Supplementation on HE**

Zinc is an ornithine transcarbamylase (OTC) coenzyme, a main enzyme in the liver urea cycle<sup>40</sup>. Because cirrhotic patients are low in zinc, OTC function is decreased, contributing to elevated amounts of ammonia in the blood via the down-regulation of the urea cycle<sup>41, 42</sup>. Oral zinc supplementation improved hepatic OTC development in cirrhotic rats, contributing to a reduction in blood ammonia concentrations<sup>43, 44</sup>. In cirrhotic cases, relative to BCAAs supplementation alone, BCAAs in conjunction with zinc administration substantially reduced blood ammonia rates and improved HE<sup>45, 46</sup>.

Recently the additive effects of other amino acids on supplementation to oral BCAAs have been investigated. The addition of L-ornithine L-aspartate (LOLA) to the BCAAs supplementation has been shown to improve HE<sup>47</sup>. It also has been shown that adding L-acetylcarnitine to BCAAs supplementation significantly improves HE and reduces ammonia levels in the blood<sup>48</sup>.

### **Effects of BCAAs on Albumin level**

Malnutrition of proteins and energy is common in patients suffering from liver cirrhosis. It also provides an important predictor for patients' survival<sup>6, 49, 50</sup>. BCAAs has a protein-free effect and increases the concentration of serum albumin. BCAAs supplementation has been suggested as an intervention for candidates for liver transplantation<sup>51</sup>. Patients with chronic liver disease may have low levels of serum albumin due to either protein

deficiency or impaired liver function<sup>52</sup>. L-leucine promotes in vitro albumin synthesis by activating a transcription factor, the mammalian target of rapamycin (mTOR)<sup>53,54</sup>. Subsequently, BCAAs increases hepatocyte synthesis and albumin secretion rates in patient with liver cirrhosis. This suggests that BCAAs could increase oncotic pressures by improving the levels of blood albumin and thus decrease peripheral edema.

### Role of BCAAs in HE and MHE

Different pathological conditions such as dehydration, spontaneous bacterial peritonitis and non-compliance of medication can cause HE. Additionally, one of the pathogenesis of HE in cirrhotic patients involved a drop in serum BCAAs levels. Even though the established treatment for HE is lactulose or antibiotics, supplementation with BCAAs appears to further improve HE in cirrhotic patients. A research found that the BCAAs treatment significantly raises the BCAAs/AAAs ratio and reduces the grade of hepatic encephalopathy<sup>55</sup>. In addition, Horst et al performed a randomized trial comparing dietary protein with an oral BCAAs supplement and observed substantial changes in the grade of mental state, flapping tremors, and portal-systemic encephalopathy index<sup>56</sup>. Hence, it can be postulated that oral BCAAs administration may have beneficial effects on HE.

Minimal HE (MHE), known as subclinical or latent HE, is the mildest form in the clinical spectrum of HE<sup>57, 58</sup>. Kato et al have shown that energy and protein intake nutritional consultations improve MHE, and the severity of MHE is negatively associated with BCAAs serum levels<sup>59</sup>. BCAAs supplementation is therefore considered to be a therapeutic agent for MHE.

### Quality of life (QoL) evaluation through BCAAs

Patients with liver cirrhosis are prone to PEM which significantly contribute to various conditions such as painful muscle spasms induced by muscle atrophy, muscle weakness<sup>60</sup>. Moreover liver cirrhosis patients are also susceptible to edema and ascites, hepatic encephalopathy and gastroesophagealvarix. All of these conditions would therefore lead to a reduction in quality of life (QOL). In the case of liver cirrhosis, disease development was shown to be an significant factor in evaluations of QOL. Suzuki et al. have used SF-36 to prove that QOLs for the patients with liver cirrhosis were not only lower than the healthy, but also lower than those suffering from peptic ulcerations and diabetes<sup>61</sup>. Moreover, they reported that the use of branched chain amino acids may have the potential to improve QOL in patients with liver cirrhosis<sup>61</sup>. Large-scale clinical trials in Japan also indicate that BCAAs improves nutrition in patients with cirrhosis of the liver, raising levels of BTR and serum albumin leading to improved survival rates and QOL increase<sup>62</sup>.

Since the nutritional treatment focused on the administration of BCAAs, it resulted in an improvement in the clinical condition, which also led to an improvement in QOL.

### CONCLUSION:

Many studies have shown that BCAAs is responsible in the management of LC. HE is one of the LC complication which occurred due to decrease in the Fischer ratio (BCAAs/AAAs molar ratio). High AAAs level cause increase influx into the blood brain barrier and in turn resulting in imbalance in the synthesis of neurotransmitter which responsible for the symptoms of HE. Therefore, administration of BCAAs stabilise the Fischer ratio and reduce the symptoms of HE. Addition of oral zinc supplement and L-ornithine L-aspartate (LOLA) have been shown to improve HE. Therefore, increase in quality of life is seen in LC with BCAAs supplement.

# Increased serum interleukin-9 and interleukin-1 $\beta$ are associated with depression in type 2 diabetes patients

Interleucina-9 e interleucina-1 $\beta$  séricas aumentadas estão associadas à depressão em pacientes com diabetes tipo 2

Prabhat VARSHNEY<sup>1</sup>, Rizwana PARVEEN<sup>2</sup>, Mohd Ashif KHAN<sup>2</sup>, Sunil KOHLI<sup>3</sup>, Nidhi B. AGARWAL<sup>1</sup>

## ABSTRACT

**Background:** Co-morbid diabetes and depression are prevalent chronic conditions negatively affecting quality of life (QoL). Inflammation has been considered as an integral mechanism in patients with both diabetes and depression. **Objective:** The aim of the present study was to investigate depression and its association with interleukins (IL)-1 $\beta$  and IL-9 in type 2 diabetic patients (T2DM) and controls. The QoL in diabetic patient was also assessed. **Methods:** Eighty subjects were included, distributed among three groups: Group 1 - Healthy controls; Group 2 - T2DM patients without depression; Group 3 - T2DM patients with depression. Depression and QoL were assessed using Patient Health Questionnaire (PHQ-9) and The Audit of Diabetes-Dependent QoL (ADDQoL), respectively. IL-1 $\beta$  and IL-9 were measured in serum samples of all the patients using ELISA kit. **Results:** The PHQ score in the Group 3 was significantly higher as compared to Group 1. The ADDQoL scores in the Group 3 were significantly higher as compared to Group 2. Levels of IL-9 and IL-1 $\beta$  were elevated in Group 3, as compared to the other groups. **Conclusion:** This study showed positive association between depression and IL-1 $\beta$ , IL-9 in T2DM patients. Additionally, the diabetic patients have poorer quality of life, which is further worsened by the presence of depression. Thus, routine assessment for the presence of depression is suggested in T2DM patients.

**Keywords:** Cytokines; Depression; Patient Health Questionnaire.

## RESUMO

**Introdução:** O diabetes e a depressão comórbidas são condições crônicas prevalentes que afetam negativamente a qualidade de vida (QdV). A inflamação tem sido considerada como um mecanismo integral em pacientes com diabetes e depressão. **Objetivo:** Investigar a depressão e sua associação com interleucinas (IL)-1 $\beta$  e IL-9 em pacientes diabéticos tipo 2 (DM2) e controles. A QdV em diabéticos também foi avaliada. **Métodos:** Foram incluídos 80 indivíduos, divididos em três grupos: Grupo 1 - controles saudáveis; Grupo 2 - pacientes com DM2 sem depressão; Grupo 3 - pacientes com DM2 com depressão. A depressão e a QdV foram avaliadas usando o Questionário de Saúde do Paciente (*Patient Health Questionnaire* — PHQ-9) e a auditoria de QdV dependente de diabetes (*Audit of Diabetes-Dependent Quality of Life* — ADDQoL), respectivamente. IL-1 $\beta$  e IL-9 foram medidas em amostras de soro de todos os pacientes utilizando kit de ELISA. **Resultados:** O escore do PHQ no grupo 3 foi significativamente maior em comparação ao grupo 1. Os escores de ADDQoL no grupo 3 foram significativamente maiores em comparação ao grupo 2. Os níveis de IL-9 e IL-1 $\beta$  foram elevados no grupo 3, como em comparação com os outros grupos. **Conclusão:** Este estudo mostrou associação positiva entre depressão e IL-1 $\beta$ , IL-9 em pacientes com DM2. Além disso, os pacientes diabéticos têm pior QdV, o que é ainda piorado pela presença de depressão. Assim, a avaliação rotineira da presença de depressão é sugerida em pacientes com DM2.

**Palavras-chave:** Citocinas; Depressão; Questionário de Saúde do Paciente.

*Diabetes Mellitus* (DM) is a complex and heterogeneous chronic metabolic disease affecting 425 million people worldwide. It is estimated that the number of diabetic patients would increase to 700 million by 2045<sup>1</sup>. Type 2 DM (T2DM), also called non-insulin-dependent or adult-onset diabetes, accounts for approximately 90% of all diabetes cases<sup>2</sup> and is

the seventh leading cause of death worldwide<sup>3</sup>. Depression is a common mental health disorder affecting more than 300 million people around the globe<sup>4</sup>. Various studies indicate that depression is more prevalent in adults with diabetes as compared to the general population<sup>5</sup>. The prevalence of depression among individuals living with diabetes has

Received on July 04, 2019; Received in its final form on September 25, 2019; Accepted on October 24, 2019.

been estimated between 9 and 35%. A study reported a 43% increase in the risk of developing depression over six years for participants with baseline diabetes and a 102% risk for diabetes among those with depression at baseline<sup>6</sup>. The occurrence of clinically significant depression in patients with diabetes has been reported to be associated with biochemical changes either directly due to illness or hypoglycemic drug treatment<sup>7</sup>. Depression in diabetic patients has been found to be associated with insulin resistance, deranged circadian rhythms, and hypothalamic-pituitary-adrenal (HPA) axis<sup>8</sup>. Depression has also been linked with diabetes via biological and behavioral pathways such as neurohormonal pathways, alterations in glucose transport, and increased immunoinflammatory activation<sup>9</sup>. The co-occurrence of depression and T2DM is associated with increased morbidity, mortality, and health care costs, as well as decreased QoL and productivity<sup>10</sup>. Depression, when accompanied by macrovascular and microvascular complications, further worsen the QoL of the patient<sup>11</sup>.

Inflammation has been ascertained as an integral mechanism in patients with both diabetes and depression. Certain clinical studies have reported that raised serum markers of inflammation, particularly IL-6, are associated with the onset of T2DM<sup>12</sup>. Different cohort studies indicate the involvement of activated innate immunity in patients with T2DM<sup>11</sup>. Depression has been found to be associated with impaired immune system and increased susceptibility to various diseases. An increase in plasma cytokines and acute phase protein concentration has been reported in the blood of depressed patients. Cytokines affect multiple CNS functions that are dysregulated during depression. Moreover, external administration of IL into the CNS has been found to induce immune function and produce stress-like effect on behavior<sup>13</sup>. Studies have highlighted higher levels of IL-1 $\beta$  and IL-6 in patients with T2DM and depression<sup>14</sup>. IL-9, which is a Th2-related cytokine, has been reported to be over-expressed in the *post mortem* brains of depressed people<sup>15</sup>. It is a pleiotropic cytokine whose elevated levels have been linked to allergic lung inflammation<sup>16</sup>.

Despite the above probable mechanisms observed in depressive patients, it is not yet clear whether inflammation is associated with depression in diabetic patients. Thus, the aim of the present study was to investigate the depression in diabetic patients and its association with interleukins. We also assessed QoL in diabetic patient.

## METHODS

### Study site, duration, design, and population

This study was conducted in Hakeem Abdul Hameed Centenary Hospital, Jamia Hamdard, New Delhi, from March 2018 to May 2018 after approval was obtained from Ethics

committee. This case control study was conducted to investigate the association between depression and diabetes. The study focused on diabetic patients who attended diabetic clinic in the HAHC Hospital (Figure 1). Healthy human subjects, aged  $\geq 18$  years and  $\leq 65$  years, and able to give informed consent were included as controls. Patients diagnosed with T2DM, aged  $\geq 18$  years and  $\leq 65$  years, and ability to give informed consent were included as cases.

Cases with T1DM, severe psychiatric disorders (e.g.; alcohol abuse, severe depression, schizophrenia, bipolar disorder), already on psychotropic drug, severe complications of diabetes (i.e., amputation, blindness, renal insufficiency, and dialysis), liver disease, renal disease, primary hyperparathyroidism, cancer, HIV, obesity, congestive heart failure, myocardial infarction or coronary artery bypass surgery, or percutaneous coronary intervention within the previous 6 months, cardiac arrhythmias, and inability or unwillingness to give written informed consent were excluded.

### Ethical considerations

This study was conducted in accordance with the guidelines of Declaration of Helsinki. Ethical approvals were obtained from the Ethics Committee of Hamdard Institute of Medical Sciences and Research (HIMSR), and the Institutional Ethics Committee of the School of Pharmaceutical Education and Research (SPER). Written informed consent was voluntarily obtained from all participants before their in the study.

### Sampling method & sample size

The estimated sample size for this study was 80 participants. The calculation of the sample size was conducted on the assumptions that confidence level (95%), margin of error not more than (5%), and prevalence of depression among diabetes patients of (50%). The value of 95% confidence interval (95%CI) from the normal distribution is 1.96 and for practical reasons we rounded it to be 2. Participants were recruited in diabetic clinic in the HAHC Hospital. All type-2 diabetic patients visiting the diabetes clinic fulfilling the inclusion criteria and willing to participate were included in the study.

### Data collection

#### Questionnaires

The data was collected by “face-to-face” interview using two standardized questionnaires: Patient Health Questionnaire-9 (PHQ 9) and The Audit of Diabetes-Dependent QoL (ADDQoL).

#### Assessment of depression

The PHQ-9 questionnaire was used for assessing depression among diabetic with depression and control patients. The PHQ-9 offers a categorical algorithm for the

diagnosis of depressive disorder. Major depression is diagnosed if five or more of the nine depressive symptoms criteria were present for at least “more than half the days” in the previous two weeks (suicidal thoughts count if present at all) and one of the symptoms is depressed mood or anhedonia. In addition, the sum score [0-27] were used for screening purposes and for measuring depression severity. The cut-off point that is most widely used to indicate a positive case for depressive disorder is the sum score of 10 or higher<sup>17</sup>.

### Assessment of quality of life

The ADDQoL questionnaire was used for assessing QoL in cases. The ADDQoL is a 19-item questionnaire that measures the impact of diabetes on specific aspects of life and the importance of these aspects of life for QoL. Being an “individualized” measure, it is not assumed that all items are applicable to everyone: five items, including working life, have a preliminary ‘Yes/No’ option<sup>18</sup>.

### Assessment of interleukins

Blood samples were collected on the day of their assessment of depression. The blood samples were processed, the samples were centrifuged, and the serum was stored at -80°C. Biomarkers of subclinical inflammation were measured in serum samples by using ELISA technique (Krishgen Biosystems Private Ltd., Mumbai, India).

### Statistical analyses

Data were analyzed using IBM SPSS software (version 22.0) (IBM Corp., Armonk, NY, USA). Analyses were based on 80 individuals with controls and T2DM with a complete core data set comprising age, sex, body mass index (BMI), and duration of diabetes. Data are presented as SD or percentage (%) for continuous or categorical variables. Difference between controls and cases were tested using Student’s t-test (two sided) and Fisher’s exact test. Unadjusted correlations between biomarkers of subclinical inflammation and/or depression scores were estimated using unpaired t-test or nonparametric test (two sided) correlation and corresponding p-value. The  $p < 0.05$  was considered statistically.

## RESULTS

### Baseline data

Eighty subjects were included in the study, distributed among three groups:

- Group 1: controls (healthy individuals).
- Group 2: T2DM patients without depression.
- Group 3: T2DM patients with depression.

The mean±SD age of Group 1, Group 2, and Group 3 was 45.0±8.1, 47.9±7.8, and 46.7±6.1 years, respectively.

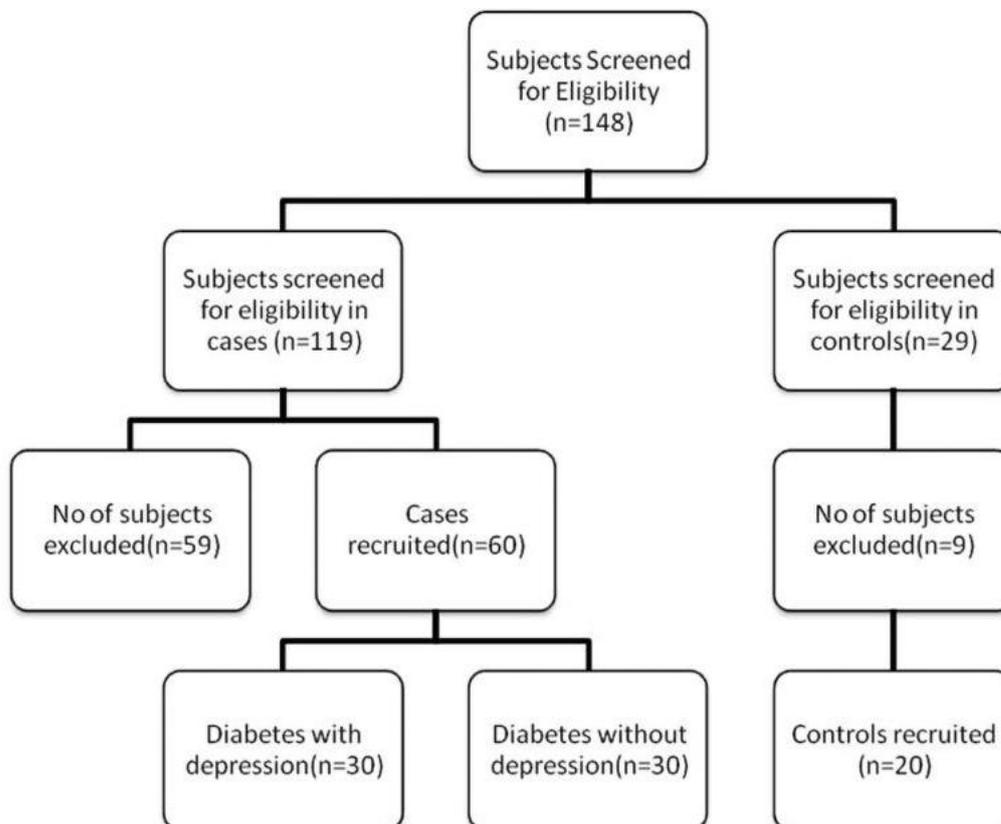

Figure 1. Study flow chart.

Group 2 and Group 3 had a known T2DM of mean duration 5.3±4.4 and 6.0±3.9 years, p=0.49.

There was no significant difference in mean age, gender distribution, RBS (random blood sugar), FPG (fasting plasma glucose), HbA1c, time spent on exercise between the three groups. The socio-demographic characteristics of study participants are shown in Table 1.

### Assessment of depression

The PHQ-9 scores in Group 1 and Group 3 were 1.3±3.3 and 11.9±1.9 respectively (p<0.001). It was observed that the PHQ scores in the Group 3 were higher as compared to Group 1. There was a significant difference between both the groups. The PHQ-9 scores in Group 1 and Group 2 were 1.4±3.3 and 1.5±2.0 respectively (p=0.88).

### Assessment of QoL by ADDQoL

The ADDQoL scores in Group 2 and Group 3 were 2.3±0.5 and 2.6±0.7 (p=0.04). There was a clear difference in the QoL scores for the Group 3 when compared with the Group 2. Between these two groups, Group 3 was significantly higher score compared to Group 2 (Figure 2).

### Assessment of IL-1β in cases and controls

Levels of IL-1β were found to be significantly higher in Group 3 or Group 2 as compared to Group 1. Additionally, Group 3 had significantly higher IL-1β concentration as compared to Group 2 (Figure 3).

### Assessment of IL-9 in cases and controls

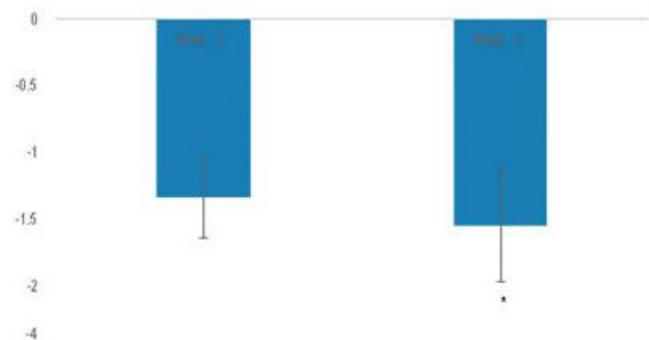

Levels of IL-9 were found to be significantly higher in Groups 2 or 3 as compared to Group 1. Additionally, Group 3 had significantly higher IL-9 concentration as compared to Group 2 (Figure 3).

### Correlation between IL-9, IL-1β, and PHQ

A positive association was found between IL-9 and PHQ-9 (r=0.6191 and p=0.003), IL-1β and PHQ-9 (r=0.7783 and p=0.0001) in Group 3 (Figure 4).

### Correlation between IL-9, IL-β, and ADDQoL

An inverse association was found between ADDQoL and IL-9 (r=-0.5737 and p=0.0009), ADDQoL and IL-1β (r=-0.5501 and p=0.0016) in Group 2 (Figure 5).

Group 2: T2DM patients without depression; Group 3: T2DM patients with depression. \*p<0.05.

## DISCUSSION

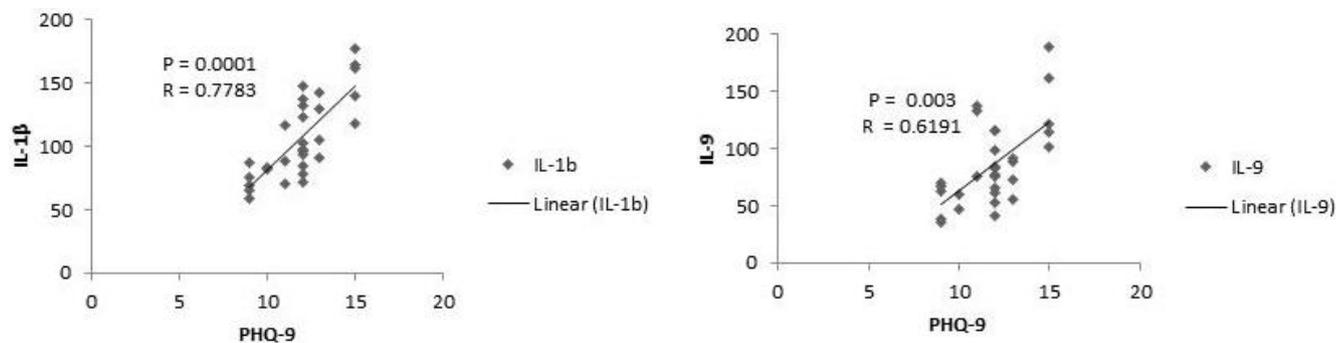

The current study was performed to assess the association of depression with IL-1 $\beta$  and IL-9 in T2DM. The increased

susceptibility to depression in individuals with T2DM is yet to be clearly understood. Depression is linked with physiological changes in the neuroendocrine system. The hidden cause of depression is thought to be related to changes in the

Group 3: T2DM patients with depression.

Figure 4. Correlation between PHQ-9 scores with IL-9 and IL-1 $\beta$  in Group 3.

Group 2: T2DM patients without depression.

Figure 5. Correlation between ADDQoL scores with IL-9 and IL-1 $\beta$  in Group 2.

neurotransmitters in the brain such as serotonin (5-HT), dopamine (DA), and norepinephrine (NE), which are monoamine neurotransmitters that affect mood and behavior. Counter-regulatory hormones such as catecholamine, glucocorticoids, growth hormone, and glucagon are believed to be activated during psychological stress. The activation of the counter regulatory hormones interferes in the natural action of insulin, leading to insulin being unable to lower glucose and instead elevating blood glucose. The increase in glucose level creates a major challenge in maintaining metabolic control. Poor glycemic control and functional impairment due to increasing diabetes complication may cause or worsen depression<sup>19</sup>.

The results of our study showed that serum IL-1 $\beta$  levels in T2DM patients were significantly higher than controls. Additionally, T2DM patients with depression had significantly higher serum IL-1 $\beta$  levels than patients without depression. These findings are in agreement with several other clinical studies. A prospective population-based study showed a higher production capacity of the pro-inflammatory cytokine IL-1 $\beta$  preceding a greater increase of depressive symptoms<sup>20</sup>. Another prospective study showed increased levels of IL-1 $\beta$  in T2DM as compared to the control subjects<sup>21</sup>. A previous clinical trial showed association between biomarkers (IL-1RA and IL-18) of subclinical inflammation and depressive symptoms in patients with T1DM and T2DM<sup>12</sup>. A study showed higher levels of IL-1 $\beta$  and IL-6 in patients with T2DM and depression<sup>14</sup>. Similar cross-sectional study in newly diagnosed T2DM patients demonstrated that higher depressive symptom scores were associated with higher concentration of IL-1 $\beta$  and other inflammatory biomarker. The increases in concentration of the inflammatory markers were seen in the study suggesting the role of inflammation in the pathogenesis of depression<sup>11</sup>.

The present study found significantly higher serum IL-9 levels in T2DM patients as compared to healthy controls. Moreover, patients with depression had significantly higher levels of serum IL-9 as compared to those without depression. IL-9 is a pleiotropic cytokine with anti-inflammatory effects. IL-9 has been associated with asthma, atherosclerosis, Hodgkin's disease, and cancer in humans<sup>22</sup>. However, to the best of our knowledge, there are only few studies available assessing IL-9 in the context of depression or anxiety symptoms. A

previous clinical study has observed that IL-9 cytokine correlated positively with prenatal depressive and overall anxiety symptoms<sup>16</sup>. Another study conducted on *post-mortem* brain tissues samples showed that IL-9 was over-expressed in the brains of depressed people<sup>15</sup>. Additionally, animal study conducted on mice has demonstrated IL-9 to be commonly reported cytokine in depressive like behaviors that were associated with local distinct neuroinflammation<sup>23</sup>.

Depression is one of the most neglected symptoms in diabetic patients and is directly linked with lowering the QoL<sup>24</sup>. The present study demonstrated significantly poorer QOL in diabetics with depression as compared to those without depression. Our finding is in line with previous literature. Cross-sectional studies have demonstrated a poor QoL in diabetic patients with depression as compared to patients without depression<sup>25</sup>. A similar case-control study showed lower QOL in diabetics with depression as compared to patients without depression<sup>26</sup>. Moreover, several cross-sectional studies have also demonstrated lower scores of QOL in diabetics<sup>27</sup>.

Our study has several limitations that need to be mentioned. Some of the data, such as duration of T2DM, exercise, BMI and age were self-reported or were obtained from the patients' medical records. This could have led to recall bias. As this was a case-control study, no causal relationship can be inferred. Lastly, the sample size was small which might not represent all diabetic patients.

In conclusion, this study showed positive association between depression and IL-1 $\beta$ , IL-9 in T2DM patients. Additionally, diabetic patients have poorer quality of life, which is further worsened by the presence of depression. The strength of the relationship between lifetime experience of depression and diabetes risk suggest that intervention designed to lessen the burden of diabetes should focus on depression that occurs at any time moment over a person's lifespan instead only that which is found immediately at the time of diabetes diagnosis or treatment.

## ACKNOWLEDGEMENTS

## A Survey on Awareness of Probiotics Knowledge and its Consumption among Student Population in a University Campus

*Sonam Bhatia, Sabreena Shafi Shiekh*

### Abstract

Probiotics are important pharmaceutical substitutes required for maintenance of gut health. In the present context, as the drug resistance for infectious pathogens is increasing, at alarming rate hence, it has become a dire need to boost up the immunity level so as to fight against infections. Therefore, the knowledge regarding use of probiotics has relevance among each of us. With this motive, a knowledge based survey was conducted among students residing in university campus and few other higher degree professionals to gather data regarding awareness on probiotics. The respondents of the study were majorly students; hence, an analysis was done among student subcategory only. A questionnaire-based survey was framed, which had variety of questions comprising general familiarity about the term "probiotic" and its different available products, technical know-how, their sources, use, effectiveness, etc. The data analysis was carried out using Microsoft Excel and SPSS software. The study shows that students from life science and paramedical courses are extremely familiar of the term probiotics (~40 to 50 %). Rest of the respondents, have learnt it from sources like newspaper or TV, however they did not know technical specifications necessary when purchasing these products. However, most of the respondents are quite familiar with Yakult product among various marketed probiotics products. Further, more interestingly students knew that food and supplements are the sources for probiotics but still there is a lack of proper understanding regarding concept of probiotics and its use in pharmaceuticals.

## Abstract

**Background:** Although several studies have been conducted and several articles have been published on India's new clinical trial regulations, very few have examined the views of investigators and ethics board members regarding modifications to the previous regulations. Overall, they have neglected to find out the opinions of other relevant professionals, such as research assistants, coordinators, associates, and managers. To our knowledge, no study has yet investigated the awareness and opinions of Indian research professionals on the new 2019 regulations.

**Objective:** This study aims to describe the awareness and opinions of Indian research professionals on the new drug and clinical trial regulations.

**Methods:** In this cross-sectional, Web-based study, we will conduct an open survey for various Indian research professionals. These professionals will be selected randomly using multiple sources. The survey questionnaires, which have already been validated, were developed using the form function in Google docs. A Web link was generated for participants to take the survey. Descriptive statistics will be shown as means and standard deviations for constant variables, whereas certain variables will instead be shown as numbers and percentages.

**Results:** The survey was opened in July 2019. Enrollment has already started and will be completed in three months. The results calculations are expected to begin in October 2019.

**Conclusions:** The results of the survey are expected to represent the views of research professionals on the new regulations that will support the development of clinical research and the pharmaceutical industry in India. These regulations are expected to help advance clinical trials, help with the approval of new drugs, and enhance ethical norms in the country.

online survey; professionals; clinical trial; rules

## Introduction

### Background

In India, the clinical trials industry has exemplified rapid growth in the last few years, driven by economic globalization, and is thus one of the most promising economic sectors in the country [1]. This rapid growth of clinical trials may be attributed to the outsourcing of clinical trials to India by various multinational pharmaceutical organizations [2]. Furthermore, the availability of infrastructure, such as comprehensive treatment, a broad spectrum of prevalent disorders, ethnic variation, English-speaking health care specialists, and medical and information technology, provides proper conditions for conducting clinical trials in the country [2]. However, reports of irregularities in the administration of clinical trials has overshadowed the flourishing of the industry [2,3]. These ethical violations in the industry have exposed loopholes in the regulatory system, which has led to it struggling to oversee clinical trials effectively [4,5].

Due to this, the loopholes of the regulatory system were amended in 2016 by Indian authorities to strengthen the regulatory mechanisms for reviewing clinical trials. These amendments were issued based on a high level of scrutiny, significant media attention [6], the involvement of non-governmental organizations [3], hearings in the Supreme Court, and the recommendations of an expert committee [7]. Details of these three back-to-back amendments and their associated challenges have been summarized elsewhere [8-11]. Furthermore, two pilot studies have detailed the knowledge of investigators and members of ethics boards regarding the impact of these regulations [12,13].

Recently, new regulations were issued in 2019 [14], which involved amending the 2016 regulations [8] to bring further changes in the clinical research sector. These rules have focused on clarifying the terms of clinical trials of new drugs and phase IV trials, and of clarifying post-trial access to new drugs, clinical trial approval validity, equality, compensation, and monitoring, which have all been described elsewhere [15]. To our knowledge, no study has thus far described research professionals' awareness and opinions regarding these new rules and regulations.

### Objectives

The purpose of this survey is to describe the awareness and opinions of research professionals on the new drug and clinical trials regulations.

### Hypothesis

We hypothesize that most Indian research professionals will be aware of, will welcome new changes to, and will agree that these new changes will speed up clinical trials, new drug approval, and improve ethical standards for clinical trials in the country. Also, they will aid with the expansion of clinical research and the pharmaceutical industry in India.

## Methods

### Overview

The methodology used in this survey is based on previous studies [16-18], and on the Checklist for Reporting Results of Internet E-Surveys (CHERRIES) [19].

### Ethics

The Institutional ethics committee was notified about the intended survey and excused from the review. This study does not require the informed consent of participants because this is an observational survey involving no risk or minimal risk to participants [20].

### Design

A cross-sectional, online survey design will be adopted to collect the data. No data which directly identifies any of the participants will be collected, but data that indirectly identifies participants, such as demographic information (eg, age, gender), will be collected. Mean, or range will be used to represent age, and counts/percentages will be used to show gender. We will select participants from different sources, including databases (eg, Clinical Trial Registry India, Indian Society Clinical Research, and the Central Drugs Standard Control Organization), personal networks, hospitals, institutions, and LinkedIn.

### Participant Eligibility Criteria

Those who are eligible to take part in this survey include research professionals. For this study, a research professional is defined as research investigators, members of ethics committees, assistants, coordinators, associates, and managers who have engaged in clinical trials in India. The number of target participants for this survey will be 80-100. Participants will be chosen randomly to avoid any selection bias.

### Data Collection

Validated questionnaires were selected from previous studies [12,13] and obtained from the respective authors or journals with their approval for use in the present project. Each questionnaire was developed using the form function in Google docs, which is a widely used and free survey tool [21]. A link was generated to enable participants to take the survey online [22]. The Google form feature of a limit of one respondent per email (respondents will be required to sign into Google) was enabled to prevent multiple entries from the same people. The "required to answer" feature was also enabled for each question, except for the following question: "If you are a member of the ethics committee, what is your role?"

The survey was announced on LinkedIn [23]. An email or message with a website link was sent to participants on LinkedIn to request that they complete the online, self-administered questionnaire. Participants' participation in this survey is entirely voluntary and anonymous. Therefore, it does not require participants to provide a name or any other identifying information, except for age and gender. Email reminders will be sent to all the participants to ensure the maximum possible number of responses. Respondents will be able to review and change their answers before clicking on the submit button at

the end of the form. All the responses will be accessible by only the study investigator.

### Outcome

The outcome of this will be an enhanced understanding of research professionals' awareness and opinions of the new clinical trials rules that came into effect in 2019.

### Statistical Analysis

Descriptive statistics will be estimated for continuous variables, whereas counts and percentages will be shown for categorical parameters. These data will be utilized to describe the awareness and opinions of the participants. *Post hoc* tests, such as the independent one-tailed *t* test and chi-square test, will be employed to test the significance of continuous and dichotomized parameters, respectively. Missing data will be explored in future studies, as appropriate. Results will be presented through graphs or tables. An analysis will be carried out utilizing SAS version 9.2 for Windows (SAS Corporation Inc, North Carolina, USA).

## Results

The enrollment of Indian research professionals will begin from multiple sources in July 2019 and is expected to end in November 2019. The results evaluations are expected to start in October 2019. The survey questionnaires being used in this project were previously validated by other studies [12,24], and approval was obtained for their reuse. The demographic characters of the respondents, such as age, gender, and region in India, will be presented in a table. The awareness and opinions of the respondents will be summarized in tables and illustrated as a pie chart.

## Discussion

### Primary Findings

This study, using a Web-based, online, open survey, aims to investigate the awareness and opinions of Indian research professionals who have engaged in clinical trials regarding the new rules put into place in 2019. It is crucial to understand the awareness and opinions of Indian research professionals, as they act as communicators and are a bridge between sponsors

and patients. Therefore, understanding the awareness levels and opinions of these research professionals is crucial to determine whether clinical trials are being conducted per the new rules. Furthermore, considering the new directives, these professionals play a crucial role in addressing and reporting unethical clinical trials on vulnerable populations in India.

This open survey will be conducted online, so it will not be necessary to meet participants at any point physically. The survey will need about 10 minutes to complete. Participants will be able to take the survey on their mobile devices or their computers. Participation in this survey will be voluntary and anonymous, which is expected to boost the response rate.

The findings will expand the current knowledge base regarding the awareness and opinions of various Indian research professionals on the new clinical trial regulations, and allow for comparison to the findings of previous studies. Some professionals may have a higher level of awareness of the regulation now or may even have changed their perspectives regarding the recent amendments to Schedule Y of the Drug and Cosmetic Act.

### Limitations

Nonetheless, this survey has some limitations. First, the survey will be taken by only a specific sample within the population. Therefore, the results cannot be generalizable to the whole population of India. Second, self-administered questionnaires may introduce some level of social desirability bias. Finally, the surveys are limited by their cross-sectional design, which allows us to determine the association but not causality.

### Conclusion

At present, there is a significant lack of clarity on the awareness levels and opinions of various clinical research professionals in India regarding the new rules. Findings from this study will fill a glaring gap in the literature by providing a knowledge base regarding views of the new rules. The findings may improve the ethical and quality standards of clinical trials, which will further benefit the expansion of the clinical research and pharmaceutical industry in India by speeding up clinical trials, the approval of new drugs, and protecting patients, especially vulnerable ones.

**Abstract**

**Objective:** The main objective of the study was to measure the association of quality of life between anxiety and depression in patients with chronic rheumatic heart disease.

**Methodology:** Psychometric assessment (anxiety and depression) of the subjects was measured using HADS. Clinical data were collected from the Department of Cardiology OPD of Safdarjung Hospital, New Delhi. A total of 500 RHD patients and 100 healthy controls were included in the study based on inclusion and exclusion criteria. Data analysis was performed with Chi square test and ANOVA using IBM SPSS version 22.

**Findings:** Almost 80% of the subjects were suffering from moderate RHD, and 20% were suffering from Severe RHD. Most cases of RHD were suffering from moderate anxiety and depression levels. Among all the variables of SF-36 questionnaire, only pain was only variable associated with anxiety. None of the SF-36 variables was associated with depression in patients with RHD.

**Conclusion:** It was seen that high levels of anxiety and depression levels are present in patients with RHD. It was also observed that the high anxiety levels in the RHD patients can also be a major cause of depression in patients. The factors related to the disease like physical pain, social functioning, and general health causes high anxiety and depression in the patients when the disease prevails over a long time.

**DOI:** 10.6092/2282-1619/2019.7.2164

**1. Introduction**

Rheumatic Heart Disease (RHD) is a condition that is initiated by the rheumatic fever and results in damaged heart valves of the affected individual. Rheumatic fever is generally caused by group A streptococcal bacterial infection (Marijon et al., 2012).

According to a recent report, there were 15.6 million of existing cases of RHD and each year 233,000 number of deaths caused by RHD and 282,000 new RHD cases were reported globally (Watkins et al., 2017). The epidemiological data presented by the author revealed that the disease

is more prevalent in developing countries due to lack of prevention strategies and poor medical facilities. Today, RHD is almost absent in developed regions such as Europe and North America, but it is still present in parts of Africa, the Middle East, Central, and South Asia, and South Pacific (Carapetis et al., 2016; Pilgrim et al., 2012).

In India, RHD burden is causing an enormous amount of money to be spent on its cure prevention and treatment (Ramakrishnan et al., 2012). Nearly, 20%-25% of the global RHD burden is caused by India. RHD can also be impacted by the psychological aspects over a prolonged time of prognosis. These psychological morbidities negatively impact the neural functioning of the patients causing the low quality of life (Alvarenga & Caldeira, 2009). Results from World Mental Health Survey conducted in 17 countries showed that the specific anxiety disorders (generalized anxiety disorder, panic/agoraphobia, social phobia and post-traumatic stress disorder or PTSD) were generally less prevalent than major depression. Among persons with heart disease, the prevalence of generalized anxiety disorder (GAD) ranged from circa 0.3% in Lebanon to about 5% in Ukraine, US and France (Ormel et al., 2007). Similar data are not available in India.

Various tools such as Hospital Anxiety and Depression Scale (HADS) and Quality of Life (QoL) are used to measure the anxiety and depression in the patients of RHD. HADS is a tool to identify and quantify anxiety and depression (Christoph, 1997). QoL and cognitive functions in RHD patients is reduced in all patients, and it can be assessed by using the Short Form 36 (SF-36) health survey (Idorn, 2013). In India, data regarding QoL associated with anxiety and depression in patients with RHD is scarce. Hence, this study was aimed to measure QoL associated with anxiety and depression in patients with chronic RHD.

## **2. Methods**

Patients with RHD aged >18 years and both sex with at least one year of the duration of the disease were included in the study as case. For control group subjects with age >18 years, both male and female and without RHD were included. The patients were excluded if they were participating in other studies, suffering from other co-morbidities, and refused to participate in the study. Informed consent was obtained from both case and control.

### **2.1 Methodology**

All the data was collected at the Department of Cardiology, Safdarjung Hospital, New Delhi during the period of February 2017 to June 2018. Subject HADS and SF-36 questionnaire were taken from the subjects for both case and control.

Subjects were studied for the RHD based on history, physical examination, and echo cardiogram.

#### Hospital Anxiety and Depression Scale (HADS)

The HADS is a self-reporting scale used to measure anxiety and depression in a general medical population of patients. It is simple and easy to use. The questionnaire comprises of seven questions for anxiety and seven questions for depression, and takes 2–5min to complete. Variables used for HADS consists of physical functioning, role limitations due to physical health, role limitations due to emotional problems, energy, emotional well-being, social functioning, pain, general health, and health change (Stern, 2014).

#### Short form 36 (SF 36)

The 36-Item Short Form Health Survey questionnaire (SF-36) is a very popular instrument for evaluating Health-Related Quality of Life. The SF-36 measures eight scales: physical functioning (PF), role physical (RP), bodily pain (BP), general health (GH), vitality (VT), social functioning (SF), role emotional (RE), and mental health (MH). Component analyses showed that there are two distinct concepts measured by the SF-36: a physical dimension, represented by the Physical Component Summary (PCS), and a mental dimension, represented by the Mental Component Summary (MCS). All scales do contribute in different proportions to the scoring of both PCS and MCS measures (Saris-Baglama RN et al., 2010).

## **2.2 Safety measures**

Vital signs and electrocardiogram of the subjects were evaluated as a safety measure. Vital signs included health issues and other physiological issues, including heart rate and its activities.

## **2.3 Ethical considerations**

The study was ethically approved from the Institutional Ethics Committee of Safdarjung Hospital, New Delhi to conduct the research. The data containing the names and disease history of all the patients involved in this study were kept highly confidential. All the clinical data and personnel files of the patients are only accessible to the study personnel to maintain the confidentiality and authenticity of the research. Informed consents were taken before the participation of the subjects.

## **2.4 Statistical analysis**

Data were presented as frequency, percentage, mean, and standard deviation wherever applicable. Chi square test was used to compare Analysis of variance (ANOVA) was used to compare anxiety and depression categories across demographic and SF-36 domain. P value

<0.05 was considered significant. All the statistical analyses were performed by using IBM SPSS version 22.0 software.

### 3. Results

Five hundred patients with RHD after they followed inclusion criteria were included in the study. General characteristics of the patients have been shown in table 1. The patients' age ranged from 18 years to 75 years with a mean age of 35.77 years. 95.8% of the patients aged between 21 to 60 years. Mean duration of treatment of RHD for the patients was  $5.3 \pm 2.2$  years. We observed that the majority of the patients (52.4%) were receiving the treatment between 5 to 8 years.

**Table 1.** General characteristics (n=500)

	n (%)
<b>Age (Years)</b>	
<20	18 (3.6%)
21-60	479 (95.8%)
>60	3 (0.6%)
<b>Sex</b>	
Male	271 (54.2%)
Female	229 (45.8%)
<b>Duration of treatment (Years)</b>	
<5	199 (39.8%)
5-8	262 (52.4%)
>8	39 (7.8%)

#### 3.1 Anxiety and depression

Table 2 and Fig 1 show anxiety and depression in the patients and healthy controls. We observed that 87% of the patients had borderline to abnormal anxiety and 78.6% of patients had borderline to abnormal depression. Borderline to abnormal anxiety and depression was observed in 80% and 97% healthy controls respectively.

**Table 2.** Distribution according to anxiety score among cases and controls

Anxiety	Group	
	Cases	Controls
Normal	61	20
	12.2%	20.0%
Border Line	217	64
	43.4%	64.0%
Abnormal	222	16
	44.4%	16.0%
Total	500	100
	100.0%	100.0%

### 3.2 Association of sex with age, treatment of disease, anxiety, and depression

Table 3 shows the association of sex with age, treatment of disease, anxiety, and depression. We observed that age ( $P=0.228$ ), treatment duration of disease ( $P=0.475$ ), anxiety ( $P=0.879$ ) and depression ( $P=0.215$ ) were comparable between male and female groups.

**Table 3.** Association of sex with age, treatment of disease, anxiety and depression

	Male, n(%)	Female, n(%)	Total, n(%)	P Value
<b>Age Group (Years)</b>				
< 30	79 (29.2)	82 (35.8)	161 (32.2)	0.228
30-40	96 (35.4)	85 (37.1)	181 (36.2)	
40-50	83 (30.6)	51 (22.3)	134 (26.8)	
50-60	12 (4.4)	9 (3.9)	21 (4.2)	
> 60	1 (0.4)	2 (0.9)	3 (0.6)	
<b>Duration of Treatment</b>				
< 5 years	152 (56.1)	130 (56.8)	282 (56.4)	0.475
> 5 years	119 (43.9)	99 (43.2)	218 (43.6)	
<b>Anxiety</b>				
Normal	33 (12.2)	28 (12.2)	61 (12.1)	0.879
Border Line	115 (42.4)	102 (44.5)	217 (43.4)	
Abnormal	123 (45.4)	99 (43.2)	222 (44.4)	
<b>Depression</b>				
Normal	56 (20.7)	51 (22.3)	107 (21.4)	0.215
Border Line	122 (45.0)	116 (50.7)	238 (47.6)	
Abnormal	93 (43.3)	62 (27.1)	155 (31.0)	

### 3.3 Association of Quality of life with anxiety and depression

The patients were also analyzed by the SF-36 questionnaire. It comprises of 36 items in 8 domains: Physical functioning, Role-physical functioning, bodily pain, general health, vitality, social functioning, role emotional functioning, and mental health.

The SF-36 generates a total score for each domain. The score is transformed into a value on a scale ranging from 0 to 100, where better health status is designated through a higher score value.

We observed that only pain variable was found to be a risk factor for anxiety (table 4), while none of the variables was associated with depression (table 5).

**Table 4.** Association of Quality of life with anxiety

		<b>n</b>	<b>Mean</b>	<b>Std. Deviation</b>	<b>F-test</b>

#### 4. Discussion

There is various availability of questionnaires which have been developed and validated to evaluate quality of life, data of QoL assessment in patients with RHD is scarce. RHD is a major burden in developing countries like India where it is one of the most common causes of cardiovascular morbidity and mortality in young people (Marijon et al., 2012).

Patients diagnosed with the disease experience severe difficulties due to complications caused by this disease such as atrial fibrillation (Diker et al., 1996), stroke, (Wolf, Abbott, & Kannel, 1991) and consequently often have problems in maintaining normal daily activities.

The present study demonstrated that quality of life in terms of pain and physical functioning was associated with anxiety while depression was not associated with quality of life in the patients with RHD. Patients with chronic RHD had been shown to have intellectual decline (Khalil, Mansour, & Attaia, 1998).

It has been reported that the patients with heart failure experience various physical and emotional symptoms such as dyspnea, fatigue, edema, sleeping difficulties, depression, and chest pain (Zambroski et al., 2005). These symptoms limit patients' daily physical activities and result in poor QOL (Rector, Anand, & Cohn, 2006). Bodily pain is one of the major manifestations of rheumatic fever that lead to sleeping difficulties in patients. Although heart diseases cause a significant impact on physical health from the medical point of view (Guyatt, 1993), most studies on quality of life also reported low scores in the psycho social aspects (DeMaso et al., 2004; Ruo et al., 2003). Adolescents with severe heart disease reported a higher level of anxiety and depression as compared to the age-matched healthy controls (Cohen et al., 2007).

Study on QoL in adults with congenital heart diseases showed that inoperable conditions had a trend towards a poorer quality of life (Varni, Limbers, & Burwinkle, 2007). Lane et al. (2002)

showed that arthritis and RHD negatively affected several sides in QoL, such as the work, and home activities compared to individuals without chronic disease. Regarding cognitive problems, it was observed that individuals with rheumatic fever may exhibit profound reversible cognitive problems, such as poor attention and concentration (Carapetis, 2008).

In our study, QoL was not associated with depression. However, a study suggested that depressed patients with cardiac heart failure (CHF) scored significantly worse than non-depressed patients on all components of Kansas City Cardiomyopathy Questionnaire measuring quality of life. Depressed CHF patients may perceive their quality of life to be lower and to underestimate their functional status.

Depression is less investigated in association with quality of life in cardiac disease (Gottlieb SS et al., 2004). Severity of anxiety has also suggested in the patients with osteoporosis and chronic breathing disorders (Kunik et al., 2005; Martino et al., 2018).

The findings also conclude an association between physical functioning, role physical functioning, bodily pain, general health, vitality, social functioning, role emotional functioning and mental health with anxiety and depression among the RHD patients. Therefore, anxiety and depression may be considered as a co-morbid effect of RHD, especially in economically backward patients. This implies that the patients generally belonging to the middle class or low-income families with RHD are impacted by anxiety and depression. Anxiety and depression in patients with Chronic RHD are therefore inter-related.

The current study had a few limitations as well. We used the English version of the SF36 questionnaire, and more than 90percent of our patients could not understand it and were unable to answer, so we had to take direct interviews afterward.

The data collected was from the patients of north region only, so we didn't know if the different region and environment will have the same effect.

## **5. Conclusion**

RHD is associated with a lower quality of life in patients. Anxiety and depressions in patients with RHD are associated with external and internal conditions. External conditions include work life, personal life, financial issues, and others, while the internal issues include co-morbid health condition and prolonged diseases. Anxiety and depression in patients with Chronic Rheumatic heart disease are inter-related with the quality of life.

## An Eco-Conscious Awakening - A Socio-Eco-critical Elucidation of Select Indian Poets

Rashmi Maniar & Priya Raghav

### Abstract

In the last few decades, Indian English poets have penned down many a verse pertaining to popular subjects such as social activism, environment, eco-consciousness etc., with censorious compassion and candor. India is home to a rich cultural tradition of deifying each and every element of nature. This oriental view was negated by the occidental view of man's supremacy over nature. The advent and further rise of Christianity created an anthropocentric view of nature which further led to the earth's natural resources being pilfered, pillaged and raided. Not one to be left behind, Indians too, explored, excavated and experimented with its natural resources. This act helped in awakening the consciousness of nature lovers like Dilip Chitre and Vihang Naik to pick up their pens and voice their concerns against impending ecocide of man. They used poetic techniques and expression in such a manner so as to create awareness amongst the readers about the actual endangerment of community life. Both Chitre and Naik's approach in this direction, lies in the usage of satire heavily layered with cynicism, in their verse. The readers readily empathize and sympathize with the poet's pain of denuding nature. Thus, they project human responsibility towards caring for and protecting the environment. This paper is an endeavour to showcase the perceptions of these two poets on how they resist and raise the green movement to a level where it awakens eco-consciousness in the society through their poems "The Felling of the Banyan Tree" and "The Banyan City".

**Keywords:** Eco-criticism, Nature, Human, Anthropocentrism, Eco-consciousness

**Introduction:**

I didn't heed, I don't heed and I won't heed....  
The painful cry of the fish in the oil filled ocean  
The angry outbursts of nature when trees are cut  
The trembling of the ground when mines are dug  
The sudden silence of the chirp of the sparrow killed midflight  
The towering, irate waves resounding sworn vengeance  
The cloudy black sky, hurt, due to the loss of her beauty  
I didn't heed, I don't heed and I won't heed....  
But today,  
You, Corona, dumb than the dumbest of creatures  
Have brought me to my knees....  
'Me', the cleverest of all the clever creatures  
I don't know where to run, to hide, to save myself and my loved ones  
I don't know how to stop your roller coaster ride  
Oh! Corona, please stop  
You, oh tiny one! Have humbled the giant!  
I promise to heed, to love, to care, to have compassion  
I promise to leave the Earth 'safe', for my children  
For, it's our only HOME that we know of.

Today, when this tiny bug has heeled the world and brought it to a standstill, it becomes imperative for all of us to retrospect. In this forced period of cooling our heels and slowing down, let's all recollect our past deeds, act by act, scene by scene, that has helped in inching forward towards doomsday. Something which began with foraging for food went on with ruthlessly violating Mother Nature for our greed. These deeds or rather misdeeds have brought us to the brink of disaster. Our anthropocentric attitude of dominating nature has thus led to a new theory of reading nature writing in the last decade of the nineteenth century, known as Eco-criticism.

## Origin of Eco-criticism

Eco-criticism is a comparatively new literary field which emerged in 1990, it traces its origin to environmental degradation by human activities and investigates, interprets man's relation with the nature as presented in literature. It is an interdisciplinary study of interconnections between nature and culture; it examines relation between writers, texts and the ecosphere. The word 'ecology' has been derived from the Greek root 'oikos', means 'house' and 'logos' means 'study of', so 'ecology' is the study of the house/home or relationship between organisms and the environment. Thus, Eco-criticism is the criticism of 'house' or the environment, as represented in literature. In the mid-eighties, scholars began to embark on collaborative projects in the field of environmental literary studies; also, several annual literary conferences started adding sessions on nature writing or environmental literature to their program. At the annual meeting of the Western Literature Association, a new Association for Study of Literature and Environment (ASLE) was formed in 1992, with the mission: "to promote the exchange of ideas and information pertaining to literature that considers the relationship between human beings and the natural world" and to encourage "new nature writing, traditional and innovative scholarly approaches to environmental literature, and interdisciplinary environmental research." This then, is the origin of eco-criticism.

The credit of coining the term 'Eco-criticism' goes to William Rueckert, while, it was Cheryl Glotfelty who worked towards introducing this movement to most literary critics. Glotfelty's persistent efforts to include Eco-criticism in the family of literary studies finally bore fruit at the Western Literature Association meeting in 1989 (Dorbrin & Weisser, 2002, p. 569) The term 'eco-criticism' was coined by William Rueckert in 1978, in his essay "Literature and Ecology: An Experiment in Ecocriticism" where he says that eco-criticism entails "application of ecology and ecological concepts to the study of literature" (Glotfelty and Fromm xx). He calls upon each individual to become conscientious planet stewards and engage in creative and cooperative activities to shoulder the responsibility of the entire

biosphere, but, a question arises how? The answer lies in turning to the poets and then to ecologists so as to formulate ecological poetics which will help in promoting an ecological vision. An ecological vision will help merge all political, social economic and technological boundaries and thus radicalize them. Rueckert says, 'Poems are energy pathways that sustain life...properly understood, poems can be studied as models for energy flow, community building and ecosystem ... Poems are green plants among us...green plants are nature's poets'.

Thus, turning to these nature's poets who in turn have inspired many a poet to turn to verse in glorifying and deifying nature, this paper tries to eco-critically elucidate the poems of two Indian poets who are bilingual i.e. they write in their mother-tongue and in English. Through their poetry, Dilip Chitre and Vihang A. Naik endeavor to portray the coexisting relationship between man and nature and their attitudes and reactions to each other. Their perceptions and perspectives are similar to the point that both of them lay emphasis on the preservation of environmentalism and try to impart or inculcate values amongst the readers to respect and revere nature.

### **Social Ecology**

Social ecology is a theory associated with Murray Bookchin. Early in the 1960s, even before Rachel Carson's 'Silent Spring' was published, Bookchin's book, "Our Synthetic Environment" was published on the theme of humanity's collision course with the natural world and the effects of urbanization on human life. In his book, "The Ecology of Freedom"<sup>1</sup> he maintains a connection between ecological and social issues, he argues that social domination between humans is the principal cause for human domination and further destruction of nature. Bookchin's social ecology proposes "ethical principles for replacing a society's propensity for hierarchy and domination with that of democracy and freedom".<sup>[2]</sup> A critique of prevailing socio-political and anti-ecological attitudes, social ecology presents a reconstructive, ecological, communitarian and ethical approach to society. In this paper I shall

attempt to uncover the ecological consciousness reflected in the poems of Vihang A. Naik and Dilip Chitre.

### **'Nature' in Dilip Chitre's poetry**

There is a whole tree within a seed  
And a seed at the end of each tree  
That is how it is between you and me  
One contains the Other.

"Says Tuka" (Penguin Classic) – translated by Dilip Chitre from Saint Tukaram's bhakti poetry.

This abhang is the most appropriate description of the multi faceted Dilip Purshottam Chitre. He was an acclaimed poet, painter, fiction writer, translator etc., whose reputation overshadowed his demise in 2009. He wore all the hats with equipoise, doing justice to each field. He was a prolific poet in Marathi and English who started placing his thoughts into verse at a young age of fourteen. For him, poetry was like a survival kit in the dangerous journey through life. He embarked upon his literary career with his work in a Marathi magazine. Arun Kolatkar, Ramesh Samarth and Chitre created a magazine entirely devoted to poetry.

His Marathi collections are: Kavita (1960), Kavitenantarchya Kavita (1978), Ekoon Kavita that was published in three successive volumes. He has also published poems in English as: Ambulance Ride (1972), Travelling in a Cage (1980), The Mountain (1998), No Moon Monday On The River Karha (2000), Postclimactic Love Poem (2005), and As Is, Where Is (2007). His poetry consists of simple words used sparsely to create beautiful imagery which fills the mind of the readers with pictures. His awards speak of a distinguished and esteemed career.

His poems contain the angst of urbanization, ill effects of technological development, progress in science, deforestation etc., For him society is a 'wretched hill' / '*bhunda tekkad*'. In his Marathi book entitled *Satthottari Marathi Kavita Va Kavi* (1997), R. G. Jadhav, the well known Marathi critic, makes a comment on the symbol of the 'wretched hill' used for society by Dilip Chitre and provides an elaborate assessment of Chitre's Marathi poems in the context of ecological enlightenment of the post 1960s. B. S. Magade, in his Research Paper entitled "Dilip Chitre's Poetry: Through a Green Lens" (2009), has examined Chitre's English poetry in terms of an ecocritical perspective. His deep feeling for nature and ecological concern is evident in his poem "The Felling of the Banyan tree."

### **Eco-criticism and "The Felling of the Banyan Tree"**

"The Felling of the Banyan Tree", is an autobiographical poem where Dilip Chitre has used the banyan tree as a metaphor for a major upheaval in his life. The poet's father decides to uproot the poet from his surroundings, in Baroda, and migrate to the industrial city of Mumbai. The poem expresses feelings of alienation and isolation of man due to his estrangement from nature (or his surroundings).

Eco-critically viewing the poem, the poet symbolizes his father as the exploiter with an anthropocentric attitude of manipulating nature. The poem is composed in three stanzas. While the first stanza describes the relationship between Nature and the Feminine Vs Masculine world, the second stanza portrays the attack on Nature; the third stanza describes the consequences of deforestation on the animals and birds. It talks about the narrator's house situated on a hill surrounded by houses which have been vacated by the tenants and subsequently destroyed, on his father's behest. What remains now, is the narrator's house and many trees atop the hill. The father decides to cut all the trees, including the huge banyan tree which is nearly two hundred years old. The poet's father signifies the masculine attitude of dominance, destruction and moving forward towards modernism as compared to the grandmother's feminine traits of conservation, religious, nurturing and strong belief

in our ancient values and traditions. She raises her voice against the assault on nature due to modernization. This conforms to the poet's eco-feministic view that while man is the guardian of culture, woman is the guardian of nature. Just as humans dominate nature, men dominate women as is seen in the poem, the poet's father did not heed the grandmother's advice. Vandana Shiva has very succinctly opined, "Indian women have been at the forefront of ecological struggles to conserve forests, land and water. They have challenged the western concept of nature as an object of exploitation and have protected her as Prakriti, the living force that supports life."

In the first two lines, the poet has used the word "house" instead of "home", to imply the temporary nature of human stay on earth. The conflict between the older generation represented by the grandmother and the new generation represented by the father is clearly evident in the poem. The grandmother maintains sanctity of nature, she vehemently opposes the callous chopping of trees as it is a 'crime' yet, the father adamantly 'massacred' them 'one by one'. The poet's usage of words like 'demolished', 'massacred' vividly paints a scene of destruction in the reader's psyche. All types of trees were cut down 'but the huge banyan tree stood like a problem' whose roots lay deep in the soil. Our ancient, deep rooted values of respecting nature is metaphorically shown as a problem by the poet, in the father's blind rush towards urbanization. Right from the Vedic period, we have a rich history of deifying, glorifying, worshipping and caring for each and every element of nature. The deep rootedness of the banyan tree is compared to the poet's attachment to his house or grandmother's attachment to nature which is inversely proportional to the father's attachment to the land. The father's greed for his cruel technological assault on nature overpowers his grandmother's need to preserve nature. The poet displays a socio-ecological perspective of the grandmother's helplessness in saving her sacred trees from the father's act of chopping them away, may be for economic gain.

The poet describes the banyan tree using many numbers (fifty feet, thirty feet....) to explain the height and width of the gigantic tree. To paint a true picture of its magnificence, the poet says that it took many days and a number of men to cut the tree. The tree was an ecological haven for the insects and birds that began to leave in despair when men attacked innocent nature with their axes and reduced it to a "huge heap". This scene haunts the poet in his dreams even after shifting to Bombay, a land of technology, where trees are found only in the subconscious mind.

### **'Nature' in Naik's poetry**

According to Wordsworth poetry is "spontaneous overflow of powerful feelings: it takes its origin from emotion recollected in tranquility. ...". For Vihang A. Naik, poetry is a "fusion of thought and feeling". Poetry is an excellent way to express one's inner most feelings in the form of verse. His poetry is a fine amalgamation of his view of life and keen observation and deep study of the relationship between man and nature. Taking an eco-sociological perspective, his poetry deals with the effects of urbanization on nature and how it helps man find his true identity in a techno cultural society. Thus, his poetry is a dialogue between man's external self and inward soul in a modern society. When a poet uses his pen to take the readers on a fascinating exploration of human consciousness through the rich experience of the trials and tribulations, success and failures that he himself has faced, he surely strikes a deep chord with his readers and the verse remains in their hearts and minds for eternity. Vihang A. Naik is one such poet who has achieved this remarkable feat and is held in high esteem for his poetic excellence. At times, he uses his poetry as a medium to portray a realistic outlook of society and its norms through multiple perceptions. His expertise lies in sparsely using simple words to expose elementary feelings of the human mind and paint a satirical picture of society. A distinct pursuit of spiritual and physical freedom combined with an intense desire for creation is the central theme of his poetry.

Vihang Naik is a well known post modernist poet devoted to Indian literature. His poetry depicts the unjustified misuse and abuse of our natural resources due to the growing industrialization. His four collection of poetry includes 'Poetry Manifesto: new and selected poems' (2010), 'Making a Poem' (2004), 'City Times and other poems' (1993). His Gujarati collections of poems are entitled as 'Jeevangeet' published in the year 2001. His poems are his mouthpiece to shake the natural consciousness of human beings to get up and work towards the preservation of natural resources because their activities have brought our ecosystem to a verge of near destruction. In 1998, he was awarded the Michael Madhusudan award for poetry. In this context, the present paper attempts to offer a critical evaluation of Vihang A. Naik's "A Banyan City" from his poetry collections. The main focus is upon the poet's perception and appeal to humans to go back to nature and appreciate all that it offers.

### **Eco-criticism and "The Banyan City"**

We, humans, are the most intelligent and an integral link of the ecological cycle and thus it is our moral responsibility to care for the environment. But, for centuries we have been repaying the generosity of Mother Nature by destroying her natural beauty, by replacing her beautiful forests full of flora and fauna with concrete jungles. We have become sworn enemies of the environment in general and humanity in particular. Our quest for more and more modern comforts, our insatiable thirst for knowledge, our hunger to lead an everlastingly happy life has led to the direct or indirect destruction of elements of Nature. Vihang Naik's poetry is a true representation of this destruction and stresses on the importance of natural conservation. The poem, "The Banyan City" thus speaks on themes of urbanization, death and rebirth. The poet uses a simple, sober and restrained tone and takes his readers into confidence to create a bond with them. Naik uses an extended metaphor and parallel imagery to compare a city with an old banyan tree. Brevity of words is the poet's trademark and he uses it to create vivid images which create a turmoil in

the minds of the readers regarding the 'hacking' of the tree and the after effects of modernization.

The poem begins with the seemingly innocuous statement that it is difficult to uproot a banyan tree, these lines are followed by sudden violence with "chop or hack" in the fourth line. The poem is composed so as to bring about the suddenness of the action; the usage of enjambment vividly portrays the speed of the act needed to uproot the banyan tree. The lines that follow slacken the speed of the poem and take the readers back about a hundred years in time. The tree metaphorically relates to the history of the poet's native city. The tree as well as the city have become old and lost their splendor. The visual image created by the alliteration "withered/wrinkled/weather-beaten" shows effect of time and the elements of nature on both.

The ill-effects of urbanization are enunciated when a river (probably next to the banyan tree) turns into a gutter, the open spaces are filled with 'humming' vehicles due to which the personified city 'mumble'. The city is bursting at its seams; it groans and grumbles at the atrocities against her. This is the cost of man's greed for comfort and luxury under the guise of modernization, which nature has paid. Fertile, green, light-breathing lungs of rural land have been converted into sterile, brown, heavy breathing modern cities. The poet forcefully shakes the consciousness of the reader, 'the city dweller' by addressing him directly with the pronoun "you". The word 'traffic' relates to the vehicular volume in the city as well as the immense noise traffic in the world. In the seventh stanza the poem is placed in a specific location at the National Highway in the city of Vadodara. It is here that Naik describes how the banyan tree from the first stanza has disappeared, "you can no longer ... crossroad."

The death of the tree metaphorically implies to the end of the city itself. The poem ends on an optimistic note that over a period of time, the roots will come alive again

and so will the city. As an eco-socialist Naik, portrays the collective experience of hordes of humans who suffer due to converting green fields into sterile cities.

## **Conclusion**

After illustrating the poems in the light of eco-criticism, lastly, I would like to briefly compare them. Both, Dilip Chitre and Vihang Naik are products of modern age. It is natural that they have witnessed denudation of forests, technological development, urbanization, progress in science and its effects on both-Nature and human beings. Their perceptions and perspectives are similar in the beginning, yet, difference is seen in the way they observe the future. Both the poets wax eloquently on the grandeur of nature and emphasize on its conservation and preservation, at the same time, their main focus is on simple way of living. They gently coax and cajole the reader to shift their focus from marginalized Nature to nudging it towards the center of their lifestyle.

Eco-feminism views the connection between women and their natural ecosphere. Chitre as an eco-feminist raises his voice on the oppression of both women and Nature under a dominant patriarchal society. Chitre's grandmother strongly resists denudation of land in the name of modernization but his father goes ahead with his plan of exploitation and uproots the centuries old Banyan tree. Whenever women act against ecological destruction there is an equal and opposite reaction of patriarchal oppression to silence them. Woman's adherence to her ancient culture, her environmental ethics proves her loyalty to future generations and to life on planet Earth. Naturally, man's chauvinist attitude forces him to subdue and suppress these feminist ideals in the same manner that the father acted against the grandmother's wishes. Chitre's poem begins with a call to raise the eco-consciousness of the society and lend their voice for ethical environmentalism. He tries to show the way in which human being adapts and integrates according to the demands of his race and exploits Nature. On the other hand, Naik is more likely an eco-socialist, ready to

start environmental justice movements, for, his poems portray collective experience, ignoring individual suffering, by criticizing anthropocentric attitude of humans.

Both the poems portray not only the romantic and pastoral outlook towards nature but also the deterioration of nature. Chitre ends the poem on a pessimistic note of moving away from Baroda to Bombay- a concrete jungle, where trees are found 'only' in dreams. A tone of abject desolation and hopelessness marks the end of the poet's hopes and aspirations for a revival of eco-consciousness in the human psyche. On the other hand, Naik ends on a very hope filling, optimistic note which gives a message of rebirth- rebirth of a city, rebirth of human consciousness, rebirth of eco-consciousness!!!

# ROLE OF SOCIAL NETWORKING SITES IN TEACHING AND LEARNING: AN INNOVATIVE APPRAISAL

**Dr.Hanan Khalid Khan**

**Assistant Professor English**

*Department of Humanities, Mewar University Rajasthan, India*

## **Abstract**

*Web based Social Networking Sites have increased in recent years. Several books and articles have been written from the past twenty years on the area of the subject using Social Networking Sites (SNSs) in different fields of study. On the other hand, in the area of experimental and applied linguistics, in common, and particularly in second language teaching (SLT), the value of SNSs seems to have been an untouched area of investigation. In this paper, an effort is being made to develop our understanding on the subject of the execution and implementation of latest technologies such as Social Networking Sites (SNSs) and second language teaching (SLT). This understanding will provide a room for investigation on the issues, which has been generally ignored in the field of English Language Teaching (ELT). The issue possibly might signify a considerable challenge not only for emerging and developing cities including Jammu and Kashmir, but for other state's around the Country. To put it in a different way, using Social Networking Sites could provide a vital importance in enhancing second language teaching programs of both emerged and emerging countries.*

**Keywords:** *Innovative technology, Second language teaching (SLT), Social networking sites (SNSs)*

## **Introduction**

Recently, there has been an escalating interest in the application of innovative technology to deal with the challenges in second language teaching and learning. Pollock (2007) believed that in order to be successful teachers and educators, they need to incorporate different learning tools keeping in mind the effective teaching methods that are

already in use. Another straightforward explanation of the term by Boyd and Ellison (2008), Social Networking Sites are defined as

Web-based services that allow individuals to (1) construct a public or semipublic profile within a bounded system, (2) articulate a list of other users with whom they share a connection, and (3) view and traverse their list of connections and those made by others within the system. The nature and nomenclature of these connections may vary from site to site. (p. 211)

Science and technology are continuously advancing. Online tutoring and technology incorporated education are now vital. The educator's should acquire some of the qualities while training his/her students. The educator's individuality, approach, skillfully handling teaching materials, capability in answering students' questions and aptitude to teach by means of techniques instills attention among students. However, there remains a relative dearth of research regarding the instructors' experiences of using social media in their teaching. Furthermore, little detailed attention seems to have been paid to the role of Social Networking Sites (henceforward SNSs) in second language teacher education programs in metropolitan states, including the state of Jammu and Kashmir. To encounter with this situation to fill in and to account for, in this research paper, an effort is being made for the usage of Social Networking Sites in Second Language Teaching (SLT). It's no secret that most of students & teachers have smart Mobile Phones and are using social networking sites for educational purpose. In context to that, there are applications that suggest social media in an educational context. By the variety of social media platforms efforts are being made to support the learning and development by which the quality of teaching will be increased abruptly. The study tells that making social networking sites (SNSs) as a part of conventional teaching, will attract students and can motivate them in E- learning process.

## **SOCIAL NETWORKING SITES (SNSs) AND TEACHING**

It has been verified and experimented that in the field of psychology and linguistics the practice of the stored information or the human mind vocabulary is resolved by the psychosomatic state of the receiver. This idea was also supported by the Aristotle's Greek philosophy which emphasizes on the theory of knowledge that some form of entertainment should be used while delivering the lessons. So as far as I am concerned I think that these Social Networking sites (SNSs) will be helpful in generating a revolution in the field of education, provided we should have the ability to meet the requirements of Science and Knowledge. In general, the Social Networking sites (SNSs) focuses on building online resource for the common interest of the communities and provides them with the tools that help them to do so. Social Networking sites (SNSs) led to attract people towards E-Learning and the researchers

carrying out the study examined this phenomenon and clarified the reason behind the attraction towards the innovative mode of learning in classrooms. Now we can observe from the previous studies that the social networking sites will play a main role in developing and improving education both at the level of the teachers or students.

### **Implementation of Innovative Uses of (SNSs) in Teacher Education**

Generally speaking, “social media are technologies that smooth the progress of social interface, make possible relationship, and enable thoughtfulness across stakeholders. These technologies include media (text, photo, audio, video), blogs, wiki, networking platforms (including Whatsapp, Facebook), and other virtual worlds” (Bryer & Zavatarro, 2011). The diversification in the field of technology has become much more important and open to innovation on the part of educationalist (i.e., practitioners in training and teaching) (Kukulka-hulme & Pettit, 2009). In this regard, some of the important Social Networking technologies are given below for educators and stakeholders.

1. Blogging with the help of Mobile.
2. Mobile Messaging (instant-messaging).
3. Wikis (modifiable collaborative web pages).
4. Video conferencing (Simulated Face-Face communication).
5. Podcasting (Web based Broadcast)
6. Vodcasting (video podcast over web broadcast)
7. Electronic teaching sites.
8. Virtual classroom & staffroom.
9. Virtual Blackboard or Projector.
10. Multimedia consulting organizations.
11. Lecture on demand (LoD)
12. Online testing system.

### **Objectives Obtained from the above innovative platforms**

In the field of education, social-networking sites offer a student the opportunity to connect with other students, educators, administrators, alumni, both within and outside his current institution. Scholars praise social-networking tools for their capability to attract, motivate and engage students in meaningful communicative

practice, content exchange, and collaboration (N.Mills, 2011). Some of the objectives obtained from these platforms are as under.

1. Vocabulary is enriched in both educators and learners.
2. Students' computational skill can be improved.
3. Reading skill Improvement.
4. Speaking skill Improvement.
5. Listening skill Improvement.
6. Accent & pronunciation Improvement.
7. Development of appropriate use of selective lexis.

### **Conclusion**

The aim of this research paper was to focus on the necessity of latest applications of Social Networking Sites in teaching at various levels. This paper also focuses on the issues in respect of the utility of Social Networking Sites (SNSs) in teacher education and English language teaching, Social Networking Sites (SNSs) for the development of professional teaching, the value of modern innovative uses of (SNSs) in teacher education (e.g., podcasting, vodcasting, blogs, messaging, etc.), skills and methodological concerns are also touched in this paper.

In view of the previous discussions in this paper, it is not difficult to understand the importance of innovative technologies in education and English Language Teaching. On the other hand, one might be on the finding's that with the utilization of the innovative technologies in programs like second language teacher education and learning is a challenging factor for teachers & educators. Kukulska Hulme (2008) are of the view that,

the main obstacle in the implementation and integration of innovative technologies in teaching and learning programs pertains to "lack of personal experience of mobile learning on the part of those involved in teaching" (p. 9) and also the people who are responsible for the "preparation of distance learning materials and resources, and more generally, those who devise programs, courses, and methods of supporting learners" (p. 9).

In this regard many teachers, educators and syllabus designers are bound to consider the application, integration and implementation of latest innovative technologies in various teaching programs in order to regulate the teachers' line of work and occupations. In short, using latest and modern methodologies in the classroom will provide learners the congenial and positive way of learning language meaningfully. Students will be able to understand the significance of learning second language without any panic and this will help them to endow with the influence of self-confidence and accomplishment. Thus this remains very exciting and promising area of academic research justifying the scope of further assessment and investigation. In view of the facts and discussions, further vital investigations are requisite to carry on the opinions made in this paper revealing and opening up some new opportunities of research.

**TRAINING AND DEVELOPMENT AND ITS IMPACT EMPLOYEE AND ORGANIZATIONAL PERFORMANCE: A REVIEW**

**\*Swati Bhatia, \*\* Dr.Richa Khugshal**

*\*Research Scholar, Lingaya's Vidyapeeth, Faridabad, Haryana, India.*

*\*\*Assistant Professor, Lingaya's Vidyapeeth, Faridabad, Haryana, India.*

There is no question that multinational organisations are aiming to attain excellence and outpower others in the same field. To achieve this, organisations must successfully acquire and use their human resources. Organizations must be more conscious of their human resources in a practical way. Training has a positive influence on employee work results. Training is a driving force that strengthen the workers' competence in their work and improve their capacity to achieve positive performance. Training is often seen as a valuable way for grappling with technical innovation-fostered changes; business competitiveness, corporate structure and, most significantly, employee success play a vital part. This paper analyses the relation amid the effect of training on employee efficiency and performance.

**Keywords:** Training, Development, Employee, Performance, Human Resource

**Introduction**

Organizations are experiencing intensified competitiveness due to globalisation, technical developments, political and economic conditions (Evans, Pucik & Barsoux 2002) so that they can train their workers to brace themselves to respond and develop their efficiency to the above rise. The recent proof of awareness development in the business environment over the last decade can not be overlooked. It is significant this development was brought on not only by technical changes or variations of output variables, but also growing attempts to enhance organisation's human capital.

Human resources in this era of globalisation have been a strategic weapon for sustainable competitive advantages. The distinction between a successful business versus a good organisation is human resources. The human resource is the foundation of any company, it is also the organisation's primary capital. The distinction between financial resources and a successful business is human capital. Training and development was an essential task for the administration of HRM and efficient utilisation of human resources. An investment in an organisation's human resources, both immediate and long-term profits, is successful training and development.

Training is a crucial factor in enhancing efficiency and can strengthen human and organisational abilities. Training is critical to open up the future prospects for growth and advancement and gain a competitive advantage. Training systems allow staff to understand more about modern technologies and acquire robust competencies and expertise such that recently designed technological equipment can perform the tasks and fundamentals. Training encourages capability upgrades and contributes to enhanced engagement, wellbeing and sense of membership, which directly strengthens the competitiveness of company.

Therefore, the obligation for enhancing employee efficiency of any company is definitely one of the key measures that most organisations ought to do. Training and development is definitely one of the main steps. As is clear, workers are a vital resource, the commitment of employees in order to sustain productive efficiency must be optimised. This also allows managers to have sufficient personnel who are physically and socially qualified and willing to establish their professional careers in divisions or managerial roles (Afshan, Sobia, Kamran & Nasir 2012, 646)

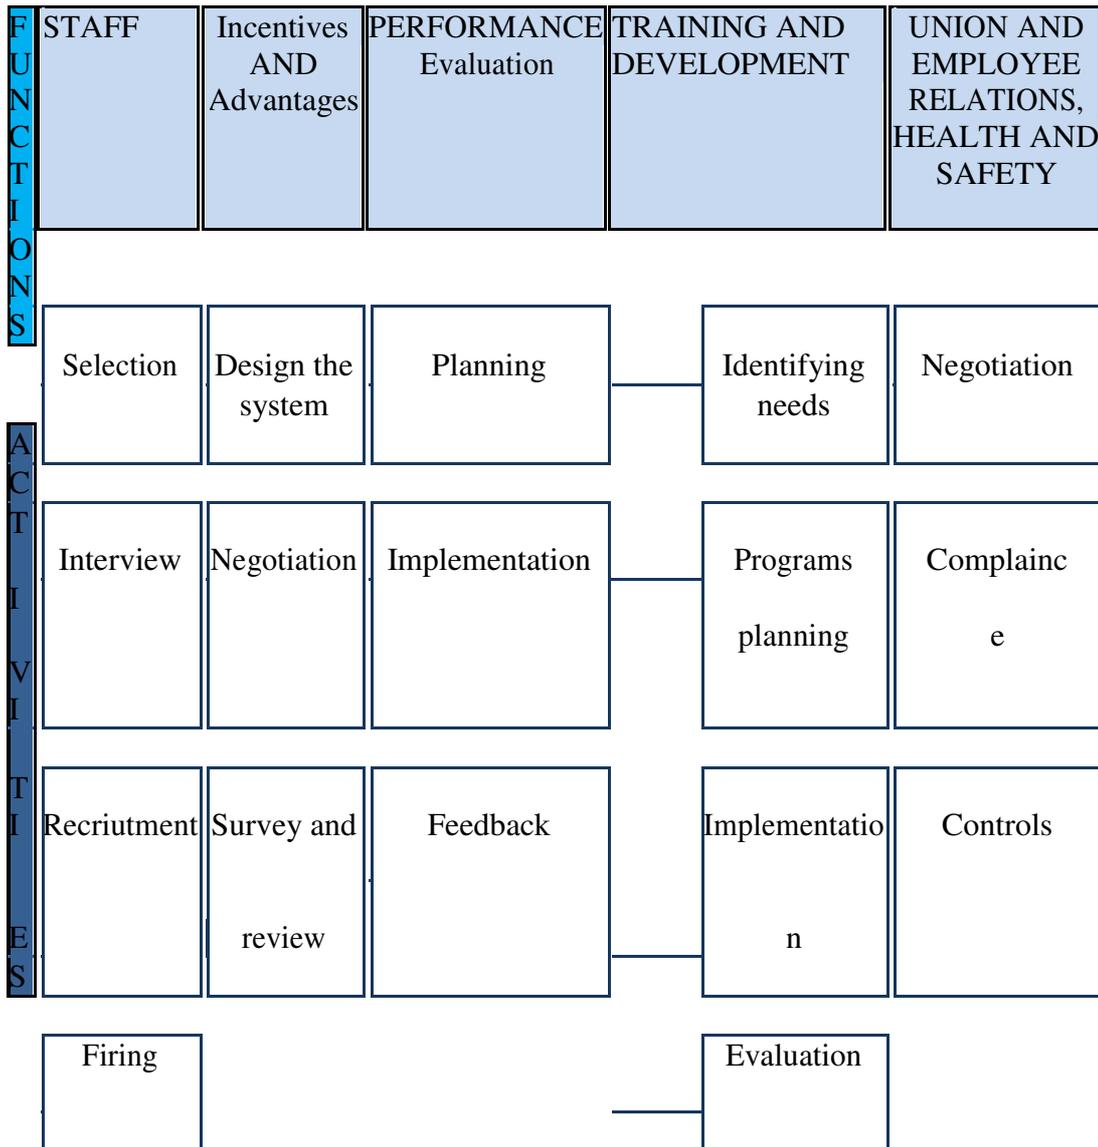

Training has the main function in enhancing workers' abilities to carry out existing and potential activities. Training allows you to alter things such as technologies and competitiveness. Training is, beyond a doubt, essential for an organisation in many things. Training is historically described as the mechanism by which persons adjust their abilities, expertise, attitudes and/or actions.

**Objective**

This study is intended to know the impact of training on employee performance on their jobs.

**Human Resource Management**

The management of human resources includes maintaining the human resources required by a company and ensuring that human resources are gained and retained in order to support the vision, policy and priorities of the organisation. In other terms, the emphasis of HRM is on the securing, management and use of an productive workforce, which companies demand for their short and long-term business survival. HRM main roles Briscoe (1995) are staff, training and development, performance evaluation, incentives and advantages and essentially the health and safety and employee relations.

**Training and Development**

Several variables included in these studies include: quality / quantity of jobs, preparation / organisation, effort / engagement, collaboration / co-operation and contact about the gaps in the employee output prior to and after training (Paat and Rumokoy, 2015). The findings of their analysis demonstrated the substantial gap in employee efficiency before and after training in quality / quantity

of jobs, plan / organisation, initiative / commitment, coordination and communication. One of the valuable systems for enhancing employee efficiency is the training programme. Management could also increase the quality of the training and expand the diversity of the training programme content and module (Paat & Rumokoy, 2015).

Falola 's (2014 ) explored the efficacy of training and development in Nigerian banking in terms of employee success and company competitive advantage. Descriptive study approaches were used by two hundred and twenty three accurate questionnaire, conducted using basic random sampling techniques by selected banks in the State of Lagos in the South-West of Nigeria. The collected data was evaluated in order to represent the raw data substantially using descriptive statistics. The findings revealed that there is a clear correlation between education and growth, success and competitive gain for employees. The results reveal that the tested dependent variable and independent construction have a close relationship.

Adeniji et al (2012) In the surveys of librarians in such Institutions, researchers showed that the quality or lack of a training programme depended strongly on the form of education offered by workers and the training they gained.

The effect of training on employee efficiency was evaluated in Bin Atan et al , ( 2015). The study was performed in a small and medium-sized (SME) Malaysian business. The research looked at the preparation element which had an effect on the success of company employees. The functional field of the organisation chosen for the research has also been analysed and involves preparation and staff success in the successful human resources management practises. A questionnaire was used to engage openly in the study by 85 workers of the respective development units of the company. Study results found that an essential association existed between productive training and the job performance of workers.

By an applied study model integrating the main factors which have been demonstrated in current literature with training transitions and also by evaluating the connexion between the transition of training and organisational results, the medium to long-term consequences of training programmes for companies were examined by Diamantidis and Chatzoglou (2014). The research involved the nature of preparation, self-sustainability and working conditions of trainees. Applying the Structural Equation Simulation method to data from 126 workers who have worked in a variety of Greek organisations, the test is accurate. The findings show the greatest influence on post-training work success and self-efficacy and after-training actions of trainees while the training curriculum is planned.

Al-Awawdeh (2011) carried out an analysis aiming primarily at statistically examining the connection between training policy and employee efficiency. The aim of this research was to evaluate the possible impact of staff performance found in the theoretical part of the study. Single regression method; SPSS were used to assess individual modules; training framework; training system, training and obstructions. Out of 651 staff members from the Al-Bayt University, a sample of 120 were selected. The findings revealed statistically significant impacts on output of all independent variables; the influence on morality was statistically significant. The transaction results of the two independent output variables were also positive. The research exposed the need for scientific approaches that will assess employees' training needs and that training systems are structured to concentrate on the practise and function to overcome challenges in the workplace. The Study guidelines included designing educational programmes in the face of global trends to give trainees training opportunities to deal with shifts in the environment which includes retraining from time to time.

### **Benefits of training**

Training strives primarily to develop awareness, expertise and behaviours in relation to job assignments and to enhance them. It is one of the most powerful motivators that can help both people and organisations on a temporary and long-term basis. With preparation, there are so many advantages. The following was summarised by Cole (2002):

1) Strong morals – trusted and inspired workers earned training;

- 2) Reduced manufacturing costs – training reduces the risks of efficient, more cost-effective usage of products and facilities in order to minimise and prevent waste;
- e3) Lesser turnover – preparation offers a feeling of protection at the office, minimising labour sales and avoiding absenteeism.
- 4) Change Management – preparation promotes change management by the staff awareness and interest in the change phase and also offers the knowledge and skills required for adjusting to different situations;
- 5) To include visibility, improved transparency and expanded compensation and advancement opportunities;
- 6) Support to maximise employee quality and availability.

### **Training and development methods**

Nadler (1984) stated that all practises relating to human resource growth are intended to enhance the individual's work efficiency, trainee new talents for new employment and new roles in the future and generally increase individuals and organisations in order to accomplish the present and future goals of the organisation. There are two ways in which organisations may opt to prepare and improve their staff's skills. This is on-the-job preparation given to corporate workers when doing their daily jobs at the same workplaces and off-work training allows employees to get away from their normal work atmosphere. Examples of work-related formation involve career rotations and transitions, coaching and/or mentoring, but are not constrained. Off-the-job preparation scenarios, on the other hand, include workshops, role playing, among several others, as detailed below.

Armstrong (1995) suggests that training on the job can be a teaching or coaching on the desk or at the table by more qualified persons or instructors. Various companies, for example, are encouraged to use various teaching strategies, (1) according to the policy, the objectives and the appropriate resources of the institution, (2) based on the requirements defined at the time and (3) according to the target population to be trained which may include, inter alia, particular staff, associations, teams, divisions or the whole organisation.

### **Effect of training on performance**

There are a lot of factors that influence organisation's success and development in the modern world. In view of present study, training for workers plays an important role in maximising efficiency and competitiveness in the growth of organisations. This ensures the companies are well positioned to compete and remain at the top. This also suggests that there is a substantial gap between the companies that train their workers and others that do not. Existing research indicates that there are clear impacts on job success in training and growth. In specific, several researchers have analysed employee efficiency (Purcell, Kinnie & Hutchinson 2003; Harrison 2000), while others have generalised to a general viewpoint on corporate performance (Swart et al. 2005). Both of these are associated in the way that the success of workers relies on organisational performance when employee performance affects overall organisational performance. Wright & Geroy (2001) states that the capabilities of workers change with successful training systems. In this sense. Therefore, it not only boosts employee's average efficiency in order to fulfil their existing roles successfully, it also raises workers' expertise and abilities, and thereby leads to greater corporate efficiencies.

Interesting results have been made on this partnership in the field of previous studies on training and employee performance. Training has shown a positive effect on success by improving awareness, talents, skills, abilities, maturity and actions for the employee and the business (Appiah, 2010; Harrison, 2000). (Appiano, 2014). Furthermore, other research by Swart et al. (2005) for example, analyse training to overcome ability deficiencies and competence gaps in order to enhance employee performance. The bridging of the performance gap is a relevant training technique for the acquisition of special abilities and skills of the workers and enhancement of their performance, according to Schwart et al., (2005). He expanded the idea further and claimed that creation allows organisations to understand that their employees do not perform well and therefore thus their expertise, abilities and

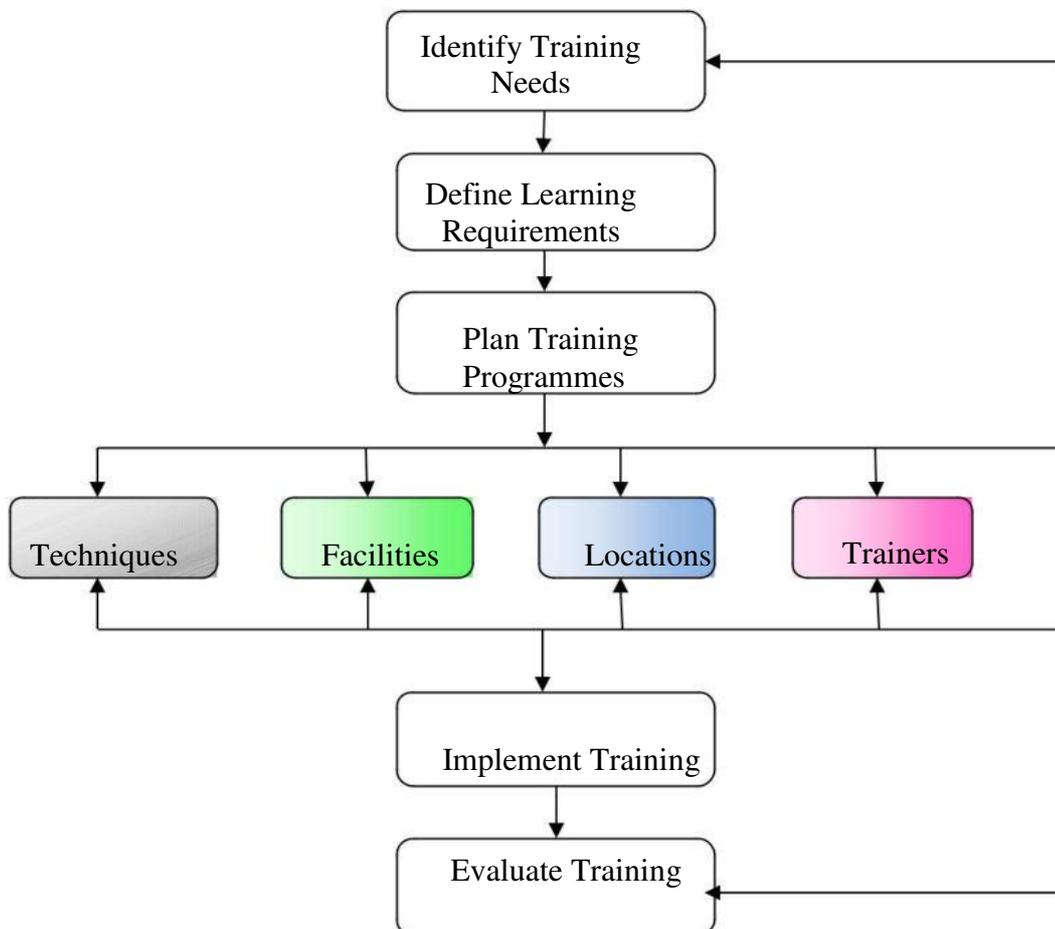

behaviours ought to be tailored to the firm's needs. It is often the case when workers have any information regarding multiple jobs. However this is not enough and workers need to respond regularly to new work performance criteria. In other terms, companies require quality preparation and staff engagement policies, and thus should not have to wait for qualifications and failures to arise.

The capabilities of workers change through successful training programmes, according to Wright & Geroy (2001). It not only boosts employees' cumulative efficiency to successfully fulfil the current work, but also enhances employees' expertise, abilities and mindset, thereby leading to higher organisation. Via training, employee skills are built and empowered to execute the role successfully and accomplish firm targets competitively. In addition, concerns of frustration, absentness and attrition may be significantly minimised where workers are so well trained that their success and expertise can be guided toward their innate strengths (Pigors & Myers 1989).

When training is scheduled, much of the gains from training will quickly be accomplished. So the company, trainers and trainees are trained well in advance for training. The proposed training is intentional action in order to obtain the requisite education to enhance jobs efficiency, according to Kenney & Reid (1986). The following phases are scheduled for training under Kenney and Reid:

- Identifying and defining needs for training
- Defines the training needed to recognise the expertise and abilities and the behaviours that need to be improved. Defining the training goals
- Planning training programmes, utilising the best blend of training methods and sites, to satisfy needs and goals. Choose who delivers the instruction
- Assess training.
- Amendment and expansion of training as needed.

Planned Training Process (Source: Armstrong Michael (1995).

### Conclusion

Training and development and its effect on results were outlined in the current study. In addition, the study indicates that organisational performance is substantially influenced by training provided to employees. A company's success depends on its dedication to workers, which in turn depends on its training and growth strategy for human resources. The analysis of the relationship between employees' training and success is relevant because the current market patterns need greater productivity, accuracy and efficiency in a lower period and expense and can only be accomplished by planning, improving and introducing excellent training programmes for employees. In order to acquire information about their employment, further educational programmes in the company allows workers to receive promotions between their colleagues. Given that training affects employee commitment and efficiency, it is essential that training is improved and implemented in order to meet organisational objectives.

# Women Entrepreneurs in India - Emerging Issues And Challenges

**Dr. Richa Khugshal**

**ABSTRACT** - Women need to struggle a lot to have equal rights and place like men have in Indian society. Regardless of all the social barriers, women have struggled with man effectively and improved their educational status, living conditions, made necessitate changes in their life style, managed to survive in the competitive environment with their hard work, attentiveness, determination, and perseverance. The present research endeavors to recognize the factors that motivate women to become an entrepreneur, assess the several problems and challenges faced by women entrepreneurs and highlight the various government schemes to promote women entrepreneurs. This study is descriptive in nature and secondary data is accumulated from published articles, books, thesis, websites, newspapers, journals, etc. on women entrepreneurs. This research showed that increased family support, education and qualification, success of friends and relatives, better future of their children, family occupation, need of extra income, government procedures and policies, liberty to take own decision, new challenges and opportunities for self accomplishment are some factors that motivate women to become an entrepreneur; women face various problems and challenges like family dispute, scarcity of finance, marketing problems, deficiency of entrepreneurial training, scarcity of raw materials, low risk taking ability, hard competition, inadequate managerial ability, absence of entrepreneurial aptitude, high cost of production, patriarchal society, legal formalities, travelling to become an entrepreneur; and government has various schemes like Swalamban (NORAD), Rashtriya Mahila Kosh, Support to Training and Employment Programme for women (STEP), Women Component Plan (WCP), Technology Development and Utilization Programme for Women (TDUPW), Women Enterprise Development Scheme(WEDS), Self Employed Women's Association (SEWA), The Stand up India scheme etc. to promote women entrepreneur in India.

**KEYWORDS:** Entrepreneurship, Women, Business, Government Schemes.

## I. INTRODUCTION

According to Indian government "women enterprise is an enterprise which is managed, controlled and owned by women, that means women are having minimum 51 per cent of the capital/ share and at least 51 per cent women are working in an enterprise". Educated women are not willing to limit their lives within the boundaries their house. They also want equal respect from their spouses. Though, Indian society has been a male dominated, so Indian women need to go a long way to attain equal rights and equal position in the society. In Indian culture, women are assumed as weaker than men and they are asked to execute the decisions taken by the men in their family. But now Indian society has been changed in terms of enhanced educational status of women, better living standards and life style. Women struggled and competed with men and successfully stood up with men and performed well. Women are self-confident, persuasive, enthusiastic, willing to take risk, and capable enough to manage to survive and excel in their work. Women with their ability to learn quickly, solving problem, willingness to take risk, to motivate people, and to know how to win are the strengths of the women

entrepreneurs in Indian. Women stand high in the society and are applauded for their accomplishments in their respective fields.

## II. WOMEN ENTREPRENEUR

Women entrepreneurs are those women who think about business enterprise, take initiative, organize and combine the all necessary factors of production, and by undertaking the risks run a business enterprise.

**Kamal Singh** has defined woman entrepreneur as "a creative, innovative and confident woman competent of attaining self-financial freedom independently or in partnership, creates employment opportunities for others people also by starting, establishing and running the business enterprise by keeping pace with her personal and social life."

**Indian Government (GOI2006)** has defined women entrepreneur as "an enterprise hold, owned and controlled by a women with a minimum monetary interest of 51 per cent of the capital and also providing employment opportunities to at least 51 per cent to the women."

## STATUS OF WOMEN ENTREPRENEURS IN INDIA

India is a country where there is a rich cultural heritage. But now social scenario in India is changing. Time has gone when women were not permitted to venture out of their homes, now women have enhanced their education standards and also participate in social, financial and political activities with equal zeal and enthusiasm like men. Traditionally, Indian women like Brahmi, Gargi, Laxmi Bai, Damyanti & Razia Sultana were strong and considerable decision makers. But, today the role and status of women has been drastically changed all over the world. In all over the world women are breaking their traditional and stereotypic roles.

Progressively with time, women entrepreneurs are being measured as essential for the economic development of the nation. Women help in generating employment opportunities and economic growth. Entrepreneurship facilitates women to become economically independent and also to develop and improve their social status in the society.

World Bank report showed that women entrepreneurs usually tend to recruit women. Perhaps because women entrepreneurs have started these enterprises. A considerable quantity of women entrepreneurs are micro-domestic based enterprises increasing their family income in India.

Ministry of Statistics and Programme in sixth economic census released that women comprise about 14% of the total entrepreneur base that means about 8.05 million out of the total 58.5 million entrepreneurs in India.

## NEED TO STUDY WOMEN ENTREPRENEURSHIP

In today's period of social change and advancement, it is significant to study about women entrepreneurship and also about how to promote and boosted women entrepreneurship. In many countries it has been observed that where there is gender impartiality and women play important roles in an organization, there is social development, greater wealth, and development of moral organizations. Women entrepreneurs are generally the owners of micro, small and medium enterprises that mean women play important role in the development of MSME. Thus, role of women as an entrepreneur and in modern organization is of great academic interest.

## III. LITERATURE REVIEW

**Terjesen, S., Elam, A. and Brush, C.G. (2011) De Bruin, Brush, Welter, 2006; Bullough, Moore, and Kalafatoglu, 2017<sup>[1]</sup>** in their study showed that women entrepreneurs play a vital role in generating new opportunities and also contribute towards the social and economic growth of their societies.

**Ramasetu (2015)<sup>[2]</sup>** in his study, focused on the issues and difficulties faced by urban working women in India and

found that women go through with physical and psychological pressure, poor work-life balance, inequitable management in the work place, stressed life and work place discrimination.

**Chanchan (2013)<sup>[3]</sup>** in his study, recognized and examined the pull and push factors related to the growth of women entrepreneurs and showed that irrespective of the education level and the income, the economic restrictions are the key reasons for women starting up entrepreneurship.

**Tuschano (2013)<sup>[4]</sup>** in his research, showed that women mainly belonging to lower or middle income group were found in the micro businesses in the unorganized sector. Women entrepreneurs faced immeasurable problems as these businesses run under condition of intense scarcity of all resources and also outside the range of social security. The amount of low investment limit their businesses to remain small sized. Thus, it enforced them to utilize traditional tools and economical raw material. Professionalism, lack of skills and low production level in business also affect their income but there was a immense chance of development in some businesses.

**Umamaheswari (2011)<sup>[5]</sup>** considered the development and the factors affecting the development of women enterprises in her research and showed that the factors such as nature of the organization, age of the enterprise, location of the organization, supply of labor, and professional management have control on the growth of women enterprises. Also other variable such as technically qualified entrepreneurs, past experience and the special skills of the entrepreneurs also have influence on the growth women enterprises.

**Mehta and Mehta (2011)<sup>[6]</sup>** in their research found that the major challenges and problems faced by women are work background and educational in rural area in business. The research indicated that various State Small Industries Development Corporations, NGOs and the nationalized banks are conducting several development programmes for women entrepreneurs.

**Thangaraju (2011)<sup>[7]</sup>** in his study considered the factors of entrepreneurial motivation, growth and problems faced by women entrepreneurs. The study found that the key problem was inavailability of money but reimbursement of it. The reimbursement is hard due to low paying ability, which is influenced by poor education and skills, and some issues related to marketing, viz., poor mobility, partial towards women and social group they belong and bad infrastructural facilities. Therefore, women need to be educated, skilled and trained to become successful entrepreneurs.

**Kulkarni (2010)<sup>[8]</sup>** in his study showed that the difficulties that women entrepreneurs faced micro issues related was financial problem caused by lack of money and modern technology. The second limitation that women entrepreneurs faced macro issues related was competition.

Women entrepreneurs need to be emotionally stronger to survive in the male dominated society. The third limitation that women entrepreneurs faced macro issues related to external environment was the geographic problems concerned with channels of distribution, distance, communication mode, etc.

**Ghosh and Cheruvalath (2007)<sup>[9]</sup>** in their study they discussed about various challenges faced by women entrepreneurs such as low education and socio-cultural constraints. The research also given some proposal to improve women entrepreneurship such as inculcating an entrepreneurial attitude, accurate training, understanding their entrepreneurial inspiration, attribution augmenting, and removal of discriminating social duties essential to them.

**Setty (2004)<sup>[10]</sup>** in his research focused on challenges and potential of women to become entrepreneurs. Women have been the economic associate of men in numerous fields when they become entrepreneurship, but men seem to rule the entrepreneurial world. Woman are equally endowed with the managerial abilities and psychological qualities that required in successful entrepreneurship. At times, the opportunities and environment are the same for both women and men. But the entrepreneurial activities in traditional societies have been restricted to men.

#### OBJECTIVES OF THE STUDY

1. To recognize the factors that inspires women to become an entrepreneur.
2. To study the several problems and challenges faced by women entrepreneurs.
3. To know about the various government schemes to promote women entrepreneurs.

#### IV. RESEARCH METHODOLOGY

Research methodology used in present study is as follows:-

**Research design:** Descriptive research was used in the present study.

**Research area:** Research area in present study was India.

**Data collection:** This study was based on secondary data. Secondary data was collected from published books, articles, thesis, websites, newspapers, magazines, public records, journals, and annual reports on women entrepreneurs. For the present study data about the women entrepreneurs in India was collected.

#### V. ANALYSIS

##### Objective 1

**1. To recognize the factors that inspires women to become an entrepreneur.**

In India, women entry into business is traced out as an expansion of their day to day primarily kitchen activities such as 3P's, Pappad and Pickle. But with the enhanced education and span of time women started shifting from 3P's to modern 3E's i.e., Energy, Engineering and Electronics. Skill, knowledge, compliance and adaptability in business are the key factors for women to emerge into business. Women entrepreneurs take such challenging role to congregate their personal needs and to become economically independent. Inbuilt quality of entrepreneurial and a strong aspiration to do something in their life make women capable to contribute values to both family as well as social life. Media makes women to know about their own personality, rights and the work conditions. Numerous women start a business because of some hurtful incidents such as divorce, the health of a family member, unfairness due to pregnancy, or economic reasons. But today a new flair pool of women entrepreneurs is forming, because many women leaving the corporate world and planning their own future. Women are booming as interior decorators, designers, publishers, exporters, garment manufacturers and still trying to search new opportunities for economic contribution.

There are various factors which inspire women to become entrepreneurs such as innovative thinking, new challenges and opportunities for self accomplishment, employment generation, freedom to take own decision, desire to become independent, favorable government policies and procedures, family occupation, requirement of additional income, better future of children, success stories of friends and relatives, role model to others, supportive family, education and qualification, self identity and social status.

##### Objectives 2

**To study the several problems and challenges faced by women entrepreneurs.**

In India, women faced several problems to get ahead in business in their life. Women entrepreneurs face various problems to develop their own enterprise. Women faced problems at various stages starting from their initial commencement of business and also in running their business. The major problems faced by women entrepreneurs in India are as follows:

**Shortage of Finance:** Women entrepreneurs endure from insufficient economic resources and working capital. Women have a very less assets and bank balance and family members show least interest in investing money in the business run by women because of lack of confidence in the ability of the women to run business successfully. It also very complicated to take loan and support from banks and manage the working capital for the women.

**Marketing problems:** Women entrepreneurs always face difficulties in marketing their products because they depend upon the middlemen for advertising their products who ask

for the high profit. The middlemen usually take advantage of the women entrepreneurs. It's very difficult for women entrepreneurs to capture the market and to make their products popular because of tough competition from male entrepreneurs.

**Shortage of raw materials:** Women entrepreneurs also find it difficult to acquire the essential raw materials and other inputs required for production because of high prices of raw materials.

**Stiff competition:** Male entrepreneurs and organized industries pose strict competition for women entrepreneurs.

**Limited managerial ability:** Women entrepreneurs may not be specialist in all functions of the business venture and they shall not be able to dedicate enough time for all kinds of activities of enterprise.

**High cost of production:** The development of women entrepreneurs is also restricted by the high cost of production. To reduce the cost of production it is required to increase competence and expand productive capacity. Reduction of cost of production is required to make their survival possible for longer tenure. Women entrepreneurs also face the problems of human resources, legal formalities, infrastructure, lack of family support, overload of work, etc.

**Absence of Entrepreneurial Aptitude:** The another problems of women is the lack of entrepreneurial aptitude such as innovation, risk bearing etc.

**Low risk taking ability:** Women entrepreneurs usually plan for a protected life so they have a problem of low risk taking ability as comparison to male entrepreneurs.

**Family Conflicts:** In India, women are also supposed to take care of the children and other family members. Married women entrepreneurs have to balance their household activities and business activities. Women spend long hours in business and thus they find it hard to fulfill the requirements of their family members and also sometimes become unable to do the domestic work, to have time for children's education, personal hobbies, and this lead to family conflicts.

**Patriarchal Society:** In India, women do not get equal treatment because of male-dominated society and men ego also places barriers in women progress.

**Lack of entrepreneurial training:** Many women usually do not have proper technical and professional training to start a new business enterprise.

**Legal Formalities:** Women entrepreneurs find it very hard to comply with several legal formalities to obtain license etc.

**Travelling:** Women entrepreneurs cannot travel from one location to another freely in comparison to men.

### Objective 3

**To know about the various government schemes to promote women entrepreneurs.**

Development of women has been a policy objective of the government since independence. Following are the government schemes to promote women entrepreneur.

#### **Trade Related Entrepreneurship Assistance and Development Scheme for women (TREAD)**

This scheme is for women involved in non-farm activities. The main components of this scheme are as follows:

- Grant by government to 30% of the total project expenditure to the NGOs for encouraging trade associated activities among women. The remaining 70% of the project expenditure is financed by the primary agency as loan for operating activities as laid down by the project.
- Government grants up to Rs 1 lakh per programme to the many training institutions and NGOs for organizing training programmes for the women who willing to start up their own business.
- The government also grants need based grants up to Rs 5 lakhs to national entrepreneurship development institutions and any other institution for conducting research, field surveys, and evaluation studies and hence making a blueprint for training modules.

#### **Credit Guarantee Fund Scheme**

Government grant loan up to 25 lakhs without third party guarantees to small scale industries. It is run by Credit Guarantee Fund Trust for Small Industries (CGTSI). This scheme covers up to 80% of the credit to enterprises run by women which embrace maximum guarantee limit of Rs 20 lakhs.

#### **Support for Entrepreneurial and Managerial Development**

Micro, Small and Medium Enterprises conducts entrepreneurship development programmes and charge fees for enrolling in such programmes. To promote more entrepreneurs from women, SC/ST, physically challenged groups, it is emphasized that such programmes will not ask for any fees instead these programmes will give stipend of Rs 500 per capita per month. 50,000 entrepreneurs will get trained in diverse industries like Fashion, IT, Agro, Catering, Pharmaceutical, Food Processing, etc. 20% of the programmes will be organized only for women.

#### **Exhibitions for women under promotional package for Micro and Small Enterprises approved by CCEA under marketing support**

To promote women entrepreneurs to take participation in International Exhibitions some provisions are implemented which are as follows-

- Free space in exhibitions is provided to women.
- Reimbursement of air fare of economy class for one women representative.
- Reimbursement of shipping cost up to 15000.

**Swalamban(NORAD)** This scheme is to offer training for skill development to women to facilitate them to get employment or self-employment. The focus of this scheme is the needy and poor women from backward and weaker section of the society. The Haryana State Women Development Corporation (WDC) is the nodal organization for execution of this scheme through voluntary organisation of the state.

**Rashtriya Mahila Kosh** A cluster is a assembly of venture producing similar products/services. In a cluster there can be 20 or more venture. This Cluster Development Program aims to improve technology, competitiveness, manufacturing practices, market the products competently, create employment, etc. The clusters encompasses women enterprises and they are assigned up to 90% support to organize diagnostic study, workshops and seminars, forming association, capacity building through training programmes, market development, etc.

#### **Support to Training and Employment Programme for women(STEP)**

Ministry of women and Child Development manages STEP scheme of training of women to develop their skill, to enhance employability and helps them to become entrepreneurs /self-employed. This scheme is for 16 years and above age group women.

#### **Swa Shakti project and Swamsiddha scheme**

This scheme grants financial aid to capacitate rural poor women through microfinance from international agencies.

#### **The Ministry of Small Scale Industries**

The ministry develops productivity, competitiveness, and capacity building of small women ventures in India.

#### **Women Component Plan (WCP)**

This plan gives prioritizing economic resources for schemes/programmes for women, mainly those which give power to women.

#### **Technology Development and Utilization Programme for Women (TDUPW)**

This programme encourages awareness regarding the new technology, acceptance of new technology by women, training programmes for women regarding technology issues, encourages technological upgradation of tiny, small and medium enterprises run by women entrepreneurs, also conducts demonstration programmes on design, technical procedures and growth of products for the benefit of women.

**Schemes of Consortium of Women Entrepreneurs of India (CWEI)** CWEI supports in attaining E-commerce (Electronic Commerce) through its global information transformation system and web portal. E-commerce is the online buying and selling of services and products.

#### **The Federation of Indian Women Entrepreneurs (FIWE)**

This federation is to conduct training programme in domestic marketing, export marketing and management, quality control, management of enterprises, procedures and systems, laws and regulations for running a small and medium scale enterprises in order to sustain their growth.

#### **Scheme of Assistance to Women Co-operatives (SAWP)**

This scheme commence several functional, structural, and institutional measures to empower women, development of their access to inputs and technology, capacity building, and other farming resources.

#### **Women Enterprise Development Scheme(WEDS)**

This scheme provides economic assistance to women for any feasible economic creating activities in liberal terms and conditions.

#### **Self Employed Women's Association (SEWA)**

SEWA is a trade union registered in 1972 and supports poor and self-employed women workers. SEWA supports women in establishing their own economic organization and capacity building. SEWA connects women workers to development programs, so that they can attain full employment and self-reliance.

#### **The Stand up India scheme**

This scheme helps the SC/ST and women entrepreneurs economically so that women have a equal chance to set up their own enterprises. This scheme helps by giving loans from Rs 10 lakh to Rs 1 crore to the weaker section of the population. The Start-Up India scheme was launched in January 2016 by Prime Minister Narendra Modi to assist new entrepreneurs to start up their own enterprise.

**The Ministry of Small Scale Industries** The Ministry enhances competitiveness, productivity and capacity building of small women ventures and their collectives in India.

## **VI. FINDINGS**

1. Increased education and qualification, support of family members, success stories of friends and relatives, better future of children, need for additional income, family occupation, government policies and procedures, freedom to take own decision and be independent, new challenges and opportunities for self fulfillment are some factors that inspire women to become an entrepreneur.

2. Women face several problems and challenges like scarcity of finance, marketing problems, scarcity of raw materials, hard competition, inadequate managerial ability, high production cost, lack of entrepreneurial aptitude, inability to risk, family disputes, inadequate entrepreneurial training, legal formalities, travelling to become an entrepreneur.
3. Government has various schemes like Trade Related Entrepreneurship Assistance and Development Scheme for women (TREAD), Credit Guarantee Fund Scheme, Support For Entrepreneurial and Managerial Development, Swalamban (NORAD), Technology Development and Utilization Programme for Women (TDUPW), Rashtriya Mahila Kosh, Support to Training and Employment Programme for women (STEP), Ministry of Small Scale Industries, Women Component Plan (WCP), Women Enterprise Development Scheme(WEDS), Self Employed Women's Association (SEWA), The Stand up India scheme to promote women entrepreneur in India.

## VII. CONCLUSION

Women have increased their education and qualification and they are motivated to become an entrepreneur. Today women have equal passion and enthusiasm like men. Enhanced education and qualification, supportive family, success stories of friends and relatives, better future of children, requirement of additional income, family occupation, government policies and procedures, freedom to take decisions, desire to become independent, new challenges and opportunities for self accomplishment are some factors that inspire women to become an entrepreneur. But to become an entrepreneur women face several problems and challenges like scarcity of finance, marketing problems, scarcity of raw materials, hard competition, inadequate managerial ability, high production cost, lack of entrepreneurial aptitude, inability to risk, family disputes, inadequate entrepreneurial training, legal formalities, travelling. Progressively with time, women entrepreneurs are being considered as crucial for the economic development of the country. Women contribute towards the employment creation and economic growth. In India, government has come up with several schemes to promote and support the women entrepreneur like Women's Association (SEWA), The Stand up India, Trade Related Entrepreneurship Assistance and Development Scheme for women (TREAD), Credit Guarantee Fund Scheme, Support For Entrepreneurial and Managerial Development, Swalamban (NORAD), Technology Development and Utilization Programme for Women (TDUPW), Rashtriya Mahila Kosh, Support to Training and Employment Programme for women (STEP), Ministry of Small Scale Industries, Women Component Plan (WCP), Women Enterprise Development Scheme(WEDS), Self Employed. These schemes facilitates women to become

financially independent and also to improve their social status in the society.

# SUCCESSION PLANNING AND ITS EMERGING ISSUES IN TODAY'S DYNAMIC ENVIRONMENT: AN EMPIRICAL STUDY

**Dr. Richa Khugshal**

Assistant professor, Dr. Richa Khugshal working as Assistant Professor in School of commerce and management in Lingayas Vidyapeeth, Faridabad, Haryana

**ABSTRACT**DOI URL: <https://doi.org/10.36713/epra3093>

Succession planning plays a crucial role in today's competitive environment. Escalation pool of talent has major contribution in organizational growth. Thus, identification and development of talent is a necessity for overall development of every organization. The aim of this study is to help organizations to know the importance of succession planning and various challenges of succession planning. This research is tried to cover many aspects of succession planning like organizational survival, strategic planning, prepares future leader, a necessary process in today's organization, challenges, and organizations performance. This present study showed that succession planning helps organization to survive for longer span of time; it has positive impact on organizational performance; it has positive relationship with strategic planning; it is a necessary process for organizations to motivate and create competent and stable workforce; organizations face many challenges in implementing succession planning, so organizations must be capable enough to make effective succession plan; and it also assists organizations in identifying and preparing future leaders.

**KEYWORDS:** Succession Planning, Organizational Survival, Strategic Planning, Future Leaders, Challenges, Organizations Performance.

## 1. INTRODUCTION

In the today's competitive and dynamic environment, the corporate human capital has become a precious source for gaining competitive advantage over other firms. Firms are becoming increasingly dependent on their human resource capabilities. This identified the need for succession planning as it identifies key roles and mapping out ways to ensure the organization has the right people with the right skills, capabilities, and experiences, in the right place at the right time.

## 2. Definition of Succession Planning

Succession Planning is defined as the process of identifying and creating leaders for future who will take the place of the previous employees when they leave the organization for some reasons like promotion, retirement, resignation, retrenchment, transfer, or death.

Succession planning is a modern and popular technique used by many companies that concentrates on recognizing the talented employee in the organization, who will be possible successors for the key positions.

## 3. How Succession Planning Works

Succession planning appraises each leader's skills and knowledge, recognizes potential replacements both within and outside the organization, and trains and prepares recognized employees to take senior positions in the case of internal replacements. Succession planning is not a one-shot event; but should be reevaluated and updated each year in the organization. Moreover organization might need to build both an emergency succession plan in order to replace key leader unexpectedly, and a long-term succession plan to anticipate changes in leadership.

In large organizations, the board of directors oversees the succession planning. Succession planning also has impact not just on owners and employees, but also shareholders of organization. For small organization, the succession planning means to provide training to the next generation talent to take over the business.

## 4. Need for Succession Planning

Succession planning is a part of the human resource planning that recognizes employees may or may not work with the organization in the future. Succession plan is made to

investigate the vacancies which may take place when an employee leaves the organization, the business areas which may get affected, and the skills, knowledge and job requirements of the existing incumbent. Therefore, succession planning is required to determine how and where viable employees can fill the vacant positions in the organization.

### 5. Benefits of Succession Planning

The numerous significances of succession planning for both employers and employees are as follows:

- Employees are more satisfied as they know that there is an opportunity for advancement in an organization.
- Reinforcement of career development among employees as organization is planning for future opportunities.
- Supervisors will mentor employees to enhance skill, knowledge and expertise.
- Positions can be filled internally when opportunities arise.
- Leadership and employees are able to share organization's values and vision.
- With Baby Boomer business owners and leadership retiring in huge numbers, a new generation of leaders will be needed.

### 6. LITERATURE REVIEW

**Department of management and administrative services, 2010** said that succession planning is a process that confirms that required number of employees is employed in the organization, and also that employees trained to be placed in key positions in the organization. The exercise of succession planning is to make sure that the key positions, which have been left by the related employees, are filled by using effective succession planning. Succession planning is not just a promotion of employees, but also includes experimenting, training, coaching, evaluation, communication, and accomplishment of the organization's goal.

**Paul, E. Ricci, 2006** argue that succession planning is not a short-term process, but a yearly permanent one beginning from the employer of employees, since the future managers of an organization are among the employees employed today.

**Collins (2009)** defines succession planning as "a process that provides flawless leadership conversion across the organization".

**M. Dami Baldwin (2005)**, found that succession planning plays a key role in the companies' strategic planning. Succession planning is not only the concern of CEOs but also for all the key positions. The succession planning process requires a long term strategy of the organization including the key areas that necessitate continuity and development of the key people that the organization wants to develop.

**Jeff Weekley (2005)** states that the HR professionals prepare the succession plan with a permission of CEO. A few techniques should be followed by organization to put the succession plan in the process. CEO must be a keen supporter and an energetic participant, the line management must involved in the process with HR and play a supportive role, gaps between the current skill employees possess and the future skill requirements are to be identified, succession planning ought to be consistent with other programs.

**Charan, et al. (2001)** said that it is crucial for organizations to provide training to successors before the vacancies are generated.

**Tropiano, M., 2004** said that succession planning is a systematic, strategic and premeditated attempt to develop competencies in potential employees through anticipated learning experiences such as educational training and targeted rotations in order to fill senior positions without discrimination.

**Schoonover, 2011** Succession planning refers to a purposeful and systematic effort to make sure leadership stability in senior positions, to develop intellectual and knowledge capital within the potential employees for the future, to encourage individual advancement, to ensure the stability of key employees, to retain and to enhance performance of the organization.

**Conger (2004), Kesler (2002), Leibman (1996), Rothwell (2005)** have defined the key factors of succession planning and management system including ten elements i.e. organizational commitment with communication of expectations, process of transparency, process evaluation, identification of organizational needs, recognition of key positions, enhancement of knowledge, skill, and ability, accountability, appraisal of talents, development of individual growth policy, individual feedback, and integrity of process throughout the organization. An effective succession planning and management process is well integrated, continuous, and systematic, lined up with strategic planning, and matches available talent with the projected talent requirement for the future.

**Neefe, 2009** has defined succession planning as determined by the philosophy that the leadership can be learned by potential employees and current employees can be recognized and developed to fill future leadership openings, and also allow the smooth conversion and ensures business continuity.

### 7.OBJECTIVES OF THE STUDY

- i. To know the role of succession planning in preparing future leaders.
- ii. To examine the importance of succession planning as a process in an organization.
- iii. To analyze the impact of succession planning on organizational performance.
- iv. To know the relationship of succession planning with strategic planning.
- v. To assess the role of succession planning in organizational survival.
- vi. To study the various challenges organizations face with respect to succession planning.

### 8. RESEARCH METHODOLOGY

This research is based on secondary data. The secondary data was collected through various books, magazines, research journals and other relevant sources.

### 9. SUCCESSION PLANNING AND ITS EMERGING ISSUES

**Objective 1:-** To know the role of succession planning in preparing future leaders.

#### 9.1 Succession Planning: Prepares Future Leader

In today dynamic global economy, organizations face many troubles such as rapidly changing customer demands, public pressure from activist groups, and technological distraction. The average time period of CEO for publicly traded companies is only five years. New generation is keen for career opportunities advancement to enter the workforce, so organizations to build a strong pipeline of future leaders ought to focus on long term strategies. Succession planning

facilitates organizations to identify high-potential and capable candidates and prepare them to take responsibilities of senior positions as per the availability. With the increased competition for talent bound, establishing a succession planning process has become very crucial. Further, succession planning accelerates the organizations performance. Succession planning is a transformational stage through which management explores the future leaders.

Therefore, Succession planning enables organizations in filling the senior positions with talented candidates to assure that every leadership level has plenty of talented performers to draw from, for both present and future need.

**Objective 2:-** To examine the importance of succession planning as a process in an organization.

### **9.2 Succession Planning: A Necessary Process in Today's Organization**

Succession planning helps organizations to reduce employee turnover rate, to retain talented employees, and to have stable workforce. Organizations implement a structured succession planning that make a distinction between the significance of establishing ownership of the succession plan and align the internal culture with external branding. Thus it includes identifying, assessing and developing high potential employees in the organization. Once high potential employees are identified and selected, they'll go through the development program which includes a job rotation program, a formal mentoring/coaching program, after that 360 appraisal is done to get their feedback and also receive an appropriate reward for their performance.

In today's rapid changing environment, organizations face major uncertainty and unpredictability, which sometimes further cause instability in the business operations. Thus in this unstable environment, organizations require to depend on their employees. Therefore, organizations ought to make strategies to encourage their employees and get connected with their employees in order to build competitive advantage and achieve high profitability. For this purpose organizations need to emphasize on methods like succession planning which promote their employees' skills, knowledge, capabilities, talents, and to tackle problems which may arise in future.

Therefore, organizations to prosper and survive in the challenge environment require reviewing the succession planning and management requires reacting, promoting or shedding staff. While succession planning and management both are the process and the system like any other human resource activities, so become necessary to be implemented properly in business organizations.

**Objective 3:-** To analyze the impact of succession planning on organizational performance.

### **9.3 Succession Planning: Its' Impact on Organizational Performance**

Succession planning is a significant way of identifying talented employees who can take senior positions in an organization. A management succession plan helps in preparing employees to replace senior executives. Succession planning identifies in advance the gaps between what employees should to know and what they know currently i.e. competency gaps. Thus, a succession plan assesses the strengths and weaknesses within an organization and accordingly provides training to employees to impart knowledge, skills and abilities they may require to fill future vacancies that mean succession planning identifies the weak areas of employees and accordingly conducts training program to enhance the employees'

performance. Effective and efficient succession planning activities have a positive and significant impact on organizations performance not only by ensuring that key positions will remain occupied with competent employees, but also saves money of external recruitment, selection and training, which may be significantly more expensive than promoting from within the organization.

Therefore, there is positive and significant impact of succession planning on organizational performance.

**Objective 4:-** To know the relationship of succession planning with strategic planning.

### **9.4 Succession Planning: Its Relationship with Strategic Planning.**

Strategic planning is an important element of succession planning. Succession plan helps organizations to lessen the gap in its active ties when its employees are promoted, resigned, transferred, retired, or terminated and improves the strategic planning of the organization. Succession plan is a continuous and systematic process that consist assessment of organizational talents, recognition of the existing skills, identification of the future requirement for the skills, identification of skill gap, implementing required training programs using on-the-job and off-the job training methods, plans for the development, job rotation plans, effectively and efficiently. Thus a formalized and determined strategic planning is required to be developed for the successful implementation of succession planning. Concerned senior directors encourage their employees to actively participate in strategic planning. Therefore, it can be concluded that there is a significant and positive co-relation between succession planning and strategic planning as these two types of planning interact with each other.

**Objective 5:-** To assess the role of succession planning in organizational survival.

### **9.5 Succession Planning: Its Role in Organizational Survival**

Organizational survival is implanted organizational objectives that necessitate the investment of the energy and resources. The objective of organizational survival emphasizes all other objective of the organization. Emphasizes on this objective ultimately contributes towards the satisfaction and implementation of other organizational objectives. Moreover to assess some of the internal variables that drain from the organization the effort that ought to be directed to the accomplishing the company' objectives with execution of succession planning; such as high turnover rate; internal conflict, nepotism, career development, talent retention, supervisor' support, etc. The key independent variables of succession planning concept of the human resource planning such as talent retention, career development, nepotism, and organizational conflict play a crucial role to improve the organizational survival. All variables intended for this study that influence succession planning and human resource planning concerning organizational survival is illustrated in the figure below:

The talent retention (independent variable) act as a mediator variable in concept of succession planning that further contributes towards the organization survival to a great extent.

**Objective 6:-** To study the various challenges organizations face with respect to succession planning.

#### 9.6. Succession Planning: Its Challenges

Succession planning is one of the important processes that cannot be ignored in today's competitive environment. Amplification of this process has direct and positive impact on organization as it helps in nourishing employees. There are numerous challenges that organizations face in today's dynamic environment in succession planning. Some of the challenges that organization face while conducting succession planning are size of the organization that determines the ability to provide opportunities for advancement; issues with the financial resources; the nature of funding may be an issue as more organizations rely on project funding as opposed to core funding; looking at temporary staff; senior managers who stay in their positions for too long or have expectation rights that are unrealistic; management that no longer has the skills needed for the top job; the requirements of the company's executive leadership have changed; the company's leader is no longer making a meaningful and productive contribution to the company; failing to strategically include promising employees in the succession plan, rather than including those who are disinterested, unmotivated, or lack the capacity to advance; inadequate training and development will mean employees who are not ready for a promotion; the succession plan doesn't promote people regularly, resulting in potential successors leaving the organization for other opportunities; and poor communication, which creates confusion and unrest within the company with staff speculation about the true details of the succession plan.

#### FINDINGS

- i. Succession planning helps companies to ensure leadership continuity in key positions, retain and develop intellectual and knowledge capital within key employees for the future, encourage individual advancement, ensure the workforce stability.
- ii. Succession planning helps organization to promote their employees' knowledge, skills, talents, and capabilities to motivate and connect their employees in order to create competitive advantage, achieving higher profitability, reduce workforce attrition and prepare for an aging workforce.
- iii. There is positive impact of succession planning on organizational performance as succession planning helps organization in identifying and providing training to employees to help them to move up in an organization. Further this would help the organization to improve its performance.
- iv. A formalized and concentrated process for strategic planning should be developed for the implementation of succession planning.
- v. Organizational survival is a primary goal of every organization and the variables of succession planning concept of the human resource planning namely; talent retention, career development, organizational conflict and nepotism play a crucial role to enhance the organizational survival/growth.
- vi. Organizations face many challenges in implementing succession planning such as the organization size that verify the ability of organization to provide opportunities for advancement; financial issues like employees contentment regarding adequate salaries and benefits; looking for temporary staff; senior managers stay for longer tenure in their positions; skills for the top level jobs no longer required; the

need for executive leadership have changed; leaders are not making productive contribution to the company; unable to include talented employees in the succession plan; improper training and development program to prepare employees for promotion; the succession planning is not done on regular basis that results in employee attrition; and improper flow of communication which creates confusion and unrest within the company.

## CONCLUSION

In today's dynamic world where competition is high, organization's future plans may change for some reasons such as retirements, transfer, promotions, sickness, death, or resignation. Succession planning is considered as an appropriate plan to cope up with such kind of changes, as organizations must have key employees for replacement plan. This research has found that succession planning has positive impact on organizational performance; it helps in organizational survival for longer tenure; its helps in identifying and preparing future leaders, it has positive relationship with strategic planning, it is also a necessary process to motivate and create competent and stable workforce; and organizations face many challenges in implementing succession planning, so organizations must be capable enough to make effective succession plan. So, succession planning is not just an exercise, but an extremely important process that can be converted into organization development. Hence the organizations must be capable enough to prepare and implement effective succession planning.

**A study of student's perception regarding E-learning during Lockdown.****Submitted By:****Dr Rachna Kalsan****Assistant Professor****Lingayas Vidyapeeth****Faridabad****8295472725****drrachnakalsan@gmail.com****Abstract:**

Corona virus pandemic era interrupt many things in the world. Where the GDP fall down, the education sector also faces several problems. Due to the lockdown all the colleges, universities, schools, institutes are interrupted. Due to these students faces many problems. This lockdown creates a major cause in student's learning. Due to this several health issues occurred among students. To limit/ minimize the loss of studies, Ministry of Human Resource Development & Regulators, Directorate of Higher Education in States motivated to educational institutions to shift to online modes of education. Due to this online teaching mode starts for higher education to reduce the loss of student's study. Online mode is a new challenge for both the students and teachers. This paper helps in knowing the current situation of online learning of students. For this study primary data was collected from 150 college students. The data was collected from Haryana rural areas with questionnaire method (in Google form) and mailed to students. This paper focus on the student's hurdles faced during lockdown basically in rural areas.

**Keywords:****Lockdown, MIHRD, Corona virus.****Introduction:**

The covid-19 pandemic era comes with several challenges for the whole world. The covid-19 spoils the whole world economy. All sectors were seriously harmed. In all sectors the education sector is also one of the major sectors faced various challenges. Education sector is also plays a very important role in Country's economy. In India both state and central government authorities faces various challenges and do preventive

measures to solve this problem. This pandemic situation disturbed the education sector, which effects the students future.

COVID-19 is an infectious disease caused by a newly discovered corona virus. Formerly, this disease was referred to as '2019 novel corona virus' or '2019 ncov'. COVID-19 was first identified in Wuhan, China in December 2019. This lockdown situation develops various health issues in students and teachers life.

E-learning tools are playing a crucial role during this pandemic, it aims to help instructors, schools, and universities facilitate student learning during periods of universities and schools' closure. Besides, most of these systems are free which can help ensure continuous learning during this Corona virus pandemic. The success of any information system depends on the usage of the system by users.

E-Learning is just like a web based training means to install a software through which both teachers and students communicate with each other. Everything change with the changing technology. Now the new tools of teaching and learning changes with the technology.

The deadly and infectious disease Corona Virus also known as Covid-19 has deeply affected the global economy. This tragedy has also shaken up the education sector, and this fear is likely to resonate across the education sector globally. The Covid-19 pandemic outbreak forced many schools and colleges to remain closed temporarily. Several areas are affected worldwide and there is a fear of losing this whole ongoing semester or even more in the coming future. Various schools, colleges, and universities have discontinued in-person teaching. As per the assessment of the researchers, it is uncertain to get back to normal teaching anytime soon. As social distancing is preeminent at this stage, this will have negative effects on learning opportunities. Educational units are struggling to find options to deal with this challenging situation. These circumstances make us realize that scenario planning is an urgent need for academic institutions. This is a situation that demands humanity and unity. There is an urgent need to protect and save our students, faculty, academic staff, communities, societies, and the nation as a whole.

E-learning tools are playing a crucial role during this pandemic, it aims to help instructors, schools, and universities facilitate student learning during periods of universities and schools' closure. Besides, most of these systems are free which can help ensure continuous learning during this Corona virus pandemic.

### **Literature Review:**

1. Dr Amita (2020) in his study analyse that faculty made appreciable efforts to compensate the loss of syllabus. According to them various online learning tools were used to deal with students. With the help of online teaching 60 to 80 percent syllabus were completed. The data is collected from 882 students of various higher education institutions through the questionnaire method.
2. Radha and her research coordinators conduct a research in 2020. According to them E-learning mode become the future trend of leaning. The study conducted on 175 students across the world using stratified sampling method. The findings are based on primary data of different students. According to them most of the students were interested in online learning but within their comfort. This mode become more effective and popular during the lockdown situation.
3. Accorging to Suraksha and their co-researchers findings in 2020 analyse that most of the respondents were suffered from disturbance during lockdown. The disturbance are in the form of internet connectivity problem, electricity problem, data packs facilities etc. Due to these hurdles online teaching mode makes difficult to understand the concepts. The data is collected from 13 different nursing colleges of Nepal. The primary data was collected with distributed the questionnaire to all the respondents through mail. This is a descriptive cross-sectional online survey on students. Both teachers and students faced the problem of internet connectivity, and others. If we have to reduce or minimize theses hurdles than it makes the online teaching and learning process more effective and efficient method.
4. According to the study motivation is most important element while using online classes. When the students are not motivated then they don't prefer to use this mode. According to their survey teachers use various strategies to motivate the students.
5. Raheem in his study concluded that learning and teaching from home with the help of online tools is a very efficient step to teach the students. It is beneficial for both the teachers as well as students. In today's life technology become the most

important part of our life. For E-Learning various applications like Zoom, Google meet, Google classroom, Youtube etc were used to help the teachers. So finally during the pandemic era E-Learning through various applications become the most effective tool. It is interesting to share something new.

6. M Samir, said that many educational institutions faced various obstacles during online classes. But the latest technology can help in overcome these problems with the help of different E- Learning platform like Zoom, Google Meet, Youtube, Google Classroom etc. Now these technologies were used in the universities to deliver lectures. This study is done in Egypt. Due to him E- Learning is a easy and effective way to motivate students for learning.
7. Mohammadi, in his study has showed the role of e-learning and its application in language learning process and compared it with traditional form of language learning. It also has provided advantages and disadvantages of e-learning in language learning. The researcher when referred to the above related studies was able to bring out this maiden thought into his research done on the role of e-learning in COVID19 crisis and to show the important of it in different fields. The present paper is going to show the role of e-learning in COVID -19 crisis.
8. Amidst this deadly virus spread such online platforms are needed where (a) video conferencing with at least 40 to 50 students is possible, (b) discussions with students can be done to keep classes organic, (c) internet connections are good, (d) lectures are accessible in mobile phones also and not just laptops, (e) possibility of watching already recorded lectures, and (f) instant feedback from students can be achieved and assignments can be taken in the study.
9. Kapasia in his study analyse the impact of lockdown on students both (graduate & undergraduate). This survey is basically conducted in West Bengal through questionnaire method. The survey conducted on 232 students. According to them 70% learners were involved in the online learning process. But during online classes students faced many obstacles like depression, poor internet connectivity, anxiety, unfavorable study environment at home etc. She suggests targeted interventions to create a positive space for study among students from the vulnerable section of society. Strategies are urgently needed to build a resilient education system in the state that will ensure to develop the skill for employability and the productivity of the young minds.
10. Pravat in his study highlights on major impacts of Covid-19 on HEIs in India. Some measures taken by HEIs and educational authorities of India to provide seamless educational services during the crisis are discussed. Due to Covid-19 pandemic, many new modes of learning, new perspectives, new trends are emerged and the same may continue as we go ahead to a new tomorrow. So,

some of the post Covid-19 trends which may allow imagining new ways of teaching learning of higher education in India are outlined. Some fruitful suggestions are also pointed to carry out educational activities during the pandemic situation

**Objectives:**

1. To know the status of e- learning during lockdown.
2. To study students behavior regarding e-learning.
3. To gather suggestions to make online teaching more effective.

**Research Methodology:****Population:**

All the college students of faridabad are the population of this study.

**Sample:**

This study is conducted on the Faridabad students. The study was done on college going students of different colleges of Faridabad. It mainly focuses on the private sector colleges students.

**Sample Size:**

In the study the sample of 150 students was taken to reach at the conclusion.

**Data Collection:**

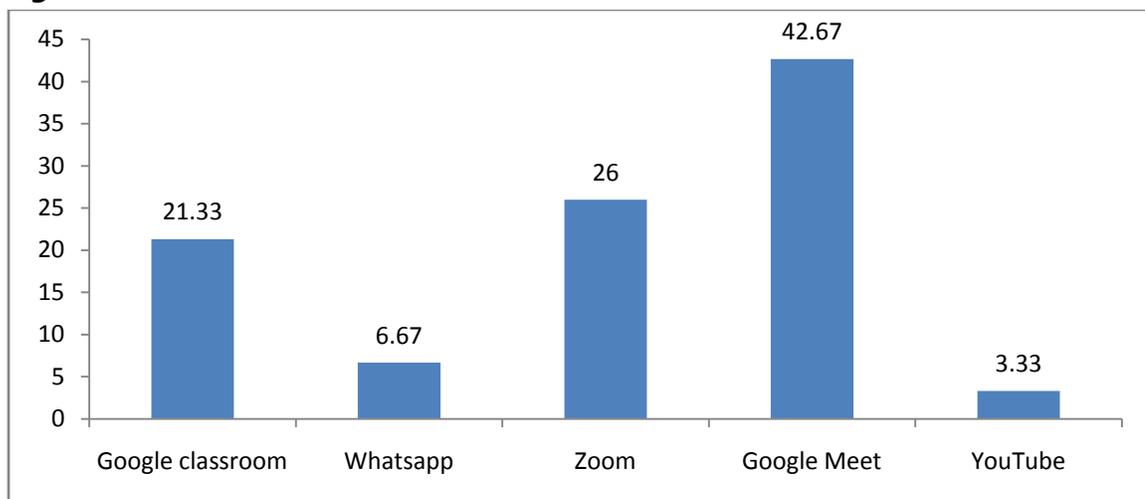

Primary as well as secondary both the sources of data were used in collecting the data. The primary data was collected through questionnaire method. The questionnaire was mailed to the respondents and collects the necessary information from them.

**Findings:**

1. Students preference on different types of application tools used for e-learning:

Table 1:

Classification	Respondents	Percentage
Google classroom	32	21.33
Whatsapp	10	6.67
Zoom	39	26
Google Meet	64	42.67
YouTube	5	3.33
Total	150	100

**Figure 1:**

2. Types of Device used for e-learning:

Table 2:

Classification	Respondents	Percentage
Laptop	42	28
Mobile	84	56

8	Are you satisfied with Google Form mock test?	69%	15%	16%
9	Does e-learning make your quarantine time a useful one?	56%	32%	12%

10	Do you believe that improving knowledge through e-learning is better than traditional learning?	42%	52%	6%
11	Do you think Face to face learning is important for practical teaching?	87%	9%	4%
12	Did you face any issues during e-learning?	92%	2%	6%
13	Are you positive towards e-learning?	76%	28%	4%
14	Does e-learning make your knowledge wider?	81%	6%	13%
15	Do you think web-based teaching is important for a student?	76%	6%	18%
16	Can e-learning bring a social change in India?	84%	7%	9%

Figure: 5

**Conclusion:**

This pandemic era is very difficult for all human being. Due to this various sectors face obstacles and try to overcome the barriers. For students also this time is very difficult where they study from home using various applications and device to learn something new. This time period taught something new to students. They learn time management, give time to their parents, help in each and every activity. These all things are not done when they went to colleges. This covid-19 has positive and negative effects both. It can make students more efficient. More than 70% of students believe that online classes are effective to learn but there are several obstacles arise during E-Learning. If these

obstacles will remove then it makes learning more effective. But it can create health problems among students. Those who have cervical problem before lockdown, it may increase and also back pain increases due to over sitting for online classes. Eye problem also rises due to over usage of phones, laptops, Desktops and sit in front of camaras for a long time. Ministry of Education can control on make rules and guidelines for online classes for school students. According to their guidelines the time limit of each lecture is fixed of 30-40 minutes and 9 -12 pm is fixed to take classes. But for college students no guidelines were made. They take 6-7 lectures per day. Internet connectivity problem, electricity problem are the various obstacles during online classes. For remove these obstacles if we work on these things, then we make online classes more effective and attractive for the students.

The measures to be taken to remove the obstacles during E-Learning are:

1. Fix the time limit of online classes with limited Hours.
2. Fix the limit of no. of lectures per day with 3-4 lectures per day.
3. If the companies minimize the data rate, so that each and every student easily afford the network connection.
4. Make presentation more attractive for students.

# Impact of Digital Banking in India: Trends & Challenges

**Dr. Rachna Kalsan**

**Abstract -** For the growth of any country's economy various sectors play a very important role. In the Indian economic growth banking sector is the most important aspects. Banking sector become the backbone of Indian economy. Any changes regarding technology or other aspects directly impact the growth of the economy. With the change in technology various changes occur in banking sector. Now more of customers are educated. They don't want to stand in queue for various activities like: Make payments, Deposit Cheque, Open bank accounts, Deposit Cheque and many more. With the change in time now digital banking introduced and it proves a star for the banking sector. Today's era accept this digital banking concept very easily and in a short time period it become more demanded mode of transaction in the market. In this paper we analyse the concept of digital banking. How it effects the human life. The research is based on secondary data. The concept of digital banking in banking industry brings numerous opportunities. But with every benefits some risk also introduced. And this digital banking also come with some risk.

**Key words:** Financial Inclusion, Digital Finance, Financial Products, Financial Services, Innovative Financial Technology.

## I. INTRODUCTION

Now banks are part of human life. Now Indian govt. do efforts to make cashless economy. In this process digital banking play a important role. In the present era we found ourselves in a wonderland, where the milkman accepts wallet payment without a fuss, a men buys a geometry set worth rs 100 using a credit card and the vegetable vendor uses QR code based "scan and pay" utility. The new innovative digital technologies and fantastic thoughts have given birth to whole new business and social dimensions. Digital banking provides solutions to bankers for their short term and long term business and technological requirements.

