(Source: Author's own calculation from Banks Annual report for FY 2015-2019)

table No. 4 reveals that the quality of earnings represents the sustainability and growth of future earnings, its capability to maintain quality and earn consistently. State Bank of India has held the first position with a group average of 2.84 and Bank of Maharashtra stood the last position with a group average of -21.10 because of its lower Net profit margin and Return on equity ratio.

#### **Results of the study:**

**Net Profit Margin ratio indicates** Indian Bank was in the first position with the highest average net profit margin of 5.09, followed by IDFC First Bank (3.13%) and State Bank of India (3.09). IDBI Bank Ltd. In the last position with the least average net profit margin of -22.40. **Return on Equity shows**, State bank of India was in the top rank with the highest average return on equity with 4.57 %, followed by Syndicate Bank (1.77 %) and Andhra Bank (1.75 %). Bank of Maharashtra was in the lowest position with an average of -53.45%. **Interest Income to Total Income ratio point out**, Punjab and Sind Bank come first with an average rate of 0.93, followed by the Central Bank of India (0.91) and UCO Bank (0.90). **However, ranking of earning quality among the public sector banks**, State Bank of India has held the first position with a group average of 2.84 and Bank of Maharashtra stood in the last position with a group average of -21.10 because of its lower Net profit margin and return on equity ratio.

#### **Conclusion:**

Bank contributes an important role within the economic process of a nation by inserting and steering all the financial services. Earning quality is an important element for banks to perform their financial obligations strongly. Therefore, each banking entity must keep watch on its sources of income. the quality of earnings represents the sustainability and growth of future earnings, its capability to take care of quality and earn consistently. It found that state bank of India has held the first position with a group average of 2.84 and Bank of Maharashtra stood in the last position with a group average of -21.10 because of its lower net profit margin and Return on equity ratio. The study suggested that the banks should increase the interest and non-interest income through the complete utilization of the resources and improve operational efficiency.

**Abstract**

The pandemic has created the largest disruption in face-to-face teaching. E-learning is the only way to innovate and implement alternative educational systems and assessment strategies on track. But to be able to transact online teaching, there is a need for digital skills with digital leadership skills among stakeholders of education. All the more, digital leadership is significant for first-time users, especially challenges brought by the pandemic situation. This research article will encourage and motivate the stakeholders of education to develop digital leadership characteristics in order to wisely use their space and opportunities to bring about significant changes in school culture, as well as a positive impact on the educational system. To foster leadership practise and the processes involved in teaching and learning, digital leadership must be grounded in practise. It is necessary to realign educational stakeholders, not only to address difficulties but also to reposition themselves, in order to prepare students for the future by equipping them with digital competencies and leadership.

**Introduction** The pandemic has led to shifts in the ways of teaching learning activities, communicating, collaborating, problem-solving, and consuming

digital content. The unprecedented challenges posed by the pandemic have placed stakeholders in a position to reflect upon the effectiveness of the teaching learning process and leadership to cultivate competent learners equipped to thrive and survive in a digital era. New digital tools have popped up faster than ever. The way of teaching and learning has changed rapidly. Do the learners know how to adapt to these shifts to lead meaningful, sustainable changes in schools? Schools and the education of children should undergo an extensive digital transformation to be able to meet the needs of the younger generation and their digitalized future (Iivari, et al., 2020). The increasing domains of technology in the teaching and learning process desperately need digital leadership to improve the pedagogy and communication with students and colleagues. All the stakeholders in education (principal, teachers, students, and staff) are required to develop digital technology skills, including digital technology-focused leadership characteristics (Yusof, Yaakob & Ibrahim, 2019). Thus, in order to achieve educational transformation, stakeholders in education must make use of these skills in order to enhance the academic performance of students through the utilisation of digital technology. Digital leadership has therefore become imperative in order to cultivate a school culture with the changing paradigm of the 21<sup>st</sup> century.

The concept of digital leadership is a rethinking, reconceptualising, and renovating of the concept of leadership in the context of the technological revolution, which takes digital technology as its centre and is reshaping society and the international landscape. Digital leadership is the ability that individuals or organisations should have in the era of the digital world to lead others, teams, or entire organisations to give full play to digital thinking by leveraging digital insight, digital decision-making, digital implementation, and digital guidance to ensure that their goals are achieved (Peng, 2021). It consists of a dynamic composition of digital skills, mindsets, and behaviours that lead to establishing direction, influencing others, and initiating sustainable changes that enhance school culture through the strategic and advanced use of the latest technology. Sheninger, 2019). Digital leadership is not about the use of flashy tools. It is a strategic mindset that leverages available resources to improve school culture in the direction of quality education. To attain the learning goals, digital leadership is concerned with providing direction in terms of digital education through improving access, capacitating peers, making informed decisions, and cultivating creativity (Brown et al., 2016). Digital leadership focuses on three important areas: effective integration of digital technology; critical reflection on technology; and fostering digital leadership for the digital age. Yusof (2019) proposed two dimensions—communication and school climate—as well as several functions that can be used in school-based digital leadership practises. Leaders in the 21st century need to know how to use digital technology so they can create a good digital environment for teachers and students and improve their own knowledge, skills, and mastery of digital technology and the new way of communicating

virtually. The pillars of digital leadership are the specific areas that pave the way to improving or enhancing the school culture through the purposeful use of digital technology. Leaders need to be the catalysts for the change, and pillars of digital leadership pave the way. Each is necessary for transforming and maintaining a positive culture in its own way.

#### **Student Engagement & learning**

Today, students spend much of their time surrounded by and using technology. To make them competent enough, there is a need to design the learning environment for the students that supports multi-tasking, random access to information and resources, frequent feedback and suggestions (Prensky, 2001). Leaders must understand that schools should reflect real life and provide opportunities for students to use real-world tools to complete real-world tasks (Sheninger, 2019). To ensure efficacy in digital learning, changes to pedagogical and instructional design must be made in accordance with technology. The current educational paradigm requires new approaches and pedagogical strategies based on digital technology. Leaders need to give priority attention to what changes the configuration of learning space in educational centres should undergo (Marta, 2019). It is essential to establish a healthy relationship between classroom design and the use of technology to enhance (access to information, motivation, immediacy, personalisation, communication, etc.) the learning space and environment. Leaders must begin to establish a plan to create classrooms that are more reflective of the real world and improvised learners must use technology in progressive ways.

Leaders' professional development can play an important role in improving the quality of the teaching-learning process (Liu & Hallinger, 2018). Technology has huge potential to enhance professional development. Using technology in the school setting requires training (to develop the knowledge and skills to apply the tools) and professional development (to understand and apply the technology in instruction and school management). Thus, teachers, staff, and students need continuous training and professional development in order to make the best use of technology in schools.

Communication is an important leadership potential, and the digital age has revolutionised people's communication styles. Communication, in general, is a mechanism for people to connect via information, news, emotions, and so on. However, people's communication styles have changed, resulting in new communication opportunities and obstacles. In the digital age, leaders must change their communication strategies to be more dynamic.

**Public Relationships** This section outlines how headers can create a favourable public relations platform using various digital media platforms to share the positive aspects of their work. We need to understand that the behaviour of people's ways of communication and working styles is rapidly changing due to more reliance on technology. Our educational stakeholders are required to make use of the power of digital technology in order to fulfil their legal obligations in a manner that is open to scrutiny, meaningful, engaging,

and inspirational for students. As a consequence, there is an urgent need to embrace digital leadership, which means digitising public services via the strategic use of governments' digital assets in order to increase citizen participation and improve social, economic, political, and environmental progress. Leaders can leverage social media tools to create a positive brand presence that emphasises the positive aspects of school culture, increases community pride and helps to attract and retain families when they are looking for where to send their children to school (Sheninger, 2014).

It is important for leaders to consistently seek out ways to improve existing programs, resources, and professional learning opportunities. Priority should be given to equipping the technological ecosystem for youths to develop the necessary skills for global success. Two components are required to integrate digital leadership into the curriculum: digital education and digital education leadership. The primary goal is to integrate digital technology to improve communications with stakeholders, improve public relations, create a positive brand presence, discover opportunities, transform learning spaces, and assist educators in growing professionally.

#### **Strategies to improve digital leadership**

During the fight against the pandemic, we faced the arduous task of 're-shaping' information dissemination as well as supply management and distribution in the context of the teaching-learning process. The reasons were not only a lack of technical capacity but also a backwardness in digital leadership that led to inadequate and limited application of the available resources and technology. Recently, the Government of India has introduced e-Governance for the effective and progressive use of information and communication technology (ICT) for providing government services, exchange of information, transactions, and integration of previously existing services and information portal. The concept of e-Governance increased the citizens' expectations of the government to solve the previously complex existing system of administration and services. It is therefore necessary to launch a campaign of digital literacy training to spread knowledge of digital technology, foster digital thinking and enhance digital leadership. At a time when digital transformations are taking place, leadership should be competent as well as change their working methods in the digital direction with a transformative digital vision towards digital governance.

### **Abstract:**

The female self is seen on the verge of Shift as gets revealed in the studies made during post-independence times. In this regard, the women writers are gaining much recognition due to their emphasis to study the self of the women protagonists. Undoubtedly, the conflicts are perennial but the strategy to combat with 'Self' and 'Society' differs from individual to individual. In this regard, the women novelists namely Gloria Naylor and ManjuKapur have been taken to study the exploration of selves in their respective novels namely *The Women of Brewster Place* and *Bailey's Café, A Married Woman & Difficult Daughters*. The blend of two authors with different cultural contexts would help in forming a better viewpoint about the changing images of 'Self' to get a rightful approach to rectify the wrong perception prevalent in the societies with respect to women.

Through their female characters namely Astha, Peeplika, Mattie, Esther, Eve, Sadie, Virmati, Eda and Kasturi, the twin authors have tried to do mind mapping of various female protagonists who have been confronted with dilemmas throughout their existence in this male dominated world. They try to idealize their dreams within the social framework. We come to know about two different cultural contexts during post-colonial period, where the treatment of women is taken altogether different. They assume different

responsibilities for 'Self-Fulfillment'. They are constantly on the verge of losing their morality. With growing times, the rigidity of being charged with sex-taboo goes at the back side of the mind of the female protagonists. They try to listen to their inner voices, thereby breaking the conventionality and do not follow patriarchy. They act thoughtfully and do confront with the quintessential question of survival. Thus, the images of Women are seen in a flux and truly indicate towards the feministic vision of both Indian and Afro-American female writers. The coping strategy of the protagonists differ to in order to make a fine balance to their lives and hence forth the 'Self-Image' also gets reconstructed.

Key Words: Perennial, Mapping, Dilemmas, Patriarchy, Existence, Feministic & Self-Image.

**Introduction:-**The early twentieth century writers glorified the beauty of the black colour and showed that they were proud of their black identity. The modern black novelists focus on the complexity of the individual attainment of his self as it is submerged in the false selves stacked on it by the destructive images and typecasts of the society. The Afro-American fiction basically deals with the mistreatment of the black particularly sexual exploitation of the black women and loyalty to the country which never gave them a chance to enjoy the basic principles of liberty, equality, and justice enshrined in its constitution. The antagonism of the white American culture induces the blacks to search for dignity and identity. The American Negro came into sight from this exceptional situation in America-a person self-esteemed, self-confident with a complete identity and as good as an individual as any white.

A black American is a Negro and an American as well. The origins of Afro-American culture do not propose appearance of any diverse social culture and institutions but a network of social relationship of a group and the actions of the members generally correspond to one another. An Afro-American is thus an exaggerated American. Their identity is denied not only by the white men but also by the black men. The Negro in America has happened to develop an identity for himself which exists without a regular past. Their domestic designs are varied, but still show women's edged alternatives in a patriarchal society. Black women in America are triply burdened and this burden curbs them from a fuller and significant participation in American society.

The theory of Feminine Aesthetics gives a new dimension to the understanding of female psyche. "For the Indian woman the home had been the entire world for many centuries." Woman is torn between cultural conditioning as a woman and feministic aspirations for autonomy and selfhood.

"Why do we travel not in straight lines but in circles?" Do we come to the same point again and again?"

The educated Indian woman is living in the suffocating atmosphere of deep psychic repression, economic exploitation and the tyranny of obsolete conventions and rituals. Yet she carries the indelible imprint of Indian

sensibility and culture in her blood and consciousness. Daring attempts by woman to break the laws lead to nothing but fear and guilt. She sometimes becomes powerless to conquer her own consciousness. In this battle of Self-predicament, she emerges herself in a new image that is Self-contradictory.

**Self Image in ManjuKapur:-**The impact of education becomes prominent in the three generations women in the novel 'Difficult Daughters' by ManjuKapur where Ida seems to formulate altogether a different image as a daughter whose ideological variation brings for her lack of acceptability and distort the traditional image of a daughter who is only obedient to fulfil the age-old practices who gets married in a well to do family to uphold the family honour. The new education and the life of Kasturi generate a new urge and emotion in Virmatito get herself free from the bondage of patriarchy that denies or deserts her freedom and choice. Her marriage is final with Inderjit but is postponed because of the death of her father. She does not think of the marriage and child bearing just after the high school qualification. She falls in love with the romantic oxford-returned professor Harish Chandra who lives next door and is already married. Thus, Virmati's self-affirmation leads a turning point in her life and in a way she draws a new image of herself before her family and creates contradiction in her daughter's mind Ida. Ida does not like to be a replica of her mother and imbibes the values at her own pace.

In ManjuKapur's 'A Married woman' the protagonist is seen torn between duty and responsibility, faith and fact, history and contemporaneity, public ethos and personal ethics, Astha thinks, "tired women cannot make good wives" (154), She fights for her self-assertions. Unlike many unmarried girls she had her infatuations of adolescent love for Bunty, a boy of another colony and for Rohan who left for overseas for a better career. But her real story of love and marriage started with Hemant, the son of a successful government official in Delhi. Soon after marriage Astha gets disillusioned about human nature in general and politics of the country in particular. Sharing her feeling, "we should struggle with her, agonize together with her about her choices and weep with her once she has made them."

Astha's family affairs are also not so good and nothing is right with her. As a married woman she becomes an enduring wife and sacrificing mother. Her temperamental incompatibility with her corporate thinking husband compels her to play the role of mother and father for her children. This denies her self-fulfilment and leads to the collapse of the institution of marriage. Discontentment leads her to defiance and restlessness. Her anxiety, discomfort, loneliness and isolation don't encourage her to give voice to her unhappiness over her troubled relationship, rather it prompts her to develop the feelings of guilt, negativity and lack of self-esteem in facing the challenges in her life. Astha understands that a married woman's place in the family is taken to be that of an unpaid servant or a slave and the thought of divorce brings social and economic death in her Indian status. She realizes for herself that, "A willing body at night, a willing pair of hands and feet in the day and

an obedient mouth.”(231) If Astha becomes the victim of male passion, Pipeelika becomes the victim of communal riot and for the mistakes in history. While the lesbian attempts drag Pipeelika to the world of forgetfulness, Astha takes a sweet revenge on her husband. In this act of vengeance, unnatural sex, little excitement, little impatience and much imagination, she has a big jerk in her mind and this cripples her married life. Astha is Kapur’s New Woman, “conscious, introspective, educated, wants to carve a life for herself, to some extent she even conveys a personal vision of womanhood by violating current social codes.”She canonizes and commemorates her insulted feminine sensibility raising the male tantrum to socially transform a society.

Thus, ManjuKapur embedded in feminism has well made her point of view clear that a woman’s basic solidarity needs to be tackled in relation to the socio-cultural situation.“ A woman should be aware, self-controlled, strong-willed, self-reliant and rational, having faith in the inner strength of womanhood. A meaningful change can be brought only from within by being free in the deeper psychic sense.”

**Self-Image in Gloria Naylor:-**InAfro-American context, during post-colonial times, the women writes are telling the real stories, stories of their own lives and struggles. This has made them even stronger and since they are progressing on the way to a more activist feminist stand. An ardent appeal for this is made by Virginia Wolf through her essay *A Room of One’s Own* (1929). Zora Neal Hurston wrote *Their Eyes were Watching God* in 1937. It was an ethnically supported journeying of black female selfhood and proved world-shattering. As a result, it paved the path for many upcoming writers.Fiction in the late 1970’s and 1980’s broke the ascendancy of poetry and drama. During this new period women were the primary writers Toni Morrison, Gayle Jones, Alice Walker, Toni Cade Bambara, Paul Marshall and Gloria Naylor. Glorification of the African women by the African writers in colonial and post-colonial Africa gave rise to woman as an icon but it frequently channels to stereotyping her role and contradicting her position outside her home.