Digital Banking is the new paradigm in India which offers multiple benefits to the banking sector. It helps in increasing the productivity and profitability of banking sectors. It is a technological Updation in the growing era. This is mainly introduced to improve 4C's namely: Cost, Convenience, Control and Customer satisfaction. The framework/ structure of digital banking is the result of the collaborated efforts of the group comprising IDRBT research team, bankers, IT professionals and consultancy experts. The term digital is refers to the storage of data in the form of digital signals. It can make the banking function easy. ATM (Automatic Teller Machine) is an electronic telecommunication device. It is the best example of digital banking system. Digital banking makes the transaction very simple & easy. SMS banking is the example. Now every customer is free and do their as per their convenience. Digital banking is part of the broader context for the move

to online banking, where banking services are delivered over the internet.

### Defination's:

1. "Digital Banking- a new concept in the era of electronic banking, which aims to enrich standard online and mobile banking services by integrating digital technologies, for example strategic analytics tools, social media interactions, innovative payment solutions, mobile technology and a focus on user experience".
2. "Digital Banking is the application of technology to ensure seamless end to end (STP in the 'old' jargon) processing of banking transactions/ operations; initiated by the client, ensuring maximum utility to the client in terms of availability, usefulness and cost; to the bank in terms of reduced operating cost, zero errors and enhanced services".

## II. EVALUATION OF DIGITAL BANKING IN INDIA

The traditional system of banking in India has been the branch banking. The (MICR) Magnetic Ink Character Recognition based cheque processing was introduced during the period 1986- 88. The late 80's marked the emergence of computerisation of bank's with the introduction of LPM's (Ledger Posting Machines). The new economic policy gave motivation to introduce digital banking process in India in 90's. The year of 1991- 92 proves a successful year because of its rapid growth in the market. The major turning point was private and foreign

banks came to Indian banking sector due to this New Economic Policy. It has born a high competitive market. And due to this the trend of digitalization arises. Now every bank wants to use digital banking services, so that they can give better services to their customers.

The challenges for banks are now facilitate demands that connect vendors with money through channels determined by the customers. This is a dynamic shape which is the base of customer satisfaction. It can be maintained by customer relationship management (CRM) software. This is an important aspect in digital banking. It can directly communicate with the customers. And it can be base to connect both customers and bank management.

### III. REVIEW OF LITERATURE

1. Arunangshu in his paper focus on digitalization on rural banking system in India. Digital banking system have enormous potential to change the landscape of financial inclusion. They found that with the features of low cost, ease of use of digital banking can accelerate the integration of unbanked economy to the maintenance.
2. Rajeshwari in his research paper found that digital banking increase the expectations of customers from banks. With the help of secondary data they analyse that digital banking become the milestone in Indian banking system. It enhance the growth and progress of Indian banking. It found that due to digital banking the operating cost of banks has been reduced rapidly. Lower operating cost means more profits for the banks. According to him digital banking has a power change the banking structure.
3. Aarti Sharma, in his research paper concluded that digital banking will proves a milestone in the Indian economy. The study is analytical in nature and based secondary data. According to him digital banking impact on Indian economy. With the change in the technology of banking system, the economy also faces the changes. It can provide better services to their customers. Due to their rapid growth it is acceptable in the market. Now by analysing the benefits of digital banking everyone in the market demanded this for the overall growth and success.
4. Kiran Jindal conducted a research and analyse that with the promotion of digital banking it is also necessary to enhance awareness and preference of cutomers for banking products. It basically emphasis on HDFC banking products. The paper is based on empirical study. They can use primary data for the study. With the use of questionnaire they collect the data they analyse that age factor is most effective factors which effects the digital banking system. The customers over the age of 35 doesn't accept the change and still they are dependent upon public sector banks other than privet sector banks. Customers are not much aware with the new technology. So it is very important for the success of digital banking is to promote awareness among customers. For analysing the data researcher use SPSS software.
5. Ruby in his paper studied the problems and prospects of E- Banking. It also focus on the pros and cons of digital banking which effects the customers perceptions. They also focus on the risk involved while introducing digitalisation in the market. The secondary data was used for the research paper. They concluded that E- Banking offered a high level of convenience for managing finance for the customer in the digital market. They also analysed the risk means financial security, personal privacy towards the customers
6. Vishal conducted a study and concluded that customers always want safety and security during cash transactions. This paper makes more emphasis on the perception and opinion of urban mobile banking users. He focuses on practices, challenges and security issues related mobile banking in India. He uses quota sampling method. The data is collected from the primary source of data. The sample size is 100 respondents divided into two catagories: 50 users and 50 non- users of mobile banking. The sample is taken from Ghaziabad city. It was analysed that knowledge regarding use of mobile phone was the most important issue in mobile banking due to availability of various handsets models supporting different types of technology in the market.
7. Chandrawati identify the drivers of digital banking transformation for Indian banking system. E- Technology has become a tool that facilitates banks' organizational structures, business strategies, customer services and related functions. Using exploratory research, the study concluded that digitalization changed the face of branch banking and mobile was being increasingly used as a primary channel of banking. Moreover, integration with social media components as their online channels was also a major driver for digital banking transformation
8. Sahu and Kumar studied the important factors responsible for successful implementation of digital payment (e-Payment) system in India. Conducting a qualitative study with extensive literature review and using interview and expert opinion, 13 success factors namely Anonymity, Bank Involvement, Drawer, Infrastructure, Mobility, Parties, Popularity, Range of Payment, Risk, Security, Transfer limit, Transfer mode, and Transfer time were responsible for successful implementation of digital payment at Allahabad city.
9. Ankit and Singh conducted a study to analyses the impact of technology acceptance model (TAM) in the context of internet banking adoption in India under security and privacy threat. Keeping the TAM proposed by Davis as a theoretical basis, the paper

revealed that perceived risk had a negative impact on behavioural intention of internet banking adoption and trust had a negative impact on perceived risk. A well-designed web site was also found to be helpful in facilitating easier use and also minimizing perceived risk concerns regarding internet banking usage.

10. Geetha conducted a study on 200 respondents of metropolitan city in India. The researcher has laid down various parameters which has direct impact on the adoption of E- Banking facilities. They specified the parameters like innovativeness, familiarity, awareness, security and trust among the various customers. These factors effects the customers perception regarding digital banking.
11. Utpala conducted a study to evaluate the current status of E- Banking in the market. From the primary source of data she analyse the respondents reviews about E-banking. It will cover the Indian respondents as well as the non- residence respondents of India. They analyse the hurdles faced by the customers during online banking. They found that 60% of the urban population using digital banking. So for banks it should be important to focus on rural population by creating awareness programmes and training session. It should help in promoting digital banking in India.
12. Hoehle note that the utilization of digital banking channels has grown substantially. It focus on the customer related issue. They analyzed that if banks can use this digital banking system it can improve the financial performance of banks. Customers are looking for value and demanding more mobile banking services.

#### IV. RESEARCH METHODOLOGY

##### Objectives of the Study:

1. To know the role of Digital Banking among Adults life.
2. To identify the services provided by Indian banks to promote digital banking.
3. To know the Pros & Cons of Digital Banking.
4. To understand the challenges of digital banking.

##### Data Collection Methods:

The data should be collected with a secondary source. Various research papers, bank data, banking structure should be analysed for this paper.

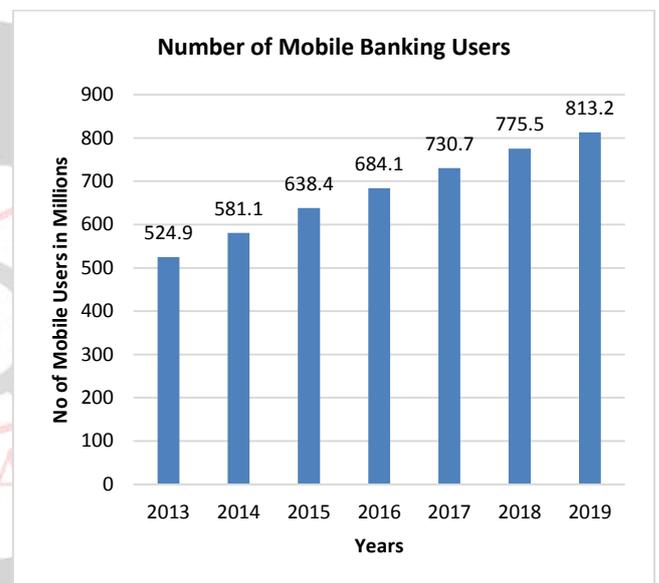

#### V. RESULTS

**Objective 1:** To know the role of Digital Banking among Adults life.

Now the time has been changed. With the change in technology human life also changes. In the past people go to banks and do their works by their own. But now all are educated and adopts new technologies for their growth. Now no one is like to go to banks because of shortage of

time. All are busy in their jobs. I'm sure any one of them not wants to stand in queue for depositing money or to withdrawal of money. Everyone wants comfort and peace in their life. In the past this system of queue is applied. Now smart banking starts. And this smart banking is come in our way of life. It is a part of our life. Now every transaction is done through mobile banking. Now paying bills with mobile banking become very easy.

Years	No. Of Mobile Users in Millions
2013	524.9
2014	581.1
2015	638.4
2016	684.1
2017	730.7
2018	775.5
2019	813.2

**Number of adult Indians with bank accounts rises to 80%**

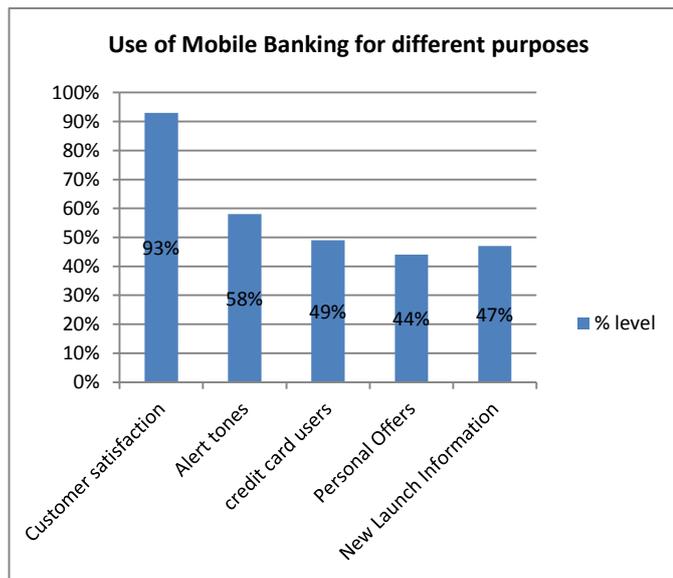

##### No. of Adults using Mobile Phone Banking

Years	% of people
2018	69%
2017	62%
2016	51%
2015	49%

Globally, 69% of adults (3.8 billion adults) now using mobile banking. The Modi Government put more efforts to increase the use of digitalization in banking. India's Jan-Dhan Yojana scheme, developed by the government to increase account ownership, brought an additional 310 million Indians into the formal banking system by March 2018, many of whom might not yet have had an opportunity to use their new account.

In India the contribution of adults has been increased by doubled since 2011 with 80%.

During 2017-18, the number of transactions carried out through credit cards and debit cards was 1.4 billion and 3.3 billion, respectively. Prepaid payment instruments (PPIs) recorded a volume of about 3.5 billion transactions, valued at Rs 1,416 billion. Indians prefer a digital-first approach to banking, and will not hesitate to protest poor service, finds a survey by Avaya. 51% of Indians use online banking channels. 26% of Indian customers prefer to access services via their bank’s website, and the same number would prefer to use a mobile app rather than talk to a human agent.

**Benefits of Digital Banking for Student’s:**

1. No need to carry cash (plastic notes).
2. Avoid long queues.
3. Highly secured system.
4. No worry of loss and theft of money.
5. Easily availability of money.
6. One card- multiple uses.
7. Reduce operational expenses.

**Digital banking Users according to Age Group:**

Age Group	% of Users
Below 18	33.3
18- 29	78.6
30- 49	67.5
50- 59	33.3
60 and Above	-

**Objective 2:** To identify the services provided by Indian banks to promote digital banking.

S.no.	Services:
1	Tablet banking.
2	Mobile check deposit.
3	Tax alerts.
4	E-Statements.
5	
6	

7	Online Bill pay.
8	Deposit Account opening.
9	Account statement.
10	Cheque book Issue.
11	Fund Transfer facility.
	SMS Banking.
	Request status enquiry.

**Objective 3:** To know the Pros & Cons of Digital Banking.

(Pros) Advantages of Digital Banking:	(Cons) Disadvantages of Digital Banking:
1. Customer Satisfaction.	1. Increase Cyber attacks.
2. Cost Reduction.	2. Afraid of Privacy & Security.
3. Paper less Work.	3. Increased in unemployment.
4. Face Competition.	4. Increase training and development cost.
5. Reduce Human Error.	5. It is not useful for uneducated Peoples.
6. Easy Accounts Handling.	6. Digital knowledge is must.
7. Cash less Transactions.	7. Customer’s perception changed.
8. Increased Productivity.	8. Low internet speed.
9. Increased employees Performance.	9. Transactional Charges.
10. Time Saving.	10. Habitual causes.
11. Eliminate area gap.	

**Objective 4:** To understand the challenges of digital banking.

1. **Security/ Privacy:** This is the most important challenge in digital banking. Every person has a doubt regarding privacy and security of digital banking. They don’t believe on digitalisation. They only prefer to do cash transactions. Most of the customers were not changed their perception regarding banking. They think that with the growth of technology some problems also occur. Customers don’t want to take any chance with their money which they have earn in their life with full of efforts and hard work. With digitalisation, antivirus also come which destroy your life.
2. **Knowledge of Digitalisation:** Many people don’t understand the concept of digitalisation. This system wants Updation time to time to improve its accuracy. This digitalisation work only when the customers are educated and have knowledge regarding this. This is the challenge that it wants to cover more & more customers. For this knowledge is most important.
3. **Internal Barriers:** Banking industry also has departments like other industry. With the change in technology effects the departments of the organisation. Like customers & bank employees are the most important part of banking system. As customer knowledge regarding digital transaction is important as such employee’s knowledge regarding digitalisation is also matters. If employees don’t know this then how

they can influence the customers. So banking system can give training to their employees so that they can update themselves with the change in technology. It can increase the performance & productivity of employees.

4. **Non financial Institutions:** Like Govt. banks, several other institutions like Google, face book, paytm etc. offers similar services like banks provided to their customers. These non financial institutions provide a platform to the customers to send their money directly to someone's bank account. These institutions were not bounded with any rules and regulations. But financial institutions were bounded with some rules. This is the most challenging concept for financial institutions.
5. **Digital banking system:** Now a days the demand for digitalisation grow on a high speed. But most of the banks have no guts to adopt this technique quickly. For this best and skilled management will be required so that their policies & strategies will give benefits to the organisation. Some wants a readymade system and some wants to build a system and then implement it. It takes a lot of time to take a decision which is beneficial for the organisation. This makes a challenge for the organisation to adopt which system because each decision has with some cools & fires.

## VI. CONCLUSION

Digital banking captures a large market share. Now a days with technical advancement there is a change in the banking sector. Now every customer accept the digital banking for their comfort. But with benefits of this advancement some errors also occurs. So there are some technical issues which effects customers perception. According to the study the active users of digital banking are 562 millions in India. Digital banking is converting the brick and mortar banks into more greater and efficient places to operate. Digital banking makes easier all the transaction for the customers. They can easily pay their bills, convenient places, transfer money from one place to another and easily check the bank details. Growth of digital banking in India can help in various issues like: Growth of capital market, Growth of insurance sector, Growth of venture capital market.

## **A study on the Buying behaviour of females in Delhi NCR (Impulsive Vs Rational buying)**

**Priyanka Chauhan**

**Assistant Professor**

**Lingayas Vidyapeeth**

**Faridabad**

### **Abstract**

Impulsive buying is the spontaneous purchase or a purchase without any pre planned idea of buying that specific product. It is observed that impulsive buying is mostly related to females as females are majorly inclined towards impulsive behaviour when compared to males. It is a sudden and immediate purchase decision. This study aims at searching the factors which influences the buyers (particularly females) to go for impulse buying. It also try to find out whether any price factor is involved in the impulsive buying. The study extends to find out the post purchase behaviour of females after buying impulsively. This study is based on the secondary sources of data. This is mainly descriptive in nature. Secondary sources mainly includes past research papers, articles, journals etc. According to past studies the ambience, convenience and shelf positioning have a significant impact on the Impulsive buying behaviour of consumers.

**Key words:-** Impulsive buying behaviour, post purchase behaviour, females, price of products

### **1. Introduction**

In today's scenario as pool of options is available for the consumers, they generally opt for the impulsive buying. "Impulsive buying" is basically a spontaneous purchase without any intention to buy a particular product. The person who goes for this type of purchases referred as impulse buyer. Mostly females used to shop for products impulsively without any pre purchase intention. This paper focuses on the female purchase intension.

#### **1.1 Indian consumer buying behaviour**

Buying behaviour is basically the decision making process and the acts involved in customers buying and using products. Buying behaviour of consumers may vary from person to person. The buying behaviour has become a great necessity for the marketers to understand as success of an organisation majorly depends on the consumers purchase behaviour. Initially Indian consumers were price sensitive, they always go for the economical product with the best quality, even a small change in price of products will induce the consumers to switch from one brand to another. Now the mind-sets of consumer have changed, they mostly now prefer the

best combination of quality, quantity and price. As the drastic change in socio-economic pattern of Indians are witnessing the new markets and they are going to get exposure of the new varieties. The Indian consumer profile has been changed and developed in terms of employment, income, advertising, education, media exposure etc. Now consumers have become aware about the pros. and cons. of each and every product. Nowadays consumer buying preferences change rapidly towards high end technology products.

## 1.2 Consumers buying process

### The Consumer Buying Process

---

[www.shanepatrickjones.com](http://www.shanepatrickjones.com)

(SOURCE: [www.shanepatrickjones.com](http://www.shanepatrickjones.com))

The study of consumer buying process is important to analyse as it gives the idea about how the customer purchases the products. In the buying process consumers follow various steps and at every step they analyse everything. A rational consumer can follow all these steps while he/she decides to go for the purchases. Firstly the consumer finds out his need of the product or recognises the problem. Then after problem recognition the consumer go for the information search. In information search the consumer searches the information from each and every available source, and then he/she compiles the information. After searching of information the next step is evaluation of alternatives i.e. to compare the entire available alternative and evaluate these alternatives on the basis of price, quality etc. After evaluation of alternatives purchase decision should be made and when the consumer decides about the purchase, he/she can finally go for the purchases. Purchases is not the final step of the

decision making process after purchases, the consumer can go for post-purchase evaluation. In post purchase evaluation the customer evaluates the after sales services, on the basis of which the customer evaluate the marketer. If the customer is not satisfied with the services of the marketer, he/she may also return the product. If post purchase stage is not taken seriously, the loyalty of the customer may be lost.

### **1.3 Female buying behaviour**

As India is a diverse country the choices of people will also differ based on their culture, caste and creed. The buying pattern may also differ as we travel from one region to another. Also there is a difference between the buying pattern of males and buying pattern of females. Females frequently visit at the shop for buying one thing or the other. As compared to males females are more indulged into impulsive buying. Females attach emotions with their product and that's why they impulsively buy product. Sometimes the influence of the seller, sometimes the packaging of the product also persuades the buyer (especially females) to go for purchases. Window dressing plays a crucial role in enhancing the shopping experience of buyers. It is also observed that women seek variety of products and from the hundreds of available brands she chooses one or two.

### **1.4 Factors affecting the buying behaviour**

With the new entrants in the market and a variety of options the consumers keep on changing their preferences from time to time. There are various factors which influence or attract them to buy. These factors include marketing campaigns, income of the buyer, buyer's personal preferences, group influence etc. Many a times just because that particular product is advertised by their favourite star or the person to whom they admire induce them to purchase.

## **2. REVIEW OF LITERATURE**

**Rajput, Kesharwani and Khanna(2012)** - This paper examine the buying behaviour of females and analyse the key factors in branded clothing which influence them to buy branded clothes. It is included in the study that price, income level of consumers are the main factors in their buying process. Also the author specifies that females have a wide knowledge in the branded products and the shopping behaviour of females is occasional.

**Ekeng, Lifu and Asinya(2012)** – This study highlights the demographic characteristics in buying behaviour. It focuses on the purchase behaviour of people according to their demographic condition and how impulsive buying is directly related to their demographic characteristics. This paper collected data through filling of questionnaires. The study reveals that though education was insignificant factor but it was the one which indulge the consumers to go for impulse buying.

**Badgaiyan and Verma(2015)** – This study is tried to find out the impact of situational factors on the impulsive buying behaviour. They categorise the variables into two classes (i) personal variables (ii) in-store variables. The study is based on the primary data collection. Their study concluded that gender does not impact impulsive buying behaviour while age has a negative relation with impulsive buying.

**Liao, Shen and Chu(2009)** – The study investigate the marketing effectiveness in attracting the customers to go for the impulsive buying. Also focuses on how the sales strategy induces consumers to adopt impulsive buying. They concluded from their study that a price discount promotion and also a premium price promotion of a product encourage them for impulsive buying.

**Ghani and Jan(2011)** – This study is based on examining the demographic factors with impulse buying tendency of consumers in developing countries. This study concludes that age plays the major factor in impulsive buying whereas gender and income plays secondary role. Also the demographic variables have an indirect effect on impulsive buying behaviour.

**Amir et. ,al.(2014)** – This study focuses on the relation and effect of factors that may influence the impulsive buying behaviour of females in apparel industry. This study mainly tries to find out the factors which trigger the female to adopt impulsive purchases. This report is based on primary data collection. The results show that the impulsive buying of Pakistani women mainly increases because of social desirability.

**Gangai and Agrawal(2016)** – This study tries to establish the link between personality traits of an individual and impulsive buying. They highlight that many marketing organisation focuses on their personality traits and depending on them they make their strategy. In this study two objectives were set (i) to examine the effect of personality traits on impulsive buying (ii) to identify the role of gender and their personality traits on impulsive buying.

**Akram et. ,al.(2016)** – This study explores the relation between store atmosphere and impulse buying behaviour. It also analyses whether the demographic variables like education, gender, age affect the relationship between store atmosphere and impulsive buying.

## OBJECTIVES

1. To study the impulsive buying behaviour of females.
2. To find out the post purchase behaviour of females after impulsive buying.

## RESEARCH METHODOLOGY

This study is based on the secondary data. It is basically descriptive in nature. The data have been collected from various sources like research papers, journals, government reports, newspaper articles etc.

## ANALYSIS/FINDINGS/DISCUSSIONS

It was analyzed on the basis of past study that most of the females prefer for impulsive buying. Females go with their intuition and purchases what they actually want to buy. In impulsive buying females does not consider cost factor. After impulsive buying the females are mostly satisfied. Studies show that females are more frequent buyers as compared to males. Also from the past observations it can be concluded that shopping act as a stress buster for mostly consumers (especially females).Female buying pattern is less rational than male buying pattern. On the basis of prior researches, it was found in the study that frequent advertisement of product is the main source of making the buying decision. Producer should invest on the advertisement so that they can attract more and more customer.

## CONCLUSION

The purpose of the research was to understand the buying behavior of females. The results of this study clearly indicate that there is difference between the buying pattern of males and females. Females do have impulsive behavior in case of certain things but not necessarily always. It has been observed that female shop according to their moods and most of the time they thought of buying something and bought another thing. After buying things impulsively mostly females were satisfied but it has been observed that most of the times they do feel the thing is of no use to them. This study is based on secondary data and the information collected is on the basis of the research papers studies. This study reveals the purchase and post purchase behavior of the people with special focus on the females.

## A Theoretical study on Buyers Preference in Purchasing the Attires of Universal Brands

Dr. Deepak Bhandari<sup>1</sup>, Dr. Javalkar Dinesh Kumar<sup>2</sup>, Dr. Savita Yadav<sup>3</sup>

Professor<sup>1</sup>, Assistant Professor<sup>2,3</sup>

Lingaya's Vidyapeeth (Deemed to be University), Faridabad, Haryana.

### ABSTRACT:

Apparel, being a more brand-driven category than, food & groceries, has already seen many international brand apparel retail outlets enter India over the past 15 years despite the restrictions in the FDI policy in retail sector. A lot of international brand Apparel retailers are most likely to look at India, as global markets have stabilized and the Indian economy has proved to be better than most other countries. This study was conducted to find out the factors that determine the shopper's inclinations for international apparel brand. The purpose is also to identify the predictors for internal brand apparels among consumers. From the study it was found that consumers are brand conscious now a days. To look more stylish they prefer branded apparels and branded apparels also depict the status of a person. Due to more durability, variety and quality and people prefer branded apparels. The study found out that price and media influence are strongest predictor for the consumer preference followed by quality and Land of original and style has less prediction towards the consumer preference. Overall, the survey shows that shoppers have positive attitude towards international apparel brands.

### INTRODUCTION

Globalization is vital sensation that is gaining attention worldwide, and lead the world to become a one combined market, an international market. In the era of pre-liberalization, consumers of India were acknowledged to have high preference towards foreign brands and imported goods. Though, after the decade of liberalization, Indian market, is highly served by the brands, which have their origin from the foreign countries. With the increased in popularity of international brands, market become a part of attractiveness and high competition. "Tastes and preferences of the consumers are the main base of fashion, to develop the brand popularity".

India has developed as third attractive market for apparel industry throughout the world. India is the nation which have different cultures and customs, and for each culture and customs they have

different dressing style. It has variation of dressing from “salwar-kameez to sari and from lungi to dhoti”. Indian market is increasing day by day through the branded garments. According to the past survey by various researcher, it has been noted that, in last ten years India is source of attraction for American and European brands because of high demands of apparel in India. And due to the preference over the brands by customers it becomes necessary of the companies to develop brand management so that they can gain competitive advantage worldwide. Brand management gain importance due to continuous change in the international market at global level, and due to the competition among the various international firms. Proper management of brands makes a clear differentiation among the products and give a proper information about the loyalty and preferences of consumers, which ultimately lead to increase the market share of the organization.

## **Brands**

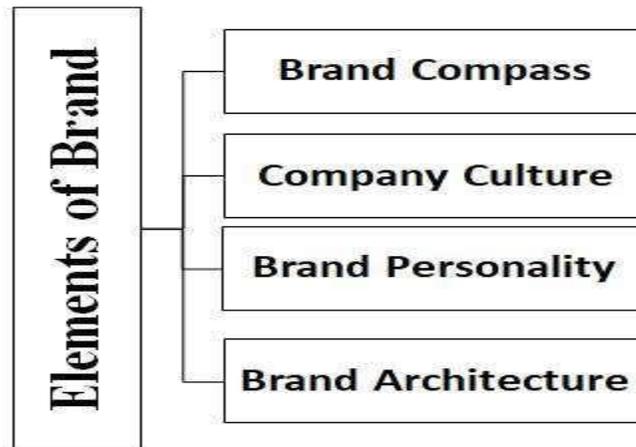

Brands is not a new concept to marketing. Earlier the concept of brand, firstly used by “Egyptian Brick-makers” who use symbols and signs on the bricks to make their product identical (Farquhar et. Al., 1990).

Branding is practice of marketing, which created by company as a “name, design or symbol” that is used by the consumer to identify the product and make the product different from the other products and services. Branding is vital for company because it makes a memorable impact on consumer’s mind as well as it allow consumers and clients to know what to be expect from the company. Brand should be a word, symbol or sign which represent a picture of your company.

Marty Neumeier defined brands as “*a brand is person’s gut feeling about a product, services or organization*”.

Fried lien defined Brand as “*Brand is the sum total of how someone perceives a particular organization*”.

## Element of Brands

- **Brand Compass:-**Brand Compass refers to abstract of the supreme fundamental facts about your brand. Brand compass leads to the directions, why branded is headed. Brand compass is outcome which company get through the work done in the stage of brand strategy plus in the stage of research and positioning. It contains five parts “purpose, vision, mission, values and strategic objectives”.
- **Company Culture:** - Company culture is inner self of motives, purpose and stimulus that drives brand of your company. If company have strong culture, it will create core value to brand, which defines how your product is engaged with the world by the name of your brand.
- **Brand Personality:** - Brand personality involves the individualist’s traits of brands. Brand personality of product is the reason that reveals the rational and loyal customers and build a cordial relationship between the customer and company.
- **Brand Architecture:** - Brand architecture is a combination of “name, color, symbol and visual language” that make brand identifiable. Brand architectures are highly purposeful and creative, founded by researchers through customers experiences. “Brand architecture systems are commonly categorized as either monolithic, endorsed, or pluralistic”. Monolithic brand architectures’ includes a single major brand and various sub brands. Endorsed and pluralistic includes parent brands which have different-different relationship with other divisions.

## Preference towards the Branded Apparels in India

In today's trend of fashion, people are switching on branded apparels form the non-branded ones. Brands are getting awareness throughout the world. There are various factors that are crating demand of branded apparel like "increase in the income of consumer, increase in literacy level among consumers, globalization, increase in purchasing power and consumer consciousness towards fashion".

Promotion and media is the main reason behind the increasing brand awareness among youth. This is the new era in which people are more aware about the brand and want to buy apparels which are related to reputed brands. People are becoming more brand conscious and it is new fashion trend which is gaining more attention now a days. People consider brand value as quality, price and style. Youths are preferring branded clothes due to the comfort level of clothing stuff and they also believes that branded clothes are recognized as a symbol of status.

International brands of apparels also capturing the attraction of people of India. Market of India is attracting various niche foreign retailers. Many International brands of apparels has been set up their stores and shops in India by using the franchisee route. Many International Brands of apparels are available in India which are as follows:-

➤ Lacoste	➤ Crocodile
➤ Benneton	➤ Reebok
➤ Dockers	➤ Lee
➤ Levi Strauss	➤ Zara
➤ Versace	➤ Mother Care
➤ DKNY	➤ Debenhams
➤ Wrangler	➤ Nike
➤ Mango	➤ Esprit
➤ Marks and Spencer	➤ Tommy Hilfiger
➤ Peter England	➤ Arrow

## Consumer Buying Preference

The most difficult issue for the manufactures of clothing is to identify the consumer's needs. Identification of need is not valuable until it is not transformed in to product and service. Before developing any product and service specially related to garments it is required to understand the full make up mind of consumers, it is known as the consumer behaviour.

Sproule's& Kendall (1980), defined consumer decision making as "a mental orientation characterizing a consumer's approach to making choices". They identify eight dimension, on which decision of consumer has depend whether to buy or not to buy apparels of particulars brands. These dimension are ass follows:-

- Quality Conscious
- Brand Trustworthiness
- Style Conscious
- Price Conscious
- Product Conscious
- Spontaneous and Careless Tendencies
- Jumbled by over varieties
- Amusing and pleasure-seeking orientation

## LITERATURE REVIEW

Stanforth (2009), states that shopper perceptions about the international brand fashion apparel are based on various factors, like "perceptual leadership and perceive role model in the society, matching attire status to employment and workplace ambience, socialization with peers and people they like, self-esteem and fun, and respectful treatment in the society (Stanforth, 2009).

Janson and Power (2010), found that fashion and latest design offers by global brands of apparels are the main actors which help in creating the good brand image and provides various myths that clear the consumers orientation to buy fashion apparels of global brands.

Tee, Gharleghi& Chan (2013), conducted a study, main purpose of this research to identify the factors which predict the preferences of buyer for choosing the foreign fashion brands. Result of study revealed that origin of a country, is a factor that play a vital role in making the buying

choice to buy branded clothes, which are followed by other factors like lifestyle, media influence and quality of the product.

Pandian, Varathani&Keerthivassan (2012), Conducted a study to know the most preferred international brands opted by Indian. Study reveals that “John player, Peter England and Raymond” are top most favorite brand which are preferred by the consumers of India, who are more brand conscious. It was found in the study that shopper decision about the brands mostly the man shoppers, has influenced by choice of color, design & style, price series, celebrity endorsers and stability.

Laskar& Abbas (2014), tried to find out the source of awareness among consumers about the brands of apparels and to know the level of awareness of brands among the buyers. It is found that the main source of awareness is advertisement and attentive mind of buyers towards the trend and market increases the level of awareness. International brands of clothing industry need to be invest huge amount of money on advertising to capture the attention of consumers.

## **OBJECTIVES OF THE STUDY**

1. To identify shopper inclinations in buying apparels of international brands.
2. To find out the elements that influences the purchasing choice of shoppers for the apparels of international brands.
3. To check whether Brand image affects the purchase intention of shoppers.

## **DISCUSSION/ ANALYSIS**

- It is found in the study that the majority of people go for the brands occasionally not always. People like to buy the branded apparels, it shows the likelihood of respondents towards the branded apparels and indicates that people are becoming brand conscious.
- Majority of shoppers have a medium level of priority towards the international branded apparels.
- Shoppers give importance to international brands of apparel, when the brands make them feel good it influences their buying decision.

- According to the respondents, the topmost factor that influences their preference is price after that media influence affect their decision. Media influences include advertisement, promotion and celebrity endorsement. Media influence and festival offers to carry equally according to the respondents. Whereas after the media and festival offer the next factor that affect the buying decision is the loyalty of the brand follows by the festival offers and quality of customer service. It shows that price is on the top most important factor for the shopper which influences their decision to go for the apparels of an international brand.
- It is found that attractiveness of logo is not so much important for the shoppers while taking the buying decision regarding the apparels.
- Majority of people among the respondents are agreeing the international brands are fashion focused which motives the shoppers to buy the apparels of the international brand.
- Consumers are agreed on the fact that variation in fashion in style provided by international brands in apparels and consider an important element of global brands covered by the apparel industry.
- Majority of people among the respondents are neutral on this element, that the international brands provide more comfortable apparels.
- It is found in the study that international brands of apparels have high impact on the mind of shopper, they wants to buy the apparels of international brands.

## RECOMMENDATIONS

- Consumers are becoming brand conscious. They prefer to buy the apparels on the origin of brand image and distinctiveness of the brands. So apparels manufacturer of the international brand can increase their profits and attract more consumers by providing the uniqueness in their apparels.
- Buyers get more influenced by price and loyalty factors, so companies may increase their sale by offering the apparels at low cost, this will also create loyalty among the consumers. Price can be reduced by reducing the tax prices so that consumers can afford easily the apparels of international brands.

- International brands of apparels can focus more media influence and promotional activities, it will lead to gain fame as well as attract more consumers.

## CONCLUSION

Consumer buying inclination has gained significant attention from the researchers. But, while reviewing the literature of shoppers' inclination towards the international brands of apparel, few studies have been found. The present study was conducted to identify the factor that affects the inclinations of customers while going for the apparels of international brands. Preference of consumers can be changed by the cultural effects also. Shoppers prefer international brands because they think that it relates to prestige and consider it as a symbol of status. From the analysis, it is found that store image, quality of product and customer services also reveals the inclination of shoppers. Study indicates that consumers are becoming more brand conscious and their decision was affected by the services given by the international marketers of apparels like style, location, store attribute, brand name, fashion and quality of stuff. The manufactures of the International brand must focus on all these factors to gain profit and to attract more consumers. If consumers have a high preference towards the international brands of apparels then, there will be higher the chances to go for the international brands.

# "Transformational Leadership and Employee Empowerment: An Empirical Study of the Attitudes of the Employees of Indian Automobile Sector"

Dr Vinita Agrawal and Dr **Savita Yadav**

*Professor, Amity University, Jaipur*

*Assistant Professor, Lingaya's Vidyapeeth, Faridabad*

## **Article Info**

**Volume 82**

**Page Number: 9459 - 9473**

**Publication Issue:**

**January-February 2020**

## **Abstract:**

The concepts of transformational leadership (TL) and employee empowerment (EE) occupy a prominent place in business world. Past researches signify a positive relationship between these two concepts, as has been studied by various researchers in various sectors. But the current study is only focusing upon relationship between TL&EE in the automobile sector. The population for the study covers middle level employees of automobile sector in Delhi-NCR region. Data were collected from 500 sampled respondents with the help of administering pre-developed structured questionnaires on transformational leadership (MLQ-5X) and employee empowerment (Psychological Empowerment). Non- Parametric tests like one sample sign test, chi-square test and Kruskal-Wallis tests and parametric test like Z test and t-test were applied for analysis. The findings indicate that all the dimensions of TL and all the dimensions of EE are vital and also prominent. However, the prominence in the case of technical cadre of employees occupies first rank while the management-cadre of employees has third rank, out of the three categories of cross sections. As such the scores differ significantly. There is very positive & significant relationship between EE and TL and EE is the effective function of TL..

## I. INTRODUCTION

Leaders are visionary, altruistic and have influencing power, who help organization in developing high performance of teams and thereby lead to develop learning organizations and improves job satisfaction playing very vital role in improving an organizations performance. Today's organizations are facing changing environment and, therefore, organizations require transform themselves as per the changing environment. Transformation of organizations is not possible without employee involvement. Employees are vital source for the organizations and if the employees are empowered, organizations can survive in the corporate world and improve their

existence. Employee empowerment is the main issue which is gaining attention due to increasing competition and, therefore, growth of organizations largely depends on how organizations treat their employees. The studies related to leadership indicate that TL has relation with the employee job performance and also their satisfaction (Bass & Avolio, 1993; Özaralli, 2015). Since past few decades, competition is globally increasing due to advancement in technology and socio-economic changes; it influences the organizations to change their structure from centralized to decentralized nature. Organization structure could be changed by the dominated role of leadership, which modifies the management practices complementary to the

aim of employee empowerment (Conger & Kanungo, 1998; Forrester, 2000, Dewettinck & Ameijde, 2011).

Past researchers indicate that leadership and employee empowerment has positive relationship (Dust *et al.*, 2014; Ismail *et al.*, 2011; Judge & Piccolo, 2004). This paper mainly concentrates on the relationship of TL& EE in automobile sector for middle level employees. Every organization has its own leadership style and employee empowerment strategies. In the past, various areas of corporate world have covered in the research of transformational leadership and employee empowerment. This study, mainly focuses on automobile manufacturing sector, which is the most growing sector in Indian economy. Automobile sector is facing challenges due to complex changing environment as also due to the requirements of customers and society. To deal with the issue of continuous technical up-gradation in production process and requirement of customers, it is the need of manufacturing sector to build transformational leadership and empowered employees. For this purpose, the attitudes of the employees have been studied in connection with TL& EE.

## II. REVIEW OF LITERATURE

### Transformational Leadership (TL)

It has been defined by Downton (1973), as "when one or more person engages with others in a way that leaders and followers raise one another to a higher level of motivation and morality". Burns (1978) defined TL as "the truly transformational leader who is seeking the greater good for the greatest number and is concerned about doing what is right and honest and is likely to avoid stretching the truth or going beyond the evidence, because he/she wants to set an example to followers about the value of valid and accurate communication in maintaining the mutual trust of the leader and his or her follower". Because of its nature to motivate and relate TL is gaining attention (Gardner *et al.*, 2005).

Transformational leaders inspire followers to work in a team for long hours and achieve

performance beyond the expectations (Bass, 1985). Podsakoff *et al.*, (1982) states that contingent rewards affect the performance of subordinates. Contingent rewards motivate the followers which lead to job satisfaction. Transformational leaders raise the morale of the followers, build up awareness among employees, provide them guidance to work according to their own method and encourage participative management (Yukl, 2009). Avolio & Bass (1995), classified transformational leadership in four dimensions as explained below:

- **Idealized influence:** Leaders influence their followers, create culture and value between the followers. Transformational leaders inspire and motivate the employees to build confidence among them as also contribute in building trust and creating an environment of loyalty. They perform their role as ideal to their followers (Avolio, 1999; Bass & Avolio, 1992; Goh, 2002).
- **Inspirational Motivation:** Leaders play a role of motivator who encourages the followers to perform according to the organization's norms. They clearly communicate objectives and vision to the employees and provide guidance to them, so that they can achieve targets within the time frame (Bass & Avolio, 1992; Sarv & Santra, 2001). Transformational leader increases the quality of work and inspires the followers towards positive thinking (Avolio & Bass, 1988).
- **Individualized Consideration:** Transformational leaders treat followers individually. They do not focus on the present needs of the followers but try to exploit their needs and develop potential among the followers to achieve those needs. They give preference to one to one relationship. Leaders establish a connection line between the needs of employees and mission of organization (Bass, 1985). Here, leaders act as coach and mentor to their

followers (Bass & Avolio, 1992; Skosik, 1997).

- Intellectual Stimulation: Innovative leadership and leadership for innovation is again an important aspect of leadership encouraging employees to be innovative, creative and problem solver. They offer challenging work to the followers and encourage them to work according to norms, values and traditions. They also influence the followers to perform a task with new ideas and techniques (Bass, 1990). Transformational leader connects the ideas with value.

#### Employee Empowerment (EE)

Empowerment term came into existence in 1981. It was introduced by Julian Rappaport. "It is a state of mind as well as result of position, policies, and practices, Block (1987). As managers, we become powerful as we nurture the power of those below us. One way we nurture those below us is by becoming a role model for how we want them to function". According to Clutterbuck & Kernaghan (1994), "empowerment is, in essence, the transfer of power within organizations from top management to middle management and so on, all the way to the front line employees". The term empowerment focuses on enhanced participation of employees in organizational processes and decision making (Mitra & Sinha, 2005).

Empowerment has the positive relationship with commitment and increases the job accountability among the employees (Sarkar, 2009). Kauffman (2010), states that empowerment is a continuous process of encouraging employees to generate new ideas, make plan and strategy for actions and take initiatives which ultimately aids organization. The primary aim of employee empowerment is redefining the power between employee and management, which increases the employee authority, commitment and responsibility (Handy, 1993; Spreitzer, 1996; Greasley et al., 2008, Sahoo et al., 2010). To be the highly effective

empowerment, an organization must adopt practices which increase the "power, knowledge, information and rewards" and share it with the employees on lower and organizational level (Bowen & Lawler, 1995). The employee empowerment has been classified into the following eight dimensions:

- Meaning: It is "the value of the task goal or purpose, judged in relation to the individuals intrinsic caring about a given task" (Thomas & Velthouse, 1990, p.672). Meaning acts as engine to the empowerment; it inspires and encourages employees to work effectively and actively (Spreitzer, Kizilos & Nason, 1997; Spreitzer, 1995).
- Competence: It is "the degree to which person can perform task activities skillfully when he or she tries" (Thomas & Velthouse, 1990, p. 672). Competence stands for self-efficacy and personal mastery.
- Self-determination: It is related to freedom of employees to take decisions related to their own job. It deals with choice of performing the task according to employees (Deci, Connell & Ryan, 1989. Locus of control is important in self-determination. Individual behaviour and attitude are to recognize as self-determination.
- Impact: It is the extent to which one can create a difference through their behavior which leads to accomplishing the task in a purposeful manner as also producing intended effects in one's work environment (Thomas & Velthouse, 1990, p.672). It is influenced by the personality characteristics and locus of control. Impact is to deal with how much employee activities have impact on department and on organization.
- Clarity to expectations: Organizations need to communicate the vision and mission to the employees. Supervisors should clearly communicate the job expectation to the employees; and also the organization expectations from them and employees

having authority to job (Fishmen& Keys, 1997).

- Value and rewarding: Employees are rewarded and praised for their efforts. Organization should value their employees who take participation in the management activities. It increases the empowerment and helps organizations in achieving the targets more easily.
- Access to resources: Supervisor should have clear idea about the resources available to the employees. Task is incomplete with improper resources, so the supervision should ensure that employees have proper and adequate resources to perform their jobs and activities.
- Voice: Voice deals with the encouragement from the supervisors to the employees for future growth. Supervisors should encourage decisions-making from the employees as it creates responsibility among employees which raises the employee-empowerment. Employee involvement and participation culture supported by the organization provide authority to employees to perform their job

#### Theoretical Framework between TL& EE

Employee empowerment has positive relation with transformational leadership as also with organizational commitment Ismail et al., (2011). Past researches investigate the relationship between TL & EE based on varied samples and industries. Özaralli (2003) & Meyerson & Kline (2008), assures that if a leader implements transformational leadership style properly it will lead to the increase in the empowerment of the followers and have the impact on functions of the organization. LMX (Leader-Member Exchange) is positively related with the creativity of employees (Scott & Bruce, 1994; Tierney et al., 1999). Ahearne et al., (2005), exhibits various aspects of empowering leadership which includes “enhancing meaningfulness of work, fostering participation in decision-making

expressing confidence in high performance, and providing autonomy from bureaucratic constraints”. Empowerment is affected by forthrightness (Appelbaum et al., 2015), innovation and creativity (Behroozi et al., 2012), and organization assistance (Huanget al., 2005).

Erkutlu & Chafra (2015), states that servant leadership has an influence on the innovation behavior of employees mediated by the empowerment. Empowerment plays an intermediary role between TL and the performance of the employees (Judge & Piccolo, 2004). Transformational leadership style raises the empowerment which has a positive impact on organizational commitment. Dust et al., (2014), states that there is positive influence of psychological empowerment on the relationship between employee task performance and TL. Lang & Chang (2015), study assures that transformational leadership improves the perception of the employees about empowerment, and it directly affects the team effectiveness in a positive manner. Gill et al., (2011), said that employee retention depends upon the degree of freedom to do the job; empowering employees and exhibiting transformational leadership help reduce the turnover and increase employee retention and performance. The theoretical relationship propounded by the past researchers denotes that Employee Empowerment is the function of Transformational leadership. This implies that EE and TL are highly positively related. For, the effective TL improves EE and thereby results into higher levels of employee performance.

In this backdrop, the researchers are curious to study empirically the relationship between EE and TL in the automobile industry. For this purpose, the attitudes/perceptions of the employees have been studied with 5-point Likert scale

#### Hypotheses

On the basis of the survey of literature, the researchers could develop the following broader hypotheses:

1. All the dimensions and parameters of EE and TL are very prominent and vital.
2. All the dimensions and parameters of EE and TL do not differ substantially in general as also in terms of cross sections of the employees.
3. There is positive relationship between EE and TL for all the employees.

### Objectives

In the context of the hypotheses mentioned, the objectives of the study are as under:

1. To calculate the average scores of the aspects/parameters of EE and TL and to pinpoint their prominence. In other words, whether their prominence is different or is equally prominent for all the employees as also for the cross sections of the employees.
2. To measure the average nature and degree of co-relationship between TL and EE for all the employees as a whole

### Research Methodology

The title of the problem is “Transformational Leadership and Employee Empowerment: An Empirical Study of the Attitudes of the Employees of Indian Automobile Sector”. The nature of the study is sample based on descriptive research. The population covers employees working at middle level in automobile sector of Delhi-NCR region.

Primary data are collected from the sampled middle-level managers of automobile sector in Delhi NCR by administering a well and a pre-tested structured questionnaire on 5-point Likert scale. The instruments of transformational leadership developed by Bass (1985), namely MLQ-5X contains 20 items and employee empowerment instrument developed by Spritzer (1995) and Fishmen & Keys, (1997), it contains 23 items

divided in eight dimensions. The size of the sample is 500 middle-level employees. The sample size was determined on the basis of the following formula:

$$n = Z^2 * \sigma^2 / e^2,$$

Where the researchers have accepted the error term 0.058 and the S.D of the population ( $\sigma$ ) as the proxy figure is 0.66.

$$n = (1.96)^2 \times (0.66)^2 / (.058)^2$$

$$n = 496$$

By rounding the figure, the sample size is of 500 employees (the cross sections of 256, 41 and 203 employees of management cadre, non-management cadre and technical cadre). The sampled middle-level managers have been identified by using a stratified random sampling technique so that sample represents the whole population.

To check the significance and to test the hypotheses, Non- Parametric tests like one sample sign test, chi-square test and Kruskal-Wallis tests and parametric test like Z test and t-test were applied at 5% level of significance. For studying the relationship between EE and TL, Karl Pearson’s Correlation Coefficient and Linear Regression Analysis are used. Moreover, the average scores of all the aspects/parameters in the form of percentage of total spectrum represents as follows

Criteria Percentag e	Remarks
Up to 60	Normal
>60 <75	Highly Satisfactor y
>75	Vital or prominent

### Result & Discussion

The data collected for this study relate to 500 middle-level employees which have been processes as depicted in Table 1.

Measurement of the overall aspects of Transformational Leadership

**Table: 1**

Average Score of Attitude Measurement on a 5-point scale for the aspects and Dimensions/Parameters of Transformational Leadership of the Sampled Respondents

Dimension	Aspects of Transformational leadership Pertaining to each Dimension	Aspects Average Score & Average Score of the Dimension	
Idealized Influence	Instills pride in me for being associated with him/her	(20) 3.518	3.936 (86)
	Acts in way that builds my respect	(17) 3.862	
	Talks about their most important values and beliefs	(16) 3.896	
	Specifies the importance of having a strong sense of purpose	(2) 4.114	
	Emphasizes the importance of having a collective sense of Mission	(3) 4.072	
	Goes beyond self-interest for the good of the group	(18) 3.856	
	Considers the moral and ethical consequences of decisions	(9) 4.034	
	Displays a sense of power and confidence	(1) 4.136	
Inspirational Motivation	Talks optimistically about the future	(14) 3.934	3.9855 (42.5)
	Talks enthusiastically about what needs to be accomplished	(6) 4.046	
	Articulates a compelling vision of the future	(15) 3.92	
	Expresses confidence that goals will be achieved	(7.5) 4.042	
Individualized Consideration	Spends time teaching and coaching	(7.5) 4.042	4.041 (26.5)
	Helps me to develop my strengths	(5) 4.048	
	Considers me as having different needs, abilities, and aspirations form others.	(4) 4.062	
	Treats me as an individual rather than just a member of a group	(10) 4.012	
Intellectual Stimulation	Suggests new ways of looking at how to complete assignments	(13) 3.962	3.8755 (55)
	Gets me to look at problems from many different angles	(11) 4.006	
	Seeks differing perspectives when solving problems	(12) 3.998	
	Re-examines critical assumptions to question whether they are appropriate	(19) 3.536	
Total average		3.9548	3.9595

Source: Authors(Based on MLQ Multifactor Leadership Questionnaire, Bass, B., & Avolio, B., 1995)

(Note: figures in brackets denote rank values among all the scores in descending order covering all the 20 statements and total of ranks for all the statements covered in each of the parameters).

The table contains the average scores of attitude measurement on 5 point scale for the aspects and

dimensions of the transformational leadership of 500 samples.

As per the table, the overall average score of all the aspects and dimensions of transformational leadership comes to 3.954 which indicates, in term of percentage, 79% of the total spectrum and as per

the criteria pointed out earlier, it has the vital importance of all the aspects of transformational leadership. Moreover, the average scores of all the dimensions in term of percentage came to Idealized Influence 77%, Inspirational Motivation 80%, Individualized Consideration 81% and Intellectual stimulation 77% of the total spectrum and this indicates the vital importance of all the dimensions of transformation leadership.

In order to examine the significance of the overall average score, the researcher has adopted one-sample sign test as follows

Null Hypothesis  $H_0: \mu = 3.9548$ , Alternate Hypothesis  $H_a \neq 3.9548$ ,

Total Number of Signs ( $n$ ) = 20, 13 plus sign and 7 minus sign,

Number of less frequent signs ( $s$ ) = 7

The critical value for the two-tailed test at 5% level of significance ( $k$ )

$K = (n-1)/2 - 0.98 \sqrt{n}$ ,  $= 19/2 - 0.98 \sqrt{20}$ ,  $= 9.5 - 4.38 = 5.12$

Since  $S(7) > K(5.12)$ , Null hypothesis is accepted

Hence, the average score of the dimensions is not different and whatever difference comes, it is just because of sampling fluctuations. To authentic this result, another test of hypothesis testing, chi-square test was applied.

Null Hypothesis ( $H_0$ ): the observed average scores are equal to the overall theoretical scores

Alternate Hypothesis ( $H_a$ ): the observed average scores are different from the overall theoretical scores.

If the calculated value of chi-square is less than the table value of chi-square ( $X^2_C = \sum (O-E)^2/E$ , when  $X^2_C \leq X^2_t$ ), then null hypothesis is accepted. Since, the calculated value of chi-square 0.1313 is less than the table value of chi-square at 5% level of significance for 19 degrees of freedom 30.144, the null hypothesis is accepted. It indicates that all the average scores of transformational leadership aspects individually are not significantly different from the theoretical value of all the aspects taken together. Though, the percentage values of the parameters denote that these parameters are all very vital, as their value exceeds 75% of the total spectrum of the scale. These percentage values are apparently not equal. But as per the Kruskal Wallies Test (H-test) at 5% level of significance, these values do not differ significantly; as the calculated value of  $H_c$  is 0.08 while  $X_t$  at 5% level of significance for 3 degrees of freedom is 7.8%. Hence, they are all equally prominent and vital. The mean scores of aspects of TL for the cross sections of employees (management, Non-Management and Technical) are shown in Table 2. The score values in percentage of 5-point spectrum indicate vital prominence. But, as per Kruskal-Wallis Test, the score values show substantial differences. This is obvious from the fact that calculated H-statistics is 15.49 which is far more than chi square value of 5.991 for 2 degrees of freedom at 5% level of significance. Hence, first rank goes to technical employees while the last to managerial cadre employees

**Table: 2**  
Average Scores of Attitudes Measurement on a 5-point Scale for the Aspects of Transformational Leadership of Sampled Respondents

Aspects of Transformational leadership Pertaining to each Dimension	Mean Scores of Cross Sections			Overall Mean Score
	Management	Non-Management	Technical	
1. Instills pride in me for being associated with him/her	3.425 (59)	3.609 (57.5)	3.615 (56)	3.549
2. Acts in a way that builds my respect	3.832 (47)	3.804 (51)	3.911 (41)	3.849
3. Talks about their most important values and beliefs	3.832 (47)	3.756 (53)	4.004 (26)	3.864
4. Specifies the importance of having a strong sense of purpose	4.015 (25)	3.975 (32)	4.266 (2)	4.085
5. Emphasizes the importance of having a collective sense of mission	3.941 (40)	4.073 (15)	4.236 (3.5)	4.083
6. Goes beyond self-interest for the good of the group	3.695 (55)	4.024 (22)	4.024 (22)	3.914
7. Considers the moral and ethical consequences of decisions	3.882 (45)	3.975 (32)	4.236 (3.5)	4.031
8. Displays a sense of power and confidence	4.031 (21)	4.048 (18)	4.285 (1)	4.121
9. Talks optimistically about the future	3.816 (50)	3.951 (36)	4.078 (13)	3.948
10. Talks enthusiastically about what needs to be accomplished	4 (27.5)	3.78 (52)	4.157 (9)	3.979
11. Articulates a compelling vision of the future	3.832 (47)	3.902 (43.5)	4.034 (20)	3.922
12. Expresses confidence that goals will be achieved	3.945 (38.5)	4.17 (8)	4.137 (10)	4.084
13. Spends time in teaching and coaching	3.91 (42)	4 (27.5)	4.216 (5)	4.042
14. Helps me to develop my strengths	4.023 (24)	4.073 (15)	4.073 (15)	4.056
15. Considers me as having different needs, abilities, and aspirations form others.	3.949 (37)	4.195 (6)	4.177 (7)	4.107
16. Treats me as an individual rather than just a member of a group	3.976 (29.5)	3.829 (49)	4.093 (12)	3.966
17. Suggests new ways of looking at how to complete assignments	3.957 (35)	3.975 (32)	3.965 (34)	3.965
18. Gets me to look at problems from many different angles	3.945 (38.5)	4.097 (11)	4.064 (17)	4.035
19. Seeks differing perspectives when solving problems	3.976 (29.5)	3.902 (43.5)	4.044 (19)	3.974
20. Re-examines critical assumptions to question whether they are appropriate	3.394 (60)	3.609 (57.5)	3.699 (54)	3.567
Overall Mean Score	3.869	3.937	4.066	3.957

Measurement of Overall Aspects of Employee Empowerment:-For quantifying the overall aspects of employee empowerment of the sampled 500 respondents, the collected data of various dimensions of employee empowerment on 5-point Likert scale and their equivalent average scores have been shown in table 3

**Table: 3**

Average Score of Attitude Measurement on the 5-point Scale for the Aspects and Parameters of Employee Empowerment for the Sampled Respondents

Dimensions	Aspects of Employee Empowerment Pertaining to each Dimension	Average Score for Aspects & Dimensions	
Meaning	The work I do is very important to me	3.794	3.967
	The work I do is meaningful to me	4.094	
	My job activities are personally meaningful to me	4.014	
Competence	I am self-assured about my capabilities to perform my work Activities	4.158	4.160
	I have mastered the skills necessary for my job	4.142	
	I am confident about my ability to do my job	4.182	
Self-determination	I have significant autonomy in determining how I do my job	4.018	4.02
	I have considerable opportunity for independence and freedom in how I do my job	3.98	
	I can decide on my own how to go about doing my work	4.062	
Impact	My impact on what happens in my department is large	4.094	4.021
	I have a great deal of control over what happens in my Department	3.982	
	I have significant influence over what happens in my department	3.988	
Clarity of expectations	I feel certain about how much authority I have	3.99	4.030
	My supervisors communicates clear expectations about my job performance	4.072	
	The company clearly communicates its vision and direction to Me	4.03	
Valuing and rewarding	In this organization, people are encouraged to learn from their mistakes	3.736	3.921
	In this organization, people are rewarded for taking personal responsibility to meet customer and customer needs	4.106	
Access to resources	My supervisors ensures that adequate resources are available to achieve objectives	3.996	3.996
Voice	My supervisor encourages decisions to be made at the lowest appropriate level in the organization	4.172	4.083
	This organization supports employee involvement in decision-making	4.104	
	This organization provides me with the authority to effectively do my job	4.024	
	Meaningful opportunities to participate in decision-making at work are given to me	4	
	I am given the responsibility for managing and prioritizing the competing requests of others	4.118	
Total Average		4.037	4.025

Source: Authors(Based on Employee Empowerment Instrument developed by Spritzer, 1995 and Fishmen & Keys, 1997).

As per table 3, the overall average score of all the aspects and parameters of employee empowerment comes to 4.037 which shows in term of percentage 81% of total spectrum and as per the criteria pointed out earlier; it has the vital importance of the aspects of employee empowerment. Moreover, the average scores of the parameters of employee empowerment in term of percentage are as, meaning 79%, competence 83%, self-determination 80%, impact 80%, clarity of expectations 81%, valuing and rewarding 78%, access to resources 80%, voice 82%. All these parameters possess vital prominence.

To find out the significance of all the aspects of employee empowerment, one sample sign and chi-square test were applied.

Null Hypothesis  $H_0: \mu = 4.037$ , Alternate Hypothesis  $H_a \neq 4.037$ ,

Total Number of Signs ( $n$ ) = 23: 11 plus sign and 13 minus sign

Number of less frequent signs ( $s$ ) = 11

The critical value for the two-tailed test at 5% level of significance ( $k$ )

$$K = (n-1)/2 - 0.98 \sqrt{n}, = 22/2 - 0.98 \sqrt{23}, = 11 - 4.699 = 6.33$$

Since  $S(11) > K(6.33)$ , Null hypothesis is accepted. It indicates that all the aspects of employee empowerment are equally important. To authentic/ cross-examine the result, another hypothesis testing through chi-square was applied.

Null Hypothesis ( $H_0$ ): the observed average scores are equal to the overall average scores

Alternate Hypothesis ( $H_a$ ): the observed average scores are different from the overall theoretical scores.

If the calculated value of chi-square is less than the table value of chi-square ( $X^2_C = \sum (O-E)^2/E$ , when  $X^2_C \leq X^2_t$ ), Null hypothesis is accepted.

$X^2_C = 0.06286 < X^2_t$  at 5% level of significance for 22 degrees of freedom = 33.924

Hence, the null hypothesis is accepted. It indicates that all the average scores of the aspects are not different from the expected value of the aspects of employee empowerment. It means, all the eight parameters of employee empowerment, i.e., meaning, competence, self-determination, impact, clarity of expectations, valuing and rewarding, access to resources, voice are equally important for the aspects of employee empowerment.

The mean scores of all the aspects of EE for the cross sections of employees are shown in Table 4. The score values in percentage of 5-point spectrum indicate vital prominence. But, as per Kruskal-Wallis Test ( $H$ ), the score values show substantial differences. This is obvious from the fact that the calculated H-statistic is 22.9 which is far more than Chi-square value of 5.99 for 2 degrees of freedom at 5% level of significance. Hence, first rank goes to technical employees while the last to management employees

**Table: 4**

Mean Score Values of all the 23 Statements (Row-Wise) and Cross Sections of Respondents (Column-Wise) on a 5-Point Scale for Employee Empowerment.

Aspects of Learning Employee Empowerment Pertaining to each Dimension	Mean Scores of Cross Sections			Overall Mean Score
	Management	Non-Management	Technical	
The work I do is very important to me	3.683 (68)	3.902 (59.5)	3.911 (57)	3.832
The work I do is meaningful to me	4.05 (32)	4.024 (40)	4.162 (13)	4.078
My job activities are personally meaningful to me	3.957 (50)	3.878 (62)	4.113 (23)	3.982
I am self-assured about my capabilities to perform my work activities	4.078 (30)	4.121 (21)	4.266 (6)	4.155
I have mastered the skills necessary for my job	4 (43.5)	4.292 (3)	4.29 (4)	4.194
I am confident about my ability to do my job	4.082 (29)	4.317 (2)	4.28 (5)	4.226
I have significant autonomy in determining how I do my job	3.976 (45)	3.951 (51.5)	4.083 (27)	4.003
I have considerable opportunity for independence and freedom in how I do my job	3.898 (61)	3.975 (47.5)	4.083 (27)	3.985
I can decide on my own how to go about doing my work	3.933 (54.5)	4.195 (10)	4.197 (9)	4.108
My impact on what happens in my department is large	4.046 (34)	4.121 (21)	4.147 (15)	4.104
I have a great deal of control over what happens in my Department	3.843 (65)	4.121 (21)	4.128 (18.5)	4.030
I have significant influence over what happens in my department	3.91 (58)	4 (43.5)	4.083 (27)	3.997
I feel certain about how much authority I have	3.875 (63)	3.975 (47.5)	4.137 (16.5)	3.995
My supervisors communicates clear expectations about my job performance	4.035 (37.5)	4.024 (40)	4.128 (18.5)	4.062
The company clearly communicates its vision and direction to me	4.019 (42)	4.048 (33)	4.039 (36)	4.035
In this organization, people are encouraged to learn from their mistakes	3.66 (69)	3.804 (67)	3.817 (66)	3.760
In this organization, people are rewarded for taking personal responsibility to meet customer and customer needs	4.105 (24)	3.951 (51.5)	4.137 (16.5)	4.064

Source: Authors(Based on Employee Empowerment Instrument developed by Spritzer, 1995 and Fishmen & Keys,1997).

(Note: Figures in brackets denote rank values among all the scores of cross sections in descending order) Relationship between Transformational Leadership and Employee Empowerment studied through Karl Pearson's Coefficient of Correlation as per the following results.As such the Coefficient of Correlation between EE and TL is +0.757.

TL EE

TL	Pearson Correlation	1	.757**
	Sig. (2-tailed)		.000
	Sum of Squares and Cross-products	104.755	77.948
	Covariance	.210	.156

The Coefficient of Correlation was calculated between transformational leadership and employee empowerment on the basis of their paired average scores of 500 sampled respondents. As per the results, the calculated value of correlation coefficient between them is  $r = 0.757$ . To test the significance of the results and to test the hypothesis z test was applied with the following null and alternate hypothesis

H0: There is no relationship between transformational leadership and employee empowerment.

Ha: There is a significant positive relationship between transformational leadership and employee empowerment.

$$Z = r \sqrt{n-1} / \sqrt{1-r^2} \quad S.E = 1-r^2 / \sqrt{n}$$

The calculated value of Z 39.736 is much greater than the table value of Z at 5% level of significance 1.96. Hence the null hypothesis is rejected while the alternate hypothesis is accepted. This implies that the transformational leadership and employee empowerment have significant positive co-relationship. In order to study the functional relationship between EE and TL, the Linear Ordinary Regression model was used as under

$$EE = f(TL)$$

Where EE is the dependent variable and TL is the independent variable. For this purpose, the average scores of all the statements in EE as also in TL for all the 500 respondents were regressed with the latter variables. The Linear Regression equation developed on the basis of the analysis was as given below:

$$((EE)^{\wedge}) = \beta_0 + \beta_1(TL), ((EE)^{\wedge}) = 1.11 + 0.743(TL)$$

$(EE - 4.04) = .757(.449) / (.458) \times (TL - 3.95)$ , where  $((EE)^{\wedge})$  is expected average score of employee empowerment and  $(TL) =$  Average score of the Transformational Leadership,  $\beta_0 =$  Intercept,  $\beta_1 =$  Shape of the Regression line (Regression

coefficient).

$$H_0: \beta_1 = 0 \text{ and } H_a: \beta_1 \neq 0$$

Since  $\beta_1$  is positive and its value is significant because t-statistic calculated is  $\beta_1 / \text{Standard Error of Estimate of EE}$  which is  $= 0.74 / 0.37$  which is equal to 2. It is more than the table value of t-statistic for very large degrees of freedom at 5% level of significance (1.96). Hence, there is significant cause and effect relationship between TL and EE average scores.

### Major Findings and Conclusion

1. The average scores of all the aspects of TL as also for the parameters are equally prominent. They are not different from one another.
2. The average score value for TL is 3.95 which comes to 79% of the total spectrum of 5-point scale.
3. All the score values of TL for managerial, non-managerial and technical cadre of employees are prominent and vital but their values differ. Technical cadre employees had the highest score value while managerial cadre recorded the lowest value.
4. The average scores of all the aspects of EE as also for the parameters are equally prominent. They are not different from one another.
5. The average score value for EE is 4.02 which comes to 81% of the total spectrum of 5-point scale.
6. All the average score values of EE for managerial, non-managerial and technical cadre of employees are prominent and vital but their corresponding values differ substantially. Technical cadre employees recorded the highest average score while managerial cadre the lowest average scores.
7. There is significant positive relationship between TL and EE scores of the respondents, as the r is 0.757. Moreover, EE is the effective function of the TL and with the enhancement of average score value of

the TL, the average score value of EE enhances.

The findings support first and third hypotheses, hypothesis stood rejected; for the cross sections of the employees record subsequently different average scores for TL and EE. The results revealed that all the aspects as studied under the four dimensions of transformational leadership and all the aspects as studied under eight dimensions of employee empowerment are equally important. In terms of percentage, the level of agreement for the aspects of transformational leadership is 79% and for employee empowerment it is 81%, which are significantly vital. The results indicate that the dimensions of transformational leadership, namely, idealized influence, inspirational motivation, individualized consideration and intellectual stimulation are equally important, and the dimensions of employee empowerment like meaning, competence, self-determination, impact, clarity of expectation, value and rewarding, access to resources and voice are also equally important. These dimensions are an inbuilt part of transformational leadership and employee empowerment. The results of the study indicate that transformational leadership and employee empowerment are having significant positive relationship. Moreover, the EE is the effective function of the TL. Since the research focused on automobile sector and conducted the study on only middle level employees, the future researches can be conducted in various sectors for different levels of management. There is also a potential scope in the automobile sector itself to focus the study for other category of employees. On the whole, this empirical study also supports the results of the earlier researches in this area

### Abstract

The silver nanoparticle was successfully synthesized by using the help of *Phyllanthus emblica* plant extract as a reducing agent and aqueous silver nitrate as the precursor. Moreover, physical and chemical methods are widely used for the synthesis of nanoparticles, but these methods have expensive and not ecofriendly. This study highlights the green, rapid, facile, cost-effective, and ecofriendly synthesis and synthesized nanoparticles also investigate their antibacterial activity. Synthesized silver nanoparticles are analyzed by different techniques of modes like XRD, UV-Visible spectroscopy, TEM, FTIR, and photoluminescence (PL). The prepared AgNPs show characteristic absorption peak in UV-Visible spectroscopy due to SPR (surface plasmonic resonance) band between 400 to 450 nm wavelength, which was confirmed by TEM (transmission electron microscopy) image. X-ray diffraction (XRD) results showed the crystalline nature of AgNPs as well as the size of nanoparticles calculated with the help of TEM (20-25 nm) and XRD (25 nm). ATR spectroscopy identified the functional groups that are involved in the reduction of silver ion to AgNPs and the PL spectrum indicates higher emission in the green region and low emission peak in the UV region. Antibacterial activity of AgNPs analyzed against with the help of *E. Coli* bacteria and the result shows that a higher concentration of AgNPs is increasing as well as a zone of inhibition increased. This method is environmentally friendly, of low cost,

and less expensive method for the fabrication of AgNPs in abundance which can be further helpful for biosensor devices as well as for other applications such as pollutant degradation, pharmaceutical, and hydrogen production, etc therefore can promote the application of green technology for the production of AgNPs.

### Introduction

The specific characteristics features of metal nanoparticles participate in the field of energy, optics along with biomedicine as well as disaster management with other health care issues.<sup>1</sup> Among the various nanoparticles like Ag, Au, Pt, and Pd, etc. are their broad range of applications like antibacterial agent, photocatalyst in a photocatalytic reaction as well as a biosensor technology. Generally, researches are prepared of silver nanoparticles by a number of the process such as chemical reduction,<sup>2</sup> electrochemical reduction and photochemical reduction<sup>3</sup> but such type of convention method requires more amount of chemicals as well as a large amount of energy for nanomaterial synthesis process so such type of synthesized products are more hazardous for the environment.<sup>4</sup> Different types physical and chemical methods apply for preparation of silver nanoparticles for various shape and size of nanoparticles, and such type of technique are involved in UV irradiation<sup>5,6</sup> microwave irradiation<sup>7,8</sup> chemical reduction<sup>9-11</sup> photochemical method<sup>12,13</sup>

electron irradiation<sup>14,15</sup> and sonoelectrochemical method.<sup>16</sup> However extremely all previous methods in engaging more than one step as well as advanced energy, low conversions, the trouble of purification, and required critical chemicals. All chemical synthesis methods of nanomaterial show the poisonous chemicals, but the synthesis of nanomaterial by the green method can be removed from this issue, so it requires developing a green synthesis method for nanomaterial synthesis. A wide range of metal NPs such as Ag,<sup>17-18</sup> Au,<sup>19-23</sup> ZnO,<sup>24</sup> TiO<sub>2</sub>,<sup>25</sup> CuO,<sup>26</sup> In<sub>2</sub>O<sub>3</sub>,<sup>27</sup> etc, have been synthesized using the help of herbal plant extracts. Various, plants have been used for the synthesis of metal nanoparticles including medicinal plants. Ag has long been reputed for its goods inhibitory effect on many bacterial strains and catalytic activity. So, normally used in industrial and medical products so, in this research work, we have synthesized AgNPs with the help of *Phyllanthus emblica* plant extract for the conversion of silver ion to silver nanoparticles by silver nitrate solution.

**Fig. 1: *Phyllanthus emblica* fruit**

Present investigation focused on the effects of the different optical parameters on the silver nanoparticles and investigates of the antibacterial

effect of the synthesized AgNPs. *Phyllanthus emblica* is a common plant, which is more amount of exceedingly in a nearby part of Indian subcontinents

as shown in figure 1. Some organic phytochemicals compounds are present in plant extract so *Phyllanthus emblica* fruit extract can be used in the synthesis of another different type of nanoparticles like Au, Ag, Pd, Pt, ZnO, and TiO<sub>2</sub>, etc. Present phytochemicals in plant extract such as terpenoids and flavanones which act as stabilizing and reducing agents for the nanoparticle synthesis process. Synthesized AgNPs show the no harmful effects on the human body as well as environmental health, natural antibacterial activity in the direction of pathogens like as viruses, fungi and bacteria etc.

### Experimental

#### *Phyllanthus Emblica* Extract

Sigma-Aldrich grade AgNO<sub>3</sub> (99%) solutions was prepared by distilled water and all glassware was purified by distilled water and dry and glassware was autoclaved before the experiment. Extraction of plant fruit and ready the aqueous plant extract<sup>28</sup> by the dry fruit. Firstly washed carefully by distilled water to make free from dust particles and dried 24 h on room temperature. After that 2 gm dry fruit was soaked in 50 mL of pure distilled water for 24 h. Then synthesized plant extract was filtered and stored for nanoparticle synthesis.

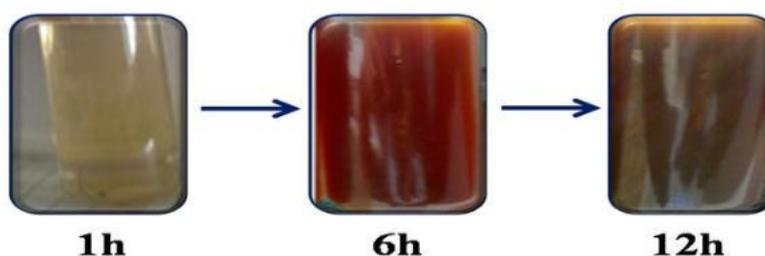

#### Nanoparticle Synthesis

Synthesis of AgNPs by green synthesis process.<sup>29</sup> *Phyllanthus emblica* fruit extract (0.5% (w/v)) was

mixed drop by drop in aqueous 0.001 M AgNO<sub>3</sub> solution and kept in boiling tube at around 25°C temperature till 12 h aging. Then the solution of a mixture of silver nitrate turns brown with increasing time interval; its optical property shows the confirmation of AgNPs. Synthesized silver nanoparticles are established without any chemical reagent and their stability for a long time due to antimicrobial properties of this plant extract and now synthesized silver nanoparticles was separated by centrifugation technique at 5000 rpm for 20 minutes. For the further settlement of particles, the supernatant material was transferred to a beaker and frequent centrifugation process was carried out to clean AgNPs. The obtained nanoparticle pellet was dry in an oven and stored for further study.

### Results and Discussion

Synthesis of AgNPs was noted by optical observation with reaction time, initially a silver salt solution is mixed to *Phyllanthus emblica* plant extract, it observed a color change from light yellow to brown color within 12 h of incubation as shown figure 2, after that the color of the solution not be changed and stable therefore observed change of color is strong indication formation of nanoparticles and the stability of color shown that means it's have been completely done the conversion of silver ions to silver nanoparticle due to SPR.<sup>30-33</sup>

**Fig. 2: *Phyllanthus emblica* fruit extract after the addition of silver salt shows the coloration due to the synthesis of silver nanoparticles**

It's indicated these plants extract reducing agents such as terpenoids and flavanones are responsible for the reduction of Ag<sup>+</sup> to AgNPs. It is suggested, the time duration is an important role during the nanoparticle synthesis process, and present analysis indicates that's 12 h time duration is more

appropriate for the complete synthesis of silver nanoparticles.

#### UV-Visible Analysis

Synthesized AgNPs were characterized and confirmed by respective UV-visible absorption

band at appearing around 400-450 nm at 12 h shown in figure 3, due to the strong surface plasmon resonance. This wavelength corresponds to the AgNPs and a previous study revealed that the SPR value for the AgNPs was in the

range 400- 450 nm.<sup>34-36</sup> After 12 h of reaction time UV-visible absorption band did not change peak position and highly stable which means 12 h reaction period is more reliable for synthesis and stability of silver nanoparticles.

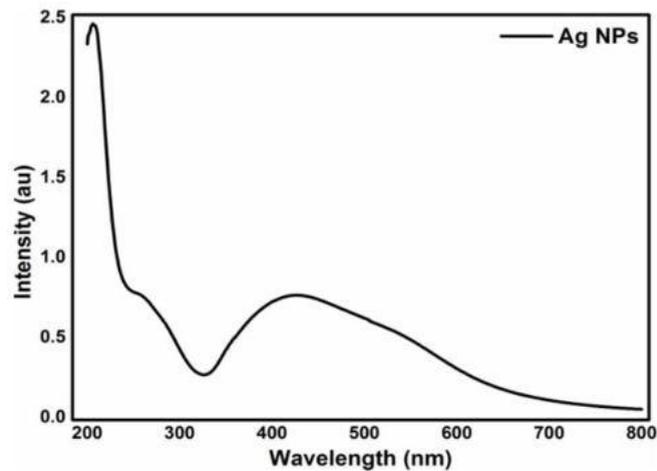

Fig. 3: UV-Visible spectrum of synthesized silver nanoparticles

Surface plasmon resonance (SPR) is the excitation of free electrons within the conduction band. Hence the broad absorbance was observed. This broad absorbance, indicating the amount of synthesized AgNPs. The broad spectra could be generated due to some reasons (1) organic elements that

are produced by plant extract (2) homogeneity,<sup>37-38</sup> and extra-fine nature of AgNPs.<sup>39</sup> (3) Moreover many other factors such as the size and shape of nanoparticles.<sup>40</sup> The TEM image from this study confirms the spherical shape of synthesized silver nanoparticles.

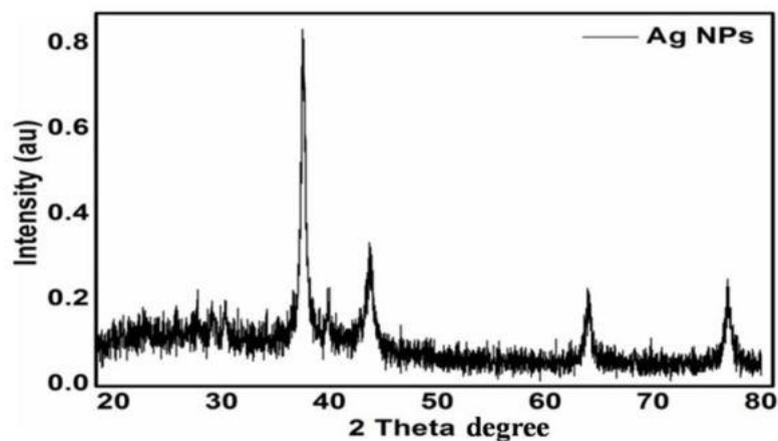

Fig. 4: X-ray diffraction patterns of synthesized silver nanoparticles

### XRD Analysis

Figure. 4 shows the XRD patterns of synthesized AgNPs by *Phyllanthus emblica* extract. Some intense characteristic diffraction peaks at  $2\theta$  angles of 38.4, 44.5, 64.8, 77.6 are observed, which crystallographic planes of (111), (200), (220), and (311). According to the TEM, synthesized AgNPs are evidently showed the most AgNPs were highly dispersed in spherical shapes. Synthesized silver nanoparticle directly corresponds with JCPDS 00-004-0783. No, any other peaks were obtained, only cubic shape AgNPs appeared. Usually, XRD peaks width directly related

to the crystallite size of nanomaterial. Which are useful in the debye scherrer equation for the analysis of average particle size.<sup>41</sup> That means Diffraction peak  $D = (k\lambda)/(\beta \cos \theta)$ , here  $\lambda$  wavelength of  $\text{CuK}\alpha$ ,  $D$  is the crystalline size of the sample powder,  $\beta$  is the full width at half maxima,  $\theta$  is the bragg diffraction angle and the  $K$  is the constant. The highest peak (111) was picked to determine the crystalline size of nanomaterial. According to this equation, the average size of AgNPs is found 25 nm and mostly spherical. That's the result that was found consistent with the TEM analysis.

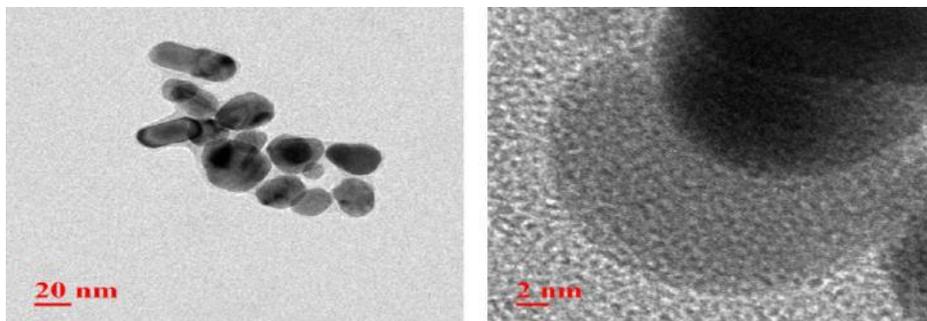

Fig. 5: (A) TEM image of synthesized Ag nanoparticles  
(B) HRTEM image of spherical shape Ag nanoparticles

### TEM Analysis

Synthesized silver nanoparticles shape and size are calculated by with the help of HRTEM image shows in figure 5. Aliquots silver nanoparticle solutions were placed on a copper grid and dry under

ambient conditions than after the HRTEM image was recorded. These results shows the particles are still in the range of nm scale with a spherical shape. These spherical shape synthesized AgNPs with a size range of 20-25 nm.

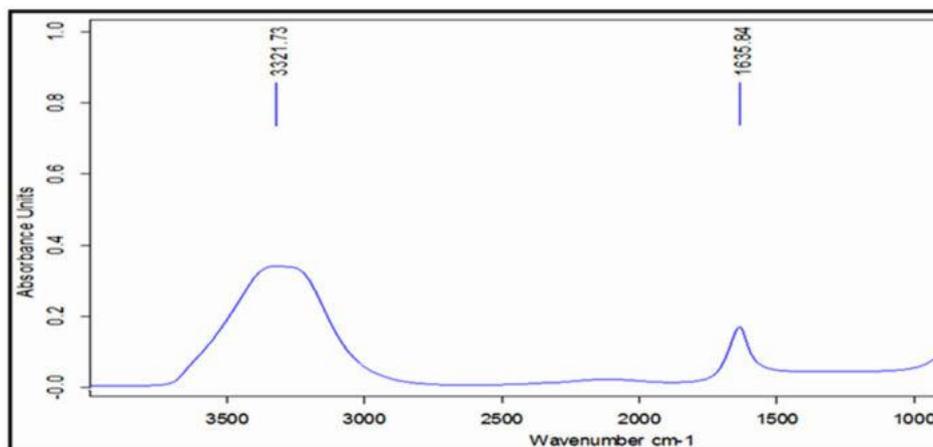

Fig. 6: ATR spectrum of synthesized silver nanoparticles after 12 h

### ATR Analysis

ATR measurement was used for identifying the responsible biomolecules for capping and stabilizing agent in AgNPs. Two types of infrared bands are observed at a position of  $3321\text{cm}^{-1}$  and  $1635\text{cm}^{-1}$  figure 6. Present intense peak around at  $3321\text{cm}^{-1}$  responsible for OH stretching of alcoholic and phenolic groups<sup>42</sup> and another intense peak around at  $1635\text{cm}^{-1}$  appear from the C=O stretching mode of amine group these groups are found in proteins<sup>43</sup>

and these groups of proteins as a capping and stabilizing agent for synthesized AgNPs, which are responsible for increasing the stability of the synthesized nanoparticles.<sup>44</sup> It is observed the structures of proteins were not affected by the silver ions before and after binding with AgNPs.<sup>45</sup> Previous studies by<sup>46-48</sup> have also identified the plant extracts in the samples and proposed that these alcoholic and phenolic groups could serve as organic reducing as well as capping agents.

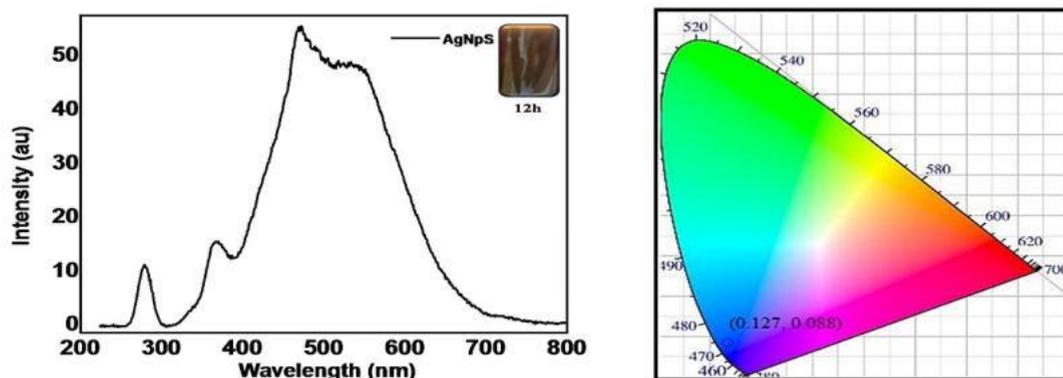

Fig. 7: (A) Photoluminescence (PL) emission spectra of synthesized AgNPs under the excitation radiation of  $\lambda_{\text{ex}} = 289\text{ nm}$ . (B) Chromaticity coordinate plotted on CIE-1931 diagram

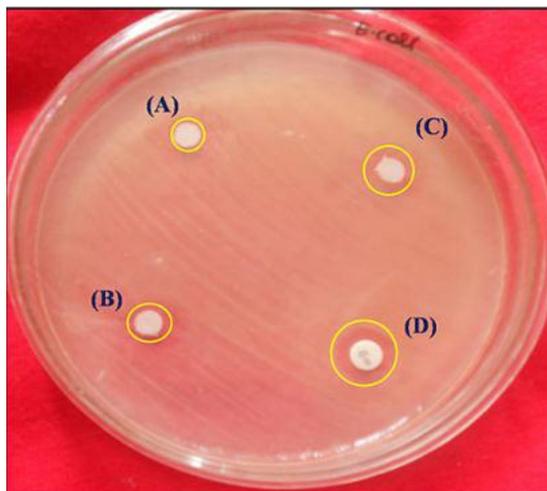

### Photoluminescence Analysis

Figure. 7 represents the photoluminescence spectra of the synthesized silver nanoparticles by *Phyllanthus emblica* plant extract that are studied through emission spectroscopy. This is one of the technical methods for observation of the optical properties of synthesized AgNPs. Synthesized AgNPs are mixed in distilled water then emission spectra are obtained within a range from 200 to 800 and for the wavelength of excitation at 289 nm. It exhibits the emission peaks around 400 to 600 nm which belong to the green-yellow region. The intensity of emission peak continues increased up to 469 nm, then after it's gradually decreased up to 650 nm. The luminescence spectrum of AgNPs is generated by the excitation of an electron from occupied d bands into states above the Fermi levels its responsible for luminescence spectra of AgNPs<sup>49</sup> and broad peak in green-yellow emission is produced by radial recombination of photoexcited holes with

the electrons in oxygen vacancies and indicates that AgNPs have a good crystal structure.

### Antibacterial Activities

Antibacterial activity of synthesized silver nanoparticles analysed against *E.Coli* bacterial samples, shown in figure.8. During this process in which synthesized silver nanoparticles are used in different concentrations (2, 4, 8, and 10mg) are further agar dishes containing colony. The dishes are visible every concentration with a bacterial colony and experimentally observed after 24 h incubating time at  $37^{\circ}\text{C}$ . The zone of approval is experiential maximum at 10 mg of AgNPs. The antibacterial activity results show due to modifying bacteria cell permeability as well as enzyme degradation by synthesized AgNPs. The resultant zone of inhibition increased as well as increases the concentration of AgNPs.

**Fig. 8: The inhibition zones of AgNPs against *E.coli***

### Conclusions

We have reported a reasonable, eco-friendly, and easy approach for the synthesis of AgNPs. *Phyllanthus emblica* plant extracts which act as a reducing, stabilizing, and capping agent for nanoparticle synthesis. This is a simple, green efficient method for the synthesis of silver nanoparticles at room temperature without using any harmful reducing and capping agent. The green synthesized silver nanoparticles were collected of spherical shape which was highly stable and crystalline. These AgNPs were characterized carefully by XRD, TEM, FTIR, PL, and UV-visible spectroscopy. The UV-visible spectra showed a characteristic range of 410-425 nm for nanoparticle. XRD results showed the crystalline nature of AgNPs, and size with the help of TEM (20-25 nm) and XRD (25 nm). ATR analysis found numerous phytochemicals and functional groups these groups are responsible for stabilizing and creation nanoparticle. Antibacterial activity of AgNPs analyzed against *E.Coli* bacteria and the result shows that a higher concentration of AgNPs is increasing as well as the zone of inhibition increased. This synthesizes process is cheaper,

a single step, and faster as compared to chemical and biological methods as well as eco friendly, of low cost, and simple therefore can promote the application of the green method for silver nanoparticle synthesis.

### Acknowledgement

All authors provided critical feedback and helped shape the research, analysis and manuscript as well as we gratefully acknowledge, Department of Botany, Rajasthan University, Jaipur for the biological activity measurement of our samples and the Materials Research Centre MNIT Jaipur, and Department of Chemistry, Kalindi College, University of Delhi, for providing help in characterization and synthesis of samples.

### Funding

This research received no specific grant from any funding agency.

### Conflict of interest

There is no conflict of interests regarding the publication of this article.

## ABSTRACT

Polyaniline (PANI) has attracted a special attention from researchers, scientists and chemists in fields of nanotechnology. It is widely known for its easy synthesis process, high environmental stability and can be easily doped by different acids/ dyes and other dopants. This review deals with the synthesis of PANI by several methods in which oxidative polymerization is the main focused as well as deposition of thin films via chemical & physical methods has been discussed. Several properties of PANI thin films such as magnetic, electrical, redox, antioxidant, anticorrosion, along with its sensing properties to various analytes, etc. are discussed at the end of the review.

## 1. Introduction

Electrically conducting polymers (ECPs) are class of conjugated polymers which are vibrantly used in various opto electronics and medical devices now days. Among all electrically CPs, polyaniline (PANI) has been extensively studied due to its outstanding redox properties, variable oxidation states and wide applications. PANI was first known in 1835 as aniline black and it is a term that has been used for those products which were obtained by oxidation of aniline. In 1840, Fritzsche studied the oxidative products of aniline and later on. Letheby's work resulted in discovery of the final product from oxidation of aniline at Pt electrode in aqueous H<sub>2</sub>SO<sub>4</sub> solution [1]. Subsequent researchers have been achieved the same results with similar observations during the oxidation of aqueous HCl solutions of aniline. For these results, in 1907 Bucherer proposed a phenazine type structure for the synthesis of polymer which was complex for understanding. Therefore, a linear arrangement of the quinone-imine linked on para-position has been proposed for the product obtained by the chemical oxidation of aniline [2]. The base of the linear structure was the poly-leucoemeraldine form which converted into another form such poly-pyrnigraniline & polyemeraldine base shown in graphical abstract.

In 2000, three scientists namely A.J.Heeger, A.G. McDiarmid, and H. Shirakawa were awarded Nobel Prize in the chemistry for their study on intrinsically conducting polymers and obtained the world's appreciation owing to the unique characteristics, properties and technological applications of these polymers. During the past two decades, these

polymers and their composites are the subject of intensive research and development in the academic world and also in the chemical and electronic-based industrial organizations. The use of these composites as new materials has opened an entirely new domain of polymeric applications in industrial and consumer products.

The polymers are the key components of the new fascinating research area owing to their simple preparation and the diversity of their properties. Even though conventional insulating polymers are used in the past 50 years, it did not meet the latest requirements which led to the development of different conducting materials such as conducting polymer composites, conducting fibers and conducting films. The polymers are comprehensively used in the manufacture of insulators and dielectric materials in electrical based industrial organizations due to their insulating and low conducting properties. Nevertheless, some polymers are synthesized with a remarkable ability to conduct electricity. The organic polymers that possess the magnetic, optical and electric properties of a metal are called an intrinsically conducting polymer, and such polymers are the electroactive polymers which possess the properties mentioned above while retaining their structural characteristics. It is a class of polymer with conjugated double bonds in their backbones, and it demonstrates good electrical conductivity without the use of conductive additives. It becomes highly conductive only in its doped state. The conductivity of the polymers is converted into the metallic state from its insulating state through the doping process. Both N-type (electron-donating) and P-type (electron-accepting) dopants are utilized to induce an insulator to metal transition

**Scheme 1.** Chemical structures of PANI and their conversion.

in electronic polymers [3,4]. It was demonstrated that charges are either added or removed chemically or electrochemically from the polymer chain by introducing acidic or basic solutions during the polymerization or post-processing of the polymer. During this process, the negative (electron) or positive (holes) ions formed are then free to move throughout the polymer chain creating the current.

## 2. Constitution and nomenclature

Since the preparation of polyaniline, there was a lot of confusion regarding its constitution, and later it has been proposed that polyaniline may be described as that it is formed by combination of aniline as repeating units.

PANI is found in one of the five idealized oxidation states during polymerization of aniline monomer: (a) Leucoemeraldine (white/clear), (b) Protoemeraldine, (c) Emeraldine (Salt-green/Base-blue), (d) Nigraniline, and (e) Pernigraniline (Blue/Violet). PANI exists in two different forms: (i) completely reduced form which contains only benzenoid rings (Scheme 1a) and (ii) completely oxidized form containing benzenoid and quinonoid ring as repeating unit (Scheme 1b). In both cases, nitrogen atoms present in the repeating unit may be protonated, and it depends on the pH of the solution. The base and protonated form of PANI has been called an amine (A), and salt (S) forms respectively proto-emeraldine, and nigraniline are the intermediate form of PANI. In older nomenclature PANI was known by their oxidation state but presently 'poly' is used as a prefix to the older names. For example, the older term, 'emeraldine,' is now replaced by 'poly-emeraldine.' The completely reduced form of PANI converted into completely oxidized form by removing one electron and proton, as illustrated in Scheme 1c. The polyleucoemeraldine form is obtained from polypernigraniline by reducing it to polyemeraldine form and finally back to polyleucoemeraldine form with an alkaline solution. During oxidation of the polyleucoemeraldine base, the oxidant removes the unbound electron from the amine nitrogen center, and a proton is liberated.

The lone pair electron is resonated with a neutral position due to which imine group is formed. Polyleucoemeraldine is then oxidized into polyemeraldine form and then into polypernigraniline form. The oxidation of the polypernigraniline state results in the degradation of polymer and polyleucoemeraldine is easily oxidized in air. The polyemeraldine base estimates the most stable form of PANI, and hence polyemeraldine form of PANI is most widely used because the polyemeraldine salt form of PANI is electrically conducting. Polyleucoemeraldine and polypernigraniline are the poor conductors

even when doped with an acid.

PANI is known for its simplicity of unique, environmental stability and simple to dope by protonic acids [5]. PANI can be characterized by 1,4-coupling of aniline monomer units. PANI may be present in various oxidation states and it can be characterized by FTIR benzenoid to quinonoid ratios. Polyleucoemeraldine (PANI-LE) base form of PANI is totally reduced form whereas polypernigraniline (PANI-PE) base is completely oxidized form. Similarly, the polyemeraldine base (PANI-EB) is half oxidized and half reduced form of PANI (Scheme 2). These structures of polyaniline give information about synthetic representations of the various oxidation state of PANI [6].

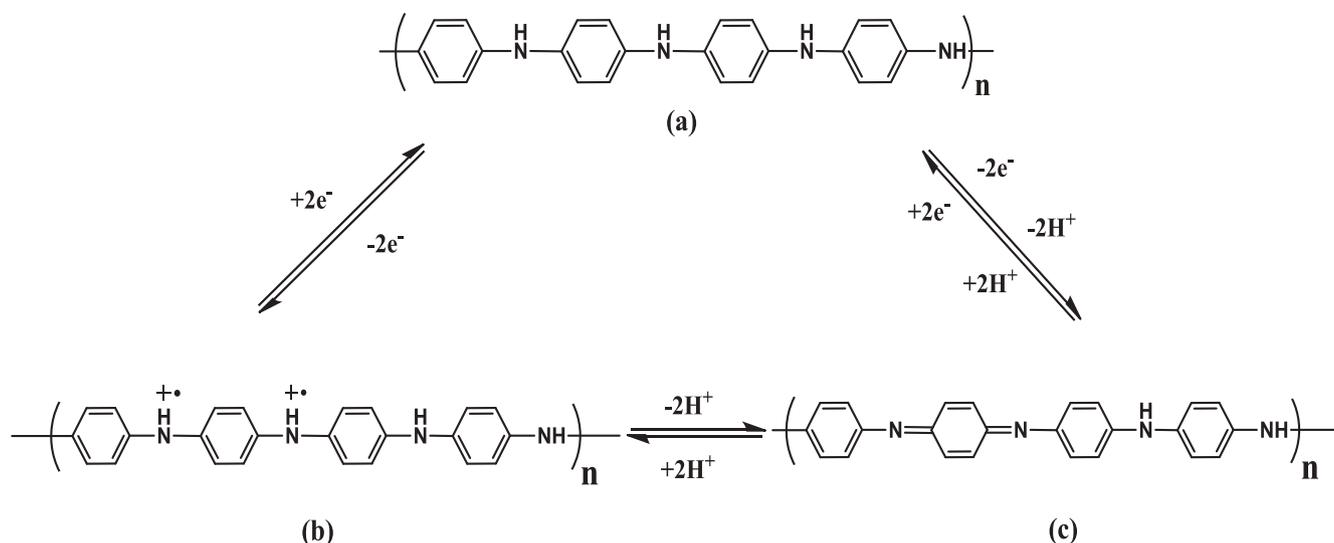

Nonetheless, a protector blue polyemeraldine base might direct on the off chance that it is doped with protonic acids and end up green protonated ES. PANI-EB varies considerably from PANI-LE and PANI-PE, its conductivity has been obtained from  $-10^{-10}$  S/cm up to  $10^0$  S/cm after doping with different acids. PANI has potential applications in various fields such as organic electronics and biomedical fields due to its extraordinary properties. It has a number of utilizations, for example, sensor [7–10], electromagnetic shielding [11], biosensor [12], memory device [13], and natural or polymer light-transmitting diodes [14]. Other than all the potential applications detailed above, PANI can likewise be utilized for erosion insurance for mild steel. PANI microtubes/nanofibers and PANI-multi walled carbon nanotubes, nanocomposites might be utilized as microwave safeguards and electromagnetic shielding materials [15]. Besides this, review deals with the synthesis of PANI thin films by different methods and thin film deposition on substrates.

## 3. Synthesis of PANI

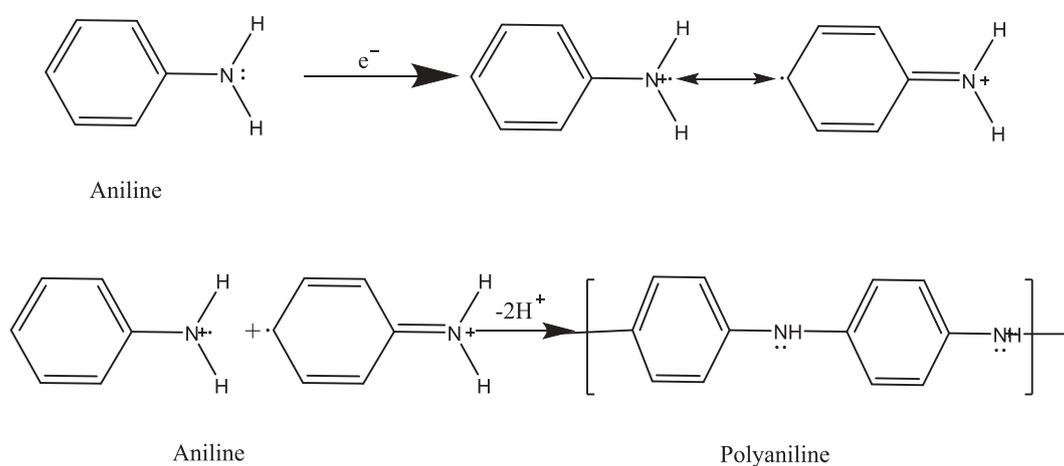

In the literature, several reports on polyaniline have been observed which deals with advanced oxidative polymerization method of polyaniline synthesis. In this method, doping and polymerization occur at the same time, and a chemical or electrochemical process may complete it. The major difference between these methods is the chemical method gives higher yield as compared to the electrochemical method [16].

### 3.1. Chemical synthesis (Oxidative polymerization)

Synthesis of PANI can take place by chemical oxidation polymerization method by using HCl and H<sub>2</sub>SO<sub>4</sub> as dopant and ammonium persulfate as an oxidant in aqueous media. Here, the oxidant removes a proton from aniline monomer without forming a strong co-ordination bond either with the substrate/intermediate or with the final product

**Scheme 2.** Different oxidation states of PANI and their conversion in each other (a) polyleucoemeraldine Base (b) polyemeraldine salt (c) polyemeraldine base.

**Scheme 3.** Homo-polymerization of PANI.

(Scheme 3). The progress of the polymer chain can proceed by a redox reaction between the growing chain and an aniline unit. PANI has been synthesized by oxidation of aniline either with an electrochemical or a chemical oxidant.

The chemical synthesis of PANI mainly requires three reactants: aniline as a monomer, an oxidant and an acidic medium. The more common acids used in PANI synthesis are HCl & H<sub>2</sub>SO<sub>4</sub>, while as an oxidant ((NH<sub>4</sub>)<sub>2</sub>S<sub>2</sub>O<sub>8</sub>) ammonium persulfate, hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>), potassium iodate (KIO<sub>3</sub>), cerium sulfate (Ce(SO<sub>4</sub>)<sub>2</sub>), potassium dichromate (K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>), potassium ferricyanide (K<sub>3</sub>(Fe(CN)<sub>6</sub>) and sodium vanadate (NaVO<sub>3</sub>) are frequently used. Most common mechanism used for synthesis of PANI is oxidative polymerization method in which aniline reacts in the presence of acidic medium by using acid as dopant and polymerization is initiated by dropwise addition of ammonium persulfate (APS) which is used as an oxidizing agent at different temperature under constant stirring at least for 2 h. After fulfillment of the polymerization mechanism (2 h), the blue color solution has been observed which is separated by filtration. The pure PANI can be obtained by washing the above solution 3–4 times with double distilled water after that alcohol and acetone until the filtrate becomes colorless which ensures that unreacted substances are completely removed. This product will be dark green and known as polyemeraldine salt form of PANI which is unstable due to the presence of counterions. Therefore, this precipitate was allowed to equilibrate with an appropriate amount of NH<sub>4</sub>OH overnight, during this polyemeraldine salt form convert into

PANI – EB form which is environmentally stable at room temperature [17,18].

The camphorsulfonic acid (CSA) doped PANI thin films were prepared on glass slides by using the chemical oxidative polymerization method and spin coating [19]. The sticking efficiency of the film to glass plate was excellent due to an organic solvent and organic dopant while FTIR studies reveal the presence of dopants and change in the molecular environment of the film with a high CSA dopant ratio (1:8). The pristine films were found to be amorphous nature and indicated to change into the crystalline structure with increasing CSA doping ratio while SEM represents the change in smooth morphology to rough root-like morphology of the PANI films.

### 3.2. Electrochemical synthesis

The electrochemical synthesis of PANI focus on the electrochemistry and electrochemical process, therefore, it is an electro-organic process as compared to organic synthesis. Electrochemistry plays a vital role in the synthesis of conducting polymers (CPs) because, in most of the applications, it is essential to synthesize polymers in the form of a thin film with a well-defined structure which has a large surface area [20,21]. When CPs are synthesized by the chemical method, then they cannot proceed easily whereas processing becomes easy in the electrochemical process because in these thin films will be adhered to electrode surface which makes it useful in the study of optical and

electrical properties. The electrochemical synthesis process has very much similarity with the electrodeposition method of metals which CPs deposited on the surface of the electrode. An electrochemical method such as galvanostatic, potentiostatic and potentiodynamic has been used for the synthesis of PANI.

Electrochemical synthesis process has several advantages on chemical process listed below;

- It is a simple and cost-effective technique. Therefore, the electro-deposition of CP on the oxidizable conducting glass is extremely economical.
- By change, the nature of solution doping of polymer can proceed with the desired ion.
- In electrochemical method, the catalyst is not required as a chemical method.
- CPs which was deposited on the electrode surface will be homogeneous and pure.
- This synthesis process completed in a single compartment cell that contained an electrolyte, electrode and power supply.

### 3.2.1. Mechanism of PANI polymerization

The synthesis mechanism of polymerization proceeds by step by step. The first step is known as an oxidation step in which aniline converts in aniline radical cation by removal of one electron from nitrogen lone pair (Scheme 4).

This step can be accelerated by using it as a catalyst during synthesis. The cation radical of aniline may be represented by three resonating structure, Scheme 5.

Among these three resonance forms, second is more reactive because of the substituent inductive effect and absence of steric hindrance. The next step in scheme 6, the reaction takes place in between radical cation and second resonating form of aniline radical cation in head to the tail manner and dimer will be formed [22].

In the next step, the dimer is oxidized by the removal of electron and converted into a new radical cation, as shown in Scheme 7.

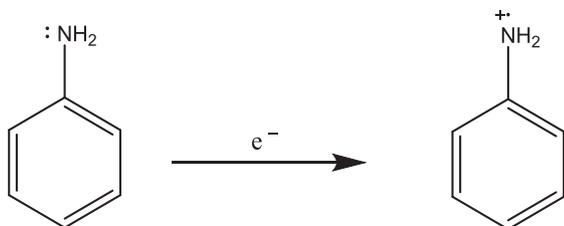

This radical cation further reacts with the radical cation monomer or with radical cation dimer to form, respectively, a trimer or a tetramer, and polymer shown in Scheme 8.

### 3.3. PANI doping

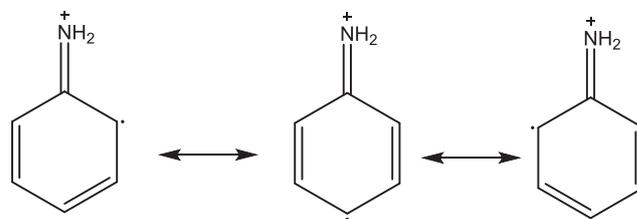

The term “doping” is employed here for showing similarity with semiconductors like Si or Ge in which P or B atoms are introduced. Doping in CPs introduced the insertion of  $e^-$  acceptor (oxidation) or  $e^-$  donor (reduction) molecule, therefore, polymers are considered as p-type and n-type respectively. PANI is a different conducting polymer because its mechanism of conductance induced either by the protonation of the polyemeraldine base or by oxidation of polyleucoemeraldine. In this process, PANI converts into polyemeraldine salt form which is highly conducting in nature shown in Scheme 9.

### 3.4. Oxidative doping

The oxidative doping of PANI can take place by using  $Cl_2$  or  $I_2$  in  $CCl_4$  solution,  $SnCl_4$  or  $FeCl_3$  organic solutions and with  $O_2$  or  $H_2O_2$  in

Scheme 4. Formation of aniline radical cation.

Scheme 5. Resonating form of aniline radical cation.

aqueous acidic solution. Oxidative doping of PANI by using chlorine molecule has been given in Scheme 10, where chlorine was considered as dopant as well as the oxidant. Although chemical doping is a well-organized process, the control of the doping level  $\delta$  is challenging to process.

Above said problem can be overcome by electrochemical doping in which the doping level has been determined by the applied voltage in between the CP and counter Electrode [23]. The electrochemical doping of polyleucoemeraldine base can be written as Scheme 11, where the counter-ions are inserted in the polymer backbone.

### 3.5. Acidic doping

In acidic doping, treatment of polyemeraldine base occurs via HCl,  $H_2SO_4$  acids which induce the protonation on the imine sites and give the polyemeraldine salt, through a mechanism illustrated in Scheme 12. A drawback associated with hydrochloride polyemeraldine salt form because it is poorly soluble in common solvents and its conductivity also altered with temperature and moisture. Therefore, to improve solubility and temperature stability polyacrylic acid [24] or another polymeric acid has been used as a dopant on the place of hydrochloride [25].

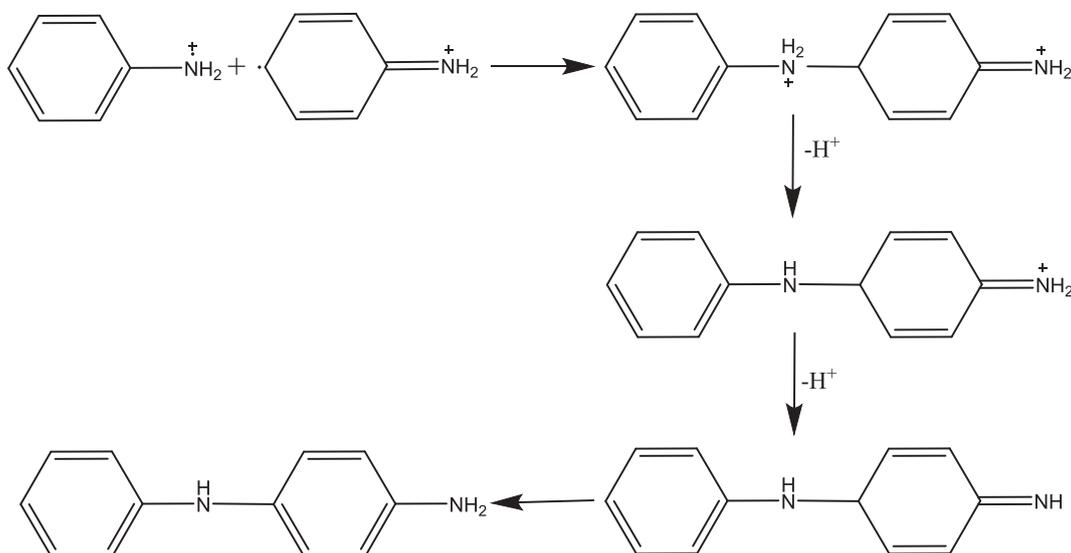

## 4. Synthesis of PANI thin films by various methods

Most regular union of PANI (PANI) has been accounted for as synthetic oxidative polymerization (Scheme 13) of aniline can take place in the presence of acidic medium by using acid as dopant and polymerization is initiated by dropwise addition of ammonium persulphate (APS) which is used as an oxidizing agent at different temperature under constant stirring at least for 2 h. After fulfillment of the polymerization mechanism (2 h), the blue color solution has been observed which is separated by filtration. The pure PANI can be obtained by washing the above solution 3–4 times with double distilled water along with alcohol and  $(CH_3)_2CO$  until the filtrate becomes colorless which ensures that unreacted substances are completely removed.

This product will be dark green in color and known as polyemeraldine salt form of PANI which is unstable due to the presence of counter ions. Therefore, this precipitate was allowed to equilibrate with an appropriate amount of  $NH_4OH$  overnight, during this polyemeraldine salt form convert into PANI – EB form which is environmentally stable at room temperature [26].

### 4.1. Cost-effective oxidative polymerization

Different PANI thin films can be prepared by doping with inorganic acids, afterwards deposition on glass substrate via various techniques which are cost-effective. [27,28]. The pre-cleaned glass substrate was embedded vertically in the blended reactants for the proclamation of PANI film for one hour [29]. The thickness of the deposited thin film was 220 nm [30]. These PANI thin films are investigated by different methods.

Scheme 6. Formation of the dimer.

#### 4.2. Surface-initiatelectro-polymerization

The PANI thin films were deposited on Au electrode by surface-initiated electrochemical polymerization method. This process is initiated by the formation of a monolayer of 4-aminothiophenol (ATP) or a substitution on 4-nitrobenzenediazoniumsalt (NBDS) by reduction of aromatic  $\text{NO}_2$  functional group to aniline monolayer. By this process chain bonding will take place on surface and well organized PANI structure has been obtained. This PANI thin film shows a peak that differentiates redox transition in between reduced and oxidized form due to shifting towards negative potential [31].

#### 4.3. Atmospheric pressure plasma polymerization technique

Plasma-polymerized aniline (PANI) nanofibers and nanoparticles have been synthesized by iPC-APPJ device. In this plasma polymerization process, iPC-APPJ device works with a single bundle of three glass tubes to increase the plasma jets in fragmentation regions. A plastic tube and substrate of polytetrafluoroethylene (PTFE) bottom cap fixed at the end of jet for getting plasma cloud with high density. Consequently, the iPC-APPJ including a bottom cap can extend farther downstream and can produce the broad and intense glow plasma in the fragmentation regions [32].

#### 4.4. mSILAR (microwave-assisted successive ionic layer adsorption and reaction)

Zinc oxide nano-polycrystalline thin films have been set up by down to earth mSILAR framework. ZnO/PANI organized by *in situ* polymerization technique and thin films were made using turn covering. The ZnO thin films were set up by mSILAR, by which the ZnO thin film was first secured on a glass substrate by then again diving it in a sodium

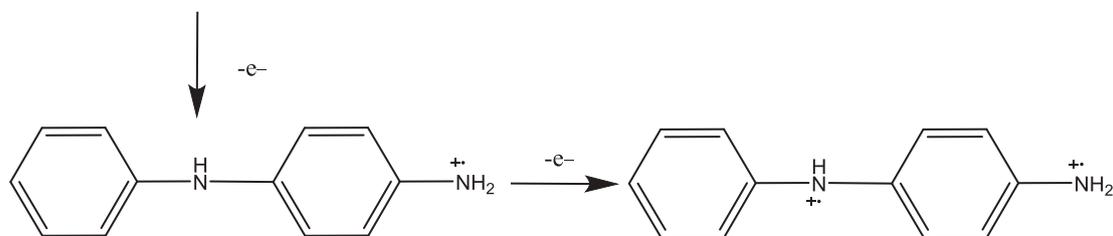

zincate shower at room temperature and in warmed water at 90–95 °C using prompt micro-controlled dip-coating unit. Aluminum doping was done by adding anhydrous aluminum chloride [ $\text{AlCl}_3$ ] to the sodium zincate shower [33]. The doping centralizations of the extensive number of blends were kept up at 3 and 5 wt%. The plain much-cleaned substrates were immersed in the creation shower for 10 s sought after by submersion in high temp water for a proportionate range, and the strategy was reiterated. These models were tempered at 450 °C in the air using a heat annealing chamber [34].

#### 4.5. PANI-TiO<sub>2</sub> composite thin films

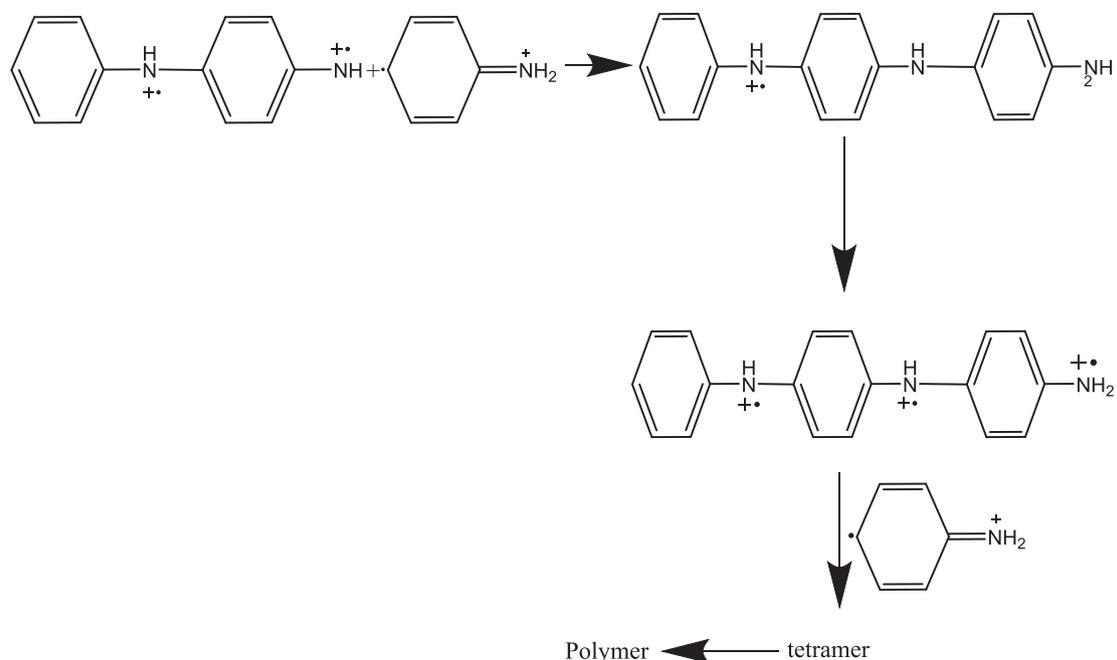

PANI-TiO<sub>2</sub> composite thin films have been synthesized by using aniline,  $\text{TiCl}_3$  and APS solutions. Initially, a sol of TiO<sub>2</sub> has been prepared by a solution of  $\text{TiCl}_3$  which was aged for five days. The very first-day solution was visible violet in color, as days pass color of the solution become whitish. On the fifth day, whitish sol has been formed which is converted into TiO<sub>2</sub> at six days. This TiO<sub>2</sub> sol was treated with a 1:1 ratio solution of aniline (0.1 M) &  $\text{H}_2\text{SO}_4$  (1 M), stainless steel substrates were vertically immersed in the reaction vessel and APS (0.1 M) add as an oxidant. During the polymerization process, the color of the solution becomes blue to dark blue and finally green. Precipitation was started to settle down in the bottom after 30 min and 0.03  $\text{mg cm}^{-2}$  thickness observed on a steel substrate. For an increase, the thickness of the films the same procedure has been repeated [35].

#### 4.6. Perchlorate ( $\text{LiClO}_4$ ) doped PANI thin films

PANI (PANI) is joined through compound course subject to manufactured oxidative polymerization and starting there *in-situ* doped with HCl and unmistakable weight dimension of  $\text{LiClO}_4$ . Thin films of PANI and its particular doped variety are put away on plain soda glass and

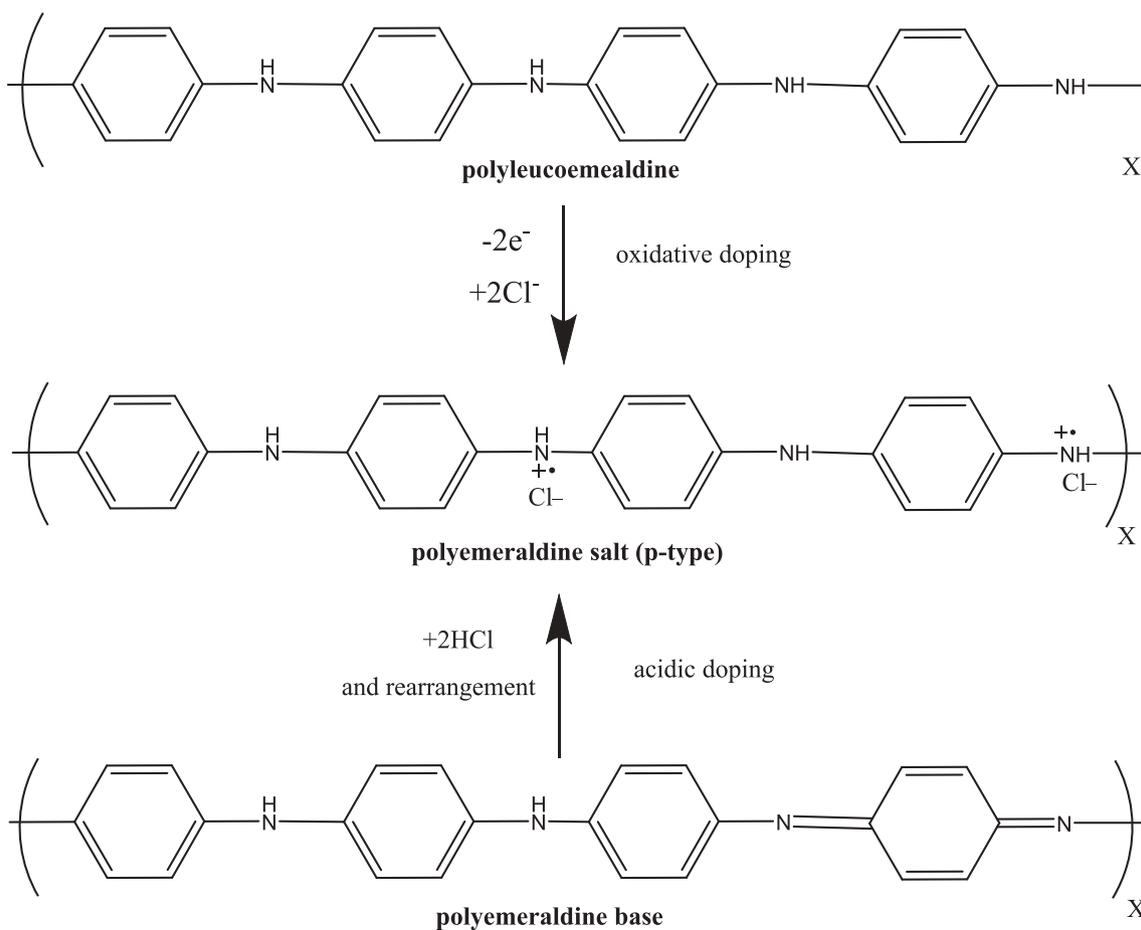

Scheme 7. Formation of the radical cation dimer.

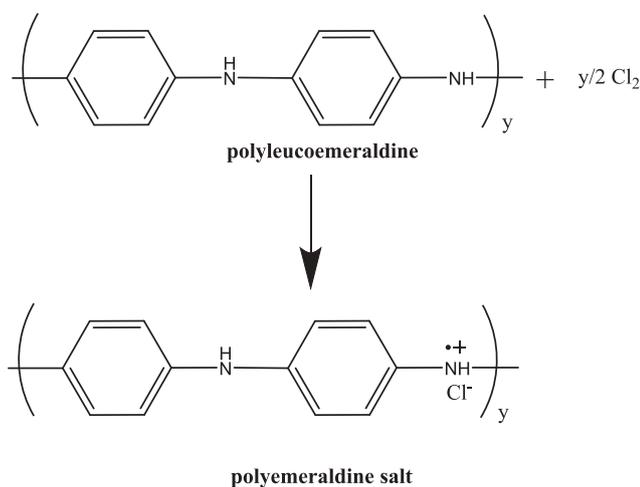

Scheme 8. Mechanism of polymer synthesis.

ITO driving glass with compound shower proclamation technique. The PANI base is organized by methods for chemic course filtered and dried. PANI thusly got was crumbled in N-methyl pyrrolidinone (NMP) dissolvable at 3% wt. Extent concerning the dissolvable. The soda plain

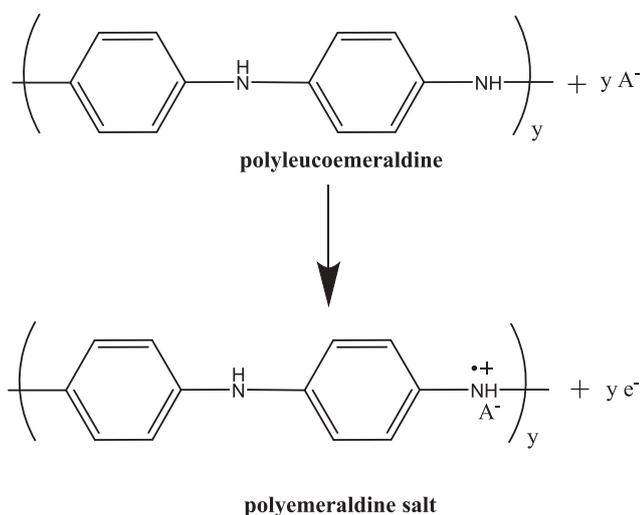

glass and ITO glass slide are immersed in the response for 72 h, and PANI disengaged covering in this manner obtained are washed, cleaned and dried. The doping course of action of  $\text{LiClO}_4$  was made by dissolving it in DMC (dimethyl carbonate) by weight rate extent 1%, 2% and

Scheme 9. Doping mechanisms in PANI.

Scheme 10. Oxidative doping by chlorine.

Scheme 11. Electrochemical doping of polyleucoemeraldine.

5% independently. PANI base unattached films were submerged in the individual course of action of Li salt for 48 h. The doped films were dried in a vacuum grill for 6 h [36].

#### 4.7. Synthesis of HCl-doped PANI thin films

PANI-HCl has been set up by oxidative polymerization at three different temperatures which are 4 °C, 13 °C and 31 °C with 1 M & 2 M concentrations of HCl as the dopant. PANI-HCl has synthesized by chemical oxidative polymerization process by using aniline, HCl as dopant and APS as an oxidant. APS is added by dropwise addition and complete polymerization will take place in 15 min and PANI-HCl thin film has been formed. The same procedure has been repeated on 4 °C, 13 °C and 31 °C with 1 M & 2 M concentrations of HCl. Synthesized thin films have been washed with deionized water, acetone and dried at room temperature [37].

#### 4.8. V<sub>2</sub>O<sub>5</sub>/PANI thin films

V<sub>2</sub>O<sub>5</sub>/PANI in the presence of xerogel V<sub>2</sub>O<sub>5</sub> has been used for the detection of NH<sub>3</sub> gas. During oxidative polymerization, process gel reacts with aniline monomer and hybrid material is has been formed. In the detection of ammonia gas can be taken place without any interference of another gas by V<sub>2</sub>O<sub>5</sub>/PANI thin films. Aniline & V<sub>2</sub>O<sub>5</sub> gels show acid-base & redox reaction during polymerization which is an

example of an intercalation reaction. By the reaction of aniline (4.0 mL of 0.2 mol/L) and 30 mL V<sub>2</sub>O<sub>5</sub> gel under constant stirring for two days V<sub>2</sub>O<sub>5</sub>/PANI has been formed by intercalation reaction. The green color product has been obtained which is spread on a glass substrate followed by water evaporation at room temperature; obtained thin film was rinsed with deionized water and dried [38].

### 5. Deposition of PANI thin films

Deposition of PANI thin films can be taken place by the chemical and physical method:

#### 5.1. Chemical methods

The covering of various materials with leading electroactive polymers (CEP), i.e., PANI, their subordinates, given by methods for compound polymerization, is quickly explored. Herein, we will discuss the chemical deposition methods of PANI such as bulk oxidative chemical polymerization, surface-located polymerization, chemical vapor deposition, Langmuir–Blodgett technique, layer by layer self-assembly technique, Spin coating, Drop coating, Nanopatterning, Inkjet printing, Screen printing, Line patterning and Nucleation and growth process.

##### 5.1.1. Bulk chemical polymerization

The strategy of the manufactured oxidative polymerization is regularly trailed by a change in ion during polymerization. Initially, the solution was colorless which turned into blue & dark blue which indicates that dimer & oligomers of PANI are formed. The chemical polymerization process possesses autocatalytic character means a rapid coloration and polymerization proceeds after a definite induction period. The rate of the process depends upon many factors, like oxidant nature, and reactant concentration [39]. Most of the CEP formed by the chemical polymerization process, spontaneously a part of the CEP can deposit as a thin film on various substrates of the reaction medium.

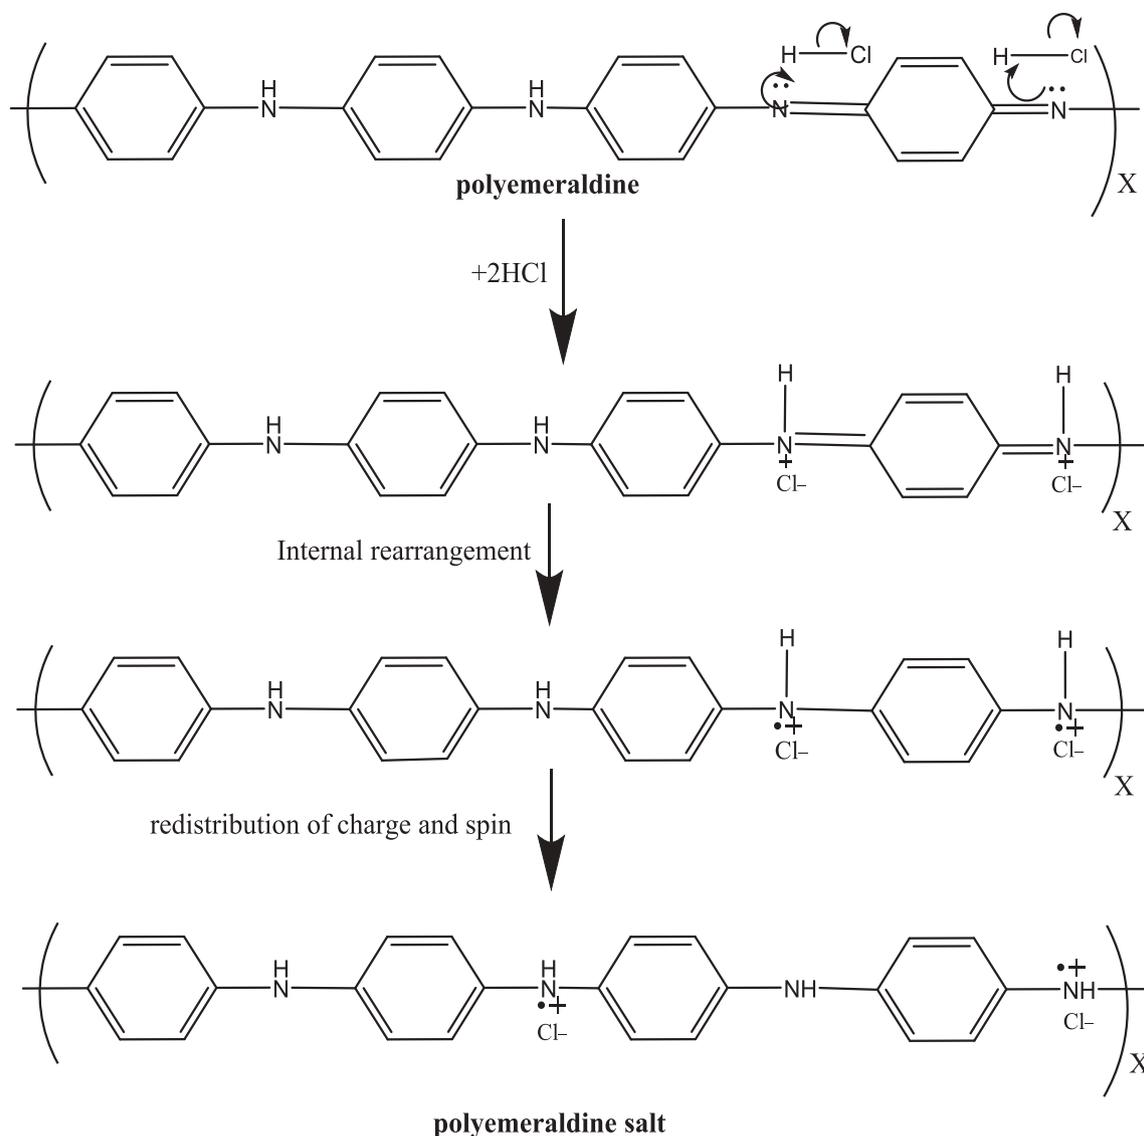

Various CEPs shows different redox states. Therefore conductivity is as per their form have existed. Likewise, we can say that by removing one electron from the structure with doping of anion then half oxidized polaronic form will be obtained. Similarly, by removal of the second e<sup>-</sup> the oxidized bipolaronic form will be produced. Therefore, it has been found that PANI-EB form shows the highest conductance as compared to PANI-LE and PANI-PB. PANI-LE and PANI-PB do not have any conductance power.

##### 5.1.2. Surface polymerization

Metallization of printed circuit boards (PCBs) shows the most important practical use in the deposition of CEP by chemical polymerization on the surface of nonconductor substrates from the 1990s. In this procedure, the printed circuit board's surface is reacted with basic KMnO<sub>4</sub>, and MnO<sub>2</sub> is spread on selective plastic parts of PCBs. After that, a thin layer of PANI is deposited onto the PCB followed by reaction of it with an acidic solution of PANI, where the polymerization of PANI initiated by MnO<sub>2</sub>. And finally, the Cu metal layer is deposited by electrodeposition on PANI-deposited PCB. Therefore, from the last few years, this technique gains so much attention, and various materials have been involved in this process [40].

##### 5.1.3. Chemical vapor deposition (iCVD&oCVD)

Initiated chemical vapor deposition (iCVD) and oxidative chemical vapor deposition (oCVD) methods are able to deposition of thin films on bulk, micro and nanoscale materials. In the deposition of polymer in the vapor phase, many effects like solution and wetting has been observed which has to be avoid must. In iCVD, the deposition rate has been increased by using a hot filament of CVD and for maintenance of chemical nature of polymers a thermally labile initiator used in the feed stream. In oCVD, by direct use of oxidant and monomer into the reactor electrically conducting and the infusible film have been formed. In iCVD,

Scheme 12. Mechanism of acidic doping.

polymeric monomer and initiator molecule has been introduced into the vacuum chamber. Therefore many free radical homopolymers, random copolymers, and alternating copolymers has been created in iCVD method. Ultrahydrophobic, hydrophilic, chemically resistant, antimicrobial, biopassive and peptide-functionalize polymer surfaces have all been characterized by iCVD. For oCVD, by using monomers and volatile oxidants step-growth polymerization of polymers occurs [41]. Thin, adherent coatings of CPs show various properties, such as work function have been demonstrated by oCVD [42]. This Strategy developed a covalent link between underlying substrate and films [43]. The enhanced adhesion is required for many practical applications and also enables high-resolution patterning of the CVD polymer layers [44].

#### 5.1.4. Langmuir–Blodgett technique

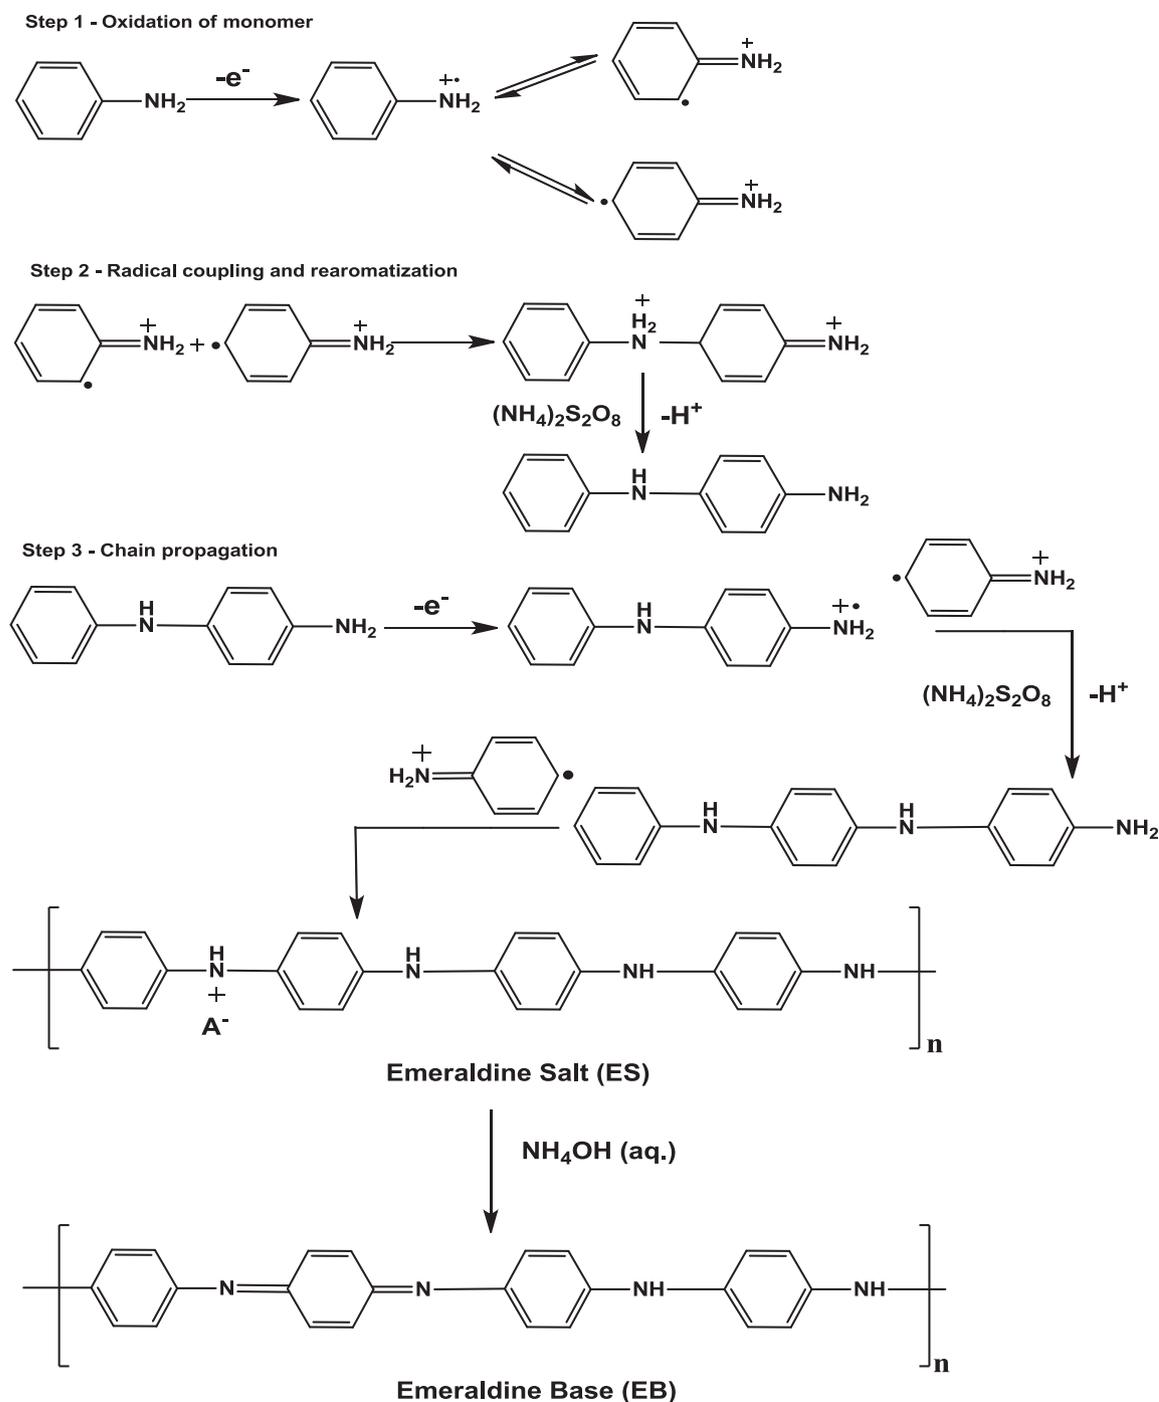

By this technique, PANI–CSA composite thin film has been prepared. In this process, PANI–CSA solution (800 mL.) has been expanded over the substance by syringe.  $\text{CHCl}_3$  is highly evaporating in nature so it will evaporate first and monolayer films are left undisturbed a period of 20 min for complete get rid of the solvent particles. Therefore the gaseous phase of the film has been obtained. PANI–CSA and CdS incorporated thin films are prepared by the same method, by isotherm check process we can compare the change found in both thin films during the deposition process.

#### • LB film deposition

CdS incorporated PANI–CSA thin films are deposited on a glass substrate at room temperature, on  $12 \text{ mN m}^{-1}$  surface pressure &  $20 \text{ mm min}^{-1}$  compression speed. After several performances, increase compression speed for getting stability in multilayer deposition. Next deposition followed by after 30 min of elapsing and substrate kept undisturbed for drying. LB films of 25 layers, 21 layers, 19 layers, 15 layers, 9 layers and 3 layers are deposited on a glass substrate [45].

#### 5.1.5. Layer by layer (LbL) self-assembly technique

By this technique, PANI thin film deposition takes place on a glass substrate by LbL self-assembly formation. In this technique first glass substrate will be cleaned by RCA –1 Silicon Wafer Cleaning method [46]. In this process, 325 mL of distilled water take in a beaker and add 65 mL of ammonium hydroxide then heat it on  $70\text{--}75^\circ\text{C}$  temperature. After that add 65 of hydrogen peroxide followed by stop heating. Then add silicon wafer in this solution for 15 min., when the reaction is finished then transfer the wafer into a container in which overflowing of distilled water is present. After several washes, we will remove the wafer from flowing water so as a result it has been obtained that the water surface only has an organic substrate that will be deposited on the wafer surface. After cleaning the surface of the glass substrate, the

$\text{A}^-$  = Counter ion

**Scheme 13.** Oxidative polymerization of aniline to PANI.

glass substrate will be immersed into the PANI solution by adding some natural rubbers particles for absorption. After deposition of first layers surface will be washed by deionized water and dried in  $\text{N}_2$  gas atmosphere and the next layer will be deposited by the same procedure. By this method, 10 layers can be deposited on a glass substrate [47].

#### 5.1.6. Spin coating

Spin coating is a method that is extensively used for depositing layers of organic semiconductors on any suitable substrate. A quantity of a polymer solution is first placed on the semiconductor wafer that

rotated at the desired speed while the solution flows radially outwards, reducing the fluid layer thickness. The evaporation of the solvent results in a uniformity of this film. The initial stage involves delivering a quantity of solution to the surface of the substrate. The substrate surface may be pretreated with an adhesion promoter to improve the wetting [48].

#### 5.1.7. Drop coating

In the drop coating method, the sample is dissolved into any suitable solvent and may be stirred with a magnetic stirrer for better mixing.

Then the solution is filtered, the insoluble material which remain on the filter paper is discarded. The resulting solution is used to cast a thin film. A clean suitable substrate is placed on a leveled surface and the solution is put on the substrate drop wise. The coated substrate is dried in a vacuum and the films appear visually dry. To have a thicker film, a second layer of the solution is casted overlaying the first layer the same in a way. After 4–5 h, the glass is taken out from the oven and submerged in distil water and then the film can be peeled off from the substrate and ready for use [49].

#### 5.1.8. Nanopatterning

The planar microelectronics components are patterned using photolithography where a surface is covered first with a light-sensitive photoresistor and then exposed to ultraviolet light through a mask. Either the exposed photoresist (positive resist) or the unexposed regions (negative resist) can be washed away subsequently to leave a positive or negative image of the mask on the surface [48].

#### 5.1.9. Inkjet printing

The inkjet printing technique is mainly used for the fabrication of film of an organic semiconductor. It is very simple, compatible with different substrates, feasible of non-contact and non-mask patterning can be processed in the low temperature range. Herein the inkjet printer of computer printing with simple modification can be used to pattern solution processible polymers or nanoparticles inks on various substrates including glass, semiconductor materials, overhead transparencies and even paper.

#### 5.1.10. Screen printing

This is a very simple and environmental friendly printing process and used to manufacture conductive inter-connections between the electronic components on the circuit boards. Herein, a squeegee blade across a screen mesh moves and pushes ink through a screen mesh and patterned by means of a stencil to produce open areas that result in the pattern of a conductive material on the circuit board. This method is suitable for high viscosity materials including conductive ink, dielectric pastes, UV durable materials and various adhesives [50].

#### 5.1.11. Line patterning

Line patterning is the simplest and cheapest printing method introduced by MacDiarmid and co-workers [51]. It includes (i) the design of a negative image of required pattern using computer design software, (ii) deposition of conductive polymer on the substrate, and (iii) removing the printed mask by sonicating the substrate in toluene. This method can be used for the fabrication of resistors, R.C. filters, FETs and R.F. identification tags, etc.

#### 5.1.12. Nucleation and growth process

Generally, the atoms/molecules can deposit on certain sites in the initial stage leading to assemblages of atoms/molecules is known nuclei or clusters. These nuclei may increase laterally to form a monolayer over a small area and later on also thickness with the fresh arrival of more atoms or molecules. The increase in the sizes of these nuclei is also accompanied by fresh deposition of atoms/molecules at newer sites of the uncovered portions of the substrate surface. These new nuclei/clusters along with the earlier ones will increase laterally as well as in height with the arrival of fresh atoms/molecules. The gaps in between

these nuclei will decrease gradually eventually a continuous film will be fashioned at a certain average film thickness. The theory involves film formation often over a foreign substrate surface which plays an important role in nucleation. This is known as heterogeneous nucleation. If the substrate is of the same materials as the vapor atoms then the nucleation process is called homogeneous. In the case of nucleation and cluster formations from the vapor phase, the surface of the substrate should be smooth, void and defect-free. The general process of additions, adsorption, desorption, migrations, etc. of atoms is called the nucleation. The formation of a film and its growth from the vapor phase or there wise involve phase transitions, adsorption, desorption, nucleation, cluster formation, etc. In order to explain the nucleation and cluster formation, several theories may be applied [52].

### 5.2. Physical methods

The present area oversees the synthesis and characterization of PANI thin films using room temperature electrodeposition systems. Assorted preparative parameters, for instance, kind of dopant, deposition potential, the union of monomer and declaration period were progressed to get uniform and well teach PANI thin films and depicted by different methods. The strategy of electrodeposition incorporates a mix of thin films from deteriorated species by changing their oxidation states over electricity. The terminal position has diverse focal points over others dealing with techniques used for the announcement of thin films [53].

It is a cost-effective method for the preparation of thin films.

1. The deposition should be possible in a picked specific region and the thickness of the store can be controlled entirely by checking the exhausted charge.
2. It is an incredibly beneficial procedure for making thin multilayered materials.
3. Deposition can be finished at a low temperature.
4. Deposition on complex shapes is possible.
5. The deposition process can be controlled even more absolutely and easily.

Different sorts of morphologies and compositions can be gained for different polymers, mixes and blends (Table 1)

#### 5.2.1. Galvanostatic mode

Fig. 1 shows potential versus time transient of affirmation of PANI film at unflattering current thickness. The possibility of the plot chooses the nucleation and improvement of PANI. At first, the potential was raised out of the blue to +0.92 V due to the institution of the space charge region. At B, oxidation of aniline on substrate happened and over way BC, a perpetual improvement of PANI viewed. The films put away under predictable current conditions are thin and less supporter to the treated steel substrate. Along these lines, this method was finished to prepare PANI films. At B, oxidation of aniline on substrate happened and over way BC, an interminable improvement of PANI viewed. The thin films spared under reliable current conditions are thin and less teach to the treated steel substrate. Subsequently, this strategy was suspended to prepare PANI films.

**Table 1**  
Modes of electrodeposition.

Mode of Electrodeposition	Difference
Galvanostatic	Deposition by applying a constant current between counter electrodes and working electrodes
Potentiodynamic	Electrode potential is varied using a stable the reference electrode and the current flow is measured between the working and counter electrode.
Potentiostatic	Deposition by applying a constant potential between working and counter electrodes.

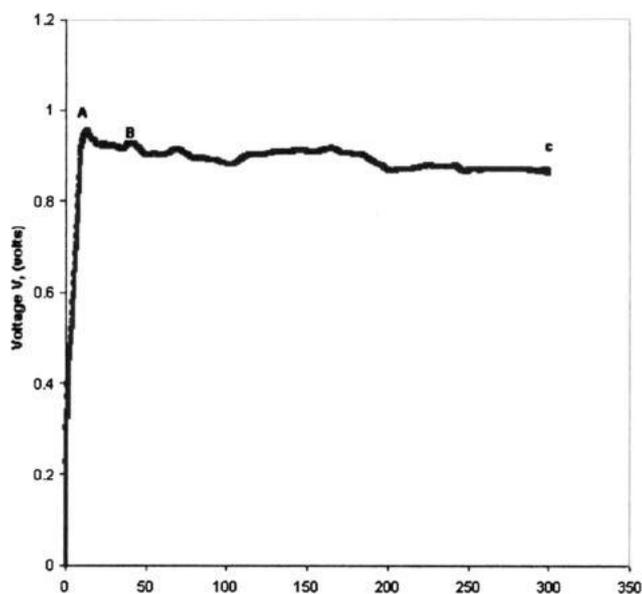

Fig. 1. Galvanostatic deposition of polyaniline film.

### 5.2.2. Potentiostatic mode

The hidden decreasing in current is seen due to the adsorption of the molecule at the electrode surface. Constant rising in current after initial decay suggests parallel nucleation of PANI close by the autocatalytic improvement of PANI. The possibility of the current-time transient in the potentiostat deposition is a result of the use of  $H_2SO_4$  as an electrolyte. For our circumstance light blue due to  $H_2SO_4$  electrolyte used at the assembly of monomer solution (0.45 M aniline), the current transient seeks after nature as showed up in Fig. 2. The electro-oxidation of aniline at constant potential produces a powder that adheres poorly to the electrode hence not employed to deposit PANI films in further work.

### 5.2.3. Potentiodynamic mode

Fig. 3 shows cyclic voltammograms (CV) plots of PANI deposition by potentiodynamic strategy at a broadness rate 50 mV/s in the potential domain  $-0.2$  V to  $+0.8$  V/SCE. The peaks at A ( $+0.45$  V/SCE) analyzes to oxidation of aniline and inside the potential region part AB (upto  $+0.8$  V/SCE) PANI advancement occurs. Right, when the cycle was come to at potential regard  $-0.2$  V/SCE PANI was in the completely reduced state, i.e., Leucoemeraldine (LE) state. The color of the film was light yellow. With positive potential at about  $+0.45$  V/SCE (first oxidation top at A), the reduced state was not entirely oxidized

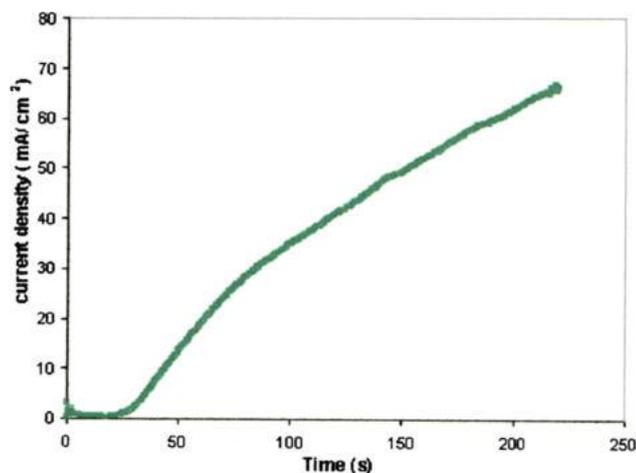

Fig. 2. Potentiostatic deposition of PANI film.

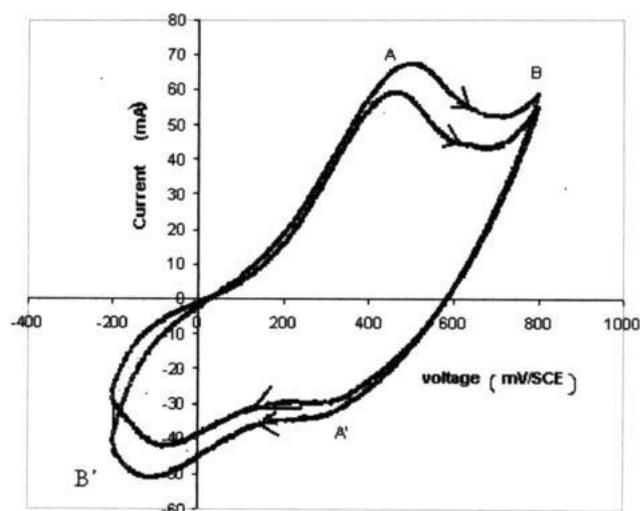

Fig. 3. Potentiodynamic deposition of polyaniline film.

which realized a state to Emeraldine (EM). The color of the film turns emeraldine green. Above capacity of  $+0.8$  V/SCE (point B), EM went to complete oxidation to make polypemigraniline. The film color change in some degree blue-violet. These oxidation states and the way A-B are electrochemically reversible. In the procedure used to store PANI, the cathode was checked for ten cycles between  $-0.2$  to  $+0.8$  V/SCE at breadth rate 50 mV/s. During  $-0.2$  to  $+0.45$ , V/SCE oxidation of aniline did not occur. The oxidation and advancement of PANI happened over the potential region  $+0.45$  to  $+0.8$  V/SCE.

Notwithstanding the way that the PANI films were spared by three distinctive courses, for further examination and production of hetero-junctions, PANI films were spared potentiodynamically. The thin films spared potentiodynamically are adherent, even thicker and co-ordinating.

### 5.2.4. Thermal evaporation

The thermal evaporation method is widely applied for the deposition of metals, alloys and several compounds that involves the evaporation or sublimation of the material in vacuum by thermal energy and allowing the vapor-stream of material to condense on a substrate and consequently to form a continuous and adherent film of desired thickness. The quality and properties of the film will depend on the evaporation rate, the temperature of the substrate, ambient pressure, etc. The uniformity of the film also depends on several factors including inter alia the geometry of the evaporant source and its distance from the substrate [52].

Thermal evaporation is done by in a variety of ways e.g. resistive heating where the material is heated by resistive filament generally made of refractory metals such as W, Mo, Ta and Nb with or without ceramic coatings. Others are flash-evaporation, arc-evaporation, exploding wire technique, laser evaporation, RF heating, and electron-beam evaporation. To overcome the drawbacks upon resistive method, an efficient source of heating by electron bombardment of the material may be used which is capable of evaporating any materials with rates ranging from fractions of an angstrom to microns per second. In the process, thermal decomposition and structural changes of some chemical compounds may occur because of the intense heat or energetic electron bombardment [54].

### 5.2.5. Sputtering method

The ejection of atoms from the surface of the target material by bombardment with energetic particles is known as sputtering. If the ejection is due to the positive ion bombardment then it is referred to as cathodic sputtering. The ejected or sputtered atoms can be condensed on a substrate to form a thin film. If the ions are supplied by glow

discharge phenomena owing to an applied electric field between two electrodes in a low-pressure gas then it is called glow discharge sputtering. The factors affecting the operation of the glow discharge technique are gas, pressure, deposit distribution, current and voltage values of the systems, and size of the cathode. The deposition/evaporation rate remains constant with the time that provided the current density and voltage do not vary and can be attainable by regulated power supply using an automatic pressure controller. The sputtering technique can be categorized as reactive sputtering, rf-sputtering, triode-sputtering, ion-plating, magnetron sputtering and ion beam sputtering [55].

## 6. Properties of conducting polymers

The nano-sized inorganic particles and their unique properties are introduced into conducting polymers for the formation of new desired properties. It is apparent from the literature review that PANI is successfully utilized for the preparation of nanocomposites. Mostly, inorganic metal oxides nanoparticles are incorporated into conducting polymers to achieve desired properties. Recently, interest is shown on PANI inorganic nanocomposite due to their interesting various physical properties and potential applications. Maeda & Armes carried out a series of pioneering works in colloidal conducting polymer nanocomposites [56]. They incorporated  $\text{SiO}_2$ ,  $\text{SnO}_2$ , etc., into PANI to achieve stable colloidal dispersions. Some of the stable dispersions [57], stable PANI- $\text{SiO}_2$  dispersions [58] and films [59] were studied for biomedical applications. Nano-dimensional manganese (IV) oxide was incorporated into PANI to produce water-dispersible nanocomposites [60].  $\text{WO}_3$  [61] and Prussian blue [62] were synthesized for their electrochromic properties. Some researchers prepared the nanocomposites by incorporating the  $\text{Cu}_2\text{O}$  nanoparticles into PANI to enhance electronic, electrical, optical and mechanical properties [63]. Kondawar et al. [64] prepared the nanocomposites by the incorporation of ZnO into the PANI matrix, and they found the increased electrical conductivity of ZnO in the nanocomposites. This group also found that the change in the conductivity of the nanocomposites is indicating a change in the doping state of the polymer [65]. Nowadays, several researchers have reported the nanocomposites of metal oxide/polymer nanocomposite and the incorporation, embedded or intercalation of metal oxide into polymers which increased the optical absorption, thermal stability, corrosion resistance and conductivity of metal oxide [66]. Some pioneering work to prepare the  $\text{Cu}_2\text{O}$ /PANI composite is done by explaining the possible proposed photocatalytic mechanism for the improvement of the photocatalytic activity in which photocatalysts effect with enhanced photocatalytic activity and stability of its composite. So, PANI associated with various properties such as magnetic properties, electrical and dielectric properties, redox properties, antioxidant properties, anticorrosion properties, charge-discharge properties, capacitive properties, sensing properties etc.

### 6.1. Magnetic properties

The PANI has attracted much attention because of its magnetic behavior as it exhibits high spin density [67]. The magnetic properties of CPs have been intensely studied because these properties give information about unpaired spins and charge-carrying species [68]. The paramagnetic nature of the conducting PANI upon HCl doping changes its electrical and magnetic properties which are closely related to each other. Lu et al. [69], PANI- $\text{Fe}_3\text{O}_4$  composite nanotubes have been synthesized by ultrasonic irradiation technique and studied their magnetic properties, and as a result, it has been observed that PANI- $\text{Fe}_3\text{O}_4$  composite nanotubes showed a super paramagnetic behavior. Similarly, of PANI- $\text{Fe}_3\text{O}_4$  composites nanorods prepared via a self-assembly technique and their magnetic properties have also been studied. By comparing to both methods, it has been observed that the samples synthesized through the ultrasonic irradiation technique promote the distribution of  $\text{Fe}_3\text{O}_4$  particles. The magnetic properties of 1D-CPs – Ni,

Co, Fe nanocomposites have also been studied [70]. A remarkable ferroelectric response in PANI nanotubes has been observed due to the polarization caused by intermolecular H-bonding in methanol and PANI chain. Djurado et al. [71] studied that an independent film of the PANI protonated with a di-(2-butoxyethoxy-ethyl) ester of 4-sulfophthalic acid did not show magnetized behavior at zero magnetic fields. The magnetic behavior of PANI in the presence of chloranil has also been studied during the electro-oxidation [72]. The spin susceptibility of PANIs shown that this term employed from paramagnetic centers which were present in charge carriers which mainly present in implant metal-like domains as well as in amorphous polymer backbone. In this electron spin interacts with samples and shows antiferromagnetic behavior as paramagnetic susceptibility [73].

Huang et al. [74] prepared the HCl, PTS and CSA doped  $\text{SrPr}_{0.2}\text{Fe}_{11.8}\text{O}_{19}$ /PANI composite films and HCl-PANI film employing a sol-gel method and in-situ oxidative polymerization. They observed that the magnetic properties of these composite films have no much difference. The electromagnetic losses of the four kinds of films in series from strong to weak are HCl-PANI film,  $\text{SrPr}_{0.2}\text{Fe}_{11.8}\text{O}_{19}$ /(HCl-PANI) composite film,  $\text{SrPr}_{0.2}\text{Fe}_{11.8}\text{O}_{19}$  film,  $\text{SrPr}_{0.2}\text{Fe}_{11.8}\text{O}_{19}$ /(CSA-PANI) composite films. They concluded that the acid doped PANI materials had a great impact on the electromagnetic loss of the composite films and improved the electromagnetic properties of the composite films.

### 6.2. Electrical and dielectric properties

In a variety of polymers, PANI is especially attractive owing to both its thermal and environmentally stable properties. The origin of the metallic phase and its dimensionality of the natural form of PANI are still unknown [75]. The first electrically conducting doped organic polymer as polyacetylene was reported in the year 1977 [76]. The pristine polymers are converted into a metallic regime through the doping process. The electrical conductivities of polymers are increased with increasing the doping level while the conductivity of PANI is increased in many orders in magnitude with the doping. The electrical properties of the polymers and its nanocomposites are understood based on the explanation of various models devised by the scientists. Several reports are focused on the nature of the carriers in the highly doped metallic state. Even though there is a high concentration of conduction electron at the Fermi level in the highly doped state, the carriers are spatially localized, and hence they do not participate in transport except through hopping. Since conduction is carried out through localized electrons where the electrons jump across an energy barrier from one site to the other site. If two molecules are separated by a potential barrier, a carrier can move from one side to the other by tunneling either through the barrier or over the barrier. The process of movement of carriers from one side to another over, the barrier is known as hopping in which the structural disorder is the prime source of localization in the polymers. In a polymer system, the charge transport is an important phenomenon which obtained from the relationship between AC conductivity and the temperature of the polymer. Generally conducting polymers is either polycrystalline or amorphous and has a substantial amount of disorder. The presence of partial crystallinity and impurities produces disorder in a polymer. The conduction also depends on the number of defects present on the polymer. The charge transport takes place between localized sites through phonon-assisted hopping due to localized charge carriers instead of band conduction. Activation energy is required for each hop and hopping occurs near the Fermi energy which dominates at low temperature. The hopping obtained near the maximum density of states dominates at high temperatures. Generally, an electron or hole hops to a more remote site than the nearest neighboring one, to reduce the energy required for the hop. The crystallinity and disordered system of polymers are studied through X-ray spectroscopy. Also, the fibrillar nature of many of the conducting polymers may lead to localization by reducing the effective dimensionality of the electrons delocalized in a

bundle of polymer chains [77]. In a perfect crystal with periodic potentials, electron wave functions form delocalized Bloch waves [78]. The impurities and lattice defects in the disordered systems are introduced through backward scattering. Anderson 1958 studied this phenomenon regarding a localization effect and the disorder-induced metal-insulator transition. It is well known that the electronic structure of the system strongly depends on the degree of disorder. The energy fluctuation in the random potentials broadens the bandwidth and creates smooth band-tails while the original band gap between the conduction and the valence bands of a semiconductor may be closed owing to these band tails. In the year 1979, Mott discussed the ramifications, and the finite density of states  $N_{EF}$  produced at the Fermi level ( $E_F$ ) between the mobility edges. In the second half of the forties, it was observed that the transistor effect of semiconducting materials like Ge-doped semiconductor had broken the behavior mechanism at low temperature and Hung and Gliessman found the type above of behavior in the general conduction mechanism. In the year 1956, the new conduction process was suggested by Mott (1979) in which the charge carriers conducted the electric current from an occupied site to an empty site by thermally activated tunneling. Many numbers of transport theories were developed as per the model of Miller and Agraahans in the year 1960, even though the theories were most widely accepted, it possesses few discrepancies. To overcome, a more sophisticated treatment (called as percolation theory) has been suggested, and it is still most reliable as well as considered for the evaluation of electric coefficient as conductivity and thermal electric power of non-crystalline semiconductors.

It is well known for a one-dimensional metallic chain that the localization of charge carriers arises for even weak disorders because of the quantum interference of static backscattering [79]. In contrast, strong disorder (the mean free path is comparable with the Fermi wavelength) is required for localization in three-dimensional systems. The localization effects in the in-homogeneously disordered (partially crystalline) conducting polymers may originate from the one-dimensional localization in the disordered regions. In the case of conducting polymers as fillers, the degree of cross-linking between the polymeric chains also affects the electrical properties in these composites [80]. Generally, the percolation theory is used to explain the behavior of electrical conductivity and dielectric properties of conducting polymer composites, but it could not explain very low values of the percolation threshold observed in many of the composite systems of conducting polymers. In the year 1998, Wessling proposed a non-equilibrium theory for the composites of conducting polymers. This theory accounting for the interfacial interactions between conducting polymers and host matrix could also explain the observations of the low percolation threshold.

The conducting polymers are appreciable candidates for electronic and electromagnetic applications. Among these, PANI is having a high level of conductivity and permittivity (Piou et al. 2004), and the dielectric properties are tuned easily by blending with inorganic nanoparticles. Though, when they are taken in the form of the nanocomposite, their electrical, as well as dielectric properties, are altered from those of basic materials. Some groups are reported on the electrical conductivity and dielectric properties of composites of a variety of conducting polymers [81]. It is observed that the conductivity of these systems depends on several factors such as the concentration of conducting fillers, their shape, size, orientation and interfacial interaction between filler molecules and host matrix [82]. The nano-dimensional shape of the filler particles governs the ability of conductive network formation which results in a large increase in the conductivity. Also, encapsulation particles/matrix interactions and physical properties of the matrix influence the agglomeration of the encapsulation phase which, in turn, affects the dielectric properties of the nanocomposites. In the case of conducting polymers, the degree of cross-linking between the polymeric chains also affects the electrical properties in the composites. Although the percolation theory is generally used to explain the

behavior of electrical conductivity and dielectric properties of conducting polymer composites [80], it does not explain very low values of the percolation threshold observed in many of the composite systems of conducting polymers. Wessling proposed a non equilibrium theory for the composites of conducting polymers which explained the observations of low percolation threshold while accounting for the interfacial interactions between conducting polymers and host matrix.

The incorporation of PMMA enhanced the optical and mechanical properties of PANI thin film where films showed higher transmittance, adhesion, and lower refractive index and intrinsic stress [83]. PANI/PMMA composite thin films grown by vacuum evaporation was in the form of short-chain oligomers. The optical band gap was found to be increased with increasing concentration of PMMA which confirmed the formation of the homogenized composite. The optical transmittance of the pristine films increased from 70% to 85% with increasing PMMA concentration while the refractive index decreased from 1.822 to 1.571. The adhesion was increased from  $6.86 \times 10^4$  to  $12.26 \times 10^4$  N/m<sup>2</sup> and stress reduced from  $16.98 \times 10^8$  to  $10.50 \times 10^8$  N/m<sup>2</sup> owing to PMMA. The improved optical and mechanical properties make them more applicable in optics and optoelectronics. The camphorsulfonic acid (CSA)-doped PANI thin films are P-type semiconductors with high conductivity for PANI film of PANI:CSA weight ratio (1:8) [19].

### 6.3. Redox properties

The PANI shows different forms in which these forms are converted into each other reversibly by acceptance or removal of an electron. The reduction of the polyemeraldine form and polyleucoemeraldine base form has been shifted by increasing the scan rate in the positive direction [84]. Gospodinova et al. [85], has been studied that the HCOO<sup>-</sup> like highly hydrated anions promote the propagation of PANI reduction in organized thin films when it is deep in an aqueous acidic medium. Electrochemical activity of a PANI film has been prepared by casting PANI from N-methylpyrrolidone solution (PANI-NMP), and another film has been developed by dissolving the PANI in a combined solution of dichloroacetic acids and dodecyl benzene sulfonic (PANI-DBSA-DCA), and comparative study of both have been done with HCl/NaCl aqueous solution used as an electrolyte. As result, it has been observed that PANI DBSA- DCA and PANI-NMP films have been active up to pH < 5 and at pH < 2 respectively, whereas weight of PANI DBSA-DCA has been increased by reduction due to movement of Na<sup>+</sup> and weight of PANI-NMP film, has been increased by oxidation due to the movement of Cl<sup>-</sup>. PANI has been used as redox-active nanojunctions [86]. The scanning electrochemical microscopy method has been used for preparation of nanojunctions which showed conductance in range of 10<sup>-7</sup> and 10<sup>-8</sup> S, appeared current to be controlled when it is for less than 10 oligoaniline strands because the less number of strands will also be able to connection of two electrodes, and the junctions will be highly stable in nature.

### 6.4. Antioxidant properties

A modified 2,2-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) diammonium salt (ABTS) has been synthesized for the determination of the antioxidant property of PANI powder [87]. The reduced forms PANI show the highest radical scavenging property as compared to their partially oxidized form. It has also been observed that the radical (DPPH<sup>•+</sup>) scavenging property of the PANIs has not been dependent on surface area and the conductivity of PANI, but it subject to the various oxidation state of PANI. As a result, it has been observed that the antioxidant property has been increased with decreasing in the level of PANI oxidation. PANI exhibited a fast decrease of free-radical scavenging property when it is treated with above 200 °C temperature. Therefore it has been concluding that processing temperatures of PANI should be < 200 °C to attain higher antioxidant t property [88].

### 6.5. Anticorrosion properties

Although PANI has been studied as an important material for the formation of corrosion control coatings, it has been reported first in the 1980s, PANI has promising benefits in the protection of corrosion. PANI has been used for efficient protection of corrosion in stainless steel as well as proton exchange membrane fuel cells. In further studies, it was found that polyaniline sulfate coatings were more adequate than polyaniline  $\text{PO}_4^{-3}$  coatings for the prevention of stainless steel from the corrosion [89]. Similarly, polyaniline sulfamate coatings provided anodic prevention to the stainless steel substrate. The importance of polyaniline molybdate and PANI tungstate for the protection of steel from corrosion has also been demonstrated [90]. The potential-time curves which have been obtained by the electrochemical galvanostatic polymerization of aniline on low carbon steel in an aqueous solution of  $(\text{COOH})_2$  showed two distinct stages:

The electrochemical polymerization of aniline, the formation of polycrystalline Fe oxalate attachment and solubility of the surface of carbon steel. Electro-synthesized PANI coatings have also been used for the protection of Ni-coated mild steel from corrosion [91]. Polarization curves exhibit a little enhancement in the potential of corrosion for PANI-covered Al alloy (6061-T6) as compared with bare metal, it has been observed that no sufficient protection was obtained by PANI coating [92].

On the other hand, a reduction in Al harm because of the galvanic corrosion in aluminum-copper/PANI galvanic couples in environment of sea has been observed by Vera et al. 2010, it has been found due to the existence of PANI in the aluminum-copper system which is due to a decrease in the oxygen reduction reaction (ORR) rate. Electrochemical impedance spectroscopy (EIS) shows that the coating inhibition of Al alloys (AA 7075, AA 2024) covered with PANI which was synthesized in  $(\text{COOH})_2$  solution, and it shows resistance to more than  $10^6 \Omega \text{ cm}^2$  whereas the alloys coated with epoxy resin only then resistance value will be less than  $10^4 \Omega \text{ cm}^2$  [93]. It has been found that the resistance ability of PANI film on aluminum alloy (AA 7075) against corrosion has been enhanced from 70 to 90% by post-treatment in a solution of Ce salt. Distinguish in three different types of PANI/metal interfaces can be done by Kelvin Probe which was based on the daily exposure of PANI-covered metal to wet  $\text{N}_2$ , wet & dry air [94].

### 6.6. Charge-discharge properties

$\text{LiPF}_6$  doped PANI electro-sprayed onto aluminum foil by using the electrospinning technique and also has been used as cathode material for Li batteries at room temperature [95]. In this property, cells delivered high discharge capacity and approached towards the highest theoretical capacity, and this theoretical capacity will be decreased to 61% after completion of 50 cycles. Similarly, PANI polysulfide has also been used as a cathode material in high energy Li/S batteries [96]. In recent years, a lot of attention has been gained by rechargeable batteries which were based on PANI composite materials.

### 6.7. Capacitive properties

Supercapacitor devices and electrodes which have been formed by using PANI create a boundary between inorganic materials-based batteries and carbon-based supercapacitors (double-layer capacitors) and form units of intermediate energy. PANI has capacitive properties because in the bulk of PANI a fast redox reaction will take place which gives the capacitive response and shows superior specific energies than the double-layer capacitors. During the study of the capacitive property, it has been observed that PANI more conducting in nature and has a higher power capability than inorganic battery materials. However, the life of supercapacitors which is based on pure PANIs, is weak as compared to double-layer capacitors because of materials of PANI swell and contract during charging and discharging. Therefore, it has been

observed that sufficient progress has been found in the preparation of composites of PANI material, e.g., PANI/carbon nanotubes, PANI/graphene, etc., with excellent capacitive properties [97].

Kim et al. [98] synthesized the PANI thin films on flexible ITO/PET (indium tin oxide/polyethylene terephthalate) substrates employing the drop-casting method with varying the amount of PANI from 0.04 to 0.16 g. The morphology study shows a porous vermicular shape while the electrochemical supercapacitor properties were examined in a 0.5-M  $\text{LiClO}_4 + \text{PC}$  electrolyte. The PANI films with 0.08 g of PANI show higher current density and considerably higher specific capacitance and capacity retention vis-à-vis to compare with other PANI films. They concluded that the drop-casted 0.08 g PANI thin films could be used as a supercapacitor electrode to improve energy density, power, and stability. The effect of the amount of PANI also exhibited its excellent properties for supercapacitor applications.

### 6.8. Sensing properties

The conducting thin films of photo-responsive PANI have been synthesized for sensor applications [99]. An easy and adequate method for the measurement of ultra-trace amount of Hg and  $\text{CH}_3\text{-Hg}$  in fish tissues and water has been invented, by using a micro-column which was filled with PANI. The glassy carbon electrode was formed with the help of PANI coating has been utilized for the detection of  $\text{Pb}^{2+}$  and  $\text{Cd}^{2+}$  in  $\text{CH}_3\text{COO}^-$  buffer solutions by using square wave anodic stripping voltammetry [100]. PANI Langmuir-Blodgett film-modified glassy carbon electrode has been utilized for the determination of  $\text{Ag}^+$  ions in the voltammetric sensor for the determination of  $\text{Ag}^+$  ions [101].

PANI thin films can be used in sensors just because of its high surface area, and fast response time. These are used in the detection of many gases such as ammonia, LPG, CO, etc. In the gas detection process, PANI thin films are inserted vertically in the gas chamber, and observed changes are measured. It has been seen that absorbance on thin-film increases when gas is purged in the chamber, and it indicates the reaction between gaseous molecules and PANIs. An easy and low-cost Potentio-dynamic electrodeposition method has been employed by Mello et al. [102] to produce quality PANI thin films. They found that the electrodeposited PANI films have high sensitivity, linearity, and stability, and films could be a promising contender for commercial pH and biosensors.

Kumar and Yadav [103] have fabricated PANI thin films using spin coater and investigated with the exposure of humidity sensor. The minimum crystallite size of PANI was found to be 5 nm, and films have more porous, stable and sensitive and may be employed as a humidity sensor. Liu et al. [104] prepared PANI-TiO<sub>2</sub>-Au thin films by in-situ self-assembly method and findings demonstrated a higher response, better reversibility and faster response/recovery rates than those of PANI-TiO<sub>2</sub> based one which also possessed good repeatability, stability, selectivity and low detectable concentration (1 ppm) to  $\text{NH}_3$ . They also proposed a sensing mechanism model to enhance the sensing properties. They found that the prepared ternary film sensor could be an effective strategy for the development of room-temperature operation ammonia sensors with improved performance. Recently, this group also investigated the effect of CeO<sub>2</sub> nanoparticles on the performance of PANI based  $\text{NH}_3$ -sensing performances at room temperature [105]. The sensor showed an improved response, reduced recovery time, perfect response-concentration linearity, good reproducibility, splendid selectivity, remarkable long-term stability, ultra-low detectable concentration, and outstanding flexibility.

Khanikar and Singh [106] developed an intrinsic optical fiber pH sensor coated with PANI-polyvinyl alcohol (PVA) composite layer. The sensor was fabricated by substituting the polymer cladding of multi-mode fiber with pH-sensitive PANI-PVA layer and results demonstrated high sensitivity of 2.79  $\mu\text{W/pH}$  for 2–9 pH range. They also studied the impact of environmental temperature and ionic strength on the sensor

performance. Their investigation also revealed that the proposed sensor has excellent long term stability and durability. Santos et al. [107] fabricated PANI intercalated into the vanadium pentoxide ( $V_2O_5$ ) matrix and studied the behavior for an ammonia sensor.  $V_2O_5$ /PANI exhibited a sensorial response to different concentrations of ammonia gas which indicated that this hybrid material could be used in ammonia amperometric gas sensors for animal confinement buildings.

## 7. Conclusion

Several non-conventional polymerization methods have been used for the synthesis of PANI and extensively used by different dopant and oxidant. PANI has potential applications in various fields because of the special properties. Oxidative polymerization is the most common method for the synthesis of PANI thin films. Similarly, PANI thin films are synthesized by surface-initiated electro-polymerization, Langmuir–Blodgett technique, atmospheric pressure plasma polymerization technique, mSILAR, etc. ZnO, TiO<sub>2</sub>, V<sub>2</sub>O<sub>5</sub>, LiClO<sub>4</sub> & HCl doped PANI thin films also been studied in this review. Synthesized PANI thin films can be deposited on various substrates by chemical and physical methods. Chemical method is classified into three types: bulk oxidative chemical polymerization, surface-located polymerization and chemical vapor deposition. Likewise, the physical method basically deals with the mode of electrodeposition. These novel synthetic approaches allowed the PANI for showing different physicochemical properties and also allowed for better control over electrical conductivity, environmental stability, thermal stability, etc. Due to this nature of PANI it shows various properties like magnetic properties, electrical and dielectric properties, charge-discharge properties, redox properties, antioxidant properties, and anticorrosion properties, capacitive properties, sensing properties, etc. These properties of PANI make it useful in different fields for various applications. It has been found that the polyaniline sulfate coatings were more adequate than polyaniline PO<sub>4</sub><sup>-3</sup> coatings for the prevention of stainless steel from the corrosion. The drop-casted PANI thin films can be used as a supercapacitor electrode to improve energy density, power, and stability. PANI based NH<sub>3</sub>-sensors showed an improved response, reduced recovery time, perfect response-concentration linearity, good reproducibility, splendid selectivity, remarkable long-term stability, ultra-low detectable concentration, and outstanding flexibility.

# Postural Analysis Through RULA, REBA And QEC Of Vendors Selling Edible Items At Railway Stations And In The Trains

Iqbal Ahmed Khan, Rupak Kumar Deb

**Abstract:** An ergonomic study is conducted on postural analysis of the vendors selling edible items at various railway stations and in trains in Northern India. It has been observed that they attain a definite posture infinite number of times to perform a particular task for whole life. It depends upon the number of passengers whom they interact for selling edible products in the trains and at the railway stations. It has been observed that about 20-25 vendors are working at one railway station and +7000 railway stations in Indian railway network therefore at national level these are large in numbers. The RULA and REBA analysis are performed on the eight different vendors who were selling various types of eatable products at the railway stations and in the trains. The results of RULA analysis score is 100% score (7-high risk) was obtained for each vendor which indicates that there is a very high risk and further investigation is required on their working postures and implement change soon. On the other hand REBA analysis showed that 50% score (5- has medium risk, further investigate and change soon and remaining 50% score (8-9), pointed out that these postures have high risk, further investigate and implement change. The average of REBA score of all 8 vendors is 6.75 which showed that the working postures have high risk, further investigate and implement change soon. Further, QEC analysis also revealed that there is a high risk as per the assessment scores. Almost every vendor's shoulder score lies (31-40) which means high risk, also back score, wrist score and neck score showed high risk in QEC assessment scores. On the basis of results and succeeding discussions conclusions has been drawn.

**Index Terms:** WMSDs .RULA .REBA . QEC.

## I. INTRODUCTION

India has the largest train network in Asia. Daily 7000 trains including Gatimaan, Shatabdi, Super-Fast, Rajdhani, Duranti, Mails, Express, Passenger trains and special trains are plying at different routes. Train journey is considered to be safest, comfortable and economic journey and approximately one crore passengers used this facility on regular basis throughout the India. At the time of journey their eatable needs are different throughout the day. To cater passengers eatable needs vendors carry various eatable things/products such as tea, coffee, soup, cold drinks, water bottles, milk bottles, samosas, bread pakodas, chips, and other edible products. Further through observations it is

noticed that working postures of vendors during selling of items is awkward. Few vendors (Figure 1 & 2) holding the bucket of weight of 18-20 kg (water bottles, milk bottles, cold drinks etc.) at their forearm and moved in different Boggies of trains and at railway stations. Some vendors (Figure 3) carry breadpakodas, samosas etc. in the tray on their head. Also some vendors keep containers weight at their shoulder (right/left) (Figure 4, 5, 6 and 7). Apart for this few vendors (Figure 8) had the weight of the tray support through belt on his neck. Also tea/coffee vendors carry container on their either shoulder or hand. Besides this all the vendors shift the load when they feel tired to other part of the body. Through observations it is also noticed that they usually carry eatable/liquid items in different containers like Bucket, tub (square/round), tray etc. Also they carry load at their head, shoulder (right/left), on hands and sometimes through belt on the neck and give support by stomach and hands to the tray.

The activities of vendors are repetitive in nature which enhances the work related musculoskeletal disorders (WMSDs)/ RSI (repeated strain injury)/ CTD (cumulative trauma disorder).The vendors work is repetition in nature and have not sufficient time for body tissues to recover themselves to overcome the strain which is producing during working on body tissues might be effect discomfort, pain and prolonged working subsequently results of disability to them. Further, no doubt repetitive nature of work is the major and important parameter for WMSDs but apart from this other factors such as working conditions, environment factors, individual capabilities and habits play a significant role in WMSDs in human beings.

The literature re-examine showed that a lot of researches were conducted in the past e.g Alireza Choobineh et.al. [1] found that there was very high score of RULA (action level 3 & 4). This score could be minimized by designing ergonomic workplace to the workers of an Iranian communication company. Another study conducted by Yasser Labbafinejad et.al. [2] found a relationship between Low Back Pain (LBP) and education of workers in RULA scores. Also they found relationship between neck pain, age, gender, and working posture (mostly sitting/standing or alternating between the two). LBP, neck pain, awkward posture increased abstentism in the workers of the company. Further, J Nieves Serratos-Pereza et. al. [3] performed the investigation and ergonomic assessment in camshaft production operations.

Revised Manuscript Received on October 05, 2019

# Postural Analysis Through RULA, REBA And QEC Of Vendors Selling Edible Items At Railway Stations And In The Trains

The tasks performed by the workers are; i) managing the camshaft components i.e loading and unloading to and from the lathe machine, ii) camshaft mechanism visual inspection and test of fulfilment to the required parameters, iii) alteration of the machinery iv) setting the complete components in the containers. The REBA results showed that the 3 operations are at a very high risk, 14 classify as high risk, 14 were found as medium risk and 4 operations classified as small risk level. The body parts such as trunk, neck, arm and wrist were found at risk for WMSDs.

Keeping this in mind the present study is conducted to explore the health risk assessment of the vendors through their working postures, when they are selling edible items at platforms and in the trains. Their postures are recorded in videos and at a standstill taking photographs and these images are used for postural examination. The postural analysis tools Rapid Upper Limb Assessment (RULA), Rapid Entire Body Assessment (REBA), and Quick Exposure Check (QEC) are used to evaluate the risk assessment concerned in the functioning postures of the vendors.

## II. METHODOLOGY

The vendors working at railway stations and in the trains the following procedure is followed for postural analysis;

1. Filming (Video and still photography) the vendors' posture by Sony Camera
2. Take print of each vendors posture and measure the different angles of body parts as stated in RULA and REBA employee Assessment Worksheet (Table 1 and 2). Eventually, calculate the grand score of REBA and find out the associated risk through the Table 4.

3. The evaluation of this vendors' posture is to be carried out as per the procedure given in the RULA and REBA employee Assessment Worksheet. The outcome of the evaluation is **score** of RULA and REBA.
4. On the basis of these **scores** of RULA and REBA, determine the associated risk of posture of the vendor. This risk can be found in Table 3 & 4.
5. The similar analysis is to be carried for all the vendors' postures. The procedure of analysis for RULA, REBA and QEC is adopted from Iqbal Ahmed Khan and B.P Agarwal [4].

Further, The Rapid Upper Limb Assessment (RULA) employee assessment worksheet (Table 1) is used which was developed by McAtamney and Corlett [5] to compute the musculoskeletal risk caused by inactive tasks where upper body difficulty were high and work related upper extremity disorders are reported. The upper arm, lower arm, wrists, neck, trunk, legs postures are to be evaluated as procedure mentioned in Table 1. Finally, calculate the grand score of RULA and find out the associated risk through the Table 3. Similarly REBA (Rapid Entire Body Assessment) employee assessment worksheet (Table 2) is used, which was developed by Hignett.S. and Mc Atamney.L. [6] to give postural investigation of the worker for entire body activities i.e static and dynamic activities and give a REBA score.. The procedure of evaluation of posture is given in REBA employee assessment worksheet is to be followed for trunk, neck, and legs, upper and lower arms and wrists.

**Table 1: RULA Employee Assessment Worksheet**

**A. Arm and Wrist Analysis**

**Step 1: Locate Upper Arm Position:** +1, +2, +3, +4. Step 1a: Adjust... If shoulder is raised: +1. If upper arm is abducted: +1. If arm is supported or person is leaning: -1. Upper Arm Score.

**Step 2: Locate Lower Arm Position:** +1, +2. Step 2a: Adjust... If either arm is working across midline or out to side of body: Add +1. Lower Arm Score.

**Step 3: Locate Wrist Position:** +1, +2, +3, +4. Step 3a: Adjust... If wrist is bent from midline: Add +1. Wrist Twist Score.

**Step 4: Wrist Twist:** +1, +2. Wrist Score.

**Step 5: Look-up Posture Score in Table A:** Using values from steps 1-4 above, locate score in Table A.

**Step 6: Add Muscle Use Score:** If posture mainly static (i.e. held-10 minutes), Or if action repeated occurs 4x per minute: +1. If load < 4.4 lbs. (intermittent): +0. If load 4.4 to 22 lbs. (intermittent): +1. If load 4.4 to 22 lbs. (static or repeated): +2. If more than 22 lbs. or repeated or shocks: +3.

**Step 7: Add Force/Load Score:** +0, +1, +2, +3. Force / Load Score.

**Step 8: Find Row in Table C:** Add values from steps 5-7 to obtain Wrist and Arm Score. Find row in Table C.

**Table A: Wrist Score**

Upper Arm	Lower Arm	Wrist Twist	Wrist Twist	Wrist Twist	Wrist Twist
		1	2	3	4
1	1	1	2	2	2
1	2	2	2	2	3
1	3	2	3	3	3
1	4	2	3	3	3
2	1	2	3	3	3
2	2	3	3	3	3
2	3	3	3	3	4
2	4	3	4	4	4
3	1	3	4	4	4
3	2	4	4	4	4
3	3	4	4	4	5
3	4	4	4	4	5
4	1	4	4	4	5
4	2	4	4	4	5
4	3	4	4	5	5
4	4	4	4	5	5
5	1	5	5	5	6
5	2	5	5	5	6
5	3	5	5	6	6
5	4	5	5	6	6
6	1	6	6	6	7
6	2	6	6	6	7
6	3	6	6	7	7
6	4	6	6	7	7

**Table B: Neck, Trunk, Leg Score**

Neck	Trunk	Legs	Legs	Legs	Legs	Legs	Legs
Score	1	2	3	4	5	6	7
1	1	2	2	2	2	2	2
2	2	2	3	3	3	3	3
3	3	3	3	4	4	4	4
4	4	3	4	4	5	5	5
5	5	4	4	5	5	6	6
6	6	5	5	5	6	6	6
7	7	6	6	6	6	7	7
8	8	7	7	7	7	7	7

**Table C: Neck, Trunk, Leg Score**

Wrist / Arm Score	1	2	3	4	5	6	7
1	1	2	3	4	5	5	5
2	2	2	3	4	5	5	5
3	3	3	3	4	5	6	6
4	4	3	3	4	5	6	6
5	4	4	4	5	6	7	7
6	4	4	5	6	7	7	7
7	5	5	6	7	7	7	7
8	5	5	6	7	7	7	7

**Scoring: (Final score from Table C)**  
 1-2 = acceptable posture  
 3-4 = further investigation, change may be needed  
 5-6 = further investigation, change soon  
 7 = investigate and implement change

**B. Neck, Trunk and Leg Analysis**

**Step 9: Locate Neck Position:** +1, +2, +3, +4. Step 9a: Adjust... If neck is twisted: +1. If neck is side bending: +1. Neck Score.

**Step 10: Locate Trunk Position:** +1, +2, +3, +4. Step 10a: Adjust... If trunk is twisted: +1. If trunk is side bending: +1. Trunk Score.

**Step 11: Legs:** If legs and feet are supported: +1. If not: +2. Leg Score.

**Step 12: Look-up Posture Score in Table B:** Using values from steps 9-11 above, locate score in Table B.

**Step 13: Add Muscle Use Score:** If posture mainly static (i.e. held-10 minutes), Or if action repeated occurs 4x per minute: +1. If load < 4.4 lbs. (intermittent): +0. If load 4.4 to 22 lbs. (intermittent): +1. If load 4.4 to 22 lbs. (static or repeated): +2. If more than 22 lbs. or repeated or shocks: +3.

**Step 14: Add Force/Load Score:** +0, +1, +2, +3. Force / Load Score.

**Step 15: Find Column in Table C:** Add values from steps 12-14 to obtain Neck, Trunk and Leg Score. Find Column in Table C.

# Postural Analysis Through RULA, REBA And QEC Of Vendors Selling Edible Items At Railway Stations And In The Trains

**Figure 8: Vendor selling samosas with neck and stomach support in a container a at railway station**

# Postural Analysis Through RULA, REBA And QEC Of Vendors Selling Edible Items At Railway Stations And In The Trains

## III. RESULTS

**A. For Arm and Wrist Analysis:** Vendor's upper arm and wrist position (figure 1 and figure 2) are measured in angles. And the corresponding scores are obtained from Table 1.

**Step 1:** Position of Upper Arm

Upper Arm Angle ( $26^0$ ) Score = 2

**Step 2:** Position of Lower arm

Lower Arm Angle ( $46^0$ ) Score = 2

**Step 3:** Position of Wrist

Wrist Angle ( $10^0$ ) Score = 2

**Step 4:** Wrist Twist

Wrist Twist Score = 1

**Step 5:** Look up posture score in Table A; which exits in Table 1

Using values, from steps 1 to 4 above, position score in Table A, score = 4

**Step 6:** Add muscle score: It is repetitive, so score =1

**Step 7:** Add Force/Load Score: load > 4.4 lbs, so score =2

Add values from step 5 to 7  $4+ 1+ 2 = 7$

**Step 8:** Find Row in Table C which exits in Table 1

According to Table 1 (RULA Employee Assessment Worksheet), Steps 1-15 are given below;

**B. Neck, Trunk and Leg Analysis:**

**Step 9:** Neck Position

Neck Angle ( $24^0$ ) Score = 3

**Step 10:** Trunk Position

Trunk Angle ( $0^0$ ) Score = 1

**Step 11:** Legs Position

Leg Angle ( $0^0$ ), Leg score =2, Now find these scores of neck, trunk and leg in Table B of Table 1.

**Step 12:** Look up posture in Table B of Table 1, Score = 4

**Step 13:** Add muscle score: It is repetitive, score = 1

**Step 14:** Add Force/Load Score: load > 4.4 lbs, to 2.2 lbs score =2

**Step 15:** Find Column in Table C of Table 1

In Table C of Table 1, position the step 8 (score = 7) in row and step 15 (score =7) in column and obtained score 7. This "7" is the RULA score. Further RULA score =7, is used to see the information in Table 3. The information obtained from Table 3 is, very high risk, implement change now. The similar process is repeated for eight vendors. The results of eight vendors are presented in Table 5.

**Table.5: RULA Scores for different Vendors**

S.No.	Type of Vendors	RULA Score	Interpretation
Tea/ Coffee (Figure 7)			
1	Vendor 1	7	very high risk, implement change now
Samosas/Breadpakodas/ Kachodi (Figure 3, 4, 5 and 8)			
1	Vendor 2	7	very high risk, implement change now
2	Vendor 3	7	very high risk, implement change now
3	Vendor 4	7	very high risk, implement change now
4	Vendor 5	7	very high risk, implement change now
Cold Drinks/Water and Milk Bottles(Figure 1,2 and 6)			
1	Vendor 6	7	very high risk, implement change now
2	Vendor 7	7	very high risk, implement change now
3	Vendor 8	7	very high risk, implement change now

## IV. REBA INVESTIGATION

According to Table 2 (REBA Employee Assessment Worksheet), steps 1-13 are given below;

**Neck, Trunk and leg Analysis:** For neck, trunk and leg positions (figure1) are measured in angles. And the subsequent scores are obtained from Table 2;

**A. Neck, Trunk and leg Analysis**

**Step 1:** Position of Neck:

Angle ( $24^0$ ) Neck Score = 3

**Step 2:** Position of Trunk:

Angle ( $0^0$ ) Trunk Score = 1

**Step 3:** Legs position

Angle ( $0^0$ ), Leg Score = 2

**Step 4:** Look-up posture Score in Table: A of Table 2.

Using values from steps 1-3, Table: A of Table 2, **Score = 3**

**Step 5:** Load Score: Load > 22 lbs., score = 2

**Step 6:** Find row in Table C of Table 2. Score = 3 + 2 = 5

**B. Arm and Wrist Analysis:**

**Step 7:** Position of Upper Arm

Upper Arm ( $26^0$ ) Upper Arm Score = 2

**Step 8:** Position of Lower Arm

Lower Arm ( $46^0$ ) Lower Arm Score = 1

**Step 9:** Position of Wrist:

Wrist Angle ( $10^0$ ) Wrist Score = 2

**Step 10:** Look up posture score in Table B of Table 2.

Score = 2

**Step 11:** Add coupling Score: Score = 2

**Step 12:** Find Column in Table C of Table 2. Add values From

Step 10 to 11: Score = 2 + 2= 4

**Step 13:** Activity Score, Score = 1

REBA Score = Score in Table C of Table 2 + Activity Score.

## Postural Analysis Through RULA, REBA And QEC Of Vendors Selling Edible Items At Railway Stations And In The Trains

**REBA Score = 4 + 1= 5**

This REBA (score = 8) is seen in Table 4. The information obtained is, **Medium risk, further**

**investigation, change soon.** The similar process is repeated for eight vendors. The results of eight vendors are presented in Table 6.

**Table.6: REBA Scores for different Vendors**

S.No.	Type of Vendors	Figure No.	REBA Score	Interpretation
1	Vendor 1 Tea/Coffee	1	5	Intermediate risk, further investigate, modify soon
1	Vendor 2 Samosas/Breadpakodas/ Kachodi	2	8	High risk, investigate and implement change
2	Vendor 3	3	8	High risk, investigate and implement change
3	Vendor 4	4	5	Intermediate risk, further investigate, modify soon
4	Vendor 5	5	8	High risk, investigate and implement change
1	Vendor 6 Cold Drinks/ Water/Milk Bottles	6	6	Intermediate risk, further investigate, modify soon
2	Vendor 7	7	5	Intermediate risk, further investigate, modify soon
3	Vendor 8	8	9	High risk, investigate and implement change

### V. QUICK EXPOSURE CHECK (QEC)

Through QEC spectator evaluation sheet calculator (website <http://www.qec.freiz.com>) give all answers and obtained the results as shown in Table 7 & 8. QEC was developed by [7], it has two sections. The first section is related to the risk factors in developing WMSDs, i.e. profound manual handling, Repetitive and dynamic actions, uncomfortable static postures that arise from poorly designed workstations, tools, equipment, working methods. The other factors are back, shoulder/arm, wrist/hand and neck.

The second section involves the worker. Their responses are an important part of the evaluation. Care should be

taken that they respond the questions based on their understanding of performing the task. There are eight questions in this section pertaining to:

1. Maximum weight handled (this can be subjective, but should be verified with measurements of weights and forces)
2. Time spent on task
3. Maximum force level exerted by one hand (this can be subjective, but should be verified with measurements of forces)
4. Visual demand of the task
5. Vehicle use
6. Vibrating tools
7. Work pace
8. Stress level

**Table 7: Risk Assessment of QEC for vendors**

Risk evaluation	Low	Moderate	High	Very High
Back	10-20	21-30	31-40	41-56
Shoulder/Arm	10-20	21-30	31-40	41-56
Wrist/Hand	10-20	21-30	31-40	41-56
Neck	2-6	7-10	11-14	15-18
Stable Base	1	4	9	
Vibration	1	4	9	-
Work Pace	1	4	9	-
Environment	1	4	9	16

**Table.8: QEC Scores for different Vendors**

S.No	Type of Vendor	Figure No.	SCORES OF							
			Back	Shoulder /Arm	Wrist/ Hand	Neck	Driving	Vibration	Pace	Work Stress
1	Vendor 1 Tea/Coffee	1	32	40	42	16	1	1	4	9
	Samosas/ Breadpakodas									

## Postural Analysis Through RULA, REBA And QEC Of Vendors Selling Edible Items At Railway Stations And In The Trains

1	Vendor 2	2	32	42	38	16	1	1	9	9
2	Vendor 3	3	36	46	42	14	1	1	9	9
3	Vendor 4	4	32	28	38	16	1	1	9	4
4	Vendor 5	5	32	46	42	16	1	1	4	9
Cold Drinks/ Water Bottles										
1	Vendor 6	6	36	42	38	14	1	1	9	16
2	Vendor 7	7	36	38	42	14	1	1	9	9
3	Vendor 8	8	36	46	42	16	1	1	9	16

### VI. DISCUSSIONS

RULA score = 7, is obtained which designates, very high risk, implement change now. From the observations it is also obvious that vendors' neck, upper arm, lower arm and trunk are in several time 's bents and twist to take explicit postures for performing a specific task. These precise uncomfortable postures of the vendors are repetitive infinite number of periods all over the day and produces job related musculoskeletal disorders in their upper extremity. The RULA results are matching with the past researchers such as D. N. Agrawal et.al. [8] observed that due to constant kneeling posture of the workforce got fatigued repeatedly and musculoskeletal nuisance were identified in them. A study of Chowdury M. L. Rahman [9] had found that most of the workers exposed to the upper extremity discomfort due to the awful working postures. Also, RULA revealed that no posture is risk free for all the workers working in ceramic industry. Therefore, various means and ways should be devised to obtain desired level of output from the workers.

Further, REBA analysis of the vendors showed that their working postures were either medium or at high risks so further investigate their working postures and modify soon. It is obvious from the photographs of the vendors that their functioning posture is awkward and could be injurious to them, if it continues for long duration. Further, over a period of time their age will also increases. Eventually working postures, ageing, work demand and their capability, needs extra efforts to complete the task successfully. Numerous studies were conducted in the past such as a study conducted

by Karthikeyan Mathesan et. al. [10] results of RULA and REBA were high (REBA 53.33% and RULA 85.71%) in manual feeding of workpieces by the operators during drilling operation has maximum risk for the operators. Therefore, the ergonomic aspects have to be considered for designing drilling workstation.

Farahnaz Abdollahzade et. al. [11] studied on room nurses and found a high score of REBA analysis which reflects urgent need to change the working postures of the nurses. Also they found in univariate analysis strong relationship between working posture and age, gender and regular daily exercise, work experience and number of shifts per month. QEC results (Table 7 and 8) also showed that back, shoulder/arm, wrist/hand, neck and work pace scores are high. These factors scores are high might be due to train

vendors carry food articles on their shoulders, arms and at head and also often bent their neck again and again to provide the food articles to the passengers by keeping bucket on the floor of the train or at railway stations due to weight of the bucket. Obviously when vendors repeated this posture in several times faces the pain in different body parts (at back, neck or shoulder etc.) which is the result of the working postures of the vendors. The QEC results are matching with the past researches such as Emre Ozgur Bulduk et. al. [12] QEC scores of 382 taxi drivers were establish very high risks for the shoulder/arm, wrist/hand and neck, whereas the scores for the back were found to be high for static use and moderate for moving. The results also showed that the work-related risk factors for WMSDs were connected with constrained postures, repetitive actions, vibration, work related stress. Essential ergonomic interventions are needed to reduce risk of exposures to WMSDs in taxi drivers.

### VII. CONCLUSIONS AND FUTURE SCOPE

The present working postures of vendors are not appropriate so redesign the postures of the vendors considering ergonomic principles to reduce the WMSDs. Also, when they induct in this profession they have to aware about the posture affects in their life.

In each bogie install a machine/fix a place from where passengers purchase edible items from the vendors.

Further, work should be done on their postures to verify the present work by other postural analysis tools to reduce the WMSDs.

## IQBAL AHMED KHAN

He received his Ph.D. in Mechanical Engineering (Ergonomics) in 2007, from Jamia Millia Islamia, New-Delhi. He did M. Tech. in (Industrial and Production Engineering) in 2000, from Aligarh Muslim University, Aligarh, U.P., and B. E. (Mechanical Engineering) in 1995, from Jamia Millia Islamia, New-Delhi.

He has more than 21 years of teaching and administrative experience of different reputed

Institutes such as Galgotias University, Krishna Engineering College, Greater Noida Institute of Technology, Manav Rachna College of Engineering etc. Presently he is working as a Prof. & Head in Department of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana.

His major research interest includes evaluation and improvement of performance of industrial workers, evaluation and improvement of human working conditions, ergonomic design of tools and equipment, and Human-Computer-Interaction (Environmental Ergonomics). He had published 26 research papers in International and National Journals and also guided the students in projects and dissertations at UG and PG levels.

## RUPAK KUMAR DEB

He is pursuing his Ph.D, from Lingaya's Vidyapeeth, Faridabad, Haryana. He did M. Tech. in (Mechanical - Design) in 2005, and B. E. (Mechanical Engineering) in 1995, from Assam Engineering College under Gauhati University, Assam. He has 22 years of teaching and 3.5 years of Industrial experience. During his working in industry he has redesigned machines of Cutter and

Xylo apart from handling manpower and shut down maintenance works of Paper industry During his academic carrier he has guided B.Tech and M.Tech level projects and was the faculty Incharge of SAE and Smart India Hacathon student project on national and international competitions. He has published several papers in several reputed International and National Journals and International/National Conferences. One of his

# Effect on Material Removal Rate and Surface Finish in ECM Process When Machining Stainless Steel-316 with Cu Electrode

Iqbal Ahmed Khan, Megha Rani, Rupak Kumar Deb, B R Bundel

**Abstract:** Electrochemical Machining process is one of the popular non-traditional machining processes which is used to machine materials such as super alloys, Ti-alloys, stainless steel etc. Its working principle is based upon Faraday law of electrolysis. The aim of the present work is to optimize the ECM process parameters with the combination of SS 316 (job material) and Copper electrode (tool material). To explore the effect of ECM process parameters such as electrolyte concentration, voltage and current, feed rate on MRR and surface finish (Ra) of the job, total 27 experiments were conducted as per experimental scheme. The results of these experiments revealed that increase in electrolyte concentration decrease the mrr and surface roughness initially increases then decreases. Further, increase in current increases mrr initially and then decreases, surface roughness also increases. It is also noticed that increase in Feed rate mrr decreases and then increases, also surface roughness decreases then increases. Through RSM analysis it is found that the optimum conditions for maximum MRR, and minimum Surface roughness (Ra) is electrolyte concentration 150gm/lit, Voltage 13.5 V & feed 0.8 mm/min. The findings are discussed in the light of previous researches and subsequently conclusions are drawn.

**Keywords:** Electrochemical machining (ECM), Material removal rate (MRR), Surface roughness (Ra), Electrolyte concentration

## I. INTRODUCTION

Electro-chemical Machining (ECM) is a nontraditional machining process which is used for machining materials which are difficult to machine by traditional machining processes such as alloy steel, Ti alloys, super alloys and stainless steel etc. Literature review revealed that many studies were conducted in the past by various researchers to evaluate the effect of ECM process parameters such as electrolyte concentration, current and voltage, surface finish, material removal rate (MRR), tool and workpiece gap current and voltage etc. for its optimization with different materials. ECM is a non-contact type machining process, and it gives exact replica of the tool, a cavity in the job material. In this machining process [1] and [2] a very high current is passed among the job (anode) and the tool (cathode) through a electrolyte and a cavity (as the shape of the tool) is obtained in the workpiece. EDM has been found to be a better for smaller batch sizes whereas ECM is more suitable for large scale production [3].

Revised Manuscript Received on November 15, 2019

Iqbal Ahmed Khan, M.Tech Student, Department of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana, India

E-mail: [khaniqbalahmed@yahoo.com](mailto:khaniqbalahmed@yahoo.com)

Megha Rani, M.Tech Student, Department of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana, India

Rupak Kumar Deb, Department of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana, India

B R Bundel, Department of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana, India

One of the researchers, Neto J., et. al. [4] results showed that feed rate is the important factor which affects the material removal rate. In ECM process,  $\text{NaNO}_3$  showed the good results on surface roughness and overcut. Also it had been observed that material removal rate increases with increase in tool feed rate because of the decrease in machining time. Further, Sodium Chloride had better machining results on MRR than Sodium Nitrate as NaCl solution is a non-passivated electrolyte and has constant current efficiency. In another research, Milan Kumar Dasa, et.al. [5] ANOVA results revealed that the electrolyte concentration has the maximum influence on metal removal rate and surface roughness characteristics. Further, P. Rodriguez et. al. [6] observed that when current intensity is increases, it directly affects the material removal rate and as material removal rate is increases surface finish on the other hand decreases in the ECM process. Therefore there should be a balance in between material removal rate and the surface finish.

Also Kai Egashira et.al. [7] suggested that a semi-cylindrical tool electrode, long pulse width, high pulse frequency, high low-level voltage, and high electrolyte concentration were preferable for high-speed drilling without widening the lateral gap between the tool electrode and hole. Ming-Chang Jeng et al. [8] showed that the material removal rate & current efficiency increases with carbon content. Also the quenched microstructure and the tempered microstructure have a greater removal rate and current efficiency than those of annealed microstructures, work-piece machined at a working pressure of  $3\text{-}4 \text{ kg/cm}^2$  has the greatest removal rate and current efficiency, and the roughness of the machined surface of the annealed microstructure is greater than those of the quenched and tempered steels.

Another study of Joao Cirilo da Silva et.al. [9] concluded that resistance offered by electrolyte arrangement decreases stridently with increasing current densities, and at the same time the over-voltage of framework first increases and then achieves a saturation value with increasing current densities. In any job the primary requirement is surface finish of the job, a study was conducted by the Keeping this in mind the present experimental work is focused on "Optimization of ECM process parameters for maximum material removal rate (MRR), and minimum surface roughness (Ra) for the stainless steel (SS-316) as a job material and a Copper (Cu) electrode as a tool material.

**II. EXPERIMENTAL SET UP**

For experimental work these constituents are required;

- Work Piece (SS 316)
- ECM Machine
- Electrolyte

- Electrode
- Weighing Machine
- Surface Roughness Tester

The detail information all of the above mentioned components are given below.

**2.1 Specifications of SS 316:**

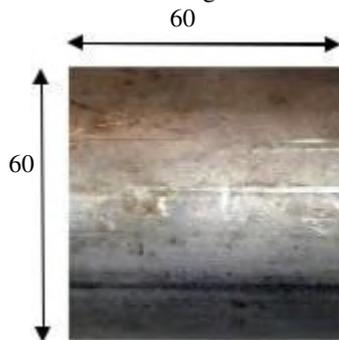

**Table 1: Composition Specification (%) for SS 316**

Grade	C	Si	P	S	Mn	Cr	Ni	N	Mo
Min.	-	-	-	-	-	16	10	-	2.0
SS 316									
Max.	0.08	0.75	0.045	0.030	2.0	18.0	14	0.10	3.0

**Table 2: Mechanical Properties of SS 316**

Grade	Tensile	Strength	Yield Strength 0.2%	Elongation %	Hardness	
	(MPa) Minimum	proof (MPa) Min	(in 50 mm) min.	Rockwell B (HR B) max	Brinell (HB) max	
SS 316		515	205	40	95	217

Four Stainless Steel (SS 316) workpieces are having dimensions of 60 mm x 60 mm x 5 mm, weighing 0.153 Kg each are used for machining. In SS 316 workpieces, 16 cavities are made as shown in Figure 7.

**Figure 1: Work Piece**

**2.2 ECM MACHINE**

ECM machine specifications are as follows;

Tool area – 259.8 mm<sup>2</sup> Cross head stroke - 150 mm, Job holder - 100 mm opening x 50 mm depth x 100 mm width. Tool feed motor - DC Servo type. AC Three phase power supply of - 415 V +/- 10%V, 50 Hz

The machining on SS 316 workpieces are to be carried out on ECM set up as shown in Figure 2. It mainly consists of electro-mechanical assembly, servo automated system for the tool vertical upward and downward motion, an electrolyte supply system, machining chamber with crystal clear window and, vice for holding the job.

**Figure 2: ECM set up Metatech Industries, Pune**

**Figure 3: ECM Control Panel**

### 2.3 ELECTROCHEMICAL MACHINE CONTROL PANEL

The Control panel (Figure 3) is used for adjustment of voltage (V), current (C), feed rate (F) and time (T) during machining of the SS jobs. The specifications of control panel are as follows;

- Electrical Output Rating: 0-300 Amperes. DC from 0-20 V.
- Efficiency: Better than 80% at partial & full load condition.
- Operation Modes - Manual/Automatic.

- Tool Feed - 0.2 to 2 mm / min.
- Supply - 415 V +/- 10%, 3 $\phi$  AC, 50 Hz.

### 2.4 ELECTROLYTE CIRCULATION SYSTEM

The pumping of electrolyte (Figure 4) is done from a tank through a pump. The used electrolyte returns to the tank. The hydroxide sludge produced will settle down at the base of the tank and further drained out. Also electrolyte supply is controlled by flow control valve. For experiments we have taken 100 gm, 125 gm and 150 gm of salt sample in 1000 ml of water at room temperature.

Figure 4: Electrolyte chamber

Figure 5: Circular cross section of the copper tool

### 2.6 ELECTRODE OR TOOL

For machining of SS 316 jobs, copper tool (Figure 5) is used having a length of 50 mm with diameter 21mm.

Figure 6: Digital weight balance ( Model: DJ 300S)

### 2.7 WEIGHING MACHINE

The material removal rate of each job has been found out by electronic weighing machine (figure 6). Initial weight and after machining of the SS jobs were measured by weighing machine by taking care of jobs i.e. all jobs must be free from water, chips etc. This weighing machine weight up to 300g with an accuracy of 0.001 g.

### 2.8 SURFACE ROUGHNESS TESTER

A moveable type surface roughness tester (Make: Taylor Hobson, Model: Surtronic,) as shown in figure 7, has been used for measurement of surface roughness (Ra) of the machined SS 316 jobs. The readings are taken at three points on the surface and take average value of it.

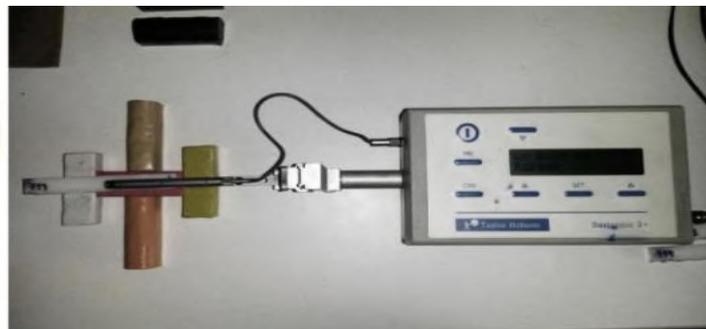

Figure 7: Surface Roughness Tester

### 2.9 PROCEDURE FOR THE EXPERIMENT

Following steps are involved in machining of workpiece and completion of experiment:

- Weigh the initial weight ( $W_{bm}$ ) of work piece.
- Place the job in ECM Machine
- Fix the Cu electrode in ECM tool holder
- Now Copper Tool is brought near to the SS 316 job and maintains a particular gap with the help of press buttons which are provided in the control panel.
- Fill the electrolyte solution in Tanks and run the pump
- Start the ECM machine through push button and set the process parameters like tool feed rate, voltage and electrolyte concentration.

# Effect on Material Removal Rate and Surface Finish in ECM Process When Machining Stainless Steel-316 with Cu Electrode

- g. The procedure is happening in the existence of an electrolyte flow, filling the gap between anode (job) and cathode (tool). Electrolyte flow is adjusted by flow control valve.
- h. After completion of ECM on a job (after 10 minutes) a beep sound is produced. And stop the Machine.
- i. After electrochemical machining on the SS 316 job note down the weight ( $W_{am}$ ) of the workpiece.
- j. Calculate MRR for the experiment.
- k. Calculate the SR with help of surface roughness tester
- l. Repeat all above steps **from a. to k.** for taking experimental values Output (i.e. MRR & SR) & varying Inputs (i.e. Electrolytic concentration, Voltage and Feed Rate) on the remaining 15 experiments

## 2.10 INPUT VARIABLES

**Table 3: Electrochemical Machining variables and their levels**

Machining Parameter	Unit	Level 1	Level 2	Level 3
Voltage (V)	Volt	10	13.5	17
Feed rate (F)	mm/min	0.4	0.6	0.8
Concentration (C)	gm/lit	100	125	150

## 2.11 RESPONSE SURFACE METHODOLOGY (RSM)

Response Surface Methodology (RSM) is used Central Composite Design (CCD) with three variables yield a total of 27 runs in seven blocks, where the cardinal points used are; 8 cube points, 6 axial points and 6 center points [Minitab16, 2011]. Electrolyte concentration, voltage and feed rate were the three experimental factors capable of influencing the process responses, namely, MRR, SR. Hence, these factors were considered for exploration.

To find out the effect of input variables on the output response, the Equation for output (y) is as follows;

$$Y = f(x_1, x_2) + e$$

The input variables  $x_1$  and  $x_2$  are independent variables and,  $y$  is the dependent variable. Also the experimental error term, denoted as  $e$ , which represents any measurement error

on the output variable. Let the output is a linear function of independent variables, then the approximating function is a first-order model. A first-order model with two independent variables is;  $y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \epsilon$

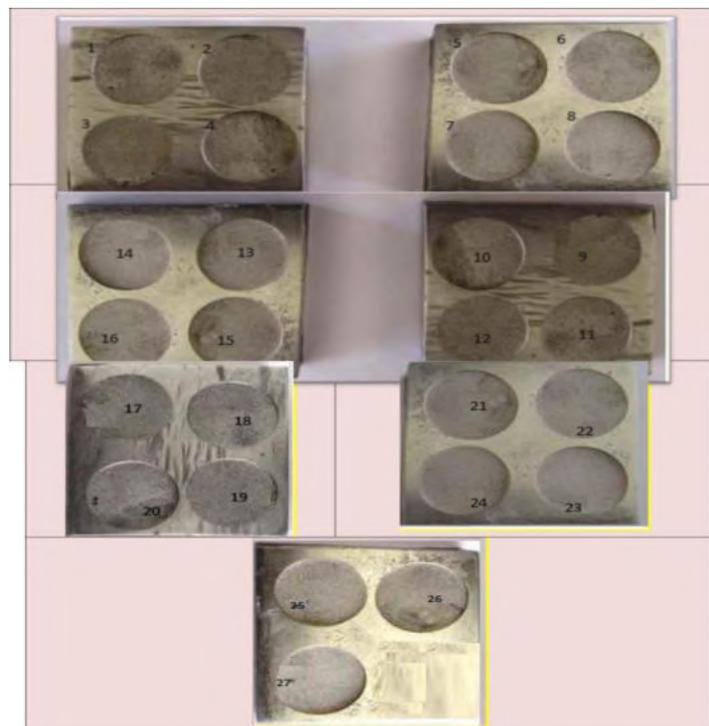

Further, if there is a curvature in the response surface, then a higher degree polynomial with two variables is called a second-order model;  $y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_{11} x_1^2 + \beta_{22} x_2^2 + \beta_{12} x_1 x_2 + \epsilon$

$X$   $n^2$  - square terms of parameters

$x_1 x_2$  - interaction terms of parameters  $\beta_0 \beta_1 \beta_2$  - unknown regression coefficients and  $\epsilon$  - Error

## III. RESULTS AND ANALYSIS

Figure 8, depicts the 27 number runs on SS 316 jobs after electrochemical machining.

**Figure 7: Work piece (SS 316) after machining**

After experimental work results are obtained, which are shown in Table 4

Table 4: Experimental outcomes for 27 runs

Std Order	Concentration ( gm/liter )	Voltage ( volts )	Feed ( mm/min)	MRR (mm <sup>3</sup> /min)	Ra (μm)
1	100	10	0.4	12.25	2.22
2	100	10	0.6	7.66	2.16
3	100	10	0.8	9.19	2.18

27	150	17	0.8	6.08	3.22

#### IV. EXPERIMENTAL ANALYSIS

##### 4.1 Effect on Material Removal Rate

The machinability of ECM process depends on the electrolyte concentration, feed rate and voltage. The influence of various machining parameters on material removal rate (means) are revealed in figure 9 (a) (b) (c). The important and major finding is material removal rate is gradually decreases (Figure 9a) with increase in electrolyte concentration. This might be due to there is no increase in electrolyte flow as a consequence the material which is already removed cannot be dislocated taken away from the machining area. So eventually mrr is decreased with increase in the electrolyte concentration.

This finding is not in line with the past researches such as studies [10, 11] concluded that the increase in electrolyte concentration and its flow rate, increases mrr. This is occur because of when we increase in electrolyte flow rate, the reaction products (small chips) in between Inter-electrode gap (IEG) removes at faster rate with electrolyte concentration and also fresh electrolyte flow in between IEG, which increases the conductivity of the electrolyte.

Therefore in the future more work has to be done specifically in combination with SS316 and Cu as tool material.

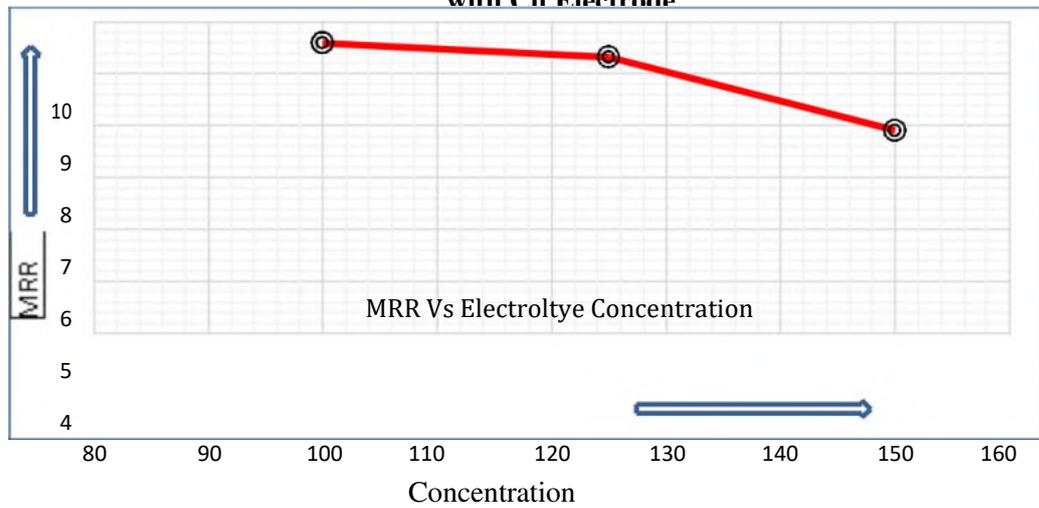

Figure 9 (a): Effect of Electrolytic Concentration on MRR (data means)

Further, Figure 8(b) showed that the material removal rate increases noticeably with increase in voltage in the range of 10 to 13.5 V and, then further decreases from 13.5 to 17 V. A similar study of Mukherjee et. al . [12]

observed that resistance of the electrolyte solution decreased rapidly with increase in current. Further, initially, the over-voltage of the system increases and attains a saturation value with increasing current densities.

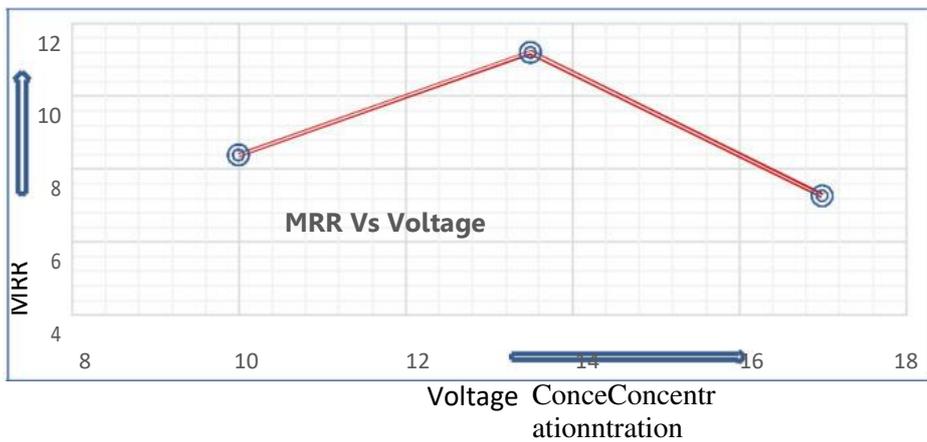

Figure 9 (b): Effect of Voltage on MRR (data means)

Also Figure 9 (c) revealed that the MRR decreases linearly with increases in feed rate in the range of 0.4 to

0.6, and then further increases considerably in the range of 0.6 to 0.8

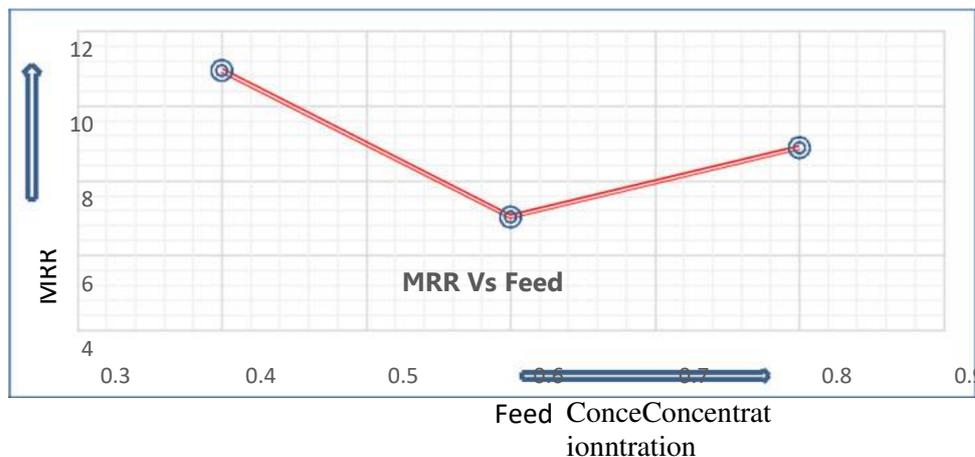

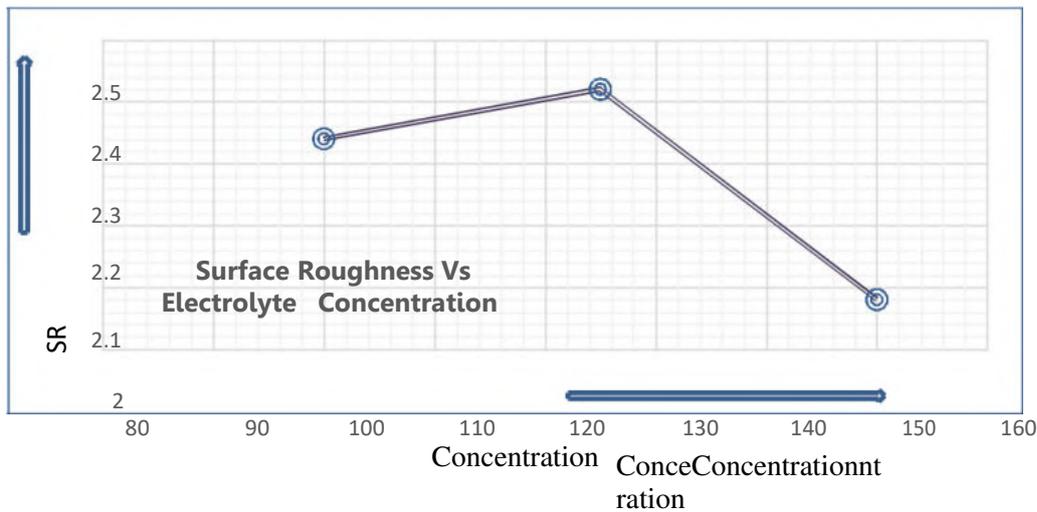

Figure 9 (c): Effect of Feed on MRR (data means)

#### 4.2 EFFECT ON SURFACE ROUGHNESS (Ra)

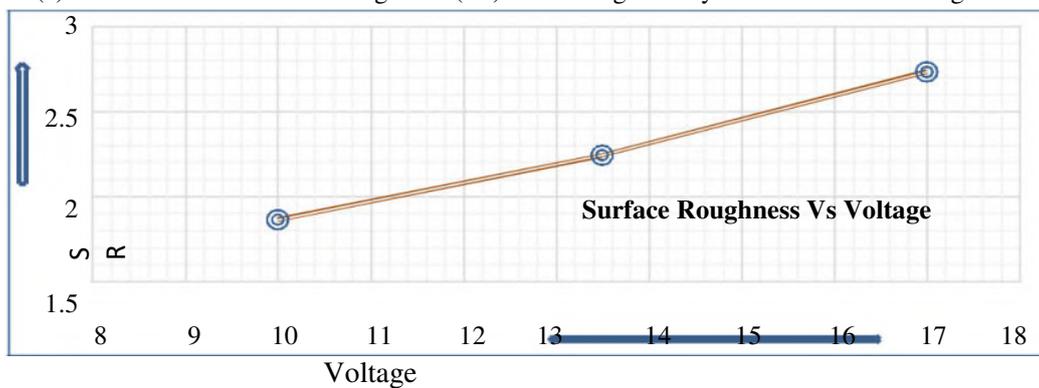

The influences of Surface Roughness (data means) Vs electrolyte concentration, surface roughness Vs voltage and surface roughness Vs feed are depicted in figure 10 (a) (b) (c). The figure 10 (a) showed that the Surface

Roughness, has slightly increased with increase in electrolyte concentration (NaCl) in the range of 100 to 125 gm and then decreased significantly in range of 125 to 150gm. This might be due to the higher electrolyte concentration; generations of machined products are more, which changes the property of electrolyte and leads to the higher surface roughness. [14].

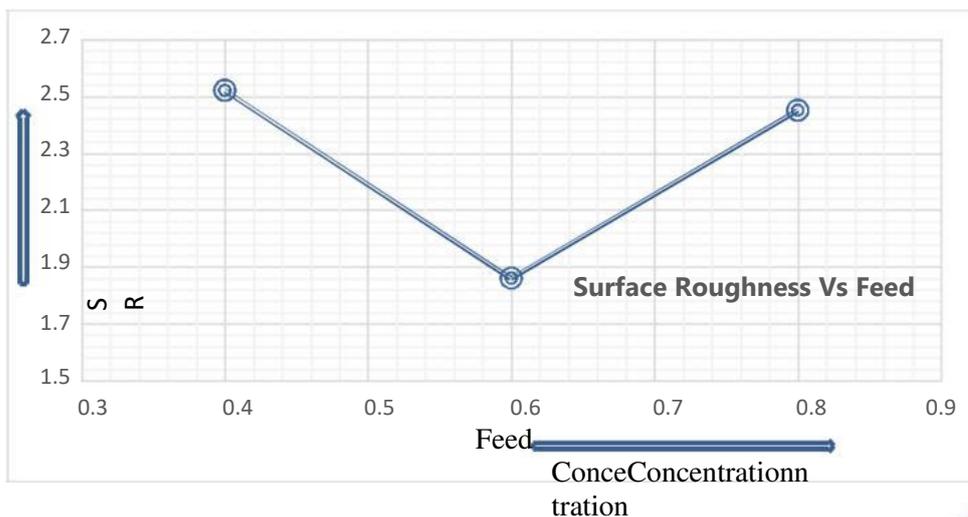

**Figure 10(a): Effect of Electrolytic Concentration on SR (data means)**

Further, Figure 9 (e) revealed that the surface roughness (Ra) increases gradually with increase in voltage.

**Figure 10 (b): Effect of Voltage on SR (data means)**

Also figure 10(c) depicted that the surface roughness (Ra) decreases with increase in feed rate in the range 0.4 to 0.6 and then increases in the range of 0.6 to 0.8.

**Figure 10 (c): Effect of Feed rate on Surface Roughness (data means)**

### 4.3 DETERMINATION OF OPTIMUM SOLUTION

By combining all the objectives, we obtained a multi-objective optimization relation,  $Min.(Z1) = W1 Z_{sr} / SR_{min} - W2 Z_{mrr} / MRR_{min}$

The optimum conditions for maximum MRR, and minimum Surface Roughness (Ra) is:

Electrolyte concentration 150gm/lit, Voltage 13.5 V & feed 0.8 mm/min

### V. CONCLUSIONS

The following conclusions have been drawn on the basis of results and discussions;

- 1) The optimum condition for **maximum material removal rate** is electrolyte concentration 100 gm/liter, voltage 13.5 volts and, feed rate 0.4 mm/rate.
- 2) The optimum condition for **minimum surface roughness** is electrolyte concentration 150 gm/liter, voltage 13.5 volts and feed is 0.6 mm/min.

The Feed rate, voltage, electrolyte concentration and its flow rate effects maximum material removal rate, and minimum surface roughness parameters.

- 3) The Feed rate, voltage, electrolyte concentration and its flow rate effects maximum material removal rate, and minimum surface roughness parameters.

The following conclusions have been drawn on the basis of results and discussions;

- 4) The optimum condition for maximum material removal rate is electrolyte concentration 100 gm/liter, voltage 13.5 volts and, feed rate 0.4 mm/rate.
- 5) The optimum condition for minimum surface roughness is electrolyte concentration 150 gm/liter, voltage 13.5 volts and feed 0.6 mm/min.

The Feed rate, voltage, electrolyte concentration and its flow rate effects maximum material removal rate, and minimum surface roughness parameters.

### AUTHRS PROFILE

**Iqbal Ahmed Khan**, He Received His Ph.D. In Mechanical Engineering (Ergonomics) In 2007, From Jamia Millia Islamia, New-Delhi. He Did M. Tech. In (Industrial And Production Engineering) In 2000, From Aligarh Muslim University, Aligarh, U.P., And B. E. (Mechanical Engineering) In 1995, From Jamia Millia Islamia, New-Delhi. He has more than 21 years of teaching and

administrative experience of different reputed Institutes such as Galgotias University, Krishna Engineering College, Greater Noida Institute of Technology, Manav Rachna College of Engineering etc. Presently he is working as a Prof. & Head in Department of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana. His major research interest includes evaluation and improvement of performance of industrial workers, evaluation and improvement of human working conditions, ergonomic design of tools and equipment, and Human-Computer-Interaction (Environmental Ergonomics). He had published 26 research papers in International and National Journals and also guided the students in projects and dissertations at UG and PG levels.

**Megha Rani** She Received Her Master Degree In Mechanical Engineering (Production Engineering) In 2019, From Lingaya's University, Faridabad And B. Tech. (Mechanical Engineering) In 2010, From Kumaun Engineering College (Now Bipin Tripathi Kumaun Institute Of Tech) Dwarahat. She Has 3<sup>+</sup>

Years Post Bachelor Experience In Education And Industry Sector And Currently Appointed As Assistant Professor In School Of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad.

**RUPAK KUMAR DEB**, He is pursuing his Ph.D, from Lingaya's Vidyapeeth, Faridabad, Haryana. He did M. Tech. in (Mechanical - Design) in 2005, and B.E. (Mechanical Engineering) in 1995, from Assam Engineering College under Gauhati University, Assam. He has 22 years of teaching and 3.5 years of Industrial experience. During his working in industry he has redesigned machines of Cutter and

Xylo apart from handling manpower and shut down maintenance works of Paper industry. During his academic carrier he has guided B.Tech and M.Tech level projects and was the faculty Incharge of SAE and Smart India Hacathon student project on national and international competitions. He has published several papers in several reputed International and National Journals and International/National Conferences. One of his patent named "Saksham Catalytic Converter" (2013) has already been published in Journal of patent by Govt. of India.

**BHARAT RAJ BUNDEL**, He received his Ph.D. in Mechanical Engineering in 2017, from Shri Jagdishprasad Jhabarmal Tibrewala University (JJTU), Rajasthan. He did M. Tech. (Manufacturing Technology & Automation) in 2010, from M D University, Rohtak, Haryana and B. E. (Production & Industrial Engineering) in 2002, from Govt. Engineering College, Kota, Rajasthan. He has 15 years of teaching and administrative

experience. Presently he is working as a Professor in the Department of Mechanical Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana. His research area includes analysis of Experimental work and intellectual property of manpower, students of the new generation. Enrichment of practical work and analysis of working parameters such as tools and equipment as well as manpower. Study and optimization of parameters for various machine tools and equipment, etc. He had published 11 research papers in International and National Journals and also guided the students in projects and dissertations at UG and PG levels.

## ABSTRACT

Herein, we report the use of Multi Wall Carbon Nano Tubes (MWCNTs) as nano-compatibilizers based on their astonishing mechanical properties and ease of processing. To fabricate laminate samples, pure MWCNTs were homogeneously dispersed in the fiber-reinforced plastic (FRP) composite with 0, 0.5, 1 and 1.5 wt. % loading. The laminates were prepared with eight plies ( $4.0 \pm 0.1$  mm thickness) using the hand layup technique assisted by the compression moulding method. It was found that the tensile, compressive and inter-laminar shear strength (ILSS) increase by 103.81%, 139.78% and 36.06%, respectively corresponding to 1 wt. % loading of MWCNTs as compared to neat GFRP specimen. However, a rapid decrease in strength beyond 1 wt. % loading of MWCNTs has been noted. Interestingly, the maximum of the tensile strength was higher than that of the compressive strength, and the maximum of the tensile modulus was larger than that of the compressive modulus in the case of 1 wt. % loading of MWCNTs. It was observed that after a certain loading, the mechanical properties of such laminates can only reach the best value with an optimum loading of MWCNTs. In addition, the micromechanical failure modes and effect of MWCNTs loading on internal morphologies of the composites were also intensively explored with the help of Field Emission Scanning Electron Microscopic (FESEM) analysis.

## 1. Introduction

In the past few decades, nanocomposites have become interesting for different applications, particularly to improve the mechanical properties of polymeric materials using nanoparticles (as nanofillers). These nanofillers may be graphene [1], chopped carbon fibers [2], nanoclay, CNTs and their derivatives [3]. Depending on the nature, these nanomaterials have capabilities to influence the mechanical, thermal and electrical properties of the produced nanocomposites. Several recent investigations have proved the applicability of CNTs based composites in many fields, especially for lightweight and high-performance structures in aerospace industry and as coating materials in the maritime and chemical industries [4]. The astonishing properties of CNTs in mechanical (axial Young modulus of 1–5 TPa [5], stiffness,

strength [6], flexibility [7], fracture toughness [8]) and physical (high thermal conductivity, electrical conductivity [3,9], semi-conducting behavior [10]) aspects, have been continuously studied and published. The large surface area of nanotubes can act as an interface and bridging agent for uniform load transfer, but an extreme agglomeration of CNTs is caused due to strong attractive forces between CNTs. Such aggregation always demises the properties of nanocomposites mainly in the case of polymer composites [11]. The specific surface area of the CNTs is dependent on the number of sidewalls and the diameter of the tubes themselves, therefore single-wall CNTs (SWCNTs) have the largest surface area as compared to the double-wall CNTs (DWCNTs) and multiwall CNTs (MWCNTs). Their dispersibility, however, is quite low and the load transfer is difficult as already discussed elsewhere [12].

In this line, we have used the MWCNTs because of their ease of bulk production, low cost per unit and high thermal, chemical stability. Such CNTs based nano-composites have been under intensive study using different matrix materials, including metals

[13,14], ceramics [15,16], polymers [17] and so on. Moreover, CNTs are being used as a secondary reinforcement in FRP composites to enhance their properties beyond the natural limit, even though there are certain challenges for developing an efficient and considerably tough three-phase glass/epoxy/MWCNT nanocomposites. These challenges are (i) a standardized and homogeneous distribution of CNTs in the two-phase glass/epoxy composites, (ii) the proper interfacial bonding between the filler and the matrices which affect the uniform load transfer from the matrix to the reinforcement, and (iii) the tedious functionalization of CNTs. To minimize these three-shortcoming, numerous efforts have been made and each procedure has its own advantages and disadvantages [15,16]. Furthermore, three foremost mechanisms have been taken to explain the load transfer from the matrix to the filler and vice-versa, including: (i) mechanical interlocking, (ii) covalent and non-covalent bonding between the matrix and the CNTs, (iii) Van der Waals interaction between CNTs/glass and epoxy composites. In the case of MWCNTs, the first one is very problematic owing to the smooth surface of CNTs and the second one cannot be guaranteed due to the low friction and the only reason left is addressed for the load transfer [18]. To explore these issues, Liu *et al.* [19] studied the tensile modulus and the yield strength by dispersing 2 wt. % of MWCNTs in a nylon-6 matrix and found an increase in values around 214% and 162%, respectively. They proved that all three-mechanisms mentioned above are applicable for MWCNTs to explain the outstanding mechanical properties of MWCNT-Nylo-6 composites. Grimmer *et al.* [20] examined and found that the incorporation of small volume fractions of MWCNTs to the glass-fiber composites greatly diminishes the cyclic delamination crack propagation rates. Schadler *et al.* [18] studied the load transfer in MWCNT-epoxy composites and found that there is a large scatter in the compression modulus, they also reported exceptional trend in tensile modulus and the maximum value of compression modulus is larger than that of the tensile modulus. Allaoui *et al.* [21] considered the mechanical and electrical properties of MWCNT/epoxy composites and found that the Young's modulus is doubled, and the yield strength is quadrupled at 1 and 4 wt. % loading of MWCNTs, respectively.

In this work, we tried to modify the brittle nature of the bi-directionally woven glass fiber composite by adding MWCNTs as a secondary reinforcement and as a nano-compatible. The tensile, compressive and inter-laminar behaviors are investigated; the modulus of tension and compression forces are compared; the fracture analysis is explored; and the morphological properties are discussed considering different loadings of MWCNTs. Nevertheless, this paper proposed an optimum loading percentage to exploit the mechanical properties of the GFRP composites using MWCNTs, which is the novelty of the paper.

## 2. Synthesis and characterization

The arc-discharge method for the bulk production of high quality MWCNTs developed by Iijima *et al.* [22] is well known and herein, we have adopted the same procedure for the MWCNTs synthesis and their surface modification as reported by Singh *et al.* [23]. To confirm the functionalization of the as-prepared MWCNTs, Raman and FTIR spectroscopic techniques were used and important features are noted below.

Raman spectroscopy is one of the best methods to analyze carbon nanomaterials. Raman spectra of the as-prepared modified MWCNTs was recorded at an excitation wavelength of 532 nm [24,25]. The Raman spectrum of the modified MWCNTs is

presented in the Fig. 1(a), showing the characteristics of -COOH functionalized carbon nanotubes [24]. Modified MWCNTs show intense D and G bands at around 1348 and 1580  $\text{cm}^{-1}$ , respectively, which disclose the prominent structural disorder caused by the incorporation of oxygen functional moieties on the carbon skeleton of the nanotubes [24,25]. The presence of a broad 2D (2690  $\text{cm}^{-1}$ ) peak in the spectrum is also a signature of the edge disorder in the nanotubes due to the incorporation of the -COOH functional groups [24,25]. To evaluate the nature of the functional groups on MWCNTs, FTIR analysis was carried out and the spectrum is presented in Fig. 1(b) [26,27]. The as-prepared, modified MWCNTs show a clear absorption for -OH, C-O, and -C=O [26,27]. This confirms the successful incorporation of the -COOH groups on the surface of the carbon nanotubes which is in good consistency with the previous investigations [26,27].

## 3. Fabrication of MWCNTs based nanocomposites

Eight layered quasi-isotropic symmetrical GFRP laminates were prepared with different loadings of the pure samples, *i.e.* 0.5, 1 and 1.5 wt. % of MWCNTs. Mixing of the surface modified MWCNTs in epoxy resins (Bisphenol-A) was completed using a probe-ultrasonicator (Fig. 2(a)). This process is one of the most effective paths for the homogeneous dispersion of MWCNTs in polymer matrices as discussed elsewhere [11]. The ultrasonication may cause heat generation in the solution and consequently aggregation of the MWCNTs. Therefore to avoid this phenomenon, the beaker was fully covered in an ice blanket [11]. Once mixing of the MWCNTs and epoxy was completed, the hardener (K-6) was mixed in 10:1 (epoxy: hardener) ratio followed by 15 minutes continuous ultrasonication. Herein, the glass fiber used was bi-directionally [(0/90) and (+45/-45)] woven (600GSM) as provided by M.S Industries, Kolkata, India. The stacking sequence of the proposed design for the laminates is shown in Fig. 2(b), *i.e.* (0<sup>0</sup>/+90<sup>0</sup>), (+45<sup>o</sup>/-45<sup>o</sup>), (+45<sup>o</sup>/-45<sup>o</sup>), (0<sup>o</sup>/90<sup>o</sup>)/(0<sup>o</sup>/+90<sup>o</sup>), (+45<sup>o</sup>/-45<sup>o</sup>), (+45<sup>o</sup>/-45<sup>o</sup>), (0<sup>o</sup>/90<sup>o</sup>). To engineer the three-phased composite laminates, the first layer was placed over a flat glass surface and the resin solution was applied manually using a soft brush. The same procedure was also applied for all other layers as per proposed symmetrical design. To remove extra resins from the edges of the wet laminates, an iron roller was rolled after placing one layer over the other manually. Authors have adopted the hand layup technique for the preparation of wet laminates and curing of the laminates was carried out with the help of a press-molding machine under 40 KN pressure at room temperature for 24 hours (Fig. 2(c)).

## 4. Experimental testing method

### 4.1. Tensile test

The prepared laminates with different loadings of MWCNTs (total 20 samples, 5 for each wt. %) were cut out in the dimensions of 125 mm × 15 mm × 4 mm using a diamond cutter as per ASTM D3039 requirement. The aluminum tabs of dimensions 25 mm × 15 mm × 2 mm were properly cleaned with propyl alcohol and pasted over the sample laminates as shown in Fig. 3(a) to avoid alteration during the testing. Each specimen was then gripped in the prepared fixture of the Universal Testing Machine (UTM) which prevented any lateral movements and forces were measured using S-type load cells as shown in Fig. 3(c). Five such tests were conducted for each loading amount of MWCNTs at a strain rate of 0.5 mm/min.

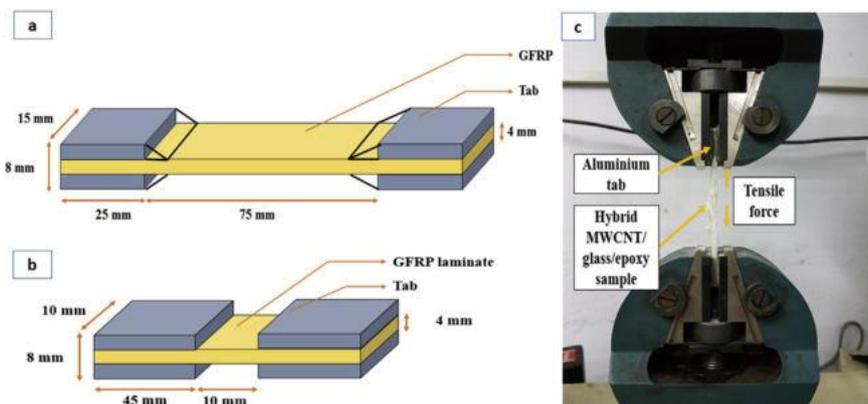

Fig. 3. (a) Specimen sample for the tensile test (ASTM D3039); (b) Specimen sample for compression test (ASTM D3410); and (c) Test fixture in UTM machine.

#### 4.2. Compression test

To investigate the compressive strength, seven different specimens (each wt. % of dimension 100 mm × 10 mm × 4 mm) were prepared as per ASTM D3410 requirement and a diamond cutter was used for the sample preparation. The properly cleaned aluminum tabs of dimensions of 45 mm × 10 mm × 2 mm were pasted over the specimen (with gauge length of 10 mm) as

shown in Fig. 3(b) to avoid alteration. This test was performed under the displacement control with a strain rate of 0.5 mm/min at room temperature. The load was measured using the S-type load cell attached to the specimen as discussed in the previous section. It is notable that the specimens used were short enough to prevent any buckling and clamping during the compression measurement. Further, any effects caused due to the stress concentration at the grips were considered insignificantly because

the repeated failures were witnessed at the gage section of all the loaded GFRPs.

#### 4.3. Inter-laminar shear strength (ILSS)

The inter-laminar shear strength tests were conducted based on the short beam shear strength test (SBS). For this test, seven specimens of dimensions 24 mm × 8 mm × 4 mm were prepared as per obligation of ASTM D2344, shown schematically in Fig. 4(a). The gage length of the specimen was 20 mm. The tests were performed at a strain rate of 0.5 mm/min as shown in Fig. 4(b). For the ILSS measurement, the gauge length of the specimens were kept very small to minimize the effect of bending during the failure of laminates under tension and compression. Thus, the main failure mechanism was dominated by the pure shear phenomenon.

The standard equation used for the calculation of inter-laminar shear strength is noted below:

$$F^* = 0.75 \times \frac{P}{b \times h} \quad (1)$$

where,

- $F^*$  = ILSS or Short-beam strength (ILSS) (MPa)
- $P$  = Max. load observed during test (N)
- $b$  = Specimen width (mm)
- $h$  = Specimen thickness (mm)

The cut specimens' samples are shown in Fig. 5(a)–(c) for the tensile, compressive and ILSS test, respectively.

The UTM (as shown in Figs. 3(c) and 4(b)) used for this work was fully computerized and the machine can be operated at loading rates varying from 0.01 to 10 mm/min. It had maximum load carrying capacity of 50 KN. Henceforth, using the UTM, the maximum values of load and stress for different samples under tension, compression and ILSS were noted and the maximum load carrying capacity was compared for the same wt.% samples in tension and compression for the systematic analysis. The maximum tensile and compressive modulus for different wt. % were also compared with neat samples.

## 5. Results and discussion

### 5.1. Tensile properties

Most of the important mechanical properties of materials, such as yield strength, elasticity, ultimate tensile strength and ductility can be obtained by the tensile analysis [21]. For the present investigation, five samples were tested and the obtained values are presented in Table 1 for better understanding. The graph shown in Fig. 6a represents the average values of the

tensile stress and it can be observed that the maximum stress values for the GFRP laminate composites are 122.70 MPa, 144.02 MPa, 250.08 MPa and 163.78 MPa for neat, 0.5, 1 and 1.5 wt. % of MWCNTs loading, respectively. The Young's modulus of elasticity ( $E_T$ ) was determined using the stress–strain data based on the tensile tests whose values were 2956.62, 3453.71, 6315.15 and 3937.02 MPa for the neat, 0.5, 1 and 1.5 wt. % of MWCNTs/glass/epoxy sample laminates, respectively and all are presented in Table 1 for the sake of simplicity. The maximum value for the modulus ( $E_{TMax}$ ) is 6315.15 MPa at 1 wt. % of MWCNTs loading and the average Young's modulus ( $E_{TAvg}$ ) for the tensile specimen laminates is found to be 4165.625 MPa. It can be observed that there is a continuous increase in the stress value as compared to neat GFRP specimen up to 1 wt. % MWCNTs incorporated laminates as shown in Fig. 6. This enhancement can be accounted to the delay in the crack generation and propagation owing to the nucleation and bridging effect of MWCNTs [18]. The role of MWCNTs to reinforce the mechanical properties is schematically presented in Fig. 7. Thus, the optimum loading of MWCNTs attributes a strong cross-linkage and enshrouding between the interfaces of resin which ultimately causes a delay in the crack propagation [11]. Moreover, with the increase in the loading percentage of MWCNTs, the tensile strength of the FRP laminate increased as fracture behavior shifted from brittle to ductile like hackle for the homogeneously dispersed MWCNTs [11]. Thus, the strong nanoparticle covalent bonding between the matrix–reinforcement interfaces is also responsible for the improved strength of the MWCNTs filled laminate specimens [18]. Further, from the tensile analysis, it can be observed that with the increase of MWCNTs loading, there is a fall in stress value by 34.5% from 1 wt. % to 1.5 wt. %. Such a drastic reduction in the value of stress may be attributed to the aggregation of MWCNTs (as shown in Fig. 9d), which takes place when MWCNTs loading increases beyond 1 wt. % [11]. In the present situation, the aggregation of MWCNTs is mainly due to the selective distribution and the high degree of entanglement of MWCNTs with matrices [11,18]. Therefore, the optimum stress value is 250.08 MPa at 1 wt. % MWCNTs incorporated GFRP and the average Young's modulus ( $E_{TAvg}$ ) for the tensile test specimen is 4165.625 MPa.

#### 5.1.1. Failure mechanism and fracture analysis

The failure mechanism is one of the most important aspects for the composites and polymeric materials [18]. There are so many reasons for the failure in the case of FRPs and similar materials. In this particular work, it is assumed that the failure originates from a region where there is the maximum stress concentration or an inherent defect is generated in the composite specimens during the testing as explained by Y. Iwahori *et al.*[28]. However, the homogeneous mixing of nanofillers in case of the three-phase composites is a serious concern and cannot be explained through the logic developed by Y. Iwahori *et al.*[28], because the mixing of nanofillers

into three-phase composites leads to the formation of clusters, cracks and voids owing to the non-uniform stress concentration (as shown in Fig. 9 (b)) which can also be the reason for the crack generation and propagation that ultimately leads to failure in the composites [28]. The mechanism explained in Fig. 8 shows the fracture and cracking of FRP composites during the tensile test which is an indication of adopted mechanism for the failure [11]. From the FESEM (Fig. 8 (d)) micrographs, it is clear that cracking at the interfaces of matrices occurs at the point of maximum stress, and then the crack propagates through the fibers and appears on the external surface of the specimen [11]. In other words, the debonding between the matrix and the nanofiber/glass is responsible for the fracture which leads to the pull-out phenomenon as shown in Fig. 8(a),(b). It is notable that the stress near the tip of the crack causes the matrix-fiber delamination before the actual bond breakdown and finally the crack reaches to the interface between

the two laminates of the composite. Fig. 7(a) and the FESEM image in Fig. 9(a) show the mechanism of delay in the crack propagation caused by the strong cross-linkage of MWCNTs between the two laminate composites [18].

## 5.2. Compression properties

The compressive strength is often used to state applicability of composite materials as it denotes the ability of a material to withstand load tending to reduce size. To further examine the mechanical properties of the fabricated composites, the compressive behavior was investigated as per ASTM D3410 and the stress vs. strain (Fig. 10(a)) curve of the same along with statistical data is presented in Table 2. The compressive results of the studied samples are in good agreement with the tensile properties as mentioned in previous section. The maximum compressive stress

( $\sigma_c$ ) values for the specimens are found to be 10.38, 13.44, 24.89 and 21.32 MPa for the neat, 0.5, 1 and 1.5 wt. % of MWCNTs loading in GFRP composites, respectively. Similarly, the compressive modulus ( $E_c$ ) of the studied specimens were obtained (1069.56, 1383.71, 4194.77 and 2195.31 MPa for the neat, 0.5, 1 and 1.5 wt. % of MWCNTs/epoxy, respectively) from the corresponding graphs and

the data is presented in Table 2 for detailed information. From the stress vs. strain graphs (Fig. 10(a)), MWCNTs loading up to 1 wt. % is accounted to the uniform load transfer from the matrix to the reinforcement which is further strengthened owing to the intrinsic properties of MWCNTs and their homogenous distribution at the interfaces of the composite. Due to the aggregation of MWCNTs at

Stress in MPa											
Specimen Number → MWCNT (wt.%), ↓	1	2	3	4	5	6	7	Average Compressive strength (MPa)	Standard deviation (SD)	Standard deviation (%)	Average compression modulus ( $E_C$ ) (MPa)
0	10.56	10.65	9.87	11.23	10.02	10.88	9.43	10.38	0.626	6.03	1069.56
0.5	14.56	14.89	13.65	12.63	13.23	12.02	13.10	13.44	1.018	7.57	1383.71
1	24.23	25.17	25.36	23.67	25.87	25.61	24.32	24.89	0.820	3.29	4194.77
1.5	22.56	22.21	20.97	21.25	20.56	20.23	21.46	21.32	0.842	3.95	2195.31

higher loading, the cross-linkage (see Fig. 9(a)) at the interfaces get decreased and therefore abrupt drops in strength can be seen above 1 wt. % of loading of nanofillers (Fig. 9(d)). In summary, the maximum value of the compressive modulus ( $E_{Cmax}$ ) is found as 4194.77 MPa for the 1 wt. % of MWCNTs loading and the average value of the compressive modulus ( $E_{CAvg}$ ) for the specimen laminates is found as 2210.837 MPa.

5.2.1. Failure mechanism and fracture analysis

Composites and nanocomposites possess different phases with different elastic properties. Hence, there is a high possibility for the formation of microcracks across various regions of interfaces in the fabricated composites under the applied load [18]. A typical

fracture of fibers is shown in Fig. 11(a),(b) for the specimen under compressive loading. The compressive strength of the laminates is controlled by various mechanisms [29]. First, it is seen that most of the laminate in the test undergo micro-buckling. Buckling is the only area in the field of structural mechanics where failure is not related to the material strength. The collapsing of the material due to buckling does not deal with the yield of the material [30]. Generally, there are two types of micro-buckling modes of failure according to Rosen's model [31] (i): out of phase buckling of fibers or extension mode, (ii) in-phase buckling of fibers or shear mode as shown in Fig. 11(e),(f). Their analysis was based on the assumption of the 2D behavior of composites and on an idealistic approach, so the predicted results in their test were significantly higher than

**Fig. 11.** (a) FESEM image of fractured fibers and (b) cracking due to compressive loading; (c) FESEM image of the kink band formation in the test sample specimen; (d) FESEM image failure mechanism of compressive test specimen (Kink-band formation and Splitting); (e) Extension mode or out of phase buckling; (f) Shear mode or in-phase buckling.

experimentally observed ones. In their model, the authors predicted the value of the shear mode failure to be lower than that of the extension mode of failures which was also in agreement with the experimentally observed results. Further, the failure modes are highly dependent on the fiber volume fraction ( $V_f$ ). For  $V_f < 30\%$ , the extension mode is dominant as with application of the sudden load, the adjacent fibers tend to deform sinusoidally with the deformation patterns being  $180^\circ$  out of phase, whereas for  $V_f > 30\%$ , the fibers adjacent to each other deform transversely in phase indicating the shear mode failure [30]. In our experiment, since the prepared composite is high in fiber content with fiber volume fraction ( $V_f \sim 55\%$ ), therefore, in the coherence to the Rosen's model, it is feasible to assume the micro-buckling to be in-phase as shown in Fig. 11. Also, researchers like Tadjbaksh and Wang in their model took into consideration the inter-ply micro-buckling of the cross-ply laminates [32]. They modelled the laminate as a single ply inhomogeneous continuum. In this analysis, they observed an increase in resistance of buckling due to adjacent plies. Similarly, in the present study, most of the samples were resisting buckling owing to the use of cross-ply laminates [33].

Secondly, there is kinking, which is also perceived to be the most common failure mechanism. Kinking in FRPs can be said to be the consequence of the combination of plastic micro-buckling and the low strain rate subjected to the fibers. A typical kinking failure mechanism is shown in the Fig. 11c. These initiative mechanisms like kinking and micro-buckling at micro-structural level lead to the global instability of the composite materials [30]. Lee and Waas [33] in their investigation on the compressive strength of unidirectional GFRP laminates found that the kink-bands were formed at different fiber-volume fractions of the tested GFRP samples. Also, for higher fiber-volume fractions, it remained one of the major modes of failure. Similarly, in this study, it was observed that the kink bands were formed. But, as the fiber volume fraction of the prepared GFRP was high ( $V_f \sim 55\%$ ), no significant stress drop was observed during testing of the loaded GFRP laminates. Thus, it can be concluded that the chances of formation of kink-bands decreases at high fiber volume fractions of loaded bi-directionally woven GFRP laminates. A typical kink band formation is shown in Fig. 11(c) of the loaded GFRP samples.

Thirdly, we address the splitting or delamination as another failure mechanism for the rupture of the composites [33]. This kind

of failure modes is supposed to occur when a pre-existing flaw inside the specimen starts growing under compressive loading conditions. In multi-directional composites, where the fibers are continuous, cracks with an opening under compressive loading are easily liable to delamination in a macroscopic level and fiber-matrix debonding in a microscopic level. The micro-cracks that grow under compressive loading tend to form transverse cracks. These micro-cracks with a gradual increase in the compressive load grow and their domain of circumferential size increases, and they form interfacial de-bonds [33]. Debonding is the transition mechanism followed by the micro-cracking which eventually leads to transverse cracking [34]. Although, it is assumed that transverse crack originates from the defects or voids present in the matrices owing to improper layering and selective distribution of MWCNTs (see Fig. 9(b)). However, the consequence of the same may enhance the cracking and therefore the fiber-matrix interfacial weakening in the case of an uniaxial transverse loading [35]. Such crack initiation and propagation cannot afford applied loads and result in fracture via the kink band formation. A typical debonding or shear failure mechanism is shown in Fig. 12(a),(b) followed as by a transverse cracking in the compression test samples.

As described in previous sections, there are three major mechanisms of failure for the compressive laminate samples, but it is observed that no particular failure is alone responsible for the breakdown of the test samples. The failure is governed majorly by a combination of kink-band formation and splitting. But there can be other failure modes like splitting or shear failure alone. However, this is the rare case, *i.e.*, one among seven specimen samples. So, for high fiber volume fraction bi-directional GFRP samples we designate the failure mode by kink-band formation followed by splitting or shear failure as shown in Fig. 11(d).

### 5.3. Inter-laminar shear strength (ILSS) properties

The tests were performed for the short beam shear (SBS) strength and the observed strength values are summarized in Table 3. Also, the statistics of the obtained force values are presented in Fig. 13(b). The force vs. deflection graph for the test samples (see Fig. 13(a)) represents the average values of force for the samples put to test in the Hounsfield UTM.

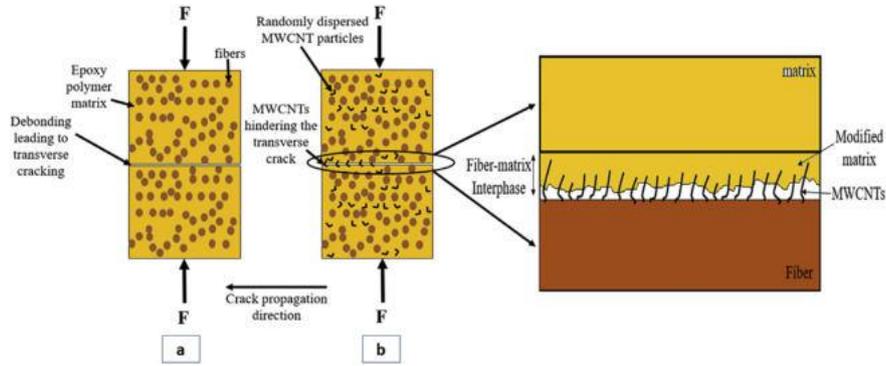

Fig. 12. (a) debonding mechanism leading to transverse crack and (b) hindrance to the transverse crack caused by loading MWCNTs.

**Table 3**  
The statistics of the SBS test performed for hybrid MWCNT/glass/epoxy laminate samples.

Specimen Number →	1	2	3	4	5	6	7	Average Force (N)	Standard deviation (SD)	Standard deviation (%)	Inter-laminar shear strength (ILSS) (MPa)
MWCNT (wt.%) ↓											
0	469.23	468.12	472.27	460.57	457.32	460.73	470.12	465.48	5.80	1.25	10.909
0.5	532.48	536.65	540.45	521.27	526.34	525.25	517.55	528.57	16.42	3.11	12.388

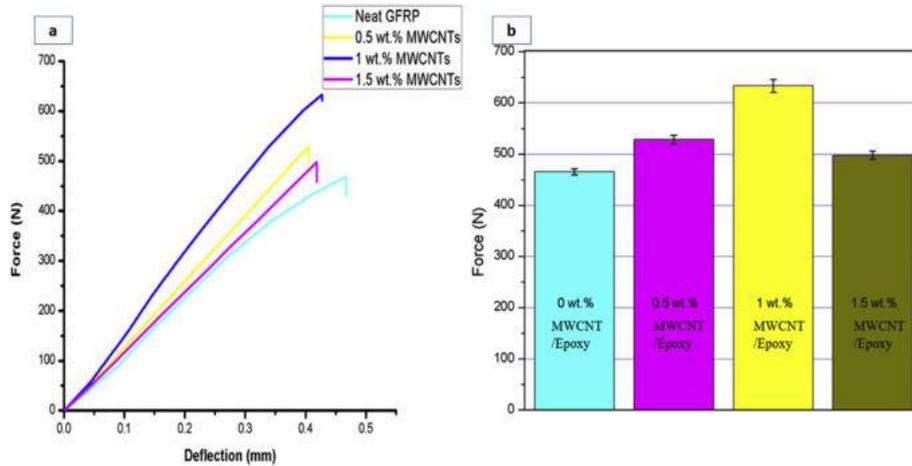

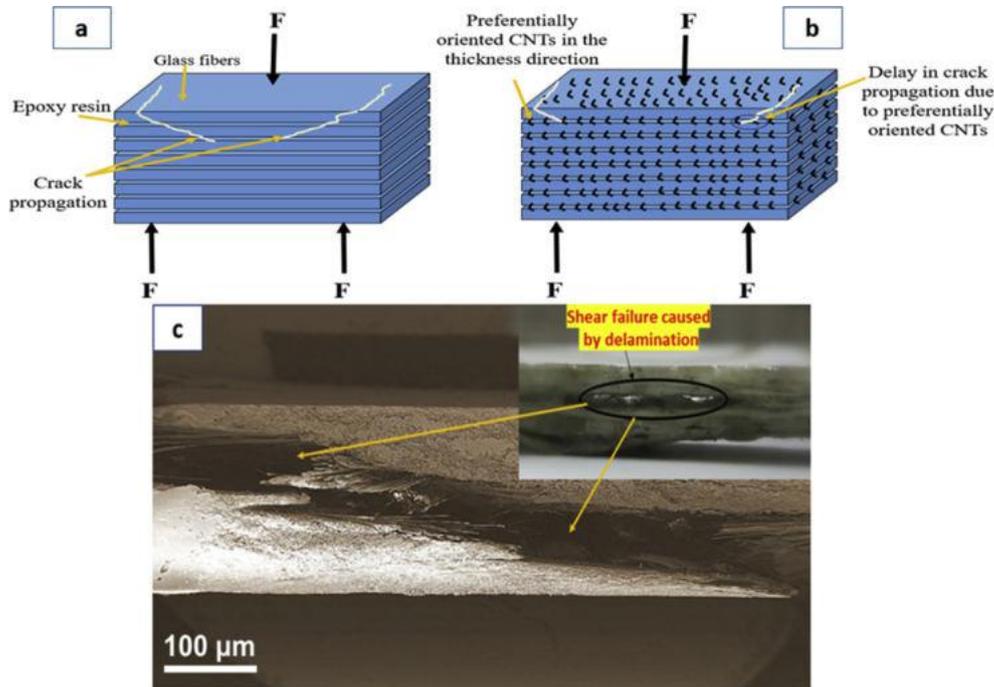

Fig. 13. (a) Force vs. displacement graph of GFRP laminate samples obtained from SBS test; and (b) statistics of the tests performed according to ASTM D2344 with reference to Table 3.

When the shear load in the transverse direction experienced by a composite laminate exceeds the inter-laminar shear strength (ILSS), a failure will occur between the fiber layers (which are the reinforcing materials in FRPs) and its was known as delamination failure [36]. In order to measure the ILSS, a pattern of the pure shear stress should be generated which will make the composite undergo an interlaminar shear failure. This failure will occur between the glass woven plies, which act as the reinforcing material. In the case of a load applied perpendicular to the fiber layers, an additional failure is possible and, therefore, an accurate ILSS estimation is not possible. In this testing, we used the SBS test, where the failure was caused by both the shear failure and the failure due to bending (caused by both tension and compression). The failure is not due to shear alone, so there can be anomaly in the results obtained [36]. To avoid the bending effects of failure, we reduced the gage length, so

that the moment is reduced which ultimately diminishes the failure due to the bending effects [36]. In this case, the gage length as per ASTM D2344 is 20 mm, so it can be assumed that the pure shear failure will dominate the bending failure at a greater scale, therefore, we can neglect the effects of bending.

From the graph of Fig. 13(a) and from the calculations using equation (1), the Inter-laminar Shear Strength values are 10.909 MPa, 12.388 MPa, 14.843 MPa and 11.663 MPa for MWCNT loading values of 0, 0.5, 1 and 1.5 wt. %, respectively, which are noted down in Table 3. The reason for the increase in ILSS of the fiber reinforced composites up to 1 wt. % can be addressed to the MWCNTs/epoxy suspension between the fiber layers, which create a strong cross-linking bond between the layers as shown in Figs. 9(a) and 14(b). Although, the CNTs in this case are not preferentially oriented, they are randomly dispersed, it is seen that

**Fig. 14.** (a) The crack propagation mechanism in th neat GFRP laminate; (b) Hinderance in the crack propagation due to MWCNTs aligned along the thickness direction; (c) FESEM image of failure mechanism of short beam shear strength (SBSS) test sample specimen (delamination).

some of the MWCNTs tend to orient along the thickness direction which transfers the load from the matrix to the MWCNTs. Fan *et al.* [36] used oxidized multi-wall nanotubes (OMWCNTs) with the vacuum assisted resin transfer molding method (VARTM) and the newly developed injection and double vacuum assisted resin transfer molding method (IDVARTM) to preferentially orient the MWCNTs along the thickness direction, which ultimately leads to increased ILSS due to the effective and uniform load transfer from the matrix to the CNTs.

The decrease in ILSS at 1.5 wt. % of MWCNTs loading from 14.843 to 11.663 MPa indicates that the CNTs after 1 wt. % loading tend to re-agglomerate (Fig. 9(d)). Thus, it can be assumed that the 1 wt.% loading is an optimum value of reinforcement, and beyond the 1 wt.% loading, owing to the saturation effect and the attractive Van der Waal forces among the nanoparticles, the agglomeration effect tends to dominate and results in major aggregation, indicating that the ILSS is decreased by 21.42% from 1 to 1.5 wt. % of MWCNTs loading.

### 5.3.1. Failure mechanisms and fracture analysis

The failure mechanism of the ILSS test samples for the SBS test is relatively easy. Since, the load is applied on an overhanging test sample with a very short gage length, the crack propagation takes somewhat close to the axial direction [37]. Since bending also exists in the failure mechanism, the crack propagation is not along the pure axial direction. Therefore, there are two mechanisms which can be accounted for the failure: (i) the shear failure and (ii) the bending failure. The shear failure is a result of the delamination caused due to the matrix cracking followed by breaking of the bond between the fiber and the matrix which eventually leads to the delamination. Since the matrix is considered to be the weakest material in the composite structure, so it is assumed that the crack initiation takes place from the defects or voids present in the matrix (Fig. 9b), and it is expected to be eventually present after the curing process [35]. This becomes the point of the maximum stress concentration, so a load up to its maximum bearing capability along the axial direction is considered the maximum ILSS. Further

application of the load after this point leads to the crack propagation from the defect which causes matrix breaking and the load is transferred from the matrix to the secondary reinforcement, *i.e.* the MWCNTs as shown in Fig. 14b. The matrix breaking and the crack propagation along the near axial direction leads to the delamination of the fiber and the matrix, which upon further spreading conquers a lot of circumferential area under its domain ultimately leading to the shear failure [37]. In this testing process, the most dominant failure mode is the inter-laminar shear failure. A typical failure mechanism of the SBSS test is shown in Fig. 14(c).

## 6. Conclusion

In summary, surface modified MWCNTs were synthesized and unvaryingly dispersed in the glass fiber-reinforced plastic composites with 0, 0.5, 1 and 1.5 wt. % loading. The mechanical properties of specimens were inspected mainly in the context of tensile, compressive and ILSS test. In the present study, it has been established that an optimum tensile stress value of 250.08 MPa was at 1 wt. % of MWCNTs loading along with Young's modulus ( $E_{Tmax}$ ) of 6315.15 MPa and the composites failed owing to the debonding followed by the fiber pullout. The optimum compressive stress for the composite in the case of 1 wt. % of MWCNTs loading was found of ~24.89 MPa corresponding to 4194.77 MPa compressive modulus. Interestingly, the maximum strength value for the tension was found greater than that for the compression which implies the role of the nanotubes as nano-compatible and as reinforcement on the properties of the fabricated composites. For the studied samples, the tensile modulus was greater than the compressive one indicating that there was less elastic deformation of the material under tension as compared to compression. Moreover, owing to the proper dispersion of MWCNTs in the fabricated composites, the increment in the tensile stress and compressive stress were 103.81% and 139.78%, respectively. Also, for the 1 wt.% of MWCNTs loading, the optimum ILSS was found to be 14.843 MPa with an increment of 36.06% as compared to the neat sample. Thus, the optimum MWCNTs loaded GFRP can be used in many structural

applications where a high stability against tension, compression and inter-laminar strength is needed at the same time.

---

## Summary

### BACKGROUND

Ellagitannins are the potential source of bioactives and found abundantly in consumable food items. S-protein is a type I fusion protein of COVID19 virus and used for initial attachment with human Angiotensin converting enzyme 2 (ACE2) receptor, which facilitates its entry into the host cell.

### MATERIALS AND METHODS

S-protein is validated target and hence, we screened food borne polyphenols and FDA approved Drugs against SARS-CoV-2 spike protein by the Autodock Vina 1.1.2. and Pymol for the molecular docking and simulation studies.

### RESULTS

The study showed that Sanguiin-H-6, Potentillin, Punicalagin, have excellent binding affinities for S-protein as compared to its natural N-acetyl glucosamine (NAG) ligand. Theaflavin-di-gallate and Theaflavin-mono-gallate also show comparably good binding affinities and similar binding conformations.

### DISCUSSION

SH6, Casuarictin, and Potentillin compounds have shown excellent binding on the hinge of S1 and S2 subunits of spike glycoprotein. As they show hydrogen bonding interaction with S2 unit by interacting with HR region and SD2 region, and on the other side they form hydrogen bonds with amino acid residues of NTD (which is present in S1 unit). The S1 unit is responsible for the virus attachment with its host ACE2 receptor, where potential ellagitannins were found to bind with NTD, and can modulate the binding of virus with host cell.

Similarly, in S2 subunit its binding in HR region leads to disruption of membrane fusion stage, hence, ellagitannins have capability to act as potential inhibitor of virus spike protein by inhibiting both cell surface attachment as well as membrane fusion. These three compounds also show good drug likeliness properties apart from solubility which can be overcome by drug delivery advancements.

#### CONCLUSION

Thus, from the result it is concluded that Sanguiin-H-6, Potentillin, Casuarictin which are ellagitannins may have ability to inhibit both attachment and membrane fusion of COVID19 virus to ACE2 receptor.

#### RECOMMENDATION

This study needs further *in vitro* and *in vivo* testing which will provide a clear path for the development of novel compounds of natural origin that would most likely prevent the receptor binding or internalization of the SARS-CoV-2 spike protein and therefore could be potential drugs for COVID-19 preventive therapy.

**Keywords:** COVID-19, Virtual Screening, Phytochemicals, Ellagitannins, Flavonoids, ADMET

## Introduction

The corona virus outbreak has resulted in a socio-economic crisis all over the world as of 11<sup>th</sup> March, 2020 [1] when the Director General of the World Health Organization (WHO) declared COVID-19 disease to be a global pandemic. This upsurge initially started in late December 2019 as a pneumonia-associated infection, reported in Wuhan, Hubei Province of China [2].

Coronavirus is of the family of  $\beta$ -coronavirus (but SARS-related coronavirus (SARSr-CoV) strain WIV1) [3], which seem to have evolved from bats and possess a dreadful threat to human health. The clinical symptoms associated with the SARS-CoV-2 generally involves the upper respiratory tract infections with its mean reproduction number (R0) 3.28 [4] and onset of pneumonia symptoms within average of 4 days (ranging from 2 to 7) [5].

The novel coronavirus is a positive single-stranded RNA that consist of majorly four proteins namely, envelope (E), membrane (M),

the nucleocapsid (N), and spike (S) proteins (*see Figure 1- all tables and figures are presented at the end of this article*) [6]. These proteins function in different ways to keep the viral machinery active with E and M protein maintaining viral assembly, N protein playing role in RNA synthesis [7]. The critical glycoprotein S is a class I fusion protein found on the surface of COVID-19 virus, which majorly causes the virus' attachment to human Angiotensin converting enzyme 2 (ACE2) receptor. This is followed by its fusion with the host cells. The attachment is facilitated by the S1 subunit of S-protein via its receptor binding domain (RBD).

The RBD is projected upward as a hairpin, and provides a structural template for ligand to bind, followed by antiparallel  $\beta$ -sheets (N-terminal domain) NTD; both contributing to formation of S1 domain part. The S2 domain consists of a linker which connects RBD to heptad repeat (HR), a central helix (CH) and connector region (CR) (*Figure 2*). Two domains

are responsible for the inclusive behaviour of the virus, namely N-terminal (S1 containing RBDs) and C-terminal (S2 for fusion). Moreover, the S1 further consists of two subdomains N-terminal domain (NTD) and C-terminal domain (CTD), both functioning as RBDs.

In  $\beta$ -coronavirus (SARS-CoV), the receptor and virus fusion interaction takes place at C Terminal [8]. The S protein also consists of cleavage sites, fusion protein near to HR1 and a TM (transmembrane) span depicted in (Figure 3). It is reported that membrane fusion and internalization of the COVID19 virus is brought about by the S2 domain of spike protein. A huge dynamism is associated with this protein as it changes its conformation from pre-fusion to post fusion state after binding and internalization [9].

Belouzard *et al.* [10] depicted the mechanism of coronavirus entry mediated by spike protein with the two different conformation structures, namely, the metastable pre-fusion and the stable post fusion. When the spike protein S1 attaches the host membrane, its trimeric pre-fusion structure gets destabilized, resulting in loss of S1, and the transition of S2 subunit to stable post fusion conformation. The virus on entering into the cell releases its genome, followed by assembly and release of virions [11] from the infected cell through the process called exocytosis. The spike glycoprotein seems to exert a potential target for inhibition of infection and treatment.

Facing, the massive casualties of this pandemic, researchers all around the world are actively engaged in finding various strategies including new and repurposed drugs to treat the SARS-CoV-2 infection. Wei *et al.* [12] reported about Digitoxin, Bisindigotin, Polygoni Tinctorii Folium and Raltegravir having high binding affinities towards spike glycoprotein. In time of need high-throughput virtual screening is also employed, which identified KT185, KT203 GSK1838705A, BMS195614, and RS504393 as a potential binder of spike protein, thereby preventing spread of COVID19 by acting both

as a entry inhibitor to cell and anti-inflammatory agents [13].

Since, the age old times, people have believed that naturally occurring substances like phytochemicals have potential to fight against infectious pathogens. Most of the polyphenols are reported to have anti-viral [14] and anti-bacterial properties [15]. It is more inspiring to know that theaflavin derivatives (Flavon-3-ols), an active constituent of black tea is found to have proteolytic activity against main protease (3-CL-Protease) of SARS-CoV established through biological assays [16].

In a similar context, we recently performed virtual screening of Phenol Explorer database against main protease of SARS-CoV2 (COVID19 virus) and strikingly similar results indicating that Theaflavin-di-gallate and Theaflavin-mono-gallate have potential to bind actively in substrate binding pocket of main protease of COVID19 virus by a characteristic covalent bond [17, 18]. This, study motivated us to perform another investigation to explore the capability of polyphenols (majorly ellagitannins) against spike protein of COVID19 virus.

In this study, we performed *in silico* screening to ascertain the most potent natural food borne compound against spike glycoprotein of COVID19 virus which can inhibit virus attachment and internalization with host cell. We found that four Ellagitannins and two flavon-3-ols can bind to (NTD) of S1 and (HR) of S2 sub unit of spike protein, with a binding interaction more stable than that of N-acetyl glucosamine (NAG) and HCQ. These natural compounds have unique features of binding to both S1 and S2 subunit and most probably prevent COVID19 virus from binding to the ACE2 receptor or internalization during fusion [10, 19]. The ADMET analysis also suggested that these ellagitannins have potential to function as effective anti-SARS-CoV-2 agents with further testing and scientific modifications.

## Material and Methods

### *Data Set Preparation*

In-house database preparation of 69 ellagitannins (comprising of hydroxybenzoic acids and urolithin) derivatives and few other polyphenols was carried out by taking these compounds mainly from Phenol Explorer [20, 21] Version 3.6. The 2D structures of these compounds were exported from ZINC database [22] in SDF format and some of them (not available) were drawn manually by ChemDraw. The database was checked for redundancy and redundant molecules, in order to avoid any repetition. These structures were further refined in Chemdraw3D ultra by performing energy minimization using Molecular Mechanics 2 (MM2) force field method and saved in .mol2 format [23].

The energy minimized structures, were imported in AutoDock Vina 1.1.2 for ligand preparation [24]. Along with this, the SDF files of known 68 FDA approved anti-asthmatic drugs and A2 receptor agonist were also imported from the ZINC database for screening study.

### *Virtual Screening by Molecular Docking Approach*

Molecular docking is an essential tool in computer-based drug design and drug discovery, which helps to predict the small ligand conformation and orientation (docking pose) within the active sites of the target receptor protein [25-30]. This technique has been highly useful in virtual screening of large libraries of ligands against suitable target proteins to identify potential drug candidates based on scoring functions and intermolecular interactions. The following were taken in conducting this study:

#### *a. Protein Preparation*

The Cryo-EM structure of spike protein of COVID19 virus co-crystallized with its ligand N-Acetyl-D-Glucosamine (NAG) was reported

by Wrapp *et al.* in 2020 [31]. This protein with PDB ID: 6VSB was taken from (protein data bank) depository for virtual screening. The protein was prepared using the protein preparation wizard of Auto Dock Vina 1.1.2. This tool helps in adding hydrogens, Kollman charges, assigning AD4 type and repairing missing atoms.

#### *b. Ligand Preparation*

The 3D structural files of compounds of the in-house database along with FDA approved drugs [22] were subjected to energy minimization using MM2 by keeping a check on the connection error in the bonds. The torsions for the ligands were set by detecting the roots in AutoDock Vina 1.1.2 followed by setting aromaticity criteria of 7.5 [24].

#### *c. Ligand Docking*

First of all, the bound ligand (NAG) was extracted from spike protein and then re-docked to generate the same docking pose as found in its co-crystallized form (PDB: 6VSB) for validation of docking protocol.

The prepared sets of ellagitannins and related ligands were then docked against the spike protein using AutoDock Vina 1.1.2. based upon docking score and docked pose, the protocol validated for docking of multiple ligands.

#### *d. Visualization*

The results obtained from AutoDock Vina (1.1.2) were visualized using the academic version of Pymol software [32].

#### *e. Prediction of ADMET by In Silico Analysis*

ADMET profiling of top 3 scoring ellagitannins at pH 7 were determined using Swiss ADME, online web server (<http://www.swissadme.ch/index.php>) [33]. The important parameters allied with ADME properties such as Lipinski's rule of five, solubility of drug, pharmacokinetics properties, molar refractivity and drug likeliness were

deliberated. Regarding toxicity [34] analysis, Ames mutagenicity and carcinogenicity on rat and mouse models were considered. All calculated values are provided in Tables 5, 6 and 7, presented at the end of this article.

## Results

The docking scores of top 14 polyphenols on spike glycoprotein of COVID19 virus is shown in Table 1 and found to be much higher in comparison to NAG (bound ligand), a natural ligand of spike protein, having docking scores of  $-5.3$  kcal/mol. The two compounds Sanguiin-H6 (SH6) and Punicalagin (PC) found to have excellent docking scores of  $-9.8$  kcal/mol and  $-9.1$  kcal/mol, followed by theaflavin derivatives Theaflavin 3, 3'-O-digallate (TDG) and Theaflavin 3-O-gallate (TMG).

Out of 69 docked ellagitannins compounds, most of the compounds show binding affinities higher than that of NAG, however, we have listed top six compounds in Table 2 with their docking scores, which have been shown to be potential binders of spike glycoprotein of COVID19 virus in *in silico* drug-receptor interaction studies

This docking exercise shows that ellagitannin nucleus has more suitability to bind in the active site of spike protein as compared to Flavan-3-ol skeleton. Based on our previous reports [17, 18] TDG and TMG, were found to have excellent binding affinities towards Main Protease (Mpro) of COVID19 virus, and we were again surprised to notice that theaflavin derivatives (anti-asthmatic agents and are established bronchodilators) have potential to bind with spike glycoprotein too, based on obtained docking scores. Hence, in order to seek any relationship between anti-asthmatic and anti-COVID activity, we have also screened a number of anti-asthmatic drugs and A2-receptor agonist. Though, data from Table 3 have shown that anti-asthmatic drugs and A2-receptor agonist have poor binding affinities on Spike glycoprotein of COVID19 virus

## Molecular Interactions with Spike Protein

Similarly, the ligand interactions of SH6, Casuarictin, and Potentillin with spike glycoproteins were also studied and represented in Figure 5a, 5b and 5c and their interactions with amino acid residues are presented in Table 4.

## In-Silico ADMET Studies: Pharmacokinetic Prediction

We also carried out ADME studies of three active polyphenolic compounds, using Swiss ADME, [33] a free web tool to evaluate the pharmacokinetics and drug-likeness scores of medicinally important compounds. The *in silico* pharmacokinetic prediction and toxicity data of top three polyphenolic compounds are presented in Tables 5, 6 and 7.

The results show that these compounds violate the Lipinski rule of 5, because of their higher molecular weight  $>500$ . These natural compounds have low Gastro-intestinal (GI) absorption rate which leads to their low bioavailability and subsequent low plasma concentration. However, these challenges can be overcome by use of drug delivery vehicles or microencapsulation process [35, 36].

## Discussion

### Molecular Docking of Ligand NAG

The molecular docking was performed for the bound ligand N-acetyl glucosamine (NAG), this ligand is able to dock inside spike glycoprotein with the binding affinity value of  $-5.3$  kcal/mol. Figure 4, demonstrates the binding of NAG in S1 and S2 subunit with the spike glycoprotein. This inhibitor forms hydrogen bonds with key amino acid residues Asn 856, Cys743, Leu977, Arg1000, which are important for the interaction.

## ***Screening of Flavonoids Database (Ellagitannins and other Polyphenols) against Spike Glycoprotein***

In our earlier study on exploration of polyphenols against Mpro of COVID19 virus, we found that sanguin H6 (SH6), Theaflavin-di gallate (TDG), Theaflavin-mono-gallate (TMG) and punicalagin (PC) effectively bind to S1 subunit of substrate binding pocket of Mpro [17,18]. This, led us to perform their binding energy evaluation on spike glycoprotein (S-protein, where *in silico* docking results, again suggested the potentiality of these polyphenolic compounds to bind to spike glycoprotein in association with Mpro. Thus, these polyphenols can act both as entry inhibitors and stop the virus replication by inhibiting main protease.

The top scoring compounds SH6 and PC both bear ellagitannin nucleus, which inspired us to perform molecular docking of in house prepared ellagitannin database containing 69 compounds.

Sanguin-H-6 (hydroxybenzoic acid derivative) (SH6), is found to be the highest-scoring compound with the docking score of -9.8 kcal/mol, followed by Casuarictin and Potentillin (isomers) both at -9.4 kcal/mol followed by another hydroxybenzoic acid derivative i.e., Punicalagin with -9.1 kcal/mol binding affinity.

SH6, Casuarictin, and Potentillin compounds have shown excellent binding on the hinge of S1 and S2 subunits of spike glycoprotein. As they show hydrogen bonding interaction with S2 unit by interacting with HR region and SD2 region, and on the other side they form hydrogen bonds with amino acid residues of NTD (which is present in S1 unit).

The S1 unit is responsible for the virus attachment with its host ACE2 receptor, where potential ellagitannins were found to bind with

NTD, and can modulate the binding of virus with host cell.

Similarly, in S2 subunit its binding in HR region leads to disruption of membrane fusion stage, hence, ellagitannins have the capability to act as potential inhibitor of virus spike protein by inhibiting both cell surface attachment as well as membrane fusion. This docking exercise again proves the importance of Sanguin-H6 as compounds with potential anti-CoV activity as it shows excellent binding affinities with spike as well as Mpro of COVID19 virus.

In recent years' awareness about the use of natural products over the synthetic consumables has revived the scientists' attention to conduct research, which will support the concept of chemicals derived from a natural source [37] which are practically considered to be much safer. Nowadays phytochemicals or bioactive compounds mainly comprising of flavonoids derived from plant sources are being marketed as preventive medicines under the class of "nutraceuticals" [38-40]. The flourishing market of nutraceuticals products has created awareness among the consumer to use more natural ways to treat an ailment [41]. Therefore the knowledge of pharmacokinetics and drug-likeness properties of natural compounds is crucial as these compounds can be a future drug candidate/pharmaceutical adjuvant.

Since the drug development process involves absorption, distribution, metabolism and excretion, profiling it is very important to access the knowledge about drug targets, its sufficient concentration and the plasma concentration to bring about the effective concentration (EC). Thus, the Swiss ADME tools works on principle of molecular fingerprint over a particular structure to report details on pharmacokinetic data.

Apart from the solubility issue the three compounds SH6, Casuarictin, and Potentillin show good drug likeliness and fair pharmacokinetic profile with good data on synthesis accessibility.