The black woman at the intersection of the sharp blades of the swords of race, sex and class is relegated to the inferior position of denominators that influence group membership. And therefore, she remains neglected and unnoticeable in the ‘dominant, mute, passive and suppressive’ American society. Naylor’s fourth novel *Bailey’s café* is composed of several mini-plots. Each chapter details the life struggle of a different character. From these collective stories the reader confronts once again the depths of human struggle and survival despite the odds. *Bailey’s Café* serves as a sanctuary for those who have been forsaken or who have been denied the solace of human compassion. It is a way station where customers are left to their own devices without interference from others. They can interact if they wish, or they can sit quietly to contemplate their condition. Because the customers have been exploited either emotionally or physically, *Bailey’s* offers them a place where

they can try to function unmolested until they can figure out their next alternative. Throughout the stories what echoes is female subjectivity to male desires.

Gloria Naylor's novel 'The Women of Brewster Place' interweaves the story about seven women in a squalid urban neighbourhood, just when she began her graduate work at Yale. This novel introduced the privileged Americans to the struggles and sufferings of those who will never see the American Dream because for them survival itself is victory. There are different stories about different women in the novel. Each story is linked to the next in some way or the other. These women whether Mattie Michael, Etta, Mae Johnson, Kishwana Browne, Lucielia, Kora Lee or Theresa or Lorraine all go through difficult circumstances in their lives, they face several problems and with the support of each other finally survive in life. These women are the residents of Brewster Place, which according to the author is 'the bastard child of several clandestine meetings...' Like its residents the place is now neglected and aloof from the main city by a wall.

Mattie Michael when declares her pregnancy before her father is beaten badly and does not expect her father to understand the real cause of her pregnancy. His attitude is a complete contrast to that of his wife, the mother of Mattie, when Mattie says,

Oh! Mama, I 'm so ashamed.' her mother replies, 'Ain't nothing to be shamed of havin' a baby is the most natural thing there is .... What's going on in your belly now ain't nothing to hang your head about-you remember that.'

This incidence clearly indicates how differently men and women look at the same issue of child bearing. After the showdown with her father Mattie decides to leave her hometown. She goes to Ashville in North Carolina and works day and night to bring up her son, Basil, all alone, supported by her inner strength. Her only dream and reality now is to give the best of life to her son. Another resident of Brewster Place is Kishwana Browne, who rebels against her middle class parents to realize and assert her black hood. She dwells at Brewster Place to accomplish this purpose and to help the other Blacks living there. Kishwana's mother understands the feelings of her daughter but does not support her because she has no doubt regarding her identity. According to her,

.... She is alive because of the blood of proud people who never scraped or begged or apologized for what they were. They lived asking only one thing of this world.... to be allowed to be. And I (the mother) learned through the blood of this people that black isn't beautiful and it isn't ugly....black is! It is not kinky hair and it is not straight hair....it just is!

There are immeasurable slum streets like Brewster, streets will prolong to be criticised and to die but there will be other streets to whose decay the women of Brewster will adhere. Though misapprehensions about factual motherhood are moreover apparent, there is habitually a glorification of motherhood and of

women who are in distress but will struggle and survive exclusively for their children. Thus, black women turn over all the fallacies associated with them. The female protagonists of Gloria Naylor like any other black women are doubly oppressed. This subjugation they have to face both in their home and outside their homes. Therefore, in these cases the struggle is not for acquirement of mere quality but for acceptance as human beings. Through her stories Naylor also presents that the Afro-American would not have been able to survive as a race without the female values of commonality, sharing and nurturing. The Afro-American women had to bond with each other in order to survive and prove their selves.

Conclusion:-Man is a social animal. He is constantly seen in a flux. He is considered as the harbinger of cultural legacy. ManjuKapur's heroines are assertive who dare to break the threshold and achieve self-accomplishments despite facing a lot of contradictions. They are able to establish their unique identities and fit themselves into different roles as daughters, mothers and wives. Their journey of creating a new self -image is not an easy one but they made it possible through their struggle with self and society. On the contrary, the women in Afro-American culture have to face triple jeopardy and they are able to cherish their identities not within the family convention. They are taken for commodities by their male counterparts and in an alien culture. They are constantly seen struggling through their experiences and are able to heal their tormented selves through sisterhood and compassion which gives a meaning for their survival and are able to create motherly image that itself becomes iconic.

**INTRODUCING DOGRI FOLK SONGS:  
A PEEP INTO THE REPOSITORY OF LIFE**

**NIDHI VERMA**

Ph.D. Scholar

School of Human and Social Sciences  
Lingaya's Vidyapeeth Faridabad India

**DR. PRIYA RAGHAV**

Associate Professor

School of Humanities and Social Sciences  
Lingaya's Vidyapeeth Faridabad India

The term folklore is comprised of two terms, that is folk and lore. Folk refers to the regional people and lore means stories. So, folklore refers to the stories of people of a particular region or area. It also defines popular beliefs, faiths and ways of life. In its current meaning folklore includes myths, legends, folktales, jokes, proverbs, riddles, chants, charms, blessings, curses, oaths, insults, retorts, taunts, tongue-twisters, greeting and leave-taking formulas. It also includes folk costume, folk dance, folk drama, folk arts, folk belief, folk medicine, folk instrumental music, folk song, folk similes etc.

Though the study of folklore gained importance in the nineteenth century but the interest in it can be dated back to the ancient times when the works of Herodotus, Livy and Pliny made references to popular beliefs and practices in ancient Greece and Rome. Indian literature played a vital role in the upholding and propagation of folklore. Sama Veda, to name one, can be considered as one of the oldest forms of folk music that has survived through the ages. India is a culturally enriched country with each region having its peculiar folklore.

Folklore in Jammu, likewise, has its own uniqueness and distinctiveness. The *Duggarland* today is known for its rich culture, heritage and traditions. According to Shivanath, "Dogri folk literature is universal in two ways: Firstly, its subjects are universal and the strands in which these subjects are woven are common, and secondly, it appears in the same forms all

over Duggar” (9). In Jammu also, there are differences in case of language, lifestyle, customs, physical features, behaviour. Still, it is interesting to find a fundamental unity among all the divergent cultures prevailing in each region or political unit. Dr. Seema Sharma in her Doctoral thesis writes “...It is interesting to study an emotional synthesis in the diverse elements and this issues forth in music, dances, rituals and ceremonies at places of worship, *dargahas* and shrines of faquirs and saints” (25).

The folklore elements in the Jammu region encompass folk songs, folk dances, ballads, folk tales, folk epics, idioms and phrases, enchantment and witchcraft and folk theatre. The folk songs of Jammu are the preferred form of oral literature in the region. Every aspect of the socio-cultural and religious life of the people of the Jammu region is found manifested in their folk songs. These songs are divided as religious songs, ceremonial songs, seasonal songs, festival songs, lullabies, play songs, and workers’ songs. Commenting on the nature of Dogri folk songs Narain and Baru were of the opinion Dogri folk songs are living repositories of human emotions and they help us understand the Dogra minds and their lifestyles in a clear manner” (26). One finds a wide variety of Dogri folk songs in Jammu. Beginning with the religious folk songs which are further divided into; *Bhishanpatte*, *Bhainta*, *Aarti*, *Gujari*.

*Bhishanpatte* or *Vaishnav Pad* are like bhajans, which are sung in praise of Lord Krishna or His incarnation in the form of their miraculous acts and descriptions of their lives. *Bhishanpatte* and *Bhainta* have the same structure and they are parallel in rhyme and subject matter as both are associated with admiration of God. An example of *Bhishanpata* is:

No one is able to understand you, Lord Krishna, (He is known for playing mesmerizing flute)

I have searched for you in the fairs, asked the gypsies too...

(Translation, *Duggar ka Sanskriti Itihas*, 537-538)

The above-mentioned song glorifies God whose mysterious deeds and secrets are beyond human perception.

There are very enthralling *Dogri* folk songs, directly linked with sowing and reaping and other rural jobs. The songs stimulate the workers with a particular beat or a refrain. *Gharlohdi* is one of the types of songs, sung while people are doing arduous work so that they stay energetic and motivated. An example of this type from *Dogri Lok Geet* volume seventeen is as under:

Say, young man – go ahead!

Live long- go ahead!...

Apply the force- go ahead!... (163)

On festivals like ‘*Lohri*’ and ‘*Rut Rade*’, songs and couplets are sung to express the curiosity, joy and pleasure of people celebrating them together.

To quote from *Dogri Lok Geet* volume fifteen:

Lohri has come, brother Lohri has come,

Everywhere peanuts and jaggery candies have come!

(Translation 33)

There are satirical verses called ‘*Tapkolian*’ to mock others. These may be called non-sense verses because the words are twisted in a way that they sound meaningless. There are folk songs connected with the cycle of seasons which makes them more joyous. *Dholru* are songs sung on the occasion of the change of season. An example of *Dholru* from *Dogri Lok Geet* volume fifteen is as under:

First the name of Lord Ram will be taken,  
Who has created this world...

(Translation 60)

There are satirical verses called ‘*Tapkolian*’ to mock others. These may be called non-sense verses because the words are twisted in a way that they sound meaningless. There are folk songs connected with the cycle of seasons which makes them more joyous. *Dholru* are songs sung on the occasion of the change of season. An example of *Dholru* from *Dogri Lok Geet* volume fifteen is as under:

First the name of Lord Ram will be taken,  
Who has created this world...

It is the religion that is always hailed! (60)

There are ceremonial songs like *Suhag* (on the marriage of a girl), *Ghodi* (on the marriage of a boy), *Doli* (when the bride is about to leave).

An example of *Suhag* from *Dogri Lok Geet* volume eleven is as under:

We are like sparrows my father, we will fly!

Our flight is very long, which place shall we to go? (Translation 6)

On the birth of a *child* (male), *mundan* (head shaving ceremony of the child), *sutra* (tying the auspicious thread to make the child part of a particular clan), going on a pilgrimage and occupying a newly built house; songs are sung to congratulate and these are called ‘*Vadhais*’ (*Bihaiyan*). An example of a *Vadhais* or *Bihaiyan* from *Duggar da Sanskritik Itihasis* as under:

My sister-in-law has given birth to a diamond, a son is born,  
What gifts will you offer to your sister-in-law (*nanad*), my dear sister-in-law! (Translation, 529)

*Sithanis* are also known as *Bolian* which are sung in an innocuous manner against the bridegroom and his relatives by the family members of the bride. The following example from *Dogri Lok Geet* volume ten brings out the essence of such ceremonial songs:

Mangoes have ripened and buds have grown on the stems,  
My Brother-in-law has gone to sell his mother! (Translation 223)

Like *Sithanis*, there are also folk songs known as *Chhand*, sung by the bridegroom on being forced by the bride’s friends to tease the bride and her relatives.

*Luhani* and *Palla* are folk songs sung on death. *Luhani* is also called *Luhan*. Women of a particular class called ‘*marasan*’ sing these songs while women of the house beat their chests.

For Example: Cut the sandalwood tree,

Build a long casket please...

(Translation, *Duggar da SanskritikItihas*, 531)

*Bhakhis* a famous Dogri folk song form in Jammu. It is sung in a group and not assisted by musical rhythm. The rhythm arises out of the innate emotions of the singers. One famous *Bhakh* of *Duggarland* from *Dogri Lok Geet* volume eleven is as under:

I offer you thin fried bread dear, puffed fried I also offer,

Be my lover the nomad of the hills! (Translation 209)

While elaborating *Dogri* folk songs, *Dogri* folk ballads called *Karakand Bar* deserve special reference here. Lakshmi Chand and Sansar Baruwrite, "...these ballads are more authentic than history as they have arrested life in its actual gestures. They have given us a verisimilitude of reality and are the ever fresh and complete pictures of by-gone times" (47). *Karkan* are sung by the bards in reverence of the sacrifices of some saints and martyrs of Dogra land. On the other hand, *Bar* is a distorted form of the Hindi word '*Bir*' which means brave or chivalrous. Since these ballads treat the theme of gallantry and adventure, they are called '*Baran*.' The stirring lines of the Dogri '*Bar*' describe the sacrifice, valour, courage and skill of renowned heroes in the battle.

A peep into these Dogri folk songs help us understand that these folk songs are a rich compendium of joy and solace with a wide variety of songs corresponding to various aspects of life. Dogras' love for poetry and music is so deep that they are seen singing these songs not only during life, birth and death but in each moment of life; from working in the field to playing in the ground, from celebrating loneliness to rejoicing in togetherness, from worshipping folk deities to showing reverence for the Vedic cult. It also highlights the fact that Dogras are musical to the core. Being tired of the days' work when *Dogra* men and women sing these songs, their echoes can be heard far and wide. When one goes through *Dogri* folk songs, they make one dive into the *rasas* present in these folk songs.

### **Abstract**

Right to health as declared by the Supreme Court in India is part of fundamental right of the individual to his/her life and liberty. The World Health Organization (WHO) defined health as “a state of complete physical, mental, and social well-being and not merely an absence of disease or infirmity”. In 1950, Government of India set up a well-organized body known as Planning Commission to formulate national plans for the development of the country. As the ultimate aim of economic development plan is to raise the level of living of the population, high hygiene is promote the national growth and also change human life styles to live. As such, National Health Planning is an essential and integral part of national development. In order to determine the National Health Policy, it is necessary to take up a thorough examination and survey of the health situation of the country. Once the survey and analyse is completed the health problems must be categorized for priority of action, general targets and objectives have to be set up for the attainment of specific achievements in a specified time. As it regards planning for economic and social development and for health, that economic and social planning came from forefront in USSR plan in 1929. The objectives of this article, to study about the contribution of Five Year Plan to Public Health, to find out what were the health programmes implemented, and to explain the growth level of

people's health through Five Year Plan. This article used methodology is adopted for the present study in historical descriptive and analytical.

**Keywords:** Health, Human Life, National Health Planning and Economic and Social Planning.

### **Introduction**

Five Year Plans are centralized and integrated national economic programs. Joseph Stalin implemented the Five Year Plan in the Soviet Union in the late 1920s. Most communist states and several capitalist countries subsequently have adopted them. India and China both continue to use Five Year Plans, although India renamed its National Institution for Transforming India (Niti Aayog) by the Prime Minister of Narendra Modi in 1 January 2015. Influx of refugees, severe food shortage and mounting inflation confronted the Country at the onset of the Five Year Plan. The main objectives of five year plan is

- i) To improve living standards of the people of India
- ii) To increasing production and offering opportunities to all for employment in the service of community and
- iii) To promote the health condition and health education to the people of India.

In 1947, India attained independence, state and district boundaries were reorganized and development schemes to afford medical and public health were submitted the Five Year Plan.

<sup>1</sup> This article focus on first two Five Year Plan from 1951 to 1956 and 1956 to 1961, all the Five Year Plan given important to public health so it is vast area of study, hence this study focus only two Five Year Plans, now we are in Twelfth Plan Year is processing. They did great job in first two Five Year Plans to grow national development. They spent 274 crores amount of money to health schemes for develop and secure the people from ailments.<sup>2</sup>

The concept of Planning in India came in 1938 during the Indian National Congress constituted the National Planning Committee under the chairmanship of former first Prime Minister Jawaharlal Nehru. Before few years back in 1933, the Medical Council of India (MCI) was established and in 1940, the post of Director General (DG) medical services was renamed as Director General Health Services and the post of Public Health Commissioner. In 1943, a committee under Joseph Bore was constituted to examine the state of health in India and to submit a blueprint for action. In 1946, this committee submitted its three-volume Health Survey and Development Report. The Bore Committee made certain important recommendations, based on principles that must guide a health system being close with to the people. It ambitious architecture consisting of one bed for every 550 people and one

doctor for every 4,600 people to be the unit of implementation. The conference of provincial ministers held in the same year, endorsed the major recommendations of the Bhole Committee but diluted the proposed coverage norms. Instead, it resolved to make plans for establishing a health centre for every 40,000 people, 30 beds for every five centre's, 200 beds in every district and support traditional medical practice, it provide safe water to 50% of the population in the next 20 years and 100 per cent in 35 years. The conference also accepted the recommendation to merge the two departments to medical services and public health. This meant amalgamating medical treatment for acute care for sick patients along with public health that essentially deals with population or community health such as infectious diseases.<sup>3</sup>

#### **FIRST FIVE YEAR PLAN (1951-1956)**

In the first Five Year Plan, for schemes of medical relief and education, rural and urban water supplies, anti-malarial measures, family planning there was an expenditure of Rs. 142 crores.<sup>4</sup> At the time of commencement of first Five Year Plan, the population of India was officially recorded in 356,879,394 people.<sup>5</sup> First Five Year Plan was based on Harrod – Domar Model (classical Keynesian model of economic growth) it is used in development economics to explain an economy's growth rate in terms of the level of saving and productivity of capital.<sup>6</sup>

The Government of India organized a Medical Education Conference in 1955, which considered the proceedings of the world medical education conference recommendations with special reference to the country's need and recommended major reforms in medical education in India. The second Medical Education Conference convened by the ministry of health at New Delhi in 1959, recommended again the early establishment of full-time teaching units, increased scales of salaries to medical teachers for the encouragement of post-graduate medical education and research and recommended measures to meet the inadequacy of teachers, especially in nonclinical subjects, such as extension of the age of retirement, employment of retired teachers, offering of fellowships for training in teaching, relaxation of conditions of appointment of qualified teacher, integrated scheme of fellowships for training abroad, with a recommendation to the universities to relax the domiciliary restrictions in the award of post-graduate degree.

Water supply and drainage works under the public health plan comprise mostly measures for improving drinking water supply, the provision

for urban and rural areas Rs. 12.12 and Rs. 11.37, crores respectively, Madras and Bombay account for a major share of the programme.

Rajkumari (Princess) Amrit Kaur, former Health Minister of India and long-time secretary of Mohandas K. Gandhi, One of her great campaigns as Minister of Health were against malaria, one of the great killers of Asia. The Prime Minister Nehru offered her the portfolio of health in his first government. Malaria is the most important public health problem in India. It has been estimate that about a million deaths are caused in India every year by malaria among the 100 million people who suffer from this disease. The economic loss is estimated at several hundred crores of rupees every year. Malaria is spread by the malaria parasites.<sup>7</sup> The plasmodium is carried out from the victim of Malaria to a healthy person through the bite of certain species of the female anopheles mosquito. National Malaria Control Programme started in 1953.<sup>8</sup> It has not been possible to extend protection to entire population in malarious areas due to lack of adequate finance, staff, equipment and supplies.<sup>9</sup> So far only about 30 million out of the 200 million populations exposed to malaria have benefited by the existing malaria control schemes.<sup>10</sup> These operations are to be carried out by 125 field malaria control teams organized and directed by the state Directorates of health services. The plan includes the construction of a D.D.T. plant to supplement by the Government of India with the WHO and UNICEF assistance, in ensure sufficient supply of DDT at reduced costs to meet the needs of the country. In 1954, the Indian government issued a postage stamp to mark the intensification of anti-malarial efforts under the Five Year Plan, funded and orchestrated by the WHO and the American Economic Cooperation.<sup>11</sup> As a result malaria was reduced after few years later in 1965.<sup>12</sup>

Filariasis disease is widely prevalent in India particularly in some of the coastal regions, with high humidity and moderately heavy rain fall. The National Filariasis control programme was launched in the country in 1957-58.<sup>13</sup> Tuberculosis is a major public health problem next in importance only to malaria. While accurate date are not available, it estimated that about 5,00,000 deaths occur even year and about two million people suffer from active

disease. Besides, it causes a mass of human misery. Measures needed to combat tuberculosis may be classified as general and special. These include improvement of nutrition, housing, sanitation each involving very large scale commitments. Under the special measures may be mentioned the provision of isolation and treatment of the sufferer and introduction of preventive measures. The Government of India have entered into an agreement with the UNICEF and the WHO to carry out a countrywide BCG programme. As a result reduce the mortality from tuberculosis.<sup>14</sup> Leprosy is estimated that the number of cases of leprosy in the country is probably at least one million. The highly endemic areas of leprosy in India are certain parts of west Bengal, Orissa, Madras and Travancore-Cochin. The anti-leprosy work is being carried out largely by voluntary organizations. Lately, State Governments and even local authorities have started the establishment of in-patients accommodation for leprosy. The total accommodation available is about 14,000 beds for the whole country. The Hind Kusht Niwaran Sangh and Gandhi memorial Trust has established a leprosy Committee and taken up work in earnest. Children are much more susceptible to leprosy than others and every effort should be made during home visits by the doctors and others to impress this fact on the people and to secure those children are safeguarded.

#### **SECOND FIVE YEAR PLAN (1956-1961)**

India's second Five Year Plan commenced on 1st April 1956. Largely under the Prime Minister personal direction, but the final document presented to parliament on May 15, 1956, was based substantially on the original estimates.<sup>15</sup> The main aim of health programmes during the second Five Year Plan (1956-61) is to expand existing health services, to bring them increasingly within the reach of all the people and to promote a progressive improvement in the level of national health. During the second Five Year Plan the population of India, recorded at 438,000,000 people.<sup>16</sup> The specific objectives are

- i) Establishment of institutional facilities to the people both locally and in surrounding territories,
- ii) Developments of technical manpower,
- iii) The first step in improvement of Public Health, institution of measures to control communicable diseases
- iv) An active campaign for environmental hygiene and

- v) Family planning and other supporting programmes for raising the standard of health of the people.<sup>17</sup>

This article indicate about planning commission contribute to health as growth to national economic development. Economic loss caused by the casualties of the victims. The period from 1951 to 1961 was marked both by progress and reverses in specific areas. Significant advances were made in agricultural production, Land reform programmes and Health. In health, hospital beds increase 65% and Doctors (practicing) also increased at the time of second five year plan as that 25%.<sup>18</sup> In providing hospital facilities the aspects to be kept in view are quantity, distribution, integration and quality. A coordinated hospital system with its free flow of medical services and patients should help to provide satisfactory medical care both in urban and rural areas. The provision of separate accommodation for cases of acute communicable diseases, as such cases takes up at present a great deal of bed space in existing general hospitals. It is estimated that in 1951 there were 8,600 medical institutions in the country with about 113,000 beds, in 1955-56 the number of institutions may be about 10,000 with about 125,000 beds. The plan provides about Rs. 43 crores for augmenting and improving hospital services, including staff, accommodation, equipment and supplies.<sup>19</sup>

Health unit's programme for extending the national extension service to the entire rural population, the establishment of primary health units in as many development blocks as possible is a necessary step towards providing an integrated preventive and curative medical service in rural areas. The plan provides about Rs. 23 crores for this programme.<sup>20</sup>

To evaluate the progress made in the first two plans and draw up recommendations for future path of development of health services the Mudaliar Committee was set up in 1959. The report of the committee recorded that disease control programmes had some substantial achievements in controlling certain virulent epidemic diseases. Malaria was considered to be under control. During the second Five Year Plan it is proposed to establish and expend about 200 tuberculosis clinics. The object is to provide one clinic at least in each district, preferably at its headquarters.<sup>21</sup> About 4000 beds are likely to be added during the second plan.

<sup>21</sup> Report of Tuberculosis Prevalence and Mortality, Directorate of Medical Services, Madras, 1980, p. 7.

Leprosy, according to estimate made by a committee appointed by the Government of India in 1953 for the control of leprosy, there are not less than 1.5 million persons suffering from leprosy. The first step was the establishment of a Central Leprosy Teaching and Research Institute at Chingleput in Madras for the training of leprosy workers and for research on problems relating to leprosy. The second step was to launch a leprosy control programme. The futility of attempting isolation of leprosy cases in special leprosy homes.<sup>22</sup> Nutrition is the most important single factor in the Maintenance of health. The increasing the production of protective foods such as milk, eggs, fish, meat, fruits and green vegetables for the development of nutrition level in the human body. To provide mid-day meals for school-going children should also be made.<sup>23</sup>

Family Welfare Programme which was implemented since 1956 on the lines prescribed by the Central Government.<sup>24</sup> To reduce the population, family planning programme was implemented in the States. Family Planning means having children by choice and it is possible not to have child when the parents do not want it. Thus if the couples desire they can prevent conception by using the Family Planning methods. The aim of family planning programme was to reduce the birth rate 25 per 1000. Grants from state funds were given to municipality, voluntary organization, Madurai Corporation, Madras Corporation and Gandhi gram Institute of Rural Health Family Planning in Tamil Nadu.<sup>25</sup>

Public Health Education is important in producing high-quality, effective public health professionals who can contribute towards achieving the health goals. The establishment of the All India Institute of Hygiene and Public Health, Kolkata, in December 1932, making it is the oldest school of public health in south Asia was a welcome development toward imparting public health education in India. The institute was established with a generous donation from the Rockefeller Foundation in USA with an objective to develop health manpower by providing postgraduate (training) facilities of the highest order and to conduct research directed towards the solution of various problems of health and diseases in the community.<sup>26</sup> During the second five year plan the Mudaliar Committee further sought to strengthen public education in the country by recommending schools of public health in every state to train medical officers, public health nurses, maternity and child welfare workers, public health engineers and sanitarians, dieticians,

epidemiologists, nutrition workers, malariologists and field workers in Central and State.

Planning commission is most important among the national development plan, at the time of India's independence. Free India Government has task to reorganized and made new India. The main task was implemented of Five Year Plan particularly in public health. The people of India suffered by many dangerous diseases like communicable and non- communicable diseases, hence the Government of India expending to the public health and eliminated many diseases from India with the help of UNICEF, WHO and Rockefeller foundation. They also did infrastructure developments such as dispensaries, hospitals, rise of beds in hospitals and promote health research and education in India. The present Government of India reducing the mortality rate with the help of mention the above. The public health is backbone of our nation hence, the Government giving all the facilities to all the people of India. This article significant only two Five Year Plans because of vast area hence, future studies focus on remaining the Five Year Plans particularly in public health.

## **ANALYSIS OF BRICK STRUCTURES OF EARLY ASSAM**

**DR. NILKAMAL SINGHA**

Assistant Professor of History

Bodoland University

Debargaon, Ranghalikhata, Assam India

**JASMER SINGH**

Assistant Professor of History

Chaudhary Ranbir Singh University

Gohana Road, Jind, Haryana India

### **Abstract**

The early brick structures of Assam were scattered all over the landscape mostly in ruined and dilapidated condition therefore necessitating a detailed study before it gets obliterated. The present paper is an outcome of study of these brick structure ruins considering all possible archaeological and architectural parameters. A limited comparative study also is made with the nearby archaeological sites of Bangladesh and Myanmar.

**Keywords:** architecture, temple, plaque, Assam, iconography, brick, *Nagara*.

In Assam, brick structural remains of temples are found scattered everywhere. Their presence lending essence to the heritage of the native land and reflective of abstract and overlapping thought processes and spiritual bearing of the populace through generations. According to popular definition temple is a structure reserved for religious and spiritual activities such as prayer, sacrifices or analogous rites. But the Indian temples are not mere representative of the abode of gods and place of worship but also centre of knowledge, art, architecture and culture. Brick structures excavated and explored in Assam can be divided in five clusters. a) Goalpara b) Kamrup c) Tezpur d) Nagaon e) Golaghat

About the temple styles, there is no homogeneity in religious belief and practices of the two identified cultural region i.e. the western and eastern region. The extant temples and their religious affiliation, the deity or deities enshrined and the allied sculpture and other cult objects provide insights to the nature of religious beliefs and practices. It is beyond doubt that in the region co existed many religions and indigenous cults; sometime between 5<sup>th</sup>-7<sup>th</sup> centuries there was a massive second wave of sanskritisation whose inference has been drawn from the land grant records during this period. Almost all the grants addresses territorial term as *pur*, *puri*, *pattana*, *bhumi* and *shetra* and the names of flora mentioned are in Sanskrit, not a

single name of flora and fauna appearing in the grants (Sharma, 1978 ) bore local names. Early medieval patronage is a complex issue; so to understand it one has to understand the role of local community in temple building activities and their maintenance. Though these communities did not always donate lands or huge sum of money, their participation in daily worship and their offering of ritual objects like flower, *dipa* (lamp), *dhupa* (incense), *naivedya* (food) played a major role in the maintenance of the temple. Also *nritya* (dance) and *vadya* (instrumental music) were two important aspect of temple worship, which in all probability were offered by local communities. The long survival of the religious shrines depended on periodical repairs, restoration and proper maintenance. This need was also fulfilled by the local community. It's a known fact that daily worship and maintenance of a temple is as important as its construction and this was largely dependent on the local communities who lived in and around the temple rather than on the royal patron.

The various brick structures located in the Brahmaputra valley show certain similarity and differences based on their location and relative correspondence to other sites. Architecturally, earlier temples are small, squarely and symmetric with exquisite sculptural carvings on certain parts. The earlier temples like Dah Parbatia are highly symmetric and conform to the parameters prevailing to temple architecture in central India, with simple plan and high *adhithan* (platform). Arguably, Dah Parbatia has highest *adhithan* in the region in its time and can be postulated as post-Gupta *Nagar* architecture in Brahmaputra valley possibly by the masons and artisans displaced during the Hun turmoil or the ruler of the area invited artisans for its construction. However, the architecture of Dah Parbatia shows very limited regional influence in its architecture and sculptural art. Sculpturally it cannot be compared with any site in Assam and it remains the sculptural epitome. A phenomenon almost universal in Brahmaputra valley is to raise temples of stone on ravaged brick structures specially in the plain areas. Location wise the structures of Goalpara region are located on the bank of rivers and streams, Guwahati region on hills and ponds, and Kopili-Jamuna region on ponds and rivers.

Table 1. Architectural Arrangement of Brick Structure of Brahmaputra Valley

Temple/Site	Building Material	Orientation	Presiding Deity	Form (garbha)	Garbha Side	Approach direction
Baitbari I	Brick	east-west		pancharatha		
Baitbari II	Brick		shiva	octagonal	centre	8 sides
Madan Kamdev	brick and stone	various		rectangular	varied	Varied

Table 4. Comparison of Northern Indian Nagara Temples and Assam Temples upto 1200AD.

<i>Diagnostic element</i>	<i>Northern temple style/Nagara</i>	<i>Assam group- Phase III</i>
Material of construction	Brick and stone, predominantly stone	Both but predominantly bricks
Shikhara	The superstructure above the cornice level	All are grounded

Roofs of axial addition to the shrine	Successive series of towers of the pitha	Superstructure not available for assessment
Elevation of the axial addition	Open mandapa type with porched balconies or entrances.	Open mandapa sometimes with mukhamandapa
Mandapa	Present	Present
Mahamandapa	Optional	Absent
Mukhamandapa	Optional seldom present	Optional
Pranala	Not very typical. May be open channel on floor level or underground.	Upper plinth level
Vertical plumb line of the cornice ( <i>manasutra</i> )	Well outside	Not available for assessment
Ceiling	Wide range of ornagements	Not available for assessment
Dhvaja	Optional. May be on top on the shrine.	Outside on the entrance/top of the shrine.
Superstructure above ground floor	Single mass	Diminishing top
Broad plinth	Mostly present.	
Prakaras	Optional.	Mostly present
Toranas	Often as entrance features	Unknown
Door	Very elaborate and ornate	Some with stone sculptured jambs
Main deity made of	Mostly of stone	All of stone so far
Dvarapalas	Small sized	Only one found, its small at Da Parbatiya

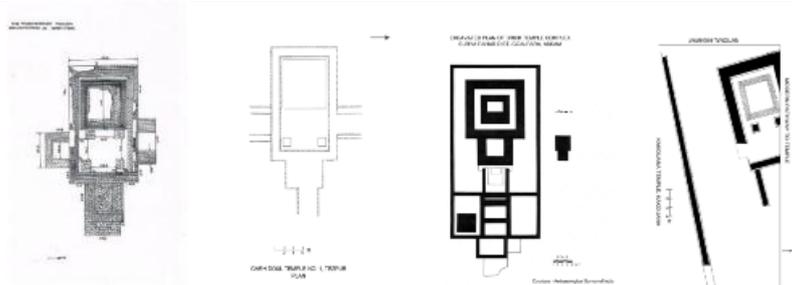

Fig. 1. Comparative plans of Garh Dou I & II, Surya Pahar and Kakoijana.