## Conclusion

This *in-silico* investigation to identify a potent novel natural compound that can interfere in COVID19 virus attachment/internalization is decisively a seamless therapeutic option in the prevailing pandemic period. Bioinformatics based drug design studies have been effectively used by many for a fast and more or less accurate prediction of potential drugs or inhibitors against their targets.

In this study, we have virtually screened ellagitannins, polyphenols and FDA approved drugs (only anti-asthmatic and A2 agonist) to identify potent natural compounds that targets and binds to the spike protein of COVID19 virus. We have identified about 3 ellagitannins (Sanguin-H-6, Potentillin, Casuarictin) out of the whole pool capable of binding both S1 and S2 subunit of spike protein of COVID19 virus.

Our results suggest that all of these identified compounds, abundantly present in “berries”, have the potential to inhibit COVID19 virus attachment/internalization and should be explored further as preventive therapeutics for COVID-19.

## Acknowledgement

A.F Lal and S. Giri carried out the computational analysis as guided and described by Dr. S. Bhatia. The drafting is done by A.F Lal and all the data/results analysis, drafting and proof reading of the manuscript is thoroughly done by Dr. S. Bhatia. Dr. Singh provides his assistance in framing of studies and result analysis. S. Mor helps in literature collection and manuscript drafting.

**Abstract-** Planning the traffic & transport facility for a mid-sized city or semi-urban city needs lots of traffic related components to be evaluated such as traffic volume, future vehicle demand, road use pattern, etc. This paper quantitatively examines the effect of traffic volume, vehicular growth and road use pattern in the movement of traffic. Traffic survey has been conducted to obtain the traffic volume and DTO vehicle record has been obtained to observe the vehicle data. DTO vehicle data has been used to analyze the future vehicle demand on the roads of the city as a part of the future traffic by applying MLR method for traffic forecasting using SPSS. The peak hour traffic volume data helps to identify the road use pattern during the morning & evening peak hours of a particular roads which helps to formulate a better traffic movement plan. An improved conclusion based on the quantitative methods is designed to solve the problems of existing traffic systems. The influence of some important parameters on the traffic analysis results was observed through a sensitivity analysis.

**Index Terms-** Traffic Volume, PCU, Mid-sized city, Road use pattern, Vehicle growth.

## 1. INTRODUCTION

[JEAN-PAUL RODRIGUE & Dr. BRAIN SLACK, 2013] Transport planning is most developed in the urban sphere, and it is there where most experience has been gathered. The predictions of future traffic flows produced by the four-stage sequence are then used to identify planning options. Study of traffic condition of Madhubani city have been done to enhance and provide a better traffic planning approach to improve the traffic problems of the city and reduce the traffic congestion, accidents, etc. For this purpose, the major traffic operated roads have been observed to calculate traffic volume. These roads have been surveyed to understand the traffic volume and road use pattern. The case study of Madhubani city have been used just for observing, analyzing and formulation a good traffic planning system for a mid-sized city. As Madhubani is a mid-sized city having no any traffic planning system, it had huge growth in traffic in last decade. It doesn't matter whether the city is small or large, where there is extreme traffic growth, there must need a traffic planning approach to maintain the proper traffic system of city. Lots of deficiencies are found in small cities regarding traffic. So, to overcome on the deficiencies of traffic, two of parameters in this paper have been analyzed. Traffic survey is very useful for understanding the traffic conditions. DTO vehicle record helps us to analyze or forecast the traffic of the city. The number of vehicles running on the roads of Madhubani have been obtained from the District Transport Office as shown in Table 3 and represented

in graphical form in Figure 3 to analyze the vehicle growth in past decades and to forecast the vehicle growth in the future decade. This will be considered a major factor for planning the traffic system of the city. The data are analyzed by SPSS. On the basics of results obtained, improvement methodologies and recommendations have been made.

## 2. STUDY AREA

Madhubani District is one of the thirty-eight districts of Bihar state, India. This semi-urban city has high traffic operations through-out the city area. There are lots of road connecting the different junctions, intersections, crossings, etc. shown in Figure 1.

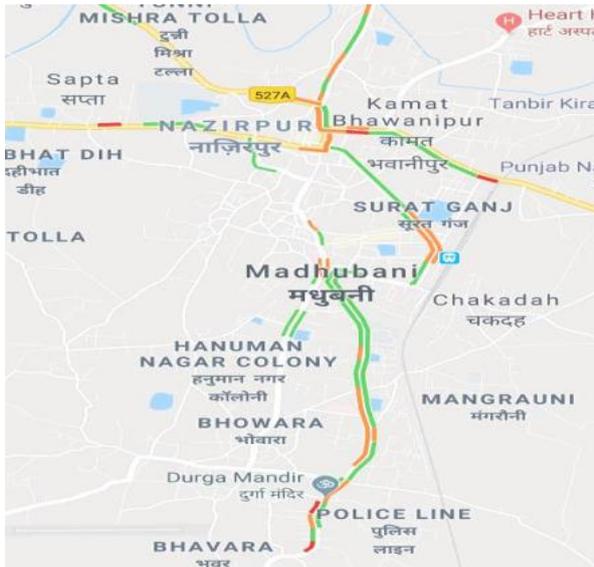

Fig.1. Study Area Traffic Route

The city has very less participation of public transport traffic for in/out through city to different destinations. Out of the total Madhubani population for 2011 census, 3.60 percent lives in semi-urban regions of district. In total 161,495 people lives in semi-urban areas of which males are 85,026 and females are 76,469. Though the Madhubani city is the key place for major marketing and employment of the district, there is always a huge traffic moving throughout the city. There are lots of road network on which the traffic condition is very serious, but there are certain roads with high traffic operations through-out the city. A study of the transport infrastructure for Madhubani is crucial for the understanding and analyzing micro level (within the different zones of the city – linkages between the different parts of city and the market).

### 3. METHODOLOGY

Traffic survey is the best method to collect the traffic data for the planning strategies. [HENSHER, 1982] If survey data is to be used to develop predictive models of travel and activity behavior, it therefore appears that longitudinal data, which can account for dynamic changes in behavior, is the preferred type of data to collect for further arguments to this effect. [JUSTO & TULADHAR, 1984] developed mathematical models to derive PCU values for vehicles on urban roads based on empirical data under mixed traffic flow. The PCU method have been adopted to convert the traffic survey data into a single unit for the uniformity of the traffic counts. DTO vehicle record also has been included for the data analysis. To analyze the Vehicular growth rate,

SPSS has been used to generate the equations of regression analysis. Traffic volume data is used to identify the road use pattern by analyzing the traffic volume data in SPSS for t-test.

### 4. DATA COLLECTION METHODOLOGY

#### 4.1. Traffic Volume Study

[Udit Batra, Mandar V Sarode, 2013] Traffic survey gives us the different analytical results such as traffic volume, road use pattern, future traffic growth, roadway capacity and Level of Service. After conducting traffic survey for the peak hour in morning & evening session on the roads identified (Thana Chowk Road) as the major traffic operations, traffic survey data summarized as shown in Table 1 & Table 2 for one of the roads among all the identified roads of major traffic operation. Figure 2 shows the variation of volume & PCU of different peak hour session wrt time on Thana Chowk Road. Likewise, traffic survey was conducted on all the roads and the data was used to analyze the various traffic related analysis.

Table.1. Motor Vehicle Volume for Thana Chowk Road in 1<sup>st</sup> Session

Time	09:00-09:15	09:15-09:30	09:30-09:45	09:45-10:00	10:00-10:15	10:15-10:30	10:30-10:45	10:45-11:00
Volume	116	124	130	151	139	119	118	113
PCU	96.1	95.8	86.9	109.1	89.7	86.9	101.7	93.7

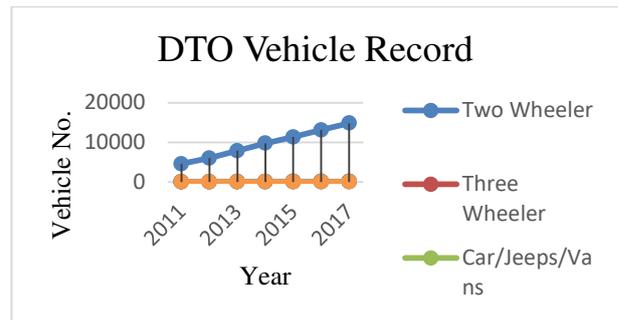

Fig.3. DTO Vehicle Record

5. DATA ANALYSIS & RESULT

5.1. Vehicular Growth Analysis

Vehicle growth rate signifies the growth of motor vehicle in the city. The maximum participation of the traffic movement in the city is the vehicle registered with the district transport authority. District transport authority have made available the data of the number of registered vehicles in the city. Refer Table.3. The significance of the analysis of motor vehicle registered data is to find the number of vehicles moving on the city road in the upcoming years. It will help in the estimation of the growth of the road network as per the vehicles moving on the road. Multiple regression analysis method best suit for this type of data analysis. MLR general expression:  $Y = a + bX$

$$b = (\sum XiYi - n\bar{X}\bar{Y}) / (\sum Xi^2 - n\bar{X}^2)$$

$$a = \bar{Y} - b\bar{X}$$

Mathematically, this formula can also be used for the data analysis, more ever, I had used SPSS for the analysis of the data. DTO Vehicle Data Record, the following regression analysis have been done and equations have been found for the different vehicle class shown in Table.4. Regression analysis of 2-wheeler vehicle is shown below. Likewise, regression analysis of all the category of vehicle have been done as given in Table.3.

Regression Analysis For 2-Wheeler:

Variables Entered/Removed<sup>a</sup>

Model	Variables Entered	Variables Removed	Method
1	VAR00002 <sup>b</sup>	.	Enter

a. Dependent Variable: VAR00001

b. All requested variables entered.

**Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.999	.999	.999	.06499

a. Predictors: (Constant), VAR00002

**ANOVA<sup>a</sup>**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	27.979	1	27.979	6623.391	.000 <sup>b</sup>
	Residual	.021	5	.004		
	Total	28.000	6			

a. Dependent Variable: VAR00001

b. Predictors: (Constant), VAR00002

**Coefficients<sup>a</sup>**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	8.456	.072		116.774	.000
	VAR00002	.001	.000	1.000	81.384	.000

a. Dependent Variable: VAR00001

**Model Summary and Parameter Estimates**

Dependent Variable: VAR00002

Equation	Model Summary					Parameter Estimates	
	R Square	F	df1	df2	Sig.	Constant	b1
1	.999	6623.391	1	5	.000	8.456	.001

Linear		6623.391	1	5	.000	-14668.000	1735.500

The independent variable is VAR00001.

Table.4. Regression equations for Vehicle growth rate

Sr.No.	Vehicle Class	Regression Equation
01	Two Wheelers	Y = -14668 + 1735.5 X
02	Three Wheelers	Y = -68.1 + 7.4 X
03	Cars, Jeeps, Vans	Y = -84.5 + 7.9 X
04	Tractors	Y = -62.3 + 8.3 X
05	LMV	Y = -51.4 + 4.8 X

After inserting the year (X) in the different equation shown in Table.4. for the specific vehicle class, we found the future number of vehicles estimated to be registered with district transport office and will be running on the roads of city as shown in Table.5.

Table.5. Future estimated vehicle record

Year	Two - Wheeler	Three - Wheeler	Cars, Jeeps, Vans	Tractors	LMV	Total	Growth Factor
2018	16571	65	58	87	35	16816	1.11726795
2019	18306	72	66	95	40	18579	1.10484062

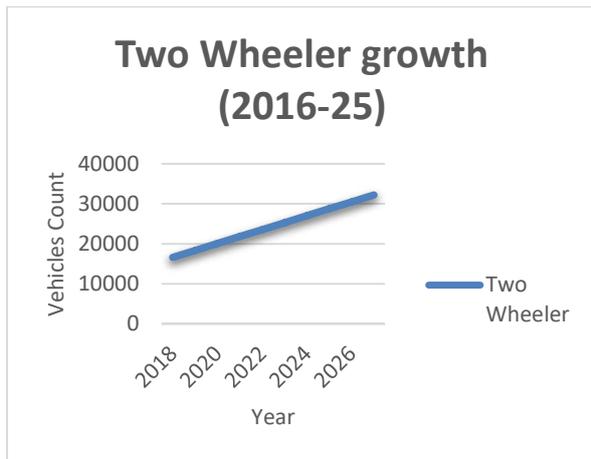

Fig.4. Two-Wheeler Growth (2016-25)

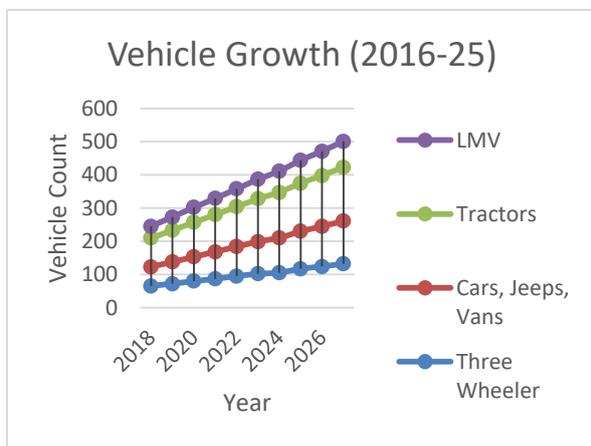

Fig.4. Vehicle Growth (2016-25)

It has been found that the average growth in the number of registered vehicles in the city will be 1.098. The Figure 3 & Figure 4 explains better the trends of future growth of vehicles.

**5.2. Road Use Pattern Analysis**

Road use pattern is the hypothetical analysis of the PCU generated on a particular stretch of road section during morning peak hour and evening peak hour. This study gives the analysis of the road use pattern with respect to the survey sessions. [Singh S. K., 2014] Road use pattern gives the analytical observation of the road section whether the pattern of road use by the motorist in morning peak hours is same of different with the evening peak hours. This method uses the researcher approach as the data is limited, Parametric test of two sample will be used as Paired t-test is perfect suit for the analysis of these types of data. At 5 % significance level, t-Critical should be 1.9146. We get t-stat valus 2.033. Now if t-stat will be greater than t-critical then the road use

pattern is different for the both sessions otherwise it will be same road use pattern in 1<sup>st</sup> session and 2<sup>nd</sup> session. The road use pattern of the different roads are shown in Table.6.

We have 8 number of samples so,

$$d.f. = (8+8-2) = 14.$$

For d.f. = 14 at 5 % significance level, the t-Critical is 1.9146.

**T-Test for Thana Chowk Road:**

**Paired Samples Statistics**

	Mean	N	Std. Deviation	Std. Error Mean
Paired Sample 1 PCU in 1st Session	94.9875	8	7.62092	2.69440
Paired Sample 2 PCU in 2nd Session	83.6125	8	12.28791	4.34443

**Paired Samples Correlations**

	N	Correlation	Sig.
Paired Sample 1 PCU in 1st Session & Paired Sample 2 PCU in 2nd Session	8	-.221	.600

**Paired Samples Test**

	Paired Differences					t-stat	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference			
				Lower	Upper		
Paired Sample 1 PCU in 1st Session - Paired Sample 2 PCU in 2nd Session	11.37500	15.82392	5.59460	-1.85413	24.60413	2.0337	.082

Table.6. Road Use Pattern Analysis

Sr.No.	Road Section	Significant/Not Significant	Type of Pattern
01	Thana Chowk	Not Significant	Different

	Road		
02	Neelam Chowk Road	Significant	Same
03	Bata Chowk Road	Significant	Same
04	Churi Bazaar Road	Significant	Same
05	Mahila College Road	Not Significant	Different
06	Railway Station Road	Not Significant	Different
07	Ganga Sagar Chowk Road	Significant	Same
08	Old Bus Stand Road	Significant	Same
09	Bara Bazaar Road	Significant	Same
10	Chavaccha Mor	Significant	Same

## 6. CONCLUSION

It has been concluded that at peak hour the traffic volume is very much in morning session i.e. 402.7 PCU/hr and in evening session i.e., 372.5 PCU.hr which is slightly more than the normal capacity of smooth traffic operation which cause traffic congestion. By the continuous growth in vehicles at a rate of 1.098 per year, market area road has not been extended cause the major congestion. Traffic volume data is very helpful for identifying the road use pattern of traffic during both peak hours. The major roads have different road use pattern for example; Mahila college road & railway station road which means the road use demand varies from morning session to evening session. Traffic growth analysis is very important for the future planning of transport facilities. Road use pattern helps to identify the trends of usability of roads during different peak hours which helps in identifying the roads used for diversion of traffic during the congestion hours.

## Abstract

Road network management is an important task for the development of any city. As no exact model of traffic flow exists due to its high complexity and chaotic Organisation, researchers mainly try to predict traffic using simulations. Simulation is a best practical method to plan for the proper road & traffic management. In this study, the road networks of Madhubani city has been integrated in SUMO. Open street map used for the map creation of the city road network. The various road networks and vehicles on the road as per traffic data have been taken as input and simulated in SUMO. Through this simulation, better traffic signal planning has also been discussed. It has been observed that the road & transport integration is not suitable at large scale as the city don't have multimodal transport facility.

**Keywords:** Simulation, Integration, SUMO, Traffic.

## I. INTRODUCTION

In order to decrease the travel time, reduce traffic congestion & to integrate the various traffic routes, Simulation of Urban Mobility (SUMO) traffic simulation tool is used to simulate the traffic studies. SUMO was developed by The German Aerospace Center as a traffic simulation tool and it is an open source, highly portable, microscopic road traffic simulation package. SUMO is licensed under the GPL. As the simulation is multi-modal, which means that not only are car movements within the city modelled, but also public transport systems on the street network, including alternative train networks, the atomic part of the simulation is a single human being.[Sanjiv K. Shukla & Anupam Agrawal, 2015] In the Indian context other vehicles are also used on the road such as Auto Rickshaws, Man pulled Rickshaws, Motorbike also some time roaming of domestic animals on the road. This is great a challenge to consider those parameters and model the computer traffic simulation and also in the real traffic management.

SUMO helps to prepare and perform the simulation of a traffic scenario along with traffic simulation [Krajzewicz D. et. al., 2012]. SUMO utilizes a variant of Gipps car model namely Krauss car model for the simulation in default which is based on safety conditions derived from braking distances of the individual vehicle. In Krauss model, between car drivers is described using the maximum safe velocity ( $V_{safe}$ ). The formula is given in equation as below:

$$v_{safe} = (v_{n+1}(t) + \{(g_n(t) - v_{n-1}(t)\tau) / ((v_n(t) + v_{n+1}(t)) / 2b) + \tau\})$$

Where:

$$g_n(t) = x_{n-1}(t) - x_n(t) - s$$

$$v_{des} = \min\{v_n(t) + a.\Delta t, v_{safe}, v_{max}\}$$

$$v_n(t + \Delta t) = \max[0, \text{rand}\{v_{des} - \epsilon a, v_{des}\}]$$

The position of the vehicle is denoted by index 'n' and predecessor vehicle has higher index. So, in the traffic, leading vehicle has the highest index. The maximum acceleration (a), deceleration (b), and jammed spacing (s) are assumed constant. The distance between two vehicles is denoted by  $g_n(t)$ , vehicle desired speed ( $v_{des}$ ) expresses how big the desire of drivers to accelerate their vehicle with a maximum speed, and the time step ( $\Delta t$ ) is assumed to be equal to the reaction time ( $\tau$ ). In the randomization step, each vehicle will be slowed down by random amount that is distributed between 0 and  $\epsilon a$ , where  $\epsilon$  is a value between 0 and 1.

Four step simulation model is used to proper run the simulation on SUMO as follows:

- I. In the first step, the network building is required in the XML format. It includes the road network, intersection or junction and traffic lights.
- II. In the second step, demand file is required to create. It includes the physical property of vehicles such as type of vehicle, acceleration, deceleration, the length of the vehicle and maximum speed.
- III. In the third steps, the computation of dynamic use assignment is required. Dynamic user assignment is a traffic assignment which the assumption of the OD-matrix and the link flows are to be time dependent. It also simulates updated route choice.
- IV. The last step is to run the simulation. The simulation can be run if the file contains the network, the information of routes that will be used in the simulation, the time period when the simulation will begin and end.

With all information, the simulation can be performed in order to get a base model that will be applied to the simulation scenario [Leksono C. Y. and Andriyana, T., 2012].

Additionally, NETCONVERT tool is used in this study for the generating road network from the XML file. NETCONVERT is a command line tool and it is developed in C++ language. It can import digital road networks from different sources and generates road networks that can be used by other tools including SUMO [66].

## II. METHODOLOGY

SUMO tool requires various data set such as road geometry of the city, traffic flow and turning movement, queue length of each section in a certain time period, travel time data which is used for calibration. Open Street Map website was utilized to obtain the road geometry data of Madhubani. The Open Street Map website provides facility to save street data on OSM file format. The .OSM file format is specific to Open Street Map. It is coded in XML and contains geographical data in a structured, ordered format. Open Street Map contains only the street structure for the Madhubani city. Therefore, the Google map was used to validate and for proper naming of the street. SUMO uses the road network structure file in the XML file format; hence,

NETCONVERT tool was utilized to convert OSM files into road network structure file format. Fig. 5.3 shows the road network structure which was extracted from open street map and converted as desired format. Traffic flow data were collected by observation of the study location by traffic survey. In these regards, the major entry and exit points were identified and data were collected during the peak traffic hours 9:00 AM to 11:00 AM and 04:00 PM to 06:00 PM. The overall traffic flow was estimated on based that. Similarly, queue length and travel time data were collected.

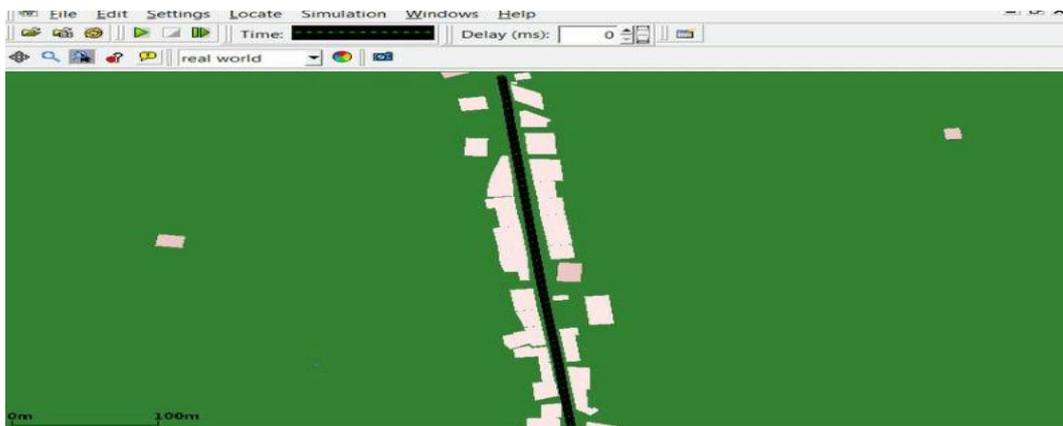

Fig.5.1. Road network development in SUMO for Station Road

The route data is also required for the simulation on SUMO which contains a basic property of the vehicles such as length, acceleration and deceleration, and maximum speed of the vehicle. In this regard standard properties of vehicles were considered.

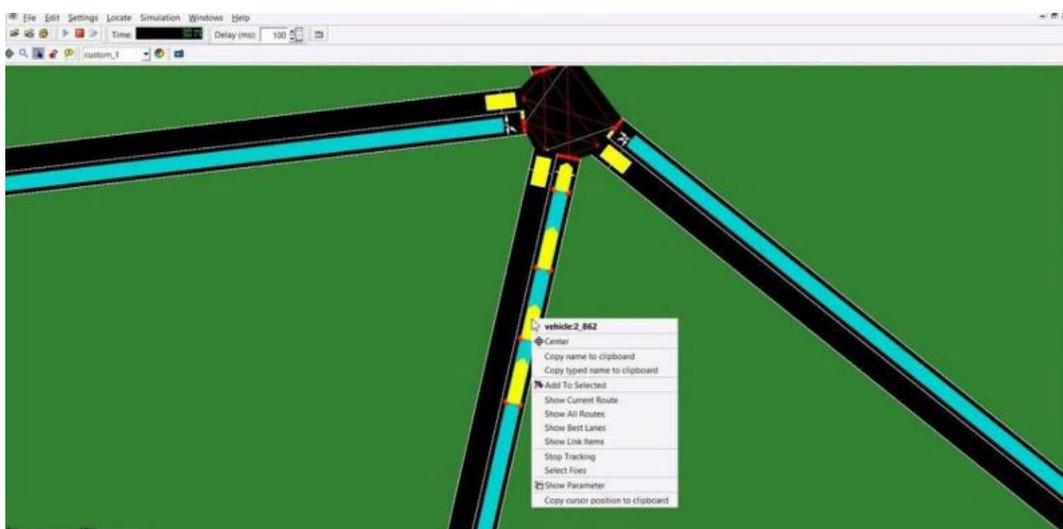

Fig.5.2. Road network development in SUMO for Thana Chowk Road

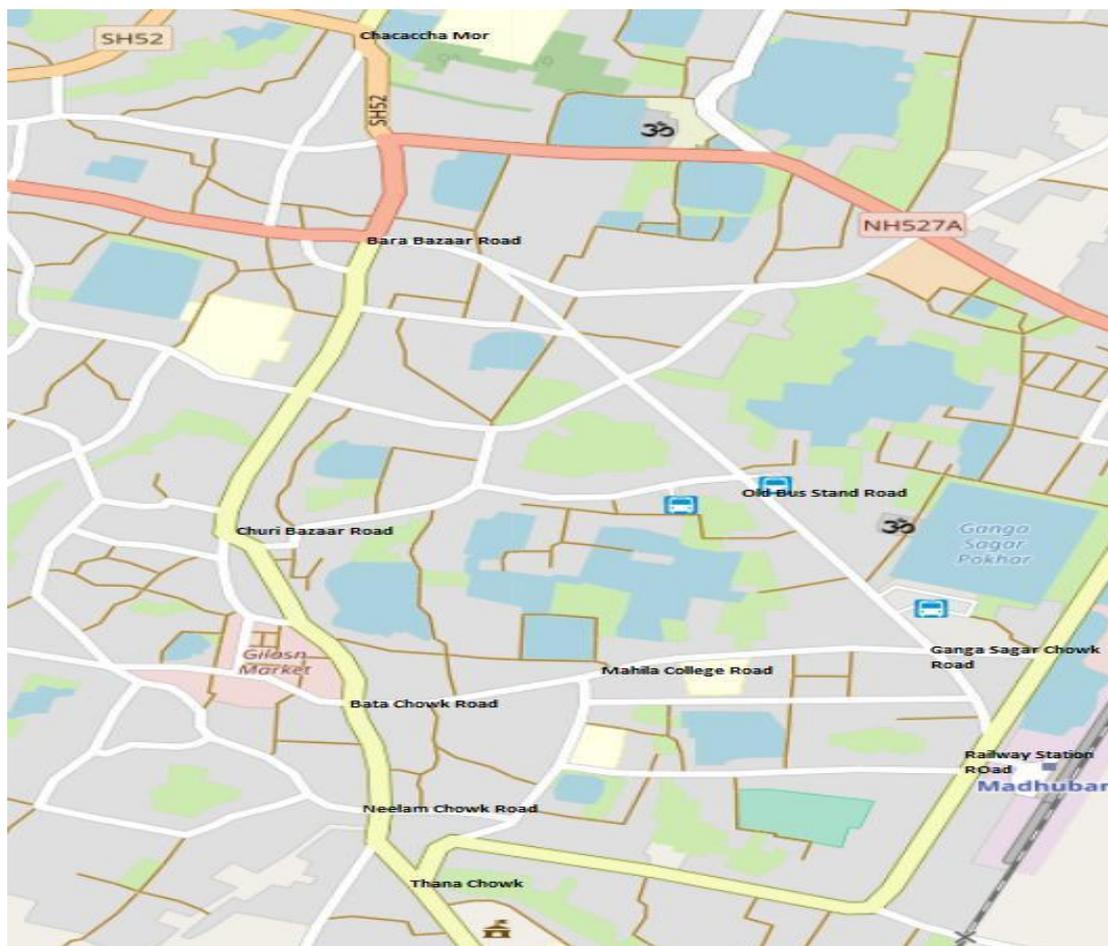

### III. EXPERIMENT

The simulation was performed in SUMO version 0.22.0 by considering the above-mentioned data set.

The experiment was performed as per the following step:

- i. In the first step network was built.

- ii. In the second step demand modeling was performed in this regard's vehicle characteristics were supplied.
- iii. In the last step configuration file was developed. It contains the network file and demand file.
- iv. This file was saved with extension of sumo.cfg. This configuration file was supplied to SUMO to observe the simulation result.
- v. Further, calibration process was performed to identify the possible better parameters. It can be several parameters which will adjust to find the optimal value in trail process. It can be used for the allowable minimum distance between two vehicles, maximum acceleration, road speed limit (sigma), and the drivers' reaction time (tau). The initial model before the adjustment parameter is taken from the [Maciejewski. M., 2010] research work for the calibration purpose and it is shown in the Table 5.1.

**Fig.5.3. Map of Road Network for Simulation**

**Table.5.1. Initial Model Before Adjustment**

V Type	Len (m)	Speed (m/s)	Min. gap (m)	Car Following	Max. Acc. (m/s <sup>2</sup> )	Sigma	Tau (s)
Car	5	27.78	2	Krauss	5.50	0.50	1
Bus	15	27.78	3		5.50	0.50	1
Truck	10	27.78	3		5.50	0.50	1

#### IV. RESULT & CONCLUSION

Following results for simulation & road network integration were observed & suggested through SUMO:

- i. Alternative scenario was developed and it was found traffic congestion reduced when some traffic diverts into Jaldhari Chowk (NH527A) Road high rather than Old Bus Stand Road for traffic approaching Bara Bazaar & Chavacchamor exit.
- ii. Similarly, we can divert route through Nidhi Chowk – Stadium Road – Maharaj Gunj Road – Gandhi Chowk – Rahika Road for the traffic which is meant to reach to the destination towards Rahika-Jaynagar road.
- iii. Traffic signals were designed for Ganga Sagar Road as shown in Fig.5.4.

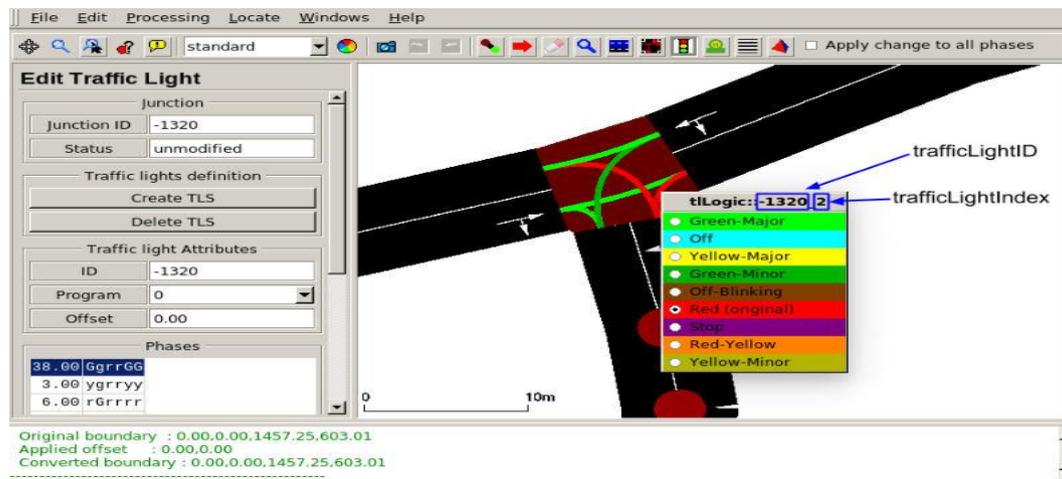

Fig.5.3. Traffic Signal Design for Ganga Sagar Road

- iv. In order to reduce traffic congestion in road network Thana Chowk-Neelam Chowk-Bata Chowk-Churi Bazaar-Thana Chowk, personal four-wheeler vehicle entry should be restricted and this road network should be integrated with the public transport preferably e-rikshaws or autos.
- v. Road network for airport connectivity also to be integrated through stadium road which may not disturb the traffic of the city area.
- vi. Multilevel traffic integration is not suggested and is also not feasible upto larger extent because, there is very less movement of multimodal transport throughout the city.

## Abstract

Steel corrosion is the main source of damage and early failure of reinforcement concrete structures that in turns create huge economical loss and creating environmental problems. In the past, several corrosion assessment techniques such as potential measurement, gravimetric weight loss measurement, electrical resistivity measurement, sensors and electrochemical methods for instance potentiodynamic polarization, linear polarization resistance, galvanostatic pulse, and electrochemical impedance have been developed to detect corrosion condition of steel in concrete. Though the potential measurement, resistivity measurement and sensors can only provide the qualitative information about the steel corrosion. The weight loss measurement is an efficient technique for corrosion rate measurement of steel, but it is destructive and requires long exposure times. The electrochemical techniques are non-destructive in nature and are used to determine corrosion rate of steel in laboratory as well as field studies. However each of these methods possesses certain advantages and limitations, therefore a combination of these techniques is recommended to use to obtain the corrosion condition of steel. As far as corrosion control techniques for steel reinforced concrete are concerned, several methods such as cathodic protection, electrochemical chloride extraction, surface treatments of the steel, surface treatment of concrete, utilization of mineral admixtures and chemical corrosion inhibitors have been developed in the past. Each of these methods offers some advantages and disadvantages. Thus, more researches are required to develop such methods of corrosion protection of steel that are economical, durable, environment-friendly and do not cause any adverse effect on the structural performance of concrete and steel.

## 1 Introduction

Prior to the invention of cement, mortars were made by mixing water, sand and slaked lime [1]. John Smeaton discovered hydraulic lime mortars in 1754 [2]. A British mason named Joseph discovered the cement in 1824 and filed the first patent on Portland cement [3]. However, the objects prepared with the use of Portland cement were extremely brittle and incapable to tolerate shocks. Joseph Monier, a French gardener in 1867 made flowerpots with embedded iron nails and consequently observed a remarkable enhancement in the durability of his pots. Afterward, efficient scientific developments in concrete manufacture took place. In

1911, American Society for Testing and Materials (ASTM) formulated a detailed specification for the utilization of steel in concrete [4]. Subsequently, various developments ensued in designing the steel reinforcement bars in order to produce stronger and durable concrete structures. Consequently, the steel-reinforced concrete became the most widely used structural material in the world because of its economical, strength and durability properties. Steel-reinforced concrete structures were viewed as maintenance-free and unlimited service life until the mid-1970s. Conversely, since then, several durability related problems have emerged, such as alkali-silica reactions, sulphate attacks and corrosion of steel reinforcement. Among all durability related problems in steel-reinforced concrete structures, corrosion of steel reinforcement has been recognized as the main source of deterioration [5].

Generally, the corrosion affects our daily lives directly as well as indirectly. In direct, it shortens the useful service

✉ Md Daniyal  
daniyalzhcet@gmail.com

<sup>1</sup> Department of Civil Engineering, Aligarh Muslim University, Aligarh, India

life of our goods. In indirect, the manufacturer and provider of goods and services incur costs of corrosion from the clients. In particular, the corrosion of reinforcing steel bar in concrete results the collapse of bridges, failure of a part of highways, damage to buildings, and parking structures, etc. consequently endangers public safety and requires considerable repair costs. For instance, the unexpected collapse of the Silver Bridge over the Ohio River at Point Pleasant due to corrosion fatigue in 1967 resulted in deaths of 46 people and cost millions of dollars [6]. Therefore, in order to estimate the cost of corrosion in the United States (US), a study entitled “Corrosion Costs and Preventive Strategies in the United States” was conducted with the help of Federal Highway Administration (FHWA) and National Association of Corrosion Engineers (NACE) International, from 1999 to 2001 by CC Technologies Laboratories. This investigation estimated the average direct cost of corrosion of \$8.3 billion per year for highway bridges alone and the total corrosion cost of US industries was estimated to \$276 billion annually, which is approximately equal to 3.1% of the US Gross Domestic Product (GDP) [7]. In 2014, a study entitled “International Measures of Prevention, Application, and Economic of Corrosion Technologies (IMPACT)” was initiated by NACE International and conducted by Det Norske Veritas (DNV), Germanischer Lloyd (GL), and American Productivity and Quality Center (APQC) and its industry and technology partners worldwide. From this study, the cost of corrosion at the global level is estimated to be \$2.5 trillion per year, which is about 3.4% of the global GDP in 2013 [8]. Hence, from the safety and economical perspective, the corrosion of steel reinforcement is very serious problem that can affect the sustainability of the steel-reinforced concrete structures directly. Numerous studies have been conducted worldwide in order to extend service life of steel reinforced concrete structures; regardless of this, several aspects are still not well known, and there is the requirement to incorporate present facts into practical field.

In this paper, an attempt has been made to review the studies pertaining to corrosion of steel reinforced concrete conducted by various investigators. The paper is organized in two major thematic sections. In the first section, an

overview of various corrosion monitoring techniques for steel reinforced concrete has been undertaken. The second section includes studies related to the different corrosion control methods for steel reinforced concrete.

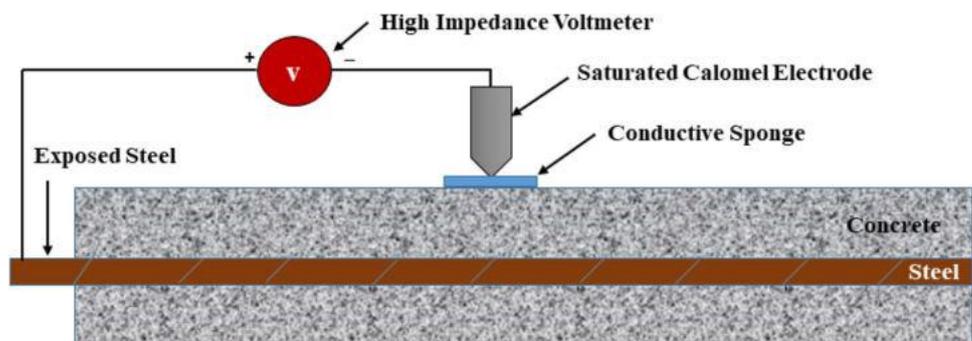

## 2 Corrosion assessment techniques

The maintenance and repair of steel reinforced concrete structures for their safety needs effective monitoring and inspection methods for evaluating the corrosion of steel reinforcement. These methods need to be able to identify any probable durability problems within structures before they become severe. Since the corrosion of steel reinforcement occurs through electrochemical reactions involving charge (electrons) transfer via concrete pore solution (electrolyte), electrochemical methods are appropriate to study the corrosion processes. In this section, some electrochemical and non-destructive techniques commonly used for monitoring the corrosion of steel in concrete structures have been discussed. Further, a destructive technique viz. the gravimetric weight loss method and corrosion monitoring using sensors have been reviewed.

### 2.1 Open circuit potential measurement

The basic principle involved in this method is the measurement of corrosion potential (also called half-cell potential or open circuit potential) of steel reinforcement with respect to a standard reference electrode (RE) such as copper/copper sulphate electrode (CSE), silver/silver chloride electrode (SSCE), standard hydrogen electrode (SHE) and Saturated Calomel Electrode (SCE). The reference electrode has a predetermined potential. For example, the SCE has a potential of + 242 mV vs. the SHE (assumed potential of 0.0 V) at room temperature. The schematic diagram for open circuit potential ( $E_{OC}$ ) measurement is shown in Fig. 1 [9]. In accordance with ASTM C 876, the probable corrosion conditions of steel reinforcement related with  $E_{OC}$  values is presented in Table 1 [10].

**Fig. 1** Illustration of  $E_{OC}$  measurement technique [9]

**Table 1** Corrosion risk of steel reinforcement associated with  $E_{OC}$  values [10]

$E_{OC}$ values				Corrosion risk
(mV vs. CSE)	(mV vs. SSCE)	(mV vs. SHE)	(mV vs. SCE)	
< - 500	< - 406	< - 184	< - 426	Severe
< - 350	< - 256	< - 34	< - 276	High
- 350 to - 200	- 106 to - 256	+ 116 to - 34	- 126 to - 276	Intermediate
> - 200	> - 106	> + 116	> - 126	Low

The open circuit potential ( $E_{OC}$ ) of a steel is a measure of its tendency to corrode. However, these  $E_{OC}$  values are not sufficient criterion, as they are affected by many factors, such as polarization by partial diffusion of  $O_2$ , porosity of concrete and the existence of resistive layers. Therefore, it is commonly believed that  $E_{OC}$  measurement must be complemented by other techniques [11]. This technique is very useful in identifying the anodic and cathodic locations in steel–concrete structures by drawing potential map. Numerous investigators have studied the effectiveness of this method and got advantageous outcomes [12–14]. However,  $E_{OC}$  values can provide information for degree of corrosion risk only and cannot specify the corrosion rate [15].

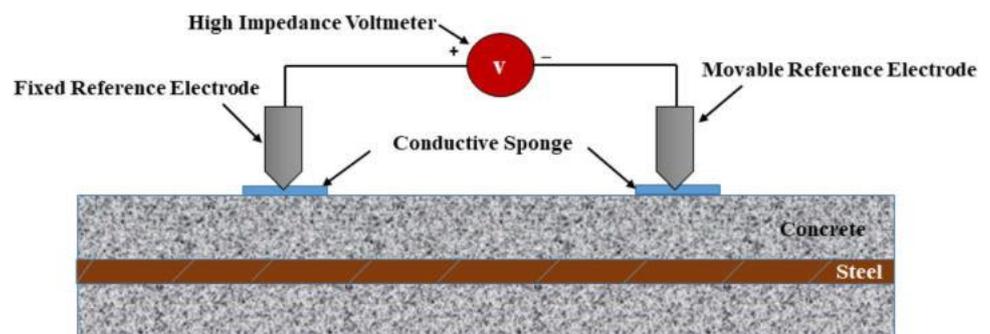

## 2.2 Surface potential measurement

This is another useful non-destructive method to identify the condition of steel embedded in concrete. In this method, two reference electrodes are used as shown in Fig. 2 [9]. One electrode is kept fixed (called fixed electrode), the other electrode (called movable electrode) is moved along the structure on the nodal points. When movable electrode is placed at the nodal points, the potential is measured against the fixed electrode by means of a high impedance voltmeter. A more positive potential value signifies anodic region where corrosion is possible. The higher the potential difference between anodic and cathodic zones higher is the possibility of corrosion. Therefore, surface potential measurement is used for detecting anodic and cathodic areas in steel–concrete structures and ultimately identifying the possibility of corrosion of steel in concrete [9].

Although potential measurement techniques (open circuit potential and surface potential measurements) have been used extensively, some of their limitations has described as follows:

- The measured potential difference between the reference electrode and the steel in concrete depends on the corrosion condition of the steel and on the type of reference electrode used [16].
- A simple comparison of the measured potential values with the ASTM recommendations on probability of steel rebar corrosion could not be useful. This is because of the fact that a more negative value of potential, which is usually considered to specify a greater possibility of corrosion, may not be valid always as several factors can change the potential values towards more negative or positive values [17].
- While performing the potential measurements, potential values should be interpreted according to the resistivity of the steel reinforced concrete system. Otherwise, the outcomes can be misrepresentative for the same degree of corrosion. Thus, one can get different potential readings at the surface of concrete, corresponding to different values of resistivity, and consequently have more than one probability for the same condition of corrosion [18].

On account of the above limitations, the use of potential measurements is considered as the first methodology for detection of corrosion, and thus requires to be complemented with other non-destructive methods for advance diagnosis.

**Fig. 2** Schematic diagram of surface potential measurement [9]

### 2.3 Potentiodynamic and cyclic polarization

The recent theory of electrochemical corrosion is based on electrode kinetics. The corroding system wherein a single anodic reaction and a single cathodic reaction take place on a single electrode surface, the relationship of the current as a function of potential can be written as Eq. (1). This equation is derived by the application of the mixed potential theory and Butler-Volmer equation [19–21]:

$$i = i_{\text{corr}} \left[ \exp \left\{ \frac{2.303(E - E_{\text{corr}})}{\beta_a} \right\} - \exp \left\{ \frac{-2.303(E - E_{\text{corr}})}{\beta_c} \right\} \right] \quad (1)$$

where,  $i$  = external current density ( $\text{A}/\text{cm}^2$ ),  $E$  = potential applied to polarize the corroding system (V),  $E_{\text{corr}}$  = corrosion potential (V),  $i_{\text{corr}}$  = corrosion current density ( $\text{A}/\text{cm}^2$ ),  $\beta_a$  = anodic Tafel constant (V/decade),  $\beta_c$  = cathodic Tafel constant (V/decade). However, when  $E$  is far away from  $E_{\text{corr}}$  then the Eq. (2) gives the Tafel equation [22]:

$$E = a \pm b \log |i| \quad (2)$$

where,  $a$  = a constant and  $b = \beta_a$  or  $\beta_c$

The Eq. (2) shows that the variation of the logarithm of the external current density with the potential is linear at high overpotential. The  $i_{\text{corr}}$  can be calculated by extrapolating the anodic and cathodic straight lines of  $E$  vs.  $\log |i|$  plot at the  $E_{\text{corr}}$ . Moreover, the  $E$  vs.  $\log |i|$  plot and various corrosion kinetic parameters can be determined easily by conducting potentiodynamic and cyclic polarization test using inbuilt software provided by the potentiostat manufacturer. A potentiostat is a specifically designed instrument that measures the potential/current characteristics of an electrochemical (electrode/solution) interface [23].

In order to perform the potentiodynamic or the cyclic polarization scan, three electrodes, electrolyte (testing solution) and a potentiostat are required. The electrodes include a working electrode (the test sample itself), a counter or auxiliary electrode (used to transport the current to the working electrode and to close the electrical circuit) and a reference electrode (used to measure the potential difference). In order to conduct the scan, these electrodes are to be immersed in the electrolyte and attached to the potentiostat [13, 14]. Moreover, the potentiostat is a device that is used to apply potential and record the induced current or vice versa. More explicitly, both controlled-current (Galvanostatic) and controlled-potential (Potentiostatic) polarization can be applied. The term ‘polarization’ means the perturbation of the potential of a sample in electrolyte from its open circuit potential ( $E_{\text{oc}}$ ). This can be done by two ways, i.e. when the polarization is accomplished galvanostatically, potential is measured and when it is achieved potentiostatically, current is measured. However, the potentiostatic method is much

more common than galvanostatic method. The response (i.e., resulting current) of the sample is measured as it is polarized. The response is used to develop a model of the sample’s corrosion behaviour [9].

The potentiodynamic polarization is used to study the corrosion behaviour and to calculate the different corrosion parameters such as corrosion current density ( $i_{\text{corr}}$ ) of a corroding system in a certain environments. In a usual potentiodynamic scan, the potential ( $E$ ) is swept over a fixed range by potentiostat and the induced current is recorded as a function of potential. The graphical output of a potentiodynamic scan is referred to as Tafel plot (named after Swiss chemist Julius Tafel), which is a plot of the potential ( $E$ ) versus the logarithm of the current density ( $\log |i|$ ). In order to perform several tests on one sample (i.e., non-destructive test) the scan range should be within the Tafel region. Applying excessive anodic potential will force the system to corrode (i.e. destructive testing) [1, 15].

The analysis of Tafel plots is performed by corrosion test software (such as Gamry Instruments, ACM Instruments etc.). The corrosion parameters (such as  $E_{\text{corr}}$ ,  $i_{\text{corr}}$ ,  $\beta_a$ , and  $\beta_c$ ) are determined by intersecting the open circuit potential ( $E_{\text{oc}}$ ) and the extrapolation of the linear portions of logarithmic current plot as shown in Fig. 3 [12, 16]. Knowing the corrosion current density ( $i_{\text{corr}}$ ) the corrosion rate (CR) can be calculated using Eq. (3) [28]. Though, this can also be estimated by corrosion test software provided by potentiostat manufacturer.

$$\text{CR} = \frac{i_{\text{corr}} \times K \times (\text{EW})}{d \times A} \quad (3)$$

where, EW (equivalent weight) = Theoretical mass of metal that will be lost from the sample after one Faraday of anodic charge has been passed ( $\text{EW} = \text{atomic weight}/\text{valence}$ ),  $i_{\text{corr}}$  = corrosion current density ( $\text{mA}/\text{cm}^2$ ),  $K$  = a constant that defines the units for the corrosion rate (for CR in mm/

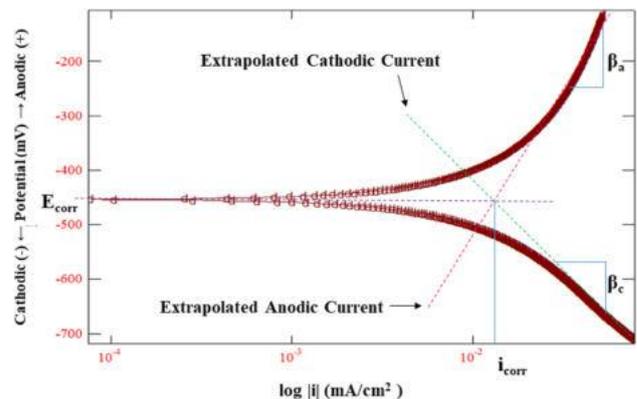

Fig. 3 Typical potentiodynamic polarization curve [12]

year (mmpy),  $K = 3272$ ; and CR in milli-inches/year (mpy),  $K = 1.288 \times 10^5$ ,  $d =$  density ( $\text{g}/\text{cm}^3$ ),  $A =$  specimen area ( $\text{cm}^2$ )

The cyclic polarization test is used primarily to study the pitting corrosion behaviour of metal in a certain environmental condition. Therefore, in this test, sufficiently high anodic potential is to be applied to ensure initiation of pitting corrosion. As soon as the scan is reached at anodic potential limit  $E_{\text{rev}}$  (reverse potential), the path of the scan is reversed on the way to the cathodic direction until the ultimate predetermined potential is reached. The potential at the scan plot in which the induced current sharply increases is called the pitting potential ( $E_{\text{pit}}$ ). The potential on the reverse scan where the loop closes is called the protection potential ( $E_{\text{prot}}$ ), below which no pitting corrosion is likely to take place. If the  $E_{\text{prot}}$  is more positive than the  $E_{\text{pit}}$ , then pitting will not occur. Though, pitting could occur if the  $E_{\text{prot}}$  is more negative than the  $E_{\text{pit}}$ . In general, the extent of the hysteresis loop indicates the degree of pitting tendency. The greater the loop size, the higher the pitting tendency and vice versa. Figure 4 shows a detailed cyclic polarization scan curve [29–31].

In this technique, the conductivity of the electrolyte (environment) plays very important role. The resistance of electrolyte lowers the potential between the reference electrode and working electrode and can cause errors in the readings. This aspect has significant effects on the interpretation, and should be compensated. Therefore, this factor should be considered while performing the potentiodynamic cyclic polarization measurement.

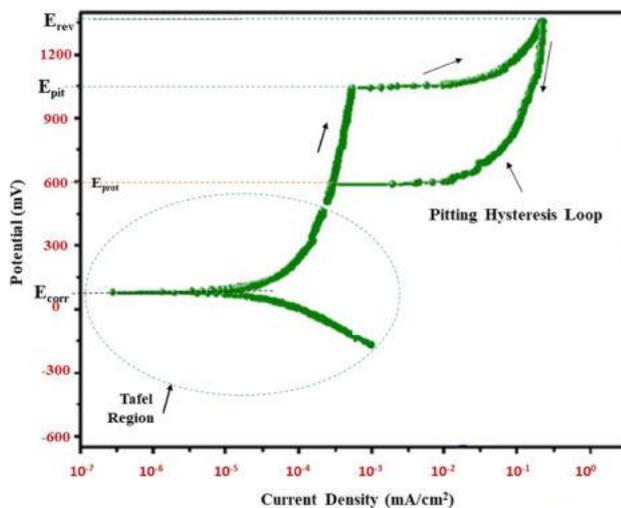

Fig. 4 Typical cyclic polarization curve [29]

## 2.4 Linear polarization resistance

The linear polarization resistance (LPR) technique can be applied in both field and lab measurements. It is a direct current (DC) technique, first introduced by Stern and Geary in 1957 [32–34]. In this technique, a small polarization perturbation (between 10 and 30 mV) is applied about  $E_{\text{OC}}$  of metal using a potentiostat and the resulting induced current is recorded. Although, the corrosion is an electrochemical process and does not comply with the Ohm's law (i.e. linear relationship between current and potential). However, it has been found that Ohm's law will be nearly true if polarization potential is very small [35]. Since in this method the applied potential is small, therefore the current response will be linear. A typical potential and current density (obtained by dividing the current response by known surface area of working electrode) plot is shown in Fig. 5 [25, 26].

The slope of the potential–current density plot near  $E_{\text{OC}}$  is defined as linear polarization resistance ( $R_p$ ) [38]. In case of steel reinforced concrete system, the  $R_p$  includes the concrete resistance ( $R_c$ ) and charge transfer resistance ( $R_{ct}$ ). Thus, linear polarization can be estimated as follows [28, 29]:

$$R_p = \frac{\Delta E}{\Delta i} = R_c + R_{ct} \quad (4)$$

The corrosion current density is then determined using the Stern–Geary formula:

$$i_{\text{corr}} = \frac{B}{R_p} \quad (5)$$

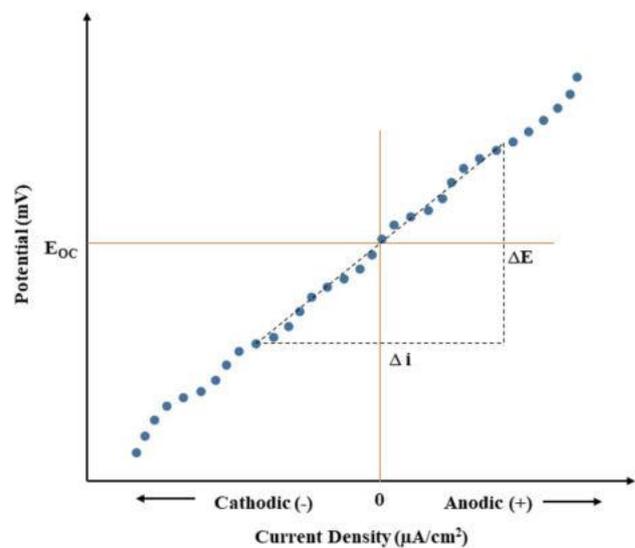

Fig. 5 Typical linear polarization plot [25]

where,  $i_{\text{corr}}$  is the corrosion current density ( $\mu\text{A}/\text{cm}^2$ ),  $R_p$  is the polarization resistance ( $\text{k}\Omega \text{ cm}^2$ ) and  $B$  can be calculated by the following relationship:

$$B = \frac{\beta_a \times \beta_c}{2.3(\beta_a + \beta_c)} \tag{6}$$

where,  $\beta_a$  and  $\beta_c$  are the anodic and cathodic Tafel constants in mV/decade, respectively.

The Tafel constants are usually obtained from Tafel plot (by polarizing the steel to  $\pm 250$  mV of the  $E_{\text{OC}}$ ). However, in the absence of necessary data on  $\beta_a$  and  $\beta_c$ ,  $B = 26$  mV (for actively corroding steel in concrete) and  $B = 52$  mV (for steel in passive situation) is used to compute the corrosion current density [41]. Moreover, the corrosion current density is inversely proportional to the linear polarization resistance. Hence, high polarization resistance value indicates low corrosion rate, and vice versa.

In order to carry out the linear polarization resistance investigation, similar to the potentiodynamic and cyclic polarization test, three electrodes are to be connected to a potentiostat. These are the working electrode (corroding metal), the auxiliary (counter) electrode and the reference electrode [35].

Several investigation has used a corrosion current density limit of 0.1–0.2  $\mu\text{A}/\text{cm}^2$  to distinguish between passive and active corrosion state of steel embedded in concrete [31, 32]. In addition, many study reported different limits (in terms of corrosion current density, linear polarization resistance and corrosion penetration rate) in order to separate the different degree of corrosion risk associated with steel reinforcement, as listed in Table 2 [1, 24].

Even with complexities, the LPR measurements method pose several complications in high resistivity media, for instance those encountered in huge steel reinforced concrete structures. Noteworthy amongst such complications has been described as follows, which may even render the in situ measurement extremely inaccurate.

- a. The resistance of concrete between the steel rebar (working electrode) and the reference electrode is very high. This offers a potential drop generally referred to as an

Ohmic drop and that must be either compensated externally or removed mathematically.

- b. The counter electrode being smaller compared to the sample, the distribution of the applied electrical signal for polarisation of the steel rebar is non-uniform throughout the cross-section of the sample.

### 2.5 Electrochemical impedance spectroscopy

This technique is also known as alternating current (AC) impedance spectroscopy, because in this method, an AC excitation potential with variable frequencies is applied to the specimen (working electrode) and the induced AC current response is measured. The AC excitation potential should be very low (usually between 5 and 20 mV) in order to retain in the linear zone and to perform non-destructive testing. In the linear zone, the AC current (induced) will have the different amplitude and identical frequency as the applied AC excitation potential, but with a phase difference. The impedance (that includes real and imaginary parts) is the ratio of AC potential to AC current, and can be calculated from the following relationships [33, 34]:

$$Z = \frac{E(t)}{I(t)} = \frac{E_0 \text{Cos}(\omega t)}{I_0 \text{Cos}(\omega t - \Phi)} = Z_0 \frac{\text{Cos}(\omega t)}{\text{Cos}(\omega t - \Phi)} \tag{7}$$

$$Z = Z_0 [\exp(j \cdot \Phi)] = Z_0 (\text{Cos}\Phi + j \cdot \text{Sin}\Phi) = Z' + jZ'' \tag{8}$$

where,  $Z$  = complex impedance,  $E(t)$  = potential at time  $t$ ,  $I(t)$  = current at time  $t$ ,  $E_0$  = potential amplitude,  $I_0$  = current amplitude,  $\omega$  = radial frequency,  $\Phi$  = phase difference between potential and current,  $Z_0$  = magnitude of complex impedance,  $j = \sqrt{-1}$

The real part ( $Z'$ ) and imaginary part ( $Z''$ ) of the impedance ( $Z$ ) represent resistive and capacitive/inductive terms respectively. The graph of  $Z'$  on the abscissa and  $Z''$  on the ordinate, measured at various frequencies (usually between 100 kHz and 10 mHz) is called as impedance spectrum or impedance graph or Nyquist plot. In order to determine various parameters (such as solution resistance, charge transfer resistance and double layer capacitance), the Nyquist plot has to be fitted and modelled with an equivalent electrical circuit that indicate the electrochemical processes at the specimen. Particularly in the steel reinforced concrete specimens, various equivalent circuits have been suggested due to complex nature of the steel–concrete interface. The simplest electrochemical equivalent circuit known as Randles circuit shown in Fig. 6 can be used for modelling the typical Nyquist plot shown in Fig. 7 [46–48].

The equivalent circuit comprises of a resistance  $R_c$  linked in series to a loop that contains a different resistance  $R_{ct}$  and a capacitance  $C_{dl}$  joined in parallel. The  $R_c$

**Table 2** Typical corrosion criteria of steel embedded in concrete [1, 24]

Corrosion condition	Polarization resistance ( $\text{k}\Omega \text{ cm}^2$ )	Current density ( $\mu\text{A}/\text{cm}^2$ )	Corrosion penetration rate ( $\mu\text{m}/\text{year}$ )
Very high	2.5–0.25	10–100	100–1000
High	25–2.5	1–10	10–100
Low/moderate	250–25	0.1–1	1–10
Passive	> 250	< 0.1	< 1

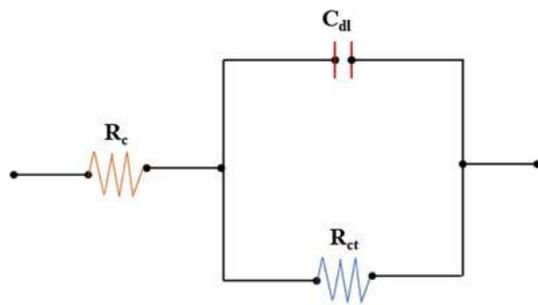

Fig. 6 Randles electrical equivalent circuit for steel reinforcement [46–48]

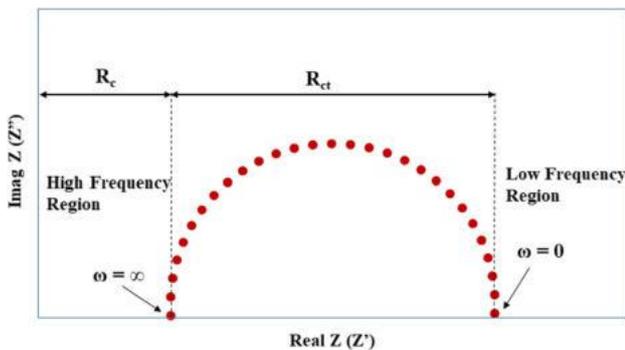

Fig. 7 Typical Nyquist plot for steel reinforcement [46–48]

indicates the concrete pore electrolyte resistance or concrete cover resistance. The  $R_{ct}$  is the charge transfer resistance at the surface of steel that represents the ease with which the charged ions can leave the steel surface and reach into the electrolyte (i.e. metal dissolution resistance). The  $C_{dl}$  is a double layer capacitor, which refers to the development of two layers on the steel/electrolyte interface. The first layer is formed due to the attraction of molecules towards the steel surface anions (free electrons). The second layer is formed due to the attraction of molecules towards cations in the pore solution. Moreover,  $R_{ct}$  and  $C_{dl}$  both resembles to the ionic resistance of the corrosion products film developed on the steel surface. These terms are illustrated in Fig. 8 [24, 38].

From the Randles equivalent circuit, the equivalent impedance ( $Z$ ) of the Nyquist plot is represented as follows [39]:

$$Z = R_c + \frac{R_{ct}}{1 + j\omega C_{dl} R_{ct}} \tag{9}$$

where,  $R_c$  = concrete resistance,  $R_{ct}$  = charge transfer resistance,  $j = \sqrt{-1}$ ,  $\omega = 2\pi f$ ,  $C_{dl}$  = double layer capacitance

When,  $\omega \rightarrow 0$  (i.e. at low frequency), the circuit turn into DC circuit and therefore

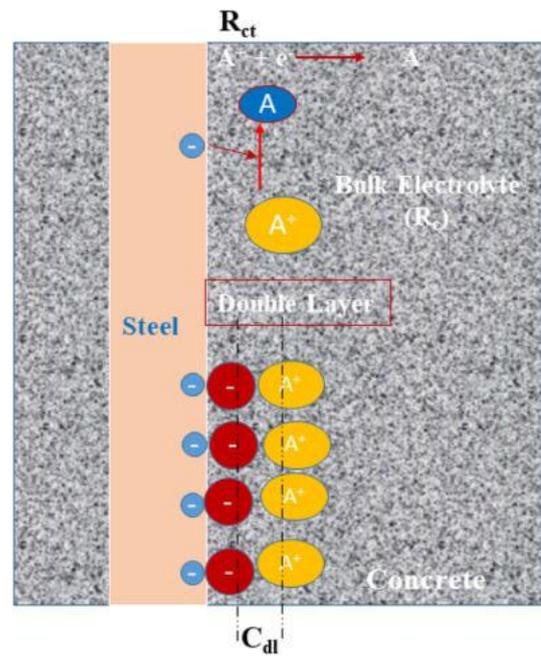

Fig. 8 Impedance components in steel concrete interface [38]

$$Z = R_c + R_{ct} = R_p$$

When,  $\omega \rightarrow \infty$  (i.e. at high frequency, AC circuit),  $Z = R_c$

The difference of DC and AC impedance gives the true polarization resistance as:

$$\text{True polarization resistance} = (R_c + R_{ct}) - R_c = R_{ct}$$

Accordingly, the diameter of the extrapolated semicircle in the Nyquist plot indicates the charge transfer resistance ( $R_{ct}$ ), which is equivalent to the true polarization resistance. Thus, if the diameter of the semicircle will be large, then polarization resistance will be high and corrosion rate will be low, and vice versa [45].

Owing to sophistication of the measurement, this method is more extensively used in laboratory investigations rather than in field. It needs more time to perform and its interpretation is also difficult. However, nowadays it used as a research tool to recognize the behaviour and mechanism of the concrete/steel interface and to reveal facts of the steel rebar corrosion kinetics [50].

## 2.6 Galvanostatic pulse

This is a rapid and non-destructive polarisation method. It was introduced in 1988 for field application [51]. In this technique, galvanostatically a short-time anodic current pulse (usually 10–100  $\mu A$  with pulse duration of 5–30 s) is applied between the steel reinforcement and auxiliary (counter) electrode placed on the surface of concrete. The reference electrode is commonly placed in the centre of the auxiliary electrode. The steel is polarised anodically and the

resulting electrochemical potential response of the steel is recorded using a reference electrode as a function of polarisation time. The characteristic electrochemical potential response of corroding steel is shown in Fig. 9 [52].

When the current pulse,  $I_{app}$ , is applied to the steel reinforcement, then the polarisation of the steel at time  $t$ ,  $E_t$ , can be written as follows [53–55]:

$$E_t = I_{app} \left[ R_p \left\{ 1 - e^{\left( \frac{-t}{R_p C_{dl}} \right)} \right\} + R_{tc} \right] \quad (10)$$

where,  $R_p$  = polarisation resistance,  $C_{dl}$  = double layer capacitance,  $R_c$  = concrete cover resistance,  $R_p$  and  $C_{dl}$  can be determined by transforming the Eq. (10) into linear form as [53, 54]:

$$\log(E_{max} - E_t) = \log(I_{app} \times R_p) - \left( \frac{t}{R_p C_{dl}} \right) \quad (11)$$

where,  $E_{max}$  = Final steady state potential

A typical plot of Eq. (11) is shown in Fig. 10 [53]. If the straight line passing through the data points is extrapolated to time ( $t$ )=0, then the intercept at ordinate will give  $\log(I_{app} \times R_p)$  and slope of the straight line will yield  $1/(R_p \times C_{dl})$ . The residual overpotential analogous to  $(I_{app} \times R_c)$  i.e. potential drop across the cover concrete. After finding the  $R_p$  by applying above technique, the corrosion current density ( $i_{corr}$ ) can be determined from Stern Geary formula (Eq. 5) [46].

### 2.7 Electrical resistivity measurement

The durability characteristics of concrete can be assessed by determining its electrical resistivity. Various investigations have given the correlation between electrical resistivity of concrete and corrosion of steel reinforcement [56–58].

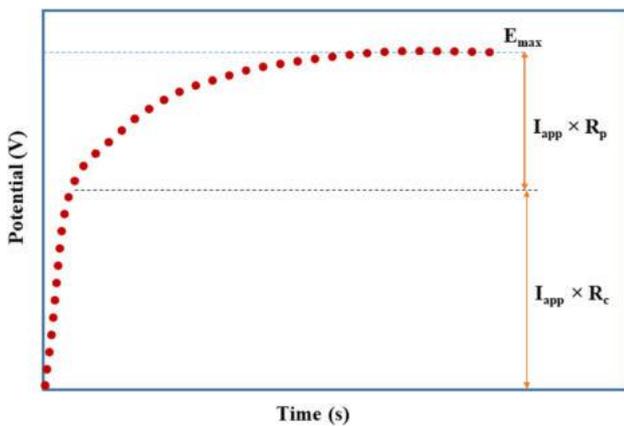

Fig. 9 Electrochemical potential response of corroding steel [52]

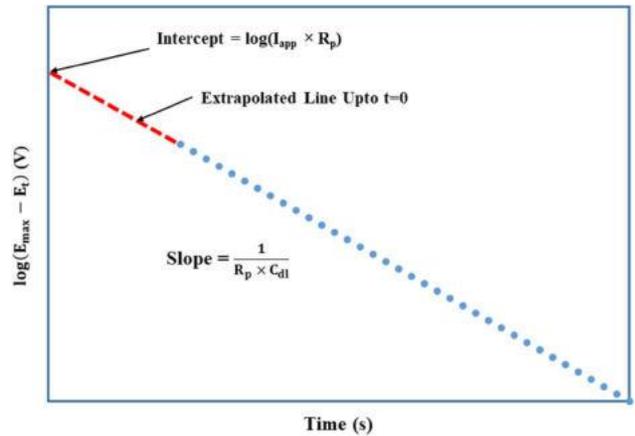

Fig. 10 A typical plot of Eq. (11) [53]

Several researchers have tried to made the relationship between the concrete resistivity and the different concrete properties such as water/cement ratio, cement content, coarse aggregate content, age, diffusion coefficient of chloride and porosity [59–61].

The electrical resistivity of concrete is commonly measured using four-probe technique. F. Wenner firstly introduced this technique in order to evaluate the soil resistivity [62]. After that, this method was widely applied for the concrete resistivity measurement in the lab as well as field. The Fig. 11 illustrates principle involved in the Wenner four-probe electrical resistivity measurement technique [63]. In this method, four equally spaced electrodes (probes) are used to measure the concrete resistivity. A small AC current ( $I$ ) is applied between the outermost probes whereas potential difference ( $V$ ) between the inner probes is recorded. Then, the surface resistivity of concrete is determined from the Eq. (12) [64].

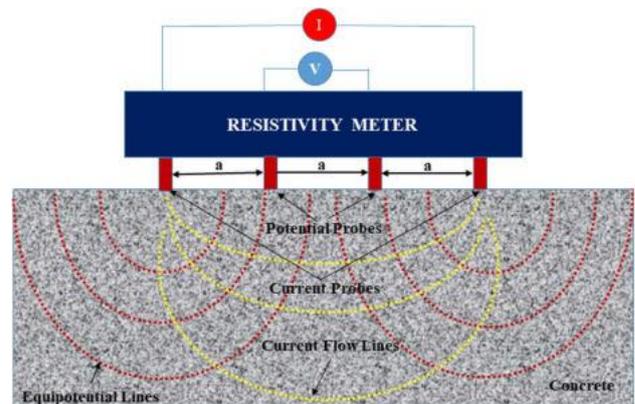

Fig. 11 Illustrations of the Wenner four-probe resistivity measurement [53]

$$\rho = ka \frac{V}{I} \quad (12)$$

where;  $a$  = distance between the probes,  $k$  = geometry factor =  $2\pi$  (for semi-infinite body such as concrete slabs)

However, the value of  $k$  is different for small cubic or cylindrical specimens used in laboratory testing condition. The AASTHO TP 95-11 Standard specified the typical value of 'a = 38 mm' and 'AC frequency = 13 Hz' in order to conduct the concrete surface electrical resistivity measurement [65].

Moreover, it is extensively recognized that resistivity of concrete can be easily determined, particularly in the field, compared to other corrosion parameters such as corrosion rate. Various investigators as presented in Table 3 have developed the correlation between the resistivity of concrete and steel reinforcement corrosion risk [65].

The variations in the results show that the concrete resistivity could not be used with full confidence as an indicator for corrosion activity in steel reinforcement and need more investigations. Furthermore, various factors that might affect the results of resistivity measurement of concrete include water/cement ratio, microstructural properties of concrete, aging, existence of steel reinforcement, geometrical constraints, surface contact of probes, spacing between probes, temperature, and moisture content [63].

## 2.8 Gravimetric weight loss measurement

This is the most commonly used destructive technique for estimating the corrosion rate of steel reinforcement [59, 60]. The detailed guideline for the preparation of test specimens and evaluation of corrosion rate by means of gravimetric weight loss measurement has been specified in ASTM G1-03 [73]. In order to carry out this test, firstly, the steel is to be immersed in the Clark solution (1L of HCl + 50 g of  $\text{SnCl}_2$  + 20 g of  $\text{Sb}_2\text{O}_3$ ) for 40 s, then, degreased with acetone, rinsed with distilled water and dried in air. Thereafter,

the initial weight of the steel is taken using an electronic weighing balance with 0.1 mg precision before embedding in concrete. After a specified period of exposure in the corrosive medium, the steel is taken out by splitting the concrete specimens. After that, the corroded steel is to be cleaned by the above procedure and finally, weighed again. The obtained weight loss value is to be used to estimate the corrosion rate (CR) by the following relationship [74]:

$$\text{CR} = \frac{K \times \Delta W}{A \times T \times \rho} \quad (13)$$

where,  $\Delta W$  = weight loss (g),  $A$  = exposed surface area ( $\text{cm}^2$ ),  $T$  = Time of exposure (hours),  $K$  = unit conversion constant =  $8.76 \times 10^4$  (for mm/year) = 534 (for mils/year),  $\rho$  = density ( $\text{g/cm}^3$ )

This is the most accurate and precise technique for determining the corrosion rate of steel reinforced concrete system because the testing is easy to replicate. This is comparatively simple method that reduces the tendency to lead methodical errors. The sensitivity of mass loss measurements is limited because mass can be measured easily only to about 0.1 mg, therefore this key issue must be considered while using this method. Further, this technique is destructive and generally performed after long exposure periods, consequently provide an average corrosion rate.

## 2.9 Corrosion monitoring using sensors

The latest advances in the field of smart materials and systems have escorted novel openings for structural health monitoring and non-destructive evaluation. Smart materials, for instance the fibre-optic materials and the piezoelectric-ceramic (PZT), have enabled online monitoring with greater resolution and quicker response as these materials have enormous competences of damage diagnosis. In recent times, sensors based on PZT and optical fibres have been studied for corrosion assessment in steel reinforced concrete structures [75–77].

Recently, an optical fibre sensor comprising of a fibre bragg grating sensor has been developed to identify steel rebar corrosion. A correlation between the weight loss rate of rebar (by gravimetric loss method) and reflected wavelength change from the grating was found through a series of accelerated corrosion tests. Through this relationship, it was noticed that the greater the wavelength shift, the larger the weight loss rate in the steel rebar [78]. Various analytical and experimental investigation have been carried out to detect rebar corrosion in steel reinforced concrete structures using fibre optic sensors [79–82]. Moreover, numerous proof-of-concept research to identify corrosion using PZT patches in metallic structures have been reported [77, 83]. However, these investigations were preliminary in nature and did not

**Table 3** Relationship between concrete resistivity and corrosion risk [65]

offer any solid means of rigorous qualification of corrosion damage after its detection. Hence, more investigations are required in this field.

## 2.10 Comparison of different techniques

Since potential measurement, resistivity measurement and sensors techniques do not provide the corrosion rate of the steel reinforcement, therefore the comparison of corrosion rate as obtained from electrochemical and weight loss measurement techniques can be made based on past studies.

Ismail et al. [49] evaluated the corrosion condition of steel rebar in high performance concrete using potentiodynamic polarization (PP), electrochemical impedance spectroscopy (EIS), linear polarization resistance (LPR) techniques, and observed that the corrosion rates obtained from the LPR were 5–20% less than those obtained using EIS but 10–30% more than those determined using PP. Nygaard et al. [84] investigated the corrosion rate of passive steel and active steel by means of galvanostatic pulse (GP) and LPR techniques. They found that both GP and LPR methods overestimated the actual corrosion rate for passive steel by factors of about 100 and 10 times, respectively. But these methods underestimated the corrosion rates by a factor of 2 (GP) and 10 (LPR) for steel rebars with localized corrosion. Aligizaki [85] assessed the corrosion rate of steel using LPR, PP and EIS and found well correlation between the  $I_{\text{corr}}$  values obtained from LPR and PP techniques. Sathyanarayanan et al. [86] measured the corrosion rate of steel rebar by GP and LPR techniques and concluded that the GP technique provides more reliable corrosion rates than LPR method, when compared with the gravimetric weight loss method results. Law et al. [87] also used gravimetric weight loss and LPR methods to measure the corrosion rates of steel at regular intervals during an exposure period of 1,085 days. They compared the corrosion rates obtained from both the techniques and concluded that the LPR technique overestimated the corrosion rate. Pradhan et al. [88] observed that the corrosion rates obtained from LPR technique were 10% higher than those from the EIS method, whereas agreed closely with that found from the gravimetric weight loss method.

There are numerous existing techniques for the detection, measurement and diagnosis of corrosion of steel rebar, however there is no consent regarding which technique evaluates the corrosion rate more precisely. Therefore a combination of evaluating methods is recommended to use in order to find the reliable information about the corrosion condition of steel embedded in concrete. The average corrosion rate as obtained from the different techniques may be used for further analysis.

## 3 Corrosion control techniques

The corrosion control methods for steel reinforced cementitious composite include cathodic protection, electrochemical chloride extraction, surface treatments of the steel reinforcement, surface treatment of concrete, utilization of mineral admixtures and chemical corrosion inhibitors. In the subsequent sections, these methods have been discussed comprehensively.

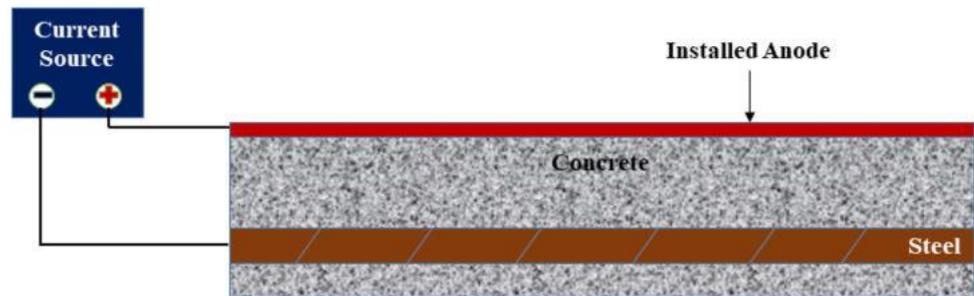

### 3.1 Cathodic protection

The first investigation on corrosion control of steel in a reinforced concrete bridge through cathodic protection was reported by Stratfull in 1957 [89], and the application of this technique began in 1972 in order to protect Sky Park bridge decks contaminated by de-icing salts in Placerville, California [90]. Thereafter, research has been carried out by various government and private industries for the development of cathodic protection systems in steel reinforced concrete structures. For example, on the basis of research investigations, Federal Highway Administration has identified that the cathodic protection is the only rehabilitation system that has proven to stop corrosion in chloride contaminated bridge decks irrespective of the chloride content in concrete [91].

The cathodic protection system can be established by two ways: galvanic (sacrificial) anode and impressed current systems. The galvanic anode system is based on the principles of dissimilar metal corrosion and the relative position of specific metals in the electro-chemical series. Hence, this system employs reactive metals as auxiliary anodes, which are connected to the steel that is to be protected. The difference in potentials between the reactive metal and the steel, as specified by their relative positions in the electro-chemical series, causes a positive current to flow in the electrolyte, from the reactive metal to the steel. Thus, the whole surface of the steel converted to negatively charge and becomes the cathode. The metals commonly used, as sacrificial anodes are aluminium, zinc and magnesium. No external power source and low maintenance is required in this system. Patch-repair and plug-type anodes are examples of galvanic anodes [92].

In contrast, an impressed current system requires a current source (generally less than 50 volts) and inert (zero or low dissolution) anode material, fixed either on the surface, or embedded within the concrete. To achieve an electrical circuit, the positive terminal is connected to anode material and the negative terminal is connected to steel (cathode) to be protected, the anode and cathode are separated by an electrolyte (concrete) as shown in Fig. 12. This

**Fig. 12** Impressed current cathodic protection system [93]

system works well until power supply is not interrupted. Therefore, this system consumes substantial electrical energy and also requires specialized services to design and verify the system's functioning [93].

### 3.2 Electrochemical chloride extraction

The aim of the electrochemical chloride extraction (ECE) technique is to remove the chloride ions from the steel rebar and out of the concrete body. This method is similar to cathodic protection, but there are two main differences. First, the current density used for impressed current cathodic protection (ICCP) is much lower than that for ECE. Second, the external anode for ECE is temporary and installed for few weeks only (during the process) [94]. However, both protection techniques have been recognized to increase the service lifespan of the structures. However, ECE technique is more advantageous because of no long-term regular maintenance requirement.

In this technique, an electric field is applied between the steel reinforcement and an external anode metal fixed to the surface of the concrete body. The commonly used anodes are titanium-activated meshes, steel meshes, and mortar pastes prepared with graphite powder [95]. The positive terminal of current source is connected to anode, while negative terminal is connected to steel rebar embedded in concrete. When the electric current is applied, anions (such as  $\text{Cl}^-$ ) are attracted towards the external anode placed on the surface of the concrete, while cations (such as  $\text{Na}^+$ ,  $\text{K}^+$ ) are migrated towards steel reinforcement and thereby produced hydroxyl ions ( $\text{OH}^-$ )

on the surface steel, as a result of cathodic reactions. The schematic diagram of the chloride extraction technique is shown in Fig. 13. The following reactions occur during electrochemical extraction treatment due to the development of electric potential difference between the external anode and the steel (cathode) [96].

At anode:

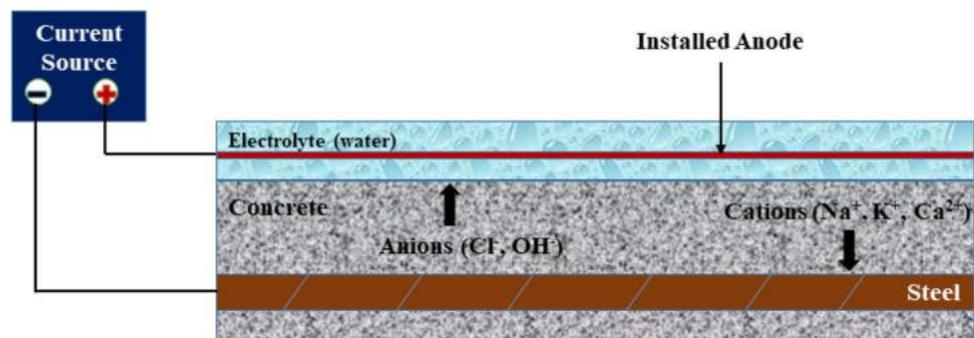

The pH of the electrolyte should be sufficiently high in order to suppress the reaction represented by Eq. (15). The highly alkaline electrolytes also neutralize the hydrogen ions produced by the reaction in Eq. (14) and protect the surface of concrete from acidification. Therefore, solution of calcium hydroxide, sodium hydroxide and treated water are commonly used as external electrolytes [97]. However, water is the most widely used owing to the deficiency of salts, thus  $\text{Cl}^-$  ions travel more easily in the concrete and are extracted effortlessly [98].

At cathod (steel):

**Fig. 13** Illustration of the chloride extraction technique [96]

The Eq. (17) shows the evolution of hydrogen gas at the level of steel reinforcement due to the low cathodic potential that is induced by the high current density. Also, it is believed that higher current densities can produce cracking in the concrete as a function of the chloride extraction velocity. Therefore, the current density has been taken between  $1 \text{ A/m}^2$  and  $5 \text{ A/m}^2$  in various studies [94]. Despite this, some authors determine that the current density should not be more than  $2 \text{ A/m}^2$  [99]. However, some of the studies focused on densities up to  $1 \text{ A/m}^2$  [100].

The period of application of this system varies from 6 to 10 weeks [101], in this period the chloride concentration is reduced below 0.4% of total chlorides, which is considered as critical value [102]. According to results of an investigation, the chloride content was found to be reduced by around 40% within 7 weeks of treatment and simultaneously, substantial quantities of alkali ions were detected nearby the steel [103]. The reduction percentage of chloride content can reach up to 70% [104]. The reduction of chloride ions content below the critical level and simultaneous increment of hydroxyl concentration on the surface of the steel reinforcement creates favourable environment for the steel repassivation [105].

### 3.3 Surface treatment of steel

The reinforcing bars commonly used are mild steel, mainly due to its significant low cost. Alternatively, stainless steel shows excellent mechanical and durability properties, but impractical for use in reinforced concrete because of its high cost [106]. The poor corrosion resistance of mild steel is a common cause of deterioration in reinforced concrete structure. Therefore, various treatments have been given to steel surface in order to increase the corrosion resistance. One such treatment is coating with epoxy, which acts as a barrier to aggressive corrosion agents, and thus significantly decrease the corrosion rate of steel rebar. But, the poor bonding between epoxy coated steel and concrete, and the damaged areas of epoxy coated steel rebar (at which pitting corrosion may occur) are the common problems with epoxy coating [107]. Another similar treatment is coating with zinc (*galvanization*), which improve the corrosion resistance of steel by acting as a sacrificial anode. It has been observed in many studies that the galvanized steel develops better bond to concrete than the epoxy coated steel, and also the tendency of the zinc coating to debond is very less as compared to epoxy coating [108]. Subsequently, techniques for surface treatment of steel that increases the corrosion resistance as well as bond strength have been developed. These techniques include inhibited cement slurry coating, surface oxidation and sand blasting.

The Central Electrochemical Research Institute (CECRI), Karaikudi, India, has developed inhibited cement slurry

coating for corrosion control in steel reinforcement. This coating system involves of four stages i.e. pickling, phosphating, two times application of inhibited cement slurry coating and sealing. This coating is an in situ process that is carried out after all bending and shaping operations are completed at the construction site. As this coating is applied at the site of working, the damage caused on account of transporting and lifting are significantly minimised. Moreover, in situ patch repairing is easy to execute in this coating system. Though, strict quality control measures are required to ensure the performance of this coating [109]. In an investigation, it was concluded that the inhibited cement slurry coating is economical and efficient to control the corrosion of steel reinforcement [110]. In an another study, it was observed that inhibited cement slurry coated steel show higher bond strength as compared to galvanized and epoxy coated steel [111].

Sand blasting technique involves the blasting of  $\text{Al}_2\text{O}_3$  particles (size about  $250 \mu\text{m}$ ) on the steel rebar under pressure of around 0.6 MPa. It is used for cleaning of the surface of the steel. The cleaning includes the removal of rust and/or contaminants from the surface of steel. This cleaning improves the corrosion resistance by making the surface of the steel more uniform in composition. Moreover, the cleaning increases the roughness of surface and thus improves the bond strength. However, the disadvantage of this method is that it is uneconomical and difficult to use in the construction site [112].

Water immersion method involves the immersion of the steel rebar under water at ambient temperature for 2 days. This treatment forms a black coating (oxide layer) on the steel surface, hence the surface of steel turns out to be more uniform in composition and thereby, enhancing the corrosion resistance. Furthermore, the oxide layer improves the bond between concrete and rebar, thus increasing the bond strength. The immersion periods less than or more than 2 days provide less beneficial effects on both corrosion resistance and bond strength. This method is found to be very simple and economical as compared to other methods [113].

### 3.4 Surface treatment of concrete

Since numerous hostile agents (e.g. chloride,  $\text{CO}_2$  etc.) ingress into the concrete through air or water and creates durability problems (e.g. carbonation, chloride attack and sulphate attack etc.), therefore, the permeation property of the surface concrete is considered as a main factor that impact the durability of entire concrete structure [114].

Concrete surface treatment has gained sufficient attention since 1980s, for example, American and German transportation agencies applied some hydrophobic agents on the surface concrete of bridges in order to prevent

chloride penetration. Also, a chemical named isobutyltrimetoxisilane (100% pure and hydrophobic agent) has been used on bridges in the United Kingdom in 1986 to protect from chloride attack [115]. However, many progresses has been occurred in terms of understanding the mechanism of already known surface treatment agents; and various new treatment agents has emerged in last two decades. Moreover, the surface treatment agents can be classified into two categories based on chemical composition i.e. organic and inorganic. Organic agents are widely used for surface treatment of concrete owing to their good barrier properties. But, there are some problems associated with organic treatments viz. poor fire resistance, crack and detach easily, inadequate service life, and after losing protecting effects their removal is difficult [116]. In contrast, the inorganic surface treatment agents are more stable and have better durability performance. The most commonly used inorganic surface treatment agent is sodium silicate. Also, it has been reported that lithium silicate, potassium silicate and fluosilicates can be used as inorganic surface treatment agents for concrete [117].

According to the functions of surface treatments, they were grouped into four types: surface coating, hydrophobic impregnation, pore blocking treatment and multifunctional surface treatments [118]. Surface coating forms a continuous layer and produce a physical barrier to prevent the ingress of the corrosive substances into cementitious substrate [119]. There are many types of surface coatings which have been used in the construction industry, for example, acrylic, chlorinated rubber, butadiene copolymer, polyethylene copolymer, epoxy resin, polyester resin, vinyl, polyurethane, coal tar and polymer modified cementitious coatings [120].

Hydrophobic impregnation works via penetrating concrete pores, expanding the contact angle. The surface turns out to be hydrophobic when the contact angle is greater than  $90^\circ$ . Thus, hydrophobic impregnation can prevent the ingress of water and water-born ions; but permits penetration of water vapour [113]. The most commonly used hydrophobic impregnation are silane, siloxane and a combination of these two chemicals. The molecular structures of silane (1.0 to 1.5  $\mu\text{m}$  diameter) and siloxane (1.5 to 7.5  $\mu\text{m}$  diameter) are extremely small; and therefore, efficiently penetrate into dense concrete substrate. Both silane and siloxane comprise an alkyl group and various alkoxy groups [121, 122]. The alkyl group can decrease the surface tension of the substrate, whereas the alkoxy group is related to the bonds between silane/siloxane and concrete. For example, the chemical reaction between silane and concrete substrate can be proceeded as: firstly, silane hydrolysis reacts with pore water, and silanol groups are formed due to hydrolysis alkoxy groups [123]. Then, the unstable silanol molecules lose water molecules and transformed into silicone resin. Subsequently, the silanol groups react with hydroxyl groups

in the cementitious substrate via hydrogen bonds. Lastly, the silicon resin bonds to cementitious substrate during drying, and creates water repellent pore surfaces. The alkalinity of the cementitious substrate serves as a catalyst in these reactions [124].

Pore blocking surface treatment agents have been used in construction industries for many years [125]. They are able to partially or completely block the existing capillary pores in concrete surface and thus increase impermeability of surface layer. Silicate and fluosilicate based pore blockers (e.g. calcium silicate, lithium silicate, sodium silicate, magnesium fluosilicate and sodium fluosilicate) have been demonstrated to be effective in blocking capillary pores in concrete surfaces. Sodium silicate is considered as one of the most common pore blocking agents [126].

Multifunctional surface treatments should have at least two functions, for example, ethyl silicate (or tetraethylorthosilicate), an alkoxy silane compound, which itself does not have binding property, and nevertheless it can produce silica gels and block the pores through hydrolysing process. Also, it can prevent the entry of corrosive substances because of its hydrophobic effect [127]. Similarly, Silane-clay nanocomposites are not only show a hydrophobic effect, but also improve the microstructure of concrete cover [128].

Surface treatment of concrete may be an effective and economical technique in order to enhance the quality of surface concrete and improve the durability of concrete structures. However, this technique of corrosion control suffers from the poor durability of the coating and the loss of corrosion protection in the parts where the coating is damaged.

### 3.5 Admixtures in concrete

Admixtures are solid or liquid substances that are added to the concrete mixture in order to enhance the properties of the resulting concrete. Admixtures that are primarily used for improving the corrosion resistance of steel reinforcement, commonly known as corrosion inhibitors. These include mainly organic and inorganic chemicals. However, admixtures that are mainly used for enhancing the structural performance of concrete are more attractive due to their multi-functionality (such as, improvement in workability, mechanical strengths, bond strength, impermeability, corrosion control, etc.). They are usually mineral particles, for example, fly ash, silica fume and slag.

Fly ash (FA) is a by-product of coal combustion and mainly composed of  $\text{SiO}_2$  and  $\text{CaO}$ . The recent advancement in concrete technology exhibits that the fly ash is the most common pozzolan and used worldwide as an essential component for making high-performance concrete. This is mainly because of pozzolanic reaction between fly ash and hydrated cement paste resulting a denser microstructure over a period of time. However, studies

have revealed that fly ash does not reduce the diffusion coefficient of concrete at early ages, but at the later ages, significantly lowers the diffusion coefficient as compared to control concrete [129]. Moreover, Class F fly ash (low CaO content) leads to a slightly lower diffusion coefficient than Class C fly ash (high CaO content) admixed concrete [130]. As far as steel reinforcement corrosion is concerned, it was observed that the corrosion resistance of steel in concrete is improved with the addition of fly ash as a replacement of Portland cement (PC) up to the 30% [131]. In another study, it was concluded that the incorporation of 15% fly ash as replacement of cement can produce quite durable concretes against corrosion [132]. Also, it was found that the chloride penetration resistance of concrete increases with increasing the fineness of fly ash [133]. In general, it is recognised that the addition of fly ash improves the corrosion resistance properties of steel reinforcement by reducing porosity and increasing the resistivity of cementitious composite [134]. Moreover, fly ash is typically used at replacement levels between 15% and 35% by weight of Portland cement so as to increase the mechanical strengths as well as the resistance to deterioration mechanisms (such as chloride attack, sulphate attack, carbonation etc.) of cementitious composites [135].

Silica fume (SF) is a by-product from silicon alloy production in electric arc furnaces. It is almost pure  $\text{SiO}_2$  and its particles size are approximately 100 times finer than cement grains. When added in cementitious composite, silica fume reacts quickly with hydrated cement due to small particle size and high surface area to volume ratio and consequently improving the microstructural and mechanical properties and decreasing the diffusion coefficient of cementitious composite at all ages with respect to plain cementitious composite [110, 111]. Though, it was observed that chloride diffusion coefficient of concrete in a marine environment reduces with lowering the water binder ratio and increasing silica fume content up to 10%. Also, the chloride diffusion coefficient is found to be high for early ages and drops over time [138]. The reduction in diffusivity leads to decrease the chloride threshold level required to initiate corrosion, and this may increase the service life of the exposed concrete structures by 15-fold in certain circumstances [139]. From the sensitivity analysis, it is calculated that with the addition of 10% silica fume in concrete, the chloride transport in terms of apparent diffusion coefficient is reduced by approximately 74% and corrosion-free life is increased by 270% as compared to OPC concrete [140]. Moreover, the incorporation of silica fume in appropriate quantity, significantly enhances the corrosion resistance properties of steel reinforced cementitious composite [115, 116]. Furthermore, the typical replacement levels of Portland cement with silica fume range from 3% to 10% in order to enhance the mechanical strengths and durability properties of concrete structures [134].

Ground granulated blast-furnace slag (GGBFS), commonly known as slag, is a by-product of steel production. It mainly contains  $\text{CaO}$ ,  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$  and  $\text{MgO}$  [143]. When slag is used as part of Portland cement in concrete, it reacts with both the hydrated cement (*pozzolanic reaction*) and the water (*latent hydraulic reaction*), and consequently refines the pore structure and enhances interfacial transition zone (ITZ) of concrete [144]. Also, the addition of slag, improves the consistency and workability of fresh concrete. The mechanical strengths and durability properties of concrete is found to be substantially improved with the incorporation of GGBFS [145]. The diffusion coefficient of GGBFS admixed cementitious composite is found to be significantly lower as compared to the plain cementitious composite, particularly at the later exposure ages. Therefore, when incorporated appropriate amount of GGBFS in concrete, the transportation of corrosive agents is greatly reduced and consequently improved the corrosion resistance of steel reinforcement, and thereby, increasing the predicted service life of concrete structures. From most of the investigational studies, it may be concluded that the use of 40% to 80% of GGBS as a replacement of Portland cement does not cause any negative impact on the performance of cementitious composite [120, 121].

Metakaolin (MK) is obtained by the calcination of clay mineral kaolinite ( $\text{Al}_2\text{Si}_2\text{O}_7$ ) at the temperature range of 500 °C to 800 °C. It is primarily composed of  $\text{SiO}_2$  and  $\text{Al}_2\text{O}_3$ . The size of 99.9% metakaolin particles is below 16  $\mu\text{m}$  and the average particle size is approximately 3  $\mu\text{m}$ . It is a pozzolanic material and commonly used in the manufacture of ceramics [148]. The small particle size, high surface area to volume ratio and pozzolanic property of metakaolin, make it possible to be befittingly used as partial replacement of cement up to 10% and fine aggregate up to 20% in concrete [149]. The studies revealed that when metakaolin is used in concrete, it reacts quickly due to small particle size and high surface area, and undergoes pozzolanic reaction, and consequently improves the microstructure of the hydrated cement paste [150]. This improvement leads to further enhancement in the mechanical and durability properties and reduction in the diffusion coefficient of concrete [151]. In particular, the corrosion resistance of steel reinforcement in aggressive environment is improved substantially with the inclusion of suitable amount of metakaolin. Besides, the appropriate replacement level of cement by metakaolin ranges from 5 to 10% [152].

Moreover, the use of binary blends (Portland cement plus one admixture, such as PC + SF, PC + SF, PC + GGBFS and so on.) and ternary blends (Portland cement plus two admixtures, such as PC + FA + SF, PC + MK + FA, PC + FA + GGBFS etc.) can significantly enhance the performance of cementitious composite exposed to corrosive environments. Research has revealed that the use of

admixtures can reduce the diffusion coefficient of concrete and consequently improve the corrosion resistance of steel reinforcement. However, it has been observed that ternary blends result in superior resistance to chloride ingress compared with binary blends at both early and later ages. This is because the ternary blends contain a slow-reacting admixture (e.g. fly ash or slag) and a fast-reacting admixture (e.g. silica fume or metakaolin) [153]. In addition, such replacement of cement will contribute to the reduction in CO<sub>2</sub> production (carbon footprint) and therefore encourage the use of such sustainable and green concrete. Furthermore, recently some new generation nano-admixtures (such as carbon nanotubes, SiO<sub>2</sub>, TiO<sub>2</sub>, Fe<sub>2</sub>O<sub>3</sub>, CuO, ZrO<sub>2</sub>, ZnO<sub>2</sub>, Al<sub>2</sub>O<sub>3</sub>, CaCO<sub>3</sub>, Cr<sub>2</sub>O<sub>3</sub>) emerges, which can be used to improve the microstructure and corrosion resistance properties of reinforced concrete [154].

### 3.6 Chemical corrosion inhibitors

International Organization for Standardization (ISO 8044:2015) defines corrosion inhibitor as a chemical substance that decreases the corrosion rate when present in the corrosion system at suitable concentration, without significantly changing the concentration of any other corrosion agent [155]. The National Association of Corrosion Engineers (NACE) defines corrosion inhibitors as substances that, when added to an environment, decrease or slow down the rate of attack of the metal [156]. ACI 116R-85 defines a corrosion inhibitor as a chemical compound, either liquid or powder, that effectively decreases or slows down reinforcement corrosion in hardened concrete if introduced, usually in very small concentrations, as an admixture [157]. Therefore, an ideal corrosion inhibitor for cementitious composite may be defined as a chemical compound, which, when incorporated in suitable quantities to cementitious composite, can control corrosion of embedded steel reinforcement and has no adverse effect on the fresh and hardened properties of cementitious composite [158]. These definitions exclude other corrosion control methods such as pore blockers, coatings etc., which modify the oxygen, water and chloride concentrations. Nevertheless, some chemical corrosion inhibitors may also act as pore blockers, which is a secondary property. The inhibitors may be the better than the other methods of protection owing to lower cost and easy to use.

The inhibitors could be classify in many ways: according to their application methods, according to their mechanism of protection, and their chemical nature [132, 133]. The main application methods for corrosion inhibitors are:

- (a) Added to fresh concrete as an admixture
- (b) Added to repair mortars
- (c) Used as a surface treatment on the steel reinforcement bars before concreting

- (d) Applied on the hardened concrete surface, as a penetrating corrosion inhibitor (also surface-applied corrosion inhibitor and migrating corrosion inhibitor).

According to the mechanisms of protection, corrosion inhibitors could be divide into three types:

- (a) Anodic inhibitors: These inhibitors passivate the metal by forming a film adsorbed or insoluble layer on anodic surfaces of the metal. They mainly act by affecting the anodic reaction and consequently reducing the corrosion rate by increasing the corrosion potential and decreasing the corrosion current density of the metal. Though, the sufficient concentration of anodic inhibitors must be used for covering the entire surface of metal. The inappropriate concentration of inhibitors affects the formation of film and leaves some exposed sites, and thus causes pitting corrosion. The commonly used anodic inhibitor are nitrites, nitrates, benzoates, chromates, molybdates, phosphates, hydroxides, silicates and carbonates.
- (b) Cathodic inhibitors: These inhibitors act by forming a barrier of insoluble precipitates over the metal surface and particularly affecting the cathodic reaction. Accordingly, reduced the corrosion rate by decreasing the corrosion potential as well as corrosion current density of metal. These inhibitors are usually less effective but more secure than anodic inhibitors. Examples of cathodic inhibitors are silicates, phosphates polyphosphates, tannins and ions of the zinc, nickel and magnesium that react with the hydroxyl (OH<sup>-</sup>) of the water forming the insoluble hydroxides as Zn(OH)<sub>2</sub>, Ni(OH)<sub>2</sub>, Mg(OH)<sub>2</sub>, which are deposited on the cathodic site of the metal surface, protecting it.
- (c) Mixed inhibitors: These inhibitors act on both anodic and cathodic sites by adsorption on overall surface of the metal. They reduce the corrosion rate by decreasing the corrosion current density without substantial changing the corrosion potential of metal. This type of inhibitor includes amines, amino alcohols, sulfonates, esters and compound with the hydrophobic group that have polar groups such as N, S and OH.

According to chemical functionality, the inhibitors can be classified as follows:

- (a) Inorganic Inhibitors: These inhibitors are generally crystalline salts such as nitrite salts, chromate salts, molybdate compounds, zinc salts, phosphates, silicate compounds etc. Usually, the anions of these salts are involved in decreasing the corrosion of metal. In general, these inhibitors have anodic or cathodic actions. However, when zinc salt is used, the zinc cation can

add some advantageous effect. These zinc-added salts are termed as mixed-charge inhibitors.

- (b) **Organic Inhibitors:** The inhibitors are characterized by high molecular weight structures, incorporating  $-\text{NH}_2$ ,  $-\text{SH}$ ,  $-\text{COOH}$ ,  $-\text{OH}$  or  $-\text{SO}_3\text{H}$  functional groups. In their concentrated forms, these are either liquids or wax like solids. Their active portions are generally large aliphatic or aromatic compounds with positively charged amine groups. These inhibitors are said to be chelating agents, which can form five or six-membered chelate rings. These rings are formed as a result of the bonding between two or more functional groups from the inhibitor and the cation metal, thus, completely cover the metal surface. However, occasionally, they act as cathodic, anodic or mixed inhibitors. Some examples are amines, mercaptobenzothiazole, aldehydes, sulphur-containing compounds, heterocyclic nitrogen compounds and acetylenic compounds.

As compared to the other corrosion control techniques, chemical corrosion inhibitors have some benefits such as economical and versatility. Application of inhibitors in concrete can aid to delay the corrosion initiation in the embedded steel exposed to aggressive environments. However, after the corrosion initiation, their efficiency was less significant. In general, the side effects of the inhibitors on fresh and hardened concrete were reported to be insignificant [161]. Very limited studies on the long-term performance of the inhibitors in real structures are available. Hence, more researches are needed to identify such inhibitors that are effective throughout the service life of structures and are non-hazardous.

## 4 Conclusions

From the critical review discussed concerning steel rebar corrosion monitoring and controlling techniques, following points can be noted

- (1) Potential measurements have been extensively used since 1970 to assess the corrosion risk of steel rebar in concrete. Though, potential values do not provide the corrosion rate of steel. In spite of the simple method for potential measurement on the surface of concrete, the potential mapping results need cautious interpretation. Also, the depth of concrete cover, concrete resistance, polarization effects and high resistivity of surface layer significantly influence the measured potential values.
- (2) The corrosion rate can be evaluated using electrochemical techniques such as potentiodynamic polarization, linear polarization resistance, galvanostatic pulse, electrochemical impedance spectroscopy, Tafel

extrapolation. These techniques can be used in small steel reinforced concrete specimens under laboratory environments as well as large scale field structures. However each method possesses certain advantages and limitations. Therefore a combination of evaluating methods is recommended to use in order to find maximum information about the corrosion condition of steel embedded in concrete.

- (3) The gravimetric weight loss measurements is an efficient technique for finding the corrosion rate of steel rebars, but it is destructive and is usually performed after long exposure times
- (4) Potential measurement, electrical resistivity measurement and sensors techniques do not provide the corrosion rate of the steel reinforcement, they only give qualitative information. However, corrosion monitoring using PZT and optical-fibre sensors is still a new area of research and needs to be explored. Although some of the researchers considered that there is a robust potential in emerging the sensors as a non-destructive method for corrosion assessment that can be possibly provide better assessment than the conventional methods.
- (5) The corrosion control methods for steel reinforced concrete include cathodic protection, electrochemical chloride extraction, surface treatments of the steel reinforcement, surface treatment of concrete, utilization of mineral admixtures and chemical corrosion inhibitors. Each method possesses certain advantages and disadvantages. Consequently, more researches are needed to develop such methods of corrosion protection of embedded steel that are economical, durable, environment-friendly and do not cause any adverse effect on the structural performance of concrete and steel.

## Abstract

The influence of 1%, 3% and 5% content of ethanolamine (EA) and nano-TiO<sub>2</sub> (NT) on the fresh, hardened, microstructural and corrosion resistance properties of cementitious composites under different exposure environments (tap water, saline water and acidic solution) had been investigated. The setting time test confirmed that the EA acts as a retarder while NT acts as an accelerator. The SEM and XRD results indicated that EA had an adverse effect on the microstructure, while NT improved the microstructure and increased the amounts of desirable hydration products. The compressive strengths of EA-admixed mortar under all the exposure mediums were found to be lower than control mortar, while NT had the opposite effects. The corrosion inhibition efficiency of 3% EA was found to be higher than the 5% content in all the three exposure environments, while the corrosion inhibition efficiency of NT was increasing with the increase in the dosage.

## 1 Introduction

Steel-reinforced concrete structures were considered as maintenance-free until the mid-1970s. However, since then various sustainability-related problems have arisen mainly due to acid, sulphate, carbon dioxide and chloride attacks [1]. However, acidic and sulphate attacks primarily degrade cementitious composites thru chemical reactions between cement hydration products and these aggressive agents [2–4]. In contrast, the carbon dioxide and chloride usually cause corrosion of steel rebars. The CO<sub>2</sub> reduces the pH of concrete by reacting with the hydrated cement and creates favourable environment for steel corrosion [5–7]. The Cl<sup>-</sup> ions pass through concrete pores and attack the steel rebars [8–10]. Among all the durability problems, steel corrosion has been

identified as the principal source of deterioration of steel-reinforced concrete structures.

In general, the penetration rate of aggressive agents in dense concrete is very low and thus maintained high alkalinity of the pore solution (pH between 12.5 and 14), and consequently rate of steel corrosion is considerably reduced in such concrete. But, the densification cannot be always related to high alkalinity content of concrete. The high pH of concrete pore solution is owing to the existence of Ca(OH)<sub>2</sub>, KOH and NaOH [11]. When the steel is exposed to such highly alkaline environment, steel reacts with dissolved oxygen and forms an oxide layer ( $\gamma$ -Fe<sub>2</sub>O<sub>3</sub>·H<sub>2</sub>O) on its surface. This layer is very thin (approximately 10 nm), passive, insoluble, dense and impenetrable and acts as a barrier to the oxidation reaction of iron. This layer is known as the engineer's dream coating due its self-formation and maintenance in the alkaline environment [12, 13]. In such condition, the steel usually has a very low risk of corrosion or at least shows a prolonged initiation period before corrosion. However, protection offered by this layer weakens in the presence of aggressive environments. For instance, pitting corrosion may occur at some areas on the surface of steel where the passive film has been damaged due to the presence of aggressive species (mainly chlorides). This is a localized form of corrosion by which cavities or holes are produced in the steel

bars and consequently local failures occurred in the structural elements. Hence, the pitting is considered to be more hazardous than uniform corrosion damage. In general, the corrosion process generates voluminous corrosion products that causes cracks in concrete, spalling and delamination of concrete cover, and consequently corrosion rate of embedded steel increases critically [14, 15]. Therefore, the corrosion has been considered as one of the most common causes of deterioration of steel-reinforced concrete structures [16].

Numerous approaches have been made in the past to control the steel corrosion. For instance, electrochemical chloride extraction [17–19], cathodic protection [20–22], surface treatment of concrete [23–26], surface treatments of steel rebars [27–30], application of chemical corrosion inhibitors [31–36] and mineral admixtures [37–43]. In addition, recently, use of some nanomaterials as an admixture for cementitious composites has been explored by various researchers. Most of the investigators reported that the use of nanomaterials could increase the strength and durability properties of cementitious composites [44–51].

The corrosion of steel rebars is an electrochemical process. The oxidation reaction ( $\text{Fe} \rightarrow \text{Fe}^{+2} + 2e^-$ ) and reduction reaction ( $2\text{H}_2\text{O} + \text{O}_2 + 4e^- \rightarrow 4\text{OH}^-$ ) occur at anodic and cathodic zones, respectively, and steel itself acts as a conducting medium [52]. Therefore, electrochemical techniques have been developed to assess the corrosion condition of steel rebars. For instance, surface potential measurement [53], open circuit potential measurement [54, 55], linear polarization resistance measurement [56–58], Tafel potentiodynamic polarization measurement [59, 60], galvanostatic pulse transient [61–63] and electrochemical impedance spectroscopy [64–66]. However, Tafel potentiodynamic polarization technique offers many advantages in comparison with other electrochemical techniques: it is rapid and easy to carry out, it provides almost accurate electrochemical parameters (such as corrosion current, corrosion potential, corrosion rate, etc.), and it can be used to monitor the corrosion behaviour of a system uninterruptedly [59].

In the present investigation, an attempt has been made to use one of the recognized chemical corrosion inhibitor, i.e. ethanolamine and one nanomaterial, viz. nano-TiO<sub>2</sub>, primarily to compare their influence on the corrosion behaviour of the steel embedded in mortar exposed under different environments, i.e. tap water, saline water and sulphuric acid solution. Moreover, Tafel potentiodynamic polarization technique was used to monitor the corrosion condition of steel rebars. Besides, the corrosion inhibition efficiency of ethanolamine and nano-TiO<sub>2</sub> was estimated. In addition, the influence of ethanolamine and nano-TiO<sub>2</sub> on the fresh, hardened and microstructural properties of cementitious composites was studied. Therefore, a series of investigations such as setting time of the cement paste, compressive strength of mortar exposed under different environments, microstruc-

tural analysis and elemental compositions of mortar through SEM and EDX techniques and mineralogical analysis of cement paste through XRD technique were carried out.

## 2 Experimental Programme

### 2.1 Materials

In this study, 43-grade ordinary Portland cement (OPC), locally available fine aggregates of fineness modulus of 2.65, nano-TiO<sub>2</sub> (NT) with 30 nm of average particle size and ethanolamine (H<sub>2</sub>N–CH<sub>2</sub>–CH<sub>2</sub>–OH) were used. Mild steel rebar of 3 mm diameter was used as embedding reinforcement in the mortar. Tap water (pH of 7.11) was used as mixing water as well as exposure environment. However, saline water and acidic solution were exclusively used as exposure environments. Moreover, the saline water was made by adding 3.5% NaCl (laboratory grade) in distilled water. We have found pH value of 7.17 of this salt solution. In addition, the acidic solution was made by adding 1% H<sub>2</sub>SO<sub>4</sub> (laboratory grade) in distilled water. We have found pH value of 1.12 of this acidic solution.

The scanning electron microscope (SEM) and the energy-dispersive X-ray spectroscopy (EDX) techniques were used to determine the microstructural properties and elemental compositions of the OPC, nano-TiO<sub>2</sub> and mild steel. The X-ray diffractometer (XRD) technique was used to determine the mineralogical properties of the OPC, nano-TiO<sub>2</sub>. The SEM micrographs of OPC and nano-TiO<sub>2</sub> are shown in Fig. 1a, b, respectively. It can be seen that the OPC particles are irregular in shape and large in size, while NT particles are almost spherical in shape and very small in size. Also, it can be seen for nano-TiO<sub>2</sub>. The EDX spectrums of OPC and NT are shown in Fig. 2a, b, respectively. Figure 3a, b shows the SEM micrograph and EDX spectrum of steel, respectively. The XRD patterns of OPC and NT are shown in Fig. 4a, b, respectively. It can be seen that the XRD pattern of OPC is complex and hence difficult to recognize the polymorphs of OPC because of coexistence of polymorphs and overlapping of large peaks. However, the most prominent peaks in the XRD pattern are obviously those of tricalcium silicate (C<sub>3</sub>S), dicalcium silicate (C<sub>2</sub>S), tricalcium aluminate (C<sub>3</sub>A) and tetracalcium aluminoferrite (C<sub>4</sub>AF). The XRD pattern of nano-TiO<sub>2</sub> indicates its crystalline nature.

### 2.2 Mix Proportions

The details of the different mix proportions for each mortar cube specimen of size 70.6 × 70.6 × 70.6 mm are given in Table 1. The amount of ethanolamine (EA) and NT was added as 1%, 3% and 5% by weight of OPC. Moreover, both admixtures were mixed thoroughly in the water. Besides, NT

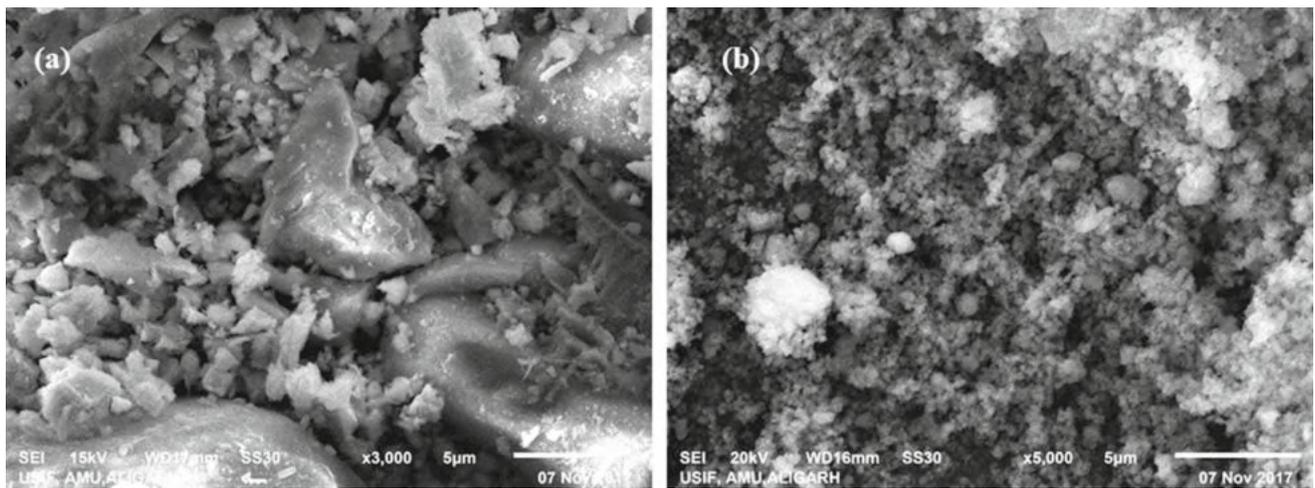

Fig. 1 SEM micrograph of a OPC and b nano-TiO<sub>2</sub>

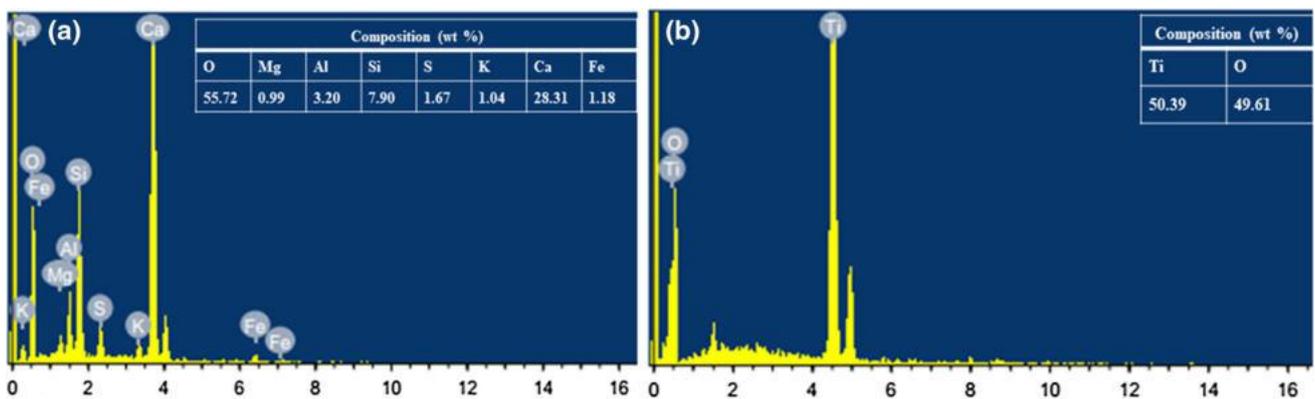

Fig. 2 EDX spectrum of a OPC and b nano-TiO<sub>2</sub>

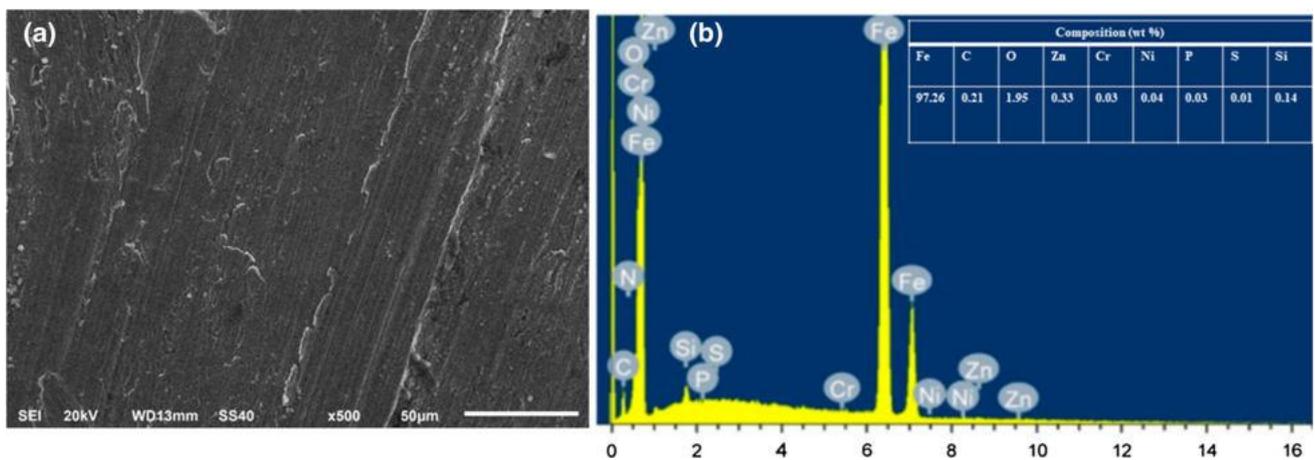

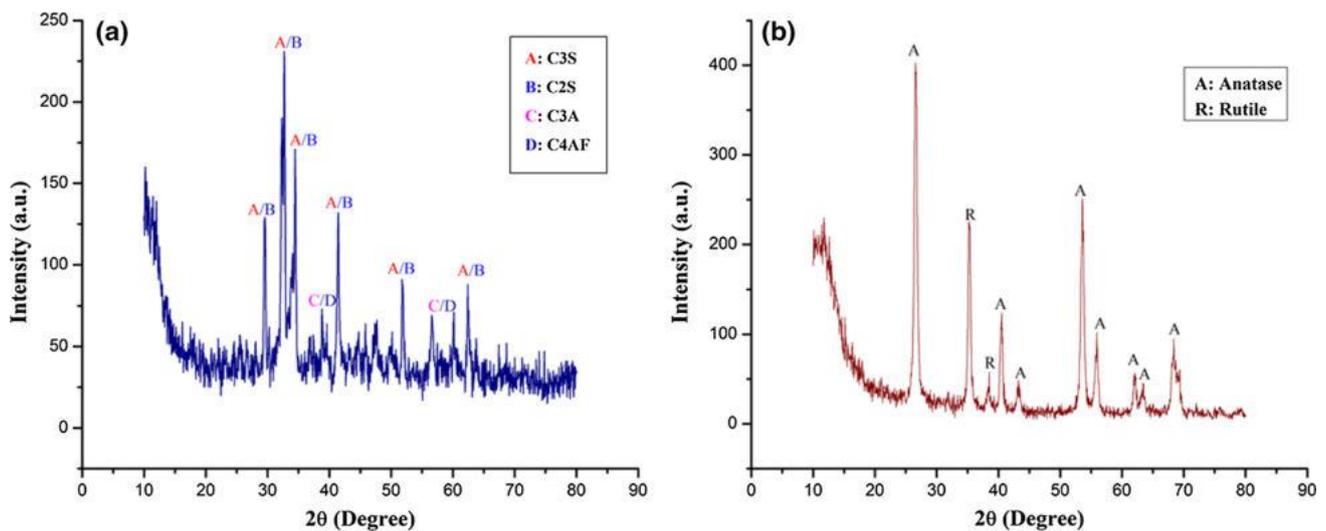

Fig. 3 a SEM micrograph and b EDX spectrum of steel

was properly dispersed in mixing water using magnetic stirrer. These mortar mix proportions were not only designed for compressive strength investigations but also used for SEM and corrosion studies. However, to perform XRD investiga-

tions, the OPC paste (P-X0), 5% EA-admixed paste (P-EA5) and 5% NT-admixed paste (P-NT5) were designed as given in Table 1. Further, the mixing water for these pastes were cal-

NT3	34	28.9
NT5	36	30.6

culated using their respective standard consistency as given in Table 2.

## 3 Specimen Specifications and Test Procedure

### 3.1 Setting Time

In order to study the influence of 1%, 3% and 5% of EA and NT on the setting time of OPC, the water content was determined by means of Vicat's apparatus in accordance with IS: 4031 (Part 4 & 5) as shown in Table 2 [67, 68]. Before blending the admixtures into OPC, they were mixed thoroughly in the mixing water.

#### 3.1.1 Compressive Strength

A total 12 mortar cube specimens of size 70.6 × 70.6 × 70.6 mm for each mix proportions were made to determine

the influence of 1%, 3% and 5% of EA and NT admixtures on compressive strength. The specimens were demoulded after 24 h of casting and then exposed to potable water for curing. After 28-day curing, 3 specimens of each mix were examined for compressive strength. And out of remaining 9 specimens, 3 specimens of each mix were submerged in tap water, 3 specimens of each mix were submerged in saline water and 3 specimens of each mix were submerged in acidic solution. These specimens were examined for compressive strength after 360 days of the exposure period. Moreover, the compressive strength test were carried out using compression testing machine (AIMIL Ltd., capacity = 1000 kN and least count = 1 kN) by applying uniform and steady load of about 310 kN/min.

### 3.1.2 Microstructural Analysis

The SEM and EDX analyses of X0, EA5 and NT5 mortar specimens were performed using JSM-6510LV (JEOL) microscope. Small fragments (about 10 mm diameter and 5 mm thickness) of the central portion of the mortar cube specimens were taken for SEM and EDX analyses. The surface of the fragments was prepared flat and regular in shape to avoid any deceptive outcomes. Further, the fragments were immersed in the pure alcohol for 72 h and then were dried at 80 °C for 8 h to stop the hydration reaction.

### 3.1.3 Mineralogical Analysis

The P-X0, P-EA5 and P-NT5 pastes of samples size 20 mm × 20 mm × 20 mm were made for mineralogical analysis. After 24 h of moulding, the samples were submerged in the potable water for curing. After 28 days of curing, the samples were submerged in pure alcohol for 72 h to stop the hydration reaction and then were dried at 50 °C for 4 h to dry and were then kept at room temperature for 72 h to cool. After that, the samples were ground to powder form to perform the XRD analysis by Bruker X-ray D8 Advance diffractometer with Cu-K $\alpha$  ( $\lambda = 1.54187 \text{ \AA}$ ) radiation at room temperature. In addition, the data were recorded with the scanning rate of 2°/min, step-length of 0.02° and  $2\theta$  range of 10°–80°.

## 3.2 Potentiodynamic Polarization Test

In order to determine the corrosion behaviour of steel bar embedded in mortar through Tafel potentiodynamic polarization method, 9 cylindrical specimens of 30 mm diameter and 42 mm height were made for each mix proportion. The 3-mm-diameter steel bar was centrally placed in the mould and was projected by 30 mm from the top of the mould. Besides, a uniform clear cover of 13.5 mm to the steel was provided from the sides as well as bottom of the specimen. Further, the projected portion of the steel was protected with insulating tape.

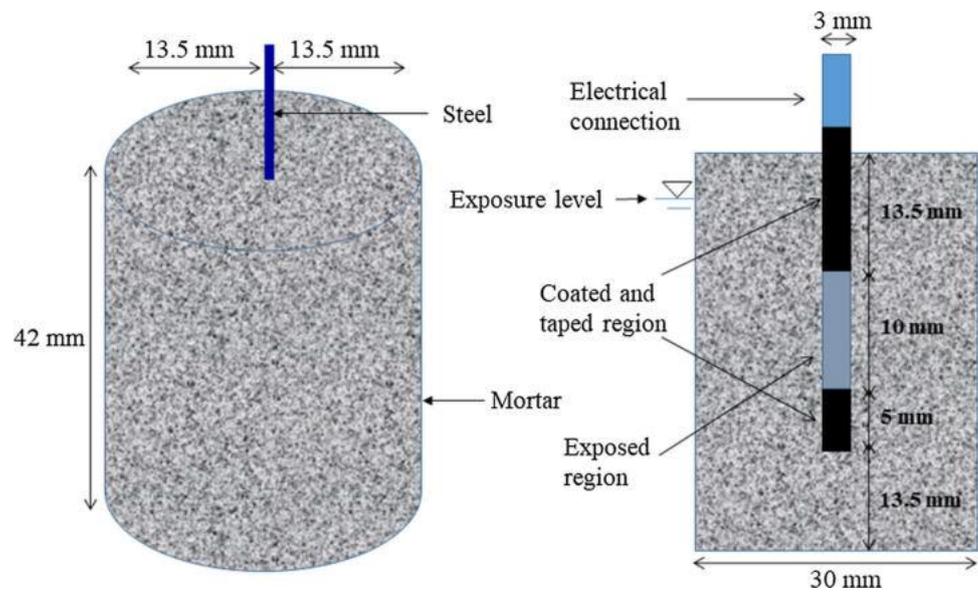

At the time of experiment, this tape was removed for connecting to electrochemical circuit. Moreover, the actual exposed surface area of the steel bar was considered as 1 cm<sup>2</sup> (about 10 mm length). The insulating tape followed by enamel and red oxide coating was applied on the remaining part of steel bar. Figure 5 shows the schematic diagram of the test specimen with details. After 24 h of casting of these specimens, they were demoulded and were cured in tap water for 28 days. Afterwards, 3 specimens of each mix were submerged in tap water, 3 specimens of each mix were submerged in saline water and 3 specimens of each mix were submerged in acidic solution. These test solutions were renewed in every two weeks. In addition, the specimens were monitored continuously with 15 days wetting and drying cycle to accelerate the corrosion process. The wet exposure environment was tap water, saline water and acidic solution; the dry exposure environment was room temperature or normal storage conditions, which means storage in a dry, clean, well ventilated area at room temperatures between 15° and 30 °C. Figure 6 shows the specimens under investigation. The potentiodynamic polarization test was performed after 360 days of exposure period.

The potentiodynamic polarization test was carried out using the Gill AC Potentiostat of Applied Corrosion Monitoring (ACM) instruments. Besides, the ACM instrument offers inbuilt programmes to assess the various corrosion kinetic parameters such as corrosion current density, corrosion potential, corrosion rate, etc. Moreover, the corrosion kinetic parameters were determined by means of the most commonly used three-electrode electrochemical cell assembly, in which the test specimen was acting as working electrode (WE), while platinum electrode (PE) and saturated calomel electrode (SCE) were acting as counter electrode (CE) and reference electrode (RE), respectively. Besides, a working sense (WS) electrode had been connected to WE to measure the potential within the cell between RE and WS electrodes. The test solutions (tap water, saline water and acidic solution) were used as an electrolyte of the electrochemical cell. Figure 7a, b shows the schematic diagram of the test set-up and Gill AC Potentiostat during test, respectively. The experiments were performed at the potential of  $\pm 300 \text{ mV}$  (vs. SCE) from the open circuit potential ( $E_{OC}$ ) with 60 mV/minute potential sweep rate.

The potentiodynamic polarization test produces a plot of the logarithm of the current density ( $\log|i|$ ) versus the potential ( $E$ ). This plot is also known as Tafel curve. The various corrosion kinetic parameters such as Tafel anodic slope ( $\beta_a$ ), Tafel cathodic slope ( $\beta_c$ ), corrosion current density ( $i_{corr}$ ) and corrosion potential ( $E_{corr}$ ) were estimated through intersecting the  $E_{OC}$  and the extrapolated linear parts of the logarithmic current plot as shown in Fig. 8. Besides, the corrosion rate (CR) and linear polarization resistance (LPR) were assessed by means of Gill AC-ACM instrument.

**Fig. 5** Schematic diagram of test specimen

**Fig. 6** Test specimens during dry cycle

Furthermore, the corrosion inhibition efficiency (IE) of EA and NT in percentage were calculated by the following relationship:

$$I.E(\%) = \left( \frac{CR_O - CR_W}{CR_O} \right) \times 100 \quad (1)$$

where  $CR_W$  and  $CR_O$  are the CR of the specimens with and without admixture, respectively.

## 4 Results and Discussion

### 4.1 Setting Time

Figure 9 shows the initial setting time (IST) and final setting time (FST) of different cement pastes. It can be seen that the addition EA led to increase the IST as well as FST of cement paste. The addition of 1%, 3% and 5% EA increased the IST by 4.7%, 8.1% and 13.9%, respectively, and increased the FST by 2.7%, 6.3% and 10.4%, respectively. Hence, it can be said that the EA acts as a retarder for the hydration

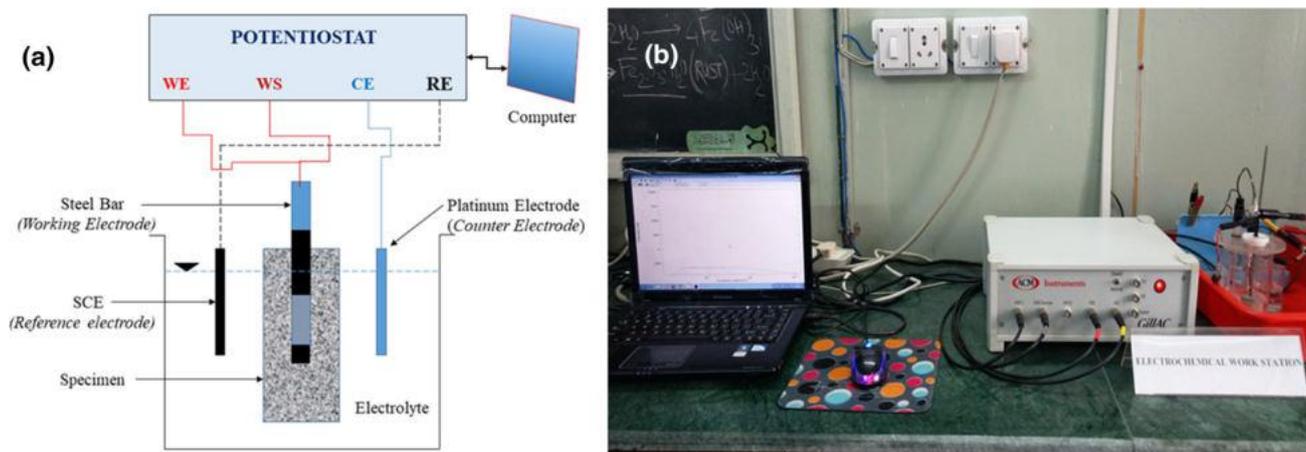

Fig. 7 a Test set-up, b Gill AC potentiostat

Fig. 8 Analysis of Tafel curve

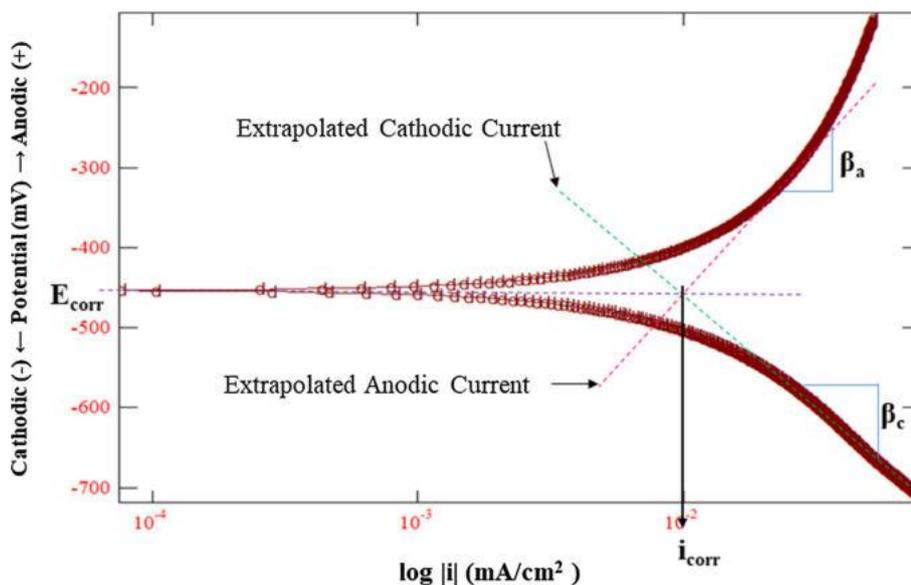

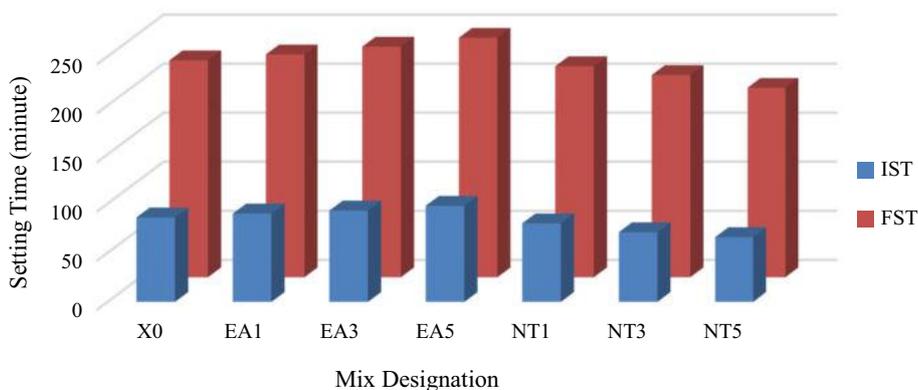

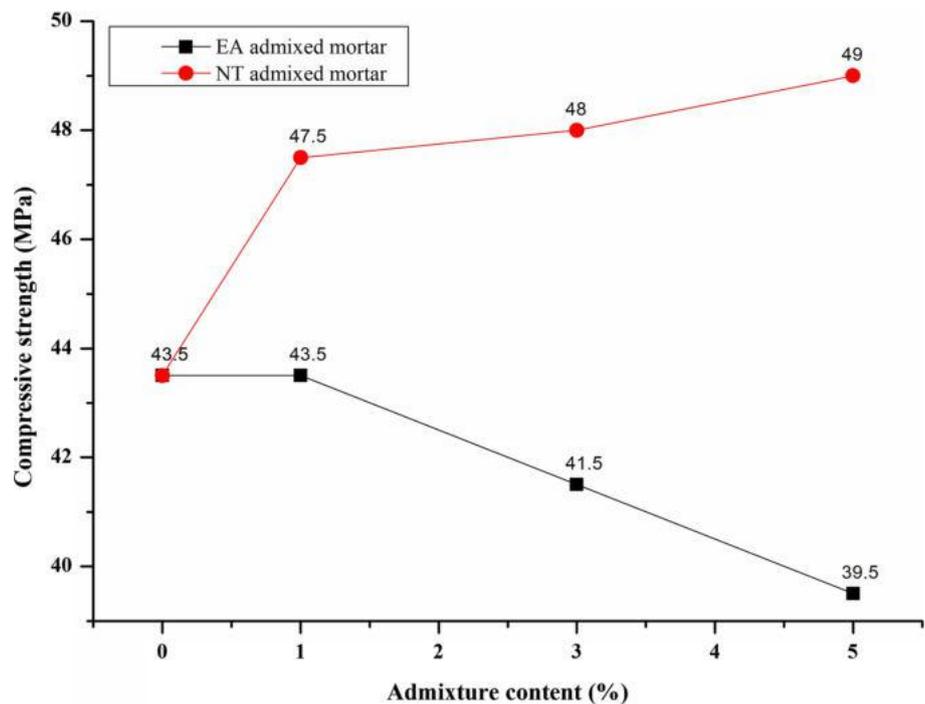

Fig. 9 Influence of EA and NT on IST and FST

process of cement paste. On the other hand, the IST and FST was decreasing with the increase in the percentage of NT. For 1%, 3% and 5% addition of NT, the decrement in IST was 6.8%, 17.4% and 23.3%, while in FST it was 3.6%, 6.8% and 12.7%, respectively. The acceleration effect may

be due to high specific surface area of NT which in turn increases the wettable surface area and water absorption. As a result, the rapid decrease in free water content may speed up the bridging process of gaps, leading to an increase in the viscosity and quick solidification.

**Fig. 10** Influence of EA and NT on 28 days compressive strength of mortar cured in potable water

## 4.2 Compressive Strength

The average compressive strength results (reported to the nearest 0.5 MPa) of 0%, 1%, 3% and 5% EA- and NT-admixed mortar after 28 days of potable water curing is shown in Fig. 10. It can be seen that the compressive strength decreases with increasing the content of EA. As compared to control mortar, the reductions in strength were found as 0.0%, 4.6% and 9.2% for EA content of 1%, 3% and 5%, respectively. These compressive strength reductions may be due to the adsorption of EA on the surface of cement particles that affect the hydration process [69].

The compressive strength was observed to increase with the increase in proportion of NT. When 1%, 3% and 5% NT was added, the corresponding strength improvement as compared to control mortar was found to be 9.2%, 10.3% and 12.6%. These improvements in strength may be because of the enhancement in homogeneity, density and microstructure of cement matrix in the presence of NT [70, 71].

Figure 11 shows the mortar cube specimens after 360 days exposure under tap water, saline water and acidic solution. On visual inspection, no obvious deteriorations were observed on the surface the specimens exposed under tap and saline water. In contrast, clear deteriorations on the surface of the specimens exposed under acidic solution were observed owing to the gypsum and ettringite formation in the presence of mineral sulphuric acid. However, it can be seen that NT-admixed specimens showed less signs of deterioration as compared to the other specimens. Hence, it can be said that

EA was not effective against mineral sulphuric acid attack. On the other hand, NT exhibited acid-resistant properties.

Table 3 shows the impacts of EA and NT on the compressive strength of mortar specimens after 360 days exposure under tap water, saline water and acidic solution. It can be seen that in all the three exposure mediums, EA-admixed specimens exhibited lower compressive strengths as compared to control specimens and the higher EA dosage, the lesser the strength. On the other hand, strengths were improved by the addition of NT and the higher NT amount, the greater the improvement.

The specimens exposed under tap water exhibited greater compressive strengths as compared to the corresponding specimens exposed under saline and acidic environments. In saline environment, the reduction in strength may be due to the consumption of calcium aluminate hydrate and the formation of calcium chloroaluminate hydrate. Besides this, it can be because of the development of stresses and microcracks due to salts crystallization in the pores [72]. In acidic environment, the loss in strength is due to the formation of gypsum in the presence of  $H_2SO_4$  and  $Ca(OH)_2$ . The gypsum forms ettringite on reacting with tricalcium aluminate (C3A). The higher volume of gypsum and ettringite causes inner stresses in mortar leading to the growth of cracks [73]. In addition, EA-admixed specimens showed higher strength loss as compared to control specimens. In contrast, NT-admixed mortar specimens showed considerably lower strength loss as compared to the control specimens. This may be because of the limiting the ingress of aggressive ions into the mortar by NT.