So far as the general layout is concerned, the brick structure of lower course of Brahmaputra have two ramparts (outer and inner) in case of Surya Pahar, Kakoijana, and Tamreshwar while the structure of Kopili Jamuna valley lack this feature whereas the structure of Garh Dou and Dubarani (Doiyang Dhansiri valley) has a single rampart. Another characteristic of all the structures is that the superstructure is absent.

The layout and plan of Garbhagriha of Kakoijana (Bongaigaon) and Garhdoul bears a stern resemblance. However, in Garh Doul the enclosure wall (prakaar) is absent. It is also observed that the main plinth of the Garbhagriha of both Kakoijana and Garh Doul has several projections (Singha, 2021).

**Moulded Bricks and Plaques:** Moulded bricks are used alongside the plain ones. Moulded bricks are used in adorning the outer walls to beautify the structures and break the monotony of similar looking structures. Moulded bricks were made with hand moulds. Moulded bricks combined with plaques gave the structure different architectural perspective and dimension. Modern Bangladesh was a nerve centre of Buddhism under the aegis of Varmans and then Palas from 7<sup>th</sup> to 12<sup>th</sup> century and it is during this period that Buddhism was propagated to south-east Asia.

Table 5. Comparative Sizes of Plaques from Assam, Bengal and Myanmar Sites (Rao, 2014).

Site ↓ Sizes→ (in cms)	Plaque size 1 (max)	Plaque size 2 (min)	Remarks
Baitbari	48X26.5X5.5	39X23X3	varying size
East and W Petleik	40X38X13		
Ananda temple, Bagan	36X32X7		
Mangalazeidi	38X34x10		
Paharpur	40.6X30.5X6.35	35.5X20.3X21.6	varying size
Ananda Vihar, Comilla	101X53X15.2	38X30.5X12.7	varying size

The depiction recovered from Baitbari are of *Ganesh, Brahma, Vinadhara, Kali, Ugra tara, Vaisnavi, Manasa, Uma Maheswara Arjuna in penance* and other *tantric* figures ( Sharma, 2003: 43-73). The plaques of Paharpur are thematically closer to Baitbari with predominantly Buddhist and Hindu icons.

The iconography in Baitbari seems to have been influenced by Buddhist plastic art initially which later on gradually Hindu sculptures dominated the representation. Plaques are also procured from Surya Pahar, Bamgaon, Na Nath; the plaques of Na Nath are smaller in size than those found in Baitbari and Bamgaon. The typical feature of Bamgaon plaques are that they are yellowish in colour, even bricks from this site are of yellowish colour.

Moulded bricks are important building material for ornate and elaborate brick edifices. Structurally they have the similar uses like general bricks as they are same building blocks with weight bearing properties. The use of these bricks is to beautify the outer walls of the structure. Elsewhere in Bihar, Bengal, Tripura, Bangladesh and Myanmar moulded bricks are profusely used in construction during 8<sup>th</sup> to 12<sup>th</sup> century. Moulded bricks are employed for two purposes, structural and decorative, sometimes serving both functions. Moulded bricks are mostly used on the outer face of the structure at its basal part. Due to the elaborate nature of their structures, brick was preferred in the Buddhist construction. Bricks moulded in various designs have been yielded from various sites of Assam. Some of the designs are popular and common whereas some are rare.

So far twenty different types of moulded bricks are yielded from excavations and surveys from the sites under the purview of this study. As far as the types of moulded bricks are concerned the site of Bamgaon has yielded more than 5 types of mouldings of different designs, whereas in Garh Doul 17 types of moulding are used and in

Paglatek and Kakoijana 3 designs have been reported so far. About the designs Type 2 and Type 3 are most popular design appearing in the five sites. Type 1, 4 and 9 appears in each of the three sites. Some of the mouldings have Buddhist connotation and that linkage can be established in more than one way. Firstly Assam (western) had always been under the Aryan zone of influence from its earliest period and politically it was ruled by kings based in Bengal or west Assam. Secondly the proselytizing and assimilating nature of Buddhism and Brahmanical Hinduism kept the region adventured throughout the past by missionaries, traders and adventurers alike.

In the Buddhist monasteries of Bangladesh and Bengal few similar mouldings can be seen, however in Assam these moulded bricks are yielded in debris and never in *in situ* where it was intended in the structure, recent excavation at Dek Dua in Goalpara however throw some light to where it was originally intended. The site of Dek Dua present the most elaborate terracotta work so far from the region however the excavation report is still to be published by the Directorate of Archaeology. The type 2 and Type 3 bricks were profusely used in the monasteries of Somapura in Paharpur, Naogaon Bangladesh.

**Bonding and laying patterns:** Strength of a brick structure depends on the bonding of the bricks and the binding material. The stretcher bond pattern was widely used in construction in Brahmaputra valley, sometimes with running stretcher bonds. The mortar used in the construction is mud mortar or red soil which has good binding properties. All the sites show certain preference for stretcher bond method.

**Associated assemblages:** Pottery consist mostly of the associated assemblages, along with the structure they form the chunk of materials to establish linkages among the various structures. Almost all the sites yielded coins of colonial period specially *annas*. These coins are yielded from Paglatek, Kakoijana, Surya Pahar, Ambari, Jaljali, Madan Kamdev, Mahadeosal, Garh Doul and the Hojai sites

Throughout red ware is the dominant pottery as most of the sites are religious in nature; the pottery generally are ritualistic and offering wares. Introduction of new pottery can be traced periodically which becomes signatures of the given period and the population. The Paglatek Phase I and Mahadeosal Phase I is similar to the Phase II of Ambari with similar pottery with appearance of mica washed pottery. This phase is marked by so called 'Ambari wares' from Mahadeosal and Ambari, both the site shows striking similarity of pottery. These two sites produced lot of other shapes which otherwise will not be considered as conventional usual shapes. Shapes yielded are all common shapes lota, pot, bowls etc.

Ambari ware pottery was followed by celadon and glazed wares. However occurrence of glazed wares is limited in fact it neither was nor recovered beyond Ambari (Guwahati).

**Chronology:** Assessment of chronology was the most complicated part of the present study. This assessment is based on three parameters namely brick size and stratigraphy, sculptural art and associated assemblage predominantly pottery. The structures of Brahmaputra valley were constructed in three phases. The first phase was the earliest phase of which we have limited structural evidence and they represent the early historical period. The second phase is from 6<sup>th</sup> to 8<sup>th</sup> century and the third is from 9<sup>th</sup> to 12<sup>th</sup> century. The first phase structure include the period-I structure of Ambari, as we can see that the period I structure of Ambari was an ablution tank with Sunga- Kushana character however we can assume that this structure went out of use due to the subsequent rise in water table and its steps got submerged. This phase is all brick phase. Structure contemporary to Ambari Phase I is not identified so far in the valley. It is widely believed that Buddhists accompanied the traders and traders, being Jaina and Buddhist found it their moral duty to help them in their missionary zeal. The second phase from 6<sup>th</sup> to 8<sup>th</sup> century show the twin tide of Brahmanical Hinduism and Buddhism and it was marked with still predominant use of brick and limited use of stone. Political situation in this period is stable Varmans ruled this period with firmness and during this period Kamarupa succeeded to come out from the stereotype of the place being inhabited by dangerous animals and cannibals and of prohibited land. Various Buddhist missionaries set foot here during this time. The marked feature of structures of this phase is Buddhist structures with Hindu influences and vice versa along with limited Jaina elements infused.

The preceding Gupta rule made a tremendous socio-cultural impact upon the valley and the Huna invasion during later Gupta period triggered migration of various people including artisans and sculptors to Bengal and to Assam afterwards the reason sculptural art of Bengal and Assam for certain period had classical bearing and within a generation or so these classical offshoot diffused into local art form. These two regions came under the political influence of Pala in Bengal and Malechchha in Kamarupa. However Palas patronized Buddhism and Shaivism also flourished in the kingdom and in Kamarupa polytheism with predominance of Shaivism flourished during the Malechchha period.

The third phase is marked by stone built temples. There was a clear shift from brick to stone in this phase. This period also is marked by infusion of tantric elements in the sculptural art. The temples of this phase are influenced by the Orissan school. The third phase show the rise of Tantric features in the construction, not much new spots were identified for constructing structures. During this phase the fallen brick structures were renovated or rebuild with stone at the same spot. Almost all the stone temples of this phase show brick temple evidence in its basement.

### **Abstract**

Sexual brutality has a genuine and different outcome for the emotional wellness of women. At the psychological level, such brutality becomes a cause for some radical changes in the self-perception of the victim, which eventually affects her relationship with her family and close friends. It along these lines adversely affects the casualty's impression of herself, of occasions, and others. The victim's perception about her past, present and future also gets adversely affected by such incidents. In terms of societal impact, such an act defames the victim with the effect of depriving her of the basic avenues of economic well-being and defenestrating her and even her family members from the 'normal strata' of the society This article examines these outcomes of sexual cruelty on the emotional well-being of woman, particularly the people who are casualties during outfitted clashes.

**Key Words:** woman, trauma, brutality, rape, assault, security, violations, psychological effects.

### **Introduction**

Rape is the most surprising and crude manner of displaying how considerably women are mistreated and demeaned. It destroys the complete bodily and intellectual stability of an individual and, reduces her existence to simply a corpse. it is extraordinarily disrespectful toward vital freedoms which each and every one is assured below the Article 21 of the constitution. Rape within

India was dealt with as the most abhorrent crime toward females and it is a social hassle. At the same time as the range of reported sexual violence instances are surprisingly low and differentiated, in each 10 minutes a female is sexually assaulted however the case isn't always reported. in line in the National Crime Facts Bureau, 24,206 sexual assault instances had been reported in India in 2011. Youngsters are defenseless in this awful act and more than 7200 young humans were raped in India. According to a survey, maximum of young people was simply mistreated, & these crimes were rather prevalent. The survivors of sexual attack suffer from diverse psychological consequences which includes anxiety disorder, ingesting disorder, sleep problem, depression, PTSD and self-harm

All around the globe, the phrase "Raptus," that is the normal term for attack, was used for wild robbery, implemented to each asset and person within the Roman tradition. It became indistinguishable among kidnapping and kidnapping or assaulting a female. Assaulting a female was considered theft of a female in opposition to her consent or the consent of her parent or people who had actual authority over her. The damage induced to the female was amusingly, handled as an incorrect towards her father or partner, females being a side problem. The assault on females changed into unavoidable situation within the length of early Roman, in spite of the reality that Roman recommendations at that point considered it as unwanted act. Rape was most usually communicated as stuprum, a sexual conduct aided by means of mercilessness or tension, within the English language of "forced intercourse". Assault was considered as and resource to battles, which follows as a long way as possible back to the times whilst mass attack of females as a restorative measure put together by means of the militaries after powerfully getting into a metropolis which was taken by way of Troops from Greece, Persia, or Rome. Rape, in addition to fighting, was prohibited by subsequent monarchs' strategic codices, and this prohibition included rationale for condemning and murdering aggressors during the Hundred Years' War.

The vast majority of Muslim professionals are well aware that a female is prohibited from having intercourse may face no punishment under Islamic criminal standards. in line with a Sunni hadith, the subject for executing assault is ended, there's no offense on the person being mentioned, neither is there any ordinary subject credited to her.

The assault guideline under the IPC had been amended several times. (Gaur, 2015) Sections 376 (2), Custodial Rape, 376 (A), Marital Rape, 376 (B to D), Sexual Intercourse but not Assault, were introduced to the law in 1983. As per according to the Criminal Regulation Amendment Act (1983), It is illegal to expose the identity of a rape victim. Regardless, this Act exists. remains aware about assault, it presents diverse new characterizations of offense of intercourse by way of individuals in custodial scenario including managers of disaster facilities, remand houses, confinement places of work, in addition

police department administrators with females in the guardianship. Such findings of custodial assault, a promise to show whatever lies with men and anticipating a female loss gives something that she was unable to consent to, which the court could recognise. The punishment for 'custodial sexual assault' or sexual assault is a minimum of ten years in prison, and the crime is non bailable & cognizable. Rape by a male of spouse residing freely from him in an affirmation for division or under any tradition or practice without her permission is punishable by custody for two years. That is a punishable offence with a bailable fine.

Conferring to the Supreme Court's 2012 decision, assault fundamentals must finish in two months, determined by guideline. The Apex Court ordered to "very well agree" existing standards while citing them to prevent "transferring" through extreme lengthy excusals. Section 309 of the Criminal Procedure Code 1973 declares that in all trials, lawsuits must be held as soon as probable, and that once the investigation of witnesses commences, it can advance forward one day at a time until all witnesses have been investigated. The Cr.P.C. states that "the solicitation or primer will, very far, be finalized in a duration of 2 months from date of inception of the investigation of witnesses" such cases that fall under Section 376 (punishment for ravishment) & associated crimes within Sections 376 A to D of the IPC, 1860. Setback from sexual assault encounters, mental injury, which need to be talked as to offer assist to permit her to modify to the harm suffered and to maintain over her close by and lengthy time period desires so that she will lead a good natural lifecycle.

Section 375 of the Indian Penal Code has been reprimanded for a variety of reasons, including requests for oral intercourse, homosexuality, and entry through new things in the meaning of rape that would never have possibly been in conflict with many safeguarded courses of movement, regular price, or real worth. For certain, even international guiding principle by means of and by using declares that rape can be identified by way of the "sexual entry, penile penetration, but furthermore splitting the distinction, robust, coercive use of pressure in opposition to the person being noted, or the access by way of any article, yet moderate." Emphasis on these guides of movement is not planned to lure, but to present the person being mentioned and not the criminal, the upside of doubt.

The section 376 in overseeing rape, in a tremendously limited place that sets out, an offense of sexual assault within the intimate relation stances for reason that the partner be below 12 years of age, anticipating she be a few places inside the scope of 12 and 15 years, an offense is submitted, anyhow, less certified, appealing minor reprimand. as soon as, the age crosses past what many might bear in mind feasible there may be no valid affirmation of the punishment. The exchange towards marital rape commenced with female activists in the United States bringing up their voices at some point of the 1970s for abolition of marital rape prohibition rationalization & growth

affirmation of equal safety to female. Meaning of permission for each person decision can not be over emphasized. Even while married, female can defend her right to life and opportunity, and her body. The majority of Western countries have made marital rape illegal.

#### INDIA'S RAPE PREVENTION GUIDELINES

Rape suggestions in India begin from very foundation of Indian Penal Code (IPC) in 1860 (45 of 1860) included in Sec 375 and 376. As per Sec 375, a male is said to have carried out rape if, apart from for the condition here after excluded, he has sexual relations with a female in any of the five following scenarios: (1) in opposition to her interest, (2) with out her permission, (3) with her agreement, while her permission was gained by putting her or any individual in whom she is concerned in fear of loss of life or harm, (4) along with her consent while the individual is aware that he is not her spouse, & her consent is given while she recognizes that he is any other male to whom she believes she's lawfully married, (5) through her express permission while she is unable to give such permission at the time to comprehend character & outcomes of that to which she offers consent owing to unsoundness of mind, use of alcohol, administration by him personally, via other, any stupefying or objectionable matter. (6) without or with her consent while she is under the age of 16. This classification describes that penetration is necessary to encompass the intercourse essentially to rape crime. This offers an exemption that sex via male along his spouse, not being below 15 years of age will no longer be taken into consideration as rape.

Section 376 offers punishment to Rape. As established by the section, anyone commits rape maybe sentenced to custody for a period of 7 to 10 years or for life, along with fine, except if a female raped by her partner is below 12 years of age, in this case he maybe sentenced to detention for a period of two years, and a fine, or both.

#### Rape Law Reforms Introduced by Nirbhaya Verdict

The said ruling is one of the milestone decisions of India which has gotten many reforms in the rape laws of India as it was the most horrifying incident. The victim Jyoti Singh was a 23-year-old student along with her companion took a transport at Munirka to arrive at Dwarka, in Delhi. Various body part alongside aspirations and yearnings of humble community young lady were obliterated an insatiable evening on 16 Dec, 2012, the rapists and attackers brutally assaulted and gang-raped her. A three-judge bench, through a constant verdict, maintained the Delhi High Court ruling that had decided with the Trial Court. Akshaya Kumar, Mukesh, Vinay Sharma and Pawan were executed for the severity they had displayed against the females of this nation. (Mukesh & Anr vs State For Nct Of Delhi & Ors, 2014)

#### Changes Introduced After Nirbhaya Case:

The Criminal Amendment Act, 2013 is likewise famously alluded as the Anti-Rape Act. As per this change, offenses like voyeurism and stalking were included into the meaning of assault. Base sentence was converted from seven

years to ten years. It makes changes within IPC, IEA, and Code of Criminal Procedure, 1973 on guidelines associated with sexual offenses. The crime of Rape under Section 375 of IPC, have stated both penile and non-penile expansion in genuine openings of a female by a man a crime. The explanation is thoroughly explained few perspectives, by acts such as invasion of penis, or anything or any part of body to any degree, into a woman's vagina, mouth, urethra, or butt, or forcing her do so with another person, or smearing of mouth to sexual organs (Cunnilingus or fellatio) deprived of the woman's consent or will laying out the offence of rape. Base sentence was increased to 20 years in cases where the victim died or was in a vegetative state.

After this case, another flaw in the framework was discovered because one of the accused was an adolescent. According to the Juvenile Justice Act of 2015, the age for being tried as amature for vehement crimes such as sexual assault was reduced from 18 to 16 years.

Panel gave broad proposals viewing staying away from marital rape and rape committed by means of instruction of void relationships.

People marry for certain, reasons like authentic, social, financial, significant, and religious needs. In India, companion's occupation has commonly been seen as agreeable condition for marriage. Marital Rape is considered hallowed sex is seen as sign of God. Sexual intercourse has been viewed as compulsory in a nuptial. Seeing marriage as a commitment of trust and affection, person rehearses sexual uniqueness by means imaginable. The Indian Penal Code through its Section 375 assents this, "Sex by a male with his significant other, companion is not below 15 years of age, isn't sexual assault." along these lines; Marital Rape isn't a crime not with standing the modifications, guideline directive reports, & latest guidelines.

This has been battled that asserting marital rape as a crime will bring "the capacity for demolishing the reinforcement of marriage." The dispute acknowledges that marriage a association didn't rely upon shared consent and decency. This concept denies a person's critical right over his or her body, whether male or female. All else being equal, the spouse's body is regarded as property, despite her consent. The marital rape will be dealt with under Section 498A of the Indian Penal Code ("illogical sexual direct from the life partner") under the Protection of Women from Domestic Violence Act 2005. (PWDVA). The said Reform went into effect in 2006, and it truly safeguards against marital sexual assault, various types of carnal abuse, & harmful domestic behaviour.

Rape has to be displaced by using the term 'assault'

According to Sec 375 of IPC asserts that sexual intercourse must include wide range of penetration. Penile/vaginal relationships.

As per the judgement of Sakshi v. Union of India and Others [2004 (5) SCC 518], physical assault on any portion of the body needs to considered as sexual assault

Sexual Assault's guidelines had been made fair-minded for safeguarding assault of teenagers has overlooked with the aid of guiding principle

A latest infraction, primarily under Section 376E with head Punishment for repeat offenders was added.

Section 509 of the IPC was attempted for modification in order to provide a more severe punishment when the specified section's offence is engaged with sexual connotations Exception (2) of IPC Section 375 must be removed. Compelled sex from man through his partner must be dealt with in the same way that any mercilessness by a partner towards the married woman is considered a crime. Section 376 A was also deleted for the same reason.

The Domestic Violence Act of 2005 (DVA) provides solutions for which section 498A of the Indian Penal Code (IPC) currently provides illegal fixes, whilst maintaining what is going on with the problem of marital rape in persevering with neglect.

Section 498A expresses vehemently that, in order to protect females from outrageous sexual lead by way of the life companion, there may be no well-known of degree or understanding for the courts, of 'debasement' or 'unnatural,' within the definition's inner secure spousal relations. Is preposterous intercourse interest absurd? Isn't taking prior permission a requirement? Is tying the knot a licence to sexual assault? (DK, 2007) This is one of the questions that must be addressed. Section 3 of the DVA "Physical assault, sexual assault, verbal and emotional abuse, and financial abuse" are all examples of domestic violence.

It excuses sexual abuse in a married or live-in relationship because it is dangerous and disastrous. There is no compelling cause to the zero in on risk of selection of a woman's necessities. It's far approximately the chief association of the intimate basis that notwithstanding being married, she holds a specific popularity, wherein she would not want to admire each real concept no matter the way the manner of her partner.

On examining a young person, it was seen that sexual abuse incites dangerous thoughts such as self-deprecating harm, depression etc. Sexual assault & different forms of assault on a young person can have long and short-term consequences, together with psychopathology later in lifetime. Anxiety symptoms, PTSD, distress, dietary issues, low self-esteem, psychotic disorder, and strain issues, as well as overall mental hopelessness & issues like summarization, sorrow, continuous pain, sexualized behaviour, school/learning issues; and lead issues such as substance abuse, horrible direct, culpability, and suicidality. Aside from legal stimulation, what is essentially required is a period of care, 'Helping society to consider females as an integral part of society, and their existence should be respected,' which will aid in the improvement of society and the attainment of amicability. It is nearly as critical as taking legal action to protect women's respect and opportunities.

Rape isn't like another offence., most events go unreported despite many efforts made, laws introduced. The arraignment of rape isn't like other typical

criminal offences. There is an incredible emphasis on the individual and motivation of the complainant. Assault is especially slanderous; an assault loss (especially if the victim was a virgin) may be perceived as "hurt" by society. Victims may experience withdrawal, be abandoned by friends and family, be barred from marrying, divorcee married, or even killed. This is referred to as discretionary victimisation.

#### Conclusion

Overcomes of sexual maltreatment experience are various mental impacts alongside a range of physical and mental issues bringing about higher medical care use. Survey shows that rape causes various mental issues, such as nervousness issues, PTSD, dietary problems, and intentional self-harm. Survivor's experience assorted adverse consequences of rape; there is no rundown of regular "side effects" they ought to show. Such effects influence not just the physical and psychological wellness of survivors yet in addition their relation with family, companions, accomplices, partners, etc. Further exploration is important to all the more likely get the pathogenesis of mental issues in overcomers of rape. Research is additionally expected to decide proof-based administration of overcomers of sexual maltreatment adapting to long haul psychological wellness.

**Abstract**

In the 19th century, India met a lot of religious and social reformers on caste and religion. All the reformers created their own social background except Theosophical Society (T.S), the only worldwide organization which was created by H. S. Olcott, who was a charismatic leader of the Theosophical world, president and co-founder of the T.S. He believed Hinduism but opposed caste-based society. His caste opposed ideas were easily accepted by Tamil Dalit Social reformer Pandit C. Iyothidasa. Their relationship created new Dalit consciousness in Colonial Tamil Nadu. Olcott Educational ideas started a way of Dalit literacy movement in Madras. He successfully implemented new education methods and midday meals scheme in Madras. This article is about Olcott Panchama Education Schemes (O.P.E.S) in old Madras.

**Key words:** Theosophical Society, H. S. Olcott, Education, Pariahs, Dalit.

**Introduction**

In nineteenth century western education was slowly spreading in India, which was promoted by two agencies. First one is Government and the second one is non-Government. Socio-Religious reform movements, are parts of non-government movements. During the period, Dalits were totally neglected of all social right, particularly in education. This situation was the reason for the emergence of many social and religious reform movements, such as Brahmo Samaj, Arya Samaj, Ramakrishna Mission and Theosophical Society (T.S). Among them, T.S was a movement which paved way for spiritual reforms in India. The role of co-founder of

this society, Colonel Henry Steel Olcott, in Dalits social and educational development in Madras is quite impressive.

H. S. Olcott met for the first time Madame H.P Blavatsky on September, 1874 in New York. Where the society was started in 1875. The society was a non-sectarian body of seekers of truth aimed to promote universal brotherhood. The founders changed the society headquarter from New York to Bombay (India) in February 1879. In December, 1882 it was moved from Bombay to Adyar in Madras. This relocation to Madras helped Olcott to understand Dalits social and economic conditions. In 1882, Olcott and Blawatsky undertook an extensive tour of Tamil Nadu. They visited Trichinopoly, Madura, Tanjore, Kumbakonam, Cuddalore, Mayvaram, Vilupuram, Coimbatore, Nilgiris, Nagapatinam, Tuticorian, Tinneveli and Pondicherry. They opened branches of their society in various places of Tamil Nadu .

Pandit C. Iyothee Thassar and H. S. Olcott

Pandit. C. Iyothee Thassar was a charismatic Dalit leader of contemporary Olcott . In 1882, Thassar met Olcott and Blawatsky in Nilgiri with his cousin Erattaimalai Srinivasan. In 1884, Olcott organized society's annual meeting and many scholars from different parts of India and other nations participated. Thassar and his cousin also joined. This conference created new thoughts on Buddhism. Thassar stated that he had his first insight into the Buddhist origins of outcastes from an old palm-leaf manuscript titled Narada Purana Sungai Thelivu. Also, Buddhism helped the new relationship between two leaders. IyotheeThassar started Sakaya Buddhist Society in 1898, with the support and encouragement of Olcott. Later, the name of the society was changed to South Indian Buddhist Society. A meeting was held in Madras on June 8th, 1898. Olcott and the two Buddhist priests spoke, and an appeal was made for support to IyodheeThassar Dalit movement. It may be emphatically said that Thasa received inspiration and help from Olcott. During the period Ven. Dharmapala made the Buddhist revivalism particularly the Tamil Dalit society.

H. S. Olcott's Idea of Panchama Education Scheme (P.E.S)

On 30th September, 1892, J.H.A.Tremenheere, the I.C.S of Chengalpattu District, submitted a report to the Revenue Board of Madras Government, which exposed the Dalit education levels in TiruvallurTaluk. Out of 303 villages, even a Pariah living in more than 200 hundred villages, could not read and write. In 272 villages, there was no single Parayars child at school .Olcott understand the lack of education, then he created the P.E.S in 1894 .Olcott was a pioneer work for educating the poor children from the marginalized sections of the society. The concept, that through education, the underprivileged and deprived can be enabled to stand on their own feet and fight for what is due to them was formulated and given a practical shape by him much before similar work was started by Mahatma Gandhi and Dr. B. R. Ambedkar. Several schools were started in and around old Madras.

In June, 1894, Olcott opened the first school, named Panchama Free School, near the society headquarter. The funds for the establishment and maintenance of this school were largely provided by the European and American friends of Olcott. At first, 55 pupil were admitted. In 1898, a second school was opened, it was named as H.B.Blavatsky Memorial Free School at Kodambakkam. Next year, 1899, the third school was started under the name of Domoder Free School at Teynampet. In 1901

fourth school was opened in Mylapore, and it was called Tiruvalluvar Free School. On 1st May, 1906 the fifth School was started at Krishnapet.

H.S.Olcott was introducing housekeeping, cooking and management studies to his schools. He taught the boys to cook, mend clothes, to manage household accounts, so that they would get employment opportunities. In 1898, S.E.Palmer came to Madras; she helped for the development of these school curriculum, she was an experienced teacher. Olcott appointed Palmer as General Superintendent of Panchama Free Schools. She introduced for the first time elementary schools in Madras with the ideas of kindergarten. These five schools for Dalits children became more advanced in their methods than the schools in the city for other caste children. In 1901, the annual report submitted by her showed that the total pupils receiving instruction in the schools as of 20th December, 1901, was 384-534 boys and 150 girls. The number of teachers who worked in the school was sixteen. Unfortunately, Palmer returned to America. In 1909, the T.S movement was growing stronger. The Olcott Panchama Schools, under Miss Kofel's devoted care, were all, that could be desired. The Madras Corporation had built another school for them, and a technical department had been opened. Schools had been opened for similar children in various places, by the Sons of India Lodges. In addition to this, the Sons and Daughters of India were doing useful work in many directions, training the young in the duties of citizenship. The Central Hindu College (C. H. C.) for Sons of India had two schools, one for poor children and one in the evening, for servants. According to R.S.Basu, Colonel H.S.Olcott, assisted by the American Theosophists, tried to introduce the kindergarten pattern of instruction in the Panchama Schools. Those kindergarten pattern were to stimulate Dalit pupils to help increase students' attendance. All the five schools took special care in children's health and education.

#### The Growth of Panchama Schools

Colonel Olcott stipulated that school should not charge fees, the school hours were to be convenient for the occupations of the domestic servants and others who might seek education. Tamil (reading, writing and correct spelling) as well as arithmetic, English speaking and Hindustani speaking were to be taught.

The education of the depressed classes was also going forward, and the Olcott Panchama Free Schools are noble movement of their founder. They are regarded as model primary schools in the Presidency, and teachers from other towns were sent to these school to learn their methods. Miss C.Kofel, the invaluable Superintendent of Panchama Schools, built her movement in kindergartens. Another important educationalist Mrs.N.A.Courtright, the superintendent of the Olcott Panchams Free Schools, she also wrote a book on How We Teach The Pariah. This work was published in July, 1906. In it an interesting account of the system of education at the Olcott Panchama Free Schools has been written.

The Sidhanta Deepika noted, 'well aware of the noble work that is being done in the Olcott Panchama Free Schools; but we are not sure that it is so well known that the latest and most progressive methods of teaching are employed in these schools and have been carried almost to perfection with great enthusiasm and practical wisdom under the able and energetic guidance of Mrs.N.A.Courtright. On the whole we believe that under the able supervision of Mrs.Courtright an easy and natural system of teaching is adopted in the schools which should be followed in all the primary schools of the country. It would be very long however before we shall have as supervisions of our primary schools by such enthusiastic and sympathetic persons as

Mrs. Courtright or have our primary school teachers persons with the spirit and skill in the methods of teaching adopted in the OlcottPanchama Schools.’

The first point to be settled, after one has decided to open a school, is the nature of the pupils to be educated therein. It is a hypothesis of scientists who have investigated the subject, that the inherited physical trait of the child limits and prescribes his possibilities; that each nerve fiber and convolution of the brain helps to fix this boundary of mental capacity, from a biological standpoint. Mrs. Courtright was justified of concluding that the possibilities and the limitations in the mental training of the child are largely, if not almost entirely a matter of the child’s ancestry; that an organism which is the product of untold ages of evolution of the more purely physical, will inherit body rather than brain, or body with brain in an embryonic stage, which will require many generations of progressively ascending attempts at growth and development before it embodies a latent capacity for sustained mental power, or even for any mental vigour beyond the simple and rudimentary; if this be so, then no system of education destined to fit the future rulers and citizens of a country adequately to play their destined part on the stage of life, can afford to overlook its fundamental significance.

The details of method and work in P.E.S, Courtright was taken additional effort on improving English knowledge development programs. In view of the child’s own future necessities, then, it becomes a valuable and a practical kindness to teach him English tongue. The Madras Educational Code has, in the past, restricted Primary Schools to beginning the study of English with the Third Standard. This rule would completely shut out the majority of Panchamas, since the majority leaves school before completing the Standard. Indeed, the English recitations are among the most attractive features of the schools, and are the most difficult adequately to describe. It would be almost as sensible to attempt to train children to perform acrobatic feats before they had gained sufficient muscular control to stand alone or to guide their own steps to some objective point, as it is to commence the education of infant pupils by training them to make letters and figures. Take the Tamil alphabet for illustration. Each letter is composed either of straight lines at various angles or of spirals and curves, or else it is a combination of lines with these parts of circles. The Teachers are aware that to draw either straight lines or spirals or circles requires considerable muscular control, as well as knowledge of form, to say nothing of an eye-training sufficient to observe inaccuracies of outline and proportion. No child should be allowed to use either slate or book until he has undergone a preliminary training, first of the fundamental and then of the accessory muscles.