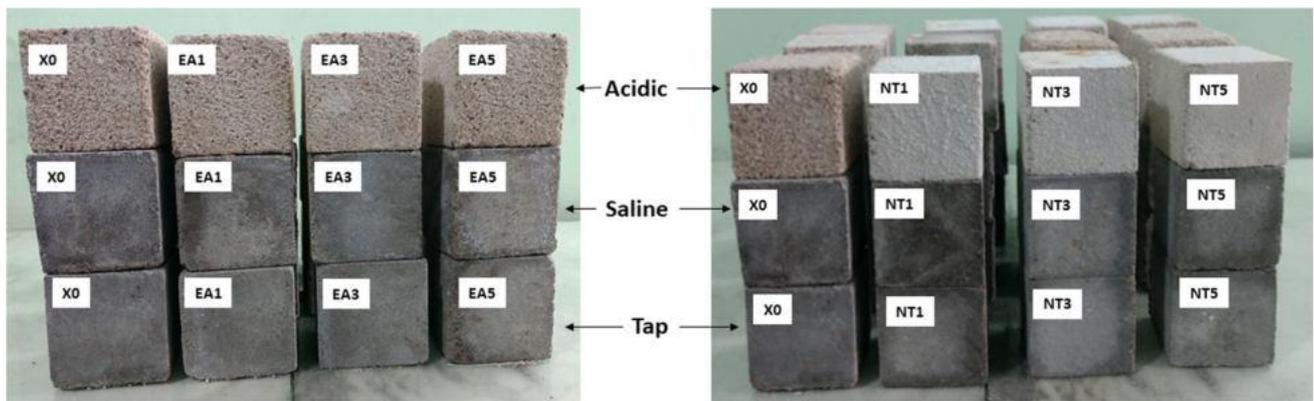

Fig. 11 Mortar cube specimens after 360 days of exposure under different environments

**Table 3** Compressive strength of specimens after 360 days exposure under tap water, saline water and acidic solution

Exposure medium	Mix designation	Compressive strength (MPa)	% Variations w.r.t. control specimen	% Variations w.r.t. the corresponding specimens exposed in tap water
Tap water	X0	47.5	–	–
	EA1	46.5	– 2.11	–
	EA3	45.0	– 5.26	–
	EA5	43.5	– 8.42	–

	NT1	40.5	17.39	– 22.86
	NT3	42.5	23.19	– 22.08
	NT5	43.5	26.09	– 20.91

### 4.3 Microstructural Analysis

Figure 12a–c shows the SEM micrographs of X0, EA5 and NT5 mortars, respectively. The images were taken at the magnification of 1000 and 10,000 times. Figure 13a–c shows the EDX spectrums of X0, EA5 and NT5 mortars, respectively. The SEM image of EA5 specimen exhibits more amount of needle-like crystals of calcium aluminate trisulphate hydrate (C-A-S-H) and pores compared to X0 specimen. This indicates that the high amounts of EA may adversely affect the

microstructural and mechanical properties of cementitious composites. Thus, the microstructural analysis results exhibited good agreement with the above-mentioned compressive strength test results. Besides, the presence of EA in the mortar is evident from EDX spectrum because its analysis results show the existence of additional carbon element. The SEM micrographs of NT5 show a special type of microstructure, comprising a voluminous quantity of calcium silicate hydrate (C-S-H gel) and a low amount of pores and C-A-S-H (Ettringite). Thus, it is clear that the addition of NT has improved

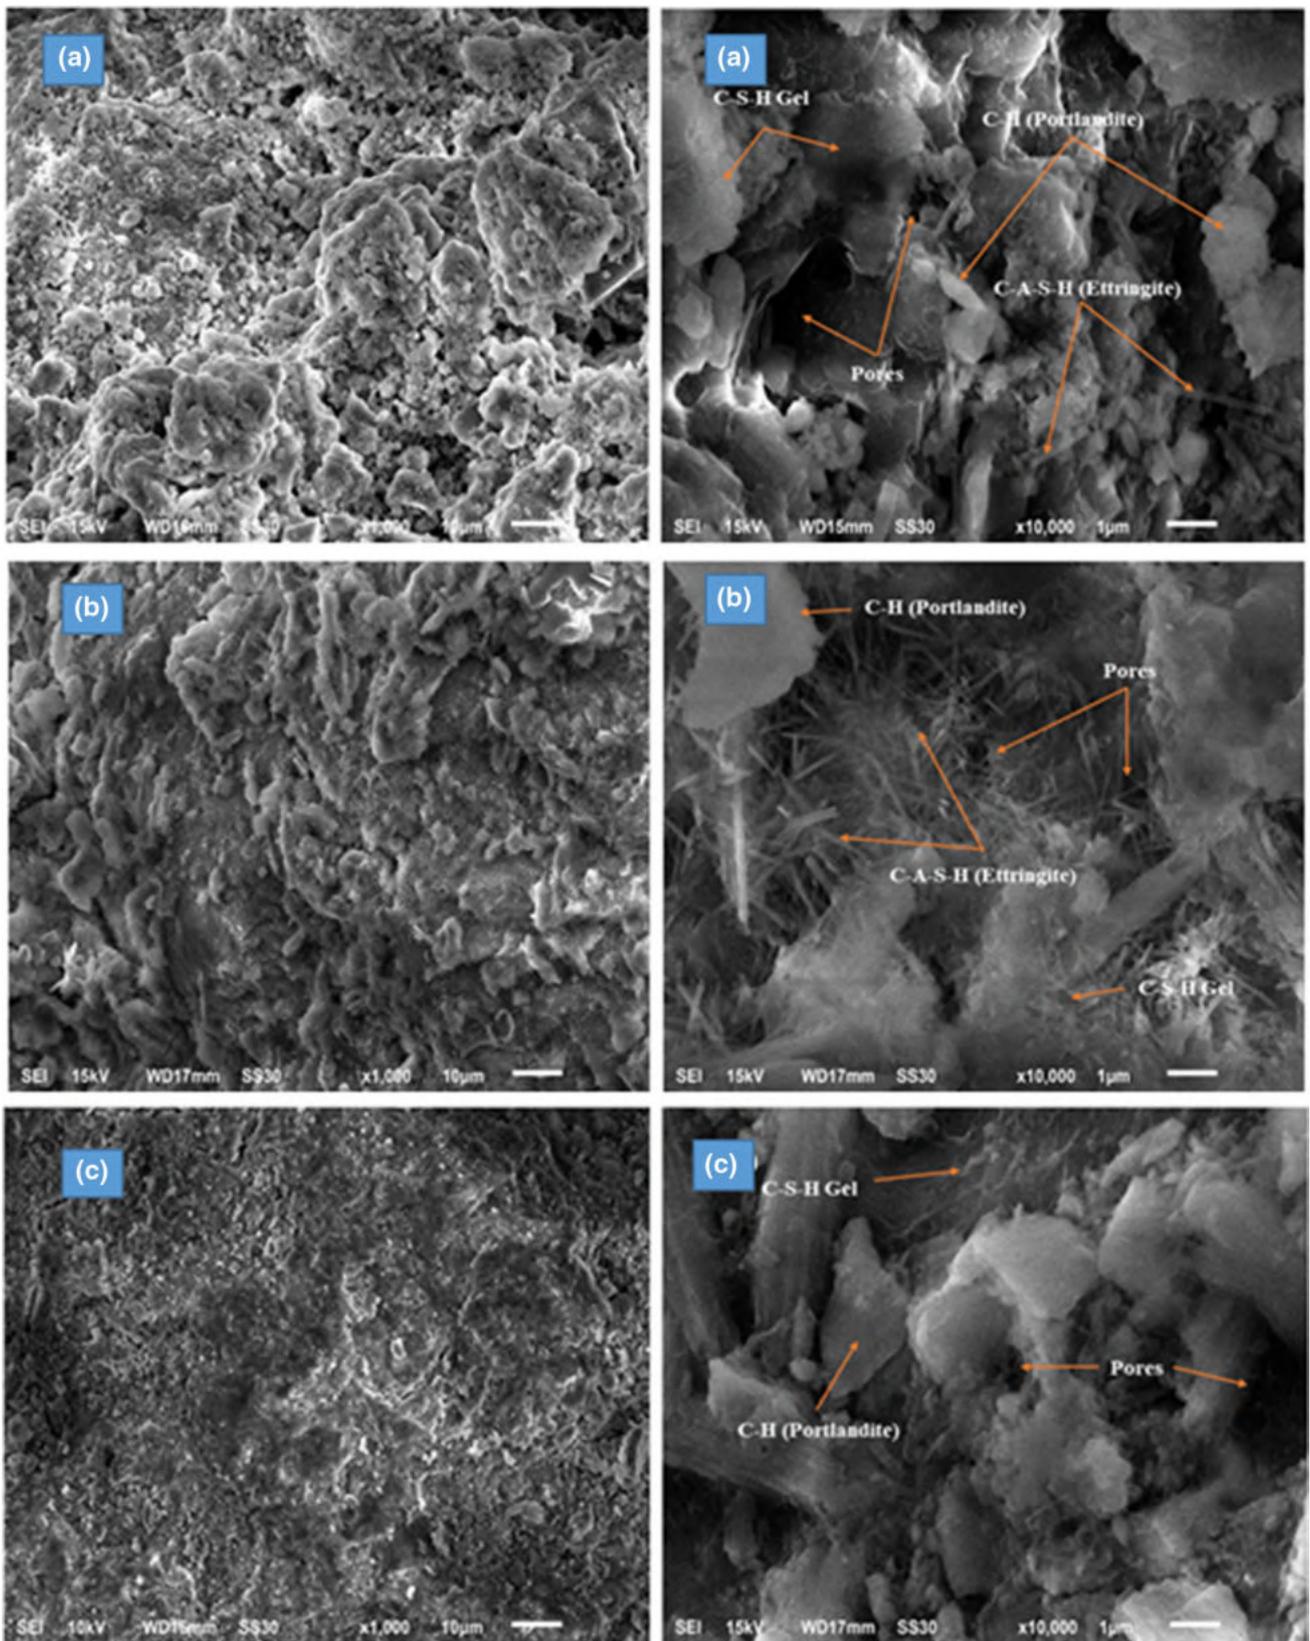

Fig. 12 SEM micrographs of a X0, b EA5 and c NT5 mortar

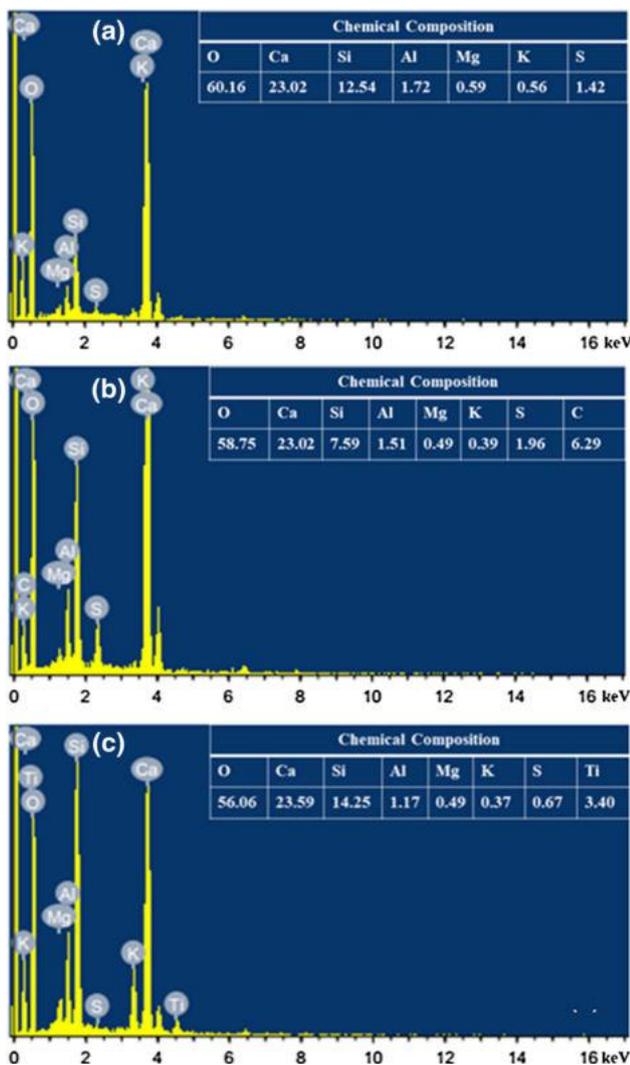

Fig. 13 EDX spectra of a X0, b EA5 and c NT5 mortar

the microstructural and mechanical properties of mortars. These characteristics might be because NT could increase particle-packing density, reduce the porosity and develop intact bonds. Moreover, the presence of NT in the mortar confirms through EDX spectrum.

#### 4.4 Mineralogical Analysis

Figure 14a–c shows the XRD patterns of P-X0, P-EA5 and P-NT5 pastes, respectively. The XRD configurations of cement paste can be explained with the help of hydration reactions. Since the total mole quantity of calcium is constant, calcium may be present in the hydration products either as calcium hydroxide (Portlandite) or as C–S–H gel or C–A–S–H (ettringite). Usually, the quantity of ettringite is considerably lower than the Portlandite and C–S–H gel. As such, a lower amount of C–S–H gel corresponds to a higher amount of Portlandite.

Generally, the quantitative analysis of C–S–H gel cannot be carried out by means of the XRD results, because C–S–H gel is poorly crystalline fibrous mass (amorphous in structure), which is not possibly reflected in XRD pattern. In addition, there is no direct technique to calculate the C–S–H gel concentration and hence the quantity of Portlandite can indirectly estimate the C–S–H gel concentration. Various investigators found that the quantity of Portlandite is inversely related to that of C–S–H concentration, and hence, the smaller peaks of Portlandite in XRD pattern indicate the higher quantity of C–S–H gel [74–76].

The XRD results signify the presence of C3S (1), C2S (2), Portlandite (3), and ettringite (4). Portlandite peaks have been considered as the main indicator of cement paste and can be used for the estimation of C–S–H gel quantity. The XRD pattern of P-EA5 specimen showed various overlapping and low-intensity peaks that indicates the presence of ettringite. Thus, the addition of a higher amount of EA may adversely affect the strength and durability characteristics of cementitious composites. On the other hand, the XRD pattern of P-NT5 exhibited considerably lower intensity peaks of Portlandite as compared to control specimen. This suggests that the NT consumes Portlandite crystals. Such consumption of Portlandite increases the desirable C–S–H gel quantity and enhances the microstructural and mechanical properties of cementitious composites.

#### 4.5 Potentiodynamic Polarization Test

Figures 15, 16 and 17 show the Tafel potentiodynamic polarization curves of all the specimens submerged in tap water, saline water and sulphuric acid solution, respectively. The corrosion kinetic parameters such as anodic constant ( $\beta_a$ ), cathodic constant ( $\beta_c$ ), corrosion current density ( $I_{corr}$ ), corrosion potential ( $E_{corr}$ ), linear polarization resistance (LPR) and corrosion rate (CR) of different specimens as found from their corresponding polarization curves are shown in Table 4. Also, the corrosion inhibition efficiencies (IE) of different percentages of EA and NT were estimated and presented in Table 4.

It can be seen that the presence of EA up to 3% produces a significant decrease in the corrosion rate of steel embedded in mortar specimens exposed to tap water. Further addition of EA up to 5% marginally reduces the corrosion rate of the embedded steel as compared to 3% dosage. Thus, the corrosion inhibition efficiency of EA increases with the increase in the dosage up to 3%, and decreases at 5% dosage. Similar trends of effectiveness of EA were observed in case of saline water and acidic solution exposure conditions. The effectiveness of EA in preventing corrosion is believed to be due to the formation of a film around the steel [36]. It was observed that the corrosion rates exhibited by the NT-admixed specimens were found to be lower than the control specimens exposed in

Fig. 14 XRD patterns of  
a P-X0, b P-EA5 and c P-NT5

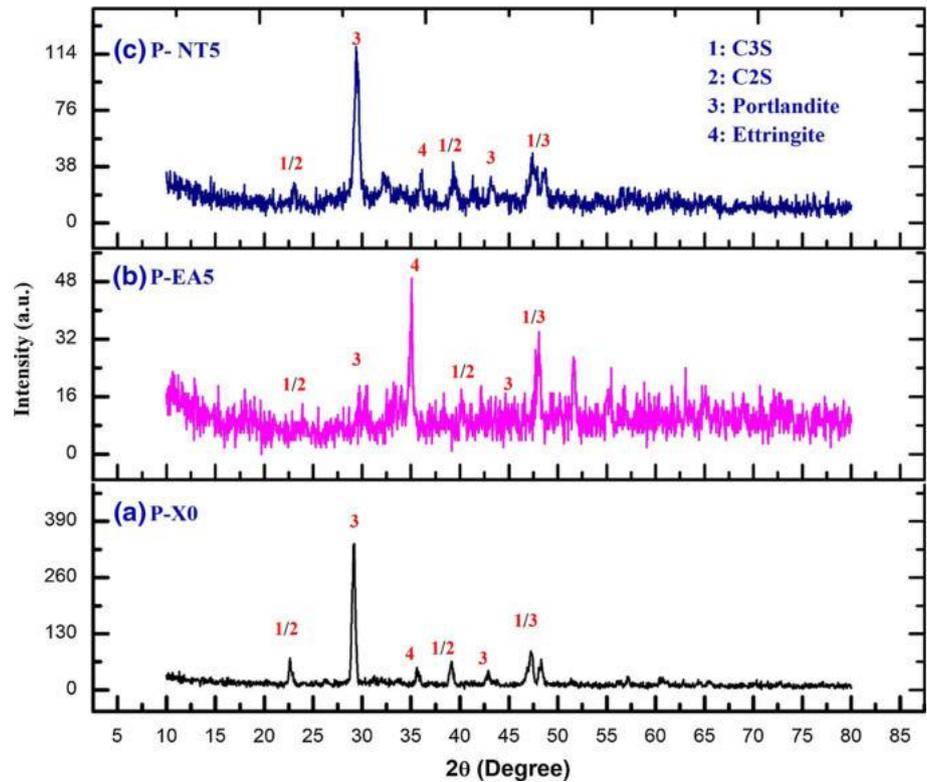

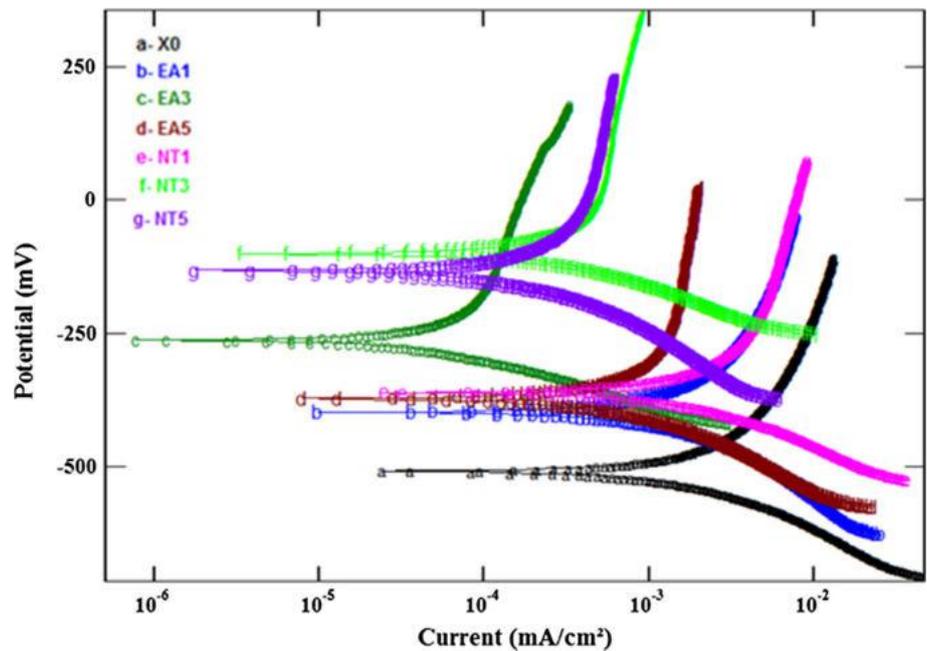

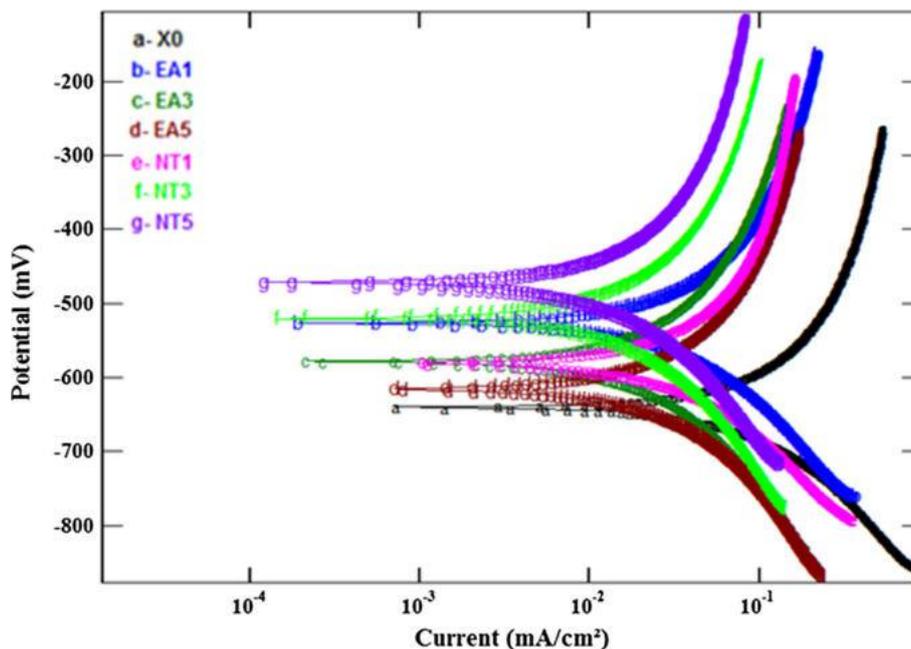

Fig. 15 Potentiodynamic polarization curves of all the specimens exposed under tap water

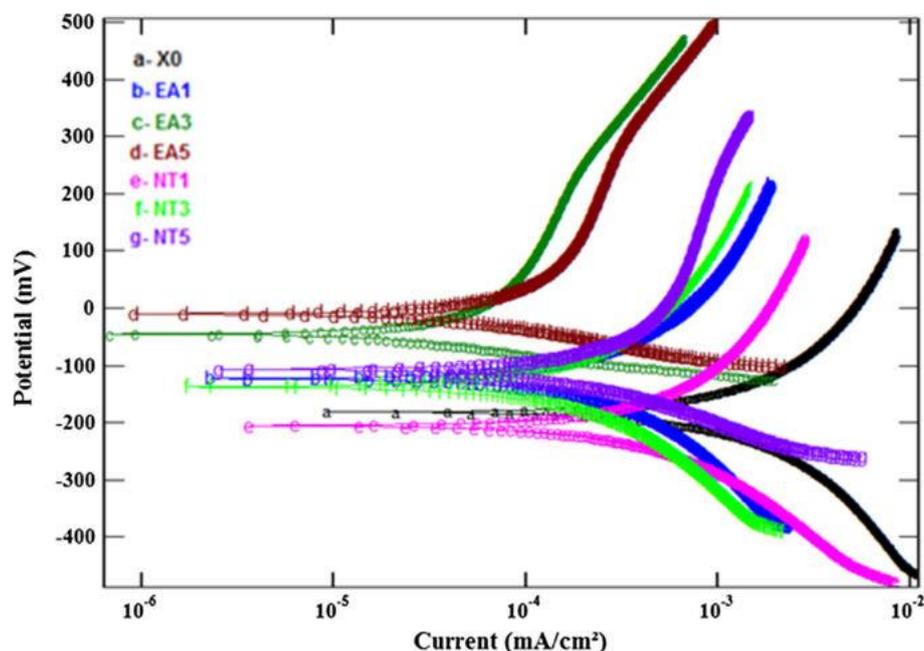

tap water. Hence, the corrosion inhibition efficiency increases with the increase in the amount of NT. Also, the specimens exposed in saline water and sulphuric acid solution exhibited similar effects. This suggests that the NT can fill up the voids and yields a compact mortar and consequently decreasing the ionic transport.

Furthermore, the corrosion resistance of all the specimens exposed in saline water was observed to be significantly lower than the corresponding specimens exposed in tap water. In contrast, the corrosion resistance of all the specimens exposed in sulphuric acid solution was found to be slightly higher than the corresponding specimens exposed in tap

**Fig. 16** Potentiodynamic polarization curves of all the specimens exposed under saline water

**Fig. 17** Potentiodynamic polarization curves of all the specimens exposed under acidic solution

water. This contradictory effect may be because of the development of gypsum and ettringite within the pores of mortar in the presence of sulphuric acid that decreases the ingress of aggressive agents.

### 5 Conclusions

The following conclusions have been drawn based on the obtained results:

1. The setting time results showed that ethanolamine (EA) acts as retarder. However, nano-TiO<sub>2</sub> (NT) acts as accelerator. The acceleration effect of NT may be due to its high specific surface which in turn increases the wettable surface area and water absorption leading to an increase in the viscosity and quick solidification.
2. The EA-admixed mortar specimens showed a slightly lower 28-day compressive strength as compared to control specimens. This reduction was more significant at the higher dosage of EA. This might be because the

**Table 4** Corrosion kinetic parameters of steel embedded in mortar and IE of EA and NT

addition of EA decreased the amount of desirable hydration products. A substantial improvement in the 28-day compressive strength of mortars was observed with the addition of NT. This was more noticeable when higher quantities of NT were added. This might be because the addition of NT increased the quantity of desirable hydration products and particle-packing density of mortar.

- The EA-admixed specimens showed considerably lower resistance against chloride and acid attack as compared to control specimens. However, the specimens containing NT showed significantly higher resistance against chloride and acid attack as compared to control specimens. This may be due to the pore-blocking ability of NT that inhibit the ingress of aggressive ions.
- The microstructural analysis confirmed that the EA-admixed specimen exhibited more amount of needle-like crystals and pores compared to control specimen. This indicates that the high volumes of EA may adversely affect the microstructural properties of cementitious composites. However, the SEM micrograph of nano-TiO<sub>2</sub>-admixed specimen showed a large quantity of C-S-H gel, and a low amount of pores and needle-like crystals. This might be because the addition of nano-TiO<sub>2</sub> increased particle-packing density of mortar.

- The XRD analysis of cement paste specimen containing EA showed many overlapping and lower intensity peaks that indicate the presence of Ettringite. Consequently, the addition of a higher amount of EA may adversely affect the strength and durability characteristics of cementitious composites. In contrast, the XRD analysis confirmed that the inclusion of NT leads to increase in the amount of C-S-H gel and thus may enhance the microstructural, strength and the durability properties of mortar.
- The potentiodynamic polarization studies showed that the EA is effective in reducing the corrosion rate of embedded steel. This may be due to the adsorption of EA on the surface of steel, thus preventing the reaction to occur between iron and aggressive ions. The corrosion rate exhibited by the NT-admixed specimens was found to be significantly lower than the control specimens. This may be due to pore blocking efficiency of NT that restrict the ingress of aggressive agents.

**Acknowledgments** Md Daniyal is thankful to CSIR, HRDG, GOI, for providing financial assistance in the form of JRF & SRF. We also acknowledge USIF, AMU for providing the instrumentation facility.

## Compliance with Ethical Standards

**Conflict of interest** None.

MS received 30 December 2018; revised 19 October 2019; accepted 20 November 2019

**Abstract.** The main aim of this study was to investigate the effect of 1%, 3% and 5% content of ethanolamine (EA) and nano-TiO<sub>2</sub> (NT) on the corrosion resistance properties of ferrocement composites exposed under tap water, saline water and sulphuric acidic solution environments. The corrosion behaviour composites were assessed through potentiodynamic polarization technique. Besides, the effect of EA and NT on the fresh, hardened, microstructural and mineralogical properties of cementitious composites were evaluated by conducting setting time, compressive strength, SEM, EDX and XRD studies. The corrosion resistance properties of ferrocement composites were found to be improved with the addition of both EA and NT. The corrosion inhibition efficiency of EA was observed to be increasing up to 3% but decreased at 5% dose, whereas it was increasing with increasing the content of NT in all the three exposure environments. The EA and NT were found to be acting as retarder and accelerator, respectively. The addition of EA led to decrease the 28-days compressive strength of mortar, however the addition of NT showed an opposite effects. Similar impacts on the 180-days compressive strengths mortars exposed under tap water, saline water and acidic solution were also observed. The SEM and XRD analyses revealed that EA caused adverse impacts on the microstructure and hydration products of OPC, though NT enhanced the microstructure and the quantities of desirable hydration products.

**Keywords.** Ethanolamine; nano-TiO<sub>2</sub>; corrosion resistance; setting time; compressive strength; microstructural properties.

## 1. Introduction

Until the mid-1970s, steel reinforced cement concrete structures were assumed to be maintenance-free for an indefinite period. On the contrary, subsequently several durability associated problems have been emerged mainly caused by aggressive agents such as chlorides, carbon dioxide, sulphates and acids [1]. Generally, the carbon dioxide and chlorides corrode the steel. Carbon dioxide creates an environment favourable to corrosion of steel by reacting with hydration products of cement and reducing the alkalinity of concrete [2–4]. Chlorides attack the steel reinforcement by passing through the pores of the concrete but usually do not attack the concrete integrity [5–7]. In contrast, acids and sulphates mainly degrade the integrity of concrete by reacting with the hydration products of cement [8–10].

Of all the problems related to the durability of reinforced concrete structures, the corrosion of the steel reinforcement

was recognized as the main cause of the deterioration. Usually, steel does not oxidize in dense concrete due to the high pH of pore solution containing NaOH, KOH and Ca(OH)<sub>2</sub> [11]. Under such environmental conditions, an oxide film ( $\gamma$ -Fe<sub>2</sub>O<sub>3</sub>·H<sub>2</sub>O) on the surface of steel is formed due to the reaction between steel and dissolved oxygen. This film is very thin (about 10 nm), passive, insoluble, dense and impenetrable. This passive film considerably decreases the corrosion of steel by acting as a barrier to the oxidation reaction. This film is recognized as the engineer's dream layer owing to its self-formation and maintenance in the presence of alkaline environment [12, 13]. Under such circumstances, generally there is low risk of corrosion of steel or corrosion initiation time is prolonged. Though, protection presented by this passive film declines in the presence of hostile agents. For example, when the passive layer gets damaged because of the presence of hostile species (primarily chlorides) then pitting corrosion may take place at some zones on the steel surface. This type of corrosion is limited to a small area and produces cavities or holes in the steel bars and thus, causes local failures in the

\*For correspondence

structural components. Therefore, the pitting corrosion is known to be more dangerous than generalized form of corrosion. Generally, the corrosion of steel forms expansive corrosion products that create cracks in concrete and leads to spalling and delamination of cover concrete and eventually increases the rate of corrosion [14, 15]. As a result, steel corrosion is known as one of the most common causes of degradation of steel-reinforced cement concrete structures [16].

Various methods have been developed in the past to reduce the corrosion of steel reinforced cement concrete structures. Some of the techniques comprise addition of chemical corrosion inhibitors [17–22], use of mineral additives in concrete [23–29], surface treatment of concrete [30–33], surface treatment of steel [34–37], electrochemical chloride extraction [38–40] and cathodic protection [41–43]. Besides, several research articles recently reported the potential use of various nanoparticles as an additives for cementitious composites. Most of the studies have revealed that incorporating nanoparticles into cement-based composites can improve the strength and durability properties [44–51]. For example, the addition of 5% nano-TiO<sub>2</sub> into self-compacting mortar caused to enhanced the 28-days compressive strength by 13% and electrical resistivity by 257% and reduced the water absorption by 11% and the chloride permeability by 58% [47]. As far as fresh properties are concerned, it was found that the addition of nano-TiO<sub>2</sub> substantially reduced the workability and setting time of cementitious composites [52].

Since corrosion of iron is an electrochemical process, hence oxidation reaction occurs at anode ( $\text{Fe} \rightarrow \text{Fe}^{+2} + 2\text{e}^-$ ) and reduction reaction occurs at cathode ( $2\text{H}_2\text{O} + \text{O}_2 + 4\text{e}^- \rightarrow 4\text{OH}^-$ ). To keep electrical neutrality, the  $\text{Fe}^{+2}$  ions move through the pore water of concrete to the cathodic zones and combine with  $\text{OH}^-$  to produce iron hydroxides [53]. As a result, various electrochemical techniques such as Tafel potentiodynamic polarization measurement [54, 55], open circuit potential measurement [56, 57], linear polarization resistance measurement [58–60], surface potential measurement [61], galvanostatic pulse transient [62–64] and electrochemical impedance spectroscopy [65–67] have been developed to assess the corrosion behaviour of steel reinforced cementitious composites. As compared to other methods, Tafel potentiodynamic polarization technique is quick and easy to execute, provides a range of electrochemical parameters such as corrosion current, corrosion potential, linear polarization resistance, etc.

In this study, the effect of one of the renowned chemical admixtures, i.e., ethanolamine (EA) and a nanomaterial, i.e., nano-TiO<sub>2</sub> (NT), on the corrosion resistance behaviour of the ferrocement composite in different environments, namely tap water, saline water and acidic solution have been investigated. In addition, the corrosion state of ferrocement composites was assessed using Tafel potentiodynamic polarization technique. Besides, the effect of EA

and NT on the microstructural, fresh and hardened characteristics of cementitious composites were investigated. Hence, various experiments such as setting time, compressive strength, microstructural and mineralogical analysis were conducted.

## 2. Experimental procedure

### 2.1 Materials and their properties

In this investigation, ordinary Portland cement (OPC) of 43-grade and fine aggregates (FA) of fineness modulus (FM) of 2.65 was used [68]. NT with average particle size of 30 nm (as specified by supplier) was used. The EA ( $\text{H}_2\text{N}-\text{CH}_2-\text{CH}_2-\text{OH}$ ) was used as corrosion inhibitor. The ferrocement composites were made by embedding mild steel (MS) bar of 3 mm diameter into cement mortar. Tap water with pH of 7.11 was used as mixing water and exposure medium. On the other hand, saline water (3.5 % NaCl solution) with a pH of 7.27 and acidic water (1% H<sub>2</sub>SO<sub>4</sub> solution) with a pH of 1.12 were exclusively used as exposure environments.

The microstructural properties and elemental compositions of the OPC, NT and MS were determined by scanning electron microscope (SEM) and energy-dispersive X-ray spectroscopy (EDX) techniques, respectively. Mineralogical properties of the OPC, NT were characterized using X-ray diffractometer (XRD) technique. Figure 1a, b show SEM images of OPC and NT, respectively. It can be seen that OPC particles have rough surfaces and irregular shapes and sizes. This suggests that there are probabilities of infilling the spaces amongst OPC particles using some finer particles. Also, it can be seen that NT particles are very small in size and almost spherical in shape. Figure 2a, b show EDX spectrums of OPC and NT, respectively. The SEM image and EDX spectrum of MS are shown in figure 3a, b, respectively. Figure 4a, b show XRD configurations of OPC and NT, respectively. The XRD configuration of OPC is quite complex due to overlapping of large peaks and coexistence of polymorphs and thus, it is very difficult to identify the polymorphs of OPC. Though, the chief compounds of OPC i.e., dicalcium silicate (C<sub>2</sub>S), tricalcium silicate (C<sub>3</sub>S), tricalcium aluminate (C<sub>3</sub>A) and tetracalcium aluminoferrite (C<sub>4</sub>AF) can be seen in most prominent peaks of XRD configuration. The XRD configuration of NT specifies its crystalline structure.

### 2.2 Mixture proportions of mortars and pastes

Mixture proportions of the mortars and pastes are listed in table 1. For mortars, the ratio of binder (OPC + NT) to FA was taken as 1:3 and water/binder ratio was fixed to 0.45 for all mixtures. The dosage of both EA and NT was taken as 1%, 3% and 5% by weight of OPC. However, NT was

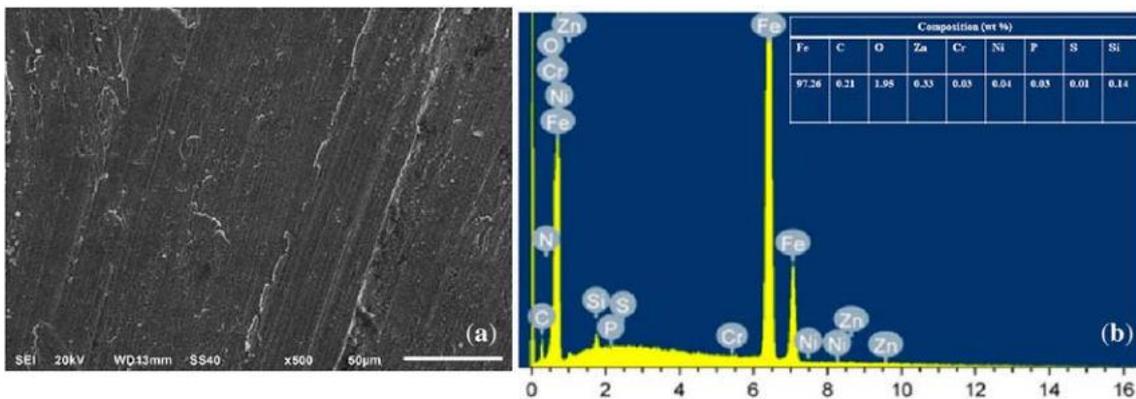

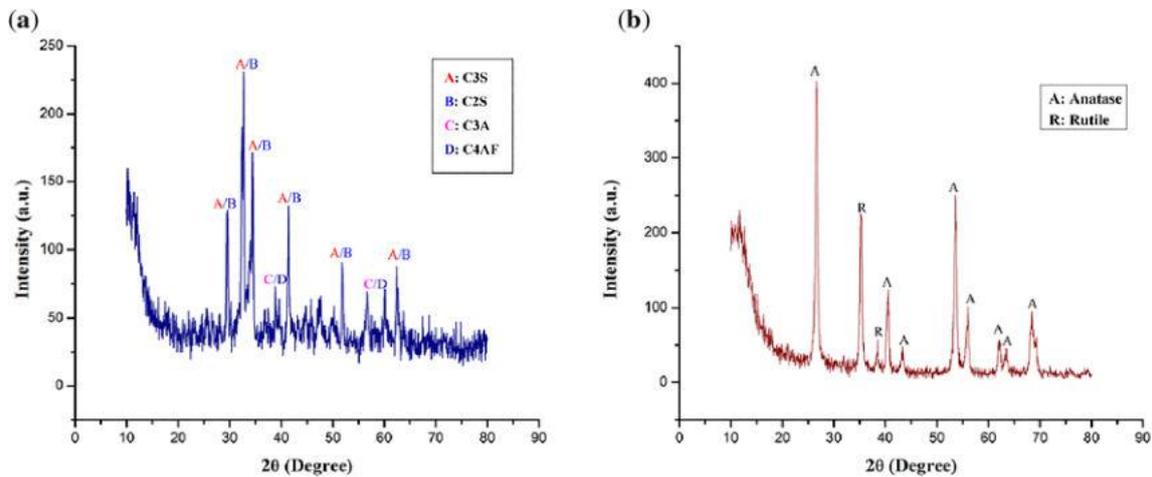

Figure 3. (a) SEM image of steel and (b) EDX spectrum of steel.

added as a replacement of the OPC. Both admixtures were mixed thoroughly in the water. In addition, NT admixed water was stirred by the magnetic stirrer for 10 minutes to get the proper dispersion. The mortar mix proportions were used for compressive strength, SEM and corrosion analysis. Moreover, the OPC paste (P-X0), 5% EA-admixed paste (P-EA5) and 5% NT-admixed paste (P-NT5) were exclusively used for XRD analysis.

### 2.3 Corrosion investigation

2.3a Preparation of ferrocement specimen: To evaluate the corrosion activities of ferrocement composites by Tafel potentiodynamic polarization method, 9 cylindrical specimens with centrally embedded MS bar of size 30 mm diameter and 42 mm height for each mixture were prepared. The MS bar was positioned in such a way that it projected

from the top of the mould by 30 mm and also providing a uniform clear cover of 13.5 mm from the sides and bottom of the specimen. This projected part of the MS bar was wrapped with insulating tape. This tape has been detached for electrical connection at the time of testing. In addition, the actual exposed length of MS bar has been taken as 10 mm (surface area of about 1 cm<sup>2</sup>). On the remaining portion of MS bar, red oxide and enamel coating were applied and after that a protecting tape was wrapped. The schematic diagram of the test specimen with details is shown in figure 5. After 24 hours of casting, the specimens were cured in tap for 28 days. After that, 3 specimens of each mixture were exposed under tap water, 3 specimens of each mixture were exposed under saline water and 3 specimens of each mixture were exposed under acidic solution. These test solutions were renewed in every two weeks. In addition, the specimens were monitored continuously with bimonthly wetting and drying cycle in order to accelerate the corrosion process. The specimens under investigation are shown

**Figure 5.** Schematic illustration of test specimen.

in figure 6. Potentiodynamic polarization test was conducted after 180 days of exposure duration.

**2.3b Potentiodynamic polarization technique:** Potentiodynamic polarization measurements of the ferrocement specimens were carried out using Applied Corrosion Monitoring (ACM) instrument. The polarization measurements were made to assess the various corrosion kinetic parameters such as corrosion potential, corrosion current, etc. Investigations were carried out in a conventional three electrode cell assembly with ferrocement test specimen was used as working electrode (WE), a saturated calomel electrode (SCE) as standard reference electrode (RE), and a rectangular Pt foil as the counter electrode (CE). In addition, a working sense (WS) was connected to WE. The exposure mediums (test solutions) were used as an electrolyte of the cell. A schematic illustration of the test set-up and ACM instrument during test is shown in figure 7a, b, respectively. A time interval of 20 minutes was given for each test to achieve the steady state open circuit potential ( $E_{OC}$ ). The polarization was carried out from a cathodic

Figure 6. Test specimens during dry cycle.

potential of  $-300$  mV (vs SCE) to an anodic potential of  $+300$  mV (vs SCE) at a sweep rate of  $60$  mV/minute.

The polarization curve i.e., a plot of the potential ( $E$ ) vs. the logarithm of the current density ( $\log |i|$ ) is obtained from the potentiodynamic polarization test. From this curve, anodic Tafel slope ( $\beta_a$ ), cathodic Tafel slope ( $\beta_c$ ), corrosion potential ( $E_{corr}$ ) and corrosion current density ( $i_{corr}$ ) were calculated as shown in figure 8. Besides, corrosion rate (C.R) and linear polarization resistance (LPR) can be assessed.

In addition, the corrosion inhibition efficiency (I.E) in percentage can be calculated using the following In addition, the corrosion inhibition formula:

$$I.E (\%) = \left( \frac{CR_a - CR_p}{CR_a} \right) \times 100 \quad (1)$$

Where  $CR_a$  and  $CR_p$  are the C.R of the specimens in the absence and presence of admixtures, respectively.

#### 2.4 Setting time investigation

The effect of EA and NT on the initial setting time (IST) and final setting time (FST) of OPC was determined using Vicat’s apparatus in accordance with IS: 4031 (Part 5) [69].

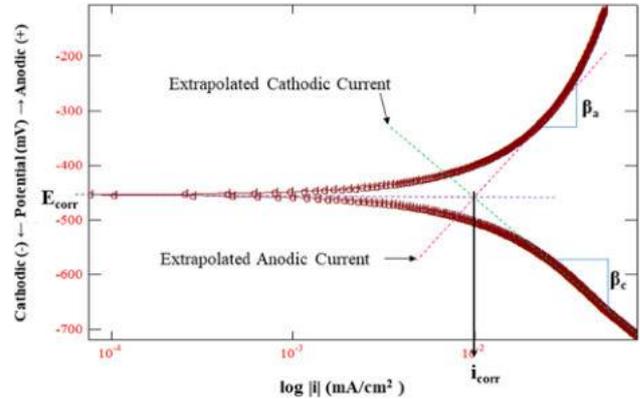

Figure 8. Exploration of Tafel curve.

The dosage of both EA and NT admixtures was taken as 1%, 3% and 5% by weight of OPC. Before mixing the admixtures into OPC, they were mixed thoroughly in the mixing tap water. In addition, NT was dispersed through magnetic stirrer.

#### 2.5 Compressive strength investigation

For each mixture, 12 mortar cubes of dimensions  $70.6$  mm  $\times$   $70.6$  mm  $\times$   $70.6$  mm [70] were made for determining the compressive strength. After 24 hour of casting, the specimens were detached from the mould and exposed to tap water curing for 28 days. After 28 days of curing, 3 specimens of each mixture were exposed under tap water, 3 specimens of each mixture were exposed under saline water and 3 specimens of each mixture were exposed under acidic solution. These specimens were tested for compressive strength after the exposure period of 180 days. The remaining 3 specimens of each mixture were tested for compressive strength using compression testing machine (AIMIL Ltd., capacity =  $1000$  kN and least count =  $1$  kN) by applying uniform and steady load until the failure.

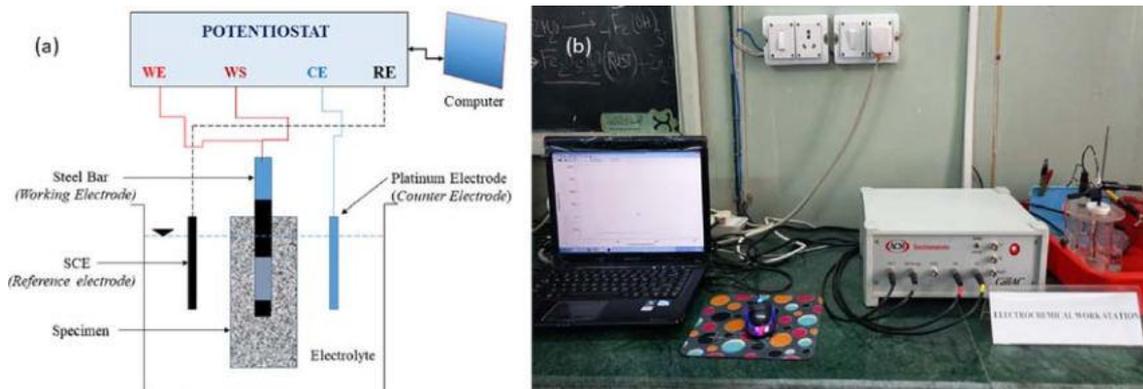

Figure 7. (a) Illustration of test arrangement. (b) Potentiodynamic polarization test using ACM instrument.

## 2.6 Microstructural examination

The microstructural and elemental analysis of X0, EA5 and NT5 mortar specimens were carried out by SEM and EDX techniques using JSM-6510LV (JEOL) microscope, respectively. For both SEM and EDX analysis, the small fragments (approximately 10 mm diameter and 5 mm thickness) obtained from the middle part of the mortar cubes after 28 days compressive strength test. The surface of samples was made flat and regular in shape in order to avoid any misleading results. In order to stop hydration reaction through elimination of free water content, the samples were dipped in the pure alcohol for 3 days, and then were dried at 80°C for 8 hours.

## 2.7 Mineralogical examination

For mineralogical analysis, P-X0, P-EA5 and P-NT5 pastes samples of size 20 mm × 20 mm × 20 mm were prepared. After 24 hours of casting, each sample was kept in the separate container (containing tap water) for curing. After 28 days of curing, the hydration of the pastes was stopped by submerging the samples in pure alcohol for 3 days, and then the specimens were kept in the oven at 50°C for 4 hours to dry and were then kept at room temperature for 3 days to cool. Afterward, the specimens were transformed to powder form in order to carry out the XRD analysis using Bruker X-ray D8 Advance diffractometer (XRD) with Cu-K $\alpha$  ( $\lambda = 1.54187 \text{ \AA}$ ) radiation at room temperature. The data was collected with the step-length of 0.02°, scanning rate of 2°/min and 2 $\theta$  range of 10°–80°.

## 3. Results and discussion

### 3.1 Corrosion investigation

The Tafel potentiodynamic polarization curves of all the specimens exposed under tap water, saline water and acidic solution are shown in figures 9, 10 and 11, respectively. The corrosion kinetic parameters such as anodic Tafel constant ( $\beta_a$ ), cathodic Tafel constant ( $\beta_c$ ), corrosion potential ( $E_{corr}$ ), corrosion current density ( $I_{corr}$ ), linear polarization resistance (LPR) and corrosion rate (C.R) of different specimens as obtained from their respective potentiodynamic polarization curves are presented in table 2. The corrosion inhibition efficiencies (I.E) of different content of EA and NT were also calculated and are presented in table 2.

A substantial reduction in the corrosion rate of ferrocement specimens exposed to tap water were observed with the addition of EA. However, it has been observed that the corrosion inhibition effectiveness of EA rises with the rise in the dose up to 3%, and reduces at 5% dose. Similar trends of efficiency of EA were noticed in case of specimens exposed under saline and acidic environments. Thus,

the optimum quantity of EA may be assumed as 3%. The efficiency of EA in inhibiting the corrosion of steel may be owing to the development of a layer around the steel [22]. It can be seen that NT admixed specimens exhibited lower the corrosion rates as compared to the control specimens exposed under tap water. Similar effects were observed in case of the specimens exposed to saline and acidic environments. Moreover, the corrosion inhibition efficiency of NT rises with the rise in the dose. The corrosion inhibiting effectiveness of NT may be due to its filler property that produced dense ferrocement composite and reduced the ionic transport.

Furthermore, the corrosion rate of all the specimens exposed in saline solution was found to be substantially higher than the corresponding specimens exposed in tap water. On the other hand, the corrosion rate of all the specimens exposed in acidic solution was found to be marginally lower than the corresponding specimens exposed in tap water. This contrary effect may be due to the formation of gypsum and ettringite within the pores of mortar in the presence of H<sub>2</sub>SO<sub>4</sub> that reduces the ingress of aggressive ions.

### 3.2 Setting time investigation

The effect of different percentages of EA and NT on the IST and FST of OPC pastes is shown in figure 12. The IST as well as FST of OPC pastes was observed to be increased with the addition EA. For 1%, 3% and 5% EA addition, the increment in IST was 4.7%, 8.1% and 13.9%, while in FST it was 2.7%, 6.3% and 10.4%, respectively. Since EA increased the time to finish the hydration process of OPC paste, therefore, it can be assumed that EA acts as a retarding agent. In contrast, it has been observed that the IST and FST of OPC pastes was reducing with increasing the NT percentages. The addition of 1%, 3% and 5% NT decreased the IST by 6.8%, 17.4% and 23.3% respectively; and decreased the FST by 3.6%, 6.8% and 12.7%, respectively. Thus, it can be said that NT acts as accelerator and it may be owing to high specific surface area of NT that rises the overall wettable surface area. Consequently, the rapid reduction of free water content may possibly speed up the bridging process of gaps that lead to rise in the viscosity and speedy solidification.

### 3.3 Compressive strength investigation

Figure 13 shows the results of average compressive strength of 0%, 1%, 3% and 5% EA and NT admixed mortar after 28 days of tap water curing. The compressive strength of mortar was observed to be decreasing with increasing the EA percentages. The reductions in strength of mortar containing 1%, 3%, and 5% of EA was found as 0.5%, 4.6% and 9.4% respectively, compared to control

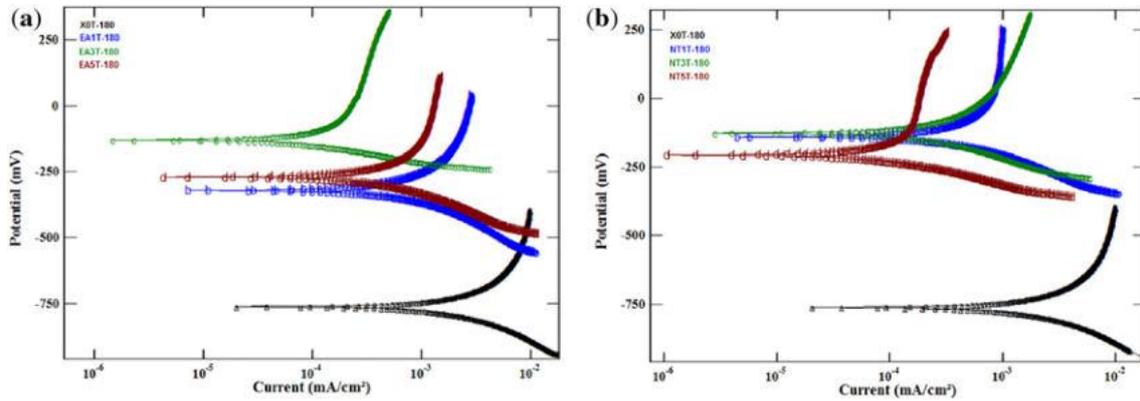

Figure 9. Tafel curves of (a) EA-admixed specimens. (b) NT-admixed specimens exposed under tap water.

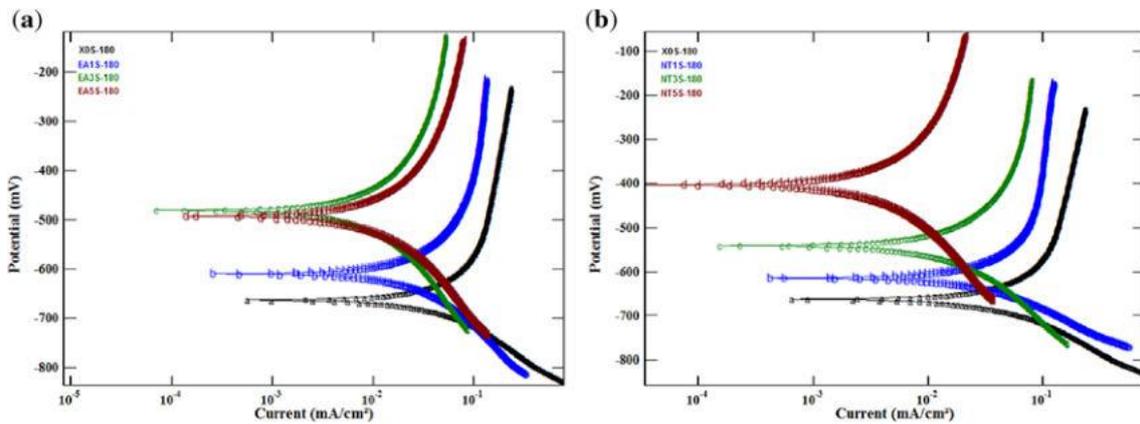

Figure 10. Tafel curves of (a) EA-admixed specimens. (b) NT-admixed specimens exposed under saline water.

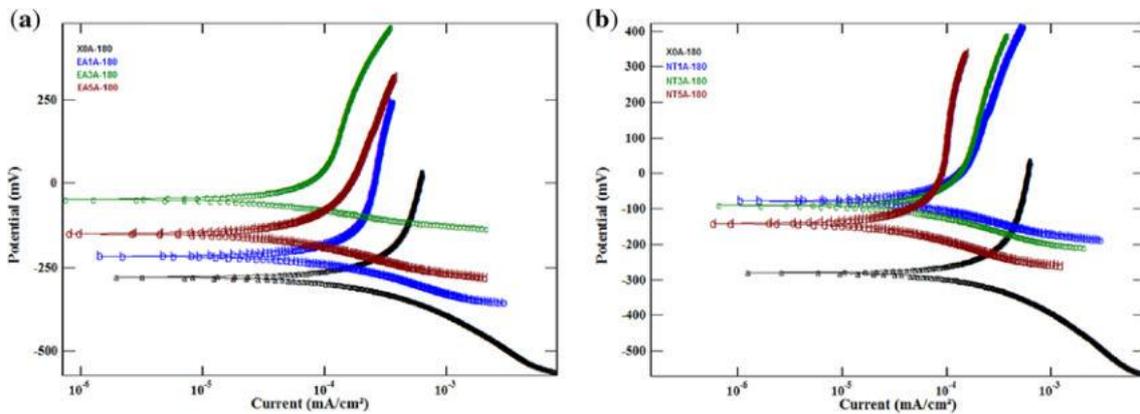

Figure 11. Tafel curves of (a) EA-admixed specimens. (b) NT-admixed specimens exposed under acidic solution.

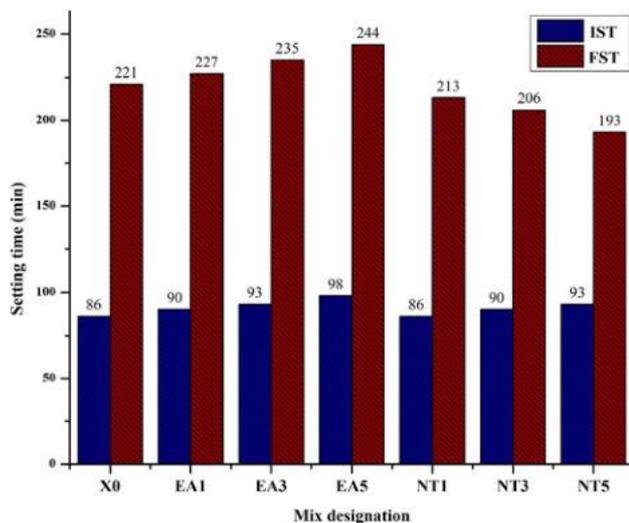

mortar. These reductions may be owing to adsorption of EA on the surface of OPC particles that interrupt the hydration process [71]. On the other hand, an upward trend in compressive strength of mortars with the increase in amount of NT was observed. The enhancements in strength of mortar containing 1%, 3% and 5% of NT was found to be 8.9%, 10.3% and 11.7% respectively, as compared to

control mortar. These enhancements in strength may be due to the smaller particle size and higher reactivity of NT that produces dense and homogeneous microstructure of cementitious composites [72, 73].

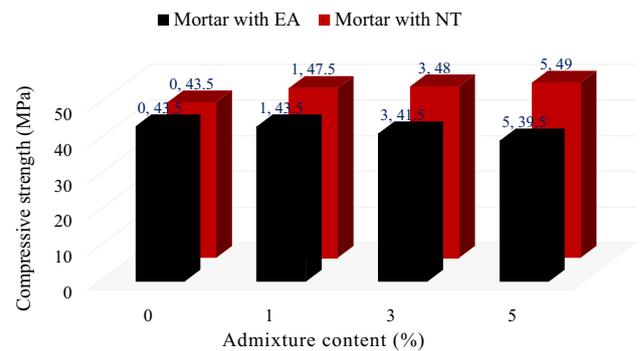

The mortar cube specimens after 180 days exposure under tap water, saline water and acidic solution are shown in figure 14. There is no obvious deteriorations on the

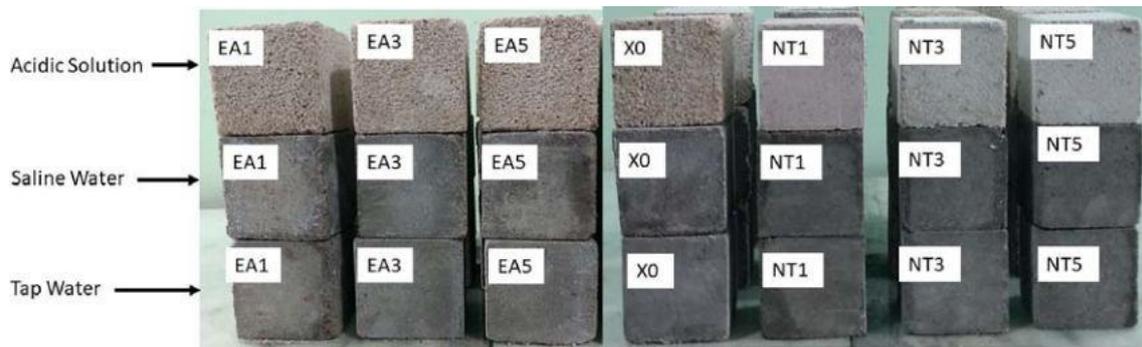

**Figure 12.** IST and FST of OPC pastes containing different percentages of EA and NT.

surface of any specimens exposed under tap and saline water were found by visual inspection. On the contrary, all the specimens exposed under acidic solution showed clear deteriorations on the surfaces. These damages are as a result of the reaction between hydration products of OPC and sulphuric acid that eventually forms of ettringite and gypsum. However, it can be seen that NT-containing specimens showed fewer signs of corrosion than other specimens. Thus, NT exhibited resistance to acid attack. In contrast, EA did not show effectiveness against acid attack.

**Figure 13.** 28-days compressive strength of EA and NT admixed mortars.

The effects of EA and NT on the compressive strength of mortar specimens after 180 days exposure under tap water, saline water and acidic solution are shown in table 3. It has been observed that the strength was reducing with increasing the content of EA in all the three exposure environments. On the contrary, NT was found to be effective in enhancing the strength and the higher NT dosage, the greater the strength in all the three exposure environments.

All the specimens exposed under saline and acidic solution showed lesser compressive strengths as compared to the corresponding specimens exposed under tap water. In saline environment, the decrease in strength is because of the formation of calcium chloroaluminate hydrate and the consumption of calcium aluminate hydrate. Apart from this,

**Figure 14.** Mortar cubes exposed under different solutions after 180 days.

it can be due to crystallization of salt in pores, which can develop stresses and cause micro-cracks [74]. In acidic environment, the loss in strength is more than the in saline environment and it attributed to the reaction between  $H_2SO_4$  and  $Ca(OH)_2$  that produce gypsum. The gypsum also reacts with calcium aluminate (C3A) to form ettringite. The volume of gypsum and ettringite is significantly higher than the initial compounds. This causes inner pressure in mortar leading to the development of cracks [75]. Besides, specimens containing EA exhibited greater strength reduction than the control specimens. On the other hand, specimens containing NT showed considerably lower strength loss compared to the control specimens. This ultimately showed that NT is effective in limiting the diffusion of aggressive agents into the mortar.

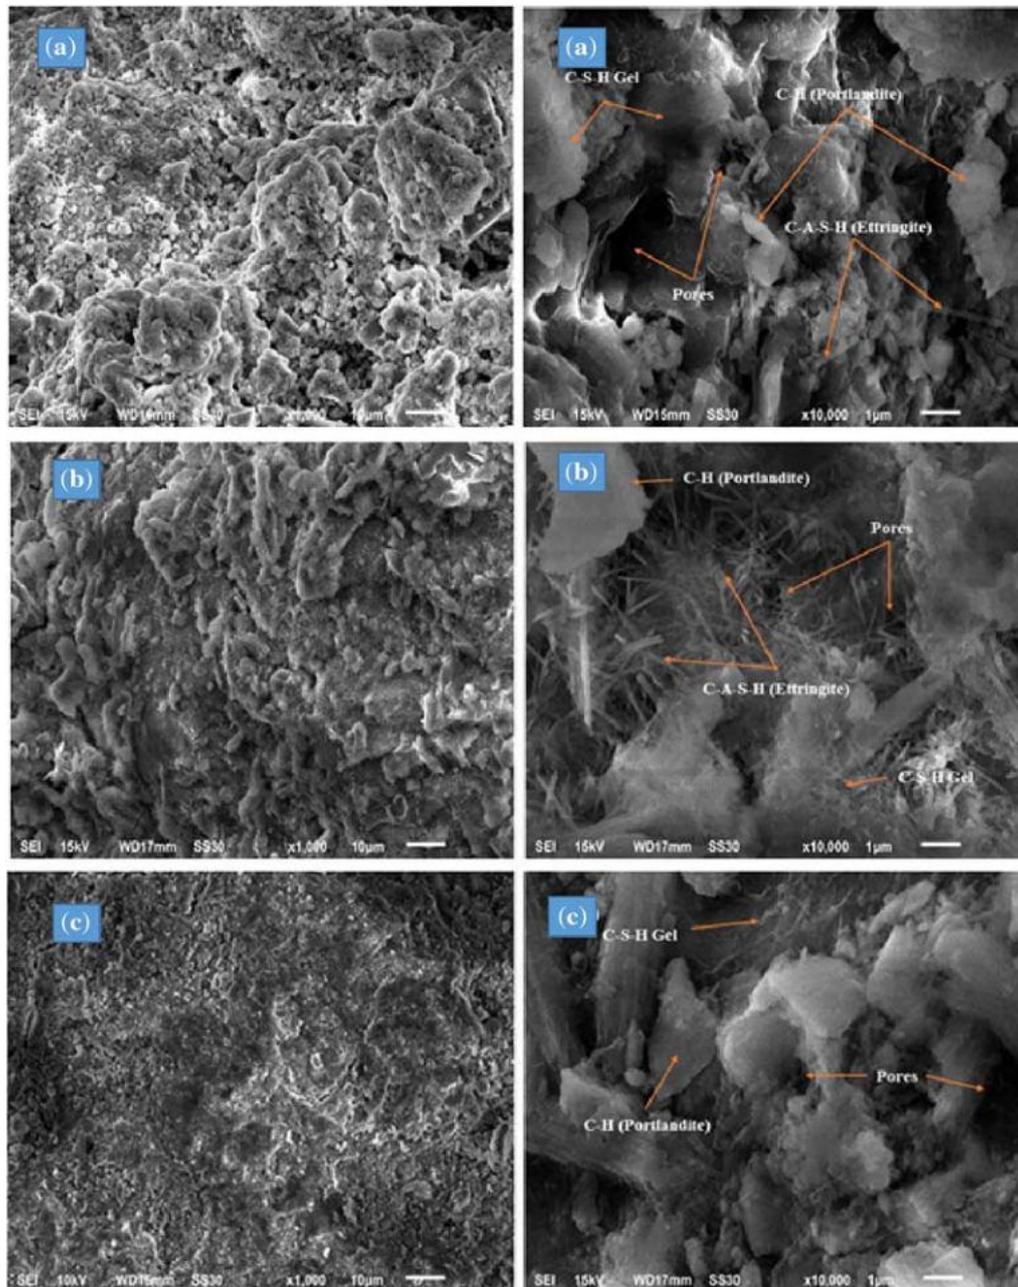

### 3.4 Microstructural examination

SEM images of X0, EA5 and NT5 mortars at the magnification of 1000 and 10,000 times were taken as shown in figure 15a–c, respectively. The EDX spectrums of X0, EA5 and NT5 mortars are shown in figure 16a–c, respectively.

The EA5 image depicts more quantity of pores and calcium aluminate trisulphate hydrate (C-A-S-H) than the X0 image. Since pores and C-A-S-H undesirable, therefore it can be said that the high percentage of EA may adversely affect the strength and microstructural properties of mortar. Hence, the above-mentioned compressive strength test results are completely validated by these microstructural analysis results. In addition, the existence of EA in the mortar can be confirmed from results of EDX analysis that

**Table 3.** Compressive strength of mortar specimens after 180 days exposure under tap water, saline water and acidic solution.

Exposure medium	Mix designation	Compressive strength (MPa)	% Variations w.r.t. control specimen	% Variations w.r.t. the corresponding specimens exposed in tap water

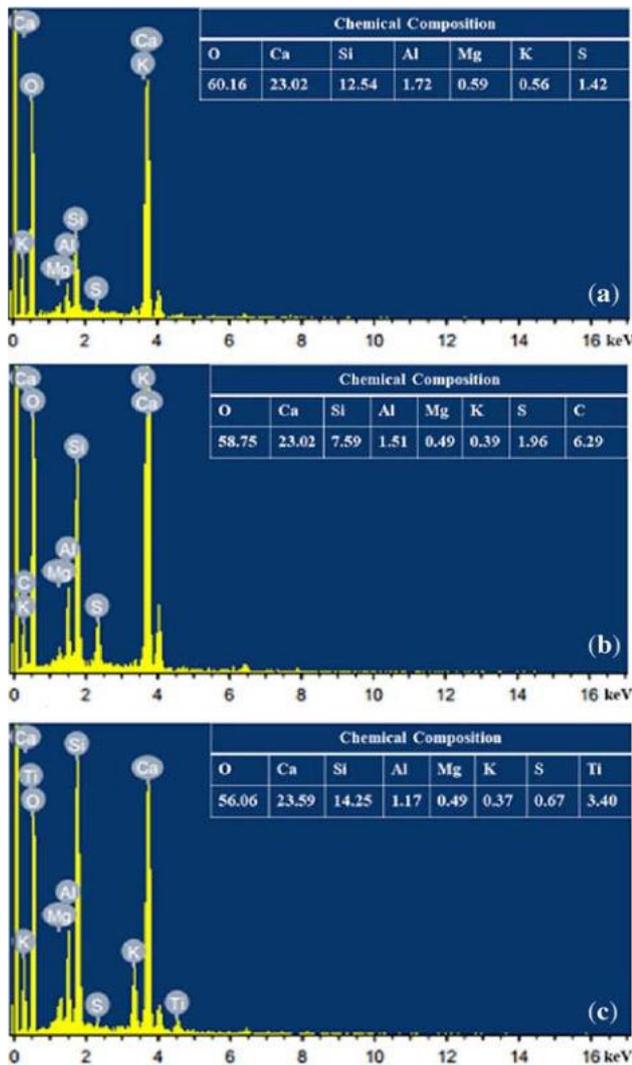

**Figure 15.** SEM images of (a) X0 mortar, (b) EA5 mortar and (c) NT5 mortar.

shows the presence of an additional carbon element. The image of NT5 exhibits a distinct kind of microstructure containing an ample amount of calcium silicate hydrate gel (C-S-H) and a little quantity of C-A-S-H (Ettringite) and pores. Thus, it is obvious that the strength and microstructural properties of mortars is enhanced by the addition of NT. These enhancements might be because of the improvements in particle-packing density, reduction in the porosity and development of intact bonds in the presence of NT. Furthermore, the EDX analysis confirmed the existence of NT in the mortar.

### 3.5 Mineralogical examination

XRD configurations of P-X0, P-EA5 and P-NT5 pastes are shown in figure 17a–c, respectively. The XRD configurations of control and admixed OPC pastes can be described through well-known hydration reactions of OPC. The calcium exists in the hydration products of OPC either as C-S-H gel or as  $\text{Ca}(\text{OH})_2$  (Portlandite) or as C-A-S-H because the over-all mole amount of calcium is constant. Normally, the amount of C-A-S-H is much lower than the C-S-H gel and Portlandite (C-H). Indeed, a lower quantity of C-H

**Figure 16.** EDX analysis of (a) X0 mortar, (b) EA5 mortar and (c) NT5 mortar.

corresponds to a higher amount of C-S-H gel. In general, the quantitative analysis of C-S-H gel cannot be carried out by means of XRD results owing to poorly crystalline fibrous structure of C-S-H gel and that is perhaps not reflected in XRD configuration. Since there is no direct technique for the assessment of C-S-H gel quantity, hence it can be estimated indirectly by determining the amount of C-H. Several investigators reported that the C-S-H concentration is inversely related to that of C-H concentration [76–78]. Accordingly, the smaller peaks of C-H in XRD configuration indicates the higher C-S-H gel concentration.

The presence of C3S (1), C2S (2), C-H (3) and C-A-S-H (4) can be seen in the results of XRD analysis of P-X0, P-EA5 and P-NT5 pastes. Since C-H peaks is considered as the principal performance indicator of OPC pastes, therefore it can be used for approximate calculation of C-S-H gel quantity. The XRD configuration of P-EA5 exhibited a number of low intensity and overlapping peaks that

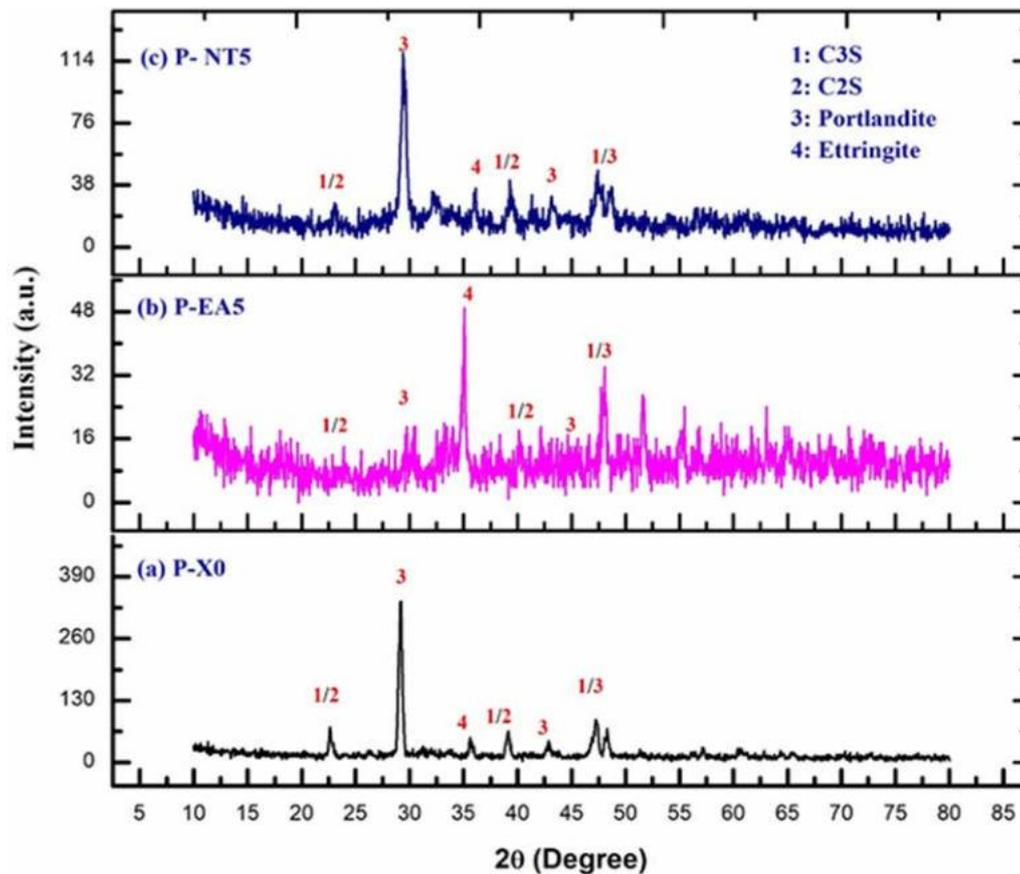

specifies the presence of C-A-S-H. Accordingly, the higher quantity of EA addition may adversely affect the desirable properties of cementitious composites. In contrast, the XRD configuration of P-NT5 presented significantly lower intensity peaks of C-H as compared to P-X0. This confirms that the addition of NT caused consumption of C-H crystals. Such consumption may lead to increase the quantity of desirable C-S-H gel and consequently improve the microstructural and engineering properties of cementitious composites.

#### 4. Conclusions

The main aim of this study was to compare the effects of ethanolamine (EA) and nano-TiO<sub>2</sub> (NT) on the corrosion resistance properties of ferrocement composites. However, their effects on the other properties of cementitious composites were evaluated. The EA was found to be effective in reducing the corrosion rate of ferrocement composites as observed in potentiodynamic polarization studies. However, the corrosion inhibition efficiency of 3% EA was found to be higher than the 5% content in all the three exposure environment. Thus, optimum content of EA was 3%. The corrosion rate exhibited by the NT admixed specimens was found to be significantly lower than the control specimens. The corrosion inhibition efficiency was observed to be increasing with the increase in the dosage of NT in all the exposure conditions. The optimal effectiveness was found at 5% content of NT. The LPR values of saline water exposure specimens was found very much lower than that of tap water/acidic solution. This is mainly because of the presence of chloride ions in saline water.

The setting time of the OPC was increased with increasing EA content. However, it was decreased with increasing NT content. The 28-days compressive strength of EA admixed mortar was found to be slightly less than the control mortar. This decrease was greater at the higher EA dose. When NT was added, a significant improvement in 28-days compressive strength of mortars was observed. This improvement was higher when larger amounts of NT were added. The 180-days compressive strength of the EA admixed mortar exposed under tap water, salt water and the acidic solution was found to be considerably lower than that of the control mortars. This was more pronounced at higher amounts of EA. However, with the addition of NT, a substantial increase in 180 days-compressive strengths was observed for all the exposure environments.

The SEM micrograph of EA admixed specimen showed more amount of C-A-S-H and pores compared to control specimen. This stipulates that the microstructural properties of cementitious composites may be adversely affected at higher percentages of EA. On the other hand, the SEM micrograph of NT admixed specimen exhibited a low amount of pores and C-A-S-H, and a large amount of C-S-

**Figure 17.** XRD configurations of (a) P-X0, (b) P-EA5 and (c) P-NT5.

H gel. The XRD configuration of EA admixed OPC paste presented numerous lower intensity and overlapping peaks that show the existence of C-A-S-H. As a result, the strength and durability characteristics of cementitious composites may adversely affected at the higher dose of EA. In contrast, the XRD configuration of NT admixed OPC paste exhibited lower intensity peaks of C-H and consequently higher amount of desirable C-S-H gel. This suggests that the addition of NT may lead to improve the microstructural and durability properties of cementitious composites.

Finally, it can be concluded that the NT was found to be effective in improving the compressive strength and corrosion resistance properties of ferrocement composites. The strength of the NT admixed mortar specimens was found to be significantly higher than the EA admixed specimens. Besides, the corrosion inhibition efficiency of NT was found to be quite comparable to the EA.

**Abstract** - Web shopping, a solid decision instead of the standard "go, see, contact and purchase" shopping, has been one of the all-around utilized working environments of the Internet. Two or three electronic shopping frameworks serve web clients all around the globe and draw in individuals to get the things they need with a little exertion. Web shopping can be considered as "see and purchase" retailing. While the "see" part is executed by the limit and inventive mind of site aces, specific segment plans have been made for the "purchase" part. The most utilized media are online Mastercard exchange structures. Several unprecedented methods have been conveyed for Mastercard exchanges. In any case, get some information about has demonstrated that a colossal piece of web clients don't absolutely believe Visa divide structures by righteousness of cash related hazards, for example, loss of cash. Different procedures have been acted to get the customers' trust in Visa exchanges, yet no numbskull confirmation strategy has been found to beat the insufficiencies in those frameworks. This paper proposes another arrangement that hardens biometric ID cards with online charge card exchanges. Since the execution subtleties, for example, the sort and the arranging calculation of the biometrics information may move between nations due to the task necessities and laws, the proposed framework stays close by for every nation that may get the strategy. To explain the proposed structure and give a solid model, we utilized the Turkish e-ID pilot structure as the character assertion module since it best fits the necessities of the system.

*Acquirer Domain (the bank and the dealer to which the cash is being paid).*

*Backer Domain (the bank which gave the card being utilized).  
Interoperability Domain (the foundation gave by the card conspire, credit, charge, paid ahead of time or different sorts of an installment card, to help the 3-D Secure convention). It incorporates the Internet, shipper module, get to control server, and other programming suppliers.*

**Key Words:** internet shopping; e-ID; biometrics; credit card transaction; multi-factor authentication.

## 1. INTRODUCTION

Web shopping is one of the most remarkable organizations of the web. As web headway advances, further made online structures are made and jobs of those frameworks increment out and out. Ordinary Internet clients all around the world

examine representative Web regions to purchase things and associations [1]. Clients examine the online stores and obtain their necessities with the least exertion veered from standard retailing structures. The capability happens in the strategy for divide; while utilizing a POS contraption to play out a segment with their Mastercards in isolated retailing, clients outfit their own information close by charge card subtleties over the Internet so as to finish an online bit. Regardless, an impressive number of people don't add to giving such subtleties as a result of budgetary dangers. To enroll the paces of clients' affirmations in various dangers for web shopping, S. M. Forsythe and B. Shi [2] have investigated an edifying rundown taken from Graphic, Visualization, and Usability (GVU) Center from Georgia Institute of Technology. In the appraisal of the open blueprint that has been performed with 5645 people, 23% of the candidates have referenced cash related threat (i.e., chance concerning hardship from online charge card use) [2] in web shopping. Ridiculing, phishing, impedance, conceivable undermining changes to the information sent over the wire, revoking of associations (DOS), hoodwinking the clients [3] are money related dangers that dishearten web clients from performing electronic shopping utilizing their Mastercards. Several techniques have been formed to overcome the money related robbery prospects and restore the costumers' trust. Regardless, no sensible strategy has been point by point to totally beaten the referenced dangers and affirmation a far and away ensured and burglary check shopping condition for web clients. This paper proposes a structure that joins the Turkish e-ID framework, which gives a biometric ID card, and online charge card exchanges and leaves the low-level security issues to the e-ID framework use. Utilizing the restrictions of biometric ID cards, this structure proposes an undeniably secure shopping condition for the two purchasers and the seller, which sells things and association over the web. Since the e-ID framework gives a prepared to utilize security and undeniable proof foundation, the banks and the sellers need to expend less imperativeness in arranging the structure by then executing security instruments themselves. Despite the way that being a neighborhood game-plan considering the particular e-ID use, the system the two gives character check to the purchasers through multifaceted affirmation and attests the shippers' institutional information to guarantee a shielded strategy for a segment from the customers' fiscal acclimates to the sellers' records. The relationship of this paper is as indicated by the going with. The past research has been introduced in Section 2 and the upsides of biometric ID cards for online charge card exchanges are clarified in Section 3. In

Section 4 Turkish e-ID structure and the character confirmation associations, it offers are portrayed. In Section 5 the subtleties of the proposed structure have been given at last finishes of this appraisal are introduced in Section 6. 2010

## 2. PRIOR RESEARCH

The nonappearance of E-Commerce exchanges has executed individuals to take a gander at new strategies. One such perspectives is Visa's "Asserted by Visa" [7] program, which has been then gotten by MasterCard as "MasterCard SecureCode" [8] and by JCB International as "J/Secure" [9]. This program acquaints a riddle key assertion section with online charge card exchanges. The system depends upon a show called 3D Secure. In this show, the Visa guarantor bank bears witness to the store move bringing about supporting the cardholder through a once in the past depicted puzzle word for which the client is induced during an online Visa exchange. Regardless, being a simple to utilize structure particularly for the clients, the quality the show offers by secret key procedure has in like way become the deficiency by uprightness of phishing and key lumberjacks [10]. The sign to the client is remaining a calm key mystery.

Another technique is, utilizing the virtual charge card numbers in online bits. In this framework, a Visa holder is given out a virtual charge card that has a similar record as the cardholder's physical Mastercard. It will all in all be utilized in online exchanges as a standard Visa until its expiry date. The virtual card has a card number, a CVC number, an expiry date, and an adaptable money related cutoff that can be renamed by the client before the exchange and reset intermittently. The bit of breathing space offered by a virtual Mastercard is that, regardless of whether the charge card number is brought with different subtleties, it can't be utilized until the client renames another brief cutoff for another exchange. Despite the way that diminished, the burglary validity happens between the time length beginning with a cutoff redefinition and decision with an exchange or periodical reset.

A decision instead of a virtual Visa, which can be utilized two or multiple times, is the "Single Use Card Number". In this framework, the card-giving bank gives the client a particular use card number, which finishes after a solitary use in an exchange. This way of thinking limits twisting trustworthiness; and thrashings the key lumberjacks considering single-use. Notwithstanding, this procedure controls the client to play out a buy with this number at the most prompt possibility, since sparing the number secure changes into a test for the client.

In spite of the way that is significant and extensively used philosophies, the current game plans remain to express for each bank and customer pair. Either the customers need to spare a couple of passwords secret for each charge card they claim and oversee worm and key-logger issues themselves or contribute vitality observing single-use or virtual Mastercard numbers. A simpler to utilize and securer technique is required to both keep customers satisfied and comprehend security when they try to make online purchases. Utilizing

biometric ID cards in online trades turns into a fundamental factor now since it offers a couple of utilization of great conditions and an even more noteworthy and credible character affirmation instrument.

## 3. ADVANTAGES OF BIOMETRIC ID CARD IN CREDIT CARD TRANSACTIONS

Biometric ID card gives multifaceted attestation (MFA), a security structure where different authenticators are utilized so as to collect the realness of character check. A touch of that authenticator is passwords, tokens, keys, cards, and biometrics.

Check factors for MFA are ordinarily amassed into these three-game plans: 1) what you know (e.g., puzzle key), 2) what you have (e.g., token), and 3) what your character is (e.g., biometric) [4]. A blend of these classes diminishes the vulnerability that ascents when every authenticator is utilized alone in a confirmation situation. Around the day's end, hacking one's puzzle riddle word is less troublesome than hacking the secret articulation and exceptional finger impression together. Thusly, multifaceted attestation gives a more solid framework than a conventional riddle express endorsement plot.

The biometric ID card understands the three groupings of MFA as follows. 1) "What you know" is the PIN of the eID card, 2) "What you have" is the snappy card that is given by the administering body to the tenant, and 3) "What your character is" is the biometric information of the occupant spared safely in the breathtaking card or a focal database for biometric endorsement and acknowledge the key representatives in undeniable check. As being passwords that are genuinely bound to people and not should have been reviewed, biometrics gives continuously solid character checks ("Is this individual who he articulates to be?") [5]. In this way, if the utilized biometric certification framework is enough astonishing, it gets hard to play out an online exchange without the client's information, regardless of whether somebody takes her card and PIN some way or another.

Another great circumstance of a biometric ID card is that the e-ID structure gives an attestation plot that is affirmed by the managerial experts. This presents an obviously bonafide and focal character check structure, which can be used in various applications. Thusly, different connections, for example, human organization affiliations, banks, police working situations may encourage this focal assertion structure into their frameworks for express character check needs. This makes the biometric ID card the focal key and empowers occupants to utilize an equivalent card in each application by techniques for a card to get to the gadget.

In this manner, the occupant doesn't have to hold a few passwords or extra tokens for each record she has, in any case, the PIN number and the ID card. Utilizing the focal biometric character check structure, a bank will have the choice to avow the character of the individual who needs to play out a remote exchange (e.g., online buy). This additional items the banks from dealing with a lot of cash to get some information about a shocking assertion part and empowers

them to devour less essentialness and financials by solidifying an in the past endeavored and masterminded to utilize security foundation.

The proposed structure has been exemplified utilizing the Turkish e-ID System [11] since the structure and its parts best fit the MFA fundamentals of the system. Thusly, we present the Turkish e-ID structure, which is a propelling pilot experience, and mean how the working environments it gives can be created into our system.

#### 4. TURKISH E-ID SYSTEM

Turkish e-ID structure is a pilot experience that has been begun in 2006 by TUBITAK UEKAE [12] is up 'til now being made. The task movement is relied upon to be done in May 2010. There have been three pilot stages for e-ID card personalization and dissipating. The central stage was acted in TUBITAK UEKAE in April 2008 and 100 ID cards were revamped and given to the representatives as cardholders. The subsequent pilot discard was passed on in Bolu (Turkey) in a fourth of a year beginning from August 2008 and 13.000 ID cards were changed and given to occupants. The last stage began in July 2009 and it should have been done in May 2010 as the last improvement of the undertaking. In this last stage, for all intents and purposes, 300.000 ID cards are should have been changed and offered over to the occupants. Human organizations were picked to be the key utilization of the Turkish e-ID experience. For that, 5 patients' workplaces in 1 state emergency office, 95 drug stores, and 9 family experts joined the task for utilizing the ID card in clinical medications and overview the associations offered by the structure. Other than social insurance, there are in like the way 10 mechanization affiliations that are expecting to sort out the pilot e-ID experience into their obvious affirmation foundation.

Turkish e-ID structure offers indisputable character check plans relying on the significant certification level. The most essential level is the visual character check plot that somebody (e.g., a cop) organizes the occupant photograph that is printed or engraved on the card surface to the cardholder for ID by free eye. In this game plan, the security level is incredibly low, and misleading probability is high a quick eventual outcome of the human factor.

The most secure and solid condition is an electronic confirmation situation that depends upon the occupant's shrewd card, open information, PIN and biometric attestation, so to talk multifaceted check. Turkish e-ID framework parcels empower this most raised level of character check to be likewise utilized in remote certification.

##### A. Turkish e-ID System Components

Turkish e-ID card is a sharp card that works AKIS national amazing card working framework [13]. The tenants' biometric information is dealt with into a stand-out record portion that requires symmetric endorsement for perusing get to. Symmetric affirmation by techniques for External Authenticate and Internal Authenticate APDU orders (ISO 7814-4) is performed between the inhabitant ID card and

another remarkable sharp card called Secure Access Module (SAM), which is implanted into the stand-out Card Access Device (CAD) [14] that is masterminded by TUBITAK UEKAE. SAM contains symmetric keys that are required to check a tenant card and topsy turvy keys and declarations that are given by definitive help specialists. PC helped design is a particular card for every client that is in like way arranged for enlisting and avowing fascinating engraving and finger-vein information.

##### A. Remote Biometric Authentication in Turkish e-ID system

Having an implanted SAM card and biometric determination support, CAD can get to the unique finger impression or finger vein information of the tenant, check the information locally, and sign the biometric insistence result with the target that the outcome can be confirmed at remote structures. The CAD requires clients' PIN input, performs information arranging, and makes a stepped single-use character insistence pack (IVP). IVP contains a timestamp, the biometric sorting out outcome, the occupants' bit information, self-decided information field that may be utilized for stepping outside information, and SAM's endorsing. Since legitimate insistence specialists issue the CAD affirmations, any remote framework will be certain that a continuously essential position authority favors the attestation result by supporting the gathering by strategies for the official character check association (IVS), a web association gave in the e-ID structure. The IVS shows the IVP as finished after support so as to ensure that it has been utilized just a single time.

#### 5. PROPOSED FRAMEWORK

Having a remote biometric affirmation structure accessible, we show the online Mastercard exchange framework, model. The structure of the framework is portrayed in Figure 1. In our proposed technique we are going to use three stage authentication to validate payment from customer bank account to payment gateway providers. These steps are:

- 1) Login
- 2) OTP Validation and
- 3) Finger print authentication

In step one, Login is the initial stage in which user has to login to the e commerce website obviously before doing so, user has to first register him/herself to our website. In registration page five field are to be filed by the user namely username, Email, Contact, Password and his thumb impression. In Thumb impression field either user can upload their image from his computer or he can plug bio metric devices to upload thumb impression. Meanwhile having uploaded their thumb impression our application converts it into binary form so that it can be easily stored in database and remains more secure, which is not easily readably by any hacker after getting hacked of our database. In second step we are using OTP validation for further security of fund transfer. In our case we are generating 6-digit pin code and send it to user's email as well as on phone number. Once user puts his 6 digit OTP number in given textbox which he received on his phone and email. we

redirect user to upload finger print page to upload his/her thumb impression. If the given otp is invalid, we warn user to enter valid otp if the user continues to enter invalid OTP for three times, we will block his account. In either case if he entered valid OTP we will redirect him to thumb impression matching page. As explained earlier. For thumb impression matching we are using pixel to pixel matching algorithm.

In image acknowledgment, a typical issue is to coordinate two given pictures, for example, when contrasting a watched image with given references. In that procedure, extraordinary techniques can be utilized. For this reason, we can characterize cost capacities depending on the twisting presented in the coordinating and quest for the best coordinating concerning a given cost work [6]. One practical and thoughtfully basic technique for deciding the picture organizing is to utilize a zero-request model that dismisses conditions between the pixel mappings. This model has been depicted in writing a few times freely and is called picture Bending model (IDM) here. The IDM yields particularly great outcomes if the neighborhood. picture setting for every pixel is considered in the coordinating procedure by utilizing angle data and neighborhood sub-windows.

In this work, we center around the invariant separation coming about because of the picture coordinating the process and, in this way, just utilize a basic characterization approach. We quickly give a proper portrayal of the choice procedure: To arrange a test picture  $A$  with a given preparing set of references  $B_{1k}, \dots, B_{Nk}$  for each class  $k \in \{1, \dots, K\}$  we utilize the closest neighbor (NN) choice guideline. For example, the test picture is allocated to the class of the closest reference picture. For the separation computation the test picture  $A = \{a_{ij}\}$ ,  $i = 1, \dots, I$ ,  $j = 1, \dots, J$  must be clarified by an appropriate distortion of the reference picture  $B = \{b_{xy}\}$ ,  $x = 1, \dots, X$ ,  $y = 1, \dots, Y$ . Here, the picture pixels take  $U$ -dimensional values  $a_{ij}$ ,  $b_{xy} \in IRU$ , where a superscript signifies the vector segments  $U$ . It has been seen in past trials that the presentation of disfigurement models are substantially improved by utilizing nearby setting at the degree of the pixels [5,6]. For instance, we can utilize the flat and vertical picture angle as processed by a Sobel channel as well as nearby sub pictures that speak to the image setting of a pixel. Moreover, we can utilize a fittingly weighted position highlights (for example  $i-1$ ,  $i-1, j-1$ ,  $j-1, \dots$ ) that portray the relative pixel position to Relegate higher expenses to mappings that go astray much from a straight coordinating.

The proposed structure renders the security of the card data out of worry considering the way that the giving bank will never do the portion aside from in the event that it endorses the different sides (for instance the customer and the merchant) checking the IVP and ODP marks. Thusly, this framework stimulates the customers who don't trust in giving their charge card nuances to perform web shopping. The delineated model is difficult to be applied to PDAs, which is a fast-rising edge of the progression. This

confinement is a prompt eventual outcome of the CAD gadget, which needs a PC relationship for this situation. This downside may appear, apparently, to be constrained to the nation that the proposed structure is applied. Notwithstanding, performing biometric insistence on a discretionary cell phone utilizing the objective e-ID card is an open issue that requires thick conceptualizing, enormous rigging alteration, and normalization and is a check for the social event of the reaction for a self-earnest adaptable structure.

## 6. CONCLUSIONS

Security in online segment structures has been a wide research territory since the beginning of the Internet and two or three methodologies have been figured by different affiliations. Regardless, there has been no sure strategy squashed the insufficiencies in these frameworks totally.

Taking a gander at the issue from the other mirror, we have acquainted an answer subject with the quickly making gifted card-based biometric ID structures; and given a model execution on the Turkish e-ID framework. The model execution is clarified with a reasonable buy condition.

The proposed structure may be utilized in nations that utilization biometric ID cards with explicit alterations agreeing on the particular use subtleties of their e-ID courses of action. Regardless of the way that the game-plan isn't overall in light of the e-ID structure contrasts for every nation, it gives high security and flourishing to both the client and the seller close by online business frameworks.

## ACKNOWLEDGEMENT

*Abstract*— In this paper the attempt of studying a Secure Gateway in payment system for Electronic transaction is made. The current research and development shows that the electronic payment system for such an electronic transaction is to be secure for participants such as Payment Gateway Server, Bank Servers and Merchant Servers, on Internet. The security architecture of such systems are designed by using various Security Protocols and Techniques, not only to safeguard but eliminate the fraud that occurs in such a transaction with stolen credit card/debit card payment information and customer information. Electronic commerce involves the tremendous exchange of some form of money for trade of goods and services over the Internet, and it is evident from the studies that the Internet is an insecure and unreliable media in many ways in such a trade. The primary goal of this paper is to review the asymmetric key cryptosystem methodology that uses Security Protocol, the Secure Communication Tunnel Techniques that protect conventional transaction data such as account numbers, Card number, amount and other information, and to finally provide secure implementation for such an electronic transaction on the Internet.

**Keywords:** SSL/TLS, SET Protocol, Symmetric/Asymmetric Methodology, TCP/IP Protocol, Dual Signatures, 3DES, AES, Communication Tunnel techniques

## I. INTRODUCTION

Online shopping by card is not new in the current e-commerce applications in our society today. The ease of purchasing and selling products over the Internet has helped the growth of e-commerce and as a result the e-payment services have proved to be the convenient and efficient way to perform financial transactions. In a nut shell, Electronic commerce involves the exchange of some form of money for goods and services over the Internet but associated with the issues and risks of insecurity and unreliable media. Therefore, in the work proposed, we focus on the following e-commerce scenario: a customer wishing to purchase goods online; Electronic Payment Methods-Electronic Fund Transfer (EFT) involved in such a transfer, Financial EDI, Credit Cards, Digital Cash, Online Stored Value Systems, and Smart Cards.

The major focus of this work is to explore the method of payment involved by means of a credit card/Debit card, and subsequently, to address methods that are to be adapted to ship the goods physically. A considerable need for secure and efficient payment systems that can operate over Internet has been created. Most people have tried at least once or twice to purchase something online. Purchasing online, whether services or products, requires that a customer have a valid credit card or International debit card or finance account such as Pay Pal but most online purchases use credit cards. Due to the increasing crime on the Internet, the customers still have second

thoughts over allowing others to view their credit account information.

Due to the nature of Internet, security and authenticity of payments and participants cannot be guaranteed with technologies that are not specifically designed for e-commerce. We need an e-payment system that would not only provide secure payments but should also have properties like online customer and merchant authentication, unforgivable proof of transaction authorization by the customer both to the merchant and the bank, privacy of customer and transaction data. To some it provides a sense of uncertainty and taking risks when purchasing online. Over the years there is lot of e-commerce technology that has been developed. This helps the customers in many ways in terms of convenience and accessibility. But still the security of their hard earned money is left unanswered. This led to the development of Secure Payment System in the e-commerce domain. It is a mode of operation wherein the security of financial transactions done on the Internet is ensured to be safe and confidential.

This application of an online store is an important service that keeps the customers of an online company coming back because they view the online store as safe and reliable. In a way also it provides them a sense of safety and security of their financial-transactions.

Under this type of e-commerce technology is SET or the Secure Electronic Transaction. The SET uses the unique process of encrypting the information obtained between the customers and the online-store. Transaction Participants scenario assumes the existence of three participants a customer (the payer), a merchant (the payee) and a financial institution (e.g. a bank).

All the participants are connected with communication links as shown in figure-1. In order to perform the purchase, the participants need to exchange certain information over those links. If the information is transmitted over the links in plain text, there is a possibility of eavesdropping. Anyone listening to the network traffic could gain access to sensitive information, such as card numbers, card type and or the complete details of the card holder. Credit card-such as a Visa or Master, has a preset spending limit based on user's credit limit. Debit Cards – withdraws the amount of the charge from the card holder's account and transfers it to the seller's bank. In electronic payment system, server stores records of every transaction. When the electronic payment system eventually goes online to communicate with the shops and the customers who can deposit their money and the server uploads these records for auditing purposes.

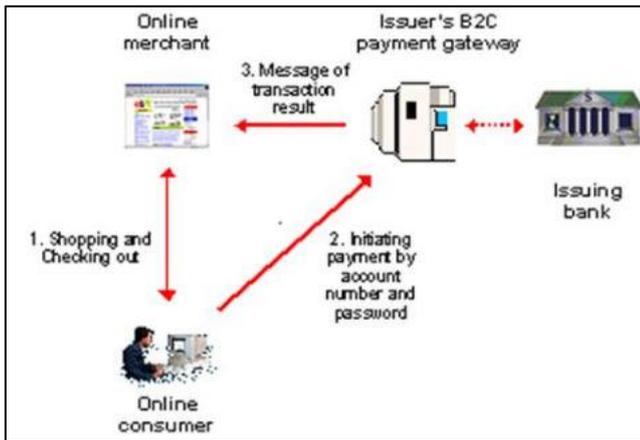

Fig. 1: A typical e-commerce scenario and Gateway Payment

We review Secure Payment System for such an Electronic Transaction. Secure electronic payment system uses different cryptographic algorithms and techniques to achieve: privacy, integrity, authentication and non-repudiation. In this work, we discuss various attacks and the important security requirements such a payment system must incorporate and satisfy, so as to be considered a safe and secure system. Initially, this work discusses some of the existing secure systems, how those systems work, their advantages and disadvantages. Subsequently, we compare and contrast the various existing solutions. Finally, we conclude this paper by showing the most efficient technique that must be incorporated for such a payment system in an electronic transaction.

## II. BACKGROUND & RELATED WORK

With the increasing impact of intangible merchandise in worldwide economies and their immediate delivery at small cost, traditional payment systems tend to be more costly than the modern methods. Online processing can be worth of value smaller than the smallest value of money in the manual world. However, there are two methods of running e-payment systems.

- Online payment: in which vendor checks the payment send by purchaser with a bank before serving the purchaser.
- Offline payment: in which over spending must be detected, and consequently, no online link to the bank is needed.

The e-payment schemes can be sub-divided into two groups according to the online assumptions.

- 1) Payments by transaction method: in which Single payment does not need previous arrangements between purchaser and vendor.
- 2) Payments by account method: in which purchaser and vendor should have system account with bank and certain type of agreement between both before carrying out the real payment transaction.

The payment by transaction can further be divided into two subgroups

- 1) The credit card payment transaction: is tailored for large charge payment of some hundreds or even thousands of dollars. In contrast, net money transaction is usually low value payment with difficult transaction cost and

online features, similar to the thought of the e-payment transaction. The drawback of the credit card payment transaction is the fee of transactions, particularly from the perspective of the vendor that have to pay some invoices to the clearing house according to the contract agreement with them. This certainly will have straight impact on the cost policy and the interest between the possible users.

- 2) The e-payment by small value transactions on service: This is acquiring certain interest from the area of research. A number of important services of e-payment are e-publishing and multimedia service. In these services, due to the small transaction amount, the merchant acquires relatively shopping mall revenue from every transaction

As a result, expensive calculations such as digital signature should be limited in order to reduce the investments in software applications. In the recent years, e-payments offering a relatively key improvement in the online revenue malls. The foundation of e-payments is to take benefit of the high level of viewers by present content for a low price. Other alternative of this thought is to rating fractions of cents for equally fractional contents sums.

The main features in e-payment protocol are less charges of payment amount and high occurrence of transactions on the e-commerce system.

### A. Secure E-payment Protocol

An e-payment process is a sequence of actions that involves a business task. There are mainly two kinds of payment transactions: i) Atomic payment transaction-single payment transaction and single payment and ii) Composite payment transaction-single payment transaction and multiple payments. Usually, a composite payment transaction involves multiple atomic transactions. Each atomic transaction supports the traditional ACID properties and must either fully commit or fully rollback. However, the classical ACID properties do not hold when a single payment transaction involves multiple atomic payments, especially when a failure occurs in any atomic payment transaction. Since atomic transactions use a two-phase commit protocol, a coordinating process is required to manage and synchronize the composite e-payment services within a given payment transaction. for example, consider a composite payment transaction. An organization has to pay Ethiopian Birr 10,000 for electricity board, Birr 20,000 for Telephone Office, Transports office-Birr 10,000 and Birr 4,000 to Water Board. At the time of issuing a debit instruction using e-check payment instrument with Birr 44,000 assume that by the time the e-check is cleared, the last date for payment towards Water Board is over and the organization has to pay a penalty of Birr 200. Since the balance after the two payments is not sufficient, it is not possible to transact the water board payment.

Though, the payment instruction toward the electricity and telephone was successful, the complete transaction has to roll back due to insufficient amount. This complete reversal based on nothing-or-all protocol may in turn lead to late payment to other successful utility services. Hence, the nothing-or-all protocol as described above is not

sufficient to handle composite e-payments. It can result in loss of confidence and trust in the e-payment services

Payments on the Internet [6] can therefore refer to either the particular type of electronic money that involves a software product (although at the moment there is no such product in general use) or to electronic access products (via a card reader and a computer), or to both of these. Systems are also emerging that will allow the use of electronic (prepaid) money to be used over a network, by allowing the cash balance of the prepaid card to be drawn in accordance with the value of the goods or services purchased. Internet payments systems cover transactions both wholesale (between companies) and retail (between consumers and companies). Methods of payments include: bank transfers, cheques, credit and debit cards, and prepaid debit cards.

### III. SECURITY REQUIREMENTS FOR SECURE PAYMENT SYSTEM

The primary goal of cryptography is to secure important data as it passes through a medium that may not be secure itself. Usually, that medium is a computer network. There are many different cryptographic algorithms, each of which can provide one or more of the following services to applications. It is generally accepted that, in order to be considered secure, a payment system must satisfy the following fundamental security requirements

#### A. Authentication

The assurance that the communicating party is the one that is claimed to be prevents the masquerade of one of the parties involved in the transaction. Both parties should be able to feel comfortable that they are communicating with the party with whom they think they are communicating. Applications usually perform authentication checks through security tokens or by verifying digital Certificates issued by Certificate authorities. Cryptography can help establish identity for authentication purposes

#### B. Access Control

The prevention of unauthorized use of a resource (i.e., this service controls who can have access to a resource, under what conditions access can occur, and what those accessing the resource are allowed to do.)

#### C. Data Confidentiality (Secrecy)

Data Confidentiality is the protection of data from unauthorized disclosure. Confidentiality is an essential component in user privacy, as well as in the Protection of proprietary information, and as a deterrent to theft of information services. The only way to ensure confidentiality on a public network is through strong encryption. Data is kept secret from those without the proper credentials, even if that data travels through an insecure medium.

#### D. Data Integrity (Anti-tampering)

The assurance that data received are exactly as sent by an authorized entity (i.e., contain no modifications, insertion, deletion, or replay) and prevents the unauthorized modification of data. Financial messages travel through multiple routers on the open network to reach their

destinations. We must make sure that the information is not modified in transit.

#### E. Non-Repudiation

Provides protection against denial by one of the entities involved in a communication of having participated in all or part of communication.

- Non-repudiation, Origin- Proof that the message was sent by the specified party.
- Non-repudiation, Destination- Proof that the message was received by the specified party.
- Non-repudiation is usually provided through digital signatures and public key certificates.

### IV. TYPES OF ATTACKS ON INSECURE SYSTEM

#### A. Network Attacks

These simple services can be used to stop a wide variety of network attacks, including

##### 1) Snooping (passive eavesdropping)

An attacker watches network traffic as it passes and records interesting data, such as credit card information.

##### 2) Tampering

An attacker monitors network traffic and maliciously changes data in transit (for example, an attacker may modify the contents of an email message)

##### 3) Spoofing

An attacker forges network data, appearing to come from a different network address than he actually comes from. This sort of attack can be used to thwart systems that authenticate based on host information (e.g., an IP address)

##### 4) Hijacking

Once a legitimate user authenticates, a spoofing attack can be used to "hijack" the connection.

##### 5) Capture-replay

In some circumstances, an attacker can record and replay network transactions to ill effect. For example, say that you sell a single share of stock while the price is high. If the network protocol is not properly designed and secured, an attacker could record that transaction, and then replay it later when the stock price has dropped, and do so repeatedly until all your stock is gone.

##### 6) PIN-guessing attack

An attacker can fake the digits and use the user authentication code (UAC) to launch a PIN-guessing attack.

#### B. Cryptographic attacks

In order to define the security level of a cryptosystem we have to specify the type of attack we are assuming (the power of the adversary) and the type of breaking which we wish to prevent (what tasks should the adversary be able to perform as the result of the attack) Given these specifications, we have to show that breaking the cryptosystem with the specified attack is as hard as performing a certain computational task. The types of attacks are

##### 1) Cipher text-only attack

Cipher text-only attack in which the adversary sees only cipher texts.

## 2) *known-plaintext attack*

Known-plaintext attack in which the adversary knows the plaintexts (messages) and the corresponding cipher texts transmitted.

## 3) *chosen-plaintext attack*

Chosen-plaintext (CP) attack; where the adversary gets to pick (adaptively); plaintexts of his choice and by exploiting the encryption mechanism he sees their encryption value.

## 4) *chosen-cipher text (CC) attack*

Chosen-cipher text (CC) attack - where in addition to access to the encryption mechanism the adversary can pick (adaptively) cipher texts of his choice and by using the decryption mechanism (as a black box) he gets the corresponding plaintexts.

## V. ISSUES OF SECURITY APPROACH TO SECURE PAYMENT SYSTEM

### A. *Secure Sockets Layer (SSL) protocol*

Netscape Inc. originally created the Secure Sockets Layer (SSL) protocol. On account of its popularity and acceptance, it is now implemented in all web browsers. SSL has two main objectives:

- 1) To ensure confidentiality, by encrypting the data that moves between the communicating parties (client and the server).
  - 2) To provide authentication of the session partners using RSA algorithm.
- 1) The SSL Handshake protocol, in which the communicating parties (client and the server) authenticate themselves and negotiate an encryption key. One point to note here is that the SSL there is significant additional overhead in starting up an SSL session
  - 2) The SSL Record protocol, in which the session data is exchanged between the communicating parties (client and the server) in an encrypted fashion. SSL is a great boon to the traditional network protocols, because it makes it easy to add transparent confidentiality and integrity services to an otherwise insecure TCP-based protocol. It can also provide authentication services, the most important being that clients can determine if they are talking to the intended server, not some attacker that is spoofing the server. SSL is currently the most widely deployed security protocol. It is the security protocol behind secure HTTP (HTTPS), and thus is responsible for the little lock in the corner of your web browser. SSL is capable of securing any protocol that works over TCP. An SSL transaction starts with the client sending a handshake to the server. In the server's response, it sends its certificate. As previously mentioned, a certificate is a piece of data that includes a public key associated with the server and other interesting information, such as the owner of the certificate, its expiration date, and the fully qualified domain name associated with the servers

### 1) *Problems with SSL*

SSL is an excellent protocol. Like many tools, it is effective in the hands of someone who knows how to use it well, but is easy to misuse. There are many pitfalls that people fall

into when deploying SSL, most of which can be avoided with a bit of work.

- 1) The merchant cannot reliably identify the cardholder. In cases where customers use stolen credit cards to initiate e-commerce transactions, merchants are responsible for card not present transaction charge backs. While SSL/TLS does provide the possibility of client authentication with the use of client certificates, such certificates are not obligatory and are rarely used. Furthermore, even if the client possesses a certificate, it is not necessarily linked with his credit card. This means that the client might not be authorized to use the credit card in question.
- 2) SSL/TLS only protects the communication link between the customer and the merchant. The merchant is allowed to see the payment information. SSL/TLS can neither guarantee that the merchant will not misuse this information, nor can it protect it against intrusions whilst it is stored at the merchants' server.
- 3) Without a third-party server, SSL/TLS cannot provide assurance of non-repudiation. So SSL protocol does not provide facilities for non-repudiation.
- 4) SSL/TLS indiscriminately encrypts all communication data using the same key strength, which is unnecessary because not all data needs the same level of protection.
- 5) MITM attacks: MITM attacks pose a serious threat to many relevant SSL/TLS-based applications, such as Internet banking and remote Internet voting's.

### 2) *Efficiency*

SSL is a lot slower than a traditional unsecured TCP/IP connection. This problem is a direct result of providing adequate security. When a new SSL session is being established, the server and the client exchange a sizable amount of information that is required for them to authenticate each other and agree on a key to be used for the session. This initial handshake involves heavy use of public key cryptography, which, as we've already mentioned, is very slow. It's also the biggest slowdown when using SSL. On current high-end PC hardware, Open SSL struggles to make 100 connections per second under real workloads. Once the initial handshake is complete and the session is established, the overhead is significantly reduced, but some of it still remains in comparison with an unsecured TCP/IP connection

### B. *Secure Electronic Transaction (SET) Protocol*

To carry out transactions successfully and without compromising security and trust, business communities, financial institutions and companies offering technological solutions wanted a protocol that works very similar to the way how a credit card transactions work. Visa and MasterCard, leading credit card companies in the world formed a consortium with computer vendors such as IBM and developed an open protocol which emerged as a standard in ensuring security, authenticity, privacy and trust in electronic transactions.

The main business requirements for SET are:

- 1) Provide confidentiality of payment information and enable confidentiality of order information that is transmitted along with the payment information.
- 2) Ensure the integrity of all transmitted data.

- 3) Provide authentication that a cardholder is a legitimate user of a branded payment card account.
- 4) Provide authentication that a merchant can accept branded payment card transactions through its relationship with an acquiring Financial Institution.
- 5) Ensure the use of the best security practices and system design techniques to protect all legitimate parties in an electronic commerce transaction.
- 6) Create a protocol that neither depends on transport security mechanisms nor prevents their use.
- 7) Facilitate and encourage interoperability among software and network provider

The goal of SET is to ensure that the payment process is private, convenient and most-important-of-all-secure.

SET ensures that the order and payment information of the customers are kept confidential. SET also has the capacity to authenticate the customer is the legitimate user of the credit account. The payment process is easy and simple. When the customer made a purchase, the SET will authenticate the credit card against the details provided by the customer, and then the merchant which is the online store will send the order details to the bank. Transaction will occur between the two for the approval of the purchase. When approved the bank will digitally sign and an authorization will be given to the merchant who can then process the order. This type of e-commerce technology is truly a breakthrough in online shopping and-transactions. The e-commerce technology developed are very important in the online e-commerce especially the secure payment system. It provides the customers a piece of mind when doing Internet transactions. Now customers will be safe against scams. A reliable e-commerce technology is truly what we need.

1) *Disadvantages of SET are as follows*

- 1) Implementing SET is more costly than SSL/TLS for merchants as well. Adapting their systems to work with SET is more complicated than adapting them to work with SSL/TLS. Furthermore, merchants must have accounts opened at business banks capable of handling SET transactions.
- 2) Business banks must hire companies to manage their payment gateways, or install payment gateways by themselves.
- 3) Despite being designed with security in mind, SET also has some security issues. In a variant of the SET protocol, the merchant is allowed to see the customer payment information. Just as with SSL/TLS. There are also some other, minor security issues in this protocol
- 4) SET employs complex cryptographic mechanisms that may have an impact on the transaction speed.
- 5) Despite being very secure, SET has not been a success in e-commerce environments. The reasons attributed are the overheads associated with SET are heavy.
- 6) For a simple purchase transaction:
- 7) Four messages are exchanged between the merchant and customer
- 8) Two messages are exchanged between the merchant and payment gateway.
- 9) 6 digital signatures are computed.
- 10) There are 9 RSA encryption/decryption cycles.

- 11) There are 4 DES encryption/decryption cycles and four certificate verifications.
- 12) It has been argued by merchants that they have to expend lot of money in order to process SET transactions. From consumer's point of view, they have to install appropriate software.
- 13) Inter-operability problem has not been solved.
- 14) With SET, while the payment information is secure, order information is not secure.

2) *D Secure*

The main advantage over SSL/TLS is that 3-D Secure provides credit card authorization and non-repudiation. 3-D Secure is built upon the relationships between three domains, named the acquirer, the issuer, and interoperability domains .The acquirer domain covers the relationship between the merchant and the acquirer. The issuer domain covers the relationship between the cardholder and the issuer. The interoperability domain supports the relationship between the acquirer and issuer domains. To protect the security of communication between the various entities, 3-D Secure requires the following links to be protected using SSL/TLS: cardholder merchant, cardholder-ACS, merchant Visa Directory, and Visa Directory-ACS (access control sever)

C. *Disadvantages*

The merchant still has access to the payment information, and all information is encrypted using the same key strength. The main advantage over SSL/TLS is that 3-D Secure provides credit card authorization and non-repudiation. On the other hand, prior customer registration is required

D. *Cyber Cash*

The Cyber Cash provide several separate payment services on the Internet including credit card and electronic cash. Cyber Cash uses specialized software on the merchant and customer's sides of the connections to provide secure payments across the Internet.

E. *The Secure electronic payment system using secure communication tunnel.*

Secure electronic payment system consists of four system participants (segments). The communication between the participants goes through secure communication tunnels.

1) *Secure Communication tunnel*

Means provide a secure way for communication between two or more parties or segments, i.e., Customer to merchant and merchant to payment gateway.

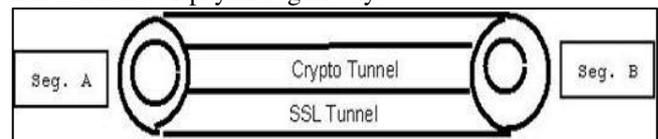

Fig. 2: Secure communication tunnel consists of SSL and nested crypto tunnel.

Secure communication tunnel consists of SSL and nested crypto tunnel, which is created by employing cryptographic algorithms and techniques on the information that are transmitted between parties. The SSL is based on session key and Crypto tunnel is based on public key cryptosystem. These Secure communication tunnel are work

between customer to merchant and merchant to payment gateway and transfer data securely.

2) Working of Tunnel

The customer decides to buy something and open the merchant's web site. Customer sees many item of merchant web site. At this time web server and our browser communicate through HTTP Protocol. To be securing this system, secure communication tunnel and key cryptosystem is used to protect conventional transaction data such as account numbers, amount and other information.

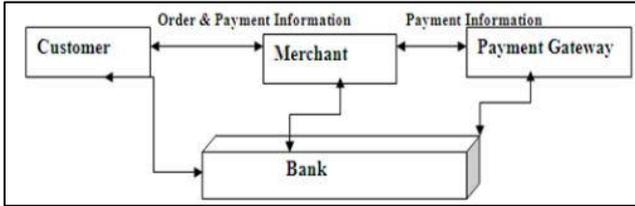

Fig. 3: Secure Communication tunnels between Customer, Merchant and payment gateway

The web payment segment creates two messages

- 1) The first message contains order information
- 2) The second message contains payment information-credit card number and other information like credit card type and expiration date. The order information is encrypted using symmetric session key and digitally signed using customer's private key. The payment information is double encrypted, first time using payment gateway public key and second time using symmetric session key. Merchant cannot peek the payment information because of the payment information is also digitally sign with the customer's private key.

VI. COMPARISON OF SECURITY SCHEMES FOR SECURE PAYMENT SYSTEM

Key Point	SSL	SET Protocol.	Tunnel
Security	Less Secure	More Secure	More Secure
Technique	Encryption /Decryption	Encryption/Decryption-With Dual Signatures	Encryption /Decryption With-Crypto Tunnel
Merchant security	Less	Yes	More
Client Security	Less	Yes	More
Payment Gateway	No	Yes	More
Channel Security	No	Yes	Using Tunnel
Use of Digital Certificates	No	Yes	Yes

Table 1: Comparison of SSL, SET and Secure Tunnel

The table-1 above outlines the key differences and similarities of major security schemes for any secure payment system.

A. Encryption: AES versus Triple-DES

As depicted in the table-2 below, all Good Link messages are encrypted end-to-end using the Advanced Encryption

Standard (AES). AES is a Federal Information Processing Standard (FIPS) selected by the U.S. National Institute of Standards and Technology (NIST) for its combination of resistance to attack, ease of implementation, efficiency, and scalable design. All Good Link clients (Mobitex, Palm OS, and Microsoft Windows Mobile 2003) support Good's implementation of AES.

	AES	Triple-DES
Description	Advanced Encryption Standard	Triple Data Encryption Standard
Timeline	Official standard since 2001	Standardized 1977
Type of algorithm	Symmetric	Symmetric
Key size (in bits)	192	168
Speed	High	Low
Time to crack (assume a machine could try 255 keys per second - NIST)	149 trillion years	4.6 billion years
Resource consumption	Low	Medium

Table 2: AES versus Triple-DES

VII. CONCLUSION

The work proposed reviews the Secure Electronic Payment schemes through SSL, SET, and Secure communication Tunnel. The security techniques are incorporated to provide security for the customers to be able to purchase the desired items on the Internet through Electronic Transaction. The system shall ensure the security of such a transaction, making it a reliable and an efficient solution to any E-business model. The primary benefits of such a Payment System over Internet are many folds: it uses strong cryptographic and authenticity checking models, thus improving the security; the merchant is prevented from seeing payment information, thus improving the privacy; as a result the customer has the freedom to use the system safely. Additionally, as the customers can use such a system without having the additional software installed, he / she can rely on these secure payments or can rely to have a digital certificate. It is evident from the literature that with the use of security principle for secure communication channels, it provides the significant level of protection over unsecured communication channels.

# Security Enhancement of RSA Algorithm using Increased Prime Number Set

Nitin Jain, Surendra Singh Chauhan, Alok Raj

**Abstract:** In this era of digital age a lot of secret and non-secret data is transmitted over the internet. Cryptography is one of the many techniques to secure data on network. It is one of the techniques that can be used to ensure information security and data privacy. It is used to secure data in rest as well as data in transit. RSA is the most commonly used cryptographic algorithm and it is also used for the creation of Digital Certificates. RSA algorithm is now not considered to be as secure due to advancement in technology and newer attack vectors. This paper proposed an algorithm for security enhancement of RSA algorithm by increasing prime numbers count. Proposed algorithm has been implemented to encrypt and decrypt the data and execution results for encryption and decryption time have been compared for increased prime numbers count. This proposed algorithm of RSA can be used to replace the existing RSA algorithm in digital signature certificates as well as in all other places where the base RSA algorithm is currently being used. In the proposed technique, as the number of prime number count increases, prime factor calculation becomes difficult. If the attacker has encryption key ( $e$ ) and Product of prime numbers ( $N$ ) then it is not easy to find out the prime number combinations and hence decryption key ( $d$ ) will be more secure by using proposed algorithm. This will be more difficult because given a number  $n$ , it is easy to find two numbers whose product is equal to  $n$  using Shor's algorithm and Grover's Search Algorithm but it is not very difficult and time taking to exactly determine  $m$  numbers whose product is equal to  $n$ .

**Keywords:** Cipher Text, Decryption, Decryption Time, Encryption, Encryption Time, Plain Text, RSA Algorithm.

## I. INTRODUCTION

Cryptography is a technique to make a readable data into unreadable data. Modern cryptography is part of mathematics and technology of computer science.[1],[2],[3]

### A. Goals of Security (Purpose of Cryptography)

There are some specific security requirements within the context of any application-to-application communication, including these goals.[3],[4],[5]

1) **Confidentiality:** It specifies that only sender and intended recipient should be able to access the contents of

message. The attack on the availability is called interception. There are two main threats to confidentiality, snooping and traffic analysis.[3],[4],[5]

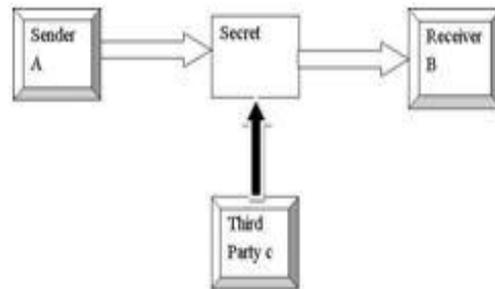

Fig. 1. Loss of Confidentiality [4]

2) **Integrity:** When sender sends a message and ensuring that the receiver receives the message as it was, wholly and error free without any changes. Attack on the integrity is called modification. [3],[4],[5]

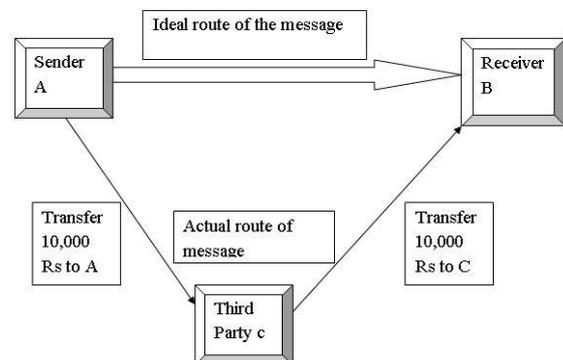

Fig. 2. Loss of Integrity [4]

3) **Availability:** Availability is ensuring that those who have the rights to information or material have always got the access to it or resources should be available to authorized parties at all time. The attack on the availability is called interruption [3],[4],[5].

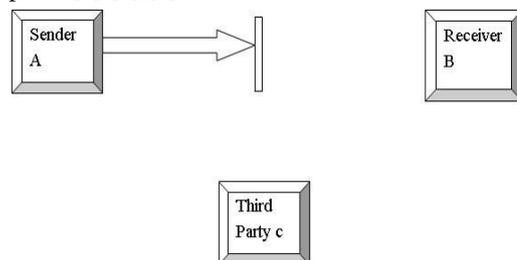

Fig. 3. Attack on Availability [4]

Revised Manuscript Received on February 25, 2020.

Alok Raj, Department of AIT-CSE, Chandigarh University, Mohali, India. Email: alokraj1789@gmail.com

4) *Authentication*: It helps establish proof of identities. It ensures that the origin of a documents or message is correctly identified. Suppose that third party C sends an electronic message over the internet to receiver B. However, the third-party C had posed as Sender A when C sent this document to user B. How would Receiver B know that the message has come from C. Who is posing as Sender A.? This type of attack is called as fabrication [3],[4],[5].

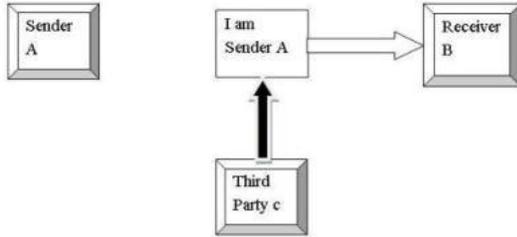

Fig. 4. Absence of Authentication [4]

5) *Non-repudiation*: It is a mechanism to prove that sender really sent this message [3],[4],[5].

**B. Types of Cryptosystem**

There are two types of cryptosystem:

1) *Symmetric Key Cryptography*: If sender and receiver share the same key for encryption and decryption of message than it is called symmetric key cryptography.[7],[9]

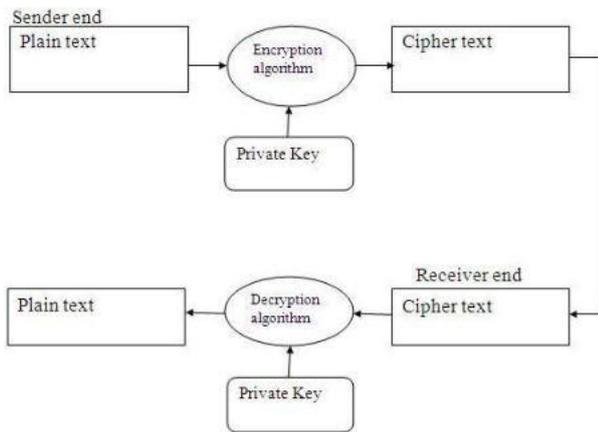

Fig. 5. Private Key Cryptography

2) *Asymmetric Key Cryptography*: If sender and receiver share the one key for encryption and another key decryption of message than it is called asymmetric key cryptography.[6],[7],[9]

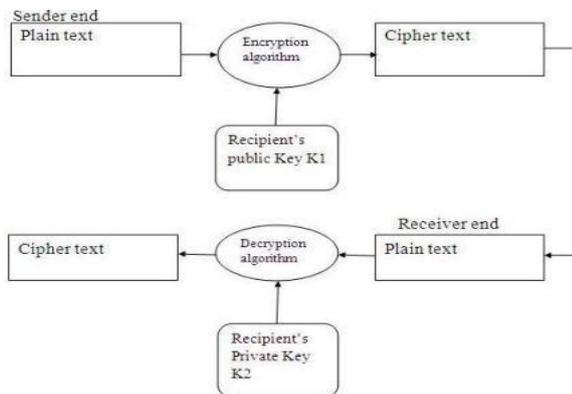

Fig. 6. Public Key Cryptography

- RSA Cryptography is the most commonly implemented Asymmetric Key Cryptography. [7],[8],[9],[10]

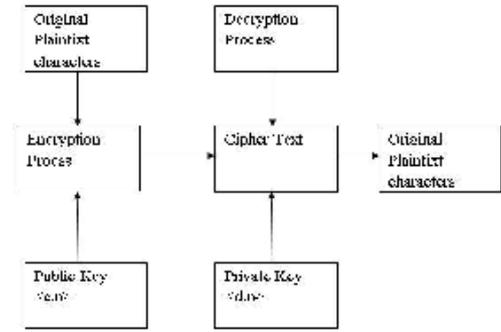

Fig. 7. RSA Model [4]

**II. PROPOSED ALGORITHM**

- Step 1 – Take the n prime numbers (P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, .....P<sub>n</sub>) instead of two prime numbers that is used in RSA Algorithm.
- Step 2 – Calculate the product of these prime numbers (N = P<sub>1</sub> x P<sub>2</sub> x P<sub>3</sub> x ..... P<sub>n</sub>)
- Step 3 – Now, select the encryption key e, such that it is not a factor of numbers ((P<sub>1</sub>-1), (P<sub>2</sub>-1), (P<sub>3</sub>-1) ..... (P<sub>n</sub>-1))
- Step 4 – Calculate the decryption key d, such that (d x e) mod ((P<sub>1</sub>-1), (P<sub>2</sub>-1), (P<sub>3</sub>-1) ..... (P<sub>n</sub>-1)) = 1
- Step 5 – Calculate cipher text (CP) from plain text (PT) as CT = PT<sup>e</sup> mod n
- Step 6 – At the receiver's end, calculate plain text (PT) as PT = CT<sup>d</sup> mod n

**III. FLOW CHART**

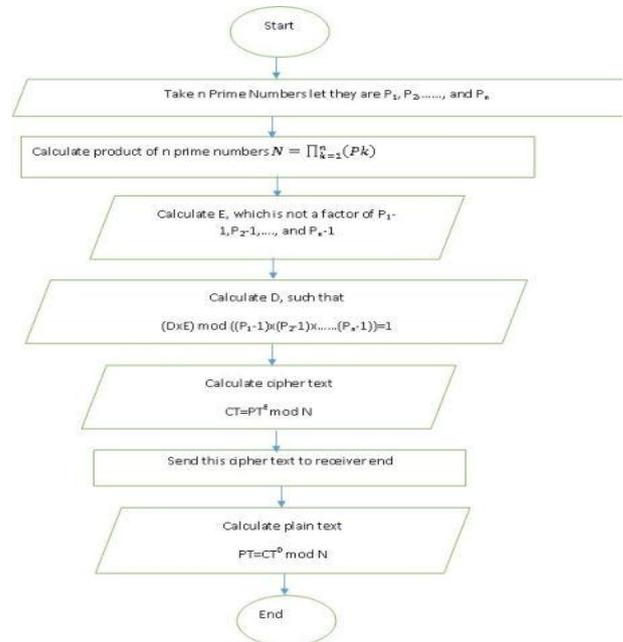

Fig. 8. Flowchart of Proposed Algorithm

**IV. PROPOSED ALGORITHM IMPLEMENTATION RESULT**

The proposed algorithm is implemented in C and python. We take here 4 types of examples. In these example there is plain text is same for all example that is "India is a Nation." and there are 2, 3, 4 and 5 different prime numbers are used and we calculate the

value of N, encryption key value, decryption key value, Encryption time, Decryption time, cipher text and again plain text from cipher text for different combinations.

We check variations in encryption and decryption time according to the prime numbers count and check the behavior of time graphs. Here the prime numbers are small for making calculations easy, but we can take large prime numbers in our practical life.

**Table- I: List of Prime Numbers Used in this Experiment**

	P1	P2	P3	P4	P5
1	23	53	11	37	17
2	29	59	13	41	19
3	31	61	17	43	23
4	37	67	19	47	29
5	41	71	23	53	31
6	43	73	29	59	37
7	47	79	31	61	41
8	53	83	37	67	43
9	59	89	41	71	47
10	61	97	43	73	53

If we are using 2 prime numbers, then P1 and P2 are used. If we are using 3 prime numbers then P1, P2 and P3 are used. If we are using 4 prime numbers then P1, P2, P3 and P4 are used.

If we are using 5 prime numbers then P1, P2, P3, P4 and P5 are used.

61	97	43	73	53	9.84E+08	1.03E+08	465483839	0.00030109999998783160	0.00019729999998542950

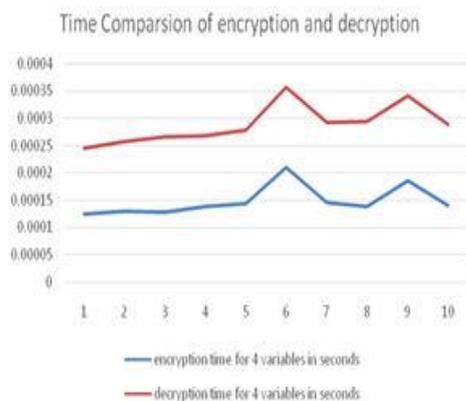

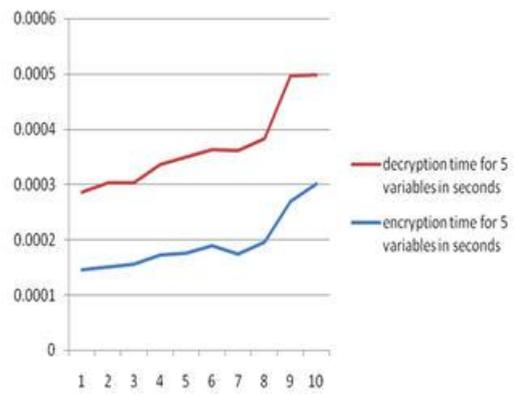

**Fig. 13. Encryption-Decryption Time Graph for Two Prime Numbers (based on Table II)**

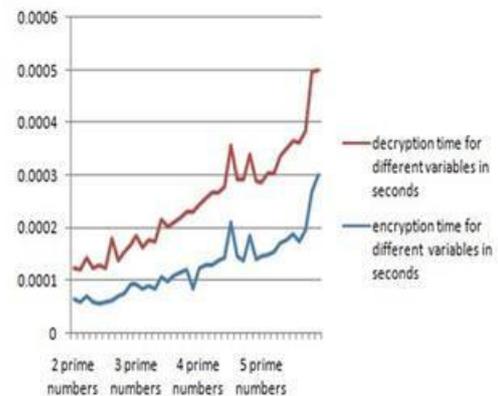

**Fig. 14. Encryption-Decryption Time Graph for Three Prime Numbers (based on Table III)**

**Fig. 15. Encryption-Decryption Time Graph for Four Prime Numbers (based on Table IV)**

**Fig. 16. Encryption-Decryption Time Graph for Five Prime Numbers (based on Table V)**

**Fig. 17. Behavior of Encryption-Decryption Time Graph for all combinations from 2, 3, 4 and 5 Prime Numbers**

By analysis of these graphs we can say that if we increase the prime number then encryption and decryption time will be increased in terms of  $e^x$ .

#### VI. ADVANTAGES OF PROPOSED ALGORITHM

1) It is very hard to find out the factors of N. In this case  $((P_1-1), (P_2-1), (P_3-1) \dots \dots \dots (P_n-1))$  because when we increase number of prime numbers then its product is also a big number.

2) The security aspects are not compromised here like confidentiality, availability, integrity, Authentication.

#### VII. CONCLUSION

At the end by comparing and checking all the parameters of proposed algorithm with existing algorithm, we can say that when we increase the number of prime numbers in RSA algorithm then its security also improves because it's hard to find the factor of N, while there are more than two prime numbers.

Encryption and Decryption time is depends on the value of e (encryption key) and d (decryption key) and here value of e is smaller because we are using more than 2 prime numbers so due to this the value of d is also not so big and by this process the encryption and decryption time is less.

**Abstract:** Counterfeit currency detection is a major issue around the world, influencing the economy of pretty much every nation including India. The utilization of fake money is one of the significant issues looked all through the world now days. The forgers are getting more earnestly to find as a result of their utilization of profoundly trend setting innovation. One of the best techniques to quit forging can be the utilization of fake location programming that is effectively accessible and is proficient.

**Index Terms - Image Processing, Feature Extraction, K-means Algorithm, Edge Detection.**

## I. INTRODUCTION

Duplicating money represents the unlawful replication of unique money, henceforth fake money is a phony cash that has not been approved by the administration. RBI is the main body which has sole duty to print cash notes in India. Consistently RBI faces the issue of fake money notes, once separated and flowed in the market.

Counterfeit note discovery framework is created for perceiving counterfeit note from the certifiable. The main arrangement that is by and by accessible for basic man to recognize fake cash is Fake Note Detector Machine. This machine is for the most part accessible just in banks which aren't reachable each time by normal resident. . Every one of these situations needs a sort of answer for average folks to pass judgment on a fashioned monetary certificate and to cease our money from losing its worth.

The technique of picture preparing depends on the extraction of the highlights of Indian banknotes. Pictures are handled by utilizing different procedures of picture preparing and assist different highlights are extricated from the pictures. The methodology comprises of various segments including picture handling, trademark extraction, looking at pictures. The essential thing of approach is that we extricate the highlights based on which we will arrange the phony note. Security highlights of money are basic for deciding genuine and phony cash. Regular security highlights incorporate watermarks, idle pictures, security string, and optically factor ink.

In the study, a methodology for counterfeit money detection separates the general characteristics dormant pictures and ID mark from the picture of money. Extricate traits from pictures of money notes can get very mind boggling as it includes the extraction of some obvious and undetectable highlights of Indian cash. After demonetization 500 and 2000 are the high esteemed money notes existing till date so there is a most extreme likelihood that this notes can be falsified so as to dodge this we are utilizing programming to recognize the phony notes utilizing picture handling system.

## II. LITERATURE REVIEW

The approaches of picture preparing based extraction of the current highlights of banknotes are delineated in subtleties to show the attainability of programming helped fake cash location framework. For Indian monetary orders following highlights are considered. Here, for testing reason Indian money has taken parameters they utilized was:

1) Micro-printing 2) Watermark 3) Optically Variable Ink 4) Iridescent Ink 5) Security Thread 6) Ultraviolet Lines.

Zahid Ahmed et...al; The proposed approach separates different highlights from Indian cash and uses them for counterfeit money location. The picture was gained utilizing picture obtaining gadget. The security highlights were extricated utilizing different picture handling calculations and afterward layout coordinating was done to distinguish counterfeit money. We will beat this issue by utilizing various parameters which will be sufficient adequate to perceive the contrast among phony and unique cash takes note of, this will be executed utilizing picture handling systems.

Hariri et...al; Iranian banknote ID should be possible through utilizing wavelet change and neural system. This strategy utilizes wavelet change to extricate picture highlights. The proposed technique comprises of two stages: In the principal stage, a pre-procedure of the picture is taken and its size is diminished and RGB picture gets dark. Removed data can be utilized as contributions to the neural system.

Hassanpour,H et...al; Indian is a developing country, Production and printing of Fake .In this article, recognition of paper currency with the help of digital image processing techniques is described. Around eight characteristics of Indian paper currency is selected for counterfeit detection. The identification marks, optical variable link, see through register and currency color code decides the currency recognition. The security threads, water mark, Latent image and micro-lettering features are used for currency verification. The characteristics extraction is performed on the image of the currency and it is compared with the characteristics of the genuine currency.

R.C.Gonzalez et...al; The extension of present day banking administrations requires the requirements for programmed money acknowledgment and verification framework, consequently reassuring numerous scientists to grow high exactness, dependable and high handling speed methods. To recognize the validness of money note there are two techniques for example first line investigation strategy and second line review technique. First line review strategy incorporates differed thickness watermarks, bright fluorescence, intaglio printing, miniaturized scale content and multi dimensional image while the second line examination techniques incorporate isocheck/isogram, fiber based testaments of genuineness, shading and highlight investigation.

Mriganka Gogoi, et al; Money is a vital piece of our needs so its truly is significant. Flow of phony cash can upset the financial development procedure of our nation. Course of phony cash makes a lot of burden individuals. Numerous individuals are as yet not mindful of how to identify counterfeit notes and the measures which are to be thought about. Right now are concentrating on a propelled portable based application that is utilized to recognize counterfeit cash. Utilization of Counterfeit is to engage the basic man with an effectively accessible gadget to assist him with distinguishing counterfeit notes. This application can be utilized on everyday premise by us for recognizing deceitful cash notes without further ado. Dissimilar to existing cash indicators in banks, Counterfeit: Currency Detector will give easy to use and convenient application to discover produced banknotes.

### III. METHODOLOGY

Being roused by the ongoing improvements in the field of picture preparing and accessibility of ease picture procurement gadgets, we present a methodology for counterfeit money discovery dependent on picture handling. The proposed approach separates various highlights from Indian cash and uses them for counterfeit money discovery. The diagram of the proposed work is introduced in framework design.

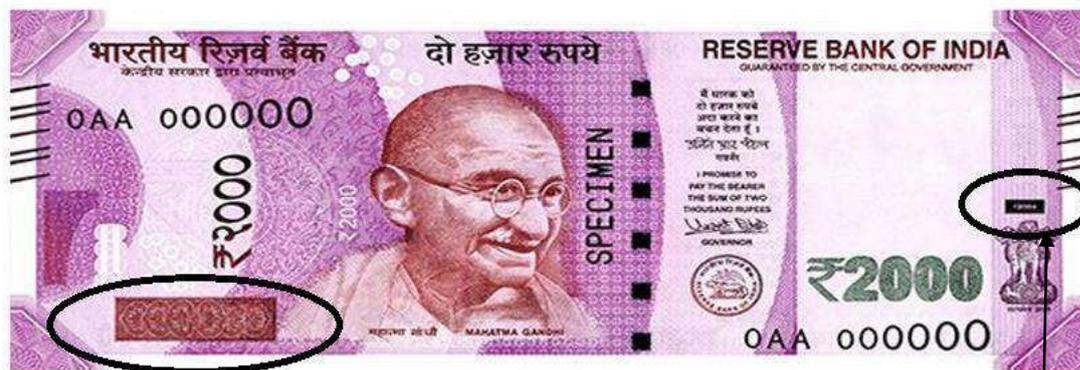

The image is procured utilizing picture obtaining strategy. The security highlights are removed utilizing different picture handling calculations and afterward format coordinating is done to recognize counterfeit money. The oddity of the methodology is in picture handling applied for extraction of security highlights from the given picture of cash. Another oddity is to utilize various securities includes as opposed to the single component.

#### A. Currency Features

The features extracted so far might be classified as general features. The general features are essentially application independent features, for example, surface, shading and differentiation, and shape. Counterfeit money detection system differs relying upon explicit features of notes of a nation.

For Indian notes following features are considered:

- Latent Image
- Identification Marks

Latent Image

Identity Marks

Latent Image

Identity Marks

Feature extraction refers to the retrieval of information about the image by applying image processing algorithms. The images of a currency note were acquired using a digital camera or scanning the currency

using a scanner. After acquiring the image, first pre-processing and then feature extraction is done to extract features. Both the steps are described in this section:

### a. Pre-Processing:

In pre-processing the operations normally initial to main data analysis and extraction of information. In this unwanted distortion are suppressed and enhance some image features that are important to further processing. It includes image adjusting and image smoothening. After these two pre-processing steps, the images of the currency were applied for feature extraction.

### b. Feature Extraction:

Feature extraction employs the selection and extraction of some of the Effective and important features, among the largest data set of the features which are extremely important for the recognition of fake currency. Some Features of an image are Latent image and Identification Mark. We first create a database of a number of authentic Indian notes and then extract their features. The extracted features are used for detection of fake currency.

## B. System Block Diagram

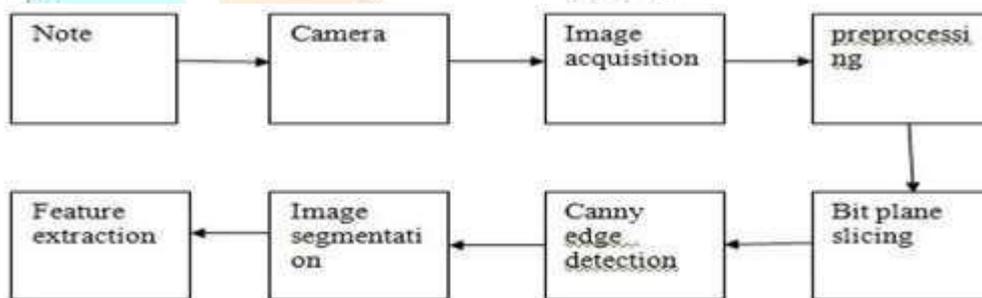

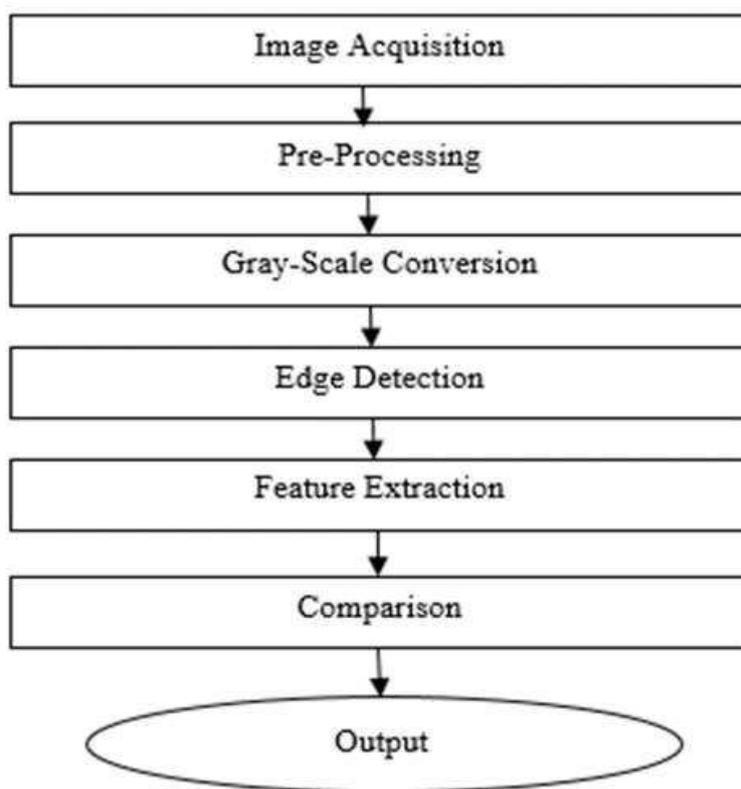

Fig.1: System Block diagram

## C. Steps of Implemented System

Image processing based currency detection technique consists of few basic steps like image acquisition, its pre-processing and finally recognition of the currency.