The lowest Standard or Kindergarten Standard pupil studied following on:

1. Chalk Drill- at the blackboard
2. Clay Modeling
3. Leaf Work
4. Games and Songs
5. Conversation and Questions.

Mrs.N.A.Courtright, personally took the responsibility of sending two little girls, who had completed the 4th standard in H.P.B.Memorial School, to a Government school teaching the higher grades. They have both just completed the First Form with great credit to themselves. In attending that higher grade school, these girls have, for the few hours of school each day, been transplanted into an environment totally different from their wretchedly poor homes and one might well

feel repaid for any effort on their behalf just to observe the great change in them in over a short year. She molded and well trained on Dalit girls education, she was discussed with her schools pupils parents, important on girls education because most of parents arranged for their daughters' marriage. The "Olcott Panchama Free Schools" collectively were awarded for teachers' and pupils' work, a large medal with certificate of "Excellent," for leaf-work, clay modelling, plaster of Paris caste, chalk drawings on brown paper, and brush-work. Besides, The Superintendent Mrs.N.A.Courtright received a "School Prize," an "Elementary Teacher's Prize" and six "Certificates." All the year the Training Class was held regularly, doing much good work. The Teacher Institute will be held in the beginning of January, under the direction of Mr.H.S.Duncan, The Government Inspector of Schools, III. Circle; Department of Public Instruction thus showing their recognition of the work. Mr.Orange, the Director-General of Public Instruction for India, after having seen O.P.F.S service and work, expressed himself very favorably about it.

H. S. Olcott well appreciated on Mrs.N.A.Courtright work on Dalit educational development, his annual report was surprising to us as it can be to anybody, that these poor, despised Pariahs of Madras should have made a record of a percentage of passes to candidates, never before known in India. In 1903, 116 pupils appeared in government exams, everyone passed as perfect in every one of the subjects. It was easy to see the success of Mrs. Courtright's came to have a strong influence towards remodeled system of teaching hitherto followed in the schools of Madras Presidency. The total of passes for the Lower Primary Schools 95 %, one school – the Olcott – passed its pupils cent percent, in the compulsory subjects, and in the optional subjects also, with a single exception- one Second Standard child failed in drawing, and optional subject- and each class was examined in as many subjects as the Government permitted. Throughout the year the work of the staff and teachers and the superintendent has been entirely directed to educate the pupils, in each and every subject. As far as possible books were not used by the pupils; they were referred to necessary first hand observation; but the endeavor has been to direct the attention of the pupils to discover facts for themselves. One of the most interesting and important feature of this school, in 1904 , has been the observation trips to the sea, the Adyar river and to St.Thomas's Mount, to study geographical points and features; also the Museum, the Zoo, the Botanical Gardens, and to the important buildings and places of educational interest in the city. The Head Master of the Olcott and the Damodar Schools have looked up to a few of the boys who completed the 4th standard within the past three years (1901, 1902, 1903) in their respective schools, with this result; 10 boys employed as peons and chokras (servants for Europeans), 10 continued their education in advanced schools; 2 are teachers in the Olcott School, 6 are employed in various shops under European management. The interested friends always supported schools development, they continued to send contributions to the Food Fund. It will be pleased to learn that for the year past, two rice cake per day have been given to the pupils in the Infant Standard at the H.P.B.Memorial School. The Head Master reports the total number of food doles to be Rs.6, 553, in the year 1904. The usual distribution of rice to all the pupils has been continued in the H.P.B –their poorest school. The meals provided for 2820 pupils attending collectively. Owing to failure of the winter monsoon, a famine was considered to be inevitable; hence there was a plea for large contributions from friends for the purchase of food for Olcott school pupils to cover during the period of dryness.

H. S. Olcott well understood on the Dalit pupil's difficulties faced for the food. As the children of Panchama Schools are often weak from lack of food, and the parents made a great sacrifice in allowing them to come to school, a little encouragement is given by a monthly distribution of a cupful of raw rice to each child, thus ensuring one full meal in the month. The Society also introduced the free-midday meals schemes to improve attendance in these schools. This society was encouraged to continue support to Dalits students. P.E.S curriculum based on creating employees, it helped to develop Dalit lifestyle, yet number of Pariah young generations slowly came to joining government and non-government jobs. When Dalit children became old enough to help support the family by their little earning they are often withdrawn from school, their wage-earnings being frequently not more than half an anna, (Anna is one of the old Indian money) is equal to British half-penny or the American cent. Olcott implemented a free food scheme with free education, which tried to eradicate Dalits food problems, yet, pupil's enrollment increased. He has compiled a statistical and historical narrative of Dalits, this unhappy race, with illustrations showing what their ancestors had been, many centuries ago, and by what methods of savage cruelty they had been compelled to relinquish their faith as Buddhists, Jains and adopted the Hindu religion. Olcott made a monograph book on The Poor Pariah and sent to his other Branches and friends supposed sympathizers, the society has received gifts and money. After H.S.Olcott's death, the society's authority was changed to Mrs. Annie Besant. Besant has emerged as one of the most important social and political activist in India. In 1893 for first time she came on as asocial worker to India.

#### **Conclusion**

H. S. Olcott was a pioneer thinker for Dalits welfare. He was an inspiring servant of mankind. His educational service only benefited Madras region, unfortunately, this scheme could not spread to other parts of Tamil Nadu. His educational ideas created a new generation of Dalit emancipation. He could not accept caste order society, therefore he believed in education eradicating caste discrimination. Pandit. C. Iyothidasa and Olcott's relationship helped Dalit society going to positive result of her colonial Tamil Nadu. After Olcott's leadership, P.E.S was slowly going down. Even today one school continues to serve its educational service in Adyar.

**A COMPARATIVE STUDY ON ACADEMIC  
ACHIEVEMENTS OF 10<sup>TH</sup> GRADE STUDENTS IN  
SONITPUR AND LAKHIMPUR DISTRICT OF ASSAM  
INDIA**

**DIPTI SAIKIA**

Assistant Professor of Economics  
Madhabdev University, Assam, India

**MANURANJAN GOGOI**

Assistant Professor of Economics  
Madhabdev University, Assam, India

**Abstract**

The present study aimed to investigate the academic achievements of 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam. In this regard 20 secondary schools were selected randomly used descriptive method. Results of the study revealed that the academic performance of the 10<sup>th</sup> grade students of Lakhimpur district is better than the Sonitpur district of Assam. Otherwise, the academic performance of male and female 10<sup>th</sup> grade students of Lakhimpur district is better than the Sonitpur district. When comparison was made between the selected districts, significant difference was found among Sonitpur and Lakhimpur district of Assam.

**Key Words:** Academic achievement, 10<sup>th</sup> grade students, male, female, Assam

**Introduction**

In the present era the world is becoming very competitive. The prime factor that plays a vital role in one's progress or the factor associated with one's progress is 'quality of performance'. Every parent wants to see their child to be in the apex of the performance ladder. This desire of parents or expectations of the society for a high level of achievement puts a lot of pressure on teachers, students, and in general the system of education. In fact, it appears as if the whole system of education revolves around the academic achievement of the students, though a variety of other outcomes are also expected from the system. Therefore a school put its maximum effort to help

the students for their better academic achievement. The importance of academic or scholastic achievement has hoisted important questions for educational research on causes that promotes students achievement and how does the different causes act as a factor that contribute towards the child's academic achievement.

Academic achievement is related to the acquisition of principles and generalizations and the capacity to perform efficiency. Assessment of academic performance has been largely confined to the evaluation in terms of information, knowledge and understanding. The term academic achievement refers to 'performance in school in a standardized series of educational test' (Good 1974). Trow (1959) defined academic achievement as "knowledge attaining ability or degree of competence in school tasks usually measured by standardized tests and expressed in a grade or units based on pupils' performance". The problem selected for the purpose of the present study is as follows- "A comparative study on Academic Achievements of 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam".

The researcher has conducted his study on the basis of the following objectives-

- To study the academic achievement of 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.
- To study the academic achievement of male 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.
- To study the academic achievement of female 10<sup>th</sup> gradestudents in Sonitpur and Lakhimpur district of Assam.

The following hypotheses have been constructed to achieve the objectives of the study-

- There is no significant difference in the academic achievement of 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.
- There is no significant difference in the academic achievement of male 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.
- There is no significant difference in the academic achievement of female secondary school students in Sonitpur and Lakhimpur district of Assam.

In present study Descriptive Survey Method was employed to find out the academic achievement of 10<sup>th</sup> grade male and female students in Sonitpur and Lakhimpur District of Assam by using following statistical techniques i.e., Mean, Standard Deviation followed by t-test. For the present study, the investigator selected a sample of 40 secondary schools from two selected districts (20 schools from each district) by adopting random sampling technique.

### **Discussion and Results**

**Objective:**To study the academic achievement of 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.

**H1:** There is no significant difference in the academic achievement of 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.

**Table-1:** Year wise summary of academic achievement mean scores, standard deviation and t-value of 10<sup>th</sup> grade students of Sonitpur and Lakhimpur district of Assam.

Year	Districts	N	M	SD	SE <sub>D</sub>	df	t-value
2010-11	Sonitpur	689	235.53	72.18	4.02	1347	6.33*
	Lakhimpur	660	261.01	75.62			
2011-12	Sonitpur	658	204.89	75.24	3.75	1342	18.26*
	Lakhimpur	686	273.32	61.73			
2012-13	Sonitpur	583	229.76	70.89	3.95	1269	4.82*
	Lakhimpur	688	248.78	69.54			
2013-14	Sonitpur	548	222.80	77.79	4.08	1244	9.63*
	Lakhimpur	698	262.08	66.03			

\*Significant at 0.05 levels

**Interpretation:**

The table shows that the calculated t-values came out to be 6.33, 18.26, 4.82 and 9.63 for the years 2010-11, 2011-12, 2012-13 and 2013-14 respectively. All these values are greater than the t-value 1.96 at .05 levels of confidence for 1347, 1342, 1269 and 1244df. Therefore, the formulated hypothesis gets rejected. This shows that the academic achievement of 10<sup>th</sup> grade students differs significantly in Sonitpur and Lakhimpur district of Assam. The table clearly indicates that the academic performance of the 10<sup>th</sup> grade students of Lakhimpur district is better than the Sonitpur district of Assam in these four academic years.

**Objective:** To study the academic achievement of male 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.

**H2:** There is no significant difference in the academic achievement of male 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.

**Table-2:** Year wise summary of academic achievement mean score, SD and t-value of 10<sup>th</sup> grade male students of Sonitpur and Lakhimpur district of Assam.

Year	Districts	N	M	SD	SE <sub>D</sub>	df	t-value
2010-11	Sonitpur	357	230.13	73.07	5.77	665	4.86*
	Lakhimpur	310	258.14	75.63			
2011-12	Sonitpur	363	199.98	72.16	5.16	702	13.62*
	Lakhimpur	341	270.21	64.10			
2012-13	Sonitpur	339	222.38	69.18	5.26	681	4.80*
	Lakhimpur	344	247.67	68.35			
2013-14	Sonitpur	278	221.45	77.56	5.64	609	7.10*
	Lakhimpur	333	261.50	61.84			

**\*Significant at 0.05 levels**

The table indicates that the calculated t-values in following four years came out to be 4.86, 13.62, 4.80 and 7.10 for the years 2010-11, 2011-12, 2012-13 and 2013-14 respectively. From the table, it is observed that all these calculated values are greater than the criterion t-value 1.96 at .05 level of confidence for 665, 702, 681 and 609 df. Therefore, the formulated hypothesis gets rejected. Thus, it shows that the academic achievement of 10<sup>th</sup> grade male secondary school students differ in Sonitpur and Lakhimpur district of Assam. However, the academic performance of male 10<sup>th</sup> grade students of Lakhimpur district is better than the Sonitpur district of Assam in above mentioned years.

**Objective:** To study the academic achievement of female 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.

**H3:** There is no significant difference in the academic achievement of female 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.

**Table-3:** Year wise summary of academic achievement mean score, SD and t-value of female 10<sup>th</sup> grade students in Sonitpur and Lakhimpur district of Assam.

Year	Districts	N	M	SD	SEd	df	t-value
2010-11	Sonitpur	332	241.33	70.87	5.62	680	3.95*
	Lakhimpur	350	263.55	75.64			
2011-12	Sonitpur	295	210.93	78.57	5.46	638	11.99*
	Lakhimpur	345	276.39	59.22			
2012-13	Sonitpur	244	240.00	72.10	5.97	586	1.66
	Lakhimpur	344	249.90	70.80			
2013-14	Sonitpur	270	224.20	78.15	5.89	633	6.52*
	Lakhimpur	365	262.61	69.72			

**\*Significant at 0.05 levels**

The above table shows that the calculated t-values in these years came out to be 3.95, 11.99, 1.66 and 6.52 for the years 2010-11, 2011-12, 2012-13 and 2013-14 respectively. The calculated t-values 3.95, 11.99 and 6.52 for the year 2010-11, 2011-12 and 2013-14 came out to be greater than the t-value (table value) 1.96 at .05 level of confidence for 680, 638 and 633 df. Thus, the formulated hypothesis gets rejected for these years. It shows that the academic achievement of female 10<sup>th</sup> grade students differ in Sonitpur and Lakhimpur district of Assam. However the calculated t-value 1.66 for the year 2012-13 is lesser than the criterion t-value 1.96 at .05 level of confidence for 586 df. Thus, the hypothesis of the study gets accepted in the year 2012-13.

**Conclusion**

The table clearly depicted that the performance of the 10<sup>th</sup> grade students of Lakhimpur district was better than the performance of the 10<sup>th</sup> grade students of Sonitpur district of Assam in these four academic years. The

overall academic achievement of 10<sup>th</sup> grade students in Sonitpur district was gradually increased, however the academic achievement of Lakhimpur district was fluctuated. Otherwise, the academic performance of male and female 10<sup>th</sup> grade students of Lakhimpur district is better than the Sonitpur district of Assam in these four years. When comparison was made between the selected districts, significant difference was found among Sonitpur and Lakhimpur district of Assam.

**Abstract:** Goods and Services tax is path breaking tax reforms in the History of India. It is one of the most thoughtful and well discussed tax reforms. It has not only changed the incidence of Indirect taxes but it has also been claimed that GST insured that tax evasion can be brought to minimum. Almost all the sector of Indian economy is brought under indirect tax regime after introduction of GST. There are certain sectors of Indian economy which were earlier exempted or taxed at minimum rates, they have also been brought under this new regime. One such sector is cotton textile industries. Textile processing is a dominant segment across the textile Industry. Considering the important contribution of textile sector in India economy the authors have conducted a empirical study in the three major Textile cluster of Rajasthan to understand the impact of this new legal reform in different aspect of their business. This paper focuses on the highlighting the difference between the old and the new tax regime, what are the advantages and loopholes of the new regime and how have the textile industry perceive it. It further takes into consideration the views of tax experts and the judgments of the courts with respect to various provision of GST which are applicable to textile sector.

**Keywords:** textile cluster, textile processing, Inverted duty credit, Input tax credit, Hand Processing Unit, Power Processing Unit

**Introduction:**

Textile processing can be divided into 4 major part: Spinning, Weaving, Dyeing and finishing and Garment Manufacturing. In the present paper we will be focusing on the third Step i.e, Dyeing, Printing and finishing industry and impact of GST on it<sup>1</sup>. Rajasthan is one of the leading textile producer of India. There are many textile cluster in Rajasthan namely Balotra, Bhilawara, Jodhpur and Pali. The Pali (Marwar) District of Rajasthan is a major processing hub where Printing, Dyeing and finishing is done at mass scale. It accommodates over 800 textile processing units that employ about 50 per cent of the city's population. The region has been a textile hub since the 1970s, with an annual turnover of over Rs 7,000 crore. The industries are dealing in both the fabrics: Cotton as well as synthetic. On the basis on the equipment used the cluster can be divided into Hand Processing unit and Power Processing unit. Most of the unit in the area falls under the criteria of SME units. These units majorly focuses on manufacturing of sarees, blouse pieces, Rubia etc. Before introduction of GST all the cotton units were exempted from paying indirect taxes. After GST the final goods of this industry was put under bracket of 5%.When GST was launched, like any other textile cluster Pali also faced lots of strikes and band called by the Trader and Manufacturer. Therefore it is very important to analyse the impact of GST on the Textile processing unit of Pali.

Universe: The 4 major textile processing cluster i.e., Bhilawara, Jodhpur, Balotra and Pali of Rajasthan.

Study Population: All three cluster of Pali District i.e, Mandiya Raod Industrial Area Phase 1, Phase 2 and Punaita Industrial Area.

Sample Size: 70 textile processing unit of the three clusters.

Sampling technique: Snowball Sampling technique has been used to for the collection of samples.

Tools: The researcher visited 40 factories in all the three cluster and interviewed the managers. Telephonic interviews were also conducted for 30 factories. A well drafted questionnaire were used to collect the first hand data. To review the authenticity of the data the researcher met two major CA firms practicing in the city. There expert opinion in the technical aspect of the law is also discussed in the paper.

Variables (Questions):

VAR1: Whether there is any changes in the turn over of the business?

VAR2: Whether there is any lay off in the factory due to GST?

VAR3: Whether there is any reduction in the wages due to GST?

VAR 4: Whether there is any increase in the price of the goods due to GST?

---

<sup>1</sup> Gopalakrishnan N (2018) Economic and Environmental Policy Issues in Indian Textile and Apparel Industries, 10

VAR 5: Whether there is any increase in the cost of compliance after implementation of GST?

VAR 6: Do you think GST regime is a better tax regime than the old one?

VAR7: Do you think there is any impact on tax evasion in the new tax regime?

VAR 8: Whether GST has reduced harassment by tax official?

VAR 9: Do you think cash transaction has been minimized after GST?

**Findings:**

For the purpose of analysis of the data spss is used. Factor analysis has been done to reach a conclusion.

Profile of samples:

Business	Profile
25	Job work (Dyeing and printing)
20	Finishing
25	Trader

The researcher has collected a sample size of 70 for the pilot study. The Industry Profile is:

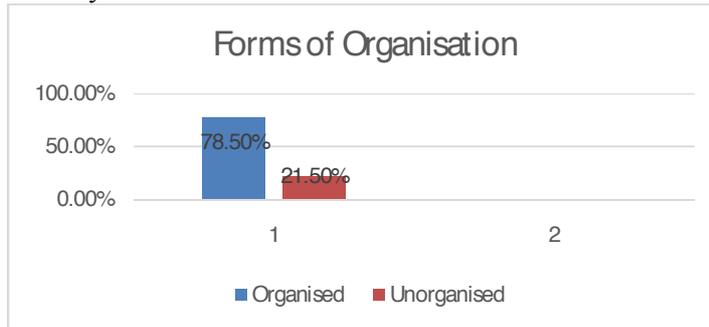

Chart - Form of Organization

Form of organization /ownership: Out of the total sample 78.5% of the samples are working under organized sector where as rest 21.5% are working under unorganized sector.

Table 1.

**KMO and Bartlett's Test**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.617
Bartlett's Test of Sphericity	Approx. Chi-Square	83.358
	df	36
	Sig.	.000

The results extracted through factor analysis are shown in KMO and Bartlett's Test in Table 1 which reflects KMO and Bartlett's Test with sampling adequacy .617 which shows  $KMO > 0.5$  that means sample is adequate, Bartlett's value is equal 0.05 is valid for Factor Analysis and the significant value in the data is .000 which means the data is valid for the Factor Analysis.

Total Variance Explained of the exhaustive 9 variables and factors with Eigen value of 1 or more than 1 as Eigen Value. According to analysis it has been noticed that there are a total of 4 factors with 1 or more than 1 as Eigen value.

**Rotated Component Matrix<sup>a</sup>**

	Component			
	Benefits of GST	Impact of Labour	Impact on the business	Reduction in Cash Transaction
VAR 7	.860	.034	-.152	-.066
VAR 6	.827	-.136	.066	.126
VAR 8	.805	-.043	-.076	-.006
VAR 2	.019	.746	.265	.233
VAR 3	-.148	.720	-.190	-.338
VAR 1	-.129	.062	.659	-.282
VAR 5	.076	-.419	.590	-.111
VAR 4	.085	-.148	-.582	-.251
VAR 9	.016	.002	-.087	.888

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 9 iterations.

In Table As the factor in 4 components were interpreted on what they signify. As the factors are clear in the component matrix with 9 iterations, it is reflected that VAR 7,6 and 8 have high loadings of .860, .827 and .805 for component 1 which is 'Benefits of GST'. These factors combined explain for 23.599 percentage of variance. The factor 2 is combination of VAR 2 and 3 with loadings of .746, .720 are two high for component 'Impact on Labour'. These factors combined explain of 14.411 percentage of variance. Consequently with a view to capture the core of VAR 1, 5 and 4 have high loadings of .659, .590 and -.582 for the component 3 which is 'Impact on the business'. The factors combined explain for 14.096 percentage of variance. Similarly, factor 4 is VAR 9 with the loading of .888 for the component 4 which is 'Reduction in Cash Transaction'. The factor explain for 12.585 percentage of variance.

From the above survey conducted for the purpose of evaluation of GST on the textile processing unit of the author has used factor analysis to reduce the above mentioned Nine VAR into 4 groups after fulfilling the basic requirement. The First group comes under the head of 'Benefits of GST' with three variables; the second group comes under 'Impact on Labour' with two variables; the third group comes under 'Impact on the Business' in which three variables are present and the fourth group comes under 'reduction in cash transaction' which represents only one variable. From the reverse component matrix we can analysis 4 major factors. First factor suggests the benefits that the respondent claim from the GST. VAR 6, VAR, 7 and VAR 8 forms the

part of this matrix which suggests that GST is preferred as old tax regime, it has reduced tax evasion and it has also put a restriction to harassment by the tax official. Second factor suggest the impact of GST on labour and their wages. VAR 2 and VAR 3 gives us the information on this. The matrix suggests that neither the percentage of labourer nor their wages has been impacted due to GST. But the limitation of this analysis is that the information has been sought from the businessman. Third factor comprises of VAR 1, VAR 4 and VAR 5. In this particular matrix suggests the Impact of GST on business. The respondent claim that there is positive change in the turn over and an increase in the cost of compliance due to GST but at the same time they also suggested increase in the cost of product due to GST. Lastly matrix four comprises of VAR 9 and from the loading it can be stated that the respondent agrees to the fact that there is reduction in the cash transaction after implementation of GST.

**Legal Analysis:**

The researcher identifies 70 different factories dealing with different aspect of textile processing. This units deals with cotton textile processing. From the very first stage supply of cotton is taxable under GST. Though the farmer is not liable for registration under GST but the buyer of raw cotton s liable to pay GST @ 5% under Reverse Charge Mechanism (RCM).<sup>2</sup> As far as sarees are considered they are charged at 5% even at the final stage as they fall under the bracket of fabric and not apparel. Under old structure output of fabric processing units were not subject to any tax and therefore they were not eligible to claim Input tax Credit (ITC) on the raw material used for the processing of fabric like chemicals, colour etc. Therefore though the respondents in the study were taxed under the new law but they have been also given an opportunity to claim ITC on the tax paid on the Inputs. At the advent of GST the Manufacture under this segment were taxed @ 5% and the job worker who are very important aspect of the industry were charged at 18%. Since the rate charged on the services of Job worker was 18% and that on the out put was 5% it created the problem of inverted duty credit. As a result of which huge gap started occurring in the working capital of the principal because refunds were not provided in the extra tax paid while availing the job work services. The policy created hue and cry among the job worker and the small industries. To solve this crisis situation the government on the recommendation of GST Council reduced the rate on job work services to 5%.<sup>3</sup>Other drawback faced by this sector is refunds on Inverted duty credits were restricted till July 2018 and further the unused ITC for the first year was lapsed on July 31<sup>st</sup> 2018. The power of the Central Government under Section 54(3) of the CGST Act was challenged before Gujurat High Court in a writ

---

<sup>2</sup>Section 9(3) and 9(4) of CGST Act read with heading 5201 of HSN Code.

<sup>3</sup>Notification No. 11/2017-Central Tax (Rate) dated 28thJune 2017 on the following services which was further amended by Notification No 20/2017 – Central Tax (Rate) Dated 22<sup>nd</sup> August 2017.

against the circular passed by the CG that allowed the lapse of the accumulated unutilized ITC lying in electronic credit ledger balance as on 31.07.2018. The petitioner suggested that this provision only empowers the Government to notify the goods and services that are not entitled for refund of ITC accumulated on account of inverted rate structure<sup>4</sup>. Gujarat High Court held that<sup>5</sup>

“The section 17(4) and sec. 18(4) of the CGST Act provides for the lapsing of the ITC respectively. Thus there were no want of legislature in this aspect. Further section 54(3) does not provide for any inherent power to the Central Government to provide for the lapsing of the under utilized ITC accumulated on account of inverted rate structure. Any delegated legislation has to be in conformity with the parent law. And therefore Notification No. 05/2017- C.T. (Rate) dated 28.06.2017, as amended by Notification No. 20/2018- C.T. (Rate) dated 26.07.2018 which prescribed for lapsing of ITC, has exceeded the power delegated under Section 54(3)(ii) of the CGST Act. Therefore the court declares proviso (ii) of the opening paragraph of the Notification No.05/2017- C.T. (Rate) dated 28.06.2017, inserted vide Notification No.20/2018- C.T. (Rate) dated 26.07.2018, is ex-facie invalid and liable to be struck down as being without any authority of law.”

The order has been challenged in Supreme Court of India and the matter is still under *subjudice*. To corroborate the information received by the respondent 2 C A firms of the town were approached who suggested following:

1. It is the first time that Textile processing units were brought under Indirect tax scheme.
2. Inverted duty credit existed in this sector.
3. The GST was a well intended tax structure but there exist a problem of working capital blockage because ITC actually adjusted in future sale. Also where there is an option of ITC refunds (in case of inverted duty credit) there is a lot of delays which further led to blockage of working capital.
4. The manufacturer has to pay GST under reverse charge mechanism in case of transportation as most of the transporters are not registered under GST.
5. Frequent changes in the GST policy by the government is also one of the problems faced by the industries working under textile processing.

The CA suggested that the small competitors may have faced some hardship in the earlier years but today the GST is actually working smoothly for the business. It has helped in controlling tax evasion as there is a check and balance mechanism in all the stages of value addition. They also suggested that GST will also help in controlling direct tax evasion as cash transaction is discouraged.

---

<sup>4</sup>CGST Act not provides for Lapse of ITC for inverted rate structure: HC

<sup>5</sup> Shabnam Petrofils Pvt. Ltd. Vs Union of India (Gujarat High Court), Special Civil Application No. 16213 Of 2018, 17/07/2019

**Conclusion:**

After considering various existing literature, Primary data and views of tax expert it can be concluded that GST is a well intended legal reform that will benefit the textile processing industry as whole. It has though increased the compliance burden of the registered person but at the same time it has helped them in claiming ITC on the raw material and services sought during manufacturing. Also under GST ITC is not only available on intermediate goods and services but also on the capital goods which were not available in the old structure. The GST as a regime intended on financial inclusion and aims to end the parallel cash economy that led to tax evasion. Since the physical compliance was shifted to virtual platform there is reduction in the unnecessary harassment by the tax official. But at the same time frequent changes in the slab rate, heading, sub heading and other regulation made by GST Council and CBIC which create unnecessary problems while filing GST. To achieve the intended reforms in long run the GST council and Government should pluck these loopholes and make this law more smooth and people friendly.

**FEAR FORBIDS FLIGHT OF EDNA IN  
*THE AWAKENING* BY KATE CHOPIN**

**ANITA SINGH**

Associate Professor in English  
Pt. N.R.S. Government College

Rohtak India

**Abstract**

Women's minds are ingrained with social fear to forbid them in various arenas and activities of life so that they can be conscripted into gender-specific roles in shadow of man. The individuality is denied to women as the facilitation of felicity will dilute the authority of master man. Kate Chopin in her novella, *The Awakening* unveils the sizzling and simmering self of a woman who craves for cognizance of her unnoticed, pent-up feelings.

In the novella, Edna Pontellier is a married woman of elite background who craves for an individual space of her own making; in perusal of autonomy, she tries artistic pursuits to earn money and independence. The fear to defy Patriarchy by sailing on unripe artistic endeavours along with her obsession to be self-reliant culminates into oblivion and she succumbs to the sea to exercise her first and final choice. Edna fails in every employment as fear forbids her flight to autonomy.

**Key Words:** Artistic Endeavours, Autonomy, Patriarchy, Sizzling.

**Introduction:**

Edna is a woman of elite background, lives in a mansion and rolls in leisure and luxury. Chopin flings a question to the readers: why does a woman of affluent home take a flight and from what and what fear forbids her? Chopin's interest lies in the revelation of what is generally hushed under the carpet to maintain the facade of contentment and composure among women. She feels that this apparent contentment covers the crazy commotion, a woman suffers when she is denied her right and reservation over her own self, in name of marriage, she is given to a man who carves out her future curtailing her to a

chosen design. Choice makes us human and denial of choice is unpalatable to a thinking woman and compulsory compliance is what Edna takes flight from. Women have a talent for survival and since centuries, they have thrived on precaution and prevarication, strategy to escape man's wrath. Edna is an aware woman who is honest enough to claim her individuality on her own terms and by her own efforts. Even in her natal home, her father exercised authority and fear to control females and this upbringing generated such strong a fear in her that her flight is unsuccessful to throw her in the sea. Edna's surrender to the sea proves her weariness before stifling social forces but also triggers an idea that women too, can fly if they venture and may be seriously if they strive sincerely.

### **Research Methods: Psychoanalysis, Feminism**

#### **Analysis and Discussion:**

Freud in his work "civilization and its discontents", explains liberal and instinctual human behaviour which here can explain the demeanour of Edna. Edna's "feeling of happiness is derived from the satisfaction of a wild instinctual impulse untamed by the ego is incomparably more intense than that derived from sating an instinct that has been tamed" (160).

Cynthia Wolff in her work, "Thanatos and Eros" specifies that "Chopin understands the connection between Edna's longing for suffusion, fulfilment, incorporation and the very earliest attempts to identity" (450).

In the light of these observations, it can be inferred that Edna, governed by her human instinct tries to carve out her identity in a world where no identity is allowed to the women, they are clubbed under umbrella of gender.

Edna like her male counterparts wants to fly high, realize her ambition of autonomy, self-worth and independence in every walk of life. She is an obedient daughter and wife but servile behavior and subservient roles are not her choice. Chopin explains: "Mrs. Pontellier was not a woman given to confidences ... with a mantle of reserve" (14). Edna is no ordinary woman to be curtailed in conventional roles but she is one who questions and argues but in silence for fear of check. Edna is an aware and thinking woman whose "activities are arrested by the absorbed expression which seemed to have seized and fixed every feature into a statuesque repose" (Chopin 16).

Deep thinking in leisure hours blended with strictness of her father and indifference and aloofness of her husband stimulates her inner recesses to assess her role in entire scheme of cosmos than to assimilate herself in conventional roles as animals have done since centuries. Edna like humans wants to drift apart from instinctual habit to follow the herd for security; she tries to be curious, to be experimental through art and earning, she strives to gain social entity.

Edna was uncomfortable with her authoritative father, matron like and manipulative sisters In her natal family and with her husband too, "she was not accustomed to an outward and spoken expression of affection, either in

herself or in others” (Chopin 17). Her marriage was her “violent opposition of her father...we need to seek no further for the motives which led her to accept Monsieur Pontellier for her husband” (Chopin 19).

Emily Toth finds autobiographical streaks in *The Awakening*; Edna, like Chopin, is “in constant pursuit of solitude, independence, and an identity apart from her children and apart from the men who always admired her” (62). Edna inherits the gene-pool of her father and emulates her father as a symbol of authority and applause whom all members appreciate for attention and appeasement; like her father, she wants to have autonomy and authority but not with audacity and avaricious abilities.

Concealment and compliance, the feminine virtues of stratagem and skills are not approved by her and she practices silence, prefers sizzling and simmering speechlessness to expression which intensify her fears up to greater momentum. The fear of caution, the fear of failure in social duties, the fear of compromised morality take a toll upon her mental health in such a way that she prefers sacrifice and surrender to the sea than to strike a considerable understanding with the family members.

In “The Power of Horror”, Julia Kristeva states that “phobia bears the marks of the frailty of the subject’s signifying system (35) here, Edna signifies the individuality of her gender but her frailty, her phobia about claim of autonomy inculcated in her since her infancy terrifies her so much so that she loses her composure to handle her flight from conscription of conventions. Edna shifts to pigeon house for “feeling of freedom and independence ...instinct prompted her to put away her husband’s bounty in casting off her allegiance” (Chopin 76).

Edna’s intention to acquire accomplishment and ability is pure and genuine but her devices and employments are not fully equipped to facilitate her with required dividends. She senses her handicap in financial and social dealings but the way to remove this subservience is not comprehensible to her. She responds to her husband’s indifference by her detachment and alienation, shifts in a small house arranged by her small income, she conveniently, forgets that to acquire such independence, she has tarnished the social image of her husband as her dwelling place is attached to his status which he prioritizes at any cost.