Image processing generally involves five steps:

- i. Image Acquisition: Importing an image with a webcam.
- ii. Performing Image pre-processing techniques such as:
  - Image Adjusting: Reduces the calculations and complexity of the size of the image and used for rotating, zooming, shrinking and for geometric corrections.
  - Image Smoothening: Reduces the noise introduced in the image.
- iii. Detect the edges of the note and partition it from the surrounding background of the image.
- iv. Perform feature extraction on the note to detect whether the note is real or fake by comparing the features of the note with the stored database.
- v. After feature extraction, the application will detect and recognize the note. The final result will be an output.

#### D. The Major Units of this Proposed System

##### K-means Algorithm

K-means algorithm is a strategy for vector quantization, initially from signal handling, that is main stream for group examination in information mining. K-means clustering intends to parcel n perceptions into k clusters in which every perception has a place with the group with the closest mean, filling in as a model of the bunch.

The algorithm has a free relationship to the K-means cluster classifier, a well known AI strategy for characterization that is frequently mistaken for k-means as a result of the k in the name. One can apply the 1-closest cluster classifier on the group communities acquired by k-intends to order new information into the current bunches. This is known as closest centroid classifier or Rocchio algorithm.

##### SVM Algorithm

In machine learning, support vector machines (SVMs, likewise support vector systems) are administered learning models with related learning calculations that investigate information utilized for grouping and relapse examination. Given a lot of preparing models, each set apart as having a place with either of two classes, a SVM preparing calculation constructs a model that allots new guides to one class or the other, making it a non-probabilistic paired direct classifier (despite the fact that strategies, for example, Platt scaling exist to utilize SVM in a probabilistic grouping setting). A SVM model is a portrayal of the models as focuses in space, mapped with the goal that the instances of the different classifications are partitioned by an unmistakable hole that is as wide as could be allowed.

In addition to performing linear classification, SVMs can efficiently perform a non-linear classification using what is called the kernel trick, implicitly mapping their inputs into high-dimensional feature spaces. When data are not labeled, supervised learning is not possible, and an unsupervised learning approach is required, which attempts to find natural clustering of the data to groups, and then map new data to these formed groups. The clustering algorithm which provides an improvement to the support vector machines is called support vector clustering and is often used in industrial applications either when data are not labeled or when only some data are labeled as a pre-processing for a classification pass.

## IV. CONCLUSION

In this study, we discuss various currency detection techniques and currency security feature, everybody has its own centrality. By using said technique we have watch that extraordinary results can be gotten quickly what's more, viably. The upsides of this assessment for the per user are that this study will give information about the particular systems what's more, calculations used for counterfeit currency detection system.

**Abstract** - This paper developed a computer vision based approach for Indian paper currency detection. In this approach, extract currency feature and develop an own datasets used for the currency detection. By using feature extraction method of front and back side Rs. 200 denomination security feature of Indian currency note. The mainly use ORB (Oriented FAST and Rotated BRIEF) and Brute-Force matcher approach to extract the feature of paper currency, so that can more accurately detection the denomination of the banknote both obverse and reverse. Our main contribution is through using ORB and BF matcher in OpenCV based, the average accuracy of detection is up to 95.0% and tested this method on different denominations of Indian banknote.

**Key Words:** Feature Extraction, ORB Algorithm, Edge Detection, Computer Vision, OpenCV.

## 1. INTRODUCTION

Today, the technology is very fast growing in the world. This increasing of technology the every year government or bank sector faces the problem of fake currency. This problem is very serious issue in India now a day. Similarly the government is also improving day to day but using high printing technology counterfeit circulates the fake banknote in the Indian market [1]. The Reserve Bank of India (RBI) in its latest annual report said that the during 2017-2018, 17,929 pieces of Rs 2,000 notes were detected in 2017-2018 while only 638 counterfeit notes of the same denomination had been detected the year before. In the past, people detecting of counterfeit banknote only manual or a hardware machine which is not easy available in market [3]. The technology of currency detection system basically used for identification and extraction the features of bank note [2].

The main objective of this paper is to get familiar with the new security feature which is provided by the government of India so that they can differentiate between the fake and real note. Detecting of fake note some module including image acquisition, Image per-processing, Image adjusting, Gray-scale conversion, Edge detection, Segmentation, Feature extraction classification every step required algorithm for which using OpenCV library ( open source computer vision library) [3]. Acquisition of image is process of capture a digital image from camera such that all features are highlighted. In the project we proposed a novel approach for the detection and classification of duplication in currency

note using ORB (Oriented FAST and Rotated BRIEF) and Brute-Force matcher in OpenCV.

## 2. LITERATURE REVIEW

Over the year a lot of researchers have made several contributions in this field of currency note detection. The researchers have done detection based on security feature, texture, color etc. In this section, we review previous work in currency detection techniques.

Deshpande and Shrivastava [1], the propose a recognition and authentication system using image processing which can be a good for recognition the fake currency note. In this methodology, extract the security features with Multi-spectral imaging. They are so many feature extract in this process is Mahatma Gandhi portrait, watermark, RBI watermark , 2000 watermark, electrotype watermark of 2000 denomination note.

Y. Neeraja et.al. [2], describe a fake currency detection using k-nn technique. In this methodology, the feature extraction process by k-nn technology is a robust and versatile classifier that is often used as a benchmark for more complex classifiers such as support vector machines (SVM).

Sawant and More [3], introduce an approach to detect fake note using minimum distance classifier technique. In this paper, the extract an ID mark and latent image and compute the Euclidean distance between the test sample and train sample. The Fourier descriptor is used for the describe the note boundary. The experimental setup is done on rupees 20, 50, 100,500 and 1000.The average success rate achieved is 90.0%.

K. B. Zende et.al. [4], describe a fake note detection system automatic recognition of Indian currency security feature based on MATLAB system. They are so many step including in this process is feature extraction, image segmentation, edge detection, bit plane slicing and comparison of image. In this paper extract some many feature watermark Detection, Security Thread Detection, checking currency series number, identification mark and sees through register. Here, they propose a GUI platform to check the currency is fake or real.

Li Liu et al. [5], introduce an approach to detect fake coins using digital images. In this paper, represented in the dissimilarity space, which is a vector space constructed by comparing the image with a set of prototypes. To recognized key points they used DOG and SIFT detector.

Ali and Manzoor [6], describe a Recognition System for Pakistani Paper Currency system. In this methodology, the scan an image and classifier used Knn. They are extract the currency feature area, height, width, and aspect ratio. They

proposed the system used the different feature of the currency for detection currency and a low cost machine. The experimental setup is done 100 Pakistani currency notes 20 each on rupees Rs. 10, 20, 50, 100, 500 and 1000. The average success rate achieved is 98.57%.

Bhagat and Patil [7], proposed a fast binary descriptor based on BRIEF, called ORB, which is resistant to noise. In this paper, proposed the system on both sides of currency feature. The recognized samples for conditions as illumination changes, rotation and scale change. The experimental setup is done 210 Indian currency notes sample 15 each on rupees Rs. 5, 10, 20, 50, 100, 500 and 1000. The average success rate achieved is 97.14%.

Yanyan Qin et al. [8], proposed systems provided by SIFT (Scale-Invariant Feature Transform). Initially, the scale spaces were built for the detection of stable extreme points, and then the detected stable extreme points were considered to be feature points which have scale invariance. Secondly, ORB descriptor is used to describe the currency feature points. This finally generated the binary descriptors with scale and rotation invariance. The ORB is 65.28 times faster than SIFT. The experimental setup is done 20 images and achieves accuracy 92.53%.

### 3. METHODOLOGY

The system proposed here works on the image of Indian currency note acquired by a digital camera. The method which is applied here is as follows

- a. Acquisition of image of Indian currency note by simple digital camera or scanner.
- b. Image acquired is RGB image and converted to Gray-scale image.
- c. Edge detection of whole gray scale image.
- d. Now Indian currency features of the paper currency both observe and reverse will be cropped and segmented.
- e. After segmentation, feature of Indian currency note are extracted.
- f. BF matcher match that database features with test images note then the test note is said as original otherwise fake.

#### 3.1 Security Features of New Indian Currency Note

**1. See through Register:** The small floral design printed both on the observer side (hollow) and reverse side (filled up) with note colour. The denomination numeral of note is written horizontally along bottom the motif on the right side (reverse side) and above the latent image on the left side (observer side). The design looks like a single floral design when seen against the light.

**2. Bleed line:** The bleed line printed on the obverse in both, the upper left and the right hand edge of the notes to aid the visually impaired. The bleed line is printed only 2000, 500, 200, 100 notes.

**3. Water marking:** The water marks seen in the new MG series note of Mahatma Gandhi and denominational value on the centre of the note. The portrait of Mahatma Gandhi is displayed in raised manner as compared to the old currency note.

**4. Security Thread:** The security thread is different in the denomination. In 2000 denomination currency note is a 3mm wide strip and usually 6 windowed and similar visible features and inscription "Bharat" (in Hindi), "RBI" and "2000". The 500, 200, 100, 50, 20, 10 denomination security thread inscription "Bharat" (in Hindi) and "RBI". The security thread changes from green to blue when the note is tilted. The security thread appears between the Mahatma's portrait and guarantee clause, Governor's signature panel.

**5. Intaglio Printing:** The portrait of Mahatma Gandhi printed in centre, the Reserve Bank seal, guarantee and promise clause printed after security thread, Ashoka Pillar Emblem on the right and RBI Governor's signature are printed in intaglio. Inscription printed using the Intaglio printing or raised printing can be felt by touch.

**6. Latent image:** On the obverse side of Rs. 2000, Rs. 500, Rs. 200, Rs. 100, Rs. 50 and Rs. 20 and Rs. 10 notes, a vertical band on the left side of the currency note. It is visible only when the note is held horizontally at eye level.

**7. Micro lettering:** The Micro lettering is written on the inside of the frame of the spectacles of Mahatma Gandhi. It always contains the word "Bharat" (in Hindi) and "India". On the Indian currency note contain the denominational value of the notes in micro letters. This feature can be read under a microscope or by using a hand magnifying glass.

**8. Identification Mark:** Each currency note has a unique mark of it. Identification marks are made for identifying the denomination of note with a visually impaired. A special feature in intaglio has been introduced on above the Ashoka Pillar Emblem in right side. The identification marks only appear 2000, 500, 200, 100 denomination notes.

**9. Optically variable Ink:** The denominational numeral of a note with rupee symbol in the Mahatma Gandhi watermark window. The optically variable ink printed on the observer side. The numeral changing the colour green to blue on bottom side.

#### 3.2 Proposed Method to Detect Fake Currency

The design flow of fake Indian currency detection system includes following stages:

1. Image acquisition
2. Pre-processing
3. Gray scale conversion
4. Binarization Image
5. Edge detection
6. Image segmentation
7. Feature extraction
8. Comparison
9. Result

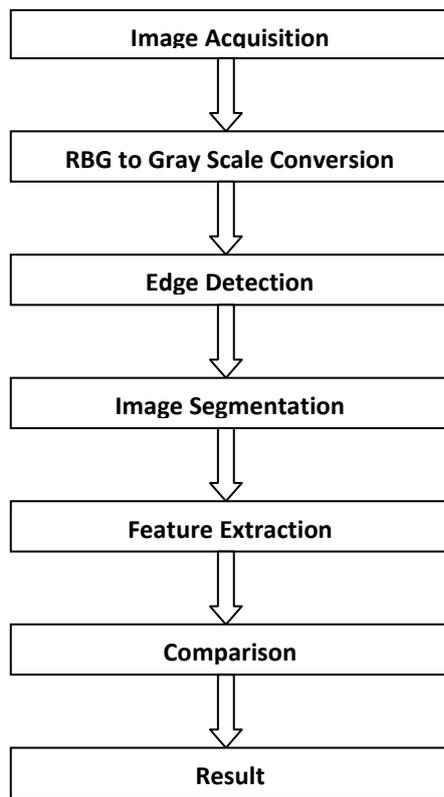

Fig -1: Block diagram of Indian Currency Detection System

The proposed system is works on two modules, one is the extract the Indian currency security feature and creates a datasets and other is the test currency dataset image on which authentication is too performed.

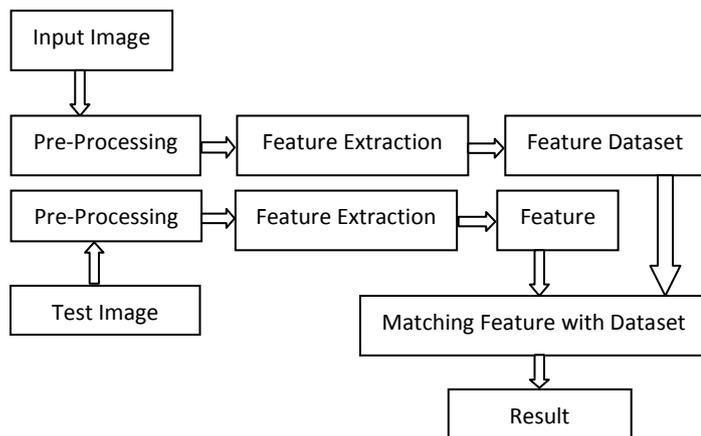

Fig -2: Proposed Detection System

**1. Image Acquisition:** Fig 3 shows the acquisition image. In this process, first image by using various ways to acquire image such as with the help of camera or scanner. This part is very important for extraction and detection of a currency.

Fig-3: Input Test Image

**2. Pre-Processing:** Image pre-processing is required prior to the main dataset and extraction of information and performs different operation for any currency verification. It includes

**Image Adjusting:** When we get the image from a camera, Fig 3 is capture in big size. Fig 4 shows reduce the calculation and decrease size of an image. These will also removing the background form the image also helping in reducing the size of the image [6].

Fig-4: Resize Image

**3. RGB to Gray-Scale Conversion:** The capture image acquired is in RGB colour. This image is heavy and has more noise. Fig 5 shows by converting into gray scale, it reduces the size of the image and also the intensity information which is easy to process instead of processing three components R (Red), G (Green), B (Blue).

Fig-5: RGB to Gray-Scale Image

**4. Edge Detection:** Edge detection is a tool in computer vision, particularly in the process of feature extraction and detection, which aim at identifying key points in a digital image. To segment an object from capture image, one needs closed region boundaries. Edge detection is one of the processes in image processing, image analysis, image pattern recognition, and computer vision techniques.

**5. Image Segmentation:** The image segmentation is the process which is divided a digital image into multiple segments, set of pixel. It is also called the image thresholding which threshold is decided and if value of given pixel is

above threshold then is converted into white pixel otherwise converted into black pixel.

**6. Feature Extraction:** Feature extraction process very important role in image processing and computer vision. In computer vision, feature extraction is the special form of dimensionality reduction. It is method of capturing image for retrieval and indexing. The aim is to extract and identify the unique feature of each Indian denomination under various challenging condition such as rough note, fold condition also under different background.

Fig-6: Observe Side Feature of Indian note

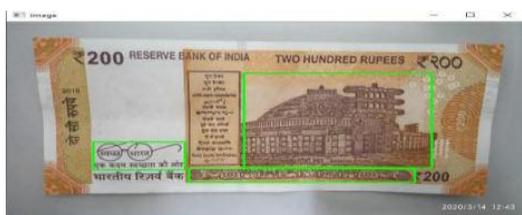

Fig-7: Reserve Side Feature of Indian note

**4. RESULTS AND DISCUSSION**

The system trained with 50 trained Indian currency note security features and the system is tested 29 testing images of denomination 200 and 500 Indian banknote. The security feature extracts of both side and compare with trained security feature. The accuracy calculated base on the testing image. The Table- I represent the accuracy in %. In denomination 200 testing images pass 29 banknotes out of 30 and the obtain accuracy 96.6%. In denomination 500 testing images pass 28 out of 30 and the obtain accuracy 93.3%. The average accuracy is obtaining 95.0%.

**Table -1: Test accuracy (%)**

Denomination	Image Datasets	Test Pass	Test Fail	Accuracy
200 Rupee Notes	30 Training and 30 Test Banknote Image	29	01	96.6%
500 Rupee Notes	30 Training and 30 Test Banknote Image	28	02	93.3%
<b>Average Accuracy</b>		<b>95.0%</b>		

Fig-8: RBI\_HIN Matches

Fig-9: RBI\_ENG Matches

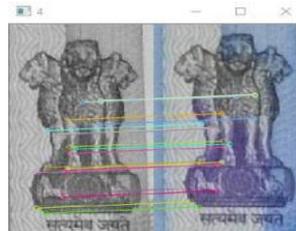

Fig-10: EMBLEM Matches

Fig-11: SEC\_THRE Matches

**5. CONCLUSION**

In this paper, we proposed ORB (Oriented FAST and Rotated BRIEF) and Brute-Force matcher in OpenCV for Indian currency detection system and currency security feature; everybody has its own centrality. By using said technique we have find that extraordinary results can be complete less time. The paper also includes the study of detailed information about various Indian currency notes. This is an OpenCV based using effective computer vision methods and algorithm which provide accurate and reliable result. At present we are having new MG series Indian currency note Rs. 200 and we can also experiment of notes Rs. 2000, Rs. 500, Rs. 100, Rs.50, Rs.20 and Rs.10. Our experiment shows that this is the low cost system to detection the Indian banknote. We had checked different notes on this system and the result is 95.0% which means that the system is working efficiently. In future, we will develop android app for detection Indian currency.

Document Sections	<p>► <b>Metadata</b></p> <p><b>Abstract:</b></p> <p>The licensed number plate is used as an image processing procedure to categorize the vehicles. Optical character recognition is widely used for this character recognition. In this paper, a vehicle licensed number plate is captured as an image and stored in a database. These images will further used for the identification of a vehicle. Due to the increase in automobile-related crimes, this technique is helpful for defense and traffic applications. In dissimilar references, this knowledge is referred as Automatic automobile discovery, Automatic number plate recognition, Car number plate recognition, Car Plate Reader, or Optical Character recognition. There are several approaches used to build an Automatic Number Plate System like Artificial Neural Network-based, Cloud Computing based, Hybrid based, Template Matching based, and Histogram based, etc. By using these approaches, the accuracy of the number of plates using the OCR technique is checked. The main motive of automatic number plate recognition is to monitor the congestion, traffic control, Smart Parking system, safety and surveillance of the drivers.</p>

**Contents****I. Introduction**

In today's development, the world is followed by the association of things and people. Today, as technology increases in every phase of life, services are also getting better using such technologies [1]. The vehicle transport system is also playing an important role in technology. As the inhabitants increase, the vehicles are also increasing speedily due to the daily desire of the citizens. The automobile transportation System plays a primary task in the traffic monitoring system [2], crime detection system, Tracking stolen vehicles, and protection applications, etc. Vehicle Number Plate Reader is an illustration Processing Technique that uses OCR (Optical Character Recognition) [5] technology to perceive the familiar terms to classify fine vehicle points. Administration of vehicle transportation is monotonous if the occurrence over the shadowing mission is not performed automatically. Accordingly, it is indispensable to build up an automatic license plate recognition system to decipher the troubles discoursed beyond which will involuntarily recognize digit from the frontage elevation image of the vehicle. Vehicle Number Plate Reader (VNPR) [16] is an organization that consists of the equipment which can examine the character and number on the vehicle's license plate. The VNPR captures the image of a verified license plate of a vehicle. These images were taken by a digital camera/gray-scale digital camera, as well as an infrared camera [11]. An optical Character Recognition (OCR) or Optical Character Reader technique was further applied to these images to categorize the vehicles [8]. The Indian number plate mostly uses a white background and black font of letters on it or the yellow background and black font letters [12].

## RESEARCH ON TEXT IDENTIFICATION, EXTRACTION AND RECOGNITION FROM NATURAL IMAGES

<sup>1</sup>Anjali Sharma, <sup>2</sup>Priyanka Rawat

<sup>1,2</sup>Department of Computer Science and Engineering,  
<sup>1,2</sup>Lingaya's Vidyapeeth, Faridabad, India  
<sup>1</sup>sanjali.gaur@gmail.com, <sup>2</sup>Priyankarawat3@yahoo.com

**Abstract** — Text extraction is that the way toward separating content from an image. The most work of an OCR is to frame editable papers from existing report papers or picture documents. Huge number of calculations is required to build up a Test extraction and essentially it works in two stages like character and word acknowledgment. Just if there should be an occurrence of a progressively modern methodology, an OCR likewise chips away at sentence location to safeguard a report's structure. Test extraction frameworks have set up a particular section place in design acknowledgment. OCR is furthermore well known among Android applications. Format is one among the premier open source libraries wont to actualize OCR in Android applications. It's discovered that in order to wash the picture record, the precision of the product is as high as 97.56%. It ought to be noticed that the exactness is estimated in light of the fact that the level of right characters and words. The existing system/the previous system of OCR on a grid infrastructure is just OCR without grid functionality. That is the existing system deals with the homogeneous character recognition without space or character recognition of single file with low Accuracy. Existing system convert only signal character detect. The benefit of proposed system that overcomes the drawback of the existing system is that it supports multiple functionalities such as character recognition with space and high accuracy and multi character convert in image to text. It also adds benefit by providing characters recognition. An accuracy of 99% means that 1 out of 100 characters is uncertain. While an accuracy of 99.9% means that 1 out of 1000 characters is uncertain. Measuring OCR accuracy is done by taking the output of an OCR run for an image and comparing it to the original version of the same text.

**Index Terms** — pre-processing, segmentation, feature extraction, pattern recognition

---

### I. INTRODUCTION

The expanding headways inside the electronic data recovery and example acknowledgment has prompted the examination inside the advancement of ongoing applications which aren't just testing yet in addition with high computational capabilities [1 2 3]. One among the machine as of late affecting the instructional exercise explore and in this manner the business is that the Optical Character Recognition for example OCR. The OCR method has gotten one among the significant

part inside the scanners which are used in applications like language recognizable proof, identification verification, and so on it is regularly been an alluring idea of getting a machine which may supplant human functionality[4 5 6]. Be that as it may, when it includes design acknowledgment, a machine isn't as shrewd as human to just perceive the character or content, particularly from the photos. Here OCR comes into picture. There are fundamentally two sorts of OCR depending on the archive, regardless of whether it's written by hand or print[7 8]. First is that the Offline OCR which manages the prevalence of the content from the picture when filtered. What's more, second is that the Online OCR which perceives the character while it's being composed through detecting the development of the pen. It's generally utilized for transcribed content.

In the past two decades, researchers have proposed numerous methods for detecting texts in natural images or videos. There are mainly three types of methods:

**1. Edge based Method:** Edges are a solid capacity of the content power, game plan, direction, and so tense based strategy doesn't make a difference shading/focused on a high differentiation between the content and thusly the foundation [9 10 15 16]. is implanted, the three distinctive highlights of content in pictures for identifying content edges are quality, thickness and along these lines the direction fluctuation are utilized. Edge-based content extraction calculation might be a universally useful technique that can find rapidly and viably and separate the content from the two records and indoor/outside pictures. This technique isn't strong for enormous content taking care of it.

**2. Texture based Method:** This strategy uses the way that the content in the picture discrete surface properties that recognize them from the foundation [11 12 13 14]. Procedures Fast Fourier Transform (FFT) to the spatial difference, et al SVM classifier bolsters Gabor channels, wavelet are used the printed idea of the content can be seen inside the picture region. [17] This method can perceive the content in complex foundation [18]. The main downside of this strategy is that the enormous computational exertion in grouping stage surface.

**3. Morphological based Method:** scientific morphology, a procedure upheld topology and geometry for picture investigation to be morphological element extraction procedure has been applied adequately for character acknowledgment and report investigation [19, 20]. It is utilized to extricate the basic qualities content difference of the picture is handled. These highlights are invariant to changes in geometric figures, for example, interpretation, revolution and scaling is likewise changed by the condition of the blaze or content shading, nor the qualities can generally be kept up. This technique utilizes a strong under various picture changes.

## II. LITERATURE SURVEY

Table 1. shows performance of various approaches in text detection and extraction.

**Table 1.** Various Text Extraction Techniques

<b>Author, Year</b>	<b>Technique Used</b>	<b>Images</b>	<b>Parameters</b>	<b>Remarks</b>
Raj et al. [14], 2014	CC based	Natural Scene Images (Devanagari text)	PR= 72.8%, RR=74.2 %	Fails for small slanted/curved text.
Anupama et al.[4], 2013	Morphology operators, Histogram Projection ( X and Y histogram)	Handwritten Telugu document images.	DR=98.54%, Accuracy =98.29%	Fail in case of touching characters and over- lapping lines.
Azadboni et al. [6], 2012	FFT Domain Filtering , SVM Classification,K-means clustering	Scene text images	DR= 98.10%	Text characters having uniform colour.
Seeri et al. [15], 2012	Median filter, Sobel edge detector connected component labeling, order static filter.	Kannada text images	PR=84.21% RR=83.16% Accuracy = 75.77%	Fails to extract very small characters.

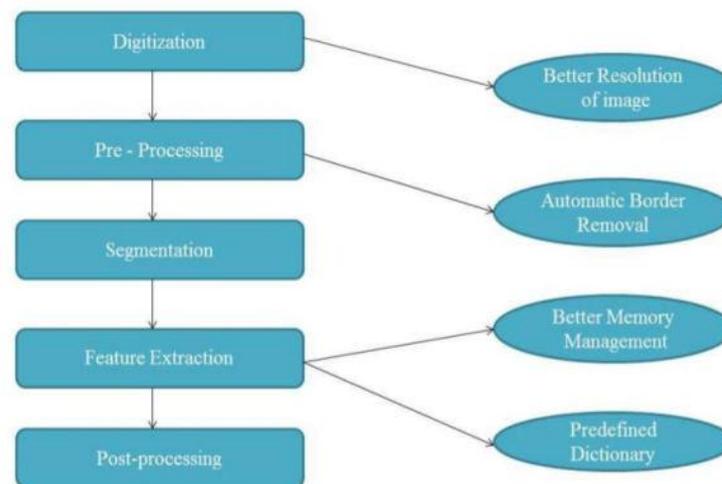

## III. PROPOSED METHODOLOGY

There are five major stages in Text extraction. They are as follows:

1. Image Digitization
2. Image Pre-processing
3. Image Segmentation
4. Image Feature Extraction
5. Image Post-processing

1) **Digitization** – In this step of image processing digital image of document is captured that is image is represented into bits for further processing of text extraction. Here Input threshold image is a colored image which is converted into a gray scale image.

- 2) **Pre-processing** - during this stage, defects in the image are eliminated which could lead to poor recognition. This binary image is given as input. Character is damaged or smeared mashed with a filling and thinning process.
- 3) **Segmentation** - character image is segmented into sub-components, namely the segment. Segments can also be identified supported supported characters such as property or popularity, a component corresponding to a predetermined class. Segmentation in the context of the text isolates individual characters of the text.
- 4) **Extraction feature** - The target feature extraction is to capture the essential characteristics of symbols. Another important task relating to the classification feature extraction. Classification is that the process of identification of each character and assign it the correct character classes. Features extracted features diagonal, transitional features, zoning, directional, parabolic curve fitting features, crossing and features open end points, etc.
- 5) **Post-processing** - This includes clustering and fault detection. recognized text characters associated with the string, so we want to develop the first string. Error detection is also underway. If the word is not in the dictionary, errors are detected and corrected by changing the words to be the most similar word.

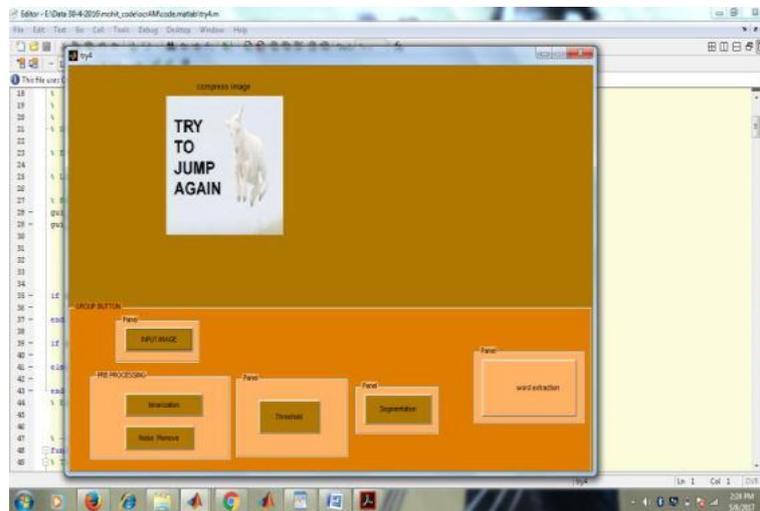

**Figure 1. Flow chart**

Digitization is just the conversion of handwriting or text documents in electronic form. Further image pre-processing pass, Pre-processing includes segmentation locations, noise reduction which consists of smoothing, thinning, fix broken, de-skewing, etc. images. The segmentation process with reference to the separation of the individual characters from the image. Once the characters are separated, the features of the individual characters are taken, which include the

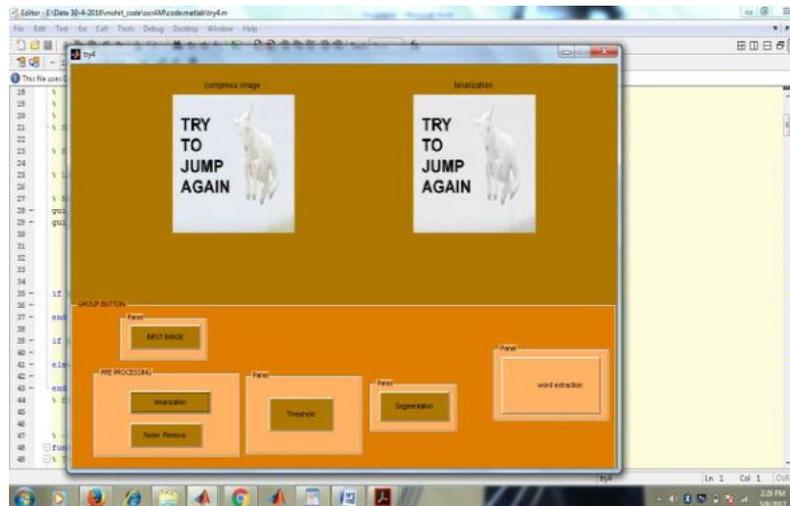

diagonal, crossing, transition, direction, curve fitting, etc., and sent for post-processing. Post processing includes grouping character and fault detection.

#### **IV. RESULTS**

**Figure 2. Browse Image in GUI (Graphical User Interface)**

In this figure we can take input image in button click event made a press button which presents me to scrutinize via my working vault and select either a 'jpg' or 'bmp' photo.

**Figure 3. Preprocessing binarization & noise Removal images**

In this figure The broken or smeared characters are smoothed by filling and thinning processes. Filling eliminates small gaps, holes, breaks in the character. Thinning reduces the width of the line. Also de-skewing of the image takes place. Pre-processing – In this stage, the defects in the image are eliminated which may cause poor recognition.

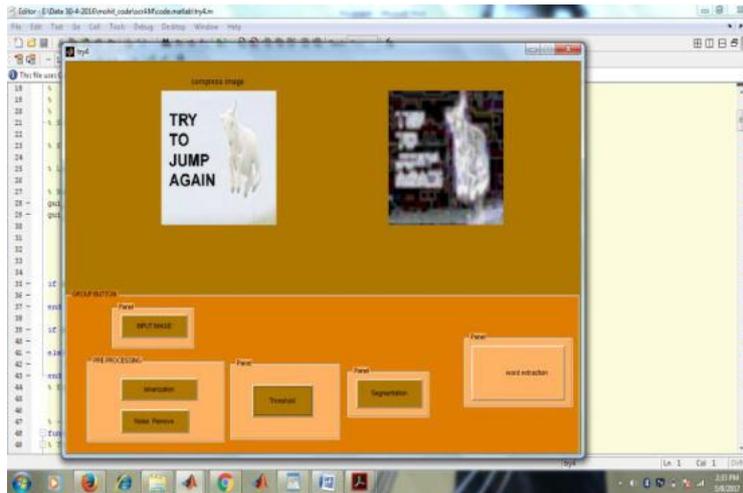

Figure 4. Images Thresholding

**Thresholding** – Character image is Threshold into its sub-components i.e. Threshold. The Threshold may identified based on character like properties or based on the recognition, components that match the predefined class. Threshold in context of text is isolating the individual character from the text.

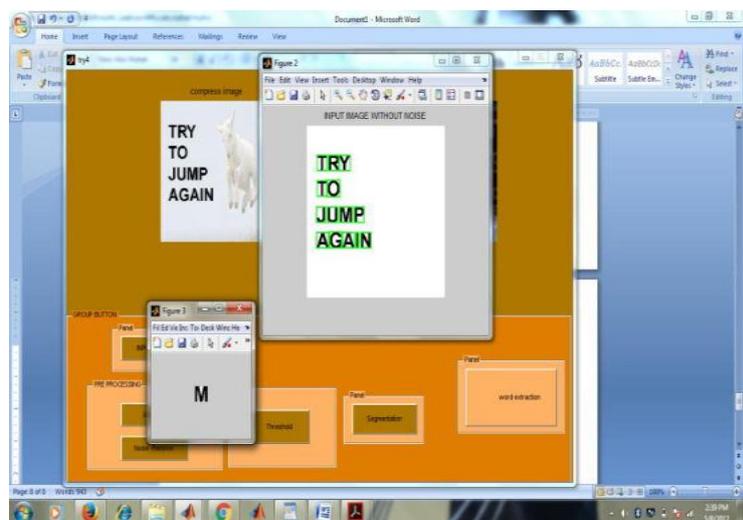

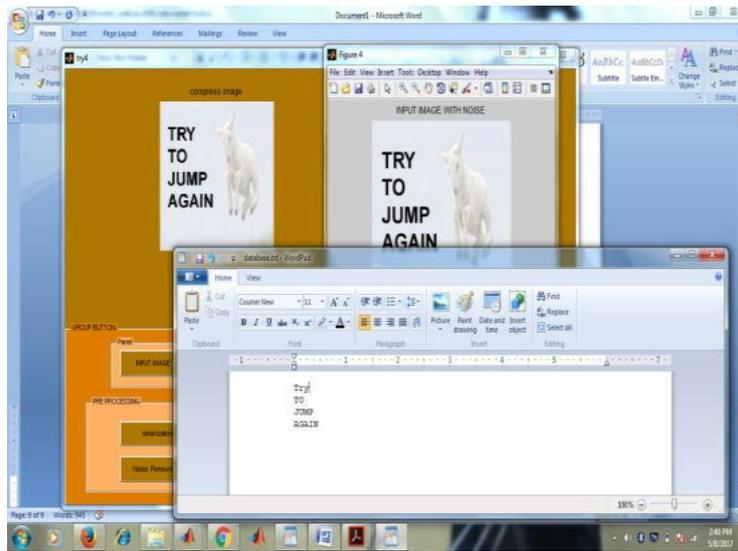

Figure 5. Segmentation and feature extraction

**segmentation and feature extraction**– The objective of feature extraction is to capture essential characteristics of symbols. Another important task associated with feature extraction is classification. Classification is the process of identifying each character and assigning to it correct character class. The features extracted are diagonal features, transition features, zoning, directional, parabolic curve fitting features, intersection and open end point features, etc.

**Figure 6. Final Output After all process we can get output in text format form image.**

**PRECISION AND RECALL**

Precision is defined as follows:

$$\text{Precision} = \frac{TP}{TP+FP}$$

recall is defined as follows:

$$\text{Recall} = \frac{TP}{TP+FN}$$

No. Image	Image type	Precision	Recall
50	Simple text text image	98%	78%
50	Image text	97%	72%

**Table 2. Precision and Recall**

## **V. CONCLUSION**

As a result, text-image analysis required to enable the text information extraction system which will be used for all kinds of images, including scanned images of documents, real scene image through a video camera, a picture of a text description. Studies show above that, most methods fall under one among techniques above and also that there are limitations of every technique to supply better detection rate with fewer false alarms without constraints for extracting text regions in various sorts of images. But still, it requires a very powerful technique and customary for text segmentation, it's difficult to supply appropriate input for optical character recognition systems. Thus, the combined methods are proposed for automatic extraction of text content from a special image that's independent of the varied characteristics of the text.

# SURVEY ON TEXT IDENTIFY, EXTRACTION AND RECOGNITION FROM NATURAL IMAGES

Anjali Sharma<sup>1</sup> Priyanka Rawat<sup>2</sup>

<sup>1</sup>Student, <sup>2</sup>Assistant Professor

<sup>1</sup>Department of Computer Science and Engineering,  
<sup>1</sup>Lingaya's Vidyapeeth, Faridabad, India

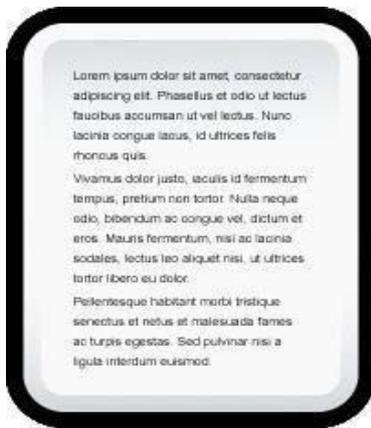

**Abstract:** Images carries important information that should be extracted whenever we need to extract. Number of algorithms and methods are proposed to extract text from the given image, and by using that user will be able to access the text from any image. Variations in text may occur because of differences in size, style, orientation, alignment of text, and low image contrast, composite backgrounds make the problem during extraction of text. If we develop an application that extracts and recognizes those texts accurately in real time, then it can be applied to many important applications like document analysis, vehicle license plate extraction, text- based image indexing, etc and many applications have become realities in recent years. To overcome the above problems we develop such application that will convert the image into text by using algorithms, such as bounding box, HSV model, blob analysis, template matching, template generation.

**Index Terms - Text Detection, Text extraction and Text Recognition.**

## I. INTRODUCTION

Text is born as an explicit carrier of high level semantics. This unique property makes text different from other generic visual cues, such as contour, color and texture. Therefore, detecting and recognizing texts in natural scenes have become important and vibrant research areas in computer vision. Text extraction is the task of automatically extracting structured information from unstructured and/or semi-structured machine-readable documents (text). The problem is challenging in nature due to variations in text properties and reflections. Text appearing in images is classified into three categories: document text, caption text, and scene text [6]. In contrast to caption text, scene text can have any orientation and may be distorted by the perspective projection therefore it is more difficult to detect scene text.

- Document text: A document image (Fig. 1) usually contains text and few graphic components. It is acquired by scanning journal, printed document, handwritten historical document, and book cover etc.
- Caption text: It is also known as overlay text or artificial text (Fig. 2). It is artificially superimposed on the image at the time of editing, like subtitles and it usually describes the subject of the image content.
- Scene text: It occurs naturally as a part of the scene image and contains important semantic information such as advertisements, names of streets, institutes, shops, road signs, traffic information, board signs, nameplates, food containers, street signs, bill boards, banners, and text on vehicle etc (Fig. 3).

Fig. 3: Scene text images

**A. Properties of Text in Images:**

Texts usually have different appearance due to changes in font, size, style, orientation, alignment, texture, color, contrast, and background. These changes will make the problem of automatic text extraction complicated and difficult. Text in images exhibit variations due to the difference in the following properties:

- **Size:** The size of text may vary a lot.
- **Alignment:** Scene text may be aligned in any direction and have geometric distortions while caption text usually aligned horizontally and sometimes may appear as non-planar text.
- **Color:** The characters tend to have same or similar color but low contrast between text and background makes text extraction difficult.
- **Edge:** Most caption and scene texts are designed to be easily read, hence resulting in strong edges at the boundaries of text and background.
- **Compression:** Many images are recorded, transferred, and processed in compressed format. Thus, a faster text extraction system can be achieved if one can extract text without decompression.
- **Distortion:** Due to changes in camera angles, some text may carry perspective distortions that affect extraction performance.

## II. LITERATURE SURVEY ON TEXT EXTRACTION TECHNIQUES

In the past two decades, researchers have proposed numerous methods for detecting texts in natural images or videos. There are mainly three types of methods: Region based methods, texture based methods and morphological based methods. The various text extraction techniques are as follow:

### A. Region based Method:

Region-based method uses the properties of the color or gray scale in the text region or their differences to the corresponding properties of the background. They are based on the fact that there is very little variation of color within text and this color is sufficiently distinct from text's immediate background [20]. Text can be obtained by thresholding the image at intensity level in between the text color and that of its immediate background. This method is not robust to complex background. This method is further divided into two sub-approaches: connected component (CC) and edge based.

#### i.) Connected Component (CC) based Method:

CC-based methods use a bottom-up approach by grouping small components into successively larger components until all regions are identified in the image. A geometrical analysis is required to merge the text components using the spatial arrangement of those components so as to filter out non-text components and the boundaries of the text regions are marked. This method locates text quickly but fails for complex background.

#### ii.) Edge based Method:

Edges are a reliable feature of text regardless of color/intensity, layout, orientations, etc. Edge based method is focused on high contrast between the text and the background [5]. The three distinguishing characteristics of text embedded in images that can be used for detecting text are edge strength, density and the orientation variance. Edge based text extraction algorithm is a general-purpose method, which can quickly and effectively localize and extract the text from both document and indoor/ outdoor images. This method is not robust for handling large size text.

### B. Texture based Method

This method uses the fact that texts in images have discrete textural properties that distinguish them from the background. The techniques based on Gabor filters, Wavelet, Fast Fourier Transform (FFT), spatial variance, SVM classifier and etc are used to detect the textual properties of the text region in the image [16]. This method is able to detect the text in the complex background. The only drawback of this method is large computational complexity in texture classification stage.

### C. Morphological based Method:

Mathematical morphology is a topological and geometrical based method for image analysis. Morphological feature extraction techniques have been efficiently applied to character recognition and document analysis. It is used to extract important text contrast features from the processed images. These features are invariant against various geometrical image changes like translation, rotation, and scaling. Even after the lighting condition or text color is changed, the feature still can be maintained. This method works robustly under different image alterations.

## D. Other approaches:

Epstein et al. [8] proposed SWT, an image operator that allows for direct extraction of character strokes from edge map. Binarization techniques, which use global, local, or adaptive thresholding, are the simplest methods for text localization. These methods are widely used for document image segmentation, as these images usually include black characters on a white background, thereby enabling successful segmentation based on thresholding. This approach has been adopted for many specific applications such as address location on postal mail, courtesy amount on checks, etc., due to its simplicity in implementation [11].

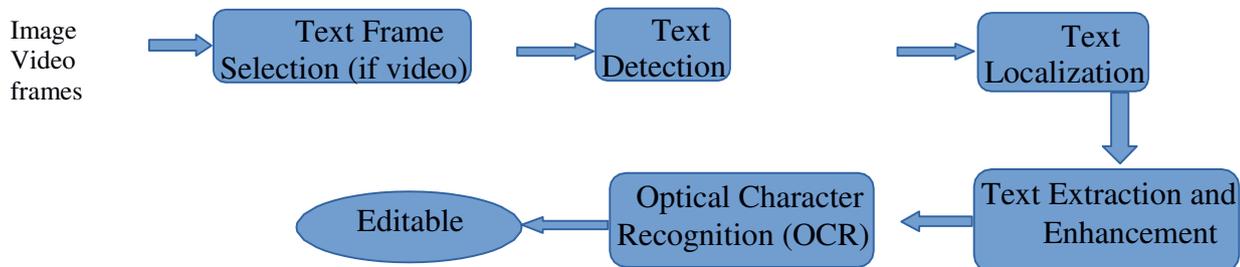

Fig. 4 Block Diagram of Text Extraction

## III. METHODOLOGY OF TEXT EXTRACTION

The input image may be gray scale or color, compressed or uncompressed format. Text detection refers to the determination of the presence of text in the image while text localization is the process of determining the location of text and generating bounding boxes around it. After that, text is extracted i.e. segmented from the background. Enhancement of the extracted text is required as the text region usually has low-resolution and is prone to noise. Thereafter, the extracted text can be recognized using OCR. The block diagram of text extraction is shown in Fig. 4.

### A. Applications of Text Extraction

Text extraction can be used for:

- Data entry for business documents, e.g. check, passport, invoice, bank statement and receipt.
- Automatic number plate recognition.
- Automatic insurance documents key information extraction.
- Extracting business card information into a contact list.
- More quickly make textual versions of printed documents, e.g. book scanning.
- Make electronic images of printed documents searchable.
- Converting handwriting in real time to control a computer.
- Assistive technology for blind and visually impaired users.

## IV. DISCUSSION ABOUT PERFORMANCE EVALUATION

There are several difficulties related to performance evaluation in nearly all research areas in computer vision and pattern recognition (CVPR). The empirical evaluation of CVPR algorithms is a major endeavor as a means of measuring the ability of algorithms to meet a given set of requirements. Although various studies in CVPR have investigated the issue of objective performance evaluation, there has been very little focus on the problem of TIE in images and video. This section reviews the current evaluation methods used for TIE and highlights several issues in these evaluation methods.

The performance measure used for text detection, which is easier to define than for localization and extraction, is the detection rate, defined as the ratio between the number of detected text frames and all the

given frames containing text. Measuring the performance of text extraction is extremely difficult and until now there has been no comparison of the different extraction methods. Instead, the performance is merely inferred from the OCR results, as the text extraction performance is closely related to the OCR output. Performance evaluation of text extraction is not simple. Some of the issues related to the evaluation of text localization methods have been summarized by Antani et al. [2].

**(i) Ground truth data:** Unlike evaluating the automatic detection of other video events, such as video shot changes, vehicle detection, or face detection, the degree of preciseness of TIE is difficult to define. This problem is related to the Construction of the ground truth data. The ground truth data for text localization is usually marked by bounded rectangles that include gaps between characters, words, and text lines. However, if an algorithm is very accurate and detects text at the character level, it will not include the above gaps and thus will not have a good recall rate [1].

**(ii) Performance measure:** After determining the ground truth data, a decision has to be made on which measures to use in the matching process between localized results and ground truth data. Normally, the recall and precision rates are used. Additionally, a method is also needed for comparing the ground truth data and the algorithm output: pixel-by-pixel, character-by-character, or rectangle-by-rectangle comparison.

**(iii) Application dependence:** The aim of each text localization system can differ. Some applications require that all the text in the input image must be located, while others only focus on extracting important text. In addition, the performance also depends on the weights assigned to false alarm or false dismissal.

**(iv) Public database:** Although many researchers seek to compare their methods with others, there are no domain-specific or general comprehensive databases of images or videos containing text. Therefore, researchers use their own databases for evaluating the performance of the algorithms. Further, since many algorithms include specific assumptions and are usually optimized on a particular database, it is hard to conduct a comprehensive objective comparison.

Table 1 shows performance of various approaches in text detection and extraction.

**Table 1:** Various Text Extraction Techniques

Author, year	Technique Used	Images	Parameters	Remarks
Yao et al.[17], 2007	CC and Support Vector Machine (SVM)	Complex background images	PR=64% RR=60%	Pixels of each character assumed to have similar color.
Lai et al. [13], 2008	Edge detection and K-means Clustering	Signboard Images		Efficient for uneven illumination.
Zhang et al. [20], 2008	Discrete Wavelet Transform (DWT), k-means clustering, Morphology Operations	Background images with different languages, fonts and sizes	DR= 94.5%, FAR= 13.6%	Text character Color independent.
Song et al. [16], 2008	Histogram Projection and color based K-means clustering	Chinese text	PR=77.05% RR=75.63%	K=3 gives performance
Dinh et al. [7], 2008	Edge detection and Histogram Projection	Signboard Texts		Low complexity algorithm
Fan et al.[9], 2009	Stroke features and connected component	Caption text images	PR=95.2% RR= 94.5%	Color information is not fully used
Audithan et al.[5], 2009	Haar DWT, Morphological Dilation operator, logical AND operator, Dynamic	Document images	DR =94.8 %	Independent of contrast

	Thresholding			
Anoualet al.[3], 2010	Edge detection, texture features, connected component analysis	Complex background images	PR=95% RR=89%	Robust and effective.
Kumar et al [12], 2010	CC Analysis	ICDAR 2003 scene images	PR=90% RR=89%	Capable of Multilingual Text extraction
Hassanzadeh et al.[10], 2011	Morphological operator, Decision classifier	Logo detection in document images	PR=95.6% Accuracy=86.9%	A novel and fast method for logo detection
Zaravi et al. [18], 2011	DWT, Dynamic thresholding, Region of Interest (ROI)	Colored book and journal cover sheets	DR=91.20%	Robust to noise
Zhang et al. [19], 2012	Edge Enhancement and CC	Web images and caption text Images	DR=92.4%	Not sensitive to various types of background noises
Seeri et al. [15], 2012	Median filter, Sobel edge detect or econnected component labeling, order static filter	Kannada text images	PR=84.21% RR=83.16% Accuracy = 75.77%	Fails to extract very small characters
Azadboni et al. [6], 2012	FFT Domain Filtering , SVM Classification, K-means clustering	Scene text images	DR= 98.10%	Text characters having uniform colour
Anupama et al.[4], 2013	Morphology operators, Histogram Projection ( X and Y histogram)	Handwritten Telugu document images	DR=98.54%, Accuracy =98.29%	Fail in case of touching characters and over-lapping lines
Raj et al. [14], 2014	CC based	Natural Scene Images (Devanagari text)	PR= 72.8%, RR=74.2 %	Fails for small slanted/curved text

## V. CONCLUSION

This paper provided a survey of text information extraction from natural images. As a result a text- image-analysis is needed to enable a text information extraction system to be used for any type of image, including scanned document images, real scene images through a video camera, caption text images and video images. This review shows that, most of the procedures fall into any one of the above methods and also that there is a limitation in each technique to give a better detection rate with fewer false alarms without any constraints for text region extraction in different type of images. But still, to need a completely robust and generalized technique for text segmentation, it is difficult to provide appropriate input to the OCR system. So, a combined method has been proposed for automatic text content extraction.

**A STUDY OF PARENTAL ENCOURAGEMENT ON EMOTIONAL INTELLIGENCE OF 11<sup>TH</sup> GRADE STUDENT**

---

**Chitra Gupta<sup>1</sup> and Dr. Sushma Rani<sup>2</sup>**<sup>1</sup>Ph.D. Research Scholar, School of Education, Lingaya's Vidyapeeth, Faridabad<sup>2</sup>HOD & Associate Professor, School of Education, Lingaya's Vidyapeeth, Faridabad

---

**ABSTRACT**

*Parental Encouragement plays a significant role in developing emotional well-being of the students. Now a days we can see that in this fast paced world, no one has time to spend with each other and to share their feelings as we are living in 21<sup>st</sup> century where the life has become really busy. Due to complexities of life, the students, especially the adolescents, always want someone to stand on their side as this stage is regarded as very crucial in their lives. They are on that path where they can't take correct decision for their lives. Therefore, this stage requires constant support being provided by the parents as they act as the biggest guiding force in the students' life. This support, emotions if channelize properly, can help the students to achieve their goals in their lives. The present study was undertaken to study the effect of parental encouragement on emotional intelligence of 11<sup>th</sup> grade students. The sample of the study composed of 160 senior secondary school students in which 80 were Males and 80 were females of 11<sup>th</sup> grade. The sample was collected through simple random sampling technique based on gender from 8 senior secondary schools. Descriptive Survey Method was employed for the present study. Parental encouragement scale (APES) developed by Dr. Kusum Agarwal and Mangal Emotional Intelligence Inventory developed by Dr. S.K. Mangal and Mrs. Shubhra Mangal was used for data collection from the selected sample. The objective that has been formulated for the present study were i) To find out the effect of parental encouragement on emotional intelligence of male students studying in 11<sup>th</sup> class. ii) To find out the effect of parental encouragement on emotional intelligence of female students studying in 11<sup>th</sup> class. Mean, Standard Deviation One – Way Anova and 't' test were used for the analysis and interpretation of data. After the analysis of the results it was found that there was significant effect of parental encouragement on emotional intelligence of both male and female students.*

**INTRODUCTION**

Yes, now a days life has become very complex and full of challenges. The life which was lived by our ancestors was totally different from the one that we are living today. The competition in every field has increased a lot and everyone, especially the students who are at their adolescent stage, want to be first at every step. At this stage they want someone who can show them a right path, provide them guidance and support them for their good deeds. Earlier, neither the parents nor the students were, in most cases worried about their future, as the options for career were limited and competition was also not at its peak like it is these days. Now the things have changed a lot. There is a change in our education system and despite a plethora of opportunities, competition has created multiple obstacles. For overcoming these obstacles, students must need encouragement from their parents and that too at an appropriate time and in an appropriate manner, i.e. without hurting their emotions. Emotions play a vital role in one's life, especially in the students who are at the critical stage of their lives when they can't decide what is good and what is bad for them. Under such circumstances parent need to step in and try and take control of their child's emotions in a most effective manner. It is absolutely true that emotionally intelligent people get more success in life then those who are not as they are able to understand their emotions and others too. They know how people would react if their emotions get hurt. This helps them to handle their relationships in a better manner, both in personal as well as in professional life. This is because the above mentioned quality makes them to feel and understand the emotions and problems of others. So, both the qualities i.e. parental encouragement and emotional intelligence are necessary for one's life, especially for those who are at their adolescent stage for achieving desired objectives.

**STATEMENT OF THE PROBLEM**

“A Study of Effect of Parental Encouragement on Emotional Intelligence of 11<sup>th</sup> Grade Students”.

**DEFINITIONS OF KEY TERMS**

**1. Parental Encouragement:** Parental encouragement is the motivation provided by parents to their children at every stage of their lives. With the help of this support, the children are encouraged to achieve success in every field and do not get disheartened in spite of failures.

**2. Emotional Intelligence:** Emotional Intelligence is the good aspect of one's personality in which an individual develops the quality of understanding the emotions of others as well his too. This quality helps the person to maintain relationships with others in a better manner.

### **OBJECTIVES OF THE STUDY**

The objectives for the present study have been formulated below:

1. To find out the effect of parental encouragement on emotional intelligence of male students studying in 11<sup>th</sup> class.
2. To find out the effect of parental encouragement on emotional intelligence of female students studying in 11<sup>th</sup> class.

### **HYPOTHESIS**

Following hypothesis have been formulated for the present study

H<sub>01</sub> - There is no significant effect of parental encouragement on emotional intelligence of male students studying in 11<sup>th</sup> class.

H<sub>02</sub> - There is no significant effect of parental encouragement on emotional intelligence of female students studying in 11<sup>th</sup> class.

### **REVIEW OF LITERATURE**

#### **1. Studies on Parental Encouragement**

Rafiq, Waqas, Fatima, Tehsin, Sohail, Muhammad, Saleem, Muhammad, Khan, Ali (2013) conducted a study on "Parental Encouragement and Academic Achievement; A Study on Secondary School Students of Lahore, Pakistan". The sample was selected from 9<sup>th</sup> class of secondary schools (public and private) from Allama Iqbal Town, Lahore City. A total of 150 students (boys and girls) were included in the sample. Simple random technique was adopted for the purpose of the study. Survey questionnaire was used as a tool for data collection. Through the results it was found that parental encouragement has significant effect in better academic performance of their children. Kishore, Vimal (2014) conducted a study on "influence of parental encouragement on students' academic achievement of high school students". The sample comprised of 200 (both male and female) from government and private high school. For the research study, the parental encouragement scale developed and standardized by Dr. R.R. Sharma was used. For testing the hypotheses descriptive statistics, 't' test and product moment coefficient of correlation has been used. The findings of the study showed that government and private high school students differ significantly on their parental encouragement and academic achievement. The study also revealed that there is a significant and positive relationship between parental encouragement and academic achievement of government and private high school students. Afroza, Akhter & Pandey, Shalini (2018) conducted a study on "A study of parental encouragement on the academic achievement of secondary level students in J & K". The sample was selected from 10<sup>th</sup> and 12<sup>th</sup> grade by using purposive sampling technique. It consists of hundred secondary school students in which 50 were Rural (25 Male and 25 Female) and 50 were Urban (25 Male and 25 Female). Parental Encouragement Scale (PES) by R.R. Sharma and for deducing the academic achievement of the students, result of High School Board Examination (2014) was used. The findings revealed that there is significant difference between rural secondary students and urban secondary students on their parental encouragement. Further it was found that secondary students have better academic achievement as compared to male secondary students. It was also found that parental encouragement with respect to domicile is positively correlated with academic achievement. The study also indicates that parental encouragement with respect to gender is positively correlated with academic achievement.

#### **2. Studies on Emotional Intelligence**

Lawrence, Arul & Deepa. T (2013) conducted a study on "Emotional Intelligence and Academic Achievement of High School Students in Kanya Kumari District". The sample comprised of 400 students (male and female) studying in IX and X standard. The tools employed in the study were self – made Trait Emotional Intelligence Questionnaire Form (TEIQue SF) and Achievement Test Questions. The findings of the study revealed that there is no significant difference between male and female high school students in their emotional intelligence. The study also indicated that there is no significant correlation between emotional intelligence and academic achievement of high school students. Chamundeswari, S. (2013) conducted a study on "Emotional Intelligence and Academic Achievement among Students at the Higher Secondary Level". The sample comprised of 321 students, selected from the higher secondary level through random sampling technique. The tools that were employed for the study were Emotional Intelligence Scale (Hydes and others, 2002) and the marks scored in

Science Subject in half yearly examination was taken to measure the academic achievement of the students. The findings of the study revealed that there was a positive significant correlation between emotional intelligence and academic achievement among the students. The students belonging to the central board schools have a higher level of emotional intelligence compared to students in state board but did not differ with students in matriculation board schools at the higher secondary level. Further the study indicates that the students belonging to central board schools are found to perform better in academics in comparison to the students who are in state and matriculation board schools at the higher secondary level. Sarita & Kataria, Sumit (2014) investigated “A Study of Emotional Intelligence and Academic Achievement among Secondary School Students”. The sample consists of 100 secondary school students selected through stratified sampling technique. The tools that were used for the study were, Emotional intelligence scale developed by Anukool Hyde and Sanjyot Deth. Descriptive Survey Method was employed in the study. The results showed that there was no significant difference in the mean score of emotional intelligence in relation to gender. There was significant difference in the mean score of Academic Achievement in relation to gender. Further it was also highlighted that there was slight relationship between Emotional Intelligence and Academic Achievement among secondary school students.

**METHODOLOGY**

Descriptive Survey Method was employed in the present research study. Quantitative approaches were adopted for the analysis and interpretation of data.

**SAMPLE USED FOR THE PRESENT STUDY**

The sample for the current research study comprised of 160 senior secondary school students, i.e. of 11<sup>th</sup> grade in which 80 were males and 80 were females which were selected by simple random sampling technique.

**TOOLS USED IN THE PRESENT RESEARCH STUDY**

1. Parental Encouragement Scale (APES) developed by Dr. Kusum Agarwal and
2. Mangal Emotional Intelligence Inventory (MEII) developed by Dr. S.K. Mangal and Mrs. Shubhra Mangal was used for the collection of data.

**STATISTICAL TECHNIQUES USED IN THE RESEARCH STUDY**

With a view to understand the parental encouragement on emotional intelligence of students at (10+1) stage, different statistical techniques were adopted for testing the hypothesis. Mean value and standard deviation were calculated from the obtained scores. Then F – ratio was worked out to judge the difference among several samples means was significant or it just a matter of sampling fluctuations. Further T – Test was used to see the significant difference among each two groups i.e. i) High – Average, ii) High – Low and iii) Average – Low.

**ANALYSIS AND INTERPRETATION OF DATA**

**Table – 1.1: Table showing Numbers, Means, Standard Deviation of High, Average and Low groups of Male Students Emotional Intelligence with respect to parental encouragement**

Different Groups/Levels	High			Average			Low		
	N	M	SD	N	M	SD	N	M	SD
Male Students	15	61.73	7.41	37	60.72	8.45	28	53.53	6.47

The groups were made on the basis of parental encouragement and scores of emotional intelligence have been taken according to these groups. From the table it was found that there is not much difference between High and Average groups’ mean scores which was 61.73 and 60.72 respectively. But High and Average groups’ mean scores were quite high than Low groups’ mean scores which was found to be as 53.53. To see whether the difference was significant or not, One Way ANOVA was calculated whose summary were as follow.

**Table - 1.2: Table showing One Way ANOVA (Male Students)**

Source of Variation	Sum of squares	df	Mean square variance	F – Ratio	Result
Between - groups	1029.99	2	514.995	8.53	Significant P < 0.05
Within - groups	4645.21	77	60.32		
Total	5675.2	79			

From the above table, it was found that calculated value of ‘F’ was 8.53 which was significant at 0.05 level. Since table value of ‘F’ was less i.e. at df = (2,77) it was 3.11. So, Hypothesis H<sub>0</sub>1 was rejected at point 0.05 level of significance with respect to groups of Male students.

**Table – 1.3: Table showing ‘t’ value of Male students**

Groups/Levels	Percentage	‘t’ value	Level of Significance
High/Average	73%/54%	5.98	P < 0.05
High/Low	70%/25%	4.87	P < 0.05
Average/Low	50%/17%	5.66	P < 0.05

To find whether there was significant difference between each two groups or not ‘t’ value was calculated. ‘t’ value between High and Average group was 5.98 and table value was 1.98 which was significant at 0.05 level. Percentage value concludes that High groups were more affected by parental encouragement on emotional intelligence as compared to Average groups of Male students.

When ‘t’ was worked out in between High and Low groups, it was found to be 4.87 which was significant at 0.05 level of significance. Table value was 2.63 and Percentage value concludes that High groups were more affected by parental encouragement on emotional intelligence as compared to Low groups of Male students.

Again, when ‘t’ was worked out in between Average and Low groups, it was found to be 5.66 which was significant at 0.05 level of significance. Table value was 2.62 and Percentage value concludes that Average groups were more affected by parental encouragement on emotional intelligence as compared to Low groups of Male students.

**Table – 2.1: Table showing Numbers, Means, Standard Deviation of High, Average and Low groups of Female Students Emotional Intelligence with respect to parental encouragement**

Different Groups/Levels	High			Average			Low		
	N	M	SD	N	M	SD	N	M	SD
Female Students	24	59.87	7.07	22	61.63	8.41	34	52.11	5.71

The groups were made on the basis of parental encouragement and scores of emotional intelligence have been taken according to these groups. From the table it was found that there is not much difference between High and Average groups’ mean scores which was 59.87 and 61.63 respectively. But High and Average groups’ mean scores were quite high than Low groups’ mean scores which was found to be as 52.11. To see whether the difference was significant or not, One Way ANOVA was calculated whose summary were as follow.

**Table - 2.2: Table showing One Way ANOVA (Female Students)**

Source of Variation	Sum of squares	df	Mean square variance	F – Ratio	Result
Between - groups	1481.425	2	740.72	14.73	Significant P < 0.05
Within - groups	3871.255	77	50.27		
Total	5352.68	79			

From the above table, it was found that calculated value of ‘F’ was 14.73 which was significant at 0.05 level. Since table value of ‘F’ was less i.e. at df = (2,77) it was 3.11. So, Hypothesis H<sub>02</sub> was rejected at point 0.05 level of significance with respect to groups of Female students.

**Table – 2.3: Table showing ‘t’ value of Female students**

Groups/Levels	Percentage	‘t’ value	Level of Significance
High/Average	76%/57%	7.89	P < 0.05
High/Low	72%/23%	7.11	P < 0.05
Average/Low	52%/13%	6.20	P < 0.05

To find whether there was significant difference between each two groups or not ‘t’ value was calculated. ‘t’ value between High and Average group was 7.89 and table value was 1.98 which was significant at 0.05 level. Percentage value concludes that High groups were more affected by parental encouragement on emotional intelligence as compared to Average groups of Female students.

When ‘t’ was worked out in between High and Low groups, it was found to be 7.11 which was significant at 0.05 level of significance. Table value was 2.63 and Percentage value concludes that High groups were more affected by parental encouragement on emotional intelligence as compared to Low groups of Female students.

Again, when ‘t’ was worked out in between Average and Low groups, it was found to be 6.20 which was significant at 0.05 level of significance. Table value was 2.62 and Percentage value concludes that Average groups were more affected by parental encouragement on emotional intelligence as compared to Low groups of Female students.

**EDUCATIONAL IMPLICATIONS**

1. The study should be simulated on a vast sample.
2. The study may be investigated to study the parental encouragement of exceptional students.
3. A comparative study may be investigated to study the parental encouragement, emotional intelligence of Government and Private senior secondary school students.
4. The study may be investigated to study the parental encouragement, emotional intelligence in different area i.e. Rural, Urban, Semi – Rural and Semi – Urban.
5. The students in various streams (i.e. Arts, Science, Commerce, Humanities) may be compared on parental encouragement and emotional intelligence.

**SUGGESTIONS FOR PARENTS**

1. Parents are the first teachers of a child, so parents should provide proper and conducive environment for the development of its emotional intelligence.
2. The small accomplishments of the child ought to very warmly appreciated by the parents.
3. Parents should not focus on what the child could not do, but instead encourage him and be positive about whatever he does.
4. Parents should not be harsh while giving any kind of instructions to their child.
5. Parents should motivate their child by giving rewards for achieving good grades.

**SUGGESTIONS FOR TEACHERS**

1. Teachers should recognise the importance of emotions of students and proper encouragement should be given to them based on those teachings.
2. Teachers should help the students to become emotionally strong by making them practice yoga and meditation.
3. Teachers should develop democratic attitude towards the students and should encourage them to express their own ideas and views.
4. Teachers should provide extra attention to the students who are emotionally weak.

**CONTINUOUS AND COMPREHENSIVE EVALUATION AND LEARNING TECHNOLOGY****Ghazala Khatoon**

Assistant Professor, Department of Education, LLDIMS, Delhi

**ABSTRACT**

*Continuous and Comprehensive Evaluation (CCE) refers to a system of school-based evaluation of students that covers all aspects of students' development. The main aim of CCE was to evaluate every aspect of the child during their presence at the school through integrating assessment with the teaching-learning process on learning and development of children holistically. Comprehensive means the scheme attempts to cover both the scholastic and the co-scholastic aspect of student's growth and development. This study covers implementation and recommendations by Kothari Commission (1964-66), acceptance and modification through different educational supportive bodies. Evaluation process developing ICT enabled CCE framework to help teachers manage the complex learning and assessment activities in CBSE schools with tools and techniques. It covers assessment pattern with advantages and disadvantages of CCE.*

*Keywords: Evaluation, Curricular, ICT, CCE, RTE Act 2009, Assessment*

Implementation of Continuous and Comprehensive Evaluation was one of the recommendations of Kothari Commission (1964-66). The recommendation was accepted by the Govt. of India under National Policy of Education (NPE), 1968 which was formulated on the basis of the recommendations of the Kothari Commission. Since then lot of changes was made by introducing unit tests in place of Term end exam or yearend exam. All the documents such as National Curriculum Framework for School Education (2000) and the National Curriculum Framework (2005) also stressed on the implementation of the CCE. One of the important features of right to education act (RTE) was the introduction of continuous and comprehensive evaluation (CCE). Thus CCE is implemented now during the tenure of Shri Kapil Sibbal, Minister of Human Resource Development. This is the new evaluation method introduced recently to decrease the accumulated stress of board exams. To achieve the objectives of evaluation or to work on the functions of evaluation "The Central Board of Secondary Education introduced Continuous and Comprehensive Evaluation (CCE) in Primary Classes in 2004 (Circular No. 5/18/25/04). The achievement records and its formats was also circulated for Classes I to V with the objective of facilitating holistic learning in the school. The Board recommended a five-point rating scale, it also recommended the elimination of the pass/fail system at the primary classes (Circular No. 31/04/21/05). The Board has also followed it up by extending this scheme up to classes VI to VIII and developed a CCE card on School Based Assessment for the same Circular No./2/06). The scheme of Continuous and Comprehensive Evaluation (CCE) will be now further strengthened in all affiliated schools from October 2009. The Class IX students will be assessed through the CCE by the school itself.

In 2009, the Right to Education (RTE) Act had mandated 'continuous and comprehensive evaluation (CCE) of a child's understanding and ability to apply the same' (Section 29.2.h) to complement policies such as no detention and age appropriate admission at the elementary stage among its slew of reform measures having the potential to transform the institutional structure and climate of elementary education in India (Kumar, 2017). Simultaneously, for the secondary stage, the CBSE announced a paradigm shift from examination to effective pedagogy in the replacement of its 10th class board exams with school-based evaluation—CCE with effect from 2011 (CBSE, Circular No. 39).

As per its provisions, section 29(2) ensures the right of each child to full time elementary education of satisfactory and equitable quality in a formal school that satisfies certain essential norms and standards. The RTE Act demands that each child should get an opportunity to learn and progress and be supported during this process. CCE can be a potent tool in respecting the intent of the RTE Act by ensuring learning for all children, as assessment during teaching-learning process would help teachers observe child's learning progress, provide timely feedback support to help the child to overcome the learning difficulties. In that case the state of 'failing' and thus detaining any child at the end of a term can be minimized. Therefore, it is crucial to understand and use both teaching learning and assessment in tandem, one complementing the other to arrive at a realistic picture of students' learning and development to help them accomplish the desired goals of education.

Thus, in order to impart quality education and help children develop holistically it is important to know their learning progress in such a manner through CCE so that it helps to;

- Find out the change in a child's learning and development over a period of time.
- map these changes through assessment of different curricular areas

## DIGITAL RESOURCES OF EDUCATION

Jugnu Khatter Bhatia<sup>1</sup> and Dr. Sushma Rani<sup>2</sup>Assistant Professor<sup>1</sup>, Satyug Darshan Institute of Education & Research, Faridabad  
HOD<sup>2</sup>, School of Education, Lingaya's Vidyapeeth, Faridabad**ABSTRACT**

*In a technology driven world where change is constant, there is a perpetual need to acquire new skills, knowledge and gain insight. In today's competitive and globalized world, digital learning provides learners not only with the different tools to add value to their current skill set but also to refine old set of skills and knowledge and provide opportunities to broaden their horizons without the constraints of time and pace. Digital learning helps to eliminate all types of borders and barriers whether social and physical. Emerging Online courses are a great solution to the challenges that learners face as they are provided with high-quality education according to their learning pace and on their own place and time. Everyone can access to the information and knowledge through various tools of digital learning. Through digital learning, the society can pave its way to accessing a conducive and effective e-learning environment with the ease of availability to necessary resources, teacher and learner-controlled activities, and collaborative opportunities & activities with peers. The digital platforms are able to enhance the learning and knowledge with respect to any field and across all age groups There are several online tools of learning that offer high-end innovative and budget-friendly digital learning opportunities.*

*Keywords: Digital Learning, Online Courses*

Technology is becoming an essential part of people's lives, and it has led to many drastic changes – both in how we think and in how we learn. The globalization of our society is a direct result of the recent technological development, which means that the barriers between different parts of world are starting to break down and world is becoming more and more closer. In today's competitive and globalized world, digital learning provides learners not only with the different tools to add value to their current skill set but also to refine old set of skills and knowledge and provide opportunities to broaden their horizons without the constraints of time and pace. Digital learning helps to eliminate all types of borders and barriers whether social and physical. Education system is moving into a new phase when it comes to the power of innovations and technology in a classroom. More effective, stimulating and sophisticated learning tools are being developed and they changed the whole scenario of how teacher will teach and students will learn. Such innovations and technological developments are being met with a blend of resistance and acceptance. Some educators worry that these new innovations may reduce their importance and role in the education process and eventually will replace them, or these learning tools are too costly, complex to understand or not required. Some are concerned that their teaching work will increase with these learning tools. Despite of these contradictory views, a growing number of teachers are accepting these tools and utilizing them in innovating ways to enhance students learning.

**DIFFERENT DIGITAL LEARNING TOOLS AND RESOURCES**

The medium of digital learning makes the overall education system highly comprehensive and effective. Development of Technology allows for various interactive activities for consolidating learning in an effective manner.

**• Webinars (Web-based Seminar)**

These are web-based seminars which are organized through the medium of the Internet. The webinars are a productive and interactive way of preaching the recent trends as well as updates with respect to global education. The webinars are held live which is attended exclusively by an online audience. These offer the opportunity to ask a question, poll, chat, survey, test, and so more over a specified topic. From a teaching and educational perspective, webinars are interesting and stimulating tool because of the very high degree of interaction, helping participants to learn and understand more rapidly.

**• E-Learning Portals**

Through e-Learning portals, effective educational and training programmes can be brought to the desktops and mobile devices of learners. They can benefit from them, by receiving up to date information. These learning portals can be customized, made accessible 24/7, are flexible, convenient and user-friendly as a centralized knowledge management entity. Learners can enhance their skills and knowledge over a certain subject or topic, learn about the latest trends and acquire some new skill through these online learning portals.

- **Massive Open Online Course (MOOC)**

A Massive Open Online Courses is a completely free online portal that offers high-end educational materials for the students of all intellectual levels. Anyone can access these courses depending upon his time and pace. Through this portal, the learners are able to participate, engage, connect, or collaborate in various interactive learning processes and programs.

- **Edublogs (Educational Blog)**

Educational Blogging is another significant aspect of digital learning in the current education system. Through education-based blogging, teachers as well as students can utilize to their advantage. Edublogs is a specialized WordPress-based blogging platform that has been designed by keeping the teachers on focus specifically. This platform serves to be a great platform for the creation of online documents like handouts and assignments that can be easily shared with students. There is even an option of adding images with the given assignments.

- **Learning Management System (Moodle)**

A Learning Management System (LMS) is a secure and private online space to post content and to facilitate online learning activities and communications for a course. Instructors can use an LMS to enhance a face-to-face class or as an integral part of blended or online classes.

- **Learning Apps/Google Apps**

Through the means of advanced smartphone technology, there are various e-learning apps available for the students. Google consists of a set of apps that have been specifically designed for educators and teachers of the current education system. There are several teachers and educators that utilize Google Hangouts as it allows the students to initiate video-based conversations even from the most remote locations. Through these apps, the students can learn content. They can also enhance their skills and talents through these apps. For eg: E-Pathshala an initiative by NCERT and MHRD.

- **Clickers**

Clickers, are a tool used to make lectures more active, effective and engaging. Clickers use PowerPoint Presentations as a vehicle for delivering questions throughout the lecture that students can answer using a personal device. Clickers can make lectures more engaging by requiring students to actively apply their learning in class, and they provide very helpful feedback about student learning to instructors.

- **Lecture Capture**

Lecture capture is a tool used to record what the instructor is displaying on the computer along with the accompanying audio of a lecture. Instructors can use lecture capture to record in-class lectures for students to use as a review resource and to improve accessibility for all learners. An instructor can also record lectures to use in place of in-class meetings in other or future sections of the course. Concordia currently supports *Panopto* and *Camtasia* as lecture capture solutions.

- **Dropbox**

Cloud computing has changed the way people store files on their computers and Laptops. Many organizations have used it to make it easier for people to access files from multiple systems, as well as to share information with different users on their network. The same technology can also be used in a classroom setting, as it can make it easier for teachers and students to share files and electronic documents. Dropbox has a number of features that can allow teachers to share specific folders with their students, and they can access them from their computers.

- **ClassDojo**

A large part of teaching is managing the classroom, and ClassDojo makes the process easier. It puts more emphasis on providing “positive feedback” to students. One can also add more detailed information about the student’s performance or behavior, and can send messages to parents about their progress. It will even allow parents to look at their children feedback in real time, so they can stay up to date about how they are doing in class.

- **Edmodo**

Classroom Communication can be a challenge, especially if one has a large group of students to manage. Edmodo can offer a more streamlined approach to this part of classroom management. It can serve as a means for submitting assignments, getting grades, and sending any relevant information to students. It makes it easier to post assignments, messages, polls, quizzes, calendars, and other classroom resources, and they can access them online.

- **Slack**

This is a great tool for assigning group projects, as students can easily collaborate with others in their group. Slack also streamlines the communication among students so they can work together from remote locations. It incorporates Google Docs and Google Hangouts so students can share files with each other.

- **Educreations**

It gives the ability to create electronic whiteboards with lessons and tutorials that teachers can share with students. It's easy to create diagrams, commentaries, animations, and other instructions, and one can even record audio for narrative purposes and share it with students – both in the classroom or via e-mail or social media.

- **Cloud-Based Word Processors (e.g., Google Drive)**

Cloud-based word processors were a boon to teachers. With cloud-based word processors, students can collaborate on writing pieces from anywhere, save comments, and curate all steps of the writing process in digital portfolios.

- **TED Talk (Technology, Entertainment and Design)**

TED Talk has a library of video lectures that cover a wide range of topics and content, and they can be used in the classroom to supplement what one is teaching. This covers almost all topics — from science to business to global issues — in more than 100 languages.

- **Kahoot**

It is a game-based learning platform where students can learn through games or, 'Kahoots,' which are multiple-choice quizzes. With this digital learning tool, which can be accessed through a web browser, teachers can draft questionnaires, discussions online with academic lessons. The material can be then projected in the classrooms and questions are answered by students while playing and learning at the same time. This not only enhances student engagement but also creates a dynamic, social, effective and fun educational environment.

The digital world has blurred the walls of the schools and places of learning. Individual learners can learn anywhere, anytime and at their own pace. Digital learning resources can add considerable value to the quality teaching and to the learner's experience. Use of Technology extends our communications ability beyond face-to-face talking. It expands it beyond the printed page and reading to a new dimension. It is building a new and more efficient means of sharing ideas and information among all people.

**SKILL DEVELOPMENT IN INDIA****Dr. Sushma Rani<sup>1</sup> and Swati Chaudhary<sup>2</sup>**HOD<sup>1</sup> and Research Scholar<sup>2</sup>, Department of Education, Lingaya's Vidhyapeeth University

---

**ABSTRACT**

*We have started Digitalization of education and try to educate each citizen of India digitally so skill development is important to propagate digitalization of each field. If we have well skilled population, sufficiently equipped with knowledge is not only necessary to sustain economic growth, but is also an important for integrated growth in every field because literate and skilled citizens able to stand for benefit most from the employment opportunities which provide growth to our India. Skills and knowledge are the driving forces of economic growth and social development for any country. Nowadays India has approximately over 460 million internet users, India is the second largest online market after China. By 2021 there will be about 635.8 million internet users in India. Therefore it is important to give them right direction to use internet and develop their skills. In this paper author focused on Professional ethics of teachers in schools, Non-profit organizations in societies and communities. Fundamentally, the Author has find that teachers are not enough digitally literate and Non-profit organizations are not ready to work on ground level even government wants to create a manufacturing-hub only. This paper based on descriptive research with qualitative and quantitative research method and higher secondary school teachers and ngo's are targeted population.*

**INTRODUCTION**

Education system makes expectation and it should by no means aim at creating simple advertises. Over a period of time lots of alters have take placed in dissimilar zones of economy including the education system. Education zone different any other zone has seen numerous phases in its development. From Guru-Shishya method of accomplishing the class in open garden under the trees to locked class room lectures, presentation type of teaching with the help of laptops touch-screen projector to online notes for teachers and students, at the present instantaneous Whatsapp communications is the exhortation among the learners. Whatsapp has increased the position of individual genuine prescribed signifies of communication among the students and the teachers. Indian subcontinent is included of different population belonging to diverse national and cultural clusters. Away from each other from these differentiations, the mainly noticeable divergence that creates a through impact on the Indian education system is the variety in purchasing power and affordability of the Indians. This paper is aimed at investigating the nature and capability of the teachers in modern education process in India. Digitalization means alteration of the entire information kinds (texts, sounds, visuals, video and other data from various sources) into the digital language. Discussing the observable fact of digitalization it should be note down those different analysts and predict specialists consider change of education procedure into digital phase as the twisting point in the history of education. The United Kingdom is supposed to be the first in the world to introduce required software engineering and IT education in the program for schoolchildren aged 5 - 16 years in 2015. The stated approach was accepted by the European Union. EU 2020 education improvement approach, accepted in 2014, centers on digital technologies. This research paper appeared to reflect remarkable accomplishments in IT region with its center purpose being combination of state-of-the-art IT-solutions in education institutions' activities across EU.

**OBJECTIVES**

1. To the study of availability of mobiles, laptops and other smart gadgets.
2. To the study of importance of Digitization in Education
3. To find out the challenges in skill development
4. To the study of digital literacy rate in teachers at higher secondary level.

**LITERATURE REVIEW**

• **Digital Strategy for Schools 2015-2020 ENHANCING TEACHING, LEARNING AND ASSESSMENT:** The Digital Strategy for Schools provides a rationale and a Government action plan for integrating ICT into teaching, learning and assessment practices in schools over the next five years. This Strategy builds on previous strategies in the area of ICT integration and it takes cognizance of current education reforms that are already underway within the education system at primary and post primary level. This Strategy focuses on the schools' sector and the proposed actions are designed to embed ICT more deeply across the system to enhance the overall quality of Irish education. Care has been taken, in developing the Strategy, to ensure that the actions align with and complement strategies and initiatives to

support digital learning in the further education and higher education sectors. In developing this Strategy, the Department adopted an evidence-based approach. A Census Report was initially conducted to provide base-line data on the levels and usage of ICT by teachers and schools. A raising from this research a consultative paper, Building towards SLearning with the launch of a public consultation phase. One hundred and twenty-four (124) submissions were received from various organizations and individuals on the content of the consultative paper and these views were further augmented by face-to-face meetings with a number of stakeholders groups.

- **The role of e-learning, the advantages and disadvantages of its adoption in Higher Education by Nelly Abaidoo and Valentina Arkorful:** earning involves the use of digital tools for teaching and learning. It makes use of technological tools to enable learners study anytime and anywhere. It involves the training, delivery of knowledge and motivates students to interact with each other, as well as exchange and respect different point of views. It eases communication and improves the relationships that sustain learning. Despite some challenges discussed, the literature has sought to explain the role of e-learning in particular and how eLearning has made a strong impact in teaching and learning. Its adoption in some institutions has increased faculty and learner's access to information and has provided a rich environment for collaboration among students which have improved academic standards. The overall literature which explains the advantages and disadvantages of e-learning suggests the need for its implementation in higher education for faculty, administrators and students to enjoy the full benefits that come with its adoption and implementation.

- **E-Learning in Rural India by Ms. Swati Yadav and Dr. Anshuja Tiwari:** has been said that development of any society depends on its access to information and the same is applicable to rural India too. E learning can work wonders in this direction and help the socially marginalized community to attain their entitlements. Launch of Digital India Program is a welcome step in this direction. It is anticipated that with dedicated leadership, willpower and control and an integrated framework comprising of the government, technology industry and society, E-learning interventions in the rural areas will undoubtedly pave way towards sustainable growth.

- **E-LEARNING TECHNOLOGY FOR RURAL CHILD DEVELOPMENT by Lect. S.K.Nayak and Dr.Kalyankar N.V.** they said Education is essential for everyone. The increased rate of literacy will push the nation towards development. E-learning is a useful way to provide education. Considering India's rural areas, problems create difficulties to implement the e-learning system but strategies can be developed and implemented. Before the actual implementation of e-learning system, the understanding of different components and their functions is necessary. A policy should be developed to implement the functions and to maintain the quality of system. With introduction of Web Based Education at school level rural children and youngsters will grow as "Computer kids". Their exposure will get increased due to which the Knowledge level will get definitely improved. Web-Based Learning adds human support through on-line tutor, thereby extending the scope of what can be effectively taught into many new subject areas. It will enhance the quality of education in our country at all levels i.e. Primary, Secondary and Higher Education. Computers are reshaping children's lives, at home and at school, in profound and unexpected ways. Common sense suggests that we consider the potential harm, as well as the promised benefits, of this change. E-learning technologies have great potential to spread learning however, the benefits of these technologies have to reach the rural masses of India, and otherwise they will be one of the causes of the Digital Divide. Development in the 21st century will be determined, to a large extent, by the thought, action and imagination of young people. This in turn, is shaped by the education system.

- **Role of e-Learning in a Developing Country like India by Deepshikha Aggarwal,** has been said that "In a market such as India where the concept is still new, one crucial element that will make a difference in generating a good response is marketing. This not only holds true for segments such as government and education, but for the corporate sector as well. Experts are of the view that there needs to be a mindset for the adoption of e-learning. The other point is content. If content providers are giving off-the-shelf content, there should be scope for customization since each organization has its own needs. Regions without university education can access universities in other regions via the Web, a solution much cheaper than building university infrastructure. In underdeveloped countries, e-learning can raise the level of education, literacy and economic development. This is especially true for countries where technical education is expensive, opportunities are limited, and economic disparities exist. However, one of the problems with e-learning in India is the lack of course content, especially outside the mainstream focus areas of IT education, English-language content, and tutorial-like courses. There will be high demand for people who can develop multi-lingual courseware that addresses various topics. The social implications of online learning center around one primary requirement that students need to feel a part of the class, regardless of where they are located physically or geographically. The

—missing of connection to the other students in the class and with the institution can impact the success of an online student. Bottom line: the Indian market is still young, but it will continue to adopt the concept of e-learning in order to meet its communication needs and seize business opportunities".

- In “**Empowering Indian Citizens Through Technology, September 2015**” ASSOCHAM suggested “To realize the vision of promoting inclusive growth through empowerment of citizens, it is important to reach out to citizens in the remotest of locations and make them part of India’s growth story. Globally, technology has been the greatest enabler in causing disruptive change. India’s story is no different, and the use of digital technologies to educate and empower citizens is being seen as a game-changer. Given India’s vast expanse and differences in demographics across the nation, there is also a vast difference in the level of adoption among the citizenry.”

### **METHODOLOGY**

According to researchers and educationists, very shortly digital layout will eradicate the require for handwriting lectures and speech, when every student will get all the materials and will be capable to progression them on a real-time basis and work interactively. The entire texts will be accessible online and stored in a digital ‘cloud’ (Apple iCloud alternative), which will sensibly remove some negative results related to absence from school. In accordance with the nature of the present study, quantitative and qualitative Method was used for the collection of information. The tools were administrated upon the sample and the descriptive data was collected by the investigator. Qualitative and quantitative method is concern with present situation, event, and practices with relationship among variables. These methodologies have been classified differently by various authors.

### **FINDINGS/ RESULTS**

In this research paper we find that teachers are not enough literate to digital literacy at higher secondary level. Teachers are feeling over saturated and overloaded with digitalized education. Demanding digital technologies access in education increases a number of sensible issues. Same like with the other innovations, the world of online technologies is associated with certain contradictions and unforeseen circumstances. For instance parents, who want their child to spend less time at the computer, should change their mind, since education process modernization presupposes the opposite. According to Lego analysts “Each education situation and each child is unique; therefore parents and teachers should determine how much time their child can spend in front of a computer. Therefore it’s vital to interactively find solution regarding correct “digital” behavior of a student and teachers work out “digital activity rules”. Although this statement is directly related to video games, teachers presentations for classrooms it can be applied to any “digital” activity, so much the more, as it was stated above, we face the tendency of ‘binding’ the games and education, especially in higher secondary schools.

According to the findings teachers should know about current technologies related to Education and also capable to use educational applications those are easy to access on smart phones and laptops. Another issue in this circumstance is wide-ranging digitalization of student’s life, forecasted by various scientists and educationists. Today digital technologies are not available in rural areas therefore mostly teachers and students are not enough literate by the technologies. At the same time the society demands turn to rise, forcing us to adapt to the 21st century progress. Nowadays the ability to adapt to new technologies is a success prerequisite, as stated in the 8-th issue of newsletter of global recruiting company Heys. (Digital Dawn, 2015).

Currently Khan Academy is a multi-field global education institution with numerous administrative and more than 80 teachers, actively engaged in their activities with wide range of classes: from online lectures and seminars for students of the academy to extensive archive of special digital records, used as a huge digital library. The key feature of the Academy is a simplified form of participation and presence at classes (personal presence, distant online or extra-mural offline). This academy concept was established when Sal Khan worked as hedge fund analyst in California, and in between was engaged in online teaching of people from all over the country. At a certain stage he collected enough records and his colleagues from Google advised him to upload these records on YouTube channel. Soon after Khan received feedback from people from all over the country and from abroad, particularly from Singapore, who asked for more uploads. The channel turned to be the starting point for today’s Khan Academy.

Today Khan Academy is a large organization with its base comprising more than 400 million lessons for students in 28 languages. In 2015 the number of languages reached its peak point according to statistical data, with more than 2.5 billion users connected to the Academy’s server. And finally more than 50000 teachers worldwide have cooperated with the Academy since its establishment. But the point is to be noted that it only limited to urban areas not for rural areas because there is no availability of smart gadgets and digital literacy educators as well.

Technologies have today redefined the conservative role of the teacher. No longer does a teacher enjoy a positive knowledge remaining over the taught. In fact, the knowledge gap is speedily narrowing between the teacher and the taught. Present teachers will require reinventing themselves by embracing technology and continuously developing to remain ahead of the knowledge curvature.

They will have to contact to their students and play catalysts for transferring information into knowledge. Application of academic perceptions in genuine life circumstances, make sure worldwide absorption and creating a vigorous and favorable learning environment will be challenges that innovative technologies can never overcome.

## **DISCUSSION**

However it should be noted that the stated education digitalization trend in India may soon raise numerous challenges for Teachers and schools. First it's digital separate between provision of information gadgets to teachers, who make lively use of them, and conventional approaches to studies. Therefore, digitalization has both realistic followers and unconvinced challengers. Thus, Y. Shikova considers that new explanations will personalize the education procedure, adjusting the program to a student's person requires. If a technology contributes to better understanding, memorizing, knowing or using any content, it's worth considering and implementing, even if it presupposes fundamental changes in academic activity. Alexander Sidorkin is however more skeptical about it, stating that Indian education digitalization process embodies major challenges; thus educational resources digitalization (for instance, tutorials) doesn't keep up with informatization of education process. The education lacks initiatives related to intensification of education communicative component using information technologies, as well as basic ideas. This area requires sustained flow of breakthrough ideas and venture projects (Internet and education, 2015). The aforementioned innovative tendencies will govern education development in terms of globalization and, as it was stated above, will influence all sides of education and will be followed by major changes in academic activity, i.e. class work and in classrooms. Classroom activities of the future will not represent a typical picture of a teacher in front of its students, sitting at desks arranged in perfect rows. Introduction of innovation digital technologies will change not only teaching form and tools, but its environment as such.

## **RECOMMENDATIONS**

### **1. Teachers should be permanent at their positions**

For the most part of the teachers in schools in rural areas are run by the government. They assign ad hoc teachers, instead of permanent ones, who are poorly paid as compared to the huge remuneration of a full-time Trained Graduate Teacher (TGT).

Furthermore, promising career views, which is pretty a motivation booster, is just about nothing for the non-permanent teachers. This leads to dissatisfaction, eventually resulting in a lack of teachers because they move away to more permanent jobs.

### **2. Lack of Responsibilities**

Lack of responsibilities of teachers and school authorities has raised the rate of absenteeism. School Development and Management Committees (SDMCs), comprising parents and members of the local community, have been entrusted with the responsibility of overseeing teachers and their duties. However, research suggests that the committee has hardly seen success.

### **3. Teachers should not take burden of non-teaching duties**

Additionally, non-teaching duties like appointment in invigilation often keep teachers away from schools and classrooms. Moreover, teachers often have to report for duty far away from their home. With an insufficient transportation system in rural India, the distance only adds to their despairs and often consequences in absenteeism.

### **4. Freedom from Teachers' Eligibility Test**

Some states have freed from candidates from Teachers' Eligibility Test (TET) as only 20 per cent of the candidates obvious it. This wrong move, in an effort to rapidly fix the matter of lack of teachers, has depreciated the feature of education in the states even further. However, quality of teachers is a most important concern not only in these states, but across the whole country.

### **5. Teacher training should emphasized on digital skills**

There are many private teacher-training institutes in India, but the quality and lack of emphasis on digital skills in the training they provide is unsatisfactory. Continuous professional development is a motivator for teachers, and adequate awareness is required in this regard.

**CONCLUSION**

We might state that modern educational system faces creative crisis. Class work and lessons do not contribute to students' personal initiatives to learn something new, establish objective connection between their knowledge and the real world, use their imagination to look for nonstandard answers to standard questions instead of using stereotypic models. Therefore the classroom of the future should not be a place of knowledge transfer, but a place of investing in the mind of students, focusing on creativity and innovation and not on repeating ready-made opinions or mechanical response to test questions. The stated approach to education will force us to reconsider curricula and integration of conceptual and actual innovations. New curricula should stipulate not only obligatory transfer of facts, but focus on students' reaching certain objectives, namely creativity, imagination and teamwork irrespective of team members' location. Finally, it should be noted that today's global education has faced major transformations, caused by further integration of new digital technologies in academic activity and is actively searching for efficient implementation models, which will compromise with traditions and innovations.

# Sustainable Solid Waste Management

**Nilofar Saifi**

Lingaya's Vidyapeeth, School of Architecture, Faridabad, India

**Abstract:** *In this paper, an attempt is made to understand the sustainable solid waste management, its composition, characteristics, collection and its transportation. Solid waste management is been a vital environmental issue since last few decades. Due to improper waste management, lots of health issues are arising, apart from that the ground water quality is affecting, due to which the drinking water quality is affecting. The Addition to a comprehensive analysis of solid waste storage, generation (as per lower, middle and higher income group households), its composition, characteristics, collection and transportation. It is found as per some researches that the lower income group (LIG) generate less quantity of waste and also found more of biodegradable waste generation from the households. The necessities of waste management system, bad effects of mismanagement, various issues are raised in several studies are mentioned in the paper. It is found as per some researches that waste management should adopt by Proper collection, storage, processing, transport & disposal of waste so that the impacts of waste can be minimised & the quality of life can be improved. Therefore, sustainable solid waste management should be implemented to maintain an sustainable and pollution free environment.*

**Keywords:** Solid waste management, Health hazards, Reuse, Recycle, Environmental issue.

## 1. Introduction

Solid waste is unwanted materials disposed off from homes, industries, shops, offices, hospitals etc. The quality and quantity of municipal solid waste generated by a particular community will vary according to their socio-economic status, cultural habitats, urban structure, population and commercial activities (Esakku et al. 2007). Urban India is facing an ever increasing challenge of providing for the incremental infrastructural needs of a growing urban population. According to the 2011 census, the population of India was 1.21 billion, out of which 31% live in cities. It is projected that by 2050, half of India's population will live in cities.

With this increasing population, municipal solid waste management (MSWM) in the country has emerged as a challenge not only because of the environmental and aesthetic concerns, but also because of the huge quantities of municipal solid waste (MSW) generated per day. According to Central Pollution Control Board (CPCB, 2013) 1,43,449 tonnes per day (TPD) of municipal solid waste was generated in India during 2014–2015, with an average waste of 0.11 kilogram (kg/capita/day). Therefore the total municipal solid waste, approximately 1,17,644 tonnes per day, (80%) was collected, while only 25,805 tonnes per day, (20%) was processed or treated. Segregation at source, collection, transportation, treatment and scientific disposal of waste was largely insufficient leading to degradation of the environment and poor quality of life (CPCB 2013).

The waste generation in small cities is lesser than larger cities. The amount of solid waste generation is also directly related to the economic status of families. As per studies conducted by Tata Energy Research Institute, higher income group generate more solid waste than middle and lower income groups (CPCB 2013).

Apart from creating air pollution, soil contamination and groundwater contamination, open dumping of wastes generally becomes breeding ground for various dreadful

disease causing health issues towards peoples or residents, particularly in the vicinity of the waste disposal sites. Further, with increasing awareness of public on environmental and health issues, there is a general opinion that the standard of services with respect to collection and disposal of municipal solid waste is progressively declining. It is also true in many cities that as much as half of the solid waste generated remains unattended.

## 2. Classification by Source of Solid Waste

- 2.1 Household Waste: this category comprises waste that are consequence of household activities, these include food preparations, sweeping and garden waste. They also include old clothing, retired appliances, packaging and etc.
- 2.2 Commercial Waste: this category consist of waste from stores, offices, fuel service stations, restaurants, hotels, informal shops and hawkers.
- 2.3 Institutional Waste: schools, offices, hospitals etc, are included in this category, this category generally involves a large proportion of paper than food.
- 2.4 Street Sweeping: this category of waste includes dirt and litter and also contain an amount of household waste, drain cleaning, animal manure and small dead animals.
- 2.5 Construction And Demolition Waste: these consist of bricks, concrete, sand etc, which are generated due to construction & demolition activities.

## 3. Classification Based on Material Composition

- 3.1 Rubbish: refers to waste which consist of inorganic material such as metal cans, dirt stones, ceramics, glass bottles and etc.
- 3.2 Garbage: refers to waste consists of organic and decomposable, paper, plastics, rags, leather, rubber, grass and garden waste.
- 3.3 Ash: this refers to residue from fires used for cooking, burning wood and leaves etc.

Volume 8 Issue 2, February 2019

[www.ijsr.net](http://www.ijsr.net)

Licensed Under Creative Commons Attribution CC BY

3.4 Treatment residues: consist of septic tank sludge, De watered sludge or chemicals.

#### 4. Classification Based on Environmental Consideration

- 4.1 Bio - degradable waste: are those waste which can be naturally decomposed, food waste ,garden waste and some other organic waste which are biodegradable and usually don't have long term effects, on the environment.
- 4.2 Non- biodegradable waste: include all other waste which cannot be naturally decomposed, example for e-plastic, glass, metals and other inert materials.
- 4.3 Hazardous waste: are those which pose a high environmental and health risk for the community and require special handling. Waste which are toxic, reactive, radioactive, explosive are included in hazardous waste.

#### 5. Solid Waste Management

**Solid waste management** includes the entire process of dealing with solid waste ,starting from the collection from the primary source to ultimately disposing off it hygienically, so that it may not be a nuisance or create any harmful effect on nearby community. The solid waste management involves , management at waste generation level , storage at the source of generation , primary collection , street cleansing , temporary storage at locality level , regular and periodic transportation of this temporarily collected waste to disposing sites and treatment plants.

Segregation at source, collection, transportation, treatment and scientific disposal of waste was largely insufficient leading to degradation of environment and poor quality of life. The objective of Solid Waste (SW) Management is to maintain clean and hygienic conditions and reduce the quantity of solid waste. (Shuddhi, 2014)

Solid waste management (SWM) is a basic public necessity and this service is provided by respective urban local bodies (ULBs) in India. SWM starts with the collection of solid wastes and ends with their disposal and/or beneficial use. Proper SWM requires separate collection of different wastes, called source separated waste collection. Indian cities are still struggling to achieve the collection of all MSW generated. Metros and other big cities in India collect between 70- 90% of MSW. Smaller cities and towns collect less than 50%. The benchmark for collection is 100%, which is one of the most important targets for ULBs at present. (kurian joseph, 2016 )

#### 6. Impacts of Improper Solid Waste Management

Improper solid waste management causes air, water and soil pollution. It clogs drains, creating stagnant water for insect breeding and causes floods during rainy seasons. Greenhouse gases are generated from the decomposition of organic wastes in landfills; insects and rodent vectors are attracted to

the waste and can spread diseases such as cholera and dengue fever. Some health problems linked to improper solid waste management are, nose & throat infections, lung infection, breathing problems, inflammation, high pollution load, bacterial infections, obstruction in airways, elevated mucus production, covert lung haemorrhage, chromosome break, anaemia, cardiovascular risk, altered immunity, allergy, asthma and other infections.

Open burning is the burning of any matter in such a manner that products of combustion resulting from the burning are emitted directly into the ambient (surrounding outside) air without passing through an adequate stack, duct or chimney. Open burning of wastes is practiced all over India due to reasons like, open burning by waste-pickers for recovery of metals from mixed wastes, open burning in bins by municipal workers or residents to empty MSW collection bins, open burning of plastic wastes by street dwellers for warmth at night (Joshi and Ahmad 2016).

The occupational health hazards of waste pickers arise from two aspects – poverty and their occupation itself. Since they belong to the poorest and most deprived section of the urban population, under nutrition, growth retardation, anaemia, tuberculosis and other bacterial and parasitic diseases are very common amongst waste pickers. These make them all the more susceptible to occupational health hazards. In the hope of discovering some saleable item the waste pickers rummage through putrefying waste heaps including toxic medical waste using their bare hands and feet and hence come in direct contact with waste material. Infections and infestations results due to such contact with human and animal excreta, sputum, dead animals and potentially infectious hospital waste dumped in refuse dumps This makes them highly susceptible to a number of health hazards.(Suresh et al. 2003)

#### 7. Conclusion

Raising awareness amongst the residents and waste collectors to prepare them to anticipate in the community based solid waste management programme. Waste Segregation, segregation of organic and non-organic waste should be maintained through the societies. Material recovery facilities can be set up at community level with space allocation for segregation by workers. These facilities can hold the segregated waste for further collection or reuse by different dealers like paper, textile, metal, glass, plastics etc. Door to door waste collection of segregated waste, Abolition of open storage, daily sweeping of the street, Transportation of waste to disposal place should be in covered, Capacity building of waste pickers and inclusion of scrap dealers in organized way.

Wastes processing by energy recovery or composting, Composting pits are a low budget, practical solutions to convert large amount of Organic waste being produced by residential population through kitchen and gardens (about 40% of the total waste generated is organic) into rich organic manure/ fertilizer which can be then sold into the open market or utilization in terrace gardens or local parks

for horticulture. Training the workers for the required skills and also improves their earning capacity. Therefore, by adopting all these methods and precautions, we are able to achieve sustainability towards the solid waste management.

She is now working with School of Architecture, Lingaya's Vidyapeeth as Assistant Professor. She is an avid learner and always seeks to achieve excellence through constant hard work and research.

## STUDY OF PHYSICO-CHEMICAL PROPERTIES OF LAKE PICHOLA, DIST. UDAIPUR, RAJASTHAN

SHAGUFTA JABIN<sup>1</sup>, SONAL GUPTA<sup>1</sup> AND G.V. RAMARAJU<sup>2</sup>

<sup>1</sup>Department of Chemistry, School of Basic Science Lingaya Vidyapeeth, Faridabad, India

<sup>2</sup>PVC, Lingaya Vidyapeeth, Faridabad, India

(Received 8 September, 2018; accepted 16 November, 2018)

### ABSTRACT

The present study was carried out to study various physico chemical factors which are affecting the water quality of Lake Pichola, District: Udaipur, Rajasthan. City Udaipur is completely dependent on its lakes water. Various parameters such as temperature, transparency, total dissolved solids(TDS), pH, alkalinity, hardness, dissolved oxygen (DO) and Biochemical oxygen demand (BOD), Phosphate, Nitrate, Chloride, Fecal Coliform and Total coliform were analyzed for year 2016 and 2017. The present study was aimed to assess the different parameters so that efficient approach can be made for the treatment of water of lake Pichola. The water was found to be polluted due to presence of high quantity of total coli and fecal coliforms.

**KEY WORDS:** Phosphate, Nitrate, Chloride, Fecal Coliform and Total coliform

### INTRODUCTION

Udaipur is a beautiful city located on the eastern flank of Aravalli hills in Southern Rajasthan. It is a bowl-shaped basin surrounded with magnificent lakes. The placid charm and beauty of the city make it one of the most picture perfect city. It has number of lakes in which few prominent lakes are Fatehsagar, Pichola Lake, Udaisagar and Badi Lake, etc. The lakes in Udaipur form essential infrastructure and they provide visual/psychological relief in the hot and dry environment. The lakes make a profound influence on the environment by bringing about favourable changes to the microclimate in a region where people are facing low humidity, scorching heat and glare (Samant, 2010). Hence water quality analysis of these lakes becomes important. Apart from imparting beauty to this city, these lakes also form the surface source of water (Rai & Chouhan, 2017) and thus, water quality testing is a vital aspect.

Pichola Lake is an important lake in the formation of Udaipur lake system. It is the oldest lake in the Udaipur city; it shares its eastern bank with "City Palace" and thus holds a historic and heritage value. The lake is extended towards north

and south forming smaller lakes viz. Doodh Talai and Swaroop Sagar. The surface water spread of Pichola lake is 10.8km<sup>2</sup> and maximum depth of 9.15m. The net catchment area of the lake is 142km<sup>2</sup>. "Presently 13.50 mld of water is drawn from the lake by PHED to serve the thickly populated areas of the old city lying around this lake" (Mangal and Pathania, 2015).

Considering these aspects; physical and chemical parameters of Lake Pichola was analyzed. Water testing is vital before it's used for drinking, domestic, agricultural or industrial purpose. Physico chemical features of any water body grossly influence the trophic status of that water body. (Mishra *et al.*, 2017). These parameters have direct relation with primary productivity (phytoplankton and zooplankton) and in turn the growth of fish. Water has different types of floating, dissolved, suspended and microbiological as well as bacteriological impurities (Sawant *et al.*, 2012). The Water quality of lake depends upon geological factor, morphological factor, vegetation, industrial and agricultural land in its proximity.

Total 15 parameters have been assessed for lake Pichola. All these parameter and their method of determination have been discussed in this paper.

The present study was undertaken with following objective:

- To assess the current status of Pichola Lake.
- To study the environmental characteristics of the study area.
- To understand the physical, chemical and biological characteristics of water of lake Pichola which is the lifeline of Udaipur.

## METHODOLOGY

### Reagents

Sulphuric acid, Phenolphthalein, Methyl Orange, Manganese sulphate Alkali-iodide-azide, concentrated sulphuric acid, Silver nitrate solution and chloride solution were obtained in our laboratory from Central Drug House Pvt. Limited (India) Molybdate dihydrogen, Brucine sulphate, sulfanilic acid and acetic acid were obtained in our lab from CDH (India).

**Analytical methods** The water samples of lake Pichola were collected at 3 points in the lake in different season. The points were selected as shown in the Fig 1. The Point A is near the inlet where the water is coming from the catchment area.

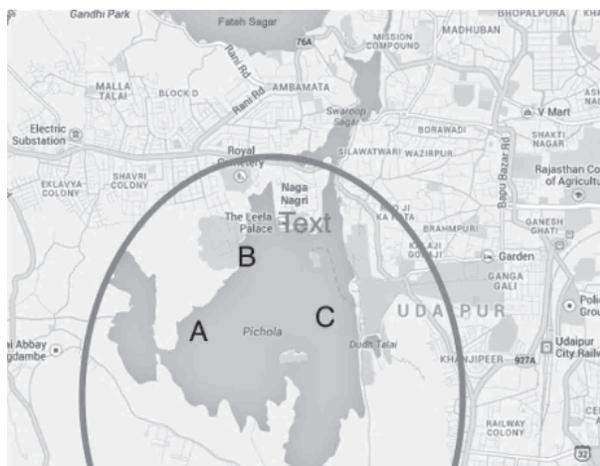

Fig.1. Showing the water collection points on lake Pichola

Point B is at the other end of the lake. Point C is near the boat jetty where the tourist and hotels boats go in the lake. The samples were collected in sterilized plastic bottles. Samples were labeled properly. Few parameters like temperature, pH and dissolved oxygen were measured at the site. Grab sampling method ((Rai and Chouhan, 2017) was applied during the sampling. Water samples were

further analyzed by standard methods (APHA, 2005). The samples were tested for important physicochemical parameters such as Water Temperature, pH, hardness, total dissolved solids (TDS), dissolved oxygen (DO), biochemical oxygen demand (BOD), alkalinity, Fecal coliforms and Total coliforms. The water temperature was measured just after the sample was taken, as it tends to change swiftly. The temperature was measured by using an alcohol filled thermometer. The transparency of water was determined using a standard secchi disc of 20 cm diameter. pH of lake Pichola was determined by using Hanna pH meter. For determining alkalinity, titration method was used. Electrical conductivity was measured using a conductivity meter of Hanna (USA). To determine dissolved oxygen (DO) and biological oxygen demand (BOD), basic Winkler's method (APHA, 1998) was followed. Total hardness was determined by using EDTA method (APHA, 1998). The phosphate was determined using a visible spectro photometer. Bruice method was used for determining nitrate content in the Lake. Total Coliform and Fecal Coliform was determined using five-tube method (APHA, 1980).

## RESULTS AND DISCUSSION

The result of investigations of various parameters of Lake Pichola water was recorded for two years (2016 and 2017) in four four seasons (winter, summer, pre-monsoon and monsoon). During these period, analysis of various physico- chemical parameters was done. The physico-chemical properties of Lake Pichola are shown in Fig. 2 and 3.

The most common and well-known physical attribute of water testing is temperature. "All metabolic and physiological activities and life processes such as feeding, reproduction, movement and distribution of aquatic organisms are greatly influence by water temperature (Gupta *et al.*, 2008). The water temperature was found to be 21.9 °C and 37.2 °C in winter and summer in 2016 respectively as shown in Table 1 and 2. However, the water temperature was recorded 23.7 °C and 38.7 °C in winter and summer season of 2017 respectively. It was also found that water temperature dips in monsoon season in 2016 and 2017 and it was found to be 29 °C in 2016 and 30.5 °C in 2017 respectively.

Fig 2 and 3 shows that transparency of water of Lake Pichola of all the seasons. It was found to be minimum in pre-monsoon season (64cm) and

maximum in winter (116cm) in 2016. However, the same trend was found in case of transparency for the year 2017. "pH is most important in determining the corrosive nature of water. Lower the pH value, higher is the corrosive nature of water. pH is positively correlated with electrical conductance and total alkalinity (Gupta *et al.*, 2009). The pH found to be alkaline in all seasons in Lake Pichola in both 2016 and 2017. The pH was found to be 7.8, 8.7, 8.5

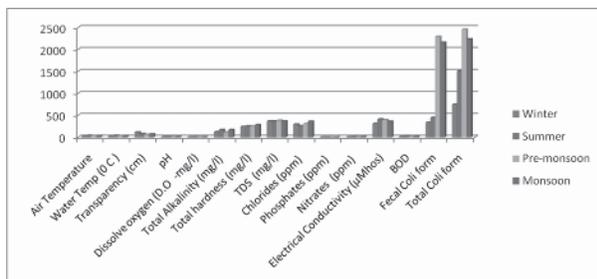

Fig. 2. Physico Chemical components of Lake Pichola - 2016

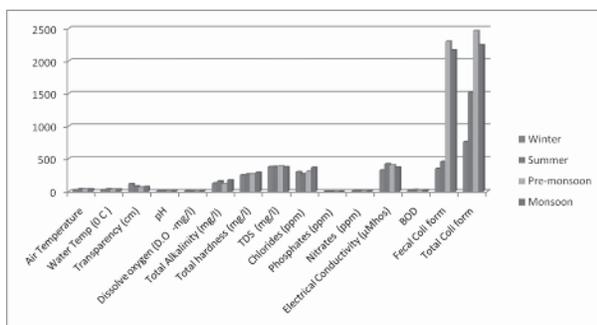

Fig. 3. Physico Chemical components of Lake Pichola - 2017

and 7.7 in winter, summer Pre-monsoon and Monsoon season of 2016 respectively. Whereas, it was found to be 8.5, 8.9, 8.8 and 7.6 in winter, summer, pre-monsoon and monsoon in 2017 respectively. It can be seen from the result that there is not much variation in the value of pH in Lake Pichola in both the years.

The DO was found to be 6.5 mg/L, 5.5 mg/L, 6.4 mg/L and 6.3 mg/L in winter, summer, pre-monsoon and monsoon season in 2016 respectively. The DO was found to be 6.8 mg/L, 4.8mg/L, 5.6mg/L and 6.7mg/L in winter, summer, pre-monsoon and monsoon in 2017 respectively. Dissolved oxygen gives direct information about bacterial activity, availability of nutrients, stratification, etc.

The total alkalinity was found to be maximum in monsoon season in Lake Pichola in both 2016 and 2017. The total alkalinity was found to be 122 mg/L, 169mg/L, 115 mg/L and 170 mg/L in winter, summer, pre-monsoon and monsoon season in 2016. However, it was found to be 125mg/L, 159mg/L, 118mg/L and 173 mg/L in winter, summer, pre-monsoon and monsoon season in 2017 respectively. The term 'hardness' is frequently used to assess the water quality and is governed principally by the concentration of calcium, magnesium and even iron and aluminum salts which combined largely with bicarbonate, carbonate, sulphate, chloride and other anions of mineral acids. It can be seen in Fig. 2 and 3 that total hardness was observed to be minimum in Lake Pichola in winter season and maximum in monsoon season for both 2016 and 2017.

Table 1. Physico-Chemical components of Lake Pichola-2016

Sl. No.	Parameter	Units	Winter	Summer	Pre-monsoon	Monsoon
1.	Air Temperature	$^{\circ}$ C	20.8	38.2	36.7	33
2.	Water Temp	$^{\circ}$ C	21.9	37.2	31.3	29
3.	Transparency	cm	116	80	64	69
4.	pH		7.8	8.7	8.5	7.7
5.	Dissolve oxygen (D.O)	Mg/L	6.5	5.5	6.4	6.3
6.	Total Alkalinity	Mg/L	122	169	115	170
7.	Total hardness	Mg/L	241	254	256	280
8.	TDS	Mg/L	368	370	381	365
9.	Chlorides	ppm	294	259	301	360
10.	Phosphates	ppm	0.99	1.1	0.87	0.63
11.	Nitrates	ppm	6.85	7.8	7.9	7
12.	Electrical Conductivity	$\mu$ Mhos	314	412	395	358
13.	Biochemical Oxygen Demand (BOD)	Mg/L	18	24	19	23
14.	Fecal Coli form	MPN/100mL	340	446	2294	2156
15.	Total Coli form	MPN/100mL	748	1506	2455	2236

The total hardness was found to be 241mg/L, 254mg/L, 256 mg/L and 280mg/L in winter, summer, pre-monsoon and monsoon seasons in 2016. However total hardness was found to be 246mg/L, 259mg/L, 261mg/L and 285mg/L in 2017 respectively. However TDS was recorded as 368mg/L, 370mg/L, 381mg/L and 365mg/L in winter, summer, pre-monsoon and monsoon season in 2016 whereas total dissolved solids recorded was 374mg/L, 376mg/L, 387mg/L and 371mg/L in winter, summer, pre-monsoon and monsoon season respectively.

Fig. 2 and Fig 3 show that chloride content is increasing in monsoon season in lake pichola in both year 2016 and 2017. The chloride content was recorded 294ppm, 259ppm, 301ppm and 360ppm in winter, summer, pre-monsoon and monsoon season of 2016. However, chloride content was observed 296ppm, 261ppm, 303ppm and 362ppm in winter, summer, pre-monsoon and monsoon season in 2017 respectively.

Phosphorus is an essential element for living organisms. "Of all the elements present, phosphorus seems to be limiting factor to some extent in nearly all-fresh water bodies" (Odum and Barrett, 1971). The phosphate content in lake Pichola was observed highest in summer season in both 2016 and 2017. The phosphate content was found to be 0.99ppm, 1.1ppm, 0.87ppm and 0.63ppm in winter, summer, pre-monsoon and monsoon season in 2016 whereas, the phosphate content was found to be 1.49ppm, 1.6ppm, 1.37ppm and 1.13ppm in winter, summer, pre-monsoon and monsoon season in 2017

respectively.

The nitrate content was found to be highest in pre-monsoon season in both 2016 and 2017. The nitrate content was 6.85ppm, 7.8ppm, 7.9ppm and 7ppm in winter, summer, pre-monsoon, monsoon season in 2016. Whereas, nitrate content recorded as 8.05ppm, 9ppm, 9.1ppm and 8.2ppm in winter, summer, pre-monsoon, monsoon season in 2017 respectively. Electrical conductivity observed highest in summer season in both 2016 and 2017. The electrical conductivity was found to be 314µMhos, 412µMhos, 395µMhos and 358µMhos in winter, summer, pre-monsoon and monsoon season in 2016. However, the electrical conductivity was found to be 319µMhos, 417µMhos, 400µMhos, 363 µMhos in winter, summer, pre-monsoon and monsoon season in 2017 respectively. Biological oxygen demand (BOD) was noted as 18mg/L, 24mg/L, 19mg/L and 23mg/L in winter, summer, pre-monsoon and monsoon season in 2016 whereas BOD was 18 mg/L, 25 mg/L, 20mg/L and 24mg/L in winter, summer, pre-monsoon and monsoon season in 2017 respectively. BOD was found to be within limit as per Central Pollution Control Board (CPCB).

The presence of Coliform bacteria in the water body is the primary indicator for pollution (Sharma *et al.*, 2007). It means there are lots of anthropogenic activities taking place near the water body. The fecal coli form observed to be increasing with onset of monsoon season in both 2016 and 2017 respectively. The fecal coli form observed was 340MPN (Most Probable Number), 446MPN, 2294MPN, 2156MPN

**Table 2.** Physico Chemical components of Lake Pichola – 2017

Sl. No.	Parameter	Unit	Winter	Summer	Pre-monsoon	Monsoon
1.	Air Temperature	°C	22.8	40.2	38.7	35
2.	Water Temp	°C	23.7	38.7	32.8	30.5
3.	Transparency	cm	118	82	66	71
4.	pH		8.5	8.9	8.8	7.6
5.	Dissolve oxygen (D.O)	Mg/L	6.8	4.8	5.6	6.7
6.	Total Alkalinity	Mg/L	125	159	118	173
7.	Total hardness	Mg/L	246	259	261	285
8.	TDS	Mg/L	374	376	387	371
9.	Chlorides	ppm	296	261	303	362
10.	Phosphates	ppm	1.49	1.6	1.37	1.13
11.	Nitrates	ppm	8.05	9	9.1	8.2
12.	Electrical Conductivity	µMhos)	319	417	400	363
13.	BOD (mg/L)	Mg/L	18	25	20	24
14.	Fecal Coli form	MPN/100mL	346	452	2300	2162
15.	Total Coli form	MPN/100mL	757	1515	2464	2245

in 2016 and fecal coli form observed in 346MPN, 452MPN, 2300 MPN, 2162MPN in 2017 respectively. The total coli form observed was 748 MPN, 1506 MPN, 2455 MPN and 2236 MPN in 2016 and 757 MPN, 1515 MPN, 2464 MPN and 2245 MPN respectively.

### CONCLUSION

The goal of this research work is to understand the nature of water in Lake Pichola so that appropriate water treatment system can be designed for purification of Lake Pichola. Dissolved oxygen, Alkalinity, Hardness, Total dissolved solids, Chloride, Phosphate, Nitrate, Electrical conductivity, Biological oxygen demand, Fecal Coli and Total fecal coli have been determined and assessed. On the basis of experimental result, it was found that pH is alkaline throughout the year in both 2016 and 2017. However, Dissolved oxygen, Alkalinity, Phosphate, Nitrate are within the limit of Central Pollution Control Board (CPCB) so no treatment is required for Dissolved oxygen, Alkalinity, Phosphate, Nitrate. However, the Hardness and Total dissolved solid are slightly higher. So the treatment is required for TDS before domestic use. The result also indicated that Biological oxygen demand is found to be within the limit. Overall, results indicate that Fecal coliform and Total coliform are present much beyond the limit as per Central Pollution Control Board (CPCB), so it is recommended that alternate technique can be implemented for treatment of water of Lake Pichola for the removal of Fecal Coliform and Total coliform. So it should be understood from the result that this paper would provide a direction for further treatment of water of Lake Pichola.

**Abstract**

A lot of researches are going on since last two decades for object recognition, shape matching, and pattern recognition in the field of computer vision. Face recognition is one of the important issues in object recognition and computer vision. In our day to day activities, a number of biometric applications are available for recognizing humans such as eye or iris recognition, fingerprint recognition, face recognition. Face is an important part of human being and requires detection for different applications such as security, forensic investigation. It requires proper techniques for face detection and recognition with challenges of different facial expressions, pose variations, occlusion, aging and resolution either in the frame of stationary object or video sequencing images. Authors tried to put the concept of face synthesis, for improving accuracy and recognition rate on different face database like ORL, YALE, AR and LFW. Authors had presented a critical review of various types of face recognition techniques and challenges, to improve efficiency and recognition rate for identifying face images in large database, with comparison of accuracy or recognition rate.

**1. Introduction**

Face recognition is always an interesting area and one of the challenging tasks in computer vision and image retrieval. It is applicable in variety of domain such as in ATM, healthcare system, driving license system, railway reservation system, surveillance operation and passport authentication. In large database, face image recognition is always a challenging task. There are various biometric features which can be used to identify human such as fingerprint, palm print, hand geometry, iris, face, speech, gaits and signature. But, the major issue was they require

10.1016/j.procs.2018.10.427

active co-operation of person for authentication, whereas face recognition does not require active cooperation of person. Therefore, face recognition is much more convenient as compared to the other biometrics.

Let us first discuss what do you mean by face recognition? One can simply define: Face recognition is the procedure of recognizing an already detected face. It can be known or unknown, in other words, it could be defined as recognizing the person who it is from our enrolled user database? Face recognition has two important tasks: verification and identification. Face verification can be defined as one to one match that correlate a face image against available face image databank whose personality being matched. Face identification is a one to N problem that match a query image of a face against available image in a face database. Third case is also considered when a query face may or may not be in the available databank. In such case, one can compute similarity score and on the basis of highest similarity score one can find out match. Shwetank Arya et al. [30] studied a number of 2D and 3D face recognition techniques and proposed Infrared Spectrum (IRS) to overcome the challenges in face recognition. Face detection and matching is important for face feature extraction and accuracy calculation. Face recognition is still a challenge for recognizing face in motion images, twin's, pose variations, having different accessories like beard, glasses, hair colour, hair partition, make-up, different facial expressions under different illumination condition, light intensity, noise, occlusion and thermal image for face matching and error generation. Jyoti kumar et al. [29] discussed various facial expression recognition (FER) based on geometry and appearance. They had compared different feature extraction techniques based on JAFFE dataset. Abdol hossein et al. [9] proposed Gabor-Zernike face feature descriptor and HOG descriptor to extract local stastical feature. They tested result on three different database and retrieved face recognition rate of 98% on ORL database, 97.8% on Yale database and 97.1% on AR database.

## 2. Types of face recognition

A human being can be identified with the help of different face features, fingerprint, eye/iris, body structure, spot mark and so on. Face is one of the important parts of the body, which plays an important role in recognizing humans. Resolution plays a vital role in face recognition while identifying face in surveillance or CCTV. In face recognition system, first step is to detect a face in an image [6]. Faces decompose into mainly four features like eye, lip, nose and mouth for recognition. Main theme of face detection is to identify whether there are single faces in the image or more in view of stationary picture or video picture. Faces are mainly having dimension in 2D and 3D with different textures and facial expressions [5, 7, 8].

### 2.1. 2D face recognition

Previously for 2D face recognition following four steps was used:

In face recognition first step was to detect face, second step was face alignment, third step was feature extraction and fourth step was feature matching from database of enrolled users to recognize face. Matrix has been computed on the basis of pixel values at corner of face under different illuminations conditions for 2D face recognition. Normally, face images are represented by a high dimensional vector containing pixel values. Feature matching is done to match the input face in the form of image or video from available database of enrolled images with unique face identity. Various techniques adopted for face detection were based on color, intensity and illumination. It is one of the challenging tasks to recognize who it is? and researcher faces many challenges like facial expression, illumination, poses variations image orientation and occlusion in face recognition. There were some limitations of 2D face recognition. In 2D face recognition system recognition rate and performance is dependent on image capture conditions like head orientation, image quality, lighting conditions, partial occlusion, facial expressions.

### 2.2. 2D -3D face recognition

Andrea F. Abate et al. proposed a reliable technique for collective 2D visual images and 3D model face recognition based on different parameters such as input size, number of addressed tasks and recognition rate. Comparison of different techniques provides future perspective to the researchers for enabling new techniques in the field of face

recognition [1]. Eigen faces and stereovision techniques used to improve the performance of 2D face recognition system with 3D information known as disparity of face. Face of a person at different position was matched with the help of scan lined-based neural network. Principal component analysis (PCA) for feature extraction and recognition were effectively used for face recognition. 2D- 3D face recognition rate were improved by adding up information in-depth [2]. Face identification process is shown in figure 1.

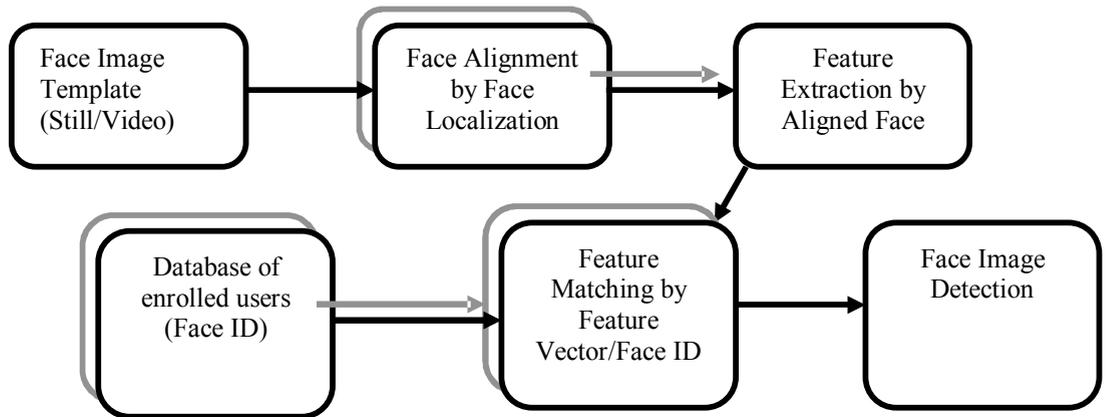

Fig. 1. Face detection process.

### 2.3. 3D face recognition

Faces are in the form of real image, various textures, different framework which convolute in three dimensions. It seems to be more precise recognition of the face image and minimize the problem of pose variations, occlusion and different illumination condition [30].

Sima Soltanpura et al. [31] proposed a survey for 3D face recognition based on local features. They divided the local descriptor into curves, key points and surface. They had applied image acquisition technology on 3D face database to compare under different conditions. Feature extraction is one of the important modules in face recognition which was considered by authors. They studied about different types of face descriptor and feature extractors for 3D face recognition. They also consider the challenges of face recognition with different face expression and occlusions.

3D image and face feature extraction adopted various techniques and methods for efficient and effective recognition. Normalization between probe and gallery texture is done with the help of bidirectional relighting. Introduction of correlation metrics for finding out similarity scores and concept of pose and light normalized signatures for face verifications applied frequently [5]. Motivation to use 3D face recognition technology is to overcome the drawback of 2D face recognition systems. 3D face images were recognized with the help of different augmentation techniques and tested on various database [6]. It was enhanced with the help of experienced sensors camera capturing better 3D face image which can generate 3D face models [4, 5, 7]. Various techniques are available to recognize a 3D face from a range of viewing angles. One of the benefits of 3D face recognition system is that it is not affected by light intensity. Several methods were introduced to extract the features so that accuracy and recognition rate will be higher [10, 29].

Ge Wen et al. [38] proposed improved face recognition with domain adaptation. In this authors, tried to evaluate face recognition by taking Labeled Faces in the Wild (LFW) dataset as a bench mark. They considered data bias as one of the problem. They had replaced the training data with same distribution because according to them web-collected dataset come from celebrities are quite different from faces of normal people in day to day activities and harder to collect due to privacy concerns. They had applied FaceNet triplet loss function. They achieved accuracy rate of 99.33% with single CNN model without face alignment.

### 3. Challenges of face recognition

#### 3.1. Aging

Face in the form of various texture entail characteristics value changes over a period of time and reflect as aging, which has a prompt importance in face recognition. Age invariant is also important for visual observation and image retrieval after a long time access. Coupled auto-encoder networks called CAN and non-linear analysis was done for aging and de-aging for the face data set called FGNET, CACD, CACD-VS [14]. Aging factor in face recognition system in different age group for various face set over a period of time calculated for accuracy checking. Aging effect descriptor for various age groups and classification need similarity measure for age discrimination. Various analyses were done globally for the different age group to compute similarity index and finding [15].

Face recognition depends on the features extraction, concerned about the data extraction and basic features properties like wrinkle, marks, spot eyebrow, makeup and so on. An Active Appearance Model (AAM) technique was introduced for reduction of image dimension in face recognition process [16]. Performance of the face feature recognition is extremely important for simulation of sparse-constrained method proposed for face recognition with aging factor to look aging over a span of time period. [17].

#### 3.2. Thermal image

Multi-feature extractions for small and large database need suitable technique for thermal face recognition system. In low resolution Gabor system, thermal image detection needs main attention on the environment based on illumination [18]. Multi-fusion techniques illustrated about Gabor jet descriptor which was used for multi-feature extraction. Fusion algorithms were used for visible thermal infra-red image detection for face recognition system, which requires formation of accuracy and recognition rate. Formation of universal image index quality for thermal image measurement was satisfactory for face recognition. Recognition rate was also checked with UGC-JU for measuring performance [19]. Gabriel Hermosilla et al, [20] stated about thermal spectrum for face recognition in unconstrained environments require local matching method based on the binary pattern, Weber Linear Descriptors and Gabor Jet descriptor. All the face recognition method compared and analyzed for performance evolution. New entropy functions also needed for infra-red image feature extraction and recognition. Feature property extraction for infra-red entropy analysis entail checking of face recognition using different discriminating characteristics on available database for performance evaluation [21].

#### 3.3. IRIS

IRIS is important part of the face, and feature extraction of IRIS plays a vital role in face biometrics analysis. IRIS recognition methods are available and mostly based on the Bio-Hashing techniques. In IRIS Mapping, robustness improved will be checked on the six databases and then results are tabulated for IRIS recognition. It has effectiveness and robustness in the recognized system for better performance [11]. Face and Iris Recognition both are having extraction and recognition for Mobile Engagement system. This application had viability on mobile for response reliability, fusion technology and sample show better accuracy result [12]. Multi-biometrics system accuracy is very important for various features. IRIS corner data loss during the filtering and synthesis of data on bin base framework causes loss of information and again checked with the help of fusion. Experimental results were checked on CASIA-IRIS Framework [13].

#### 3.4. Occlusion

Yu-Feng et al. discussed about single sample face recognition with occlusion, sparsity and robustness. Learning based PCA was used for intra-class variant dictionary and optimization for solving multi-scale sparse coding model. It was a discriminative multi-scale model, promptly used for face recognition with occlusions [23]. Partial occluded face recognition systems for large database were based on generic occlusion and structured sparse dictionary approach. Mutual incoherence regularization and fast algorithm proposed for occlusion with dictionary learning approach, which had lower computational cost for large database representation and performed better as compared to other methods [24]. Mustafa M. Alrjebi et al [22] proposed face recognition against occlusion using two

dimensional multi-colour fusion (2D-MCF) model and SRC. They used fused colour information for effective face recognition against occlusions. They first devised a new local representation for face images and then applied partitioned sparse sensing recognition (P-SRC) for improving accuracy. They applied the result on four different databases for improving the recognition rate. They improved the recognition rate on AR database up to 24.5%, 3.8% recognition rate was improved on Curtin database, up to 25% was improved on FRGC database and 2.86% on Bosphorus database. Face recognition with occlusion in different trained model of 2D-MCF widely used and in that method the previous occlusion fusion details requirement is less and accuracy rate also improved with other method. Two dimension multi colour fusion technique had improved accuracy for face recognition with occlusion.

### 3.5. Facial expressions

Yulan Guo et al. [32] proposed expression invariant 3D face recognition which was based on feature and matching shape which encompasses local geometric feature, with the help of global similarity between faces. They tested their results on FRGCv2 dataset. They had taken a probe face which was compared against face database using both local feature and 3D cloud registration. They achieved recognition rate of 97.0% and verification rate of 99.01% for different faces either having neutral expressions or having non-neutral expressions. Li Ye et al. [34] proposed an expression insensitive 3D face recognition using multiple subject specific curves. They applied 3D face matching with the iterative closest point algorithm and an expression-irrelevant factor as weight to increase the performance of face matching algorithm. Sparse Representation Classification-SRC and Collaborative Representation Classification –CRC approaches were widely used for facial expression analysis [25]. Facial expression and feature extractions for the six objects joy, sadness, anger, fear, disgust and surprise were needed to extract and classified with the help of NN classifier in 3D Face model [26]. Linearity and faster recognition of facial expression will be achieved with Modified Local Directional Patterns (MLDP) approach. Video based image and face expression with different features were also important for facial expression recognition. Facial expression with generalized discriminant analysis performed on deep belief network had better performance as compared to other available technology [27]. Multimodal model detection is widely adopted for landmark and texture value in facial expression recognition system and analysis of facial expression experiments for better performance [28]. Abdelghafour Abbad et al [35] proposed 3D face recognition based on geometric and local shape descriptors to overcome the challenges of different facial expressions. They had applied four different steps to solve the problem: first step was to model 3D face, second step was feature extraction, third step was to find out geometric information on the 3D surface in terms of curves and fourth step was to find out feature vectors on each scale. They studied and compared their result on GavabDB and Bosphorus datasets and retrieved the recognition rate of 98.9%.

### 3.6. Poses

Li-Fang Zhou et al. [36] proposed pose robust face recognition with LBP and Huffman coding. They had applied divide and rule technique on face representation and their classification to improve pose variation. Also, they had applied Region Selection Factor (RSF) for face representation of a face image to consider different poses specifically, instead of, generally and applied patch based SRC fusion classification strategy to improve the technique. They studied result on FERET database and LFW database for improving the accuracy. Thibault Napoleon et al. [33] proposed pose invariant 3D face recognition. They proposed an active shape model to detect key features with the help of finite element method. They tried to improve recognition rate by applying LBP technique and applied VanderLugt correlator and Gaussian filter to identify the edges of the image on the basis of local binary patterns for image identification. They studied their result on the PHPID database with 3D reconstructed faces of each person with an azimuth. They proved identification rate of 88.76% with proposed method and compared the result with 2D approach based on VLC database with recognition rate of just 44.97%. Brahmin Aksasse et al. [37] proposed a new technique to pose invariant face recognition. They tried to improve face recognition rate in the wild animal and proposed a technique for face alignment with the help of single 3D face model in context to FaceGen Modeller. They also introduced a new face descriptor based on Gabor Filters which was combination of Gabor phase and Gabor magnitude in a given framework. It was able to overcome standard presentation in Labeled Faces in the Wild dataset (LFW). They tried to prove accuracy rate of 97.29% on LFW dataset.

### 3.7. Facial advances

Face recognition becomes more challenging in case when an image differs by surgical variations of faces for increasing beauty. Coarse-to-fine strategy was used to identify landmarks under different poses in 3D face [3]. Half face matching algorithm technique was introduced, based on geometrical structure-based search and modified FLM based search using HK curvature analysis. Robustness and accuracy is important in HK Curvature analysis under different poses [4]. Face transposition patterns used to find out how holistic and distinctive features influenced by 2D and 3D faces detection. 3D stereoscopic effects are more accurate during holistic extraction but not during inverted face feature extraction.

It was noted that in facial inversion of 2D and 3D faces both, recognition rate and performance is almost same and focus on how 3D face recognition influenced by the integration of GPU [7]. External, internal features, facial expressions and face dynamics findings are easier to discriminate in isolated features rather than embedded features [8]. Authors tried to figure out different challenges of 2D and 3D face recognition. In table 1, different techniques and applications were compared with different face database for accuracy and recognition rate.

Table 1. Comparison of different face recognition techniques, applications and accuracy rate

S.No.	Techniques	Applications	Face database applied	Accuracy/Recognition rate
1	Histogram Oriented Gradient(HOG)[9]	Global gabor/Zernike descriptor	ORL	98%
			YALE	97.80%
			AR	97.10%
2	Featural Processing[10]	2D/3D Face recognition	Stereoscopic information	Higher in 3D Face
3	Fusion algorithm/RF classifiers[19]	Visible and Thermal Image faces	UGC-JU	99.07%
			AR	up to 24.5% improved
4	Two dimensional multicolour fusion [22]	2D-MCF Model/Partitioned sparse sensing recognition(P-SRC)	CURTIN	up to 3.8% improved
			FRGC	up to 25% improved
			Bosphorus	up to 2.86% improved
5	Modified Local Directional Patterns[27]	General Discriminant Analysis	Deep Belief Network	96.25%
6	Multi-scale strategy based on geometric and local descriptors[36]	3D face recognition	GavabDB and Bosphorus	98.90%
7	LBP technique, shape model [33]	3D face recognition	PHPID database	88.76%
			VLC database	44.97%
8	local geometric feature and shape matching[32]	3D face recognition	FRGCv2 dataset	97.00%

9	face descriptor based on Gabor filter [37]	face recognition in wild animal	LFW dataset	97.29%
10	domain adaptation [38]	face recognition in wild animal	LFW dataset	99.33%

#### 4. Conclusions

Face is the most important feature of living body, which plays important role in recognizing human beings. Various techniques across the world are used for face recognition application and research. In this paper, authors tried to extend review of face recognition techniques and its challenges for performance comparison, accuracy and recognition rate on different face database such as ORL, YALE, PHPID, VLC, GAVAbDB, AR, UGC-JU, CURTIN, FRGC, Bosphorous, LFW dataset. Face recognition has increasing applications area such as in the field of security, forensic and requires more accuracy and reliability. Synthesis of various textures is also presented here for face recognition and various challenges were also considered like aging factor, facial features, expressions, pose variations, thermal image, occlusion and illumination. On the basis of review, authors found that, till now maximum accuracy rate of 99.33% achieved for face recognition of wild animal tested on LFW dataset with domain adaptation technique and 99.07% accuracy rate achieved using Fusion algorithm or RF classifiers for human face which was tested on UGC-JU face database. Presented review will be useful for upcoming researchers for selection of appropriate techniques for face recognition.

# A Review towards the Approach for the Detection of Malicious Nodes in Mobile Adhoc Network

Garima Saini<sup>1</sup> and Dr. R.C. Tripathi<sup>2</sup>

**Abstract**—In order to ensure the users security within the vehicle-specific applications Intelligent Transport Systems (ITS) are designed. For avoiding any kind of loss there is a communication between the users for exchanging important data. Related to the Vehicle Transportation there are several applications of the ITS. There is a requirement for which there is an introduction of Ad hoc Networks (VANETs) for enhancing the safety and efficiency of ground transportation networks and real time information which is its main purpose.

**Keywords:** VANET Architecture, DoS Attacks, Review, Objectives

## I. INTRODUCTION TO VANETS

Vehicular Ad hoc Network provides vehicle to vehicle and vehicle to roadside communication by a self-configuration type of network. Through the nodes the data is shared representing themselves as servers and clients across the network. Computers, communications, management technologies, sensor and control innovations comprises of several components. For integration of these functions there can be an improvement in the functioning of a transportation system. By using Vehicular Ad-Hoc Networks the warnings related to the environmental hazards, traffic, road conditions and data regarding the transmission amongst vehicles is provided. The information can be spread across the network if there is any kind of traffic jam or road closure. This saves time and also helps the drivers for avoiding the specific routes. Through paper communication the warnings are spread by the vehicles across the other vehicles [1].

Following are the advantages of implementing the VANETs in various applications:

1. Routers can be considered as the self-configuring nodes.
2. There is no central authority for controlling these networks called decentralized ne
3. Through 5e7which the network heals on its own there is an occurring of re-configuration within the network.
4. Due to its scalable property higher number of nodes can be added to the network.

5. A flexible ad hoc network can be generated besides of the time and location.
6. The costs to create the network finally are very low as this network is decentralized in nature.
7. Establishing the connections at higher speed the nodes are independent of the hardware and software including in the systems.

## II. VANET ARCHITECTURE

The 3 domains in which the architecture of VANET is divided are as follows:

### A. VANET System Architecture

Within the In-Vehicle domain includes the On-Board Unit (OBU) and the Application Units (Aus). The AUs act as user devices while the interaction with the OBU. The ad hoc network comprises of the OBUs present in the RSUs and vehicles. In a wireless manner there is an easy communication of the OBUs and RSUs within a proper range. As the vehicles connect to RSU in an ad hoc manner on the basis of their requirements an ad hoc domain is formed. Within the Infrastructure Domain the RSUs and CA are presented. RSU and CA are connected with each other. For the CA the RSU acts as a proxy. For helping to reach the RSU the packet is to be forwarded from one OBU to another there is a requirement in between the OBUs and the RSUs. The information is passed within the network and also to the RSU by which GW represents the gateway through [3]. information is exchanged for providing warnings on roads.

### B. Routing in VANETs

Within the VANETs the basic ad hoc routing protocols cannot be used adequately due to the change for various other reasons like mobility patterns, the entering and leaving of various vehicles. The major objective of routing protocols in VANETs is the utilization of less

E-mail: <sup>1</sup>garimasainiengineeri@gmail.com

<sup>2</sup>rctripathi@lingayasuniversity.edu.in

communication time while doing fewer amounts of network resources. The VANET routing protocols can be categorized on the basis of the position accusation and route update technique. The types of routing protocols involved in VANETs are as follows[5]:

- a. *Position Based Routing Protocols*: The geographic positioning of information is shared amongst the nodes by a class of routing algorithm provided within the position. Within the network it can help in selecting the next forwarding hops. The packet is transmitted to the closed destination available without giving any map knowledge to one of the hop neighbor.
- b. *Cluster Based Routing*: The clusters based routing protocols are used within the clusters which are generated within the network. For helping in broadcasting the packet to the cluster present are the nodes which are similar for forming clusters and one cluster head will be selected. Even when there is high scalability of these networks there is an occurrence of delay and overhead within the high mobile VANETs. The virtual network infrastructure might be created within the cluster based routing with the help of clustering nodes for providing scalability.
- c. *Broadcast Routing*: Related information from the roads, the broadcasting routing is utilized within VANETs in order to share the traffic, weather and any emergency. Amongst the vehicles through this protocol the major function can be delivered and the announcements can be made. The various broadcast routing protocols involved are BROADCAST, UMB, V-TRADE and DV-CAST.
- d. *Geo Cast Routing*: geo cast routing is a multicasting routing that helps in delivering the packets from source needs to all the other various nodes present in a geographical area on the basis of its location. Geo casting scenarios can avoid any unnecessary hasty reaction by not informing the vehicles outside the Zone of Relevance (ZOR). IVG, DG-CASTOR and DRG are the several Geo cast routing protocols.
- e. *Topology Based Routing Protocols*: Within the network by the topology based routing protocols the data related to the links are present [6]. For forwarding packet across the network is done in order to perform. Proactive and reactive type of protocol in the broader categories of protocols is as follows:
- f. *Proactive routing protocols*: Most of the protocols are built based on the shortest path algorithms. On the basis of table all the information collected from several nodes is kept in the form of tables. Each node updates its routing table on the changes made as the tables created are shared amongst neighbors and in case

any occurrence of change is present. The link-state routing and the distance vector routing are the various proactive methods. LSR and FSR are various types of proactive routing protocols.

- g. *Reactive/Ad hoc based routing*: by the demand or reactive routing protocols is overcome for the overhead which is created by the proactive routing protocols. Using this type of protocol there is maintenance of the route that is currently active. For route discovery and maintenance currently used nodes for sending the packets from the source to destination are highlighted only. AODV, PGB, DSR and TORA are the various types of reactive routing protocols.

### III. TYPES OF ATTACKS IN VANET

Through various attacks VANET suffers. Following subsections classify different types of attacks [7]:

*Denial of Service Attack*: the most adverse affects within the VANETs is the type of attack. The users exchange information jammed by the attacker of the main communication medium through. The users cannot access the medium further because of this.

*Distributed Denial of Service Attack (DDOS Attack)*: DDOS attacks are caused from various locations in distributed form by one attacker. Within different time durations the messages might be transmitted by an attacker. There is a difference in the nature as well as time duration within which the message is to be transmitted based on the vehicles presented by the attacker. By this attacker there is same objective of the DOS attack.

*Sybil Attack*: within this type of attack multiple messages are transmitted by the attacker. In every message present in the network several sources of identity are present. For creating confusion to vehicles wrong messages are sent by the attacker in order to jam the traffic. In order to communicate with each other the vehicles are forced to follow the next path. Therefore, the prior objective of the attacker is to choose another route forcefully mainly the generation of illusion of multiple vehicles [8].

*Node Impersonation Attack*: a unique identifier is utilized by the vehicular networks in order to verify the messages. When any accident occurs wrong messages are sent to various vehicles.

*Application Attack*: various applications are attacked mainly by the attacker in this type of attack of the information which is relevant to safety and non-safety with the help of safety applications warning messages are provided to users. Through the attacker in this attack which results in sending wrong information to other vehicles the information present within actual message is altered.

*Non Safety Application Attack*: within the journey and the safety applications not disturbed the types of attacks

are concerned with the comfort of user. The traffic system is enhanced and the comfort is provided to the passengers by the non-safety applications. Passengers are discomforted by the generation of attacks in such scenarios.

*Timing Attack:* the attacker attacks the transmitting data in order to add the time slot within the original message. The attacker delays the original message. The messages are not able to be received on the required time and within the complete network there is a delay in occurring. The applications are unsafe as the required data to warn them is not provided in case the delay occurs within the applications.

#### IV. DISTRIBUTED DENIAL OF SERVICE ATTACK (DDOS ATTACK)

Distributed Denial of Service Attack (DDOS) attack is an attempt made by an attacker from different location for stopping the legitimate users from the system for accessing the required objects. Examples of the DDOS attack are as follows:

1. Flooding the network prevents access of legitimate network traffic.
2. Disruption of the connections amongst two machines prevents users to access service.
3. Through preventing one individual user to have access to it prevents the user from accessing a service.

Within the DDOS attacks there are different tools utilized. Even though they have different name they have same basic structure of the tools. Following are the components as shown in figure 1.2:

- *Attacker:* If the hacker uses the personal computer it is the responsibility of the hacker.
- *Master:* the system receives direct command from the attacker also the other agents are controlled by it.
- *Handler:* through this program the tasks are performed on the program master system.
- *Agent:* the system directly attack the target.

#### V. LITERATURE SURVEY

Mohamed NidhalMejri et al. (2015) [11] proposed Greedy Detection for Vehicular ad hoc Networks (GDVAN) which is a new detection mechanism. Within the VANETs this mechanism was proposed in order to detect the greedy behavior attacks which occur. Suspicion phase and decision phase are the two phases involved within this proposed mechanism. There was a development of the concept of suspicion phase based on the linear regression mathematical concept. For developing the decision phase the fuzzy logic decision method was used. Along with the establishment of a list which contains the potentially compromised nodes there

was a detection of the greedy behavior of the proposed algorithm. In order to provide such evaluations from the network utilization of the newly defined metrics is done. It was also known as passive technique. Major benefit of this proposed technique in this proposed approach was executed by any node present in the network. Within this mechanism there was no need of modification in the IEEE 802.11p standard. In terms of various performance parameters the already existing techniques in the proposed algorithm with the help of various simulations and experiments the effectiveness and efficiency of the proposed method was computed.

Pooja. B, et al. (2014) [12] presented protected and secure correspondence of messages in VANETs in this paper for which the fundamental structure was authenticated. In order to authenticate the messages present within the IEEE 1609.2 standard as a standard digital signature calculation method ECDSA is utilized. ECDSA signature provides a higher verification time. In order to flood the complete network with invalid signatures external and internal attacker uses a part of bandwidth. Within the network this outcomes are in causing Denial of Service (DoS) attack. In this paper a two phase method was proposed within VANETs for mitigating the internal and external DOS attackers are present. The HMAC signatures were calculated within the principal phase of this method through the pair of private and public key. Through this method the authentication of the communication object was done. Due to the external attackers computation of HMAC signatures was done by the authentic users of the mitigation of DOS attack. The internal attacker was recognized through the designed secondary phase in case the entity was authenticated as well as the next vehicle was subjected to DOS attack. Within this phase with the help of number of invalid signatures that were flooded by the attacker the comparisons were made with the threshold value for the identification of internal attacker. The DOS attack was mitigated with the help of both internal and external attackers. The result was taken out and shown that least computation was provided overhead to the network and on the basis of the results shown the experiments were conducted and shown that the detection of DOS attack was performed better in this proposed method.

Munazza Shabbir, et al. (2016) [13] presented the modern intelligent transportation world vehicular ad hoc networks turning into a mainstream and promising technology. Any information circulating through the network can be life crucial on the basis of the safety applications of VANETs. Towards numerous security threats the mobility of the nodes and an unpredictable way of the associations in the network made VANET vulnerable. Utilizing the greater part of its assets is DDOS attack which is one of the important attacks that exhausted the network by illegitimately. Utilizing spoofed IP addresses for exhaustion of the network in this sort of attack circulated bogus messages. For services it denied to

cater for legitimate solicitations for services. Practically, its security needs should be met so before the proper deployment of this network. After the prevention scheme was proposed DDOS attack was detected in this paper.

Nirav J. Patel, et al. (2015) [14] studied in this paper over the vehicular ad hoc networks there is vehicle to vehicle communication provided. Within the locations of the vehicles within VANETs there was a continuous change. In order to provide a mutual trust amongst the nodes present in the network there is a need to provide secure routing during the routing process. The fake data was transmitted to other nodes in order to cause attacks because of the presence of malicious nodes within the networks. By these malicious nodes as the route discovery or data transmission occurring within the network was disrupted it was very difficult to trust the nodes present in the network. Several researchers have proposed many studies to provide trust-based techniques within these networks. In this paper, in order to study the secure the routing processes the enhancement of different ad hoc routing protocols were reviewed. The different enhancements were made within the trust-based techniques that were understood on the basis of this review.

Vinh Hoa LA, et al.(2014) [15] studied in this paper in order to improve the VANETs there were numerous studies that was proposed by researchers. To the users present in these networks the traffic safety was ensured long with providing other efficient services with the applications of these systems. For the degradation of the performance of these networks there were several attacks which occurred. There was a huge loss observed in terms of time, money and the live of users because of this. In this study in a survey, different types of attacks occurred within these networks. Several techniques were proposed in this paper for the prevention of these networks from various kinds of attacks. Methods based classification of all such techniques was categorized. There was a need of introduction to intrusion detector for alerting the system related to the arising attacks. For the identification of the types of attacks the utilization of the BRO or MMT was done in this network.

Kirti A. Yadav, et al. (2016) [16] proposed in this paper a vehicular ad hoc network applied by various types of routing protocols. Generation of the securities regarding scenario within these systems by the presence of routing techniques was done. Providing security applications to the users are included in this study which is done for the identification. In this paper several security measures were provided in VANET. In order for the comparison of the performance of several techniques amongst each other different techniques were presented in this paper. Through this survey within the VANETs a successful achievement required for providing secure scenarios was done under this approach. Ensuring the security, availability as well as non-repudiation of the techniques within the security scenarios was a need for providing a future scope which was a great help. In order to provide higher level of secure environment within these networks through this study it

was analyzed for the intelligent transport system, enhancement should be provided.

Deepak Raghuvanshi, et al. (2013) [17] proposed different applications regarding the research and technology and also in this paper through the digital images a major role was played. Within digital image processing technology some degree of noise was present within digital images. There is an introduction to the noise within these images when images are clicked. In order to decrease the noise from the images several image denoising algorithms are introduced. MATLAB simulator was implemented on the basis of nonlocal means (NL-means) algorithm, the image denoising was proposed. Within the nonlocal means (NLM) algorithm there was a concept of self-similarity presented. From the internet there was an aligned pixel within the image that was collected. Alignment was not done properly from capturing the image from digital media. In comparison with other existing techniques Different experiments were conducted in this paper and as per the results was achieved it was observed that the performance of NL-means denoising was better.

Wenshuang Liang, et al. (2015) [18] presented in this paper over the recent years there was huge demand of VANET applications. These networks were deployed both in academic and industrial properties too because of their unique properties. An overview of VANETs was proposed in this paper by the view point of research. Finally, the author has presented the most famous research issues being faced within VANETs. In order to simplify the challenges and also the future enhancements within these networks that were made there was a discussion of general research techniques. Involving the network components, communication types and layered network architecture VANETs architecture was introduced in this paper. Then the discussion of the three aspects of VANETs research issues that are routing, security and privacy were done. Simulator tools were also provided and the focus of this paper was on VANETs research methodologies. On the VANETs research challenges and future trends analysis was provided. On vehicular ad hoc networks comprehensive reference was provided. From the research perspective, covers basic architecture, critical research issues, and general research methods of VANETs the introduction of vehicular ad hoc networks was done in this paper.

*Bassem Mokhtar*, et al. (2015) [19] proposed in this paper besides lacking infrastructure and communicating entities shifts with several accelerations defines the vehicular ad hoc networks as a special case of ad hoc networks. Establishment of reliable end-to-end communication paths and has an efficient data transfer was impeded. To get the availability of ubiquities connection, secure communications and reputation management systems the trust in cooperation was affected between the cell phone networking firms with different network concerned security challenges in VANETs. Because of several network layers the security attacks of

VANETs were classified and security features, challenges and attacks of VANETs in this proposed approach discussion was done on different main concerns.

Uzma Khan, et al. (2015) [20] proposed in this paper wireless communication given by VANETs within the vehicle to vehicle infrastructure. Within this approach there was a need for ensuring of the users travelling to be ensured for a comfortable and safe journey. VANETs are completely different from other networks because there are several different unique properties of these networks. There is a centralized administration and within these networks the infrastructures are fixed. Such networks are prone to several types of attacks because of these properties. The securities of techniques consequences are spoiling. Within these networks in order to present safe communication there was a need to provide correct security measures. Form the networks identification o the malicious nodes were done that was proposed by the novel DMN method presented in this paper. The enhancement of the network's performance was observed on several experiment's basis that were conducted when the algorithm was applied within the applications.

## VI. PROBLEM DEFINITION

Since the nodes can join or leave the network as per their requirement in VANETs, the possibility of malicious nodes to enter the network is also high. Several active and passive types of attacks might be generated in the network due to the presence of malicious nodes. The network can include several types of malicious nodes and a DDoS type of attack can be caused due to this. There is degradation in the performance of networks due to the presence of these attacks. The victim nodes are chosen by the malicious nodes to trigger DDoS attack in the network. The single genuine node is attacked further, by that victim node. For the detection of malicious nodes in the network, several techniques have been proposed based on signature verification amongst which some are also mentioned in the literature review. There is higher complexity of the signature verification technique. The performance of network will degrade with the increase in time required to detect the malicious nodes. A novel technique is proposed in this research using which the malicious nodes are detected from the network in minimal time.

## An analysis on impact of demonetization on rethinking of tax disclosure-A study based on national capital region

**Ms. Nain Suruchi**  
Assistant Professor, School of Commerce & Management Lingaya's University, Faridabad. Email: [suruchinain9@gmail.com](mailto:suruchinain9@gmail.com)  
(<mailto:suruchinain9@gmail.com?cc=gbehal@indianjournals.com>).

Online published on 23 January, 2019.

### Abstract

Demonetization refers to the withdrawal of particular currency (legal tender currency of country) from circulation. Demonetization done to reduce the black money, eradicate fake currency and to promote digital India. This is the bold step taken by the Indian government on 8 November 2016 for the betterment of the economy and country. In this paper, perception of general public towa tax disclosure after demonetization is analyzed through primary data collected. Questionnaire is prepared for primary data and fill with 81 respondents i.e. trader, manufacturer and service provider of Delhi NCR and this data used for further analyses by using descriptive table. After this research work, I concluded that almost all have neutral opinion toward demonetization impact on tax disclosure.

### Keywords

Demonetization, Legal Tender, Black Money, Fake Currency.

## A Comparative Study of the Academic Motivation & Academic Achievement among Senior Secondary Students

**Dr. Sushma Rani**

H.O.D. School of Education, Lingaya's Vidyapeeth, Faridabad Haryana

### Abstract

Poor academic achievement in school can be the result of differences between child factors and environment. Studies have shown that during the early years, the effects of poor academic achievement often lead to population, along with a crime, to the years of adolescence. This paper describes the attitude of CBSE & HBSE students in relation to their academic motivation and academic achievement.

**Keywords:** Academic motivation, Academic achievement.

Copyright©2018 Dr. Sushma Rani This is an open access article for the issue release and distributed under the NRJP Journals License, which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

### INTRODUCTION

“Education is a process of development which consists the passage of human being from infancy to maturity, the process whereby he adopts himself gradually in various ways to his physical and spiritual environment.”

**-T. Reymont**

“Education” we often think ourselves to be educated and use the word “Education” in our daily life. But what’s the real meaning, of it. (1)

Is it mere collection of information or receipt of degree of diplomas. People have already be considering the deviation of the work “ Education”, initially it was related to an original, Latin work Education which is a combination of two, words E and Duco meaning “ out of and to lead” According to Mahabhart, Abhimanyu had learnt how to break the chakravyuha in the womb of his mother Subhadra. It beings from the birth and lasts long even after death as according to

Hindu Philosophy there is an immortality of soul. In broader sense the process is broad- based. Every woman we gain new experiences and transfer it to the other generation. It is a process of growth and development. Every individual is both a teacher and a taught and the place of giving and receiving the process is a ‘School’ Impact, life education, and education is life. Rousseau promoted his vision of maturity, keeping this broad concept of education in his view.

In a narrow sense, school education is called education. Education is called education. Education is imparted at a definite place – school, college or university and at a definite time, with definite curriculum.

### Indian Education System

India's current educational system is an important center for the British rulers. In 1854 Woods Despatch laid the foundations of the present system of education in India.

Prior to the advent of British in India, the education system was private, in which the Woods Despatch was known as the Magna Carta of Indian Education, which changed the whole scenario. Its main purpose was to prepare Indian clerks to run local administration. Under it the means of school education were the vernacular language while the higher education was granted in English only.

British government started giving funds to indigenous school in need of help and thus slowly some of the school becomes government aids.(2)

### **Sarva Siksha Abhiyan (SSA)**

The main goal of this program is that all children (6-1) years should complete primary education by the year 2007 and all children (6-14) years of age must complete eight years of schooling till 2010.

This plan covers the whole country with special emphasis on girl education and education of schedule caste (SC) and schedule Tribe (ST) children and children with special needs SSA centers are mainly opened in areas where there is no school or where the school is very far away. Special girl oriented programs are included.

- Girl education at elementary level.
- National Program for Education of Girls at Elementary Level (NPEGEL).
- Kasturba Gandhi Balika Vidhyalaya (KGBV).
- Mahila Samakhya Scheme.

### **Intellectual Development**

Through college courses, we hope that students will develop intellectual qualities that reflect a well-educated person. We help them develop these traits by holding

them given intellectual standards (through their assignment).

Naturally, this is a learning process for students and tasks time, Faculty should plan according by developing activities appropriate to student's skill and abilities. Jump too high and cause frustration.(4) Jump just beyond and you pull students towards you. Scaffold and support this development process by providing relevant and thoughtful feedback to student's work that helps students to grow intellectually. While reading texts, students can use the questions related to the above intellectual standards to think critically about the text. Encourage the students to use the intellectual elements to examine the Scriptures more deeply and to outline those methods, in which they think of the methods written. (5)

Remember also, that modes of thinking and ways to approach texts critical, varies (sometimes greatly) between content areas. Make the ways in which people approach thinking in your discipline transparent for students.

### **Social Development**

The current paper analyzes key issues related to access to rural poor for safe and sustainable land and water rights in India, thereby identifying and suggesting policies that help improve rural access to land and water.

### **Emotional Development**

Children who learn to manage their emotions, they are benefited in many ways. Most experts agree that when children develop skills to deal with their emotions, they are better with others, academically better, and feel better themselves.

The American Psychological Association said that children who are capable of successfully controlling their emotions are better at focusing, focusing and less impulsive behaviors. Parents can help with their children by talking about emotions. (3)

### **Physical Development**

The love to demonstrate their abilities and area's too inhibited as to where; whether in the grocery store, the bank, or a crowded restaurant; here's the lowdown on movement milestones for first graders. Poor academic achievement in school may be the result of interplay between child factors and the environmental milieu. Studies have shown that the effects of poor academic achievement during the early school years often carry over to the adolescent years, with a delinquency among this population.

### **Objectives of the Study**

The objectives can broadly be stated as:

1. To study the academic motivation of C.B.S.E. & H.B.S.E. students of senior secondary school.
2. To compare the academic motivation of C.B.S.E & H.B.S.E. board students of senior secondary school.
3. To compare the academic achievement of C.B.S.E & HC.B.S.E. students of senior secondary school.
4. To study the academic motivation effects on the academic achievement of C.B.S.E. & H.B.S.E. board students of senior secondary school.

### **Hypothesis of the Study**

- There is no significant difference between the academic achievement of

C.B.S.E. & H.B.S.E. students of senior secondary schools.

- There is no significant difference between the academic motivation of C.B.S.E. & H.B.S.E. board students of senior secondary schools.

### **Research Methodology**

The researcher used simple random sampling for the present research study. A sample of 250 students is selected from the Gurgoan region of Haryana district in which students of +1 & +2 students are included. Out of these 150 students are selected from CBSE and 100 students are selected from HBSE.

### **Statistical Technique Used**

Analysis of data for the present study has been made in conformity with the objectives and hypothesis formulated. The researcher has used SD (Standard Deviation) and 't' test for the present research study to find out the significance of different between Mean, Academic Motivation and Achievement scores of H.B.S.E. and C.B.S.E. of senior school students.

### **Delimitations of the Study**

Keeping in the views the time factor and resources available the present study was delimited to the following

- The present study is confined to only one variable i.e. the academic motivation and the academic achievement.
- The study is delimited to 250 secondary school students C.B.S.E. & H.B.S.E. board senior secondary students.

### Main Findings

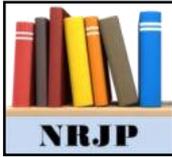

- The academic motivation and achievement level of senior secondary school students of H.B.S.E Board is average.
- The senior secondary students of CBSE students are average motivated.
- There is a significant difference in the academic motivation of C.B.S.E. and H.B.S.E. senior secondary students. The t value is more than the table

value, thus null hypothesis is rejected. There is a significant difference between the academic motivation of CBSE and HBSE senior secondary students.

- For the present research study, the researcher revealed that CBSE students are more motivated and goal-oriented than the HBSE senior-secondary students.

## Enhancing Quality of Education through Ict Based Approaches

**Dr. Sushma Rani<sup>1</sup> Ms. Jugnu Khatter<sup>2</sup>**

<sup>1</sup> H.O.D. School of Education, Lingaya's Vidyapeeth, Faridabad Haryana.

<sup>2</sup> School of Education, Lingaya's Vidyapeeth, Faridabad Haryana.

### **Abstract**

*Information and Communication technology has opened up new challenges for education . ICT has become the part and parcel of human life. The discoveries and inventions in science and technology have led to improvements in the speed of communication. Information technology has been influencing our lives in the recent years in the fields of education, healthcare, and business. Information and communication technology in educational institutions has had a major impact. Information and communication technology in educational institution can be used as an integral communication tool to improve student learning and better teaching techniques. With the advancement of technology in education, educational institutions adopt communication software to transmit, store, share or exchange information. In this technological era, ICT in education has compelled many educational institutions to get accustomed to smart technology. ICT can be a powerful enabler of development goals because its unique characteristics dramatically improve communication and the exchange of information to strengthen and create new economic and social networks.*

**Key words:** *ICT, Digital technologies, Education, Learning.*

Copyright©2018, Dr. Sushma Rani, Ms. Jugnu Khatter This is an open access article for the issue release and distributed under the NRJP Journals License, which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

### **Introduction**

#### **Concept of ICT (Information and Communication Technology)**

Technology is the nonlinear tool for accelerated economic growth, and the foundation for the sustained development of the nation.

- APJ Abdul Kalam

Information and Communication technology refers to the technology which is employed in the shape of tools equipments and application supports. It involves collection, use, storage, retrieval, transmission, manipulation and dissemination of information. ICT includes the use of hardware and software for efficient management of information. ICT means use of certain tools to represent our

knowledge and express our ideas and leads to enhance learning. (1)

According to Education Review Office 2000:," The phrase Information and Communication technology is now being used, to include telecommunications equipment through which information can be sought and accessed through the internet, television, phones , Faxes, modems and computers."

ICT has the potential to be used as a supportive and collaborative educational tool enabling students' learning by doing. ICT can make it possible for teachers to engage students in self-paced, self-directed problem-based or constructivist learning

experiences; and also test student learning in new, interactive, and engaging ways that may better assess their understanding of the content. (2)

### **According to the QCA scheme of work for ICT:**

“ICTs are the computing and communication facilities that variously support teaching, learning and range of activities in education.”

There are five aspects of the educational use of ICT –

- supporting new pedagogical methods
- accessing remote resources
- enabling collaboration
- extending educational programs and
- developing skills for the workplace

ICT is a big stimulating force which not only influences the human cognition and its thought process but also help human to construct knowledge. It enhances teaching learning process by making it more effective and interesting. It improves availability of content material and support distance and correspondence education through e-resources. it improves enrolment by convenient admission and examination process. It assists in research and development activities

ICT tools help to open up opportunities for learning by enabling four major key processes in transforming teaching and learning as follows:

Access ideas and information from diverse sources through searching, locating, selecting, and authenticating material in a wide range of multimedia forms;

Extend ideas and information through processing, manipulating, analyzing &

publishing material in different multimedia forms;

Transform ideas and information into new or different forms through synthesizing, modeling, simulating and creating material in many multimedia styles and formats; and Share ideas and information across local, national and international networks by interacting electronically with others in actual and/or delayed time. (4)

Access, extend, transform and share represent key processes by which students learn and become independent learners and self-starters. Through the processes learners express their creativity and imagination. These processes can be applied in all areas of learning and in all levels of education.

### **Importance of ICT in Education**

#### **1. Assist students in accessing information**

ICT is used as a tool for students to discover learning topics, solve problems and provide solution to the problems in the learning process. ICT makes knowledge acquisition more accessible concepts in learning areas are understood while engaging students in the application of ICT.

#### **2. Support Student -Centred and Self-directed learning**

Students are now more frequently engaged in the efficient use of technology. They build new knowledge through accessing , selecting , organizing and interpreting information and data. Based on learning through ICT, students are more capable of using information and data from various sources and critically assessing the quality of the learning materials.

### **3. Produce a conducive and creative learning Environment**

ICT develops students' new and more developed understanding in their areas of learning. ICT provides more creative solutions to different types of learning by providing stimulating and conducive environment.

### **4. Promote Collaborative learning in a distance-learning Environment**

ICT enables students to communicate, share and work collaboratively anywhere, any time. Students not only acquire knowledge together, but also share diverse learning experiences from one another in order to express themselves and reflect on their learning.

### **5. Offer more opportunities to develop critical thinking skills**

Based on a constructive learning approach, ICT helps students focus on higher-level concepts rather than less meaningful tasks. A longer exposure in the ICT environment can foster students' higher critical thinking skills.

### **6. Improve teaching and learning quality.**

The students have more opportunity to build the new knowledge onto their background knowledge and become more confident to take risks and learn from their mistakes. It concluded that ICT fosters autonomy by allowing educators to create their own material, thus providing more control over course content.

The world is changing due to technological developments in all the areas hence education is also changing. As a result imperatives of new times, new demands and new visions assign more

challenging role and responsibility to the teacher (Das.2015)

### **Effective use of ICT for quality Learning**

ICT increases the flexibility of delivery of education so that learners can access knowledge anytime and from anywhere. It can influence the way students are taught and how they learn as now the processes are learner driven and not by teachers. This in turn would better prepare the learners for lifelong learning as well as to improve the quality of learning. The rationale and guiding principles for effective use of ICT in learning and teaching can be summed up as follows:-

#### **1. Using a variety of Pedagogies**

A variety of learning and teaching pedagogical approaches and activities should be planned through various computerized softwares and programs to suit different purposes and individual styles of learners.

#### **2. Knowledge**

Knowledge is available in different forms and contexts. While some knowledge is established, some is undergoing dynamic changes with time. To be useful, construction of knowledge by the learner should take place. ICT provides infinite opportunities and resources for the construction of new knowledge and reconstruction of existing concepts.

#### **3. Optimum utilisation of Resources**

The curricula shall promote the full utilization of infrastructure and resources, integrating it with the ICT based programs. Universal access and fostering of a sense of ownership shall be encouraged to ensure maximum impact.

#### **4. Integration with learning objectives**

For the wholesome personality development, range of assessment practices such as project work, various types of tests should be used for assessing the achievement of different learning objectives.

#### **5. Tracking pace of Learning**

Assessment is a continuous process aiming at tracking learning progress over time. ICT allows students in establishing their own incremental targets and controls their own pace of learning, which in turn positively impacts their commitment to learning.

#### **6. Encouraging and Timely Feedback**

ICT can be used for keeping timely feedback through various feedback and assessment devices. A variety of encouraging feedback means can be utilized by a teacher along with an indication of areas for improvement.

#### **7. Promoting Interaction**

Interaction with students to explore their existing knowledge and notions should be used. Open-ended questions that make students think and offer views will assist students in learning from each other.

#### **8. Considering diversity of learners.**

A variety of strategies are employed under ICT that provide ease of learning for catering to learner diversity due to individual differences. (5) Development of full competency in the use of digital technologies and ICT has been the need of the hour.

The adoption and use of ICTs in education have a positive impact on teaching, learning, and research. ICT can affect the delivery of education and enable wider access to the same. In addition, it will increase flexibility so that learners can access the education regardless of time and geographical barriers. It can influence the way students are taught and how they learn. It would provide the rich environment and motivation for teaching learning process which seems to have a profound impact on the process of learning in education by offering new possibilities for learners and teachers.

## **Pragmatic and Innovative Learning Strategies for Effective Learning**

**Ms. Jugnu Khatter\***

**Dr. Sushma Rani\*\***

The conventional methods of learning call for drastic changes in the modern age through improvised technology and innovations in curriculum and assessment. The expectations and demand of modern age is to have pragmatic and innovative techniques so as to equip learners with necessary skills through their active engagement and participation in teaching and learning process.

**Key Words:** Active Participation, Innovative teaching Techniques

*"Innovation is not about timing. it is about creating something that fulfils an unmet need."*  
**-Jeremy Gutsche**

In education process, learner active participation refers to the extent of attention, curiosity, interest, optimism, motivation and passion that learners show in teaching leaning process. When learners are actively engaged with the content being taught, they learn more rapidly and retain more. Learners who are actively engaged in the work tend to persist more and find more joy in completing the work. The biggest challenge for any teacher in learning process is capturing each learner's attention, and conveying ideas effectively enough to create a long lasting impression. Innovative Learning Strategies can empower learners to think critically, access and analyze information, creatively problem solving, work collaboratively and communicate with clarity and impact.

In this research article, few innovative teaching strategies are discussed that engage learners: (1) inquiry-based learning, (2) problem-based learning (3) Review Learning (4) Jigsaws Learning (5). Smart classroom technology (6) Heuristic learning .These innovative teaching strategies encourage learners to use their imagination to dig deep when engaging with the content in the teaching learning process. The learners are actively involved with the learning and can work with their peer group in collaborative groups to showcase their learning achievements.

### **Inquiry-Based Learning**

Inquiry-based learning is one of the effective teaching strategies in the classroom because learners learn best when they construct their own meaning with the help of their abilities, capacities and interests. Inquiry-based learning helps in generating learner curiosity. Teachers act as a guide and facilitators during the inquiry-based learning process.

There are mainly three steps in the process:

1. To prepare questions and arrange them in a sequence.
2. To present the questions in appropriate way so that curiosity may be created among the learners.
3. To ask new questions by liking with learner's responses. Teacher is able to recognize the intention of learners and provides motivation accordingly.

---

\* Research Scholar, School of Education, Lingaya's Vidyapeeth, Faridabad

\*\* HOD, School of Education, Lingaya's Vidyapeeth, Faridabad

Inquiry-based learning allows learners to pose the questions and convert that information into useful knowledge, thus increase the level of learner engagement.

### **Project-Based Learning**

*"A problem well defined is a problem half-solved."*

*–John Dewey*

Project-based learning is an effective and enjoyable way to learn. It also develops deeper learning competencies required for success in real life situations. The main focus of this is to socialize a child as it provides an opportunity for work experience, divergent thinking and social efficiency.

There are six steps in the process:

1. To identify a problem related to life situation of the learner.
2. To select and define the problem.
3. To prepare a plan for finding out the solution of the problem.
4. To implement the plan.
5. To evaluate the workability of the project plan.
6. To prepare of record of the project.

Project-based learning uses real-world scenarios, challenges, and problems to engage learners in critical and creative thinking, problem solving, teamwork, and self-management. The teacher's work is to provide proper guidance. It uses collaboration, digital tools, and problem solving skills to come up with a solution to the problem presented.

### **Review Learning**

Review learning develops the ability of critical thinking among learners. The learners are assigned to review an independent topic or one topic is assigned to a group of learners. This type of learning requires self-motivation and involvement in the subject matter.

This mainly involves four steps:

1. A topic, problem or area is selected to review critically.
2. A list of relevant literature and sources is prepared by pupils with the guidance of a teacher
3. To go through the available material to collect relevant information or material.
4. On the basis of relevant literature, the pupils prepare a review of the topic or idea or problem assigned to him.

In this type of learning, learners have to perform much of library and historical work. The learners should have the patience consulting the topic from available literature and should have the feeling of cooperation to help each other in this regard, if working in a group.

### **Jigsaws Learning**

The jigsaw learning technique is a "tried and true" i.e. co-operative learning technique that helps learners to create their own learning. Learners are arranged in groups and assigned a different piece of information. In their own groups, learners learn and understand the piece of information well enough to be able to teach it to another group of learners.

Through this learning technique, learners become experts on the learning as they teach their peer group. Once all groups have learned their information, they are placed into new groups with members from each of the small groups. Each group member shares the information and knowledge they gained in their informational group. This learning technique brings lessons to life and challenges learners to create their own learning. This challenge engages learners and motivates them to share their learning with others learners.

### **Smart Classroom Technology**

Many schools have become one-to-one schools, i.e., each Learner has his/her own technology device (a tablet or Laptop) to work with each day. Learners can take the technology device home to complete their homework.

Teachers must use technology in a smart managed way and with a wide variety of activities. Several activities that lead to learner engagement are Google Docs, YouTube videos, Quizlet, Kahoot!, and the Remind app. These innovative apps and websites can help teachers engage the learners, remind them and encourage them about upcoming assignments and homework, provide visual learning through videos, organize their learning, provide group collaboration, and provide check-ups on learning through games and online quizzes.

### **Heuristics Learning**

*"Heuristic Method is a method of teaching which involves our placing the learners as far as possible in the attitude of a discoverer"*- **Armstrong**

It is based upon the assumption of Herbert Spencer that the learner should be told as little as possible and he should be encouraged to learn himself as much as possible.

This learning technique involves 'trial and error' and invention technique. It requires more logical and imaginative thinking in formulating the number of tentative solutions for the problem. It helps in developing scientific attitude towards the problem.

Main steps of this type of learning are:

1. Define objectives and opportunities.
2. Map the process or constituent elements of system.
3. Express impact of each step or element.
4. Link each impact back to each objective.
5. Organize and consolidate generated statements.

This is a psychological method as the learner learns and experience by self-practice. It inculcates in the learner the interest for the subject and also develops willingness in them.

### **Brain Storming Learning**

This type of learning consists of a problem solving situation in which learners have to analyze and evaluate the workability of their own suggestions of the problem. It is based on an assumption that learners can learn better in a group rather than in individual study. It encourages for the original ideas and more creative strategy of learning.

This learning technique involves following steps:

1. Plan all phases of the problem and think about the sub-problems which may emerge.
2. Select sub-problems to be attached.
3. Think about the data or differences which may help involving them.
4. Select the probable sources of data and collect most relevant data.
5. Decide and select ideas most likely lead to the situation.
6. Consider the possible ways to test these ideas and test them in terms of relevance, adequacy and sufficiency.
7. Imagine all possible contingencies and ways of meeting them.
8. Take decision about the final solution of the problem.

This learning technique provides more ideas of good quality.

Each of the above discussed learning techniques provide an opportunity to learners for questioning, research, use of smart technology, and create meaning from provided materials and research. These techniques also allow learners to solve problems, challenge

themselves, and present their findings to others. Learner's engagement builds on curiosity, interest, passion, abilities, aptitude and attention.

## ABSTRACT

*Constructivism is basically a theory -- based on observation and scientific study -- about how people learn. It says that people construct their own understanding and knowledge of the world, through experiencing things and reflecting on those experiences. Constructivism is currently the predominant perspective within which human learning is described and explained. It emphasizes on learners being active players in the process of learning and modifies the role of teacher from knowledge transmitter to that of facilitator. It is quite unfortunate that even today learning in classrooms is rote memorized and exam oriented. Students are not interested to learn as learning is not meaningful to them. The prime reason for such a situation is that most of the teachers continue to teach through traditional methods and do not involve students in the process of learning thus making the process of learning uninteresting for the students. Teachers cite several factors for not being able to teach using constructivist approach. The reasons will always be there. What we have to see as teachers is that how we can make the best use of our time, resources and talents to promote active learning in classrooms and make our learners self directed learners.*

**Keywords:** Constructivism, facilitator

## INTRODUCTION

Constructivism is basically a theory -- based on observation and scientific study -- about how people learn. It says that **people construct their own understanding and knowledge** of the world, through experiencing things and reflecting on those experiences. When we encounter something new, we have to reconcile it with our previous ideas and experience, may be changing what we believe, or maybe discarding the new information as irrelevant. In any case, we are active creators of our own knowledge.

In the classroom, the constructivist view of learning can point towards a number of different teaching practices. In the most general sense, it usually means encouraging students to use active techniques (experiments, real-world problem solving) to create more knowledge and then to reflect on and talk about what they are doing and how their understanding is changing.

The teacher makes sure she understands the students' preexisting conceptions, and guides the activity to address them and then build on them. Constructivist teachers encourage students to constantly assess how the activity is helping them gain understanding. By questioning themselves and their strategies, students in the constructivist classroom ideally become "expert learners." This gives them ever-broadening tools to keep learning. With a well-planned classroom environment, the students learn **HOW TO LEARN**

Contrary to criticisms by some (conservative/traditional) educators, **constructivism does not dismiss the active role of the teacher** or the value of expert knowledge. Constructivism modifies that role, so that teachers help students to construct knowledge rather than to reproduce a series of facts. The constructivist teacher provides tools such as problem-solving and inquiry-based learning activities with which students formulate and test their ideas, draw conclusions and inferences, and pool and convey their knowledge in a collaborative learning environment. Constructivism transforms the student from a passive recipient of information to an **active participant in the learning process**. Always guided by the teacher, students **construct** their knowledge actively rather than just mechanically ingesting knowledge from the teacher or the textbook.

Constructivism is also often misconstrued as a learning theory that compels students to "reinvent the wheel". In fact, constructivism taps into and triggers the student's innate curiosity about the world and how things work. Students do not reinvent the wheel but, rather, attempt to understand how it turns, how it functions. They become engaged by applying their existing knowledge and real-world experience, learning to hypothesize, testing their theories, and ultimately drawing conclusions from their findings. The classroom is no longer a place where the teacher pours knowledge into passive students, who wait like empty vessels to be filled. In the constructivist model, the students are urged to be actively involved in their own process of learning. The teacher functions more as a facilitator who coaches, mediates, prompts, and helps students develop and assess their understanding, and thereby their learning.

In the constructivist classroom, both teacher and students think of knowledge not as inert factoids to be memorized, but as a dynamic, ever-changing view of the world we live in. The constructivist classroom relies heavily on collaboration among students. There are many reasons why collaboration contributes to

learning. The main reason it is used so much in constructivism is that students learn about learning not only from themselves, but also from their peers. When students review and reflect on their learning processes together, they can pick up strategies and methods from one another and explore that view.

### What are the benefits of constructivism?

1. Children learn more, and enjoy learning more when they are actively involved, rather than passive listeners.
2. Education works best when it concentrates on thinking and understanding, rather than on rote memorization. Constructivism concentrates on learning how to think and understand.
3. Constructivist learning is transferable. In constructivist classrooms, students create organizing principles that they can take with them to other learning situations.
4. Constructivism gives students ownership of what they learn, since learning is based on students' questions and explorations, and often the students have a hand in designing the assessments as well.
5. Constructivist assessment engages the students' initiatives and personal investments in their journals, research reports, physical models, and artistic representations.
6. Engaging the creative instincts develops students' abilities to express knowledge through a variety of ways.
7. The students are also more likely to retain and transfer the new knowledge to real life.
8. By grounding learning activities in an authentic, real-world context, constructivism stimulates and engages students.
9. Students in constructivist classrooms learn to question things and to apply their natural curiosity to the world.

### THE FIVE CENTRAL TENETS OF CONSTRUCTIVISM

1. First, constructivist teachers seek and value students' points of view. Knowing what students think about concepts helps teachers formulate classroom lessons and differentiate instruction on the basis of students' needs and interests.
2. Second, constructivist teacher structure lessons to challenge students' suppositions. All students, whether they are 6 or 16 or 60, come to the classroom with life experiences that shape their views about how their worlds work. When educators permit students to construct knowledge that challenges their current suppositions, learning occurs. Only through asking students what they think they know and why they think they know it are we and they able to confront their suppositions.
3. Third, constructivist teachers recognize that students must attach relevance to the curriculum. As students see relevance in their daily activities, their interest in learning grows.
4. Fourth, constructivist teacher's structure lessons around big ideas, not small bits of information. Exposing students to Wholes first helps them determine the relevant parts as they refine their understandings of the wholes.
5. Finally, constructivist teachers assess student learning in the context of daily classroom investigations, not as separate events. Students demonstrate their knowledge every day in a variety of ways. Defining understanding as only that which is capable of being measured by paper-and-pencil assessments administered under strict security perpetuates false and counterproductive myths about academia, intelligence, creativity, accountability, and knowledge.

### The 5 E's - An Instructional Model Based On The Constructivist Approach To Learning

Each of the 5 E's describes a phase of learning, and each phase begins with the letter "E": Engage, Explore, Explain, Elaborate, and Evaluate. The 5 E's allows students and teachers to experience common activities, to use and build on prior knowledge and experience, to construct meaning, and to continually assess their understanding of a concept.

#### 1. Engage

This phase of the 5 E's starts the process. An "engage" activity should do the following:

Make connections between past and present learning experiences.

Anticipate activities and focus students' thinking on the learning outcomes of current activities.

Students should become mentally engaged in the concept, process, or skill to be learned.

#### 2. Explore

This phase of the 5 E's provides students with a common base of experiences.

They identify and develop concepts, processes, and skills.

During this phase, students actively explore their environment or manipulate materials.

### 3. Explain

This phase of the 5 E's helps students explain the concepts they have been exploring.

They have opportunities to verbalize their conceptual understanding or to demonstrate new skills or behaviors.

This phase also provides opportunities for teachers to introduce formal terms, definitions, and explanations for concepts, processes, skills, or behaviors.

### 4. Elaborate

This phase of the 5 E's extends students' conceptual understanding and allows them to practice skills and behaviors. Through new experiences, the learners develop deeper and broader understanding of major concepts, obtain more information about areas of interest, and refine their skills.

### 5. Evaluate

This phase of the 5 E's encourages learners to assess their understanding and abilities and lets teachers evaluate students' understanding of key concepts and skill development .

## CONSTRUCTIVISM IN SCIENCE

Humans are curious by nature. This curiosity has driven them since time immemorial to explore the world around them. Over time, manipulation and controlling nature for the benefit of humans has become an objective of exploration. Science is all about exploration and children are very curious by nature. A science teacher can exploit this curiosity of learners in teaching - learning of sciences.

However, often, the investigations are carried out in a routine fashion to let the children score in examination. If conducted properly, these activities not only raise the motivation but also develop interest and curiosity to learn and try things in different ways. In their strive to answer, 'what if,' children get actively involved in different processes such as observation, discussion, collecting information, manipulation, comparing, classification, improvisation, experimentation, critical thinking, logical reasoning, etc., thus enabling them to go through the processes of not only 'hands-on' but 'minds-on' as well. For example, children could be facilitated to observe natural phenomenon such as condensation, evaporation, rusting, seed germination, reflection, refraction, interference of light, electromagnetic induction, etc. Based on the observations and questions raised in the minds of children and asked by the teacher, problems could be identified and defined and hypothesis could be made. To test the hypothesis(es), experiments should be performed to validate or discard their hypothesis.

Curiosity gets aroused as a result of doubt, perplexity, contradiction, cognitive conflict, ambiguity, lack of clarity, etc. A teacher needs to create suitable learning situations for this. Science teacher must take advantage of natural curiosity of children by engaging them in the exploration of the ideas of the concept being transacted through scientific processes and inquiry.

## WAYS OF PRACTICING CONSTRUCTIVISM IN SCIENCE

There are numerous ways in which constructivist approach can be practiced in classrooms. Discussed below are few examples.

**Example 1:** The teacher may probe students with simple questions such as whether water boils faster in closed container or open container. The student should be motivated to perform an activity to solve the query.

**Sensing and identifying the problem:** Water boils in the container faster, when the lid is placed over it than when it is not placed.

**Defining the problem:** Does it have a higher temperature with the lid-on than the lid-off?

**Hypothesis:** I (child) think that water will boil at higher temperature with the lid-on as the lid prevents heat loss.

**Testing hypothesis:** Two sets of each of the following materials were required for testing the hypothesis—beaker, tripod, thermometer, wire gauze and Bunsen burner. A square/circular piece of cardboard was also taken to make the lid for the beaker. I used two beakers that were of same size and material. Then I put same amount of water in each beaker. The lid was placed on one beaker. When water started boiling I noted its temperature. The lid was kept off the other beaker. Temperature of water taken in the second beaker was noted down when it started boiling.

**Collecting data :** I did the investigation as described above. I pierced a hole in the cardboard lid to insert thermometer to take the temperature. I let the water boil for one minute before taking the observations.

**Recording data**

Temperature

With lid 99.5 oC

Without lid 99 oC

**Interpreting data:** The two readings were almost same.

**Drawing conclusion:** I think that there is no difference in the temperature of boiling water with or without lid-on the beaker.

**Making generalisation:** I think fast boiling of a liquid does not mean high temperature of the liquid, that is why its boiling point does not change.

**Further questions :** Why do we cook food in closed vessels, rather than in the open ones? I read on the LPG slip that cooking with the lid on saves fuel. How does it save fuel? How the food gets cooked faster in the pressure cooker?

The problem may either be posed by the student or the teacher. It may also arise as an idea during discussion. The teacher need not provide the whole plan to carry out the investigation, but should involve children to evolve the plan through discussion. She may help children to work in groups to carry out the investigation. Some children might be trying to heat water in beakers of different sizes/materials. Some might use unequal amount of water in the beakers. There could be variations in taking the temperatures, readings of the thermometer, etc. Through questioning, discussion and sharing the work mutually and with the whole class, the children may be trained in this approach over a period. This can help them develop the skills of scientific process and inquiry.

**Example 2:** A discussion on natural satellites was going on in Class XI when a student asked, “what would happen if there is no moon in the sky?” Rohit, the teacher directed this thought provoking question to the whole class. Students came up with a number of answers— some relevant, some irrelevant. Rohit listened, called a student to write all answers on the blackboard without labelling them as right or wrong. Some of the responses were, “our earth would spin faster;” “days and night would be shorter;” “we would get less time at school/to watch TV/to sleep;” “there will be complete darkness in the night;” “whom with the poets would compare the beauty;” “wind would blow faster;” “life would not have existed on the earth;” “centre of mass of the earth would have been different;” and “the axis of rotation of the earth would be different.” Later Rohit discussed with them the probable answers and asked students to collect more information related to the question and justify their answers through the group project work in the class.

Creativity is doing or seeing the things differently. It cannot be taught, but developed in children by using planned strategies and techniques. Emphasis should be given on providing appropriate concrete experiences which nurture creative traits in a learner, viz. curiosity, ability to fantasise, playfulness, as well as cooperative and helpful attitudes in teaching-learning of science.

**Example 3:** Angela, a teacher is transacting the concept ‘what dissolves in water and what does not’ in Class VII. She forms small groups of students and asks them to see themselves which of the following materials dissolve in water.

Sugar, Wooden shavings, Salt, Lemon juice, Iron filings, Mud/Sand, Coffee powder, Sharbat

She helps the students to think about the following questions and discuss among themselves in groups.

Q.1 Which of the substances in the above list dissolve in water?

Q.2 What happens to a substance when it is dissolved in water?

Q.3 Try to dissolve four teaspoonful of sugar in a glass of water. Observe the level of water. Does it rise?

Q.4 Do you see some undissolved sugar at the bottom? How can you dissolve it in water?

And the list of questions goes on with students’ added questions. The students perform the activities in groups and enter into argumentation among themselves about the observations and the reasons for such observations. In the process they

listen to other students and discuss with them;

express their point of view justifying their statements;

accept/reject and acknowledge other student’s point of view;

make other students understand their point of views; and

mutually arrive at the correct reason.

They interact with the teacher and students of other groups to arrive at scientific explanations.

**Example 3:** 'Air is everywhere' is a statement that every school child learns. Students may know that the earth's atmosphere consists of several gases, or that there is no air on the moon. We might be happy that they know some science. But consider this exchange in a Class IV classroom.

**Teacher: Is there air in this glass?**

**Students (in chorus): YES!**

The teacher was not satisfied with the usual general statement, 'Air is everywhere.' She asked the students to apply the idea in a simple situation, and found, unexpectedly, that they had formed some 'alternative conceptions'.

**Teacher: Now I turn the glass upside down. Is there still air in it?**

Some students said, 'Yes', others said, 'No', still others were undecided.

**Student 1: The air came out of the glass.**

**Student 2: There was no air in the glass.**

In Class II, the teacher put an empty glass over a burning candle and the candle went out! The students had performed an activity whose memory had remained vivid even two years later, but some of them at least had taken away an incorrect conclusion from it. After some explanation, the teacher questioned the students further—Is there air in this closed cupboard? Is there air in the soil? In water? Inside our body? Inside our bones? Each of these questions brought up new ideas and presented an opportunity to clear some misunderstandings. This lesson was also a message to the class: do not accept statements uncritically. Ask questions. You may not find all the answers, but you will learn more.

**Example 4: Traditional way:** The teacher may take an aqueous solution of  $\text{CuSO}_4$  in a beaker and dip a strip of Zn in it. She leaves the beaker undisturbed for sometime. Then, the teacher asks the students, what do you observe? The students may reply that blue colour of the solution fades and a brown coating appears on the strip of Zn. Teacher then explains that this is because zinc is more reactive than copper, it displaces copper from its salt solution.

**Constructivist Way:** The teacher may take two beakers and label them as 'A' and 'B'. In beaker 'A', she takes aqueous solution of  $\text{CuSO}_4$  and calls a student to dip a Zn strip in it. In beaker 'B', aqueous solution of  $\text{AgNO}_3$  is taken and a Cu strip is dipped in it. She suggests to the class, "Let us keep the two beakers undisturbed for sometime and observe what happens."

Students observe that blue colour of the solution fades and brown coating appears on Zn strip in beaker 'A'. She draws attention of students to beaker 'B'. Students observe and state that colour of solution changes from colourless to blue and a shiny coating appears on Cu strip.

**Student 1:** Why do these changes occur in beakers 'A' and 'B'? Teacher encourages the class to think about it. Students come up with some responses.

**Student 2:** I think that Zn being more reactive than Cu. Therefore, Zn displaces Cu from  $\text{CuSO}_4$ .

**Teacher:** Yes, you are right. And Cu being more reactive than Ag, displaces it from  $\text{AgNO}_3$ . What type of reaction do you think is occurring in this activity?

**Student 3:** Displacement reaction.

**Teacher:** Which metal in this experiment is most reactive? How can we arrange the three metals involved in this activity in the order of their decreasing reactivity?

**Student 2:**  $\text{Zn} > \text{Cu} > \text{Ag}$ .

**Teacher:** Now, think about a situation, where we can store a solution of  $\text{ZnSO}_4$  in a copper container.

**Student 4:** Yes, we can. Because it will not react with copper.

**Teacher:** Do you now think that the reaction taking place is a displacement reaction? Here a more reactive metal displaces a lesser reactive one from its salt solution.

**Student 5:** Yes, now I understand well.

**Student 2:** Can we arrange metals on this basis in the order of their decreasing reactivity?

**Student 6:** Yes, I have seen it in the book. Various metals are arranged as reactivity series. Because of reactivity, it is safe to store a salt solution of a metal in a container made of a lesser reactive metal.

**Example 5:**

Following is an example of activity that can be conducted in the class engaging students in teaching-learning of science.

### Concept

Solubility of common salt/sugar in water

### Observation

1. If sugar is added into still water, it takes longer time for dissolution.
2. Salt/Sugar dissolves fast in water on stirring or heating the mixture.

**Inquiry**

1. What is the reason for fast dissolution of salt/sugar in water?
2. Whether volume of solvent increases on forming solution?

**Hypothesis**

1. On increasing kinetic energy of particles, either by stirring or by increasing temperature, the components of solution intermix fast.
2. Volume of solution increases, because solute particles also occupy space.

**Experimentation**

1. Take 100 ml of water each in three beakers 'A,' 'B' and 'C.'
2. Put one teaspoonful of salt/sugar in each beaker
3. Do not disturb beaker 'A.'
4. Stir the mixture of beaker 'B' with the help of a glass rod.
5. Heat the mixture of beaker 'C' on the tripod stand with the help of spirit lamp/burner.
6. Record the time for complete dissolution of salt/sugar in beaker 'A,' 'B' and 'C'.
7. Measure the volume of solutions in beakers 'A,' 'B' and 'C' with the help of a measuring cylinder.

**Conclusion**

1. Complete dissolution of salt/sugar in beaker C takes the least time. Time taken for complete dissolution of salt/sugar in beaker 'A' is maximum out of the three cases.
2. Volume of solution in each case remains 100 mL.

**Comments**

Hypothesis no. 1 is correct, but hypothesis no. 2 is incorrect, since, there is no change in the volume of solvent on forming solution. There is a need to alter the hypothesis no. 2. The correct reason is that the solute particles occupy the spaces available in the solvent itself, called intermolecular spaces. No new space is occupied by the solute particles.

**CONCLUSION**

When a teacher enters into a classroom she is expected to be well equipped with the content knowledge as well as the pedagogical principles of teaching –learning. For constructing the knowledge of a learner, she has to adapt and adopt various strategies of teaching – learning that come in the purview of constructivist pedagogy. The teacher should motivate a learner to pursue inquiry by exploring things in his surrounds. Mostly teachers cite lot of reasons for not being able to practice constructivist approach in class. It is to inform teachers that they necessarily don't need to engage their students in performing high end experiments which perhaps needs a lot of sophisticated instruments and a lengthy protocol to follow. Even a simple experiment can satisfy the doubt, query and curiosity of a learner. Teachers should judge the previous knowledge of a learner correctly. Learners always have some doubts, misconceptions and curiosity about nature in their minds . Teachers should take these doubts seriously and encourage learners to come up with an answer to their by performing simple activities. Learning can then become meaningful for them as they themselves involved in constructing knowledge about the world around them.

**Abstract-** SC-FDMA signals are currently espoused equally the Long Term Evolution (LTE) standard for the uplink due to its high data rate and low Peak to Average Power Ratio (PAPR). In SC-FDMA, two methods of choosing subcarriers for transmission are used; distributed using Interleaved (IFDMA) and localized (LFDMA). The Interleaved FDMA (IFDMA) is a distributed mode with equidistance between occupied subcarriers. In this paper, the PAPR for LFDMA and IFDMA techniques is simulated and compared. Simulation shows that the reduction of PAPR for IFDMA decreased more than 3 dB compared with LFDMA, which means that the IFDMA has better PAPR Performance than LFDMA. Moreover as shown as in the Figures there is a direct relationship between the Roll-off-factor (Alpha,  $\alpha$ ) and subcarriers, When the value of Alpha increases and the subcarriers increase, the result is a good performance of PAPR.

**Keywords-** SC-FDMA, PAPR, LTE, IFDMA, LFDMA

## I. INTRODUCTION

To design a SC-FDMA, OFDMA is the inner part of SC-FDMA thus multiple user structures are not disparate as it performs at first. In totting of the SC-FDMA quite is deceptive as that technology similar OFDMA too uses sundry sub-carriers on the airborne interface. To elucidate how SC-FDMA mechanism is best to take a mien at OFDMA used by wi-max and to be find out the difference to SC-FDMA. SC-FDMA uses a cross format that its combine the lpar by the subcarrier network over multipath intrusion springiness and malleable sub-carrier frequency allocation.

**SC-FDMA:** In SC-FDMA transmits data through the communication channel in various sub-carriers then adds an extra dispensation step as shown in the below figure. In its place 4 bits are putting calm OFDM is one of the sample to practice the signal for additional subcarrier processing block. In SC-FDMA transfers the info to each bit to overall the sub-carriers. In this process will be done as a trails of some bits e.g. 4 signifying a 16 qam lilt are grouped calm. In the part of OFDM these group of bits oblige the input of the IDFT.

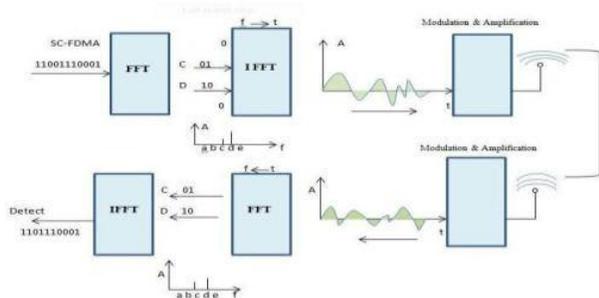

Fig.1

In some of the bits are piped into a fast Fourier function the output process for the creation of the sub-carriers are to follows IFFT. All sub-carriers are not used by the mobile station many of them are set to be zero in the following diagram. These may or may not be used in other mobile stations.

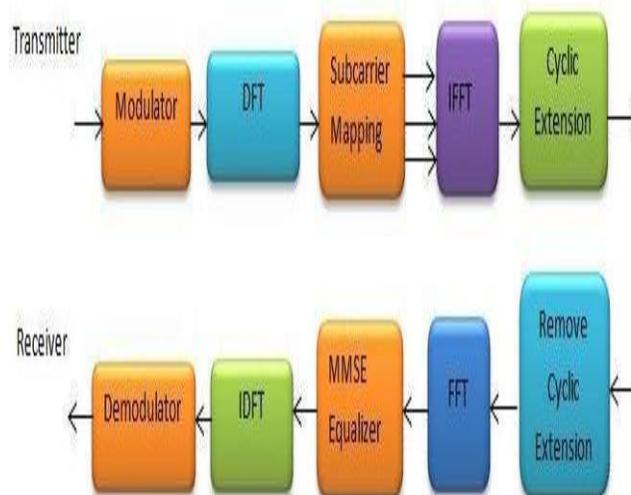

Figure2. The block diagram of an SC-FDMA system

**OFDMA:** OFDMA transfers a data creek through using some slender set of sub-carriers concurrently e.g. 512,1024 or even more reliant on the global open bandwidth e.g. 5 ,10, 20 mhz of the channel. Equally several bits are elated in comparable transmission speed on every sub carrier tin be ample lower than the whole ensuing data rate. This is significant in a practical radio atmosphere in edict to minimize weight of multipath fading formed by faintly

different influx eras of the signal from different directions. on the receiver side the indicator is first demodulated and amplified. The outcome is then treated by a fast Fourier transformation function which converts the time signal hind into the frequency domain. This re-enacts the frequency/ amplitude diagram bent at the transmitter. At the centre frequency of each sub-carrier a gauge function is used to produce the bits which remained originally used to generate the sub-carrier.

I've happened to stumble over PAPR (peak to average power ratio) quite a lot lately as it seems to play a big role in wi-max and 3gpp lte mobile devices. Most papers mention that lte has a better PAPR than wi-max but fail to explain what it is and why this is so important. After some research and help from a number of expert's heres an intro to papr:

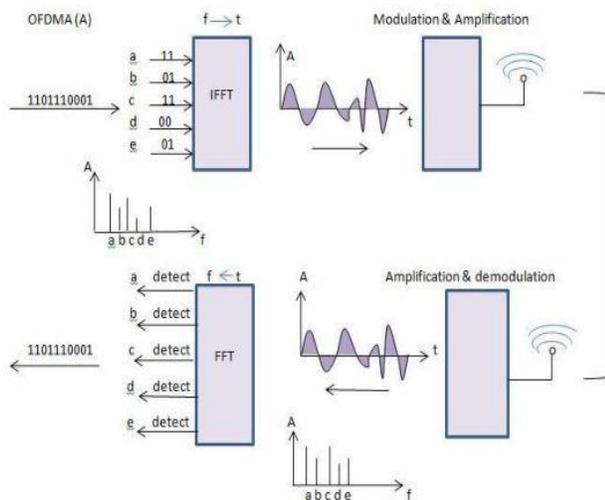

Fig.3

When diffusing data from the mobile fatal to the system a power amplifier is required to lift the outbound signal to a level high enough to be picked up by the network. The power amplifier is one of the biggest consumers of energy in a device and should thus be as power competent as possible to increase the operation stint of the device on a battery charge. The internal efficiency of a amplifier should be depends on two factors.

amplifier will able to amplify upper most value of wave due to silicon constraints utter most charge decides over the power consumption of the amplifier to take the high peaks of the waves. But do not transpose any information more than the average power signal over a time. Transmission speed does not depends on the peak output power. Output power required for the peak values of the waves but rather than average power level.as both power consumption and transmission speed are of importance for designers of mobile devices the power amplifier should consume as little energy as possible. Thus the lower

the difference between the peak power to the average power papr the longer is the operating time of a mobile device at a certain transmission speed compared to devices that use a modulation schemes with a higher papr.

Now lets moving back towards the blog entry in mobile communication as I studied & analysed that LTE has better PAPR than wi-max. Different modulation schemes are used in the uplink communication. While wi-max uses the OFDMA which one is fast but has high PAPR.LTE designers to choose the SCFDMA because higher order modulation increases in PAPR.so that OFDMA and SC-FDMA fit for another blog entry.

### II. SC-FDMA SYSTEM MODEL

The system model of a MIMO uplink SC-FDMA system consists of a base station bs with nr receive antennas and a user equipment ue with nt transmit antennas. The ue is allocated m contiguous subcarriers over the n available subcarriers and transmits independent streams or layers over each transmit antenna using a single code word or multiple code words. transmission starts with the encoding of the information bits for each code word and using appropriate mapping onto the streams. the bits over each stream are mapped to time domain constellation symbols s which are then converted into the so called frequency domain samples x by taking a m-point dft over each stream. The sample at the m<sup>th</sup> subcarrier x<sub>m</sub> is represented as

$$X_m = G_L \cdot y^m$$

The frequency domain representation of k-th user signal is **X<sub>m</sub>**

$$X_m = G_M X^m = [X_m^1, X_m^2, \dots, X_m^L] \rightarrow (1)$$

Where FM is the normalized M-point DFT operator  $FM = 1/M \sum_{n=0}^{M-1} x_n e^{-j2\pi kn/M}$

SC-FDMA supports two different subcarrier mapping techniques, namely localized and inter leaved. In former the data is mapped to adjacent localized subcarriers, whereas the latter allows to fill subcarriers that are equi-distant from each other. Localized-SCFDMA (LFDMA) provides ease of practical implementation, and multi-user diversity if combined with channel dependent scheduling. For these reasons, LFDMA has been adopted in LTE. On the other hand, interleaved-SC-FDMA (IFDMA) is robust against frequency selective channels but it's practical implementation is un-convenient. In order to have a compliancy with existing and future LTE standards, we will only deal with LFDMA2 in this work. The k-th user SC-FDMA signal as in (1) is passed through N-IFFT block and is given as,

$$(x)^{-m} = G^1_K \cdot G_L \cdot y^m \rightarrow (2)$$

Where  $F^N$  is the  $N$ -point IDFT matrix. The signal at each transmitter is then added with cyclic prefix (CP), that has length greater than channel impulse response (CIR). The received multi-user signal at  $r$ -th receiver antenna  $Y_r$  is given as,

$$x_r = \sum_{m=1}^m i_r^m \cdot x^m + W_r \quad \rightarrow (3)$$

Where  $h_{kr}$  is the time domain channel impulse response between  $k$ -th transmit antenna and  $r$ -th receiver antenna and  $z_r$  is the independent identically distributed (i.i.d) AWGN samples with zero-mean and covariance  $\sigma^2$ . For the sake of simplicity, we are dropping the user index  $k$  and receive antenna index  $r$  from the equations as received signals at the receiver are jointly detected at MUD block. The frequency domain matrix representation of (3) is,

$$X = I \cdot X + W \quad \rightarrow (4)$$

In (4)  $X$  is  $R \times 1$  matrix corresponding to signals received at  $R$  antennas of receiver and  $H$  is the  $R \times K$  channel matrix between transmit antennas and receive antennas. In this work we assume ideal channel estimation where channel estimation operation is performed at receiver for each received antenna. In the following section, we will discuss the proposed MCBEP receiver for MUMIMO SC-FDMA system.

### III. PROPOSED MINIMUM CONDITIONAL BIT-ERROR PROBABILITY RECEIVER

In this section, we will derive the cost-function for the proposed minimum conditional bit-error probability (MCBEP) receiver in MU-MIMO SC-FDMA systems. Unlike classical linear detectors that aim at maximizing signal-to interference- noise-ratio (SINR) in multi-user environment, the proposed MCBEP receiver targets the minimization of conditional bit-error-rate at the output of MUD with computational complexity more-or-less the same as linear MMSE.

State-of-the-art show such criterion based on minimum-BER provides close to optimal results. The frequency domain equalizer weights  $w$  are to demodulate signal at the receiver after removal of cyclic prefix and  $N$ -point FFT  $FN$  operation. The decision variable  $X^k$  for  $k$ th user is obtained after detection with the help of optimal weights  $w^k$ .

The MUD output  $X_m$  is given by,

$$X_m = u_m^i \cdot I_m \cdot X + u_m^i \cdot W \quad \rightarrow (5)$$

Where,  $I_m$  is the  $m$ -th column of matrix  $I$  whose size is  $(Q \times K)$  and  $(\cdot)$   $I$  is hermitian operator.

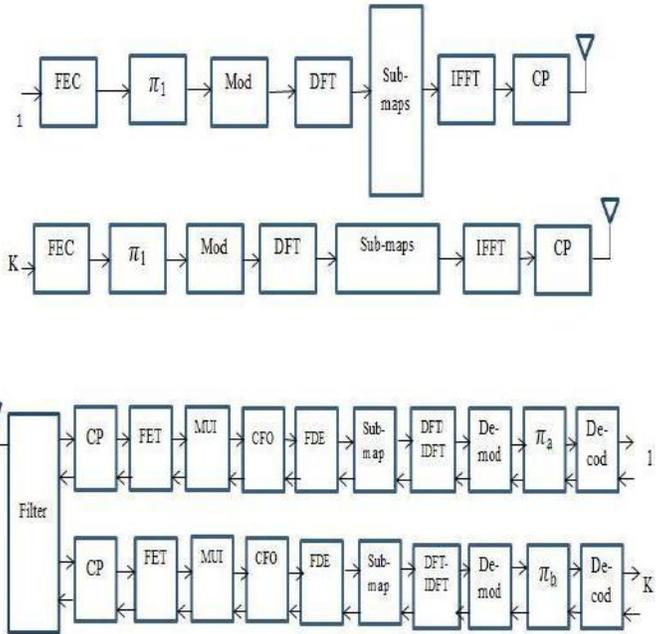

Fig.4

$$X_m = Q_m + W_m \quad \rightarrow (6)$$

Where  $Q_m = u_m^i \cdot I_m \cdot X$  and  $W_m = u_m^i \cdot W$

Performing  $M$ -point IDFT  $F^M$  on the noiseless signal  $\hat{X}^k$  at the output of MUD for  $k$ -th user, the signal  $\hat{x}^k$  is passed to decision device.

For only real-valued modulations like considered BPSK, the probability of error after decision depends on the real value of decision variable  $x^k$ . The probability density function (PDF) of noisy received signal is the mixture of Gaussian distributions associated with each possible symbol transmitted by all the users. The conditional probability of error MUD takes the  $\mu^+ k$  as the mean of  $\mathcal{N}(\hat{X}^k)$  when user  $k$  transmits symbol  $x^k = 1$ , and the mean is  $\mu^- k$  when  $x^k = -1$ . We can write as,

$$\mu_m^+ = p(Q_m | x_m = 1) \quad \rightarrow (7)$$

$$\mu_m^- = p(Q_m | x_m = -1) \quad \rightarrow (8)$$

The effective noise variance of  $\hat{Z}$  in (6) is given as,

$$\sigma_m^2 = \sigma^2 \| u_m \|^2 \quad \rightarrow (9)$$

The symbols in BPSK are assumed to be equi probable  $P(+1, -1) = 1/2$  and with the help of BPSK error probability reported in [12], the conditional bit error probability for BPSK using (7) and (8) is given as,

$$S_{m,c} = \frac{1}{2} \cdot R(\mu_m^+ / \sigma_m) + \frac{1}{2} \cdot R(-\mu_m^- / \sigma_m)$$

$$\rightarrow (10)$$

Where  $(\nu) = \sqrt{12} \int_0^\infty \nu e^{-\nu^2} 2 \nu, \nu > 0$ . The proposed MCBEP algorithm computes the filter weights  $W$  for all the transmit users by minimizing the bit-error probability as given in (10). Hence the MCBEP solution is,

$$u_{m,c} = \arg \min u_m \cdot S_{m,c} \quad \rightarrow (11)$$

$w_k$ , are the weights obtained as a result of minimization of  $P_k$ . The subscript 'c' in  $w_k$ , is acronym for "conditional". The MCBEP algorithm minimizes the conditional probability given in eq (10) with the help of an optimization rule. We employ conjugate gradient descent (CG) approach because of its simple implementation that allows to attain adequate performance. CG first computes the conjugate gradient of cost function (10) and iteratively reaches the minima with step size equal to  $\lambda$ . For the  $i$ -th iteration with step size  $\lambda$ , we have

$$u_{m,c}(i+1) = u_{m,c}(i) - \lambda(\nabla S_m | x) \quad \rightarrow (12)$$

$\nabla P_k/x$  is the gradient of (10) associated with  $k$ -th user and can be expressed in full form as,

$$\begin{aligned} \nabla S_m | x = & -1/2\sqrt{2} \exp(-(\mu_m^+)^2/2 \sigma_m^2) \\ & 1/\sigma_m(\mathbb{I}_x | x_m=1 - \mu_m^+ \cdot \mu_m / \|u_m\|^2) + 1/2\sqrt{2} \exp \\ & (- (\mu_m^-)^2/2 \sigma_m^2) \cdot 1/\sigma_m(\mathbb{I}_x | x_m=-1 - \mu_m^- \cdot \mu_m / \|u_m\|^2) \end{aligned} \quad \rightarrow (13)$$

The algorithm converges to optimal weights when (13) goes to zero or global minima. Step size  $\lambda$  should be adjusted properly because CG algorithm is sensitive to step size. Algorithm might not converge with larger step size, whereas small size will take too long to reach the minima.

#### Comparative analysis with ideal-MMSE and LMS-MMSE

In our work, we compare the performance of our proposed receiver with other two state-of-the-art approaches, namely ideal-MMSE and adaptive LMS based MMSE. MCBEP MUD receiver optimizes the filter weights of  $k$ -th user,  $w_k$ , separately by estimating symbol energy conditioned on transmitted symbols computed using (7) and (8) considering only 3  $k$ -th column of  $H$  (removing interference from other terminals).

Hence it increases the terminal signal to noise ratio that is in argument of Q-function in (10) by greatly eliminating the MUI. This helps the MCBEP MUD in achieving the near optimum performance. The ideal-MMSE MUD, minimizes the mean square error between transmitted symbols and demodulated symbols, is given by:

$$Y = [I \cdot I^H + \sigma^2 \cdot H_{Q \times Q}]^{-1} \cdot I \quad \rightarrow (14)$$

The MMSE MUD increases the output SINR by appropriately using the channel matrix  $H$  when computing the filter weights  $W$ . However, MMSE MUD does not consider the MUI from other interfering users in (14) hence causing residual MUI that makes the MUD. An adaptive version of MMSE is considered based on least mean square (LMS-MMSE) in frequency domain. LMS-MMSE considers training sequence that is known to receiver for estimating the channel  $H$  by minimizing the mean square error  $\epsilon$ , suboptimal.

$$\epsilon = F[(X - I \cdot Y_{Tq})] \quad \rightarrow (15)$$

Where  $XTr$  is the training sequence and  $\hat{H}$  is the estimate of true channel  $H$ . The filter weights  $w_k$  for user  $k$  update iteratively using (15) as,

$$u_m(i+1) = u_m(i) + \alpha \cdot X \epsilon \quad \rightarrow (16)$$

where  $\alpha$  is the step size chosen for LMS-based filter.

#### IV. SIMULATION RESULTS:

We have performed simulations in MATLAB environment where we test the proposed MCBEP approach together with state-of-the-art adaptive least mean square (LMS) based MMSE and ideal-MMSE. The parameters are selected based on 3rd generation partnership program (3GPP) LTE-A [2] uplink as listed in Tab. 1. A convergence test is conducted between iterative detectors, LMS-MMSE and proposed LMSMCBEP, with fixed number of users and transmit per-bit signal to noise ratio. In Fig. 2, the measured bit-error probability versus iteration number is shown for the MCBEP MUD, considering 6 transmitting users and transmission SNR equal to 18dB. The LMS-based MCBEP reaches the obtainable BER value in less than 50 iterations. The convergence to the averaged Mean Squared Error (MSE) of the LMS-based MMSE is shown in Fig. 3. With same number of transmit users and signal to noise ratio considered for MCBEP, the convergence of adaptive MMSE is slow and requires higher number of iterations for convergence to minima. The convergence of MCBEP is lot faster with a simple-to-implement conjugate gradient algorithm. The second series of simulation results is related to BER performance of proposed MCBEP against the approaches mentioned in Tab. 1. The first use-case is single antenna two-user MU-MIMO. The BS allows paired users to transmit over the same set of radio resources hence it is equivalent to 2x2 MU-MIMO system. Due to low interference environment where only one user is causing interference to the other, the receiver is able to distinguish the uplink streams without much performance degradation, as evident in Fig. 4.

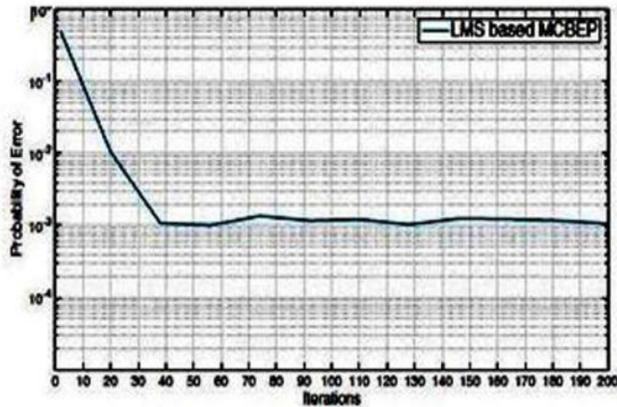

Figure 5: Convergence of MCBEP receiver with  $K=6, R=6, SNR=18dB$ .

Table 1

Bandwidth	5 MHz
Number of Subcarriers	512
CP length	36
Resource Blocks (RBs)	6
Subcarriers in RB	12
Subcarrier Spacing	15 KHz
Sampling frequency	7.68 MHz
Channel Estimation	Ideal
Channel Impulse response	Extended Vehicular A (EVA)
Receiver Algorithm	MCBEP, ideal-&LMS-MMSE

The performance of proposed MCBEP is closer to SISO-AWGN bound and shows improvement of around 3dB w.r.t ideal-MMSE MUD detector and ~4dB over LMS-MMSE in interference-limited region (high-SNR regime). Exactly the same trend can be observed in Fig. 5 when number of paired users increased to 4, thus forming 4x4.

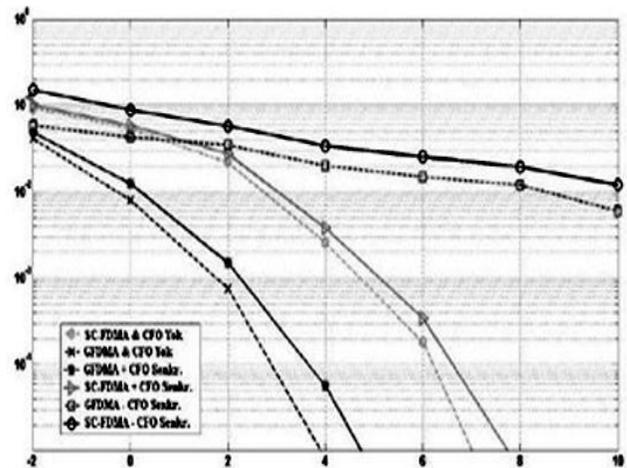

Figure 7. CFO and GFDMA with and without synchronization and SC-FDMA

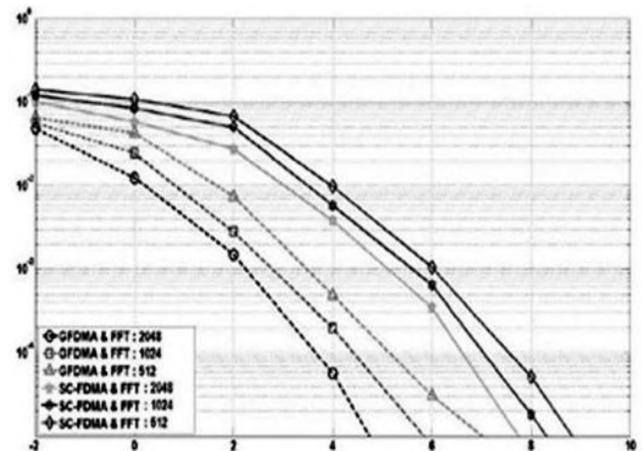

Figure 8: GFDMA with FFT sizes of 512, 1024 and 2048 and SC-FDMA.

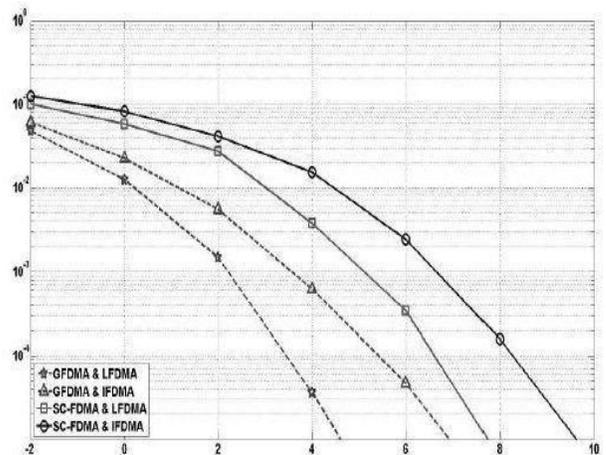

Figure 9: Sub-band approach using LFDMA and IFDMA GFDMA and SC-FDMA.

## V.CONCLUSION

In this article, a CFO synchronization using zero sub-carriers algorithm and in accordance with the algorithm GFDMA and SC-FDMA models that can operate and subcarrier suggested mapping methods. From simulations performed the findings show that the proposed method can be quite successful in influencing the CFO. Another result obtained from the simulations is the FFT increase the number of users, reduce the number of sub-bands system of using the approximate LFDMA mapping method performance. In addition, multi-user GFDMA's performance for single-user SC-FDMA and that this performance can be overcome.

### Author's Profile:

Javalkar Dinesh Kumar received his B.Tech. Degree in Electronics and Communication Engineering from the Anantha Lakshmi Institute of Technology & sciences, Anantapur, JNTUA, A. P, India, in 2012. and the M.Tech Degree in VSI System Design from JNTU Hyderabad, T.S, India, in 2014 and Now pursuing Ph.D. Degree in school of Electrical & Electronics Engineering from Lingaya's Vidyapeeth, Haryana. He is having Three years of experience in Electronics and Communication Engineering. His research era in VLSI System design.

**Alok Agarwal** received his B.Tech. Degree in Electronics from Bhilai Institute of Technology, Durg, Raipur University, India, in 1996, M.Tech. Degree in Digital Communication from U.P. Technical University, Lucknow, India, in 2009, and Ph.D. (Electronics & Communication Engineering) title "**Design and Analysis of Wideband Microstrip Antenna**", JIT University, Jhunjhunu (Raj), awarded in 2014. Presently he is working as an Associate Dean (R & D and Doctoral Research) & Professor in the School of Electronics and Electrical Engineering in Lingaya's University, Faridabad, India. He is having more than 18 years of experience.

**S.V.A.V. Prasad** as completed M.Tech, Ph.D. presently working as professor and Dean (academic affairs), Dean (R&D), sir has developed various products like High voltage tester, VHF Wattmeter, standard signal, generator with AM/FM modulator, wireless Becom, high power audio amplifier, wireless microphone and many more in the span of 25 years (1981-2007). sir has awarded for excellence in R&D in year 1999, 2004 and national quality award during the year 1999, 2000, 2004 and 2006. sir is fellow member of IEEE and life member of ISTE, IETE and society of audio & video system. sir has published more than 155 papers in various national & international conferences and journals, sir research area includes wireless communication, satellite communication & acoustics, antenna, neural networks & artificial intelligence. Reviewer for various national and international journals.

# AN FPGA IMPLEMENTATION OF SCFDMA USING WIRELESS NETWORK SYSTEMS

Javalkar Dinesh Kumar<sup>1</sup>, Dr. Alok Agarwal<sup>2</sup>, Dr. SVAV Prasad<sup>3</sup>

School of Electronics & Electrical Engineering, Lingaya's Vidyapeeth, Faridabad

**Abstract-** In wireless communication SC-FDMA is wide a vital role in the unified network systems. The real time transceivers are using in Single Carrier Frequency Division Multiple access (SC-FDMA)

Signalling system. The transceiver is implemented on a field programmable gate array using Xilinx system generator for DSP applications. In all the blocks are to be needed for the transmission path of SCFDMA.

The transmitter mount can be configured for different Flier and data schemes. In receiver side, time domain Synchronization is attained throughout a joint hood Symbol setup time, hold time, minimization period. And carrier frequency offset signal elevator through the fired information confined in the cyclic prefix. In a least square channel information rescues the channel formal information and a simple zero forecasting scheme has to be implemented for the equalization of the channel information. Results to be showed in implementation of the signal path can be implemented by using the Xilinx system generator for DSP.

**Keywords-** SCFDMA; FPG ;Frequency; time domain synchronization; Square channel estimator .

## I. INTRODUCTION

FDMA (Frequency Division Multiple access) is the division of the frequency band allocated for wireless cellular telephone communication into channels. Each of which can carry a conversation or, with digital service, carry digital data. FDMA is a basic technology in the analog advanced mobile phone system (AMPS), the most widely-installed cellular phone in all over country. FDMA each channel can be assigned to only one user at a time.

Fig.1: Mobile channel communication

FDMA is one way method of more than one user to share the single radio frequency (RF) spectrum. It's will be done by the all active users in different frequency channels. Track defined ratio (TDR) is the both popular direction of research to the modern communication and key technology of the 5G communications. Now a days green communications is plays a spirited role in wireless communication network.

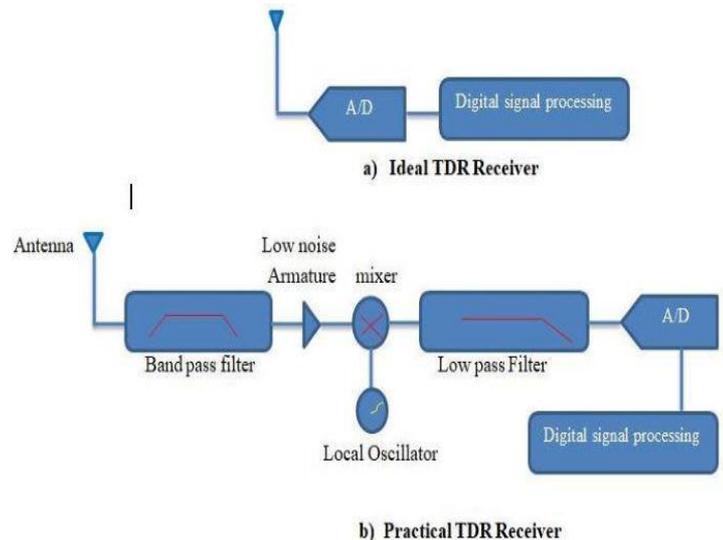

Fig.2:Track Defined Ratio Architecture

TDR is changing towards the ideal and feature TDR's to be replacing with an intelligent system controlled front end RF. It controls the range of the communication system in the main while of modulation techniques, filtering, frequency bands and bandwidths aiding its flexibility to numerous wireless canons. The Digital-Advanced Mobile Phone Service (D-AMPS) also uses FDMA but adds time division multiple access (TDMA).

TDR's Reconfigurable to allow the programmability of the standard structure to build an extra hardware is to be added to the basic module. In FPGA's (field programmable gate arrays) Gate array - a custom VLSI circuit consisting of huge number of unconnected gates. Circuit functioning is to be determined at the field by the user. Pre-tested for manufacturing defects. FPGA's are having Re-programmable logic components, Re-programmable routing resources and Re-programmable I/O blocks.

In QPLC's are Pre-laid clock trees, integrated big RAM blocks, DLLs, Embedded CPU cores, Special I/O's and Mathematical functions.

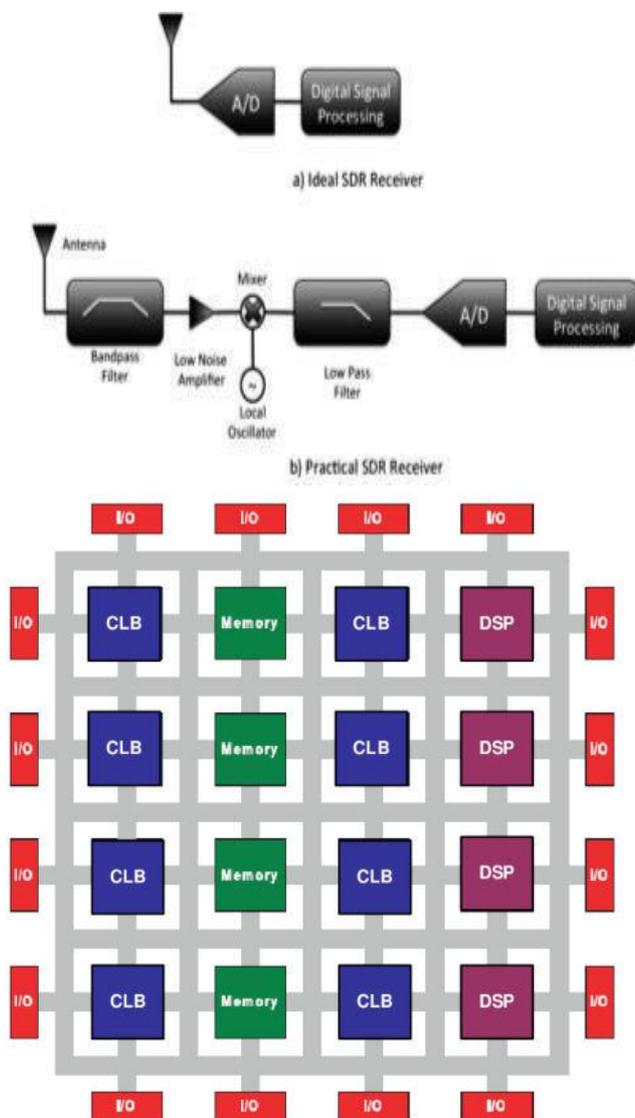

Fig.3: FPGA Structure

Present-day FPGA purveyors include Xilinx FPGA, Altera FPGA, Micro semi FPGA, Lattice FPGA, Tabula FPGA, Quick Logic FPGA among others. Each purveyor has follows its own architectural design approach. A FPGA, see Figure 3, is a reconfigurable logical device involving a group of small logic blocks are to be distributed in a interconnection of array elements. They provide a high computational power while comparing to the other processors.

In Digital signal processing, the audial range providing by a floating point representation, most of the cases fixed-point representation on DSPs and FPGAs are to be provide by a hefty speed and cost value owing to their keen cores. Static apropos process speed, once consecutively a package on a GPP it has various fixed-point swell/hoard cores formerly they were be a far-faster in fixed-point. To comparing the other chips a standard x 86 chips may be slower in fixed point. A floating point depiction will be having a high accuracy rate.

The advance of wireless systems is a long-lasting process that comprises many phases, and then at certain point, corroboration on a hardware test is needed to validate a theoretical and simulation work. Such test beads are used not only for theory verification, but they were also some concepts that can only be truly studied in practice (for e.g., interference modelling).

In a distributed antenna, the radio signals are equally process at a mid-point, therefore the enabling co-efficient interference modification, space diversity besides identical coverage esoteric the cell. Newly, some of the practical centralized pre-coding schemes are to be employed in the painstaking platform. Two centralized multicellular pre-coding schemes based on the water filling technique have been proposed. These techniques are to be achieving a close to the optimal weighted parallel interference cancellation algorithm. A blocking cell optimization (BCO) supportive multi-cell scheme was proposed in [11], the weighted sum-rate attainable for all the user stations (US's) is exploited. A auspicious unified pre-coding structure centred on Zero-Forcing (ZF) condition through numerous power distribution approaches, to reduce the average BER and signal-to-noise ratio (SNR) was proposed in [13]-[14].

The main object of this paper is to implementation of an FPGA based single carrier frequency division multiple accesses (SC-FDMA) receiver with a frequency domain, time domain synchronization using the Xilinx ISE Design suite and Xilinx system generator for DSP processors. System generator will be follow the high-level of abstractions built into Mat lab. The system will be automatically compiled into an FPGA.it provides a user defined primitives of a boundary between software and hardware, it will enables to the hardware design through allowing logical blocks will be synthesize into Verilog and compile them into FPGA.

II. BACKGROUND AND RELATED WORK

SCFDM is a single carrier bandwidth efficiency scheme used in digital communications, The main difference is conventional frequency domain multiplexing (FDM) is that frequency domain of the SC-FDMA sub-carriers overlap to each other, providing spectrum efficiency.SC-FDMA operations are conceded into a digital field, there are more platforms able to design an SC-FDMA system suitable for TDR development.

TDR can be recognised between two main fields: hardware fields and software field. The hardware features of an TDR consist radio frequency parts and communication contacts to the software-based signal processing. The lasting parts will be composed in a DSP's, FPGA.

The Tera-ASIC is chooses Enyx to propose ultra-low latency growth structure and design facilities for their latest FPGA platform. Here we are using the DE2i-150 board it's having the four modules each module associate a multiplicity of Altera Cyclone-IV, letting the provision of 30 million of gates design for each module.it runs logic up to 700 MHz in the digital communication speed at 720 Gbps per module, along through a lithe expansion such as HDMI.it explores the large amount of the data will be possess parallel. Similarly most of

the systems are to be implemented for a design flow model in the process of system generation.

In the view of Software architecture, GNU & C++ is open-source [4] software development toolkits distributed under the General Public License. It provides a set of audio signal processing library's to implementation of the processing blocks are required to transmit the sub-system. It runs only on Linux-based machine processing platform. In graphical flow of the systems they used python programming language.

To implement the RF communication systems one external hardware is rapidly used in communications. An SC-FDMA modulation/demodulation having two synchronization options and error-regulatory techniques is described in [6]-[9]. The working process of SC-FDM signals with Quaternary Phase Shift Keying (QPSK) and Binary Phase Shift Keying (BPSK) modulation techniques are to analyse the package ratio used for eminence service process. To design a super-position technique of SC-FDMA systems are used in GNU Radio processing in FPGA [11]-[13] modulators using the Xilinx ISE suite for the DSP based level designs are to be found [14]-[15].

### III. THE SINGLE CARRIER FREQUENCY DIVISION (SC-FDMA) MULTIPLEXING TRANSCEIVER

#### A. Test bench Architecture

SC-FDMA transceiver of the systems, that data will be generated erratically through an Inverse Fast Fourier Transform (IFFT) of phase shift keying (PSK) sign arrays through 1024 sub-carriers. The cyclic prefix tree is added to the IFFT and symbolic representation is turned into original frames. A Logical look-up conversion is formed by the Digital up conversion block. A DUC is a set of two interpolated filters. They are cosine filters and Half-band filters.

The Direct Digital Synthesize (DDS) and mixer blocks are to be performs translation of frequency into an intermediate frequency and attained by mixing of the frame through DDS. and another translator is used in the Receiver side to transforming signals of the inverse Fourier base band signalling blocks are there in a system. Top-Down conversions of the matched filters are to be performed by a set of similar filters as first one will be used in the transmitter block by using a digital top-down conversion.

When the esteemed offsets of the signals are performed, the frame to symbol and also carrier frequency offset correction blocks implements the reparations. A Fast Fourier Transform (FFT) signals are shifted data into Frequency domain. A lower state channel is applied to recover the esteemed state channel information and zero frequency analyser spread over the valuations.

In both perilous of the receivers are time -domain synchronized and device channel estimation signals of the sub-systems.

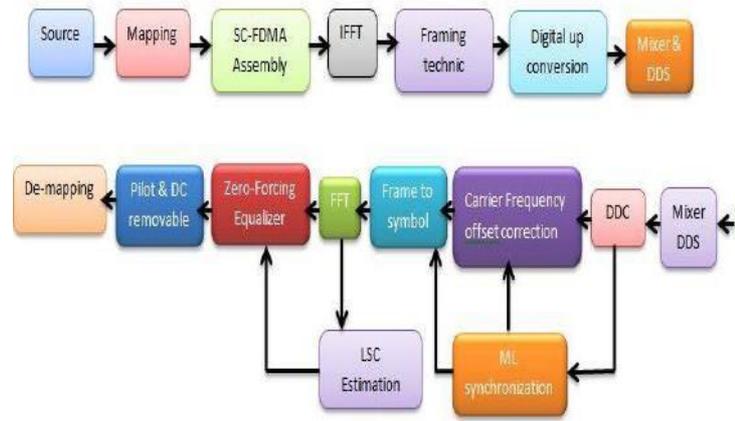

Fig.4: Mapping Architecture of transceiver

Inside the time-domain synchronization process we were calculate the frame levels of time and frequency of equalizer among the resident oscillators and Radio frequency carrier signals. In the carrier channel frequency assessment will be rectified through an equaliser.

#### B. Peak - Time organisation

In a de-modulation technique, the receiver signals are to be performing a digitalized framing signals and carrier signal synchronization. In order to define the signal synchronization of the phase and frequency among the transition and receiver section. All the sub carrier signals are shifted from the projecting diffusion to pattern plugs.

$$G. \quad x = k. (x - \tau). e^{j 2\pi\epsilon_0 k / N} + n \quad x$$

Here  $\epsilon_0$  is minimized the carrier signal optimization, T is the arrival framing time.  $k(x)$  is transmitting signal, N is no.of sampling signals,  $n(x)$  is the Gaussian noise,  $x$  is the sampling index of each signal up to 1024.

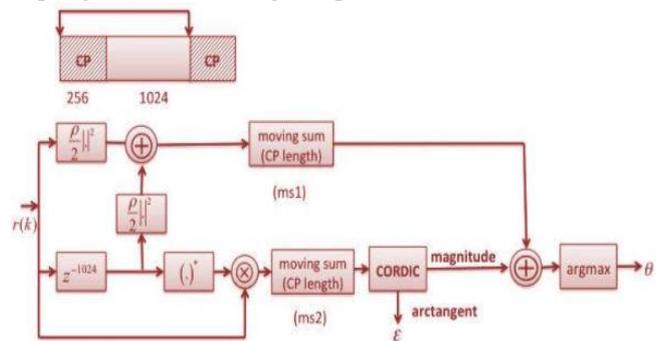

Fig.5: Peak estimation algorithm architecture

We are not using these types of preface conditions on our systems, while we are using a loof structures in each frame for time-domain synchronization owing the auto-correlation assets are given from a part of 3Gpp long term evolution interfaces. In above figure was choosing the design complexity and it's easily changed to take the adoptive gain of a loof systems.

C. Frequency domain channel estimation

Frequency domain channel estimation process will be existing in wireless systems. In this type of wireless systems are braced in the receiver section to eradicate the multi-path phase tracks inside the receiver segment. In SCFDMA systems acquire a precise stands to attain the high possessive spectral density and compactness of demodulation process. Somewhere the frequency response of co-channels by using the discrete sub-carrier frequencies require to accurate esteemed process used in decoding systems. Moreover the synchronization process boons a segment offset register uncertainty later frequency offset correlation must be highly esteemed by the source channel estimator and removing the equalization of system process.

In this process we conferred the uses of circular patterns espoused by the standard LTE with certain variations, here we are taking 24 frame SCFDMA carrier guides in their 1<sup>st</sup> and 10<sup>th</sup> and 19<sup>th</sup> symbol. The carrier guide sub-carriers are optimized and equip-power, equip-distance to achieving the low mean-square error (LMSE).

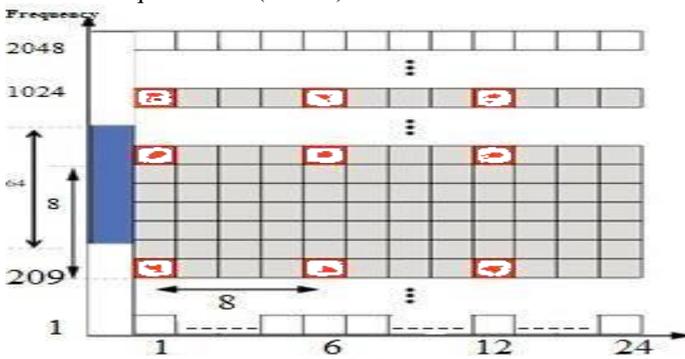

Fig.6: Frame structure

The proper distances of aviators are having 8 subcarriers. In the starting bit and ending bits are not laden building-up of the band Pickets on each and every gamut to comprise the phantom leakage of SC-FDMA systems.

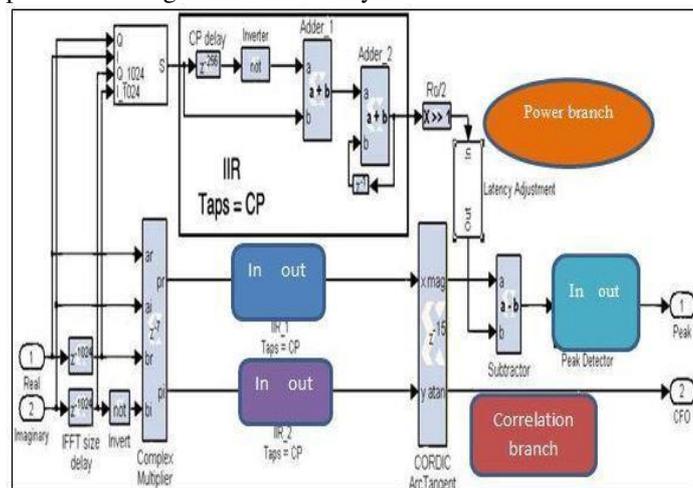

Fig.7: Peak estimation algorithm on Xilinx System Generator for DSP

To overcome these issues to extort the brink of sub-carriers with this subsequence of the assessment accuracy, the

espoused framing structure has guides at both brink sub-carriers. In initial stage of work, the guided sub-carriers are using the whole estimator. These conventional estimators are not taking any improvement on the parallel link process the sub-carriers an depends on the time dominie and frequency dominie nor it does across the prior information channel statistics are obtain to estimate, but on another hand to reduce the complexity and requiring the inversion capacity of multiplexing sub-carriers. To check the value of receiving the n<sup>th</sup> sub-carrier k (n) will be stated as

$$s_n \quad p_n \quad q_n \quad k_n \rightarrow$$

Where q (n) is the effecting channel of the n<sup>th</sup> sub-carrier. The estimation output channel can be stated as

$$q^{\wedge}(n) = k(n) / p(n) = q(n) + k(n) / p(n) \rightarrow$$

that it can be taken as strident sections of the carrier channel frequency interference (CFI).

IV. PEAK ASSESSMENT, FRAME SYNCHRONIZATION AND CFI SYNCHRONIZATION.

In a time domain synchronization algorithm will be divided in to three subcarriers.

A. Assessment of arrival time (T<sub>a</sub>) and carrier Frequency (F<sub>c</sub>).

In this algorithm is presented on the carrier sub sequent of the framing structure and it's will be adopted from the framing patterns on the above Figure (5). Peak channel feats the carrier frequency interference by comparing with the delayed version. Again a pattern is repeated to detect the arrival framing time and phasing patterns gives to the channel frequency interference.

In this algorithm will showed in the three branches .then first one is to calculating the rising time and second one calculating the falling time and last one calculating the correlation time. These are required to estimate the arrival time and phase offset.

$$Es_1 = \frac{\rho E}{2} \sum_{k=m}^{k+1} \gamma |(I)|^2 + |\gamma(I + N)|^2 \rightarrow (4)$$

$$Es_2 = \frac{IE}{2} \sum_{k=m}^{k+1} \gamma (I) \cdot \gamma * (I + N) \rightarrow (5)$$

Here Equation (4) is to show the calculation of rising time and Equation (5) is to show the calculation of the correlating time. ρ is the magnetic coefficient between γ(I) and γ(I+N) it depends on SNR but it can be set at the same. Both moving sub-carriers are designed by using the Harman filters.

The code multiplier is to boons on system libraries performing the multiply operations during the sub-system. In order to continue the two operations are performed on the foot layer. A composite module generate the peak channel it's to be associate the tardy type and to estimate the angle between the IR signals

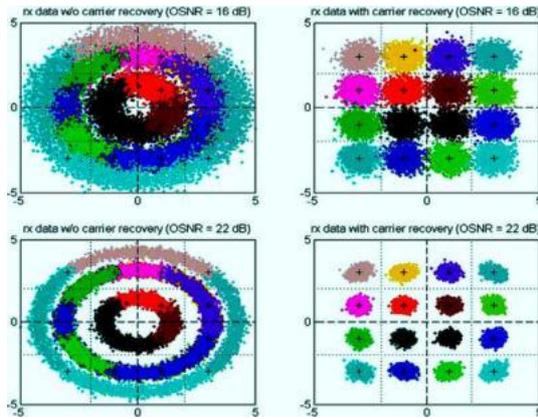

Fig.8: SC-FDMA symbol constellation with rx data W/o Carrier recovery (OSNR= 16 dB & 22 dB)

Fig.10: FPGA hardware platform set-up

System Parameters	
Baseband frequency    Bandwidth	20 MHz    10 MHz
FFT size    CP size	2048    512
Modulation	PSK - 16QAM
Subcarrier separation	30 kHz
Symbol duration (Symbol +CP)	68.78 + 18.56 = 87.34 *s
IF sampling frequency	98.64 MHz
Oscillator frequency	30 MHz

Table.1: System parameters

In system libraries are providing a Gaussian allusion block that it can be implement a rectangular eclipse direct transformation by using a Gaussian algorithm in globular vector mode, it calculates a magnitude and impious angle equation (6),(7) respectively.

$$|L, P| = \sqrt{L^2 + P^2} \quad \rightarrow(6)$$

$$\text{Avg} = 2\pi\epsilon_0 = \text{arc} (L / P) \quad \rightarrow(7)$$

If assume that the offset between the oscillators are lower than the single sub-carriers. A division operation is accomplished to build the arrival framing detection, but these types of operations in hardware mode is costly that's why it should be avoided. The compiled angle is only way to use find peak is spotted, to conforming the channel frequency interference (CFI) is to use if correlating is ample.

1) Carrier channel Frequency Interference (CFI)

Carrier channel frequency interference is attained with using the Harman filters to executing a switch function.to correlating a vector function (L,P) by angle  $\Phi$  springy a new functioning a vector(L',P')

$$L'(I) = L(I) \times \cos \Phi - P(I) \times \sin \Phi \quad \rightarrow (8)$$

$$P'(I) = P(I) \times \cos \Phi + L(I) \times \sin \Phi$$

Where,  $\Phi = 2\pi\epsilon_0 \frac{1}{N} \quad \rightarrow (9)$

By taking the angle it can be attained at section A, if the angle is divided by N samples and each sample can be quashing the phase equalizer of each emblem.

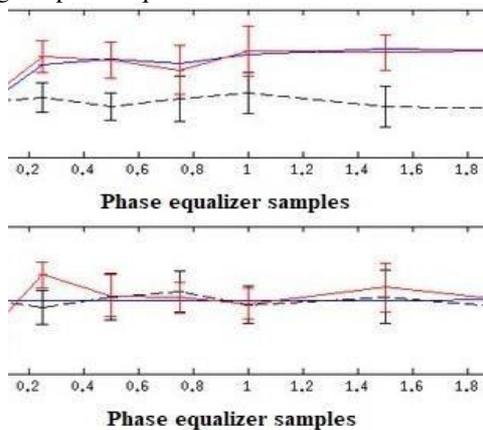

Fig.9: Peak detection phase equalizer samples

V. SIMULATION & RESULTS

This Design process will be compiled and executed on Xilinx software, which allows a simulation of system to be completely run on Hardware (FPGA) .while showing the results on Modelsim software.it, can be enable to accurate hardware exhibiting along with quick simulation and faster design. This is the easiest way to calculate the hardware verification by implementing the contrived algorithm using the Altera FPGA. In impartial way is to get both Software and Hardware working principles on prototyping stage. In this simulation model was using on the DE2i-150 board is able speed up the responsiveness of the system which contains a Altera Cyclone IV GX FPGA and an On-board USB-Blaster with JTAG and AS mode configuration; 128MB SDRAM; 4MB SSRAM; 64MB Flash and 802.11 b/g/n; Bluetooth 4.0; SSD 64GB; HDMI 1.3a;VGA output see Figure10.

In the test parameters of a wired co-channel systems are run at clock frequency ranges are 98.64 MHZ with an IF of 20 MHZ. The BER hardware results are acquired by using the simlink software. The speculative results are gained from an altered Mat lab SC-FDMA chain.

In Figure 11 illuminate the BER ratio of theoretical and practical effects for four altered simulations: to attain a flawless CSI, there is without time domain synchronization of a RF equalizer and with time domain synchronization of RF equalizer.

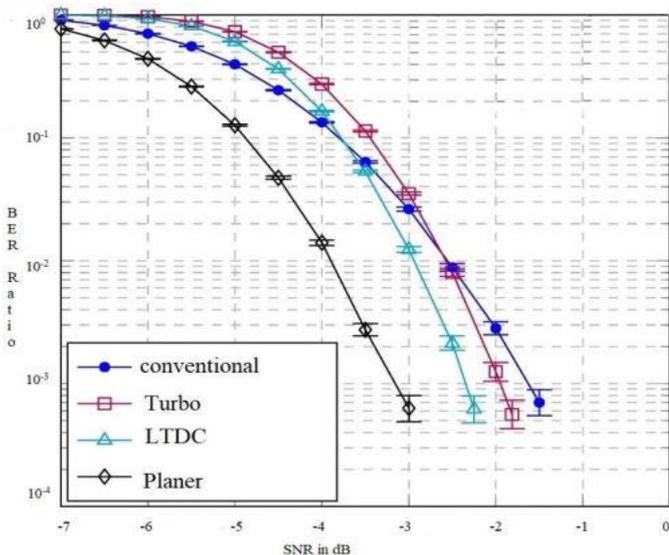

Fig.11: Baseband BER Ratio for 4 simulations

## VI. CONCLUSION AND FUTURE SCOPE

A Full baseband signal of RF design was presented focused on the synchronizing and channel estimating algorithm. In this total graft will be performed by using the Xilinx software, chipset pro-tool and validate with Mat lab simulation link. FPGA simulations are possible by using a floating point representation but some of the blocks are functioning on the system libraries to allow such type of floating point operations are used in hardware systems. When the parallel link is occurred the correlated angle should be uttered has a Flat line. But, due to lower Precision will be occurred on fixed point presentation. There are some instantaneous links on the same fixed point line. Our BER results shows that there is no pertinent humiliation between the Mat lab Floating point and FPGA fixed point simulations, we are limiting the bit registers width along with the Floating point algorithm and different system parameters.

In the next stage is to short out the SC-FDMA system generator parameters to words the 5G green communications.

## FPGA Design & Implementation of SC-FDMA Carnal Layer for TDR-based Applications

 Javalkar Dinesh Kumar, Dr. Alok agarwal and Dr.S.V.A.V. Prasad

### Abstract

Single Carrier Frequency Division Multiple Access (SC-FDMA) technique places a vital role in the wireless communications. As per its ability to certifying the high level toughness against the nosiness. Now presents a paper on a high output low power consumption and low complexity of SC-FDMA transceiver. SC-FDMA is a modulation technique it's generally recycled in the several high speed wireless communications and also various wireless mobile communications systems like as, secure Wi-Fi communication system (IEEE 802.11a), wireless mobile systems (IEEE 802.11b), static Wi-MAX systems (IEEE 802.16a), and wireless mobile Wi-MAX system (IEEE 802.16e standard). Now, in this paper, FPGA Design and implementation of SC-FDMA systems are drives classically. Additionally, a graphical design of the systems is simulated. in the simulation process the SC-FDMA using MATLAB it will observes in a practical manner. In our proposed modules were designed by a using Verilog software development language. In a transceiver is very useful on Field-Programmable Gate Array (FPGA) through Xilinx System Generator designed for DSP. Our research display we are proposing the transceiver utilization of the piece Look up table's (78.10%) plus (66.10%) of wedge registers on Virtex-7 FPGA, working by an extreme frequency 120MHz, Our design have the high PAPR, low power consumption.

# Effectiveness of enhanced external counter pulsation on clinical profile and health-related quality of life in patients with coronary heart disease: a systematic review

Vikram Singh<sup>1,2</sup>, Girija Kumari<sup>1,3</sup>, Bimal Chhajer<sup>2</sup>, Ashok Kumar Jhingan<sup>3</sup>, Saurabh Dahiya<sup>1</sup>

<sup>1</sup>Lingaya's University, Nachauli, Jasana Road, Old Faridabad, Faridabad, India

<sup>2</sup>SAAOL Heart Center, Chhatarpur, New Delhi, India

<sup>3</sup>Delhi Diabetes Research Center, New Delhi, India

## Abstract

**Introduction.** *Enhanced External Counter Pulsation (EECP) is a non-invasive United States Food and Drug Administration (FDA) approved outpatient treatment option for the complex problem of angina, a common symptom of coronary heart disease. A systematic review of the literature searched to assess the effect of EECP on the clinical profile that comprised physiological measurements, biochemical assessments, cardiac clinical symptoms, physical functional status, and Health-Related Quality of Life (HRQoL) in Coronary Heart Disease (CHD) patients.*

**Material and methods.** *Total 258 EECP research articles from the early stage of EECP development to till date screened. Out of 258 EECP articles, total 60 articles (53 EECP articles for clinical profile and 7 article for HRQoL matched the inclusion criteria and other (n = 198) articles excluded due to irrelevant to study objectives.*

**Results.** *All enrolled studies showed a significant improvement in angina pectoris and HRQoL with reduction of nitroglycerine use and exercise tolerance. There are several gaps in research has been found for further research to evaluate the EECP effectiveness on Body Mass Index (BMI), Heart Rate, Cholesterol, Triglyceride, High Density Lipoprotein (HDL), Low Density Lipoprotein (LDL), HbA1C, SpO<sub>2</sub>, Vo<sub>2</sub>max level with a comparative assessment of cardiac and non-cardiac metabolic markers including blood glucose.*

**Conclusions.** *There is further need of multi-centric randomize controlled trial studies to evaluate the effect of EECP on obese, diabetic, hypertension and other metabolic disease patients and more research required for further modifications in EECP device to cure, prevent and treat chronic diseases by the non-invasive procedure.*

**Key words:** enhanced external counter pulsation, angina pectoris, health-related quality of life, coronary heart disease

Acta Angiol 2018; 24, 4: 105–122

## Introduction

Cardiovascular disease, especially Coronary Heart disease (CHD) is the number one killer and foremost

cause of deaths around the world [1]. Angina pectoris, the prime symptom of coronary heart disease ranked first among causes of mortality [2]. The current non-pharmacological and non-invasive therapy available

**Address for correspondence:** Saurabh Dahiya, Lingaya's University, Nachauli, Jasana Road, Old Faridabad, Faridabad, Haryana, 121002 Faridabad, India, e-mail: saurabhdahiya@gmail.com

for chronic stable angina (a typical symptom of coronary heart disease) and heart failure is Enhanced External Counter Pulsation (EECP). EECP is USA-FDA approved therapy for coronary heart disease patient [3]. EECP, an electro-mechanical system is a registered trademark of Vasomedical, Inc, New York, USA and PSK (Chinese Company) is the exclusive distributor of Vasomedical's devices all over the world [4–8]. CHD patients usually undergo EECP treatment of 35 consecutive 1-hour sessions over 5–7 weeks. Treatment patient is continuously monitored for cardiac outputs, heart rate and spo2 using ECG and finger plethysmogram, which are connected to the EECP device [9–11]. This study designed to evaluate the effect of EECP in Clinical profile and HRQoL in CHD patients.

### Material and methods

#### Searching methods

A systemic review of the literature of EECP on clinical profile and HRQoL in coronary heart disease patients was search through PubMed, Medline, Vasomedical EECP manufacturer web-link, and Google scholar sources. Searching for the articles done as per the inclusion and exclusion criteria of the study and the studies summarized in Figure 1.

#### Inclusion criteria

EECP article of Randomized Control Trial (RCT), case studies, prospective and retrospective studies on clinical profile and HRQoL in coronary heart disease patients were included.

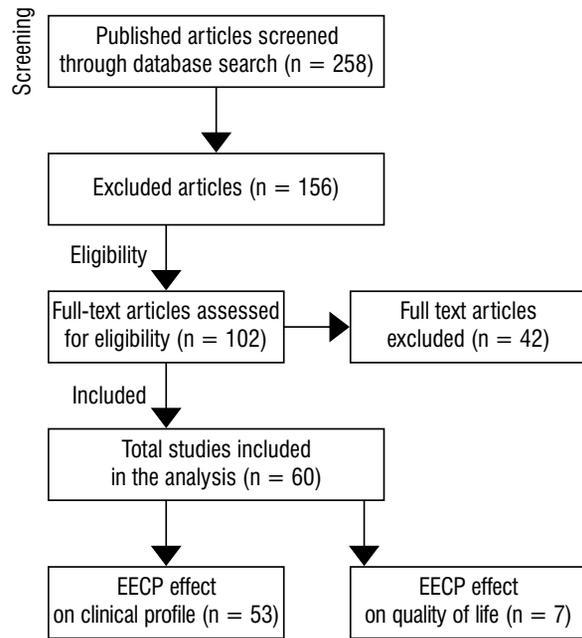

Figure 1. Flowchart of screened and included studies

#### Exclusion criteria

Heart Failure studies, Non-cardiac EECP studies with RCT, Case studies, Prospective and Retrospective and reviews of EECP papers excluded from the study.

#### Quality assessment

Study quality was assessed through two authors independently. Newcastle-Ottawa scale (NOS) was used to assess the quality of studies. Detail of assessment is given in Tables 1, 2.

Table 1. Newcastle-Ottawa scale in the assessment of clinical profile included studies

Study	Is the case definition adequate? **Figure 2.** Funnel plot of included studies in clinical profile — EECP

**Figure 3.** Funnel plot of included studies in HRQoL — EECP

**Statistical analysis**

Statistical analyses were performed using RevMan 5.0 (Cochrane Collaboration). A random-effects model was used with weighted mean difference (WMD) in clinical profile and HRQoL from pre-EECP to post-EECP. Bias in studies was assessed through visual inspection of the funnel plot as well as Begg’s and Egger’s testing. Detail of analysis is given in Figures 2 to 5.

**EFFECT OF EECP ON CLINICAL PROFILE IN CORONARY HEART DISEASE PATIENTS**

Lawson et al. [12] conducted a study on 18 patients with chronic angina treated with an improved system of enhanced external counter pulsation (EECP) and found that all patients improved in angina symptoms and generally decreased anti-angina medications. A decrease in myocardial ischemia observed in 67% patients and 89% of patients were symptom-free. Sjukri et al. [13] carried out a study on 201 coronary heart disease

patients. The results of the study showed significant improvement in coronary perfusion by 86.8% and exercise tolerance by 94.2%. Arora et al. [14] performed a multi centric prospective randomized control study to assess the safety and efficacy of enhanced external counterpulsation (EECP). A significant improvement in angina severity and exercise tolerance and timing was reported. EECP showed well tolerated and safe therapy for CHD patients. Lawson et al. [15] carried out a study on 33 patients to evaluate the effect of EECP on long-term prognosis in CHD patients. The study suggests that particularly for the majority of patients demonstrating improvement by 64% in radionuclide stress perfusion post-treatment and EECP may be an effective long-term therapy. Lawson et al. [16] conducted a cohort study in 2,289 CHD patients to evaluate EECP safety and efficacy. EECP was found to be safe and well-tolerated therapy with improvement in angina class by 74% with significant p-value ( $p < 0.001$ ). Urano et al. [17] performed a study on 512 CHD patients to examined EECP efficacy in myocardial ischemia, exercise tolerance and cardiac

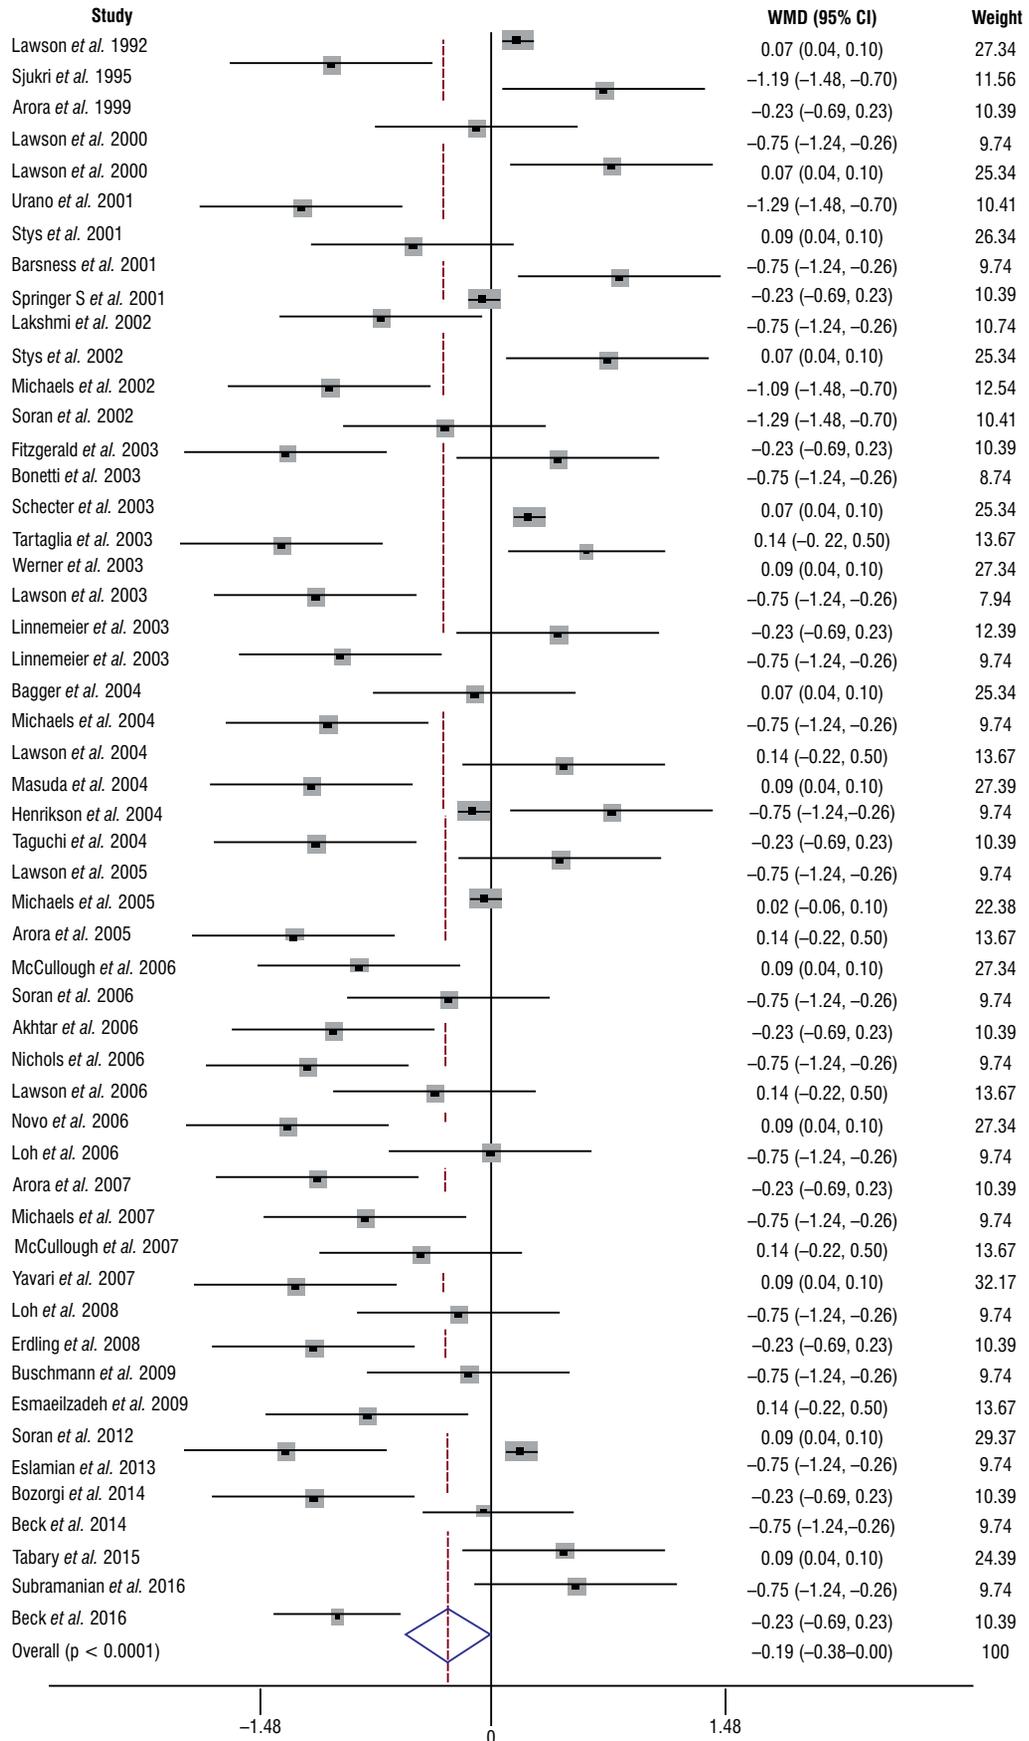

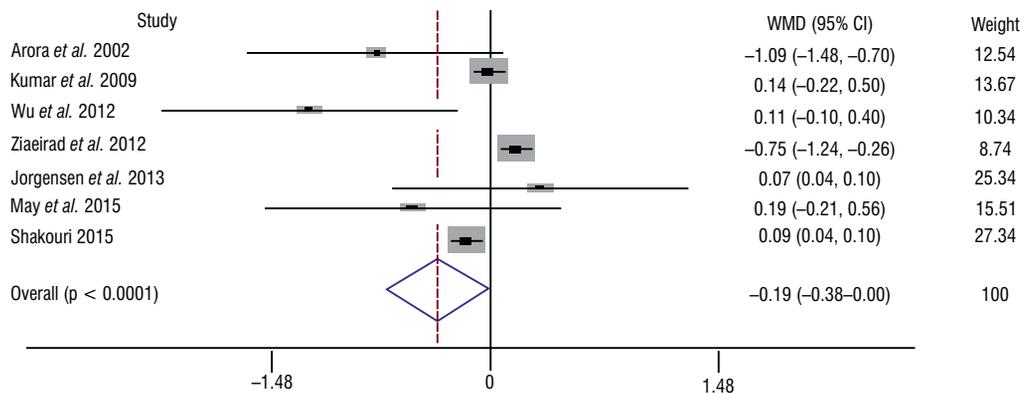

Figure 4. Forest plot of weighted mean differences in clinical profile in pre- and post-EECF

**Figure 5.** Forest plot of weighted mean differences in HRQoL in pre- and post-EECP

function. The result of the study reveals the improvement in exercise test parameters reduced myocardial ischemia by thallium scintigraphy in association with improved LV diastolic filling in patients with stable CAD. Stys *et al.* [18] carried out a clinical registry of 37 centers with the enrollment of 395 chronic stable angina patients to examine the relation of the ER to post treatment improvement in Canadian Cardiovascular Society (CCS) angina class. After EECp, CCS improved by at least I class in 88% of patients, 87% of men and 92% of women. EECp is effective in improving CCS in chronic stable angina patients. Barsness *et al.* [19] performed a study on 1246 CHD patients to determine whether EECp is a safe and effective treatment for patients with angina pectoris. The results demonstrated significant improvement in angina and reduction in nitroglycerine anti-angina drugs by 61.7%. Springer *et al.* [20] conducted a study on 28 CHD patients to assess psychological function and well-being status and observed significant improvement in psychological and well-being status. Lakshmi *et al.* [21] carried out a study on 2486 patients those were enrolled in the IEPp. The study revealed a significant improvement in angina class in patients whose DA ratio was increased and results sustained for 6 months. Stys *et al.* [22] performed a study on 175 CHD patients and found a significant improvement in angina class in 85% of patients. This study results showed the EECp effectiveness in improving stress myocardial perfusion with exercise tolerance in CAD patients.

Michaels *et al.* [23] conducted a study on 10 CHD patients and found the significant improvement in diastolic and mean pressures with reduction of systolic pressure in the central aorta and the coronary artery of CAD patients. The study concludes that EECp may serve as a potential mechanical assistant device for CAD patients. Holubkov *et al.* [24] carried out a study on 771 CHD patients treated with EECp and the results of this study conclude that EECp may be a safe treatment option for

CAD patients. Soran *et al.* [25] performed a study on 1402 CHD patients and the results showed that angina decreased by at least one class in 67% of patients with LV dysfunction just after completion of EECp treatment. Fitzgerald *et al.* [26] conducted a cohort study on 4669 CHD patients and found decreased angina episodes and nitroglycerin use and 74.8% reduction in Canadian Cardiovascular Society (CCS) functional class and improvement in angina sustained for 6 months. Bonetti *et al.* [27] performed a study on 23 CHD patients to examine the effect of enhanced external counter pulsation (EECP) on endothelial function and found that 70% patients get symptomatic relief by EECp treatment. The author revealed that significant improvement in endothelial function by EECp may benefit to the clinical status of CHD patients.

Schechter *et al.* [28] carried out a study of 20 CHD patients to investigate the influence of short-term external counterpulsation (ECP) therapy on flow-mediated dilation (FMD) in patients with coronary artery disease (CAD). The author revealed that external counter pulsation may improve vascular endothelial function and refractory angina pectoris in CHD patients. Tartaglia *et al.* [29] conducted a study on 25 CHD patients to determine the effect of EECp on exercise capacity and myocardial perfusion by comparing results of maximal exercise radionuclide testing pre- and post-EECP treatment. A significant improvement in treadmill times has been reported and radionuclide perfusion scores also showed a significant reduction in ischemic segments. Werner *et al.* [30] performed a study on 48 CHD patients and weekly angina episodes were reduced by 48%, nitroglycerin puffs were reduced by 51%, work capacity was improved by 22%. Study validates the reduction of angina with significant improvement of work capacity after EECp.

Lawson *et al.* [31] carried out a study on 4592 CHD patients and his collected data from international enhanced external counter pulsation (EECP) patient regis-

try showed significant improvement in angina by 73% in at least 1 class and 2 classes by 35.2% and 3 classes by 17.3%. The mean angina episodes per week decrease to 2.5 per week after EECP treatment and nitroglycerine uses per week after EECP was 2.5 times per week and improvement in functional status also observed in the study. Linnemeier *et al.* [32] conducted a study on 3037 CHD patients to determine whether enhanced external counterpulsation is a safe and effective treatment for angina in octogenarians. At 6-month follow-up, 81% of patients sustained angina improvement. This study concludes that enhanced external counterpulsation is effective and well tolerable non-invasive treatment. Linnemeier *et al.* [33] performed another study on 1532 IEPR patients. The author demonstrated that after 1 year, maintenance of angina rate was reduced in 86% of patients with diabetes. This study also suggests that in diabetes patients, EECP can be a safe, effective, well-tolerated treatment option for the relief of angina. Bagger *et al.* [34] carried out a study on 23 patients with angina pectoris with positive dobutamine stress echocardiogram. This study was done to evaluate EECP effectiveness on dobutamine stress-induced wall motion score among angina patients. The reduction in dobutamine-induced wall motion abnormalities after EECP therapy was reported.

Michaels *et al.* [35] conducted the long-term outcomes of enhanced external counterpulsation in 1097 CHD patients to relieve angina and improving the quality of life in a large cohort of patients with chronic angina pectoris. 73% patients had a reduction by at least 1 angina class at the end of treatment, and 50% reported an improvement in the quality-of-life assessment after enhanced external counterpulsation was; these results were sustained at 2-year follow-up. Lawson *et al.* [36] performed a study on 2861 CHD patients to examine the safety and effectiveness of EECP therapy. Post-EECP, patients had improved their CCS angina by at least one class. At 6-month follow-up, the CCS-class improved reduction in angina episodes and nitroglycerin use. Enhanced external counterpulsation was proved an effective therapy in relieving angina in patient's angina patients. Masuda *et al.* [37] carried out a study on total 18 CHD patients. Out of 18 patients, 11 were treated with EECP and 7 were treated 5000 IU heparin pretreatment along with EECP. The study was done to evaluate EECP and intravenous heparin injection therapy effectiveness in angina pectoris patients and the results of the study showed significant improvement in exercise capacity and oxygen metabolism of coronary heart disease patients treated with combination therapy of EECP and heparin.

Henrikson *et al.* [38] conducted a study on 28 CHD patients and found that post EECP most patients (82%)

had at least one full class improvement in their angina pattern. EECP remains an effective treatment for severe CAD. Taguchi *et al.* [39] performed study on 24 patients with myocardial infarction. This study was done to assess the haemodynamic effects of EECP and its mechanism with special reference to neurohumoral factors. The finding of this study suggests that an increase in ANP without an increase in BNP is an important mechanism for the effects of EECP therapy. Lawson *et al.* [40] carried out a study on 2007 CHD patients and demonstrated the angina reduction by 83% at least one CCS angina class and improvement in weekly angina episodes and their frequency of nitroglycerine use decreased with improvement in well-being status by 63%. Michaels *et al.* [41] conducted a study on 1192 CHD patients to assess the frequency, efficacy, predictors, and long-term success of repeat enhanced external counter pulsation (EECP) therapy in relieving angina in a large cohort of angina patients. After 2 years of EECP therapy, 70% of patients reported the significant decrease in angina and nitroglycerine consumption. Arora *et al.* [42] performed a study on 30 patients with stable angina pectoris having class II-IV. This study was done to assess the effect of EECP on vascular cell release of coagulation factors. The author reveals that EECP may not play a significant role in controlling coagulation factors in CHD patients.

McCullough *et al.* [43] carried out a study on 2730 obese heart patients to evaluate the association of baseline body mass index (BMI) on the outcomes of enhanced external counterpulsation (EECP) therapy for chronic stable angina. A greater reduction in weekly angina episodes from baseline to follow up observed and study conclude that reduction of angina is directly proportional to BMI value. Akhtar *et al.* [44] conducted a study on 13 CHD patients to evaluate the effect of EECP treatment on plasma nitric oxide and endothelin-1 level. This study concludes that EECP may increase nitric oxide and decreases endothelin-1 levels.

Soran *et al.* [45] carried out a cohort study on 363 CHD patients and post EECP treatment, there was a significant decrease in severity of angina class ( $p < 0.001$ ), and 72% patients were improved from severe angina and 52% of patients discontinued nitroglycerin use. At 2 years of follow up 55%, patients showed improvement in angina and prove that EECP is effective and durable therapy approach for CAD patients and 52% CHD patients discontinued nitroglycerin use. Nichols *et al.* [46] performed a study on 20 angina patients to prove the hypothesis of arterial properties and wave reflection characteristics favourably altered after EECP. The study revealed that EECP treatment may reduce arterial stiffness and can improve wave reflection characteristics in patients with angina.

Lawson *et al.* [47] conducted a study on 1458 CHD patients and found that EECP significantly reduced angina frequency, nitroglycerin use. Significant improvements in angina by 70–74% with reduction of nitroglycerine use by 52% with better well-being persist until 2 years of follow up. Novo *et al.* [48] carried out a study on 25 CHD patients to evaluate the efficacy of EECP on clinical symptoms, myocardial ischemia and cardiac perfusion in intractable angina patients. 84 per cent of patients showed an increment in at least one functional angina class and reduced inducible ischemia and maximal benefits observed in patients with worst systolic failure had been observed.

Loh *et al.* [49] did a study on 58 CHD patients to assess EECP immediate and long-term effectiveness in chronic stable refractory angina patients. This study results showed that angina improved at least one class CCS angina improvement by 78% after 1 year and increase exercise capacity with the reduction in nitroglycerine use. Arora *et al.* [50] conducted a study on 11 CHD patients to assess the effect of EECP on myocardial perfusion. In this study no significant effect on myocardial perfusion seen due to very less sample size and highly variable clinical responses. Michaels *et al.* [51] performed a study on 27 patients and significant improvement in heart rate variability in diabetic CHD patients and associated with reduced mortality rate had been reported. McCullough *et al.* [52] did a study on 902 patients from the IEPR. This study was done to evaluate the degree of residual angina on the clinical outcomes of EECP and conclude that residual high-grade angina pectoris occurs after post EECP in those patients who had the history of severe angina and multi-vessel disease.

Yavari *et al.* [53] conducted a study on 67 CHD patients to assess EECP efficacy in relieving angina and improving myocardial ischemia. The results of this study conclude that EECP is safe, effective and well-tolerated therapy for angina pectoris treatment. Loh *et al.* [54] did a study on 1477 CHD patients to evaluate EECP effectiveness. Immediately after EECP, angina reduction has been seen with  $p < 0.001$ . The improvement in CCS class was improved by at least 1 class in 78% of the patients and by at least 2 classes in 38% and sustained in 74% of the patients during follow-up for 3 years. Erdling *et al.* [55] carried out a study on 86 CHD patients and conclude that after EECP treatment 79% of patients showed improvement in CCS class immediately and 61.5% of patients sustained these benefits till 12 months and 29% at 2 years follow up. The author concludes that EECP is safe & effective for CAD with angina pectoris patients and patients with CCS angina class III & IV reported maximum improvement. Buschmann *et al.* [56] conducted a study on 23 CHD patients and found

improvement in CCS and NYHA class in CAD patients with significant improvement in pressure derived collateral flow index and fractional flow, which also increased. Esmailzadeh *et al.* [57] performed a study on 20 CHD patients to assess the effects of EECP on cardiac functions and found a reduction in NYHA angina class. Significant improvement was observed in LV systolic, diastolic function in angina patient. Soran *et al.* [58] conducted a study on 2072 patients and treated with EECP. Significant reduction by 76–84% in the severity of angina in CAD patients at 1 year of follow up was reported and both US and turkey group got good results. Eslamian *et al.* [59] performed a study on 50 CHD patients to assess Enhanced External Counter Pulsation (EECP) effectiveness on clinical symptoms, echocardiographic measurements, and perfusion scan parameters and exercise tolerancetest. A significant improvement was observed in angina severity and well-being status. Bozorgi *et al.* [60] did a study on 20 CHD patients with refractory angina. A significant reduction in angina classes III and IV was reported with sustained results for 6 months. The author concludes that EECP decreased symptoms and increased total exercise time and sustained these results for 6 months.

Beck *et al.* [61] conducted a study on 24 CHD patients and significant improvement in plasma level of nitrates, improved peak VO<sub>2</sub>, and reduced LV function with significant improvement in peripheral vascular function and functional capacity had been reported. Tabary *et al.* [62] performed a study on 48 CHD patients to assess clinical and para-clinical effects of enhanced external counterpulsation (EECP) effectiveness. Significant improvement in hemoglobin, LVEF, diastolic and systolic B.P, Chest pain, dyspnea and improvement in clinical conditions had been reported. Subramanian *et al.* [63] did a study on 72 CHD patients and found significant improvement in central systolic pressure, brachial systolic pressure, aortic pulse pressure, and augmentation pressure and augmentation index. Beck *et al.* [64] conducted the study on 17 CHD patients. The author concludes that EECP may be useful as an adjuvant therapy for improving functional classification and improve central blood pressure, aortic pulse pressure, wasted left ventricular energy, and myocardial oxygen demand in CHD patients.

## EFFECT OF EECP ON HR-QoL IN CORONARY HEART DISEASE PATIENTS

Arora *et al.* [65] conducted a study to assess EECP effectiveness on HRQoL. A significant improvement in HRQoL was observed at 12 months of follow up. The result shows improvements in HRQoL changes after EECP treatment. Kumar *et al.* [66] did a prospective

study and found that EECP significantly improved angina symptoms, dyspnea on exertion, and quality of life after 35 days of treatment and at 1 year follow up. EECP also improved the 6-minute walking capacity. Wu *et al.* [67] performed a study to evaluate EECP after six months regarding physical capacity and HRQoL in patients with refractory AP. Patients enhanced walking distance on average by 29 m after EECP. CCS class also improved and persisted at six months follow-up. HRQoL improved significantly and the effects maintained at follow-up after the treatment.

Ziaeirad *et al.* [68] did a quasi-experimental study on 64 patients to evaluate the QoL of patients with angina pectoris after treatment with enhanced external counterpulsation. The author reveals that EECP is an

effective noninvasive method in treating patients with angina pectoris and in developing their HRQoL. Jorgensen *et al.* [69] conducted a special case study of the 43-year-old woman who had 15 hospital admissions in six years due to angina. The case study proves the EECP effectiveness towards angina recovery and significant improvement in HRQoL. May *et al.* [70] performed a study to assess the effect of EECP on QoL and exercise capacity in CAD patients. Author of this concludes that quality of life and exercise capacity was improved after EECP. Shakouri *et al.* [71] conducted a study to investigate the effect of EECP on plasma nitric oxide (NO) and HRQoL in CAD patients. The author revealed that HRQoL and NO level increased after EECP treatment in CHD patients. Summary of studies given in Tables 3, 4.

**Table 3.** EECP effectiveness on clinical profile in coronary heart disease patients

Author	Study (year)	Title of study	Sample size	Findings & conclusion
Lawson <i>et al.</i> [12]	1992	Efficacy of enhanced external counterpulsation in the treatment of angina pectoris	18	Myocardial ischemia 67% decrease, exercise duration increased, reduction in anti-anginal medicines and 89% patients were symptom-free
Sjukri <i>et al.</i> [13]	1995	EECP in the treatment and rehabilitation of coronary patients in Indonesia	201	Exercise tolerance 94.2%, improvement in CCS angina class
Arora <i>et al.</i> [14]	1999	The multicenter study of enhanced external counterpulsation (MUST-EECP): effect of EECP on exercise-induced myocardial ischemia and anginal episodes	139	Exercise duration increase, angina severity reduced, extends times to exercise-induced ischemia, Nitroglycerine usage decrease
Lawson <i>et al.</i> [15]	2000	Long-term prognosis of patients with angina treated with enhanced external counterpulsation: five-year follow-up study	33	Improvement in stress perfusion after EECP, 64% did not suffer any major adverse cardiovascular event due to the effect of EECP at 5 year of study follow up
Lawson <i>et al.</i> [16]	2000	Treatment benefit in the enhanced external counterpulsation consortium	2289	74% angina pectoris patients improved in CCS angina class III & IV with significant p-value ( $p < 0.001$ )
Urano <i>et al.</i> [17]	2001	Enhanced external counterpulsation improves exercise tolerance, reduces exercise-induced myocardial ischemia, and improves left ventricular diastolic filling in patients with coronary artery disease	512	Improvement in Exercise duration and tolerance with improvement in LV function. Improvement in diastolic filling and diastolic function
Stys <i>et al.</i> [18]	2001	Acute hemodynamic effects and angina improvement with enhanced external counterpulsation	395	CCS angina class improvement by at least I class in 88% of patients
Barsness <i>et al.</i> [19]	2001	The International EECP Patient Registry (IEPR): design, methods, baseline characteristics and acute results	1246	Decrease in at least I anginal class by 81% and mean change decrease in anginal episodes per week ( $6.4 \pm 12.6$ ) with reduction of nitroglycerine use by 61.7%
Springer <i>et al.</i> [20]	2001	Psychosocial effects of EECP in the angina patient: A second study	28	Improvement in physical functioning and mental health with special reference to stress and QoL

**Table 3. cont.** EECP effectiveness on clinical profile in coronary heart disease patients

Author	Study (year)	Title of study	Sample size	Findings & conclusion
Lakshmi <i>et al.</i> [21]	2002	Relation of the Pattern of Diastolic Augmentation During a Course of Enhanced External Counterpulsation (EECP) to Clinical Benefit (from the International EECP Patient Registry [IEPR])	2486	At 6 months of follow up, the patients showed a higher reduction in angina class who had the greatest increase in the DA ratio as compared to those who had a decrease in the DA ratio
Stys <i>et al.</i> [22]	2002	Effects of enhanced external counterpulsation on stress radionuclide coronary perfusion and exercise capacity in chronic stable angina pectoris	175	85% angina improvement, improvement in stress myocardial perfusion and maximize exercise functions
Michaels <i>et al.</i> [23]	2002	Left ventricular systolic unloading and augmentation of intracoronary pressure and Doppler flow during enhanced external counterpulsation	10	Diastolic BP increase, Systolic B.P decrease and increment in coronary flow by 28% during EECP treatment
Holubkov <i>et al.</i> [24]	2002	Comparison of patients undergoing enhanced external counterpulsation and percutaneous coronary intervention for stable angina pectoris	771	Angina improvement in CCS class higher who received EECP therapy as compared to PCI group
Soran <i>et al.</i> [25]	2002	Enhanced external counterpulsation as treatment for chronic angina in patients with left ventricular dysfunction: a report from the International EECP Patient Registry (IEPR)	1402	Improvement in angina at least one class in 67% of patients with LV dysfunction 70.6% after 6 months of follow up
Fitzgerald <i>et al.</i> [26]	2003	Enhanced external counterpulsation as initial revascularization treatment for angina refractory to medical therapy	4,669	The decrease in anginal episode per week with significant value $p < 0.001$ , reduced nitroglycerine uses and CCS angina class reduction in 74.8 patients
Bonetti <i>et al.</i> [27]	2003	Enhanced external counterpulsation improves endothelial function in patients with symptomatic CAD	23	Enhanced peripheral endothelial function immediately after EECP treatment with a contribution to the clinical benefit of EECP
Schechter <i>et al.</i> [28]	2003	External counterpulsation therapy improves endothelial function in patients with refractory angina pectoris	20	Significant improvement in angina class ( $p < 0.001$ ), nitrate consumption decrease ( $p < 0.001$ ) with improvement in endothelial functions
Tartaglia <i>et al.</i> [29]	2003	Exercise capability and myocardial perfusion in chronic angina patients treated with enhanced external counterpulsation	25	96% patients improved by at least one functional angina class and exercise duration increased in treadmill exercise testing and reduction in ischemic segments
Werner <i>et al.</i> [30]	2003	Practicability and limitations of enhanced external counterpulsation as an additional treatment for angina	48	Anginal episode reduced by 48%, Nitroglycerine reduction by 51% and work capacity increase by 22%

**Table 3. cont.** EECp effectiveness on clinical profile in coronary heart disease patients

Author	Study (year)	Title of study	Sample size	Findings & conclusion
Lawson <i>et al.</i> [31]	2003	Analysis of baseline factors associated with a reduction in chest pain in patients with angina pectoris treated by enhanced external counterpulsation	4592	Significant improvement in angina by 73% in at least 1 class and 2 classes by 35.2% and 3 classes by 17.3%. Mean angina episodes per week decrease to 2.5 per week after EECp treatment and nitroglycerine uses per week after EECp was 2.5 times per week and improvement in functional status also observed
Linnemeier <i>et al.</i> [32]	2003	Enhanced external counterpulsation in the management of angina in the elderly	3037	Angina improvement in 81% at 6 months with a reduction in nitroglycerine use and improvement in well-being status with decrease rate of cardiac hospitalization has been observed
Linnemeier <i>et al.</i> [33]	2003	Enhanced External Counterpulsation for the relief of angina in patients with diabetes: safety, efficacy and 1- year clinical outcomes	1532	Significant improvement in CCS angina class by 69% in diabetes mellitus immediately after EECp and 86% at 1 year follow up, reduction in nitroglycerine use and improvement in well-being status has been observed and confirm that EECp is safe, effective and well tolerable treatment
Bagger <i>et al.</i> [34]	2004	Effect of enhanced external counterpulsation on dobutamine-induced left ventricular wall motion abnormalities in severe chronic angina pectoris	23	Reduction in dobutamine-induced wall motion abnormalities observed after EECp treatment
Michaels <i>et al.</i> [35]	2004	Two-year outcomes after enhanced external counterpulsation for stable angina pectoris (from the International EECp patient registry [IEPR])	1097	Significant improvement by 73% angina improvement, 50% improvement in well-being of CAD patients at 2 years of follow up
Lawson <i>et al.</i> [36]	2004	The effectiveness of enhanced external counterpulsation in patients with left main disease and angina.	2861	Significant improvement in angina pectoris and reduction in nitroglycerine use and reduction in weekly angina episodes observed
Masuda <i>et al.</i> [37]	2004	Improvement of oxygen metabolism in ischemic myocardium as a result of enhanced external counterpulsation with heparin pretreatment for patients with stable angina	18	Significant improvement in exercise capacity and oxygen metabolism of CHD patients treated with EECp and intravenous heparin infusion combined therapy was observed
Henrikson <i>et al.</i> [38]	2004	Enhanced external counterpulsation therapy: significant clinical improvement without electrophysiologic remodelling	28	Significant improvement in angina by 82% and effective treatment for CAD patients
Taguchi <i>et al.</i> [39]	2004	Effects of enhanced external counterpulsation on hemodynamics and its mechanism relation to neurohumoral factors	24	Study concludes that increments in ANP without enhancement in BNP was an important mechanism for EECp effectiveness
Lawson <i>et al.</i> [40]	2005	Predictors of benefit in angina patients one year after completing enhanced external counterpulsation: initial responders to treatment versus non responders	2,007	Angina reduced by at least 83% immediately, and improvement in weekly anginal episodes, the frequency of nitroglycerine use decreased and well-being status improved by 63%

**Table 3. cont.** EECP effectiveness on clinical profile in coronary heart disease patients

Author	Study (year)	Title of study	Sample size	Findings & conclusion
Michaels <i>et al.</i> [41]	2005	Frequency and efficacy of repeat enhanced external counterpulsation for stable angina pectoris (from the International EECP Patient Registry)	1192	After EECP treatment 86% reported decrease in angina CCS class by at least one and 57% patients discontinued nitroglycerine use  After 2 years 70% patients reported significant decrease in angina and nitroglycerine consumption
Arora <i>et al.</i> [42]	2005	Effects of enhanced counterpulsation on vascular cell release of coagulation factors	30	The study suggests that EECP may not play a vital role in controlling coagulation factors in coronary heart disease patients, further research required
McCullough <i>et al.</i> [43]	2006	Impact of body mass index on outcomes of enhanced external counterpulsation therapy	2730	Changes in angina and duke activity status have been observed in all BMI patients. Greater reduction of angina is directly proportional to BMI value
Soran <i>et al.</i> [44]	2006	Two-year outcomes after enhanced external counterpulsation (EECP) therapy in patients with refractory angina pectoris and left ventricular dysfunction (report from the International EECP Patient Registry)	363	At 2 years of follow up 55% of patients showed improvement in angina and prove that EECP is effective and durable therapy approach for CAD patients and 52% CHD patients discontinued nitroglycerin use
Akhtar <i>et al.</i> [45]	2006	Effect of external counterpulsation on plasma nitric oxide and endothelin-1 levels	13	EECP increases nitric oxide and decreases endothelin-1 level and changes sustained for 3 months in CHD patients
Nichols <i>et al.</i> [46]	2006	Enhanced external counterpulsation treatment improves arterial wall properties and wave reflection characteristics in patients with refractory angina	20	The study suggests that EECP can reduce arterial stiffness and may improve wave reflection characteristics in CHD patients and these changes decrease left ventricular afterload, myocardial oxygen demand and can reduce anginal episodes
Lawson <i>et al.</i> [47]	2006	Two-year outcomes in patients with mild refractory angina treated with enhanced external counterpulsation	1458	Improvement in angina by 70–74% with reduction of nitroglycerine use by 52% with better well-being persist till 2 years of follow up
Novo <i>et al.</i> [48]	2006	Enhanced external counterpulsation for treatment of refractory angina pectoris	25	Significant improvement in angina by 84% and reduced inducible ischemia and maximal benefits observed in patients with the worst systolic failure
Loh <i>et al.</i> [49]	2006	The immediate and long-term outcome of enhanced external counterpulsation in treatment of chronic stable refractory angina	58	At least one class CCS angina improvement by 78% after 1 year and increase exercise capacity with a reduction in nitroglycerine use
Arora <i>et al.</i> [50]	2007	Effect of enhanced external counterpulsation on myocardial perfusion in patients with stable angina: A multicenter radionuclide study	11	No significant effect on myocardial perfusion has been observed due to very less number of sample size and highly variable clinical responses and study suggest for further research to assess EECP effectiveness on myocardial perfusion
Michaels <i>et al.</i> [51]	2007	The effects of enhanced external counterpulsation on time- and frequency-domain measures of heart rate variability	27	Improvement in heart rate variability in diabetic CHD patients and associated with reduced with reduced mortality rate

**Table 3. cont.** EECP effectiveness on clinical profile in coronary heart disease patients

Author	Study (year)	Title of study	Sample size	Findings & conclusion
McCullough [52]	2007	Residual high-grade angina after enhanced external counterpulsation therapy	902	The researcher observed high residual grade angina after EECP in those patients who had severe angina and multivessel diseases
Yavari <i>et al.</i> [53]	2007	Effects of enhanced external counterpulsation on anginal symptoms and improvements in objective measures of myocardial ischaemia	67	The study concludes that EECP is a safe, well tolerated and effective non-invasive therapy for CHD patients
Loh <i>et al.</i> [54]	2008	Enhanced external counterpulsation in the treatment of chronic refractory angina: a long-term follow-up outcome from the International Enhanced External Counterpulsation Patient Registry	1477	After 1-year EECP treatment 78% patients reported reduction in CCS angina class and 74% of patients sustained improvement at 3-years follow
Erdling <i>et al.</i> [55]	2008	Enhanced external counterpulsation in treatment of refractory angina pectoris: two-year outcome and baseline factors associated with treatment failure	86	After EECP treatment 79% of patients showed improvement in CCS class immediately and 61.5% of patients sustained these benefits till 12 months and 29% at 2 years follow up and study conclude that EECP is safe & effective for CAD with angina pectoris patients and patients with CCS angina class III & IV reported maximum improvement

Shakouri [71]	2015	Effect of enhanced external counterpulsation and cardiac rehabilitation on quality of life, plasma nitric oxide, endothelin and high sensitive crp in patients with coronary artery disease: a pilot study	42	Mean change in quality of life and endothelial functioning has been observed in CAD patients

## Discussion

Above discussed EECP studies validates the significant improvement in CCS and NYHA angina classification, angina episodes, left ventricle ejection fraction functioning, exercise tolerance and HRQoL with reduction of nitroglycerine use & decrease hospitalization rate in coronary heart disease patients. EECP used for angina and heart failure for the past two decades, but still, more research required filling the gaps in research. There are very few or rare study conducted to assess EECP effectiveness on BMI, Heart Rate, Cholesterol, Triglyceride, High-Density Lipoprotein (HDL), Low-Density Lipoprotein (LDL), HbA1C, SpO<sub>2</sub>, Vo<sub>2</sub>max, 12-minute walk or run test and comparative prospective randomized trials on cardiac and non-cardiac metabolic markers.

## Conclusion

Further clinical research is required to evaluate EECP effectiveness on obese, diabetic, hypertension and other metabolic disease patients with CHD and multi-centric randomized controlled trials are required for further modifications in EECP device to cure, prevent, and treat chronic diseases such as obesity, hypertension, diabetes, and neurological disorders by the non-invasive procedure.

Received: 06 June 2018, Revised and Accepted: 12 June 2018

### ABSTRACT

Adverse drug reactions (ADRs) pose both financial and health encumbrances for patients. Although prevalence and risk factors associated with ADRs have been published in many studies, most of them lack the statistical evidence for predictors. The aim of this study was to review the published literature to determine the risk factors in the adult and elderly population for ADRs. An electronic search of articles published in English language in databases such as Cochrane Database of Systematic Reviews, MEDLINE, EMBASE, Scopus, and Google Scholar was conducted in between January 2001 and April 2018. The search terms used were: "ADRs," "drug-related problems," "risk factors," "general adult population," "elderly patients," and "hospital admission." For inclusion in the review, studies had to include an explicit definition of what was considered an ADR and/or an explicit assessment of causality, as well as a clear description of the method used for ADR identification. Polypharmacy was the major risk factor of ADR followed by comorbidities and length of hospital stay.

**Keywords:** Adverse drug reactions, Risk factors, Elderly patients, Adult patients, Logistic regression.

### INTRODUCTION

Patient safety is one of the most essential elements of modern-day health-care systems [1]. With the mounting reliance on medication therapy as the primary intervention for most illnesses, medications may also cause either non-preventable adverse effects or potentially preventable medication errors [1,2]. Adverse drug reactions (ADRs) are common causes of mortality and morbidity worldwide, and its occurrence in real-world medical practice cannot always be predicted by pre-marketing data given that a limited number of selected patients are enrolled in clinical trials for specific indications and monitored for a limited period of time [3]. Various studies in general adult populations have quantified that 5%–7% of all hospitalizations are due to ADRs, with over half of these arbitrated to be preventable, and that 3%–6% of ADRs are fatal or have serious health consequences [4-6]. Health-care costs attributable to ADRs have been estimated to be 5%–9% of total inpatient costs per annum [7]. Older people experience greater morbidity with a corresponding increase in medication utilization, resulting in a higher risk of ADRs. The relative physiological change that occurs with aging affects the pharmacokinetics and pharmacodynamics of medications, which may increase the potential for drug toxicity and ADRs [8]. Various definitions are being identified by researchers for ADR, for instance, the US FDA definition described it as "any adverse event for which there is a reasonable possibility that the drug caused the adverse event, 'reasonable possibility' suggesting a causal relationship between the drug and the adverse event"[9], the World Health Organization (WHO) defines it as "a response to a medicine which is noxious and unintended, and which occurs at doses normally used in man" [10], and as per Edwards and Aronson definition, "ADR is an appreciably harmful or unpleasant reaction, resulting from an intervention related to the use of a medicinal product, which predicts hazard from future administration and warrants prevention or specific treatment, or alteration of the dosage regimen, or withdrawal of the product"[11].

There are various factors that predispose patients to ADRs such as polypharmacy, age, intercurrent diseases, comorbidity, gender, history

of ADRs, and length of hospital stays [12]. Although few authors have explored the relationship between the risk factors and ADRs [13-15], there exists a controversial corroboration due to differences in definitions, study settings, study designs, study population, statistical methods, race, and ethnicity [16]. Few studies explored that female gender is the major predictor of adverse reactions [17-20], while other findings documented that patients with age above 65 years had more than 50% of hospitalizations due to ADRs [5,21].

Even though a large number of studies have identified and assessed ADRs, little has been focused on the associated risk factors with appropriate statistical analysis in adult and elderly population. This review was conducted with the aim to determine potential significant risk factors of ADRs during hospitalization in the adult and elderly population.

This review was conducted and reported according to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. An electronic search of articles published in English language in databases such as Cochrane database of systematic reviews, MEDLINE, EMBASE, Scopus, and Google Scholar in between January 2001 and April 2018 was conducted. Medical subject heading terminology and other keywords were used for studies published in different databases. The search terms used were: "Adverse reactions," "ADRs," "adverse effects," "drug-related problems," "risk factors," "predictive factors," "general adult population," "elderly patients," and "hospital admission." The auxiliary search terms used included: "Drug adverse effects," "drug therapy," "geriatric," "hospitalization," and "emergency admissions." All the titles and abstracts of identified studies were examined critically for potential relevance. The reference lists of all eligible full-text articles were hand searched and reviewed to locate other relevant original studies. Two reviewers undertook searches independently and assessed and discussed study findings, and the final consensus was reached to ensure the search strategy was accurate and reproducible.

All studies that were peer-reviewed, highly citation, available in English language, and full-text articles were included. Those studies that

reported ADRs either prospectively or retrospectively in hospitalized adult and elderly patients were included, irrespective of hospital department or specialty. For inclusion in the review, studies had to include an explicit definition of what was considered an ADR and/or an explicit assessment of causality, as well as a clear description of the method used for ADR identification. In particular, studies also had to explore factors associated with an increased risk of an ADR statistically through logistic regression (univariate and multivariate).

Studies that looked at ADR-related hospital readmissions were excluded from the review. Those studies with only abstracts were excluded if the full-text article could not be found, as it restricts meaningful evaluation and quality appraisal provided in abstracts. Studies and/or clinical trials that reported adverse reactions in special population such as pediatric and pregnant women and lactating mothers were excluded. Those studies that reported ADRs associated with off-labeled drug usage were also excluded from the study.

All the titles and abstracts that fulfilled inclusion criteria were assessed critically for relevance of title, year of publication, first author, country of origin, study sample size, study population, study design, and subject age groups. Data were extracted including explicit ADR definition, identification method, risk factors, statistical method and prevalence, and causality assessment using a custom-designed data extraction form. In those studies, where the prevalence was not directly reported, it was calculated by dividing the number of patients identified with an ADR of all included patients. Extracted data were entered into Microsoft Excel 365 for descriptive data analysis. Overall mean±standard deviation of ADR prevalence was calculated at 95% confidence intervals (CIs).

#### ADR ASSOCIATED RISK FACTORS - ADULT POPULATION

The risk factors were categorized as patient-related and medication-related risk factors. Univariate analysis identified very few significant medication-related risk factors such as polypharmacy [1,15,22,23], non-adherence [1], anti-tuberculosis drugs [23], and ART drugs [23]. Whereas results of multivariate analysis concluded that polypharmacy [1,15,22,23] was the highly influential independent predictor of ADR. Patient-related risk factors such as comorbidities, female gender, body mass index, h/o ADR, length of hospital stay, impaired renal function, number of diagnoses, and dependent living situation were significant [1,15,22,23]. Among these, comorbidity was evidenced as independent predictor in four studies, followed by h/o ADR and length of hospital stay.

#### ADR-ASSOCIATED RISK FACTORS - ELDERLY POPULATION

In this assessment of the effect of predictors in the development of ADRs, under univariate analysis, patient-related determinants were age, female gender, comorbidities, length of hospital stay, renal failure, liver disease, dementia, IHD, heart failure, depression, hyperlipidemia, and increased serum concentration and the medication-related predictors were polypharmacy, number of doses, narrow therapeutic drugs, anticholinergic drugs, antiarrhythmics, and antihyperglycemic drugs, and inappropriate prescription was significant [25-30]. While in the multivariate analysis, age ≥85 years [27], female gender [26], and length of hospital stay [29] were patient-related independent predictors and polypharmacy was the only one medication-related independent predictor identified in four studies, in which polypharmacy with ≥8 drugs was observed as the highly influential predictor in two studies [28,29] and ≥5 drugs was evidenced in a single study [26].

To the best of our knowledge, this is the first kind of systematic review that appraised univariate and multivariate logistic regression in the identification of significant risk factors for ADRs. This search found only 11 studies that met the inclusion criteria, and nearly half of the studies were done in adult population. Studies showed explaining the variations in prevalence rates and risk factors of ADRs.

An overall up to 13.7% of patients admitted to hospital experience an ADR during their hospitalization, while previously conducted

systematic review [31] projected that up to 4% of all adult patients admitted to hospital experience an ADR either leading to or during their hospital admission. However, a meta-analysis conducted by Oscanoal *et al.* [32], in the year 2017, reported that the prevalence of ADR among elderly patients that led to hospital admissions accurately to be 8.7% (95% CI, 7.6%–9.8%).

In our review, three unambiguous definitions were being utilized in the studies for ADR identification which might explain the differences in ADR prevalence rate reported. Previous literatures [33] have sufficiently elaborated on the contribution of different fundamental criteria adopted in various setting in the identification of ADR between reported studies with respect to prevalence. Although one study used USFDA definition, there was no significant change in prevalence rate reported owing to the slenderest difference compared to the WHO definition.

#### RISK FACTORS OF ADRs

In our review, overall 80 risk factors were studied among the total population of 20,974, wherein 30 significant risk factors were recognized as potential and 18 as independent predictors of ADRs based on univariate and multivariate logistic regression analysis (Table 1).

##### Polypharmacy

Polypharmacy was the most consistent and highly acknowledged predictor witnessed in almost all the literature to quantify the risk associated with ADR [1,15,24,26-29,34]. In continuation, few studies quoted that polypharmacy is chosen when a patient presents with multiple comorbidities in order to augment the initial therapy and advanced age of patients who may require drugs with varied mechanisms of action [35]. However, polypharmacy intensifies the possibility of ADRs due to drug-drug interactions from 2% to 5% [36-40] and may heighten it up to 9% with each additional prescribed drug thereafter [27]. And also, it can increase the risk of multiple ADRs than single ADR [41]. It is important for the prescribers to ponder on this risk factor, take imperative steps to reduce the risk through usage of combinational drugs, or discontinuation of unnecessary drugs through reevaluating the disease condition of the patients specifically in older adults. Reducing the number of drugs in the prescription is the simplest way of reducing the ADRs [42]. Furthermore, the total number of drugs along with the individual drug's risk could be incorporated into an electronic algorithm and determining the benefit-to-risk ratio of individual drug therapy is essential to minimize polypharmacy.

##### Comorbidities

Comorbidity was the second most frequently reported significant risk factor for ADR in the adult and elderly patients [1,22,23,25,26,28,30]. However, three studies particularized through the application of multivariate logistic regression to identify it as an independent predictor of ADR but then only in adult patients [1,22,23]. Two authors expressed renal dysfunction and limited sample size as the possible cause of refuting comorbidity as a significant risk factor. Patients with polymorbidity may have altered pharmacodynamic and pharmacokinetic mechanisms due to drug-disease interaction predisposing them to ADRs and other explanations that require further research in this area.

##### Length of hospital stay

ADRs are considered as serious health hazard in hospitalized patients. From the findings of the review, significant association was built up between the length of hospital stay and ADRs [24,29]. Findings clarified that the length of stay is the proxy measure of comorbidity and chronic illness with an increased number of prescribed drugs at higher doses, reflecting an increased risk of ADR. The probability of adverse reactions increases 6% for every additional day of hospitalization [43], and every 2.2 hospital bed day of patient was due to ADRs [26]. Length of hospital stays ≥12 days was 2.3 times of the risk for ADR [33], and it has more importance than patient characteristics in the explanation of ADR [44]. To back up this, literature witnessed that about 5% of all hospital

**Table 1: Significant predictors of ADRs in univariate and multivariate logistic regression model**

Identified risk factors associated with ADRs	Univariate analysis p<0.05	Multivariate analysis p<0.05
Patient-related factors		
Female gender	Yes	Yes
Comorbidity	Yes	No
Length of hospital stay	Yes	Yes
H/o allergy to the drugs	Yes	No
Renal failure	Yes	Yes
Liver disease	Yes	No
Age	Yes	Yes
Dementia	Yes	Yes
Heart failure	Yes	Yes
Hyperlipidemia	Yes	Yes
High WBC count on admission	Yes	No
Non-adherence to the medication regimen	Yes	Yes
H/o ADR	Yes	Yes
BMI	Yes	Yes
Ischemic heart disease	Yes	Yes
Depression	Yes	Yes
Medication-related factors		
Inappropriate prescription/STOPP medication	Yes	Yes
Drug changes in the preceding 3 months	Yes	Yes
Anticholinergics	Yes	Yes
Antiarrhythmics	Yes	No
Polypharmacy	Yes	Yes
Number of doses	Yes	No
Drugs of NTI	Yes	No
Anti-hypertensives	Yes	Yes
ACE inhibitors	Yes	No
Beta-blockers	Yes	No
Diuretics	Yes	No
Antidiabetic agents	Yes	Yes
Anti-TB drugs	Yes	No
ART drugs	Yes	No

ART: Antiretroviral therapy, WBC: White blood cell, ACE: Angiotensin-converting enzyme, TB: Tuberculosis

admissions were due to ADR with an average length of hospital stay of 1.8-8.5 days per patient per ADR. [45-48].

#### Age

Older age was reported as an independent predictor of ADR, evidenced only in one study [27], while other studies reported that age was not an independent predictor of ADR. This mismatch may be due to dissimilarities in matching criteria and demonstration of the significance of age as a risk factor only in univariate analysis. However, the incidence of ADRs was significantly higher in the elderly patients compared to other age groups [22,34,49,50], owing to increased age, deteriorating organ function, reduced hepatic and renal clearance, polymorbidity, polypharmacy, usage of over the counter drugs, and alternative medicine [34,51,52].

#### Renal impairment

It is widely accepted that renal impairment has a direct effect on a number of ADRs, and it was recognized first time in the year 1966 by the Smith *et al.* [53]. However, our review findings identified that it was an independent predictor of ADR in both adult patients and elderly patients [1,23,27,30]. The patients with renal impairment display altered drug clearance results that may ensue either drug toxicity or subtherapeutic effect. Hence, it is pretty much important for early estimation of creatinine clearance to identify the renal function, before prescription of such drugs having higher risk ADRs, particularly in

elderly patients.

#### History of ADR

This review highlighted that history of ADR as a significant predictor in adult population which may be because of their active immunity compared to elderly patients. Two studies stated that patients with previously experienced ADRs were having 17.46 times odds of ADR in tuberculosis and 28.94 times odds in HIV/AIDs positive [22,23]. Prescriber's attention toward medication and ADR history taking may reduce the recurrence of ADR in such vulnerable population.

#### Gender

Female gender was identified to be an independent predictor of ADR in the two articles [22,26], while one study revealed significance only through univariate logistic regression analysis [15]. However, further detailed research is required for a definite relationship. Few explanations behind the predisposition of women for ADR were attributed to them having lower lean body mass, reduction in hepatic clearance, differences in activity of cytochrome P450 (CYP) enzymes, and metabolization of drugs at different rates compared with men [54]. Moreover, females are known to use oral contraceptives, hormonal supplements adding on to increased number of drugs, especially in their reproductive years, and vitamin and mineral supplements during pre and postmenopausal periods that may predispose them for ADRs [55]. However, few studies recommended that it was not a significant risk factor of ADR through their observations [35,56].

#### Strengths and limitations

Strength of the present review was strict inclusion criteria mandating assessment of risk factor with fitting statistical method and usage explicit definitions of ADR. The number of studies selected was low, as many studies did not mention true sample sizes had to be excluded. Many studies failed to give the appropriate explanation for their insignificance of risk factors. However, our quality assessment of each study was subjected to affirm the independent predictors of ADRs.

#### CONCLUSION

Review of literature found eleven papers that detailed the following measurable risk factors polypharmacy, comorbidities, length of stay, age, renal impairment, history of ADR, and gender linked with ADRs. Multiple drug regimen is the most frequently documented independent medication-related risk factor of ADR. Renal impairment had non-discrimination in both adult and elderly patients with respect to their risk. Gender is an independent predictor of ADR evidenced in a negligible amount of studies; further, more research is required to find its definite relationship with ADR. Aging increases the risk of ADR in association with multiple diseases and number of drugs. There is a great significance for reevaluation of pharmacotherapy in the elderly patients to reduce the risk of drug-related issues. Researchers and health-care professionals should consider all the factors of drug-related issues for the rationale of treatment.

#### AUTHOR'S CONTRIBUTION

Manoj Kumar Mudigubba: Conceptualized the article, compiled full literature search, and drafted the manuscript. Mamatha Krishna Murthy: Developed the standards of manuscript. Ann Mary Swaroop: Reviewed and edited the manuscript. Nayantara M: Compiled literature search and evaluated. Saurabh Dahiya: Supervisor of the research work, provided guidance in the preparation of a standard paper.

**ASSESSMENT OF NOISE IN INDUSTRIAL AND COMMERCIAL ZONES OF AN URBAN SETTING****Faiza khaliil***Assistant Professor, Lingayas Vidyapeeth, Faridabad, Haryana, India*

\*\*\*

**Abstract** - Urban zones with fast modernisations are influenced by noise related medical problems. This problem originating from the street activity noise, rail movement noise, air movement noise, mechanical noise, group commotion and different random sources influences people in everyday life. Sound Level meter (Larson & Davis) type1 integrating with free field microphone was utilized to make the noise monitoring at different areas on the roadway of concerned zones of Delhi. The primary objective is to monitor noise level in the Commercial and Industrial zones of Delhi. The main objective is to compare the noise levels with the limits prescribed by Central Pollution Control Board (CPCB). To find out noise levels which people encounter in their daily life, sampling was carried on the roadside from 08 hrs to 20 hrs a day in the month of January 2017 on the selected locations. The results indicate high noise levels, surpassing on many occasions to the prescribed levels.

**Key Words:** Industrial, commercial, decibels, noise levels, sound level meter

**1. INTRODUCTION**

The complex urban soundscape comprises of environmental noise from transit systems, the built environment, road traffic, construction, industry, population density etc. These sources are additive to any other sources of noise that individuals may be exposed to. Noise pollution is a significant environmental problem in many urban areas. Noise pollution has been stated as a serious health hazard (Bies and Hansen, 1996; Yilmaz and Ozer, 2005), with noise-related damage to humans ranging from annoyance to insanity and death (Mato and Mufuruki, 1999). The influences of noise on human health may be physical or psychological. Nelson (1987) reported that long term exposure to high occupational noise can result in permanent hearing loss. Additionally, commonly experienced noise effects may include annoyance, deterioration of sleep quality, and stress-related various type of heart disease (Anonymous, 1997; Morrell et al., 1997). According to World health organization (WHO) noise is Considered as third most hazardous type of pollution, right after air and water pollution (WHO, 2005).

Major cities like Mumbai, Delhi, Kolkata and Chennai are listed among the noisiest cities in India (Shastri et al., 1996). Many surveys addressing the noise pollution problems has been conducted for several cities of the world (Alberola et al., 2005; Bhosale et al., 2010) and have clearly shown the scale of discomfort that noise causes in people's lives (Vidyasagar and Rao, 2006).

Delhi (28.7041° N, 77.1025° E) capital territory of India, situated on the bank of river Yamuna, is a massive metropolitan city in the country's north. Delhi is amongst the

most populous cities of India having population 28 million (2017) and total area of 1484 km<sup>2</sup>. Traffic noise is a major environmental concern in Delhi. Various types of vehicle, automobile, cycle, rickshaw etc. create tremendous noise at various points of this city. Vehicular noise depends on the quality of the engine and exhaust system, traffic flow, interaction with road surface, tire and honking of horns. In this study noise monitoring is done at some pre-selected locations of Industrial, Commercial zones of Delhi. Data recorded is presented in the form of charts. Noise levels were exceeding the limits prescribed by Central pollution control board (CPCB) in all zones.

**1.1 Scope & Objectives**

Scope of this study is comparative assessment of noise levels at the selected road stretches of Industrial, Commercial, Residential and Institutional area of Delhi. The continuous monitoring of noise at various locations will give clear picture about the variation of the noise intensity. The noise parameters recorded at these areas will be compared by the standards prescribed by Central Pollution Control Board. The study will be valuable contribution in the area of noise management/abatement, especially at planning stage and redevelopment of urban areas. The study will be helpful in traffic planning, development of realistic objectives for noise management. It will be supportive tool for the identification of areas with high potential of reduction measures. It will also provide more effective use of local, regional and national planning procedures to control and reduce noise. Besides, it will be useful in monitoring the effectiveness of action plans and other planning procedures. Besides, the present study will provide an extended spatial database, spatial tools and computation force to quantify and visualize noise effects.

**1.2 Aim**

The aim of this study is comparative noise assessment in industrial and commercial zones of Delhi City. The specific objectives of this study are:

- i. Extensive field survey for sampling locations as per norms
- ii. Identification of sampling location for Industrial and Commercial area
- iii. Noise monitoring at selected locations

Comparative Assessment of noise with standards prescribed by Central pollution control board (CPCB).

**2. METHODOLOGY**

In order to assess noise pollution, major noisy area has been identified in respect of commercial, residential, Industrial

and silent zones. Accordingly, noise levels have been measured in each identified station. The study was conducted during the month of January 2017. Noise levels were measured using sound level meter. Ambient sound levels are being compared with the prescribed standards of CPCB (Central Pollution Control Board), India.

**Data Collection**

The desired data in terms of noise levels have been recorded and collected from different sites selected for noise monitoring in Institutional, commercial, residential and Industrial zone of Delhi. During monitoring of noise levels at various zones international guidelines will be followed. Monitoring was carried out with instrument at a height of 1.2 to 1.5m and 1m away from the chest. Noise monitoring is done for a period of 12 hours from 8 a.m. in the morning to 8 p.m. in the evening in the month of January 2017.

**Site selection**

Lajpat nagar is a residential and Commercial neighbourhood of the South Delhi. It is today most known for its Central market.

Okhla Industrial area is divided into 3 phase, where phase 2 is taken as study area. Okhla Industrial phase –II is an industrial suburb of New Delhi in South Delhi. Okhla Industrial Phase I and Phase II is one of the 28 notified industrial areas of Delhi, as per the Master plan of 2001.

Locations in each zone are selected as per the Table 1.

**Table -1:** Site selection

S.NO	ZONES	LOCATION	LATITUDE	LONGITUDE
1.	<b>COMMERCIAL LAJPAT NAGAR</b>	Central market	28.569229°N	77.241735°E
2.		Alankar cinema road	28.568859°N	77.240874°E
3.		Veer sawarkarmarg	28.569566°N	77.242296°E
4.	<b>INDUSTRIAL OKHLA INDUSTRIAL PHASE II</b>	Honda motors	28.536933°N	77.267864°E
5.		Brinco sales pvt ltd	28.538649°N	77.271308°E

**Noise monitoring instrument**

Noise monitoring is done with type1 integrating sound level meter shown in figure 2.6 with free field microphone. Larson & Davis Model 831IEC 61672-1:2002, ANSI S1.4, ANSI S1.43 Class 1 integrating sound level meter is used.

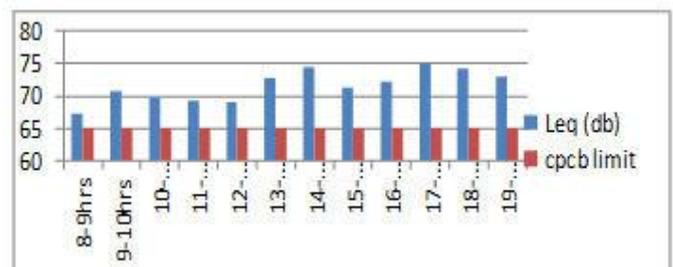

**Noise monitoring**

Noise monitoring is done in the month of January from Monday to Saturday. Monitoring is done for a period of 12 hours from 8 a.m. to 8 p.m.

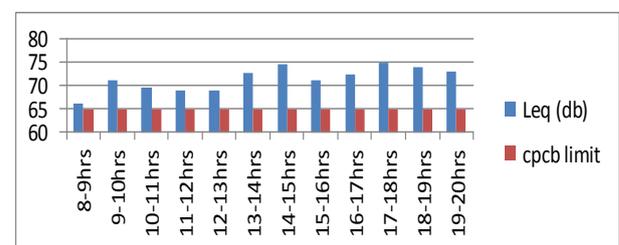

**3.RESULTS AND DISCUSSIONS**

The study is conducted on 5 different locations situated in different parts of Delhi. Comparative assessment of noise levels with the limits prescribed by Central pollution Control Board for different zones is presented graphically.

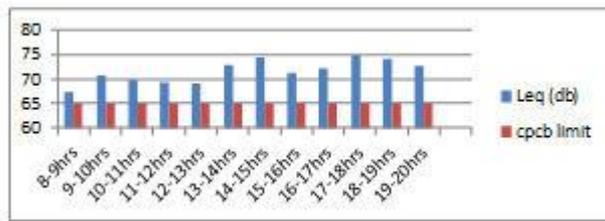

**3.1 Results of Commercial area Lajpatnagar**

**Chart 1:** Comparison of noise levels with standards prescribed by Central Pollution Control Board 28<sup>th</sup> January 2017

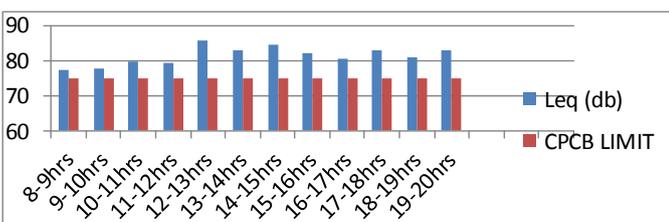

**Chart 2:** Comparison of noise levels with standards prescribed by Central Pollution Control Board 30<sup>th</sup> January 2017

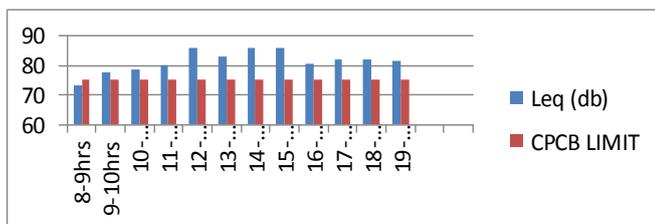

**Chart 3:** Comparison of noise levels with standards prescribed by Central Pollution Control Board 31<sup>st</sup> January 2017.

The observations show that noise levels are in the range of 63.5 to 87.1. Noise levels are higher after 10 a.m. in morning with highest noise levels recorded between 14-15 hrs and 17-19 hrs. The CPCB standards of noise in commercial area are 65 dB in day time and 55 dB in night time. Huge crowd, shouting of hawkers, shouting of sales men, are the main reason of noise in this area.

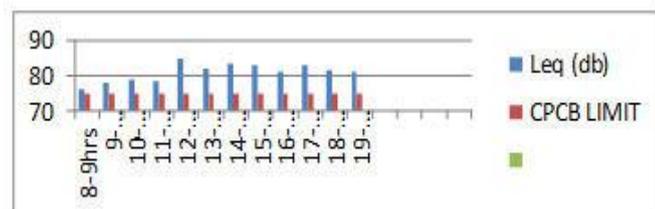

### 3.2 Results of Industrial area

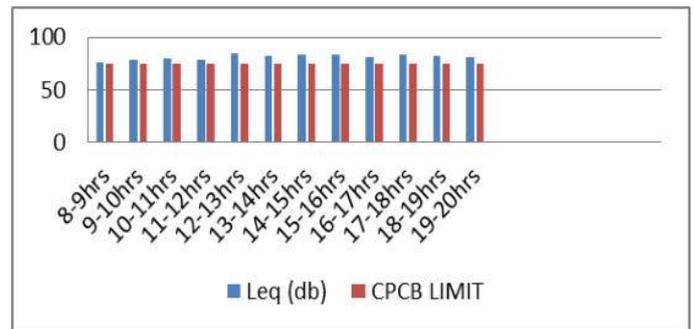

**Chart 4:** Comparison of noise levels with standards prescribed by Central Pollution Control Board 23<sup>rd</sup> January 2017

**Chart 5:** Comparison of noise levels with standards prescribed by Central Pollution Control Board 24<sup>th</sup> January 2017

**Chart 6:** Comparison of noise levels with standards prescribed by Central Pollution Control Board 25<sup>th</sup> January 2017

**Chart 7:** Comparison of noise levels with standards prescribed by Central Pollution Control Board 27<sup>th</sup> January 2017.

The observations show that the noise levels are in the range of 68 dBA (Lmin) to 94.5 dBA (Lmax).The Standards prescribed by Central Pollution Control Board for Industrial area are 75 dba in day time and 70 dba in night time .Lmin values are close to the Standards prescribed by CPCB. Honking of horns of vehicles is the main reason of noise.

### 4. CONCLUSIONS

This study elucidates the levels of noise pollution in different zones in Delhi city, capital of India. From the present study it is clear that the noise levels in all zones of Delhi city were higher than the prescribed limit by Central Pollution Control Board.

#### CONCLUSIONS FOR COMMERCIAL AREA

In commercial area hawkers, peddlers, customers, vendors all contribute towards increasing noise levels. Noise levels are in the range of 63.5 dB to 87.1 dB. Noise levels are higher after 10 a.m. in morning with highest noise levels recorded between 14-15 hrs and 17-19 hrs. The CPCB standards of noise in commercial area are 65 dB in day time and 55 dB in night time. Apart from noise due to commercial activities, there is traffic noise from vehicle horns, engines, and traffic volume. Lajpat Nagar is exposed to intracity road traffic noise every day; the most affected being the traders, pedestrians, commercial vehicle drivers and school children having their schools close to the main road.

#### CONCLUSIONS FOR INDUSTRIAL AREA

In Industrial area noise levels are in the range of 68 dBA (Lmin) to 94.5 dBA (Lmax). The Standards prescribed by Central Pollution Control Board for Industrial area are 75 dBA in day time and 70 dBA in night time .In Industrial area heavy vehicles like trucks carrying machines or other items contribute towards noise pollution. In some places industrial operations also contribute towards noise pollution.

### 6.SCOPE FOR FUTURE WORK

The main reason of noise pollution in the City are rapid urbanization and rapid increase of vehicular population,

congested traffic area, unplanned road network, construction of silence zone in the main area of the city, unplanned urban sprawl etc.

Necessary preventive measures must be taken by the authority to implement the Noise Pollution (Regulation and Control) Rules, 2000. At the same time plantations of greenery near the road will help in absorbing the noise. Prohibition of honking of horns near the silent zone, use of noise barriers, limitation of vehicle speeds, alteration of roadway surface texture, limitation of heavy duty vehicles, use of traffic controls that smooth vehicle flow, innovative tire design methods etc. should be adopted for controlling noise pollution.

### Key words:

Coronary Heart Disease, Diabetes Mellitus, Angina Pectoris, Health-Related Quality of Life, Enhanced External Counter Pulsation.

## ABSTRACT

This study was conducted to assess the effect of Enhanced External Counter Pulsation (EECP) on physical profile and Health-Related Quality of Life (HRQoL) in diabetic and nondiabetic Coronary Heart Disease (CHD) patients. This pretest-posttest designed prospective study was conducted among 163 diabetic and nondiabetic coronary heart disease patients in the SAAOL Heart Center, New Delhi. The physical profile of study subjects was assessed through Cooper's 12 minutes' walk test, Canadian Cardiovascular Society (CCS) angina scale and Medical Research Council (MRC) dyspnea scale. The HRQoL of subjects was assessed using SF-36 (short form) and Seattle Angina Questionnaire (SAQ) scale. A significant improvement was observed in blood pressure, heart rate, SpO<sub>2</sub>, VO<sub>2</sub> max, CCS angina and MRC score in both the groups from baseline to 12 months. Significant improvement was also observed in both the scales of HRQoL after EECP treatment at 12 months follow up in all the health domains of SF-36 & SAQ scale with special reference to angina severity and angina stability improvement. In conclusion, EECP is an effective non-invasive therapy to treat diabetic and nondiabetic CHD patients. This non-invasive procedure may improve the physical functional capacity, angina, dyspnea and overall HRQoL of diabetic and nondiabetic CHD patients.

## INTRODUCTION

Diabetes mellitus (DM) and coronary heart disease (CHD) has a close relationship with each other. Diabetes mellitus is an independent risk factor for CHD development (WHO, 2014). Patients with a history of diabetes are more likely to suffer from CHD compared to individuals without diabetes (Unnikrishnan *et al.*, 2016). Diabetes mellitus and CHD are a major cause of mortality and morbidity globally (Fuster *et al.*, 2010). CHD with DM patients has higher mortality rate due to uncontrolled diabetes which further causes several dysfunctions such as insulin resistance, atherosclerosis, and myocardial infarction. Indian and international registry data confirmed that 30-40 percent DM patients have CHD in India (Ali *et al.*, 2010). It is documented that

more than 65 percent of cardiac deaths are due to diabetes mellitus in which 75-80 percent were especially due to CHD (Xavier *et al.*, 2008; Moss *et al.*, 1991).

Coronary heart disease can be treated by pharmacotherapy, Percutaneous Transluminal Coronary Angioplasty (PTCA), Coronary Artery Bypass Grafting (CABG), lifestyle management and non-invasive therapy known as Enhanced External Counter Pulsation (EECP) (Antman *et al.*, 2008). Enhanced external counterpulsation is US-FDA approved non-invasive therapy for treatment of CHD patients, which are not suitable, unresponsive, and unwilling for PTCA and CABG procedures. Enhanced external counterpulsation therapy increases retrograde aortic blood flow during the diastolic phase of heart pumping. The mechanical device called EECP comprises sequential compression over legs, thighs, and buttocks to direct blood flow towards the heart when it is in the resting position. This treatment is recommended for 35 hours, one hour per day for 7 weeks (5 days in a week) (Arora *et al.*, 1999; Kumar *et al.*, 2017).

Coronary heart disease and DM comorbidity deteriorate physical functional capacity and Health-Related Quality of Life (HR-QoL) of patients (Taghadosi *et al.*, 2014). Bozorgi *et al.* and Singh *et al.* studies demonstrate that EECF may significantly improve health-related quality of life and exercise tolerance in diabetic and nondiabetic coronary heart disease patients (Bozorgi *et al.*, 2014; Singh *et al.*, 2018). The 12 minutes run or walk test was developed by Kenneth H. Cooper in 1968 to assess physical functioning capacity and to estimate VO<sub>2</sub> max (maximum oxygen uptake). VO<sub>2</sub> max is the maximum volume of oxygen consumption during an intense walk or exercise. The maximal aerobic or functional capacity is defined at the point at which oxygen consumption is high (Bandyopadhyay *et al.*, 2015). Canadian Cardiovascular Society (CCS) angina scale is widely used to assess angina severity in coronary heart disease patients. This is a valid and reliable tool to evaluate angina severity, ranging from class I to class IV in CHD patients (Kaul *et al.*, 2009). Medical Research Council (MRC) scale is widely used to assess breathlessness or dyspnea status in CHD patients. This scale comprises five segments that define the entire range of respiratory infirmity from none (Grade 1) to almost a complete incapacity (Grade 5) (Bestall *et al.*, 1999).

The quality of life assessment of an individual is the status of well-being and feeling about their health and body functioning. SF-36 and SAQ are standard tools, which are used to assess general and disease specific health-related quality of life of CHD patients (Brazier *et al.*, 1992). Thompson *et al.* study provides evidence for reliability and validity of SF-36 scale used to assess the quality of life in CHD patients (Thompson *et al.*, 2003). Seattle angina questionnaire (SAQ) is a disease-specific quality of life assessment tool which has been shown to be a valid, reproducible and reliable tool to evaluate the treatment or intervention effectiveness in CHD patients (Dempster *et al.*, 2000). The SAQ scale is widely used and its validity and reliability towards health status are demonstrated (Spertus *et al.*, 1995). Enhanced external counterpulsation treatment helps in glycemic control which ultimately improve the health-related quality of life of diabetic patients and studies done by Linnemeier *et al.* and Ramasamy *et al.* validates the effectiveness of EECF in diabetes patients (Linnemeier *et al.*, 2003; Ramasamy *et al.*, 2015).

Our study was designed to assess the physical functioning profile and health-related quality of life of DM and CHD comorbidity patients and Non-DM CHD patients treated with EECF therapy.

## MATERIALS AND METHODS

A pretest-posttest designed prospective study was done at Science and Art of Living (SAAOL) Heart Center, New Delhi among diabetic and nondiabetic CHD patients. A total of 212 subjects were enrolled in the study using consecutive sampling techniques from April 2016 to May 2017. The study subjects were divided into two groups. The first group was CHD patients with DM while the second group subjects were CHD patients without DM.

### Inclusion criteria

Coronary heart disease patients with and without DM (patients having diabetes duration maximum 5 years) aged between

30 to 75 years, who did not willingly go for invasive treatments (Coronary Artery Bypass Grafting [CABG] and Percutaneous Trans Coronary Angioplasty [PTCA]) and agreed to participate in the study with valid written informed consent were enrolled.

### Exclusion criteria

Patients having cardiac arrhythmia, coagulation disorder, deep vein thrombosis, vaso-occlusive disease, abnormal aortic aneurysm, cardiac valvular disorder, pregnancy, high blood pressure (higher than 180/110 mmHg), foot wounds, dialysis history and unable to give valid written consent were excluded from the study.

### Study procedure

The study was initiated with the screening of diabetic and nondiabetic CHD patients from the SAAOL Heart Center, New Delhi. A total of 300 subjects were screened. Out of 300 subjects, 88 were excluded from the study because they refused to participate, refused to give written consent and not willing to adhere 12 months study follow up. Finally, 212 study subjects were enrolled as they fulfilled all study eligibility criteria and agreed to 12 months of the study follow-up. After enrollment, the study subjects were allocated in CHD patient with DM (CHD + DM group) and CHD patients without DM (CHD group). After this, the demographic profile (age, gender, etc.), clinical history and physiological (systolic blood pressure, diastolic blood pressure, heart rate) profile, was done at baseline of all study subjects. Physical functioning capacity, SpO<sub>2</sub> level, VO<sub>2</sub> max, CCS angina status, and MRC dyspnea score assessed at baseline and followed at 6 and 12 months of study. Health-related quality of life of the study subjects was also assessed at baseline and followed at 6 and 12 months through SF-36 and Seattle Angina Questionnaire (SAQ).

### Measurements

#### *Physiological profile assessment*

Systolic and diastolic blood pressure were measured at baseline, 6 and 12 months. Systolic blood pressure (SBP) and diastolic blood pressure (DBP) were recorded by qualified personnel through Diamond Clock Model blood pressure monitor. Heart rate & SpO<sub>2</sub> of all study subjects were assessed through pulse oximeter (ChoiceM Med MD300C2D) at baseline, 6 months, and 12 months.

#### *Physical functioning assessment*

Physical functional capacity was assessed through Cooper 12-minute walk test and VO<sub>2</sub> max. In the Cooper 12-minute walk the study subjects were allowed to walk for 12 minutes on a flat track and a pedometer was used to measure the distance they covered within 12 minutes. VO<sub>2</sub> max was used to assess the aerobic capacity of study subjects. It was calculated with the standard formula:

$$\text{VO}_2 \text{ max (ml/kg/min)} = (22.351 \times \text{distances covered in kilometers}) - 11.288.$$

Angina status was assessed through the Canadian Cardiovascular Society (CCS) grading of angina pectoris. Breathlessness or dyspnea status was assessed by the Medical Research Council (MRC) scale.

### Health-related quality of life (HRQoL) assessment

The HRQoL of study subjects was assessed by using SF-36 and SAQ. HRQoL of CHD patients with and without DM was assessed through face to face interview and subjects were responding as they experienced problems related to mobility, normal working at work, study, personal care, leisure activities, family, pain, and depression/anxiety. Answers of the patients were recorded. Short Form-36 (SF-36) a multi-item scale comprising 36 questions was used to assess the general health-related quality of life of CHD patients with and without DM in eight health domains, namely; physical functioning, physical health problems, emotional problems, energy status, emotional well-being, body pain and general health status. The score generated for each health variable was from 0 to 100, with 0 denoting the worst and 100 the best possible health outcomes. Seattle angina questionnaire was used to assess disease-specific quality of life and it measures 5 domains to assess EECF effectiveness in diabetic and nondiabetic CHD patients. SAQ domains were the physical constraint, angina stability, angina severity, treatment satisfaction, and perceived disease.

### EECP treatment

The EECF, an electro-mechanical device, consists of three paired pneumatic cuffs applied to the lower leg, upper leg and buttocks. The cuffs of the device were inflated sequentially during diastole with maximum pressure 300 mmHg and returning blood from the legs to the central circulation and producing aortic diastolic augmentation. This increases both venous return and cardiac output in coronary heart disease patients. In the next step, cuffs are deflated at end-diastole with reducing peripheral resistance and providing left ventricular supply.

The ECP PSK machine having the model; P-ECP/TI was used for the treatment of diabetic and nondiabetic coronary heart disease patients. Each subject underwent one hour per day EECF treatment for 35 days for 7 weeks (5 days in a week) with 280 mmHg pressure. All study subjects were followed up for 12 months after completion of EECF therapy. Physical functional capacity through Cooper 12-minutes' walk test, SpO<sub>2</sub> status, VO<sub>2</sub> max, CCS angina severity and dyspnea score with health-related quality of life (SF-36, SAQ) were assessed at 6th and 12th months of study follow up (Bestall *et al.*, 1999; Bandyopadhyay *et al.*, 2015; Kaul *et al.*, 2009).

### Ethical approval and consent

Ethical permission for this study was obtained from the Institutional Ethics Committee of SAAOL Heart Center (Ref. No-IEC/SHRF/PhD/P-02/01.05.2016), New Delhi. Written informed consent was also taken from all study subjects before initiation of the study.

### Statistical analysis

A senior Biostatistician analyzed the collected data using statistical package for the social sciences (SPSS) software version 21. Demographic and socioeconomic profile of the study subjects were compared using independent t-test. Descriptive analysis of mean, SD, independent t-test and paired sample t-test with 95% confidence interval and p-value <0.05 was considered statistically significant.

## RESULTS

### Recruitment and response rates of the study subjects

The study was initiated with the screening of total 300 diabetic and nondiabetic coronary heart disease patients from the study site. Out of 300 patients, 88 patients were excluded from the study because 26 patients refused to participate, 33 patients refused to give written consent and 19 patients did not agree to 12 months follow up. Finally, 212 study subjects were enrolled as they fulfilled all study eligibility criteria and agreed to 12 months of study follow up. After enrollment, the study subjects were allocated to coronary heart disease patients with diabetes mellitus and coronary heart disease patients without diabetes mellitus. Total 163 patients had completed the whole study with 12 months follow up, 49 patients did not complete whole study and follow up, so they were excluded from the final data analysis because of missing and incomplete data. Out of 49 patients, 24 patients were excluded from the CHD + DM group (13 patients left the treatment and migrated to abroad and 11 patients did not complete 12 months follow up) and 25 from the CHD group (9 patients migrated to different places, 16 patients did not complete 12 months follow up). Finally, the data of 163 patients were analyzed. Study outlines and response rates of the study subjects are summarized in the consort diagram (Table 1).

### Baseline demographic details with the medical history of diabetic and nondiabetic CHD groups

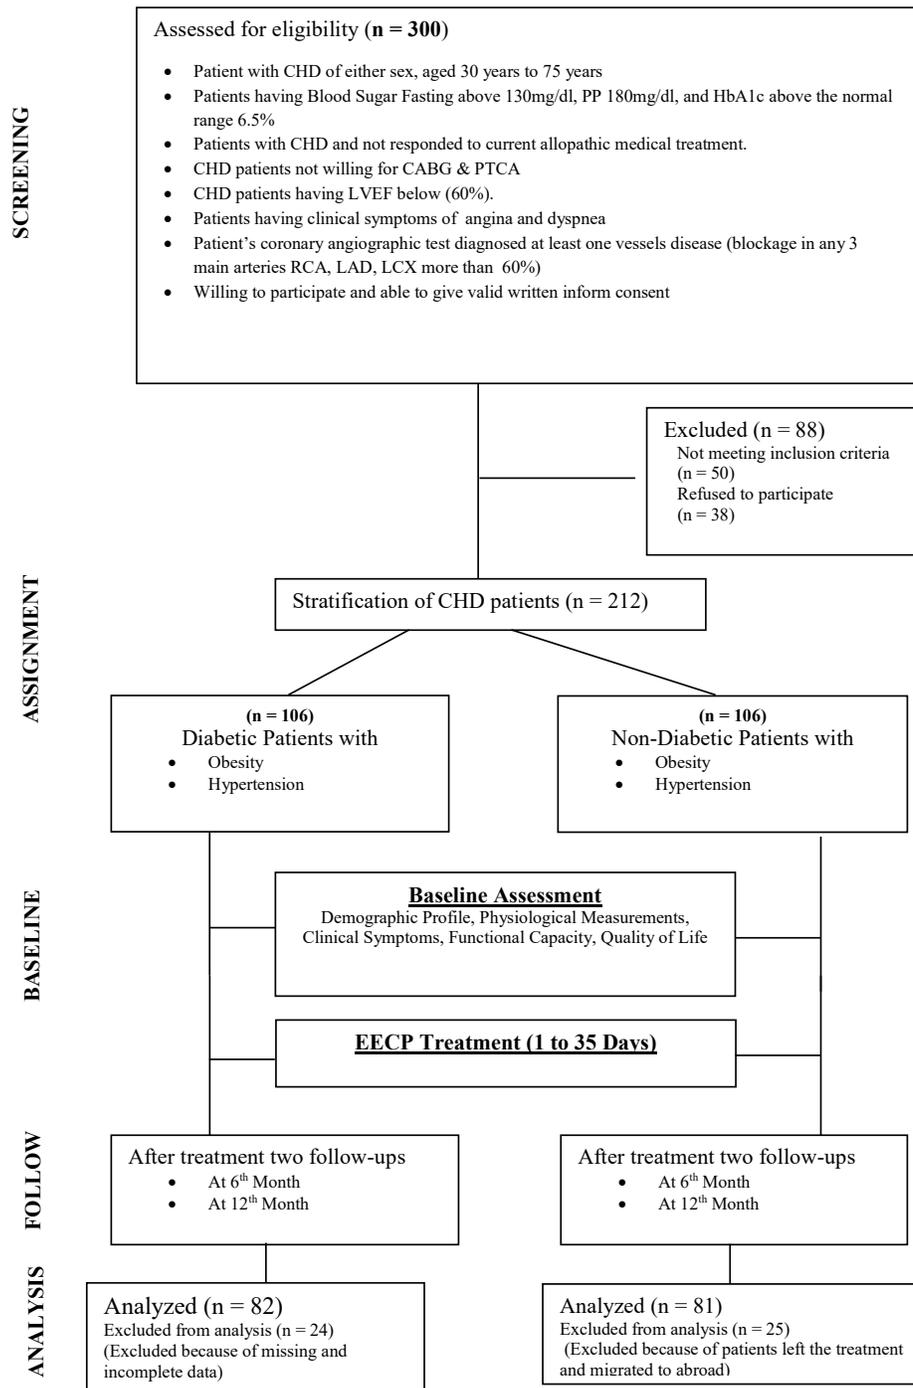

A total of 163 diabetic and nondiabetic CHD patients completed the study (12 months follow up). Out of total 163 subjects; n = 82 subjects were in the diabetic CHD group (first group) and n = 81 subjects were in the nondiabetic CHD group (second group). The total mean age of both the group was 59.6 ± 9.5 (mean ± SD) years in which mean age of diabetic CHD subjects were 60.5 ± 9.5 (mean ± SD) and nondiabetic CHD subjects were 58.6 ± 9.6 (mean ± SD) years. The male subjects were 50.4% in diabetic CHD and 49.6% in nondiabetic CHD group. Females were much higher (53.3%) in nondiabetic CHD as compared to diabetic CHD group (46.7%). In this study, urban subjects were higher (56.4%) in the diabetic CHD group and rural subjects were higher (55.3%) in nondiabetic CHD group. A number of subjects have obesity (63.1%) in nondiabetic CHD group as compared to diabetic CHD group (36.9%). There were more hypertensive (51.6%) patients in the diabetic CHD group as compared to nondiabetic CHD group (48.4%).

The family history of heart disease (62.5%) was higher in the diabetic CHD group as compared to nondiabetic CHD group (37.5%), similarly, the family history diabetes (83.3%) was also higher in the diabetic CHD group as compared to nondiabetic CHD subjects (16.7%). The average diabetes duration in diabetic CHD group subjects was 4 years. Smoker patients were higher (51.9%) in nondiabetic CHD group as compared to diabetic CHD group (48.1%) and similarly, tobacco user was higher (83%) in nondiabetic CHD group as compared to diabetic CHD group (17%). Physical activity was higher (53.2%) in nondiabetic CHD group as compared to diabetic CHD group (46.8%). The non-vegetarian subjects were higher (53.1%) in nondiabetic CHD group

as compared to the diabetic CHD group (46.9%). Medical history, such as myocardial infarction was higher in diabetes CHD group (54.9%), similarly, the rate of PCI (62.9%) and CABG (58.7%) was also higher in diabetic CHD subjects. The history of single vessel CHD was similar in both the groups, but double vessel CHD patients were higher (62.8%) in

nondiabetic CHD subjects while triple vessel CHD was higher (60%) in diabetic CHD subjects as compared to nondiabetic CHD subjects (40%). The detail of the demographic profile and medical history of diabetic and nondiabetic CHD groups is described in [Table 2](#).

**Table 1:** A systematic overview of the study.

**Table 2:** Baseline demographic characteristics with medical history of diabetic & nondiabetic CHD patients.

Characteristics	Total (n = 163)	Diabetic CHD (n = 82)	Nondiabetic CHD (n = 81)	p-value

### Effect of EECp on physiological parameters and physical capacity in diabetic and nondiabetic CHD patients

The physiological parameters consist systolic blood pressure, diastolic blood pressure, heart rate and SpO<sub>2</sub> did not show any significant change between the groups from baseline to 12 months using independent t-test. A significant change has been observed in systolic blood pressure, diastolic blood pressure, heart rate and SpO<sub>2</sub> level from baseline to 6 months in diabetic CHD patients and similar outcomes sustained till 12 months in systolic blood pressure and SpO<sub>2</sub> level in both the groups. The detailed information has been given in Table 3.

A significant change was observed in dyspnea score at baseline in male using MRC scale but at 6 months and 12 months follow up no statistical change was observed. There was no significant change between the group in Cooper 12 minute walk test (walking distance), VO<sub>2</sub> max and CCS angina classifications were observed in diabetic and nondiabetic CHD group patients. The details of findings have been given in Table 4.

### Effect of EECp on health-related quality of life (HRQoL) in diabetic and nondiabetic CHD patients

A significant improvement was observed in all SF-36 scale domains from baseline to 12 months with significant p-values <0.001. The significant changes were also observed in, energy level, social functioning, and general health after 6 months of EECp treatment between the groups but these differences did

not maintain until 12 months. The difference between the groups was assessed using independent t-test. The details of SF-36 study outcomes have been given in Table 5.

All domains of SAQ scale yielded significant improvement within both (diabetic & nondiabetic CHD) groups from baseline to 12 months as assessed through paired sample t-test. Significant improvement in treatment satisfaction and disease perception after the 12 months of EECp treatment has been observed in both diabetic and nondiabetic CHD groups. There was no significant difference observed between both the groups from baseline to 6th months and 12th months of EECp treatment, assessed through the independent t-test. The details of SAQ results have been given in Table 6.

## DISCUSSION

The aim of the present study was to assess the effect of EECp therapy on the physical functional status and health-related quality of life in diabetic and nondiabetic CHD patients. Our study demonstrates significant improvement in blood pressure, heart rate, and SpO<sub>2</sub> level after EECp treatment in both groups. Beck *et al.* and Casey *et al.* study also indicated that EECp may be useful as an adjuvant therapy for improving functional capacity in coronary heart disease patients through reductions in blood pressure and improvement in myocardial oxygen demand for better physical functioning (Beck *et al.*, 2015; Casey *et al.*, 2011). Diabetic and nondiabetic CHD patients demonstrate significant improvement

in walking status, exercise tolerance with increment in VO<sub>2</sub> max levels after EECF therapy. Similarly, studies done by Feldman *et al.*

and Urano *et al.* have supported the findings of the present study (Feldman *et al.*, 2006; Urano *et al.*, 2001).

**Table 4:** EECF Treatment effect on Cooper's 12-Minutes' walk test with VO<sub>2</sub> max, Angina & Dyspnea status at Baseline, 6th month and 12th month in CHD & DM with CHD patients.

In the present study, a significant improvement was observed in the physical functional capacity in coronary heart disease patients after EECF therapy and similar findings have been reported by Rampengan *et al.* and May *et al.* in their study (Rampengan *et al.*, 2015; May *et al.*, 2015). Before EECF treatment our study subjects were mostly poor in physical functional capacity but after EECF treatment they significantly improved. A significant effect of EECF treatment on CCS angina class and dyspnea improvement has been observed in this study in diabetic and nondiabetic coronary heart disease patients. Studies done by Chung-Kuan *et al.* & Ziaeirad *et al.* (Chung-Kuan *et al.*, 2014; Ziaeirad *et al.*, 2012) have shown similar findings. The results of our study are in agreement with Petterson *et al.* and Loh *et al.* studies which have shown significant results on the effectiveness of EECF in patients with angina (Petterson *et al.*, 2006; Loh *et al.*, 2006). Soran *et al.* study also reported similar findings in the present study (Soran *et al.*, 2006).

A significant improvement has been observed in health-related quality of life using SF-36 and SAQ scale and Arora *et al.* have reported similar findings (Arora, 1999). A significant improvement has been observed in all SAQ domains using the paired t-test to assess differences within groups from baseline to

12 months showed significant changes in both groups after EECF treatment. These results demonstrate similar outcomes in diabetic and nondiabetic CHD patients treated with EECF therapy. Our study shows improvement in the quality of life in diabetic and nondiabetic CHD patients and supported by the research done by Linnermeier *et al.* and Michaels *et al.* (Linnemeier *et al.*, 2003; Michaels *et al.*, 2004).

A significant improvement was observed in the quality of life with similar clinical outcomes of Ziaeirad *et al.* in diabetic and nondiabetic coronary heart disease patients. The author reported significant improvements in quality of life of coronary heart patients in all domains of SF-36, a standard questionnaire of quality of life assessment (Ziaeirad *et al.*, 2012). SF-36 tool used by Arora *et al.* showed significant results on physical activity, general health with reduction of bodily pain and similarly Manchanda *et al.* indicated good results of EECF in respect of the improvement in the quality of life for heart patients (Manchanda *et al.*, 2007). In the present study, overall, general health status had improved, and it is supported with the data of earlier studies to demonstrate the clinical significance of EECF health-related quality of life of coronary heart disease patients (Wu *et al.*, 2012).

Our study showed similar results in diabetic and nondiabetic CHD patients and no major significant difference has been observed in diabetic and nondiabetic CHD group using independent t-test in physical functional capacity and health-related quality of life. Eslamian *et al.* concluded that EECF therapy can improve the angina pectoris stability and severity of disease perception (Eslamian *et al.*, 2013). Similarly, our study demonstrates that both diabetic and nondiabetic coronary heart disease patients get good results in almost all domains of SAQ quality of life assessment scale.

Enhanced external counterpulsation is an effective treatment method for diabetes management and diabetes complication including CHD. It helps in lowering blood glucose level of alerting transport of insulin into skeletal muscle and thereby

help in the glyceamic control and ultimately improve the health-related quality of life of diabetic CHD patients. Linnemeier *et al.*, Martin *et al.*, and Ramasamy *et al.* studies validate the effectiveness of EECF towards glyceamic control in DM patients (Linnemeier *et al.*, 2003; Martin *et al.*, 2012; Ramasamy *et al.*, 2015).

Our study reveals that EECF significantly improves the health-related quality of life and remained high for the following one year in diabetic and nondiabetic CHD patients. Jorgensen *et al.* study demonstrated that the effect of EECF on quality of life sustained for three years in CHD patients (Jorgensen *et al.*, 2013). Hence, there is further need to conduct a multicentric randomized controlled trial to assess long-term effects of enhanced external counterpulsation on health-related quality of life in diabetic CHD patients.

## CONCLUSIONS

The results of the present study conclude that enhanced external counterpulsation therapy may improve walking capacity, maximal oxygen uptake and peripheral capillary oxygen saturation of diabetic and nondiabetic CHD patients. This non-invasive procedure also significantly improves the clinical symptoms (angina & dyspnea) of CHD patients with and without DM. Enhanced external counterpulsation therapy may also improve overall health-related quality of life of diabetic and nondiabetic CHD patients, including angina severity, angina stability, and general health. In the summary, enhanced external counterpulsation therapy is safe, well tolerated and proved to be an effective, non-invasive therapy to treat diabetic and nondiabetic CHD patients. It may improve the physical profile and quality of life in both diabetic and nondiabetic CHD patients equally. There is further need of multicentric randomized controlled trials to assess long-term effects of enhanced external counterpulsation on health-related quality of life in a larger population of CHD with DM patients.

## CONFLICT OF INTEREST

The authors of this study have no conflict of interest associated with material presented in this paper.

## ACKNOWLEDGMENT

We are very thankful to the research team of the SAAOL Heart Center, New Delhi to complete this research study.

### Abstract:

**Objectives:** To study the incidence and to evaluate the risk factors of suspected adverse drug reactions developed in the hospitalized patients of various departments and to assess the causality and severity of adverse drug reactions (ADRs). **Methods:** It was a retrospective-prospective study conducted in a tertiary care hospital for a period of two years two months, with a specific predefined criterion. A total of 254 subjects with ADRs were identified during the period of study for which 1:1 ratio of subjects with non-ADRs were taken. Subjects of all age groups and of either sex were enrolled. Risk factors included subjects' age group, gender, polypharmacy, comorbidity, intercurrent diseases and concurrent interactive drugs. **Statistical analysis used:** Multiple logistic regression analysis was performed to find the association of risk factors with adverse drug reactions. **Results:** The incidence of suspected adverse drug reactions in hospitalized patients was 13% (254/1952, 95%CI). Polypharmacy was the most significant predictor of adverse drug reactions (OR=55.952; 95%CI). Elderly population with multidrug therapy had developed the higher rate of ADRs. Cephalosporin's 27.6%, fluoroquinolones 15.5%, penicillamines 12.1%, anti-hypertensive 8.7%, NSAIDs 8.3% were more frequently implicated. Risk factors for suspected ADRs were: age (more than 60 years) (OR=1.033; 95% CI), gender [Male (OR=55.952; 95% CI)], comorbidity (OR=1.008; 95% CI), intercurrent diseases (OR=19.27; 95% CI). **Conclusion:** Polypharmacy, history of ADR, concurrent interactive drugs and inter current disease were the significant risk factors of adverse drug reactions. The elderly population was the vulnerable age group for ADRs. Multidrug therapy and comorbidity resulted in higher risk of ADRs in an older population. The Higher rate of suspected ADRs were probable and very less severe.

**Key words:** Adverse drug reaction, Age, Comorbidity, Polypharmacy, Risk factor.

### Abstract:

This study was carried out to assess the effectiveness of lifestyle modification counseling using lifestyle intervention holistic model and its adherence towards glycemic control in type 2 diabetes mellitus patients.

This quasi-experimental prospective study was conducted among 224 type 2 diabetes mellitus patients in Delhi Diabetes Research Center, New Delhi. The study participants were allocated to lifestyle modification counseling group (intervention) and usual care (control) group based on receiving or not receiving lifestyle modification counseling using lifestyle intervention holistic model. Effect of counseling on glycemic control was assessed at baseline and follow up of both the groups at 3rd, 6th and 12th months after receiving lifestyle modification counseling. The collected data was analyzed for percentage, mean, median, standard deviation, chi-squared, t-test and Wilcoxon test.

In this study, the lifestyle modification counseling proved to be effective and showed significant improvement in fasting blood sugar (175.5±32.3 to 144.7±17.6), postprandial blood sugar (275.5±61. to 199.0±48.3), hemoglobin A1c by 9.3±1.5 to 8.4±1.3. Significant improvement was observed in diastolic blood pressure (82.6±7.0 to 79.4±6.1) and high-density lipoproteins cholesterol (47.3±10.5 to 58.8±5.6) from 3rd to 12th months follow up with significant p value 0.001 in the intervention group. The study showed good adherence to balanced diet, physical activity, and tobacco and alcohol cessation but less adherence was observed towards meditation for stress management, regular checkups, and medicine adherence.

Lifestyle modification counseling is an effective, noninvasive approach towards glycemic control in type 2 diabetes mellitus patients. Lifestyle intervention holistic model used in this counseling may be helpful for type 2 diabetes mellitus patients to improve adherence and self-care behavior towards the management of their diabetes.

**Introduction**

Type 2 diabetes mellitus is a complex and multifactorial metabolic disorder, occurring mainly due to insulin resistance in the peripheral tissue<sup>1</sup> and associated with various co-morbidities (obesity, hypertension, dyslipidemia and heart disease), which increase the rate of morbidity and premature deaths due to micro and macro vascular complications.<sup>2,3</sup> Diabetes mellitus is recognized as the epidemic disease of the 21<sup>st</sup> century affecting millions of people worldwide. The prevalence of diabetes has been increased dramatically from last twenty years and the disease is now a global public health problem. International Diabetes Federation, reports that 8.8% or 415 million are suffering from diabetes around the world and this number is expected to rise to 642 million by 2040.<sup>3</sup> According to IDF, India has a burden of 69.1 million cases of diabetes and this number is estimated to increase 123 million by 2040 and it is also estimated that India has the second highest cases of diabetes in the world after China.<sup>4,5</sup> Complications of T2DM can be costly due to its chronic nature and multi-organ involvement. These may include kidney failure, blindness, foot amputations and heart disease. The condition is also associated with an economic burden at patient and national level because of the frequent visits to the doctor and admissions to hospitals. There are several lifestyle factors such as sedentary lifestyle, changes in dietary habits, obesity, stress, physical inactivity, smoking, consumption of tobacco and alcohol which are associated with the development of type 2 diabetes mellitus (T2DM).<sup>6-8</sup>

Glycemic control is the main treatment goal in diabetes management, because it is associated with improved health outcomes and reduces the rate of severe complications and co-morbidities.<sup>9</sup> Along with the pharmacological treatment, management of diabetes requires patient commitment to comply with medical check-ups, blood glucose monitoring and regular medication therapy.<sup>10-17</sup> Adherence to the lifestyle interventions and self-care behaviors of the patients plays an important role in the management of T2DM and improves glycemic control, lipid profile, BMI and blood pressure, and reduces diabetes-related complications.<sup>18</sup> Non-adherence to medication and self-care may result in increased disease burden, worsen clinical outcomes, increased health care needs, frequent hospitalizations and increased health care costs.<sup>19</sup>

Several studies indicated that a poor knowledge of diabetes and its management in T2DM patients is associated with a higher BMI, poor glycemic control, prolonged use of pharmacological treatment, and more complications and co-morbidities.<sup>20</sup> Hence repeated health education and lifestyle modifying interventions provided by physicians and other health educators are required.<sup>21</sup> The results of two randomized controlled trials showed a significant improvement in glycemic control and physiological parameters in T2DM patients following a six-month lifestyle intervention program.<sup>22-23</sup>

Lifestyle intervention is an effective, non-invasive way to manage weight, glycemic control, blood pressure and to reduce the risk of fatal complications in T2DM patients.<sup>24-25</sup>

There are only few studies in India, which have attempted to establish a comprehensive lifestyle intervention counseling program. We aimed to introduce such intervention and hypothesized that lifestyle counseling will be more effective than usual care and will improve glycemic control in T2DM patients.

**Material and Methods****Study design and setting**

This was a quasi-experimental prospective study conducted among 224 T2DM patients in Delhi Diabetes Research Center (DDRC), New Delhi, India. The study participants were allocated to lifestyle modification counseling (LMC) group or usual care (UC) group through consecutive sampling procedure. Delhi Diabetes Research Center is the health care organization, which provides treatment facilities to diabetes mellitus patients. This study was conducted in two phases in DDRC, New Delhi.

**Eligibility criteria**

Participants were eligible if they were clinically and diagnostically confirmed to have T2DM for one year or longer, were of either sex, aged between 35 to 70 years with fasting blood sugar more than 120 mg/dl, postprandial blood sugar more than 180 mg/dl, and HbA1c above 7%. WHO and American Diabetes Association (ADA) set a target of HbA1c 7% to control diabetes, hence this figure considered in this account. Patients presenting with at least one co-morbidity (obesity, hypertension, coronary heart disease) with T2DM were included in this study.

Excluded were the patients who were not willing to participate or unable to give valid written consent, hospitalized at the time of recruitment, those with Type 1 and Gestational Diabetes, or patients with severe heart, liver or kidney failure as well as patients with severe complications of foot or unable to do physical activities. Additionally, patients who received multiple lifestyle intervention counseling within the last year and patients with a history of mental disorder, visual or, hearing problem were also excluded.

#### Sample size

Patients were recruited using consecutive sampling technique. The sample size (n=224) was considered to be statistical significant, 112 per group by taking 20 % lost to follow-up into the account. The following formula was used:

$$n = \frac{(z_{1-\alpha/2}\sqrt{2p(1-p)} + z_{1-\beta}\sqrt{p_s(1-p_s) + p_t(1-p_t)})^2}{(p_t - p_s)^2}$$

Where  $p = \frac{p_t + p_s}{2}$ ,  $p_t$  is the proportion in LMC group and  $p_s$  is the proportion in UC group.

#### Interventions

The intervention was conducted in two phases. The first six months were an active period where counseling was provided once a month. The second phase was the maintenance period where the participants were followed up for another six months. A comprehensive LMC program was consist of Lifestyle Intervention Holistic Model (LIHM) and used as a tool for counseling of participants to control T2DM. An experienced dietician, diabetes educator, physical trainer and diabetologist gave the lifestyle modification counseling sessions in DDR, New Delhi. The counseling sessions were repeated at every month for 6 months and follow up and measurement of the study participants was done at baseline, 3<sup>rd</sup>, 6<sup>th</sup> and 12<sup>th</sup> month. All lifestyle intervention components were explained through counseling in the local language, supported by pictures, videos and face to face interviews and discussions with individual or group of individuals. Each session of lifestyle modification counseling took approximately 10-15 min. There were five key components of counseling session, which are described in Table 1.

**Table 1: Five key components of Lifestyle Intervention Holistic Model (LIHM) used for Lifestyle Modification Counseling (LMC)**

Intervention	Sessions Conducted by	Description of the Intervention	Rationale
1. Balanced diet	Dietician	Participants were motivated to follow diet chart strictly. They were also encouraged to reduce the intake of fatty, salty, and sugary food products and increase the intake of fibrous diet such as whole grain, green vegetables, and fruits.	Balanced diet help in glycemic control, weight & blood pressure management. Fibrous diet fruits reduce the blood sugar and cholesterol level.
2. Physical Activity	Physical trainer	Participants were motivated to adhere to the regular brisk walk for at least 30 minutes per day. Training of Mudrasana, Balasana, Vajrasana, Paschimottanasana, Ardha Matsyendrasana, Supta Vajrasana, Dhanurasana, Shavasana) yogic exercise was given and advised to adhere the practice for 30 minutes per day.	Physical activity reduces the blood glucose level, cholesterol and triglycerides, blood pressure, and improves the response of the anti-diabetic drugs. It also helps in stress management and improvement in health-related quality of life.
3. Tobacco & Alcohol Cessation	Health counselor	Motivational counseling was provided to the participants to quit Tobacco (smoking and chewing tobacco) and	Cessation of tobacco and alcohol helps in management of diabetes and associated risk

		excess intake of alcohol.	factors, coronary heart disease.
<b>4. Stress Management</b>	Diabetes educator and physical trainer	Psychological technique, counseling and breathing exercise advised for at least 15 minutes per day to control stress and advised to take proper sleep.	During meditation the level of stress hormone (adrenaline and cortisol) reduced which further help in glycemic control.
<b>5. Adherence to Routine Check-ups &amp; Medication</b>	Diabetologist	Participants were encouraged for routine medical check-ups (blood sugar fasting, PP, HbA1c, lipid profile) at appropriate time. They were also instructed to take their medicine regularly at the proper time without skipping.	Routine medical check-ups are necessary in order to obtain better diabetes management and make patients aware about complications. Medication adherence with lifestyle modification controls blood glucose more rapidly.

#### Control group

Participants in the usual care group received standard care, which consisted of pharmacological and provision of pamphlets and booklets about various health topics.

#### Data Collection

The total data collection process was completed in one year and three months (three months for enrollment of the study participant and, one year for intervention and follow-up). Data on demographic, physiological and anthropometric measurements were collected from all participants at baseline data as well as at 3, 6 and 12 months from the beginning of the intervention. Adherence to the lifestyle intervention was assessed in the participants of the intervention group via the questionnaire at 3<sup>rd</sup>, 6<sup>th</sup> and 12<sup>th</sup> months.

#### Measurements

The primary outcome measures for this study was blood sugar fasting, blood sugar PP, and HbA1C. Fasting and PP blood glucose tests were analyzed using 'Contour Plus One' blood glucose monitoring system. HbA1c was assessed using an 'Alere Afinion AS100 analyzer'. Secondary outcome measures included weight, BMI, body fat, systolic and diastolic blood pressure, total cholesterol, triglyceride, LDL cholesterol, HDL cholesterol, and adherence to counseling. At baseline, the anthropometric measurements (weight, height, BMI, and body fat) were assessed in all study subjects. Height and weight of the participants were observed using a 'Stadiometer' and 'SECA' digital scale, and BMI was calculated using the formula of weight in kg divided by height in m<sup>2</sup> (kg/m<sup>2</sup>). Body fat was measured with body fat caliper. Trained personnel assessed the blood pressure using 'Pagoda (mercury) B.P' instrument. Cholesterol was assessed by the CHOD-PAP method, triglyceride by GPO method, HDL- cholesterol by immune inhibition method and LDL was calculated using standard formula [LDL = Total Cholesterol - HDL - (Triglycerides/5)]. Adherence to lifestyle intervention (LIHM) among T2DM patients were assessed through lifestyle intervention adherence questionnaire. These questionnaires have 20 questions covering all key components of LIHM ; Balanced diet, Physical activity, Tobacco and Alcohol cessation, Stress management, Routine medical check-ups & Medication adherence. The response of the participants was based on a weekly time frame in seven-point Likert scale to answer the question expressed as "On how many of the last 7 days did you...?".<sup>26</sup> For these items, the higher scores reflect higher adherence rate except for items in questions: 3, 4, 9,10,11,12,16,17 and 18, which reflect unwholesome choices (such as foods high in sugar or fat etc.) and for these items, higher scores reproduce lower adherence.

#### Statistical analysis

Statistical package for the social sciences (SPSS) software version 21 was used for all statistical analyses. In this study percentage and chi-squared test was used in the assessment of baseline demographic characteristics of the subjects. Mean, SD, sample paired & independent t- test was used for glycemic assessment, physiological and lipid profile assessment. LMC adherence in intervention group was assessed using median and Wilcoxon test.

#### Ethical approval and consent

Prior permission has been obtained from the concerned authorities of DDRC, New Delhi and Ethical approval was granted by SAAOL Heart Center (Ref. No. IEC/SHRF/Ph.D/P-01/29.04.2016) New Delhi. Informed consent has been obtained from all enrolled study participants.

## Results

### Recruitment and response rate of participants

A total 312 T2DM patients were screened from DDRC of which 88 patients were excluded due to following reasons: 12 patients having diabetes less than one year, 27 refused to give written consent, 33 refused to participate at follow ups, and 16 patients, having timing difficulties. A total of, 224 patients were enrolled. Ten patients from LMC group and twelve patients from the usual care group lost to follow up and were excluded from the analysis.

### Baseline characteristics of the participants

The mean age was 51.4±9.3 in LMC group and 54.0±8.6 in the UC group. This study data has 118 (58.4%) males and 84 (41.6%) females. The majority of patients have co-morbidity of obesity (127), hypertension (150), and heart disease (68). In this study, 38.1% patients were having the family history of diabetes and more than half of (55.4%) patients were found non-vegetarian. Total number of smokers was 31, tobacco chewing history was 24 and excessive alcohol users were 51 in this study. The baseline characteristics of the study subjects are presented in Table. 2

Table 2: Baseline demographic characteristics of participants

Characteristics	Totaln=202	Interventionn=102	Controln =100	p-value

### Glycemic control

There was a significant improvement in blood sugar fasting (175.5±32.3 to 144.7±17.6), blood sugar PP (275.5±61.3 to 199.0±48.3), HbA1c % (9.3±1.5 to 8.4±1.3) within the LMC group from baseline to 12 months follow up. If we compare both LMC and UC group, there was a significant change observed in blood sugar PP, and HbA1c with p<0.001. The details of results are given in Table. 3

Table 3: Changes in glycemic control of participant's measurements from baseline to 3<sup>rd</sup>, 6<sup>th</sup> and 12<sup>th</sup> month follow-up with differences within and between groups over time

Variables	Treatment	Control	Difference between the group (p-value)

	6MB-12M	<0.0001		0.035
		<0.0001		0.267

### Physiological parameters

Significant changes was observed in body fat% and diastolic blood pressure from 3<sup>rd</sup> to 12<sup>th</sup> month follow-up between LMC and UC group with p<0.001. A significant change was observed in systolic B.P and pulse rate between LMC and UC group at 6<sup>th</sup> and 12<sup>th</sup> months. There was no significant change in weight and BMI throughout the follow-up. If we see within LMC, there was a significant improvement as being observed in Weight (74.4±14.5 to 72.6±12.3) Body fat % (30.7±5.5 to 29.2±3.8), Systolic B.P mmHg (134.9±16.0 to 124.7±9.5), Diastolic B.P (82.6±7.079.4±6.1), Pulse (76.6±3.774.9±2.5) from baseline to 12<sup>th</sup> months follow-up. The details of results are enclosed in appendix (Table 5).

### Lipid profile

There were significant changes being observed in HDL cholesterol between LMC and UC group from 3 to 12 month with p<0.001. There was a significant change, observed in LDL and total cholesterol at 6<sup>th</sup> and 12<sup>th</sup>. Significant reduction within the group was observed in total cholesterol (286.4±103.2 to 205.8±56.9), triglyceride (235.6±114.0 to 175.0±41.1), HDL cholesterol (47.3±10.5 to 58.8±5.6), and LDL cholesterol (192.1±91.2 to 111.9±54.8) from baseline to 12 months follow up. The details of results are given in appendix (Table. 5).

### LIHM adherence status

After lifestyle modification counseling the adherence was assessed through seven point liker scale which showed the significant improvement in diet chart(Q1), eat generous amount of fibrous diet(Q2), reduce to take sugar rich products(Q 3), reduce to eat junk foods(Q4), walk for 30 minutes (Q5), take stairs instead of using lift or elevator (Q7), walk by feet to market or office (Q8), consume tobacco (Q9), leave tobacco even you had strong feeling to consume it (Q10), drink alcohol (Q11), leave alcohol even you had strong feeling to drink it (Q12), get proper sleep(Q14), feel relax and happy (Q15), check your feet for any symptom of diabetes complication(Q20). The adherence was increased from 3<sup>rd</sup> month to 6<sup>th</sup> month follow-up but not sustained till 12<sup>th</sup> month except tobacco and alcohol cessation. In short, this study results demonstrates good adherence to diet, physical activity, and tobacco and alcohol cessation but lower the adherence to meditation for stress management, regular checkups and medicine adherence. Detail of LIHM adherence is given in Table. 4.

Table. 4: LIHM adherence outcomes based on a weekly time frame in seven points Likert scale

## Discussion

The purpose of this study was to determine the effectiveness of life style modification counseling and its adherence of intervention holistic model on glycemic control and physiological parameters among type 2 diabetes mellitus patients at the 3<sup>rd</sup>, 6<sup>th</sup>, and 12<sup>th</sup> month follow-ups. The results of our study indicate significant reductions in body fat, systolic and diastolic blood pressure, pulse rate, blood sugar F and PP, HbA1C, and an increase in HDL-cholesterol was achieved during follow-ups as compared to the usual care group. Additionally, the adherence of intervention holistic model was increased. This study also shows significant improvement in adherence towards diet chart, fibrous diet, reduce intake of sugar rich products, junk foods, physical activity, stress management, checking glucose level and daily monitoring of feet for diabetes complications and it was enhanced from 3<sup>rd</sup> month to 6<sup>th</sup> month of follow-up but not sustained till 12 months. The study results conclude that life style modification counseling and its adherence can give significant and beneficial impact on diabetes control and management.

The studies done by Oldroyd et al., and Norliza Ibrahim et al.,<sup>27-28</sup> assessed the impact of lifestyle interventions reported a decrease in the blood sugar PP in intervention group participants at 12 month follow up. In the present study, we found similar results, i.e. decrease in blood sugar PP (275.5±61.3 to199±48.2) in LMC group as compared to usual care group (300.8±64.2 to 269.5±53.2) participants that was statistically significant at 12-month follow up ( $p>0.05$ ). Similar studies by Adachi et al., and Spencer et al.,<sup>22-23</sup> demonstrated a significant decrease in HbA1c levels 0.7% and 0.8% respectively after lifestyle intervention. Our study showed a significant decrease in HbA1c levels (1.2%,  $P<0.01$ ) after 12 months follow up. Studies were done by Greaves et al., and Malkawi, et al., found significant improvements in blood sugar levels, body weight and insulin resistance in the intervention group through diet and diet plus physical activity interventions with lesser use of anti-diabetic medicines compared to a control group.<sup>29-30</sup> Decrease in the body fat and improvement in glucose metabolism<sup>31</sup> is due to adherence of diet chart and increasing physical activity adherence in the LMC group that induced the decrease in total cholesterol, triglyceride, LDL and increase in HDL, as there were dose-response relationships between level of physical activity, HDL-cholesterol, and triglycerides.<sup>32</sup>

In the present study, there was a significant reduction in body fat but no statistical significance was observed in body weight and BMI between groups but the mean weight loss in the LMC group (-2.12 kg) was similar to the mean weight loss demonstrated in the systematic review and meta-analysis by Dunkley et al.,<sup>33</sup> of -2.32 kg. Finnish diabetes prevention study and US Diabetes Prevention Program (DPP) validates that lifestyle intervention helped in weight reduction; maintain blood pressure, glycemic control and improved HDL cholesterol of T2DM patients.<sup>34-35</sup> A review of 11 studies on group-based education have shown significant improvement in HbA1c%, reduction in body weight and systolic blood pressure, and reduces the requirement for diabetes medication.<sup>36</sup> Studies done by Ghada Asaad et al., Samah et al., and Takuya et al., have shown a significant improvement in glycemic control (fasting, PP and HbA1c) and diet adherence in the intervention group participant after lifestyle based intervention counseling similar to the present study.<sup>37-39</sup>

In this study, there was significant increment in adherence at 6<sup>th</sup> month follow up, but that was not sustained till 12 month follow up, hence there is need of continuous counseling. The results of present study demonstrates significantly good adherence to diet, physical activity, and

tobacco & alcohol cessation but showed significantly lower adherence to regular medication, stress management. Lin EH and Katon W et al., in their study demonstrated that adherence to lifestyle practice minimize the burden of diabetes and improve clinical and physiological parameters which further reduce the hospitalization rate and economic burden.<sup>19</sup> The result of our study tries to establish significant improvement in sugar profile, systolic and diastolic blood pressure, pulse rate, lipid profile, HDL cholesterol and body fat. Greaves et al., also found that Intervention is more effective with adherence, follow-up, behavior change self-monitoring and social support.<sup>29</sup> A study done by Tuomilehto J et al., have been shown adherence to prescribed lifestyle modification similar to our study improve blood sugar levels and blood pressure and also reduce the risk of micro and macro-vascular complications of diabetes.<sup>40</sup> Similar studies done by Figueira et al., and Shareef et al., revealed the significant improvements in glycemic levels and medication adherence in the intervention group participants after educational counseling which support the results of our study.<sup>41-42</sup> Studies done by Fadare et al., and Farzana Saleh et al., observed a significant improvement in glycemic control, quality of life, reduction in medical treatment cost and short and long-term diabetes related complications of those patients who showed adherence to anti-diabetic medicines and self-management practice.<sup>43-44</sup>

#### Limitations of the study

Diabetes patients were selected from only one hospital of Delhi (DDRC) and hence the study findings may not be applicable to the entire diabetic population. There is no standard published tool to evaluate the adherence of the participants besides only self-developed questionnaires, adherence questionnaires were used. The participants responding to questions based on what they supposed to be the correct answer, and not necessarily what was true in their case. Furthermore, there was variability in some of the parameters related to glycemic control, as well as demographic profile at baseline. Also, the adherence of the control group was not measured and while it is assumed that there would have been no statistically significant change, it would have been beneficial to test them. These are most certainly areas that require further multi-centric randomized control study with larger population in different groups.

#### Conclusion

This study concludes that lifestyle modification counseling through lifestyle intervention holistic model (LIHM) and its adherence among T2DM patients was effective in improving both glycemic control, physiological and lipid profile of LMC group as compared to usual care group of type 2 diabetes mellitus patients. Adherence behavior of the patients improved and enhanced diabetes management and control skills of LMC group patients. Further multi-centric randomized control trials are required to assess the effectiveness of this tool in larger population for long-term effectiveness.

### Abstract

Diabetes is a costly, lifestyle disorder which increases the burden of disease and deteriorates the Health-Related Quality of Life (HRQOL) of diabetes patients and this study was conducted to assess the effect of lifestyle intervention on medical treatment cost and HRQOL in type 2 diabetes mellitus (T2DM) patients. This quasi-experimental prospective study was conducted in Delhi Diabetes Research Center, New Delhi and included 224 T2DM patients. Patients were divided into LMC and usual care group on the basis of receiving or not receiving lifestyle modification counseling. The follow-up of both groups was done at 6<sup>th</sup> and 12<sup>th</sup> months. Collected data were analyzed through IBM, SPSS software v 21 for mean, median (min-max), SD, t-test and Wilcoxon scores (rank sums) test. The results of this study showed a statistically significant reduction in diabetes medication costs, hospitalization and surgery costs in the LMC group as compared to the usual care group. The significant improvement was also observed in HRQOL domains which includes - physical functioning (62.40±6.738 to 83.67 ± 5.4920), physical health (35.30±22.069 to 64.50±13.62), emotional problem (37.90±28.93 to 71.46±16.75), energy (54.31±11.858 to

80.75 ± 15.52), emotional well-being (63.06± 9.828 to 85.79±6.36), social functioning (38.848±20.805 to 65.54±8.39) and general health (54.51±11.679 to 82.398± 11.7) at 12<sup>th</sup> month follow up in LMC group. The ADS score also showed significant improvement in overall HRQOL of LMC group. This study concludes that lifestyle intervention may improve HRQOL and reduce medical treatment cost of T2DM patients.

## Introduction

Diabetes mellitus (DM) is a non-infectious, silent, metabolic disorder, develops due to increasing age, obesity, unhealthy diet, physical inactivity, stress and consumption of tobacco.<sup>1,4</sup> Presently, more than 415 million people are diabetic globally as per International Diabetes Federation (IDF) and this number is expected to increase to 642 million by 2040. Due to increasing prevalence and, the high population, India has become the ‘Diabetic Capital’ of the world and having the second highest number (69.1 million) of diabetes patients after China.<sup>2,4</sup> Diabetes is a costly lifestyle disorder associated with various long-term, macro (cardiovascular diseases) and microvascular (retinopathy, nephropathy, and neuropathy) complications. These complications, lower the quality of life of T2DM patients and increase the rate of morbidity and mortality.<sup>3,4</sup> The cost of diabetes treatment is increased due to long-term complications and co-morbidities, which exert enormous economic burden, both for the individual and the nation.<sup>5</sup> Diabetes is the most common cause of death and disability around the world, caused due to secondary lifestyle and rapid globalization. Around 75% T2DM patients live in low and

middle-income countries.<sup>4</sup> India is a low and middle income developing country, where diabetes treatment cost is increasing day by day and patients faced the huge cost burden due to out of their pocket expenditure.<sup>1,5</sup> The global economic burden of diabetes is huge with an estimated approximately 673 billion US dollars annually in 2015, which constituted 12% of total expenditure for that year.<sup>1,4</sup> The public health expenditure on diabetes is expected to rise to the US \$ 595 billion in 2030 and the disease can be considered a risk for the world.<sup>6,7</sup>

WHO defined that health is not only the absence of disease and frailty in the body but also physical, mental and social well-being, must be present in a healthy person. The HRQOL is an important health outcome and used to assess the physical and mental health status of a person.<sup>8</sup> The relationship between HRQOL and the number of chronic complications found a trend towards poorer HRQOL if co-morbidities increased.<sup>9,10</sup> Poor QOL of patients occurred due to non-adherence to medication and self-management, which leads to uncontrolled diabetes and increased the risk of fetal complications.<sup>11</sup> A study demonstrated that diabetes can affect QOL in many ways: psychologically, physically, financially and socially.<sup>7</sup>

Medical treatment costs and HRQOL have shown a direct relationship. Diabetes treatment cost will be higher if the duration and number of complications due to diabetes increased, HRQOL of patients deteriorates.<sup>12,13</sup> A survey done by Piette et al found that 30% of patients had difficulties in paying diabetes medication costs due to out-of-pocket money<sup>14</sup> and other study revealed that out-of-pocket costs were due to diabetes-related complications and co-morbidities and experienced worse diabetes outcomes with poor QOL.<sup>15</sup> Lifestyle modification counseling (LMC) is the key component to achieve better glycemic control, improve HRQOL and reduce diabetes treatment cost due to the reduction of complications.<sup>16</sup> Educated diabetic patients can develop the skills that allow them to cope with diabetes and its related complications.<sup>17</sup> Hence, Lifestyle modification counseling generally used as an intervention is a novel, cost-effective, non-invasive method to manage T2DM and decrease the rate of complications. LMC includes- education about self-management, healthy diet, physical activity, tobacco and smoking cessation, stress management counseling with routine medical checkups and medication adherence counseling. The purpose of this study was to assess the effect of lifestyle intervention on medical treatment cost and health-related quality of life in T2DM patients.

## Materials and Methods

This hospital-based quasi-experimental, prospective study was conducted in DDRC New Delhi. In this study, total 224 T2DM patients were enrolled based on consecutive sampling technique. The study participants were allocated to LMC group and the usual care group

on the basis of patients receiving or not receiving lifestyle modification counseling. LMC group received lifestyle modification counseling with standard care (pharmacological treatment) while usual care group received only pharmacological treatment. The study was conducted in two phases. In the first phase planning, preparation for counseling components and recruitment of participants was done and in the second phase the implementation of counseling, data collection, follow-ups, and data analyses.

## Eligibility Criteria

The patients who included in this study were clinically and diagnostically confirmed T2DM, either sex, aged between 35 to 70 years, having blood sugar fasting more than 120 mg/dl, blood sugar PP more than 180 mg/dl, and HbA1c above 7%. Patients having at least one co-morbidity (obesity, hypertension, coronary heart disease) with T2DM and having diabetes more than 1 year, willing to participate and able to give valid written consent. The patients who excluded were newly diagnosed, having Type 1 and gestational diabetes, kidney failure, hospitalized, received more than one-time lifestyle intervention counseling within 1 year and having the mental disorder, visual, hearing problems and unwilling to give written consent.

## Recruitment of study Participants

Total 224 T2DM patients were enrolled as they fulfilled study eligibility criteria. The total duration of the study was 2 years (2015 to 2017) with one-year follow-up. The sample size (n=224) was calculated with an allowable error of 20% and 5% level of significance using below given standard formula.

### formula

Where  $p = (p_t \pm p_s) / 2$ ,  $p_t$  is the proportion of LMC group and  $p_s$  is the proportion of usual care group.

## Lifestyle Intervention

Lifestyle modification counseling was used as an intervention tool for participants to prevent and control T2DM. The counseling program was initiated in two phases. The first six months of the study were active period and next six months of the maintenance period, i.e. Interventional counseling was provided to the participants for previous 6 months. The LMC sessions were provided by an experienced and qualified dietitian, physical trainer and diabetes educator, under the supervision of senior diabetologist. The following five-lifestyle components were explained in local language, with the help of pictures, videos and discuss with participants and the group of the participant. Lifestyle

modification counseling (intervention) was repeated at every month for 6 months and follow up with the participants were done at 6th and 12th month.

## Key Components of the Intervention

### Balanced Diet

A qualified and experienced dietician encouraged participants to cut down high-calorie foods and advised to increase the number of fibrous foods (whole grain, green vegetables, and fruits). Participants were advised to adhere to the diet chart prescribed by the dietitian.

### Physical Activity

Participants were motivated by a physical trainer to increase their physical activities, i.e. brisk walk for at least 30 minutes per day and to do daily yogic exercises for at least 30 minutes (Yoga- Mudrasana, Balasana, Vajrasana, Paschimottanasana, Ardha Matsyendrasana, Supta Vajrasana, Dhanurasana, Shavasana).

### Tobacco and Alcohol Cessation

Participants were motivated to quit tobacco (smoking and chewing tobacco) and alcohol at every counseling session. They were educated about the harmful effects of tobacco and alcohol.

### Stress Management

Participants were encouraged to do daily meditation and breathing exercise at least for 15 minutes to control stress and advice were given to take proper sleep.

### Adherence to Routine Medical Checkups and Medications

Diabetologist advised the participants to adhere on routine medical checkups (the clinical assessment with blood sugar fasting, PP, HbA1c, lipid profile) and regular medications without skipping.

### Usual Care Group

Participants in the usual care group received only standard treatment. In addition, they were also provided the pamphlets and booklets for self-management of diabetes. A diary was provided to record their weight, diets, physical activities and other blood test results as it was also provided to LMC group.

### Measurements

Demographic and socioeconomic details (Age, sex, locality, medical history, education, occupation, monthly income and socioeconomic status) of both the groups had been done at baseline.

### Treatment cost Assessment

The cost of medical treatment for diabetes and its related complications was analyzed through diabetes and its related complications questionnaire.

### Health-Related Quality of Life (HRQOL)

The HRQOL of our study participants of both the group was measured through short-form health survey (SF-36) questionnaire and a disease-specific questionnaire, appraisal of diabetes scale (ADS). Quality of life of T2DM patients was assessed by asking questions to participants, whether they experienced problems related to life, such as mobility, personal care, housework, family, study, leisure activities, pain, discomfort and anxiety/depression. Responses were recorded as the answers. SF-36 contains 36 questions of eight health domains; physical functioning, physical limitation, emotional limitation, vitality, emotional well-being, social functioning, body pain and general health.<sup>18</sup> The eight domains were scored from 0 to 100 indicating worst to best possible health.

ADS is a diabetes-specific scale to assess QoL of diabetes patients have 7 items covering domains; stress due to diabetes, uncertainty, control over diabetes (2 questions), predictable future deterioration, coping skill and diabetes effect on life goals. The total score can range from 0 to 35. Thus, the lower score on ADS scale suggests better QOL.<sup>19</sup>

### Statistical Analysis

Statistical package for the social sciences (SPSS) software version 21 was used for all statistical analyses. Participants' demographic and socioeconomic measurements were compared between groups using independent t-test. Descriptive analysis (Mean, Median (Min-Max), SD), Chi-square, sample paired and independent t-test was used to analyze data with 95 % confidence interval and a significant p-value less than 0.05. Medical treatment cost was assessed through Wilcoxon scores (rank sum) test to calculate p-value as data was not normally distributed.

### Ethical Approval and Consent

Ethical clearance for this study was obtained from DDRC, New Delhi, and SAAOL Heart Center (Ref. No. IEC/SHRF/PhD/P-01/29.04.2016), New Delhi. Written informed consent was obtained from all study participants before initiation of the study.

### Results

### Cost Analysis of Various Expenditures of Diabetes and Diabetic Complications

At 12 month follow up, the result of the present study reveals that the LMC group ( $9627.5 \pm 1938.4$ ) spends less money on diabetes medicine as compared to the usual care group ( $10534.0 \pm 2169.4$ ) with significant p-value 0.0038. The surgery cost of usual care group ( $9212.0 \pm 17464$ ) was higher due to diabetes complications as compared to the surgery cost of LMC group patients ( $3186.3 \pm 10595$ ) with significant difference p 0.0046. The average hospitalization cost of usual care group (39580 INR) was approximately four times higher as compared to LMC group (10569 INR). The average mean (SD) of some variables including; other expenses for diabetes ( $340.0 \pm 573.7$  vs  $173.5 \pm 359.0$ ), diabetes neuropathy expenses ( $307.0 \pm 1031.0$  vs  $184.3 \pm 569.6$ ), hypertension medicines cost (257.8

$\pm 429.6$  vs  $173.8 \pm 267.2$ ), diabetes retinopathy expenses ( $39.0 \pm 390.0$  vs  $14.7 \pm 106.6$ ), foot complication related treatment cost ( $305.5 \pm 976.1$  vs  $137.8 \pm 483.2$ ) showed mean change, but that did not reach to the statistically significant level. Whereas LMC group spend more money on doctor's consultation fees for diabetic complications because of the LMC group participants have more diabetic complications. Travel cost, laboratory cost, diabetes complications diagnostics cost and heart disease medicines cost were slightly higher in the LMC group because of the higher number of heart disease patients present in the LMC group as compared to the usual care group. Details of the results are given in Table 3.

**Table 3: Medical Treatment cost assessment at 12 months of usual care & LMC group of T2DM patients**

Expenditure (INR)	UC Group (n=100)		LMC Group (n=102)		p-value*
	Mean $\pm$ SD	Median (Min-Max)	Mean $\pm$ SD	Median (Min-Max)	
Travel Cost	1146.7 $\pm$ 520.5	875 (420-2170)	1200.39 $\pm$ 537.59	1455 (600-2350)	0.822

\*Wilcoxon scores (rank sums) test was used to calculate p-value as cost data was not normally distributed.

### Effects of lifestyle intervention on health-related quality of life

On the assessment of the SF-36 questionnaire after 6 months, the LMC group participants showed significant improvement in the physical functioning, role limitation due to emotional problems, energy/fatigue, emotional well-being, and social functioning after 6 months with all significant p-values 0.0001 as compared to the usual care group. There was no statistically significant improvement observed in body pain, role limitation due to physical health and general health at 6-month follow up. At 12 month LMC group achieved significant improvement in physical functioning (62.402±6.7388 to 83.676 ± 5.4920), Role limitation due to physical health (35.30±22.069 to 64.50±13.62 ), role limitation due to

emotional problem (37.90±28.93 to 71.46±16.75), energy/fatigue (54.31±11.858 to 80.75±15.527), emotional well-being (63.06±9.828 to 85.79±6.36), social functioning (38.848±20.8058 to 65.54±8.39) and general health (54.51±11.679 to 82.398± 11.7) from baseline to 12 months with significant outcomes (p-value less than 0.05) as compared to the usual care group. There was no significant improvement has been observed in bodily pain (68.701±14.5295 to 75.123±13.35) at 12 months follow up. Details are given in Table 4.

As per as ADS score, patients of the LMC group showed statistically significant improvement at 6 months in all variables except in the first parameter (distress caused by diabetes). At 12 month follow up after lifestyle modification counseling most of the patients of LMC group showed significant improvement in all domains including distress caused by diabetes, uncertainty due to diabetes, control over diabetes, anticipated future deterioration, copying and effect of diabetes on life goals with statistically significant p values 0.05. Details of ADS are given in Table 5.

Table 5: ADS assessment at Baseline, 6<sup>th</sup> and 12<sup>th</sup> Months with significant differences within and between groups over study time in usual care and LMC group of T2DM patients

## Discussion

### Effect of Lifestyle Intervention on Diabetes Medical Treatment Cost

Present study observed that patients in the usual care group who did not receive lifestyle modification counseling, spent more money on diabetes medicines as compared to LMC group and a significant difference has been observed with significant p-value 0.0038, similar finding of hospitalization cost with significant difference p-value 0.0111 and surgery cost due to diabetes complications was higher in the usual care group with significant difference p-value 0.0046 as compared to LMC group. The average hospitalization cost of usual care group (39580 INR) was approximately four times higher as compared to LMC group (10569 INR). As per our study diabetes treatment cost assessment, it can be concluded that lifestyle modification counseling used as the intervention was cost-effective therapy. Other similar lifestyle intervention studies done by Sevick et al, Upadhyay et al and Odnoletkova et al showed same evidence that lifestyle interventions were cost-effective among diabetes patients.<sup>20,22</sup> Studies done by Anne M et al and Wolf RD et al provided the evidence that lifestyle intervention reduces the risk of diabetes complications, improves quality of life and did so without increasing health care costs, similar to present study.<sup>23,24</sup> A study by Png et al revealed that lifestyle intervention is cost-effective and can delay the risk of complications,<sup>25</sup> and Katon et al demonstrated that adherence to self-management decrease disease burden, health care cost and frequent hospitalizations.<sup>26</sup>

### Effect of lifestyle intervention on Health-Related Quality of Life (HR-QoL)

The results of our study did not show any significant difference at baseline in SF-36 domain scores. At the 6<sup>th</sup> month after lifestyle modification counseling, the participants of LMC group showed statistically significant improvement in the physical functioning, bodily pain, general health, and vitality from baseline to 6 months with all significant p-value less than 0.001 as compared to the usual care group. After 12 months of study follow up, the LMC group achieved significant improvement in all the domains, including physical functioning, role physical, bodily pain, general health, vitality, social functioning and mental health with significant p-values less than 0.001 as compared to the usual care group. As per ADS score, present study results did not show a statistically significant difference between LMC group and usual care group at baseline. After 6 months follow up the LMC group patients showed statistically significant improvement in all parameters except in one variable (distress caused by diabetes). At 12 months most of the patients of LMC group showed significant improvement in all domains with the significance p-value less than 0.05. Studies done by Norliza et al, Rajeshwari et al, and Kaskurthy et al studies have shown statistically significant improvement in glycemetic control and overall QoL in

T2DM patients after lifestyle modifications counseling provided by the pharmacist-patient counseling.<sup>27,29</sup> Similar studies by Testa et al, Shareef et al, and Sriram et al have shown significant improvement in the quality of life and significantly improved economic benefits after intervention.<sup>30,32</sup> Studies done by Reza et al and Adepu et al observed significant improvement in all domains of HRQOL in diabetes patients after educational counseling in test group participants.<sup>33,34</sup> Studies conducted by Carvalho et al, Marzieh et al, and Alireza et al verified the influence of educational counseling and shown significant improvement in the overall QoL and HbA1c scores after counseling.<sup>35,37</sup> Similar studies by Ramune et al and Adibe et al showed significant improvements in HRQOL, and glycemic control, in T2DM patients.<sup>38,39</sup> In summary, our study concludes that LMC may improve overall HRQoL of T2DM patients and supported by above-discussed studies.

### Study limitations

Due to limited resources and facilities, this study was not randomized designs, but a quasi-experimental study was designed in a standardized manner. There is need of multi-centric randomized trials to solve diabetes management queries.

### Conclusion

Results of present study conclude that LMC is effective towards diabetes management and control and can reduce the medical treatment cost, improve HRQOL and coping skills of T2DM patients. Further multi-centric randomized control trials with the large population are required, to assess the effectiveness of lifestyle intervention on medical treatment cost and HRQOL in T2DM patients.

### Conflict of Interest

The authors have no conflicts of interest related to the material presented in the present original manuscript.

<sup>3</sup>Delhi Diabetes Research Center, New Delhi, India

## Abstract

**Introduction.** *Enhanced External Counter Pulsation (EECP) is a non-invasive United States Food and Drug Administration (FDA) approved outpatient treatment option for the complex problem of angina, a common symptom of coronary heart disease. A systematic review of the literature searched to assess the effect of EECP on the clinical profile that comprised physiological measurements, biochemical assessments, cardiac clinical symptoms, physical functional status, and Health-Related Quality of Life (HRQoL) in Coronary Heart Disease (CHD) patients.*

**Material and methods.** *Total 258 EECP research articles from the early stage of EECP development to till date screened. Out of 258 EECP articles, total 60 articles (53 EECP articles for clinical profile and 7 article for HRQoL matched the inclusion criteria and other (n = 198) articles excluded due to irrelevant to study objectives.*

**Results.** *All enrolled studies showed a significant improvement in angina pectoris and HRQoL with reduction of nitroglycerine use and exercise tolerance. There are several gaps in research has been found for further research to evaluate the EECP effectiveness on Body Mass Index (BMI), Heart Rate, Cholesterol, Triglyceride, High Density Lipoprotein (HDL), Low Density Lipoprotein (LDL), HbA1C, SpO<sub>2</sub>, Vo<sub>2</sub>max level with a comparative assessment of cardiac and non-cardiac metabolic markers including blood glucose.*

**Conclusions.** *There is further need of multi-centric randomize controlled trial studies to evaluate the effect of EECP on obese, diabetic, hypertension and other metabolic disease patients and more research required for further modifications in EECP device to cure, prevent and treat chronic diseases by the non-invasive procedure.*

**Key words:** enhanced external counter pulsation, angina pectoris, health-related quality of life, coronary heart disease

Acta Angiol 2018; 24, 4: 105–122

## Introduction

Cardiovascular disease, especially Coronary Heart disease (CHD) is the number one killer and foremost

cause of deaths around the world [1]. Angina pectoris, the prime symptom of coronary heart disease ranked first among causes of mortality [2]. The current non-pharmacological and non-invasive therapy available

**Address for correspondence:** Saurabh Dahiya, Lingaya's University, Nachauli, Jasana Road, Old Faridabad, Faridabad, Haryana, 121002 Faridabad, India, e-mail: saurabhdahiya@gmail.com

for chronic stable angina (a typical symptom of coronary heart disease) and heart failure is Enhanced External Counter Pulsation (EECP). EECP is USA-FDA approved therapy for coronary heart disease patient [3]. EECP, an electro-mechanical system is a registered trademark of Vasomedical, Inc, New York, USA and PSK (Chinese Company) is the exclusive distributor of Vasomedical's devices all over the world [4–8]. CHD patients usually undergo EECP treatment of 35 consecutive 1-hour sessions over 5–7 weeks. Treatment patient is continuously monitored for cardiac outputs, heart rate and spo2 using ECG and finger plethysmogram, which are connected to the EECP device [9–11]. This study designed to evaluate the effect of EECP in Clinical profile and HRQoL in CHD patients.

### Material and methods

#### Searching methods

A systemic review of the literature of EECP on clinical profile and HRQoL in coronary heart disease patients was search through PubMed, Medline, Vasomedical EECP manufacturer web-link, and Google scholar sources. Searching for the articles done as per the inclusion and exclusion criteria of the study and the studies summarized in Figure 1.

#### Inclusion criteria

EECP article of Randomized Control Trial (RCT), case studies, prospective and retrospective studies on clinical profile and HRQoL in coronary heart disease patients were included.

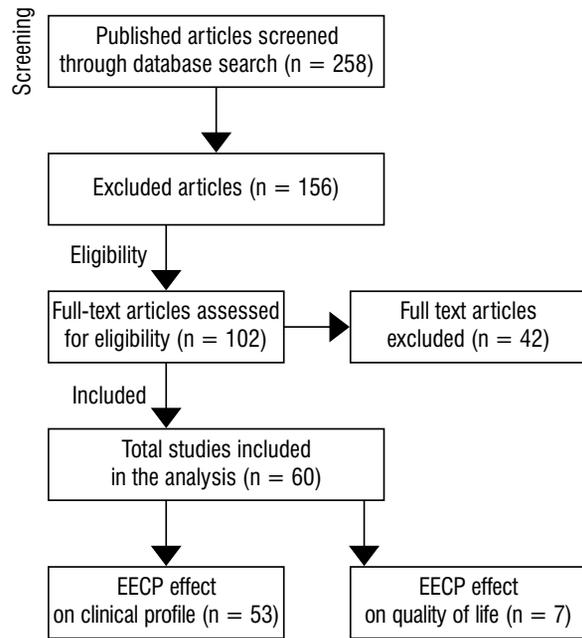

Figure 1. Flowchart of screened and included studies

#### Exclusion criteria

Heart Failure studies, Non-cardiac EECP studies with RCT, Case studies, Prospective and Retrospective and reviews of EECP papers excluded from the study.

#### Quality assessment

Study quality was assessed through two authors independently. Newcastle-Ottawa scale (NOS) was used to assess the quality of studies. Detail of assessment is given in Tables 1, 2.

Table 1. Newcastle-Ottawa scale in the assessment of clinical profile included studies

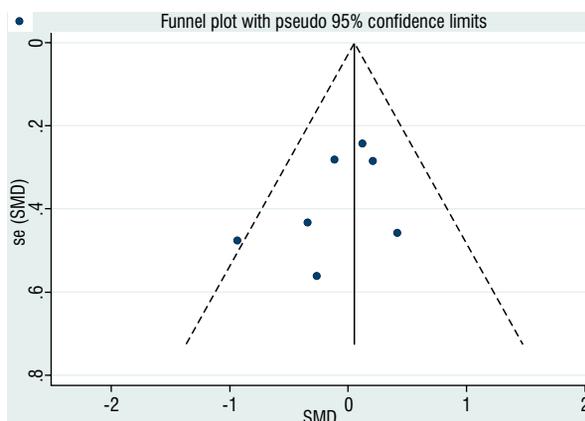

**Figure 2.** Funnel plot of included studies in clinical profile — EECP

**Statistical analysis**

Statistical analyses were performed using RevMan 5.0 (Cochrane Collaboration). A random-effects model was used with weighted mean difference (WMD) in clinical profile and HRQoL from pre-EECP to post-EECP. Bias in studies was assessed through visual inspection of the funnel plot as well as Begg’s and Egger’s testing. Detail of analysis is given in Figures 2 to 5.

**EFFECT OF EECP ON CLINICAL PROFILE IN CORONARY HEART DISEASE PATIENTS**

Lawson et al. [12] conducted a study on 18 patients with chronic angina treated with an improved system of enhanced external counter pulsation (EECP) and found that all patients improved in angina symptoms and generally decreased anti-angina medications. A decrease in myocardial ischemia observed in 67% patients and 89% of patients were symptom-free. Sjukri et al. [13] carried out a study on 201 coronary heart disease

**Figure 3.** Funnel plot of included studies in HRQoL — EECP

patients. The results of the study showed significant improvement in coronary perfusion by 86.8% and exercise tolerance by 94.2%. Arora et al. [14] performed a multi centric prospective randomized control study to assess the safety and efficacy of enhanced external counterpulsation (EECP). A significant improvement in angina severity and exercise tolerance and timing was reported. EECP showed well tolerated and safe therapy for CHD patients. Lawson et al. [15] carried out a study on 33 patients to evaluate the effect of EECP on long-term prognosis in CHD patients. The study suggests that particularly for the majority of patients demonstrating improvement by 64% in radionuclide stress perfusion post-treatment and EECP may be an effective long-term therapy. Lawson et al. [16] conducted a cohort study in 2,289 CHD patients to evaluate EECP safety and efficacy. EECP was found to be safe and well-tolerated therapy with improvement in angina class by 74% with significant p-value ( $p < 0.001$ ). Urano et al. [17] performed a study on 512 CHD patients to examined EECP efficacy in myocardial ischemia, exercise tolerance and cardiac

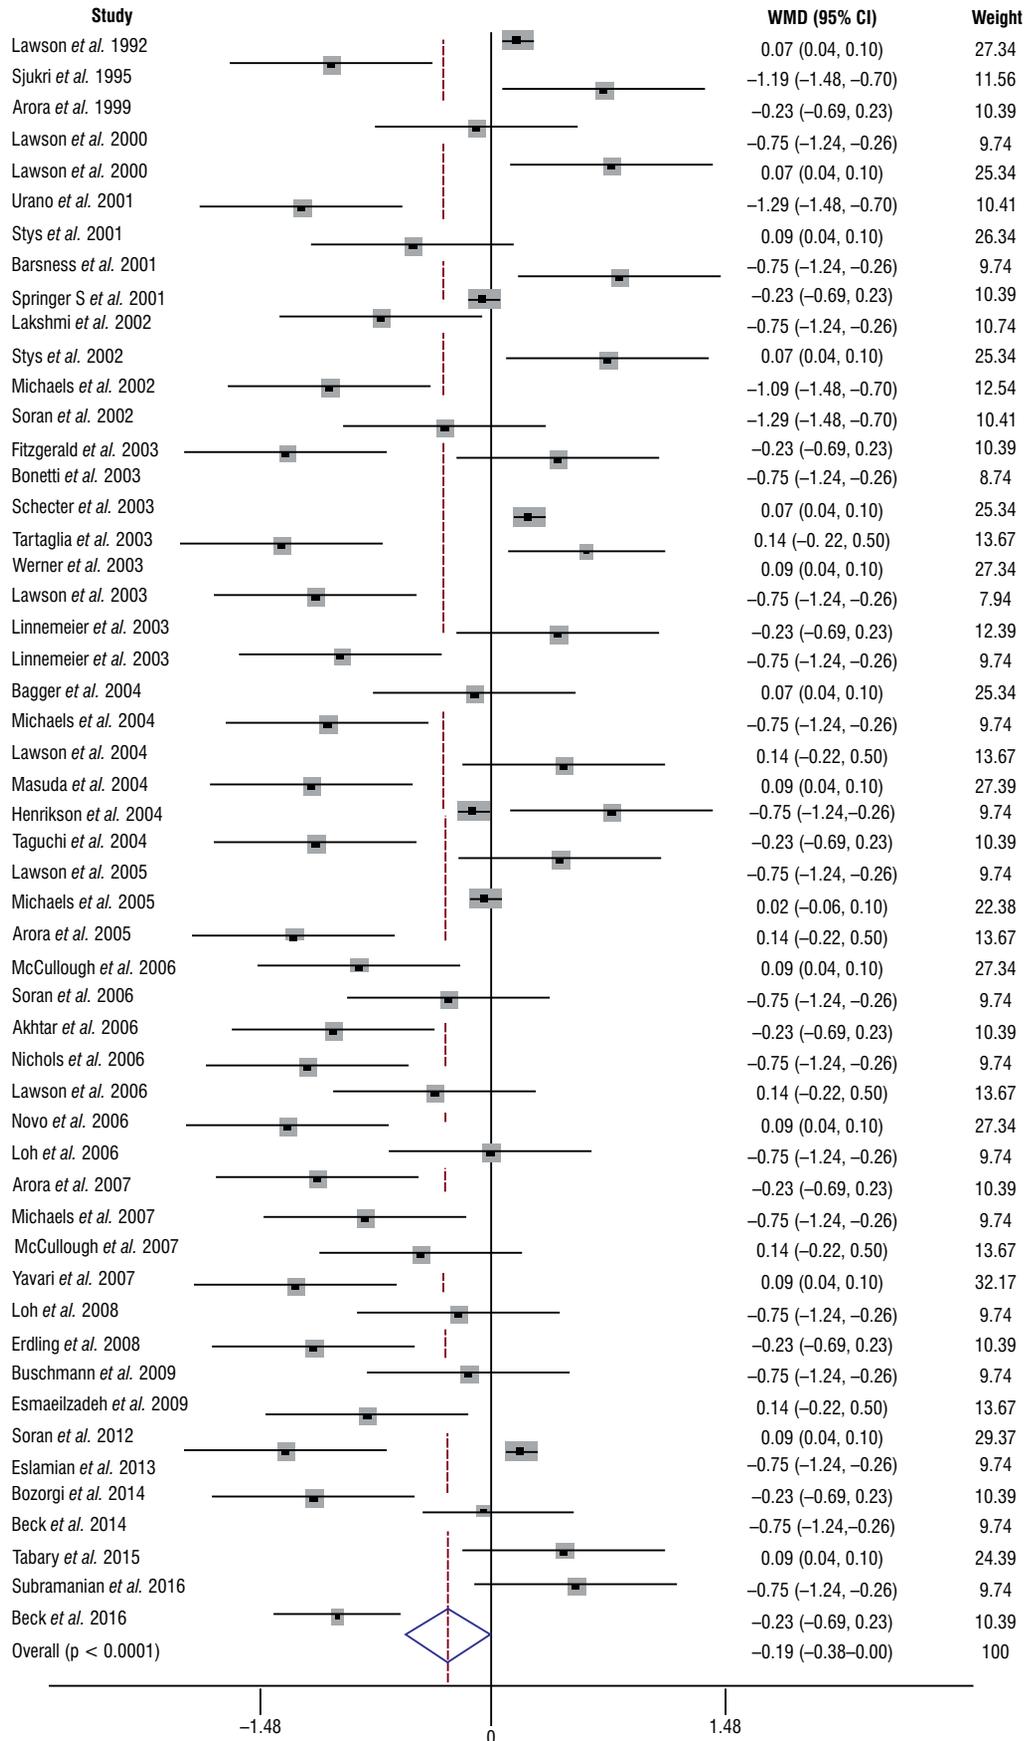

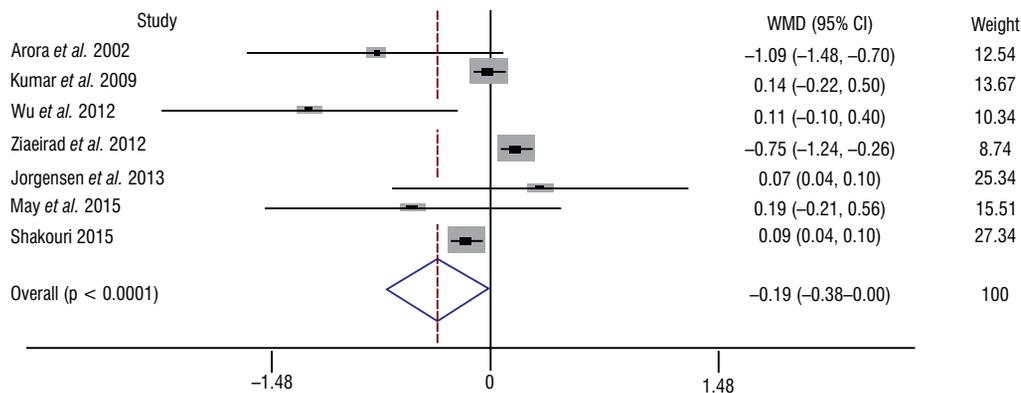

Figure 4. Forest plot of weighted mean differences in clinical profile in pre- and post-EECF

**Figure 5.** Forest plot of weighted mean differences in HRQoL in pre- and post-EECP

function. The result of the study reveals the improvement in exercise test parameters reduced myocardial ischemia by thallium scintigraphy in association with improved LV diastolic filling in patients with stable CAD. Stys *et al.* [18] carried out a clinical registry of 37 centers with the enrollment of 395 chronic stable angina patients to examine the relation of the ER to post treatment improvement in Canadian Cardiovascular Society (CCS) angina class. After EECp, CCS improved by at least 1 class in 88% of patients, 87% of men and 92% of women. EECp is effective in improving CCS in chronic stable angina patients. Barsness *et al.* [19] performed a study on 1246 CHD patients to determine whether EECp is a safe and effective treatment for patients with angina pectoris. The results demonstrated significant improvement in angina and reduction in nitroglycerine anti-angina drugs by 61.7%. Springer *et al.* [20] conducted a study on 28 CHD patients to assess psychological function and well-being status and observed significant improvement in psychological and well-being status. Lakshmi *et al.* [21] carried out a study on 2486 patients those were enrolled in the IEPR. The study revealed a significant improvement in angina class in patients whose DA ratio was increased and results sustained for 6 months. Stys *et al.* [22] performed a study on 175 CHD patients and found a significant improvement in angina class in 85% of patients. This study results showed the EECp effectiveness in improving stress myocardial perfusion with exercise tolerance in CAD patients.

Michaels *et al.* [23] conducted a study on 10 CHD patients and found the significant improvement in diastolic and mean pressures with reduction of systolic pressure in the central aorta and the coronary artery of CAD patients. The study concludes that EECp may serve as a potential mechanical assistant device for CAD patients. Holubkov *et al.* [24] carried out a study on 771 CHD patients treated with EECp and the results of this study conclude that EECp may be a safe treatment option for

CAD patients. Soran *et al.* [25] performed a study on 1402 CHD patients and the results showed that angina decreased by at least one class in 67% of patients with LV dysfunction just after completion of EECp treatment. Fitzgerald *et al.* [26] conducted a cohort study on 4669 CHD patients and found decreased angina episodes and nitroglycerin use and 74.8% reduction in Canadian Cardiovascular Society (CCS) functional class and improvement in angina sustained for 6 months. Bonetti *et al.* [27] performed a study on 23 CHD patients to examine the effect of enhanced external counter pulsation (EECP) on endothelial function and found that 70% patients get symptomatic relief by EECp treatment. The author revealed that significant improvement in endothelial function by EECp may benefit to the clinical status of CHD patients.

Schechter *et al.* [28] carried out a study of 20 CHD patients to investigate the influence of short-term external counterpulsation (ECP) therapy on flow-mediated dilation (FMD) in patients with coronary artery disease (CAD). The author revealed that external counter pulsation may improve vascular endothelial function and refractory angina pectoris in CHD patients. Tartaglia *et al.* [29] conducted a study on 25 CHD patients to determine the effect of EECp on exercise capacity and myocardial perfusion by comparing results of maximal exercise radionuclide testing pre- and post-EECP treatment. A significant improvement in treadmill times has been reported and radionuclide perfusion scores also showed a significant reduction in ischemic segments. Werner *et al.* [30] performed a study on 48 CHD patients and weekly angina episodes were reduced by 48%, nitroglycerin puffs were reduced by 51%, work capacity was improved by 22%. Study validates the reduction of angina with significant improvement of work capacity after EECp.

Lawson *et al.* [31] carried out a study on 4592 CHD patients and his collected data from international enhanced external counter pulsation (EECP) patient regis-

try showed significant improvement in angina by 73% in at least 1 class and 2 classes by 35.2% and 3 classes by 17.3%. The mean angina episodes per week decrease to 2.5 per week after EECP treatment and nitroglycerine uses per week after EECP was 2.5 times per week and improvement in functional status also observed in the study. Linnemeier *et al.* [32] conducted a study on 3037 CHD patients to determine whether enhanced external counterpulsation is a safe and effective treatment for angina in octogenarians. At 6-month follow-up, 81% of patients sustained angina improvement. This study concludes that enhanced external counterpulsation is effective and well tolerable non-invasive treatment. Linnemeier *et al.* [33] performed another study on 1532 IEPR patients. The author demonstrated that after 1 year, maintenance of angina rate was reduced in 86% of patients with diabetes. This study also suggests that in diabetes patients, EECP can be a safe, effective, well-tolerated treatment option for the relief of angina. Bagger *et al.* [34] carried out a study on 23 patients with angina pectoris with positive dobutamine stress echocardiogram. This study was done to evaluate EECP effectiveness on dobutamine stress-induced wall motion score among angina patients. The reduction in dobutamine-induced wall motion abnormalities after EECP therapy was reported.

Michaels *et al.* [35] conducted the long-term outcomes of enhanced external counterpulsation in 1097 CHD patients to relieve angina and improving the quality of life in a large cohort of patients with chronic angina pectoris. 73% patients had a reduction by at least 1 angina class at the end of treatment, and 50% reported an improvement in the quality-of-life assessment after enhanced external counterpulsation was; these results were sustained at 2-year follow-up. Lawson *et al.* [36] performed a study on 2861 CHD patients to examine the safety and effectiveness of EECP therapy. Post-EECP, patients had improved their CCS angina by at least one class. At 6-month follow-up, the CCS-class improved reduction in angina episodes and nitroglycerin use. Enhanced external counterpulsation was proved an effective therapy in relieving angina in patient's angina patients. Masuda *et al.* [37] carried out a study on total 18 CHD patients. Out of 18 patients, 11 were treated with EECP and 7 were treated 5000 IU heparin pretreatment along with EECP. The study was done to evaluate EECP and intravenous heparin injection therapy effectiveness in angina pectoris patients and the results of the study showed significant improvement in exercise capacity and oxygen metabolism of coronary heart disease patients treated with combination therapy of EECP and heparin.

Henrikson *et al.* [38] conducted a study on 28 CHD patients and found that post EECP most patients (82%)

had at least one full class improvement in their angina pattern. EECP remains an effective treatment for severe CAD. Taguchi *et al.* [39] performed study on 24 patients with myocardial infarction. This study was done to assess the haemodynamic effects of EECP and its mechanism with special reference to neurohumoral factors. The finding of this study suggests that an increase in ANP without an increase in BNP is an important mechanism for the effects of EECP therapy. Lawson *et al.* [40] carried out a study on 2007 CHD patients and demonstrated the angina reduction by 83% at least one CCS angina class and improvement in weekly angina episodes and their frequency of nitroglycerine use decreased with improvement in well-being status by 63%. Michaels *et al.* [41] conducted a study on 1192 CHD patients to assess the frequency, efficacy, predictors, and long-term success of repeat enhanced external counter pulsation (EECP) therapy in relieving angina in a large cohort of angina patients. After 2 years of EECP therapy, 70% of patients reported the significant decrease in angina and nitroglycerine consumption. Arora *et al.* [42] performed a study on 30 patients with stable angina pectoris having class II-IV. This study was done to assess the effect of EECP on vascular cell release of coagulation factors. The author reveals that EECP may not play a significant role in controlling coagulation factors in CHD patients.

McCullough *et al.* [43] carried out a study on 2730 obese heart patients to evaluate the association of baseline body mass index (BMI) on the outcomes of enhanced external counterpulsation (EECP) therapy for chronic stable angina. A greater reduction in weekly angina episodes from baseline to follow up observed and study conclude that reduction of angina is directly proportional to BMI value. Akhtar *et al.* [44] conducted a study on 13 CHD patients to evaluate the effect of EECP treatment on plasma nitric oxide and endothelin-1 level. This study concludes that EECP may increase nitric oxide and decreases endothelin-1 levels.

Soran *et al.* [45] carried out a cohort study on 363 CHD patients and post EECP treatment, there was a significant decrease in severity of angina class ( $p < 0.001$ ), and 72% patients were improved from severe angina and 52% of patients discontinued nitroglycerin use. At 2 years of follow up 55%, patients showed improvement in angina and prove that EECP is effective and durable therapy approach for CAD patients and 52% CHD patients discontinued nitroglycerin use. Nichols *et al.* [46] performed a study on 20 angina patients to prove the hypothesis of arterial properties and wave reflection characteristics favourably altered after EECP. The study revealed that EECP treatment may reduce arterial stiffness and can improve wave reflection characteristics in patients with angina.

Lawson *et al.* [47] conducted a study on 1458 CHD patients and found that EECP significantly reduced angina frequency, nitroglycerin use. Significant improvements in angina by 70–74% with reduction of nitroglycerine use by 52% with better well-being persist until 2 years of follow up. Novo *et al.* [48] carried out a study on 25 CHD patients to evaluate the efficacy of EECP on clinical symptoms, myocardial ischemia and cardiac perfusion in intractable angina patients. 84 per cent of patients showed an increment in at least one functional angina class and reduced inducible ischemia and maximal benefits observed in patients with worst systolic failure had been observed.

Loh *et al.* [49] did a study on 58 CHD patients to assess EECP immediate and long-term effectiveness in chronic stable refractory angina patients. This study results showed that angina improved at least one class CCS angina improvement by 78% after 1 year and increase exercise capacity with the reduction in nitroglycerine use. Arora *et al.* [50] conducted a study on 11 CHD patients to assess the effect of EECP on myocardial perfusion. In this study no significant effect on myocardial perfusion seen due to very less sample size and highly variable clinical responses. Michaels *et al.* [51] performed a study on 27 patients and significant improvement in heart rate variability in diabetic CHD patients and associated with reduced mortality rate had been reported. McCullough *et al.* [52] did a study on 902 patients from the IEPR. This study was done to evaluate the degree of residual angina on the clinical outcomes of EECP and conclude that residual high-grade angina pectoris occurs after post EECP in those patients who had the history of severe angina and multi-vessel disease.

Yavari *et al.* [53] conducted a study on 67 CHD patients to assess EECP efficacy in relieving angina and improving myocardial ischemia. The results of this study conclude that EECP is safe, effective and well-tolerated therapy for angina pectoris treatment. Loh *et al.* [54] did a study on 1477 CHD patients to evaluate EECP effectiveness. Immediately after EECP, angina reduction has been seen with  $p < 0.001$ . The improvement in CCS class was improved by at least 1 class in 78% of the patients and by at least 2 classes in 38% and sustained in 74% of the patients during follow-up for 3 years. Erdling *et al.* [55] carried out a study on 86 CHD patients and conclude that after EECP treatment 79% of patients showed improvement in CCS class immediately and 61.5% of patients sustained these benefits till 12 months and 29% at 2 years follow up. The author concludes that EECP is safe & effective for CAD with angina pectoris patients and patients with CCS angina class III & IV reported maximum improvement. Buschmann *et al.* [56] conducted a study on 23 CHD patients and found

improvement in CCS and NYHA class in CAD patients with significant improvement in pressure derived collateral flow index and fractional flow, which also increased. Esmailzadeh *et al.* [57] performed a study on 20 CHD patients to assess the effects of EECP on cardiac functions and found a reduction in NYHA angina class. Significant improvement was observed in LV systolic, diastolic function in angina patient. Soran *et al.* [58] conducted a study on 2072 patients and treated with EECP. Significant reduction by 76–84% in the severity of angina in CAD patients at 1 year of follow up was reported and both US and turkey group got good results. Eslamian *et al.* [59] performed a study on 50 CHD patients to assess Enhanced External Counter Pulsation (EECP) effectiveness on clinical symptoms, echocardiographic measurements, and perfusion scan parameters and exercise tolerancetest. A significant improvement was observed in angina severity and well-being status. Bozorgi *et al.* [60] did a study on 20 CHD patients with refractory angina. A significant reduction in angina classes III and IV was reported with sustained results for 6 months. The author concludes that EECP decreased symptoms and increased total exercise time and sustained these results for 6 months.

Beck *et al.* [61] conducted a study on 24 CHD patients and significant improvement in plasma level of nitrates, improved peak VO<sub>2</sub>, and reduced LV function with significant improvement in peripheral vascular function and functional capacity had been reported. Tabary *et al.* [62] performed a study on 48 CHD patients to assess clinical and para-clinical effects of enhanced external counterpulsation (EECP) effectiveness. Significant improvement in hemoglobin, LVEF, diastolic and systolic B.P, Chest pain, dyspnea and improvement in clinical conditions had been reported. Subramanian *et al.* [63] did a study on 72 CHD patients and found significant improvement in central systolic pressure, brachial systolic pressure, aortic pulse pressure, and augmentation pressure and augmentation index. Beck *et al.* [64] conducted the study on 17 CHD patients. The author concludes that EECP may be useful as an adjuvant therapy for improving functional classification and improve central blood pressure, aortic pulse pressure, wasted left ventricular energy, and myocardial oxygen demand in CHD patients.

## EFFECT OF EECP ON HR-QoL IN CORONARY HEART DISEASE PATIENTS

Arora *et al.* [65] conducted a study to assess EECP effectiveness on HRQoL. A significant improvement in HRQoL was observed at 12 months of follow up. The result shows improvements in HRQoL changes after EECP treatment. Kumar *et al.* [66] did a prospective

study and found that EECP significantly improved angina symptoms, dyspnea on exertion, and quality of life after 35 days of treatment and at 1 year follow up. EECP also improved the 6-minute walking capacity. Wu *et al.* [67] performed a study to evaluate EECP after six months regarding physical capacity and HRQoL in patients with refractory AP. Patients enhanced walking distance on average by 29 m after EECP. CCS class also improved and persisted at six months follow-up. HRQoL improved significantly and the effects maintained at follow-up after the treatment.

Ziaeirad *et al.* [68] did a quasi-experimental study on 64 patients to evaluate the QoL of patients with angina pectoris after treatment with enhanced external counterpulsation. The author reveals that EECP is an

effective noninvasive method in treating patients with angina pectoris and in developing their HRQoL. Jorgensen *et al.* [69] conducted a special case study of the 43-year-old woman who had 15 hospital admissions in six years due to angina. The case study proves the EECP effectiveness towards angina recovery and significant improvement in HRQoL. May *et al.* [70] performed a study to assess the effect of EECP on QoL and exercise capacity in CAD patients. Author of this concludes that quality of life and exercise capacity was improved after EECP. Shakouri *et al.* [71] conducted a study to investigate the effect of EECP on plasma nitric oxide (NO) and HRQoL in CAD patients. The author revealed that HRQoL and NO level increased after EECP treatment in CHD patients. Summary of studies given in Tables 3, 4.

**Table 3.** EECP effectiveness on clinical profile in coronary heart disease patients

Author	Study (year)	Title of study	Sample size	Findings & conclusion
Lawson <i>et al.</i> [12]	1992	Efficacy of enhanced external counterpulsation in the treatment of angina pectoris	18	Myocardial ischemia 67% decrease, exercise duration increased, reduction in anti-anginal medicines and 89% patients were symptom-free
Sjukri <i>et al.</i> [13]	1995	EECP in the treatment and rehabilitation of coronary patients in Indonesia	201	Exercise tolerance 94.2%, improvement in CCS angina class
Arora <i>et al.</i> [14]	1999	The multicenter study of enhanced external counterpulsation (MUST-EECP): effect of EECP on exercise-induced myocardial ischemia and anginal episodes	139	Exercise duration increase, angina severity reduced, extends times to exercise-induced ischemia, Nitroglycerine usage decrease
Lawson <i>et al.</i> [15]	2000	Long-term prognosis of patients with angina treated with enhanced external counterpulsation: five-year follow-up study	33	Improvement in stress perfusion after EECP, 64% did not suffer any major adverse cardiovascular event due to the effect of EECP at 5 year of study follow up
Lawson <i>et al.</i> [16]	2000	Treatment benefit in the enhanced external counterpulsation consortium	2289	74% angina pectoris patients improved in CCS angina class III & IV with significant p-value ( $p < 0.001$ )
Urano <i>et al.</i> [17]	2001	Enhanced external counterpulsation improves exercise tolerance, reduces exercise-induced myocardial ischemia, and improves left ventricular diastolic filling in patients with coronary artery disease	512	Improvement in Exercise duration and tolerance with improvement in LV function. Improvement in diastolic filling and diastolic function
Stys <i>et al.</i> [18]	2001	Acute hemodynamic effects and angina improvement with enhanced external counterpulsation	395	CCS angina class improvement by at least I class in 88% of patients
Barsness <i>et al.</i> [19]	2001	The International EECP Patient Registry (IEPR): design, methods, baseline characteristics and acute results	1246	Decrease in at least I anginal class by 81% and mean change decrease in anginal episodes per week ( $6.4 \pm 12.6$ ) with reduction of nitroglycerine use by 61.7%
Springer <i>et al.</i> [20]	2001	Psychosocial effects of EECP in the angina patient: A second study	28	Improvement in physical functioning and mental health with special reference to stress and QoL

**Table 3. cont.** EECP effectiveness on clinical profile in coronary heart disease patients

Author	Study (year)	Title of study	Sample size	Findings & conclusion
Lakshmi <i>et al.</i> [21]	2002	Relation of the Pattern of Diastolic Augmentation During a Course of Enhanced External Counterpulsation (EECP) to Clinical Benefit (from the International EECP Patient Registry [IEPR])	2486	At 6 months of follow up, the patients showed a higher reduction in angina class who had the greatest increase in the DA ratio as compared to those who had a decrease in the DA ratio
Stys <i>et al.</i> [22]	2002	Effects of enhanced external counterpulsation on stress radionuclide coronary perfusion and exercise capacity in chronic stable angina pectoris	175	85% angina improvement, improvement in stress myocardial perfusion and maximize exercise functions
Michaels <i>et al.</i> [23]	2002	Left ventricular systolic unloading and augmentation of intracoronary pressure and Doppler flow during enhanced external counterpulsation	10	Diastolic BP increase, Systolic B.P decrease and increment in coronary flow by 28% during EECP treatment
Holubkov <i>et al.</i> [24]	2002	Comparison of patients undergoing enhanced external counterpulsation and percutaneous coronary intervention for stable angina pectoris	771	Angina improvement in CCS class higher who received EECP therapy as compared to PCI group
Soran <i>et al.</i> [25]	2002	Enhanced external counterpulsation as treatment for chronic angina in patients with left ventricular dysfunction: a report from the International EECP Patient Registry (IEPR)	1402	Improvement in angina at least one class in 67% of patients with LV dysfunction 70.6% after 6 months of follow up
Fitzgerald <i>et al.</i> [26]	2003	Enhanced external counterpulsation as initial revascularization treatment for angina refractory to medical therapy	4,669	The decrease in anginal episode per week with significant value $p < 0.001$ , reduced nitroglycerine uses and CCS angina class reduction in 74.8 patients
Bonetti <i>et al.</i> [27]	2003	Enhanced external counterpulsation improves endothelial function in patients with symptomatic CAD	23	Enhanced peripheral endothelial function immediately after EECP treatment with a contribution to the clinical benefit of EECP