Edna’s activities are so unsocial that they invite a serious displeasure of her husband and society. Edna receives an awareness that her amorous attention to her male friends is unsocial and her lack of absorbed attention to domestic duties is disqualifying to her role. She confides in her friend, Alcee Arobin :

I am going to pull myself together for a while and think ---try to determine what character of a woman I am ;...I don’t know. By all the codes which I am acquainted with, I am a devilishly wicked specimen of the sex .But some way I cannot convince myself that I am .I must think about it. (Chopin 79)

Edna like her husband has both male and female friends who inspire her in business, art, companionship and understanding of life. She also believes in career through art and speculations at race-course, she creates her own space but her mind is imbued with fear that her stance will not be entertained by her family and society. In Chopin's times; society, axiomatically, assumed that women were contented and complacent in their homes and with their husbands and there was no exigency for them to create any separate future or home or identity.

Edna's gesture appears to be assertive and detrimental to the propagation of male hegemony and Patriarchy. Jules Chametzky states that "awakened by a realization of her sensuous self, Edna Pontellier grows in self-awareness and autonomy. But it is a lonely and isolated autonomy that exacts a terrible price" (56).

Edna enjoys material advantages of money and perusal of art not as profession but as a hobby but her fear and doubt about her potential, its exercise and the pressure of conventions forbid her flight to destination of her choice, moreover, she just wants to flee from stifling social prejudice for women but in oblivion of her destination.

Edna has been conditioned to her domestic roles since infancy and an interminable, incomprehensible fear is also induced in her, in case she tries a breakaway from constraints of Patriarchy. Chopin mentions the mechanical mental state of Edna : "she would ,through habit ,have yielded to his desire, not with any sense of submission or obedience to his compelling wishes, but unthinkably, as we walk, move, sit, stand, go through the daily treadmill of the life which has been portioned out to us" (Chopin 30).

Edna is conditioned and cautioned to follow the dictates of her master as religious inscriptions ----sacred binding on her soul dragging her down to grave of her dreams and hopes. Her marriage, she finds, closes "the portals forever behind her upon the realm of romance and dreams" (Chopin 19). Edna is devoid of her dreams and is duped by the duplicity of social agencies which cover-up the servile status of a woman by camouflage of wife-hood.

Edna in company of Madame Reisz gains confidence and tries to follow her footsteps. She tries artistic endeavours to liberate herself from the tangled mass of her dreams and mangled remains of her resolve and resilience. She perceives :

Her will has blazed up, stubborn and resistant.... and feel like one who awakens gradually out of a dream, a delicious, grotesque, impossible dream, to feel again the realities pressing into her soul...she is disturbed with dreams that were intangible that eluded her, leaving only an impression upon her half-awakened senses of something unattainable...she blindly follow whatever impulse moves her ...free her soul... (Chopin 31-32)

In the following lines the courage, spirit and the fear of Edna can be easily perceived She tries to save her from the slavery like the animals and wants to

grow like humans but the onerous onus of social constraints creates a confusion and chaos in her mind to make her impulsive not decisive in her actions and she leads herself to a chosen solace but not in the world of mortals rather in element of nature (sea-water) that comforts, soothes the senses and offers a fluid, fecund, feminine frame to her for eternal rest without disfiguring or disorienting her.

Edna has been a motherless child, she has never received affection from her father and in her unmarried life, her sisters too were not on amiable, amicable or even agreeable terms with her so she finds solace in company of her friends --- Mesdames Reisz and Ratignolle, the latter warns her about her unsocial behaviour and the former alienates herself from Edna as she does not find Edna serious and sincere with the practice of art and severely scolds her: "Ah! An artist! You have pretensions madame...the artist must possess a courageous soul ...courageous, ma foi (indeed)! The brave soul. The soul that dares and defies..." (Chopin 61).

Edna feels in her heart that she cannot defy the social shackles like Reisz as she is not an accomplished artist; Reisz is deeply applauded for her talent of music, Chopin notices: "her playing had aroused a fever of enthusiasm. What passion! I have always said no one could play Chopin(music) like Mlle Reisz !that last prelude! Bon Dieu! It shakes a man!" (Chopin 26)

This appreciation Edna is sure not to receive in her life as she fails to settle in matrimony ---- a, rebellion against father not a passion for a chosen man; she also fails in art of painting as she starts it, as a sign and signal for her rebellion against the authority of her husband and for her autonomy, is not driven by the passion for painting. Any art ascribes accomplishment on the artist only when she accords her alertness, acumen, agility and absolute ability to the service of art, Edna lacks the potential and dedication of art and gets disenchanted, Chopin notices; "she seemed to be no longer feeling her way, working... with sureness and ease...devoid of ambition and not striving towards accomplishment..." (Chopin 70).

Edna's greatest fear lies in her non-compliance to conventions like Reisz but like her, she cannot sail on her talent of art. She shuns her children and domestic duties for her emotional and artistic requirements and the children are away from her, may be forever; her sentimental dalliance with two men may make her husband desert her with no subsistence. Edna wants to carve out her niche in her pigeon house but, this impulsive decision without consent and approval of her authoritative husband unnerves her. Chopin notices:

A feverish anxiety attended her every action in that direction. There was no moments of deliberation, no interval of repose between the thought and its fulfilment...within the precincts of her home she felt like one who has entered and lingered within the portals of some forbidden temple in which a thousand muffled voices bade her be

gone...whatever was her own in the house, everything which she acquired aside from her husband's bounty, she caused to be transported to new house, supplying simple, meagre deficiencies from her own resources. (Chopin 80)

Here, the fear of Edna is strikingly visible in all her adventures and activities. Her master and his influence over her in absentia makes an unseen pressure on her and forces her to do what she detests the most. Elizabeth recommends that Edna's awakening lies in "her growing rejection of the prescribed social role of woman, namely the acquiescent creature of her designated lord and guardian (Genovese 262). Edna happily performs all her domestic duties, loves her children and never contradicts her husband.

Chopin notices: "Edna took him (her son) in her arms, and seating herself in the rocker, began to coddle and caress him, calling him all manners of tender names, soothing him to sleep" (38). Edna is irritated by the compulsive roles, the acquiescence in such roles and unquestionable authority of the the lordship of the master, man. She believes in equal treatment due from one human to the other human. She wants herself to be treated like a human not as a secondary gender, woman. She realizes that she is in a dependent role because she is not earning, not having any career, has no material possession or home and above all, every decision of family is taken by her husband. He treats her as her personal property not as a companion to foster her growth. Chopin reveals: "what folly! To bathe at such an hour in such heat! exclaimed Mr Pontellier... you are burnt beyond recognition" he added, looking at his wife as one looks at a valuable piece of personal property which has suffered much damage" (4).

Her father's advice to her husband to correct her also offends her. Chopin also notes: "authority, coercion are what is needed. Put your foot down good and hard; the only way to manage a wife. Take my word for it ...the colonel was perhaps unaware that he had coerced his own wife into her grave" (68). Edna is baffled by her father's comments as he not only controlled her freewill himself when she was in his care but also recommends now the same nasty suggestion to his son- in- law.

Edna wants to be a good wife, daughter as she welcomes her father well, she is ready to sacrifice her everything for her family and children but not her inner 'self,' her soul. She confides in her friend, Adele "I would give my life for my children, but I would not give myself" (Chopin 46). Edna faces conflict between her growth of self, her soul and her social roles curtailing her human instinct.

Her fear to defy the mega institution of Patriarchy tells upon her confidence and she succumbs to the sea as even in the fear of punishment, she can neither retreat from her conviction nor she can execute her fragile and ill-equipped plans of independence and autonomy.

**Conclusion:**

Edna is a woman of elite taste and temperament. Dr Mandelet also finds “Mrs Pontellier to be especially peculiar...don’t contradict her” (Chopin 64), he advises to Edna’s husband. Edna despite differences, has been agreeable with her father and like him, she frames and asserts her individual opinion about people and events. Her assertion and resistance are distasteful to the male members and they find her aberrant as her husband takes doctor’s counsel to understand her problem.

There is nothing unusual about Edna, her only objective is to to make an individual space of her choice. Her choice is neither understood nor entertained by male hegemony and the indifference and evasion of men in her family force her to try independent home and career. Edna has not dedicated several years in service of art like Madame Reisz so her talent is not fully realized and accomplished as it is started not as a service or worship of art but to evade the pain and pangs of loneliness and neglect. Edna strives very hard but fails as her fear to counterattack encroaching social forces forbids her flight to her dreamy destination.

## **REALIZING THE GOAL OF ATMANIRBHAR BHARAT THROUGH INTELLECTUAL PROPERTY RIGHTS**

**MANJEERA SAIKIA**

Assistant Professor

University School of Law and Research

University of Science and Technology

Meghalaya India

### **Abstract**

India's journey to become a global leader can only be realized by perusing policies that are competitive, efficient and resilient but most importantly policies which promote self-sustenance and self-generating ideas which can be culminated in the governmental initiative of Atmanirbhar Bharat. This initiative aims in uplifting the economy, encouraging domestic production, encouraging innovations and generating growth and self-reliance. However, the growth of industries in manufacturing and service sector will not be enough without innovation. Also, adequate protection of such innovation is important and this is where the need of Intellectual property rights like the copyright, patent, trademark and geographical indication is felt. IPRs plays a great role in developmental aspects as it provides exclusive rights to the owner of the property encouraging the innovation and creation along with protection from being exploited in the market by a third party. Modern IPRs with innovator friendly policies of government can help maximize the potential for IPRs to raise dynamic competition and in context of developing country like India, local captures of economic value have the capacity to stimulate broader rural development and poverty removal making it self-reliant. This paper focuses on the role of Intellectual property rights to achieve atmanirbharbharat (self-reliant India).

**Keywords:** Atmanirbhar, Intellectual Property Rights, Economy, Innovation.

### **Introduction**

Atmanirbhar is a step towards nation-building. Development involves several dimensions and economic growth is not the only development required. India is growing through all such dimensions including economic development,

reduction of poverty, and employment opportunities. India is a part of the global value chain and to continue that status India's importing and exporting mechanism is relevant. Self-reliance is not about the boycott of foreign products and remain ideal but the concept of Vasudhaiva Kutubakam, the world is one. In the 21<sup>st</sup> century the word Vasudhaiva Kutubakam has been used in many parlances and hence became a mantra but if we apply the realist prism to understand the meaning we see peaceful construct free from all kinds of power which encourage the social, political and military ability of individuals to meet their own needs as well as the need of the state. It is high time to rejuvenate Vasudeva Kutumbakam and here Intellectual property rights serve as a tool to achieve the objective and benefit the public at large. It has a positive impact on the processes of economic development and progress, which are often hindered by various circumstances. A strong intellectual property (IP) regime would help the development, foster beneficial change, improving formative opportunities making India self-reliant. So it is very important to study and analyze the role of various branches of IP and study the challenges in bringing a dynamic change.

#### **Types of Intellectual Property Rights and its Role**

Intellectual property protection has gained prominence at the national as well as international levels. Governments around the world are adopting the IP policies and this is evidenced from the empirical testing from several countries and period, however, there is a dearth of information about the IPR laws, policy-making and its relationship with the country's development. Developed countries are already having better public visibility of IPRs so it is time for developing countries particularly India which is full of economists, practitioners, social scientists, inventors, innovators who can contribute to the growth of the country. Intellectual property is the intangible property and legal right over such property is given under Article 300 A of the Indian Constitution. Also, entry 49, List I of the seventh schedule provides parliament with the power to make laws over the subject of IPR that is patent innovation copyright, design, trademark, geographical indications, plant variety, etc.

Intellectual property<sup>6</sup> is broadly classified into:

- i) Industrial property which includes patent, design, trademark, geographical indications, service marks
- ii) Copyright

The Trade-Related Aspects of Intellectual Property Rights (TRIPS) signifies patent as the right that is given to any person who invents new products or process, improvements made to products that was already invented. Such rights are exclusive for a limited period that is twenty years. The owner gets various

---

<sup>6</sup> Bhandari, M. K. Law relating to Intellectual Property Rights. Central law Publisher, 2021

rights such as right to grant licenses for the use of others, right to sell his property and lot more. The three essential ingredient required for grant of patent are Novelty, Inventive step, Non-obviousness. Governments has the power to refuse the grant of patents for following reasons:

- Article 27.2 -inventions whose commercial exploitation may be detrimental to human, animal or plant life or health
- Article 27.3 diagnostic, therapeutic and surgical methods for treating animals or humans
- Article 27.3 certain plant and animal inventions

The Indian Patent Act 1911 gives a provision for grant of compulsory license under Article 84 to prevent the misuse of patent by the patent holder.

The human mind is like a powerful bird, given the wings of freedom it will fly beyond imagination and bring new inventions. The idea may be great but such ideas need nurturing until the final result is made therefore ideal environment for nurturing would be fruitful and such innovation needs to be protected. IPR plays a great role in protecting such inventions, also, the government of India has taken initiatives like 'Make in India', 'Startup India', and 'Atal Innovation Mission' to encourage innovation. According to Section 13 of Copyright Act, 1957 copyright is an exclusive right given to authors relating to the following subject matter: Original literary, dramatic, artistic, and musical work, Cinematograph film Sound recording. These rights open up opportunities for the author to enter various agreements including reproduction agreements. Another advantage that copyright provides is a bundle of rights like the right of translation, adaptation, abridgment, right of public performance etc. It has the capability of protecting the substantial part of the work so its significance can be witnessed in the computer, entertainment music, literary fields. The copyright law aims to uplift authors, artists composers to create original work by giving exclusive rights for limited period and earn profit by exploiting their own work. For the protection of copyright owned by its nationals in other countries Berne Convention and Universal Convention made effort and India being a member of both, gets protected. India has also signed the General Agreement on Tariff and Trade (GAAT) and entered the global market economy.<sup>1</sup> Copyright prevails in original literary work. Article 10.1 of the TRIPS Agreement provides that computer programs shall be protected as literary works. It should not be confused with software patent granted in India as copyright is over computer programs, tables and compilations. Copyright does not prevail over just ideas but expressed ideas in form of print or writing. Therefore, any work to be original should be result of substantial independent skills, creative labour and judgment.<sup>7</sup> Copyright subsist in concept that is fledged with detail but there is no copyright for events. When we say creation of human mind the original

---

<sup>7</sup> Kumar Ahuja, Virendra. Law Relating to Intellectual Property Rights, Lexis Nexis, 2007

dramatic work can be such creation and get protection under copyright law. It can include recitation, choreographic work, scenic arrangement but excludes cinematograph films. Musical works including the graphical notation falls under the umbrella of copyright protection however, something intended to be sung or spoken is not included. Sound recording is protected under a different category of copyright, artistic work covers many works like painting, sculpture, drawing, photography, work of architecture, and artistic craftsmanship. The intellectual property establishes a balance of interests between public goods and private interests, it takes care of availability of things by using the doctrine of 'Fair use' which provides private usage of things protected under copyright law but subject to some condition that the use should be fair like for research, education, scientific purpose, social purpose etc. Copyright law encourages the production and distribution of work by safeguarding them with economic as well as moral right of publisher, artist, authors. Copyright protection generates automatically on creation of work. The economic value of the work is like reward to the creator but with the growing digital world there is a risk to the work as reproduction or copied version has become easy and distribution has become a work of seconds, So copyright law here ensures that the value of the work goes only to the right holder of the work or subject matter. Therefore, such legal safeguards and legislative measures are necessary for the nation to develop the economic sector. The copyright intensive industries in India are predominantly the media-entertainment industry and the publishing industry that provide greatly towards the economic growth of the country. Sectors such as software and IT also have started heavily to rely upon copyright registration for the protection of their codes and expressions.

### **Trademark**

Early humans used symbol to represent words and concepts, they have a strong effect on the culture of business as well as brand longevity. The first interaction that happens between company and consumer is the logo. Also, it is said that vision memory is the long-term memory and has a massive storage capacity so any kind of sign, symbol leaves an imprint in mind. Symbols are in large number in market today, sometimes looks similar. So, to help consumer get the desired product, trademark laws define the quality, quantity, sign, variety etc. Various sign can be protected as trademark: a word or its combinations, colours, symbols, the packaging, sound etc. The essentials for obtaining trademark is that the mark should not be confusing or similar to same category of goods and services. It helps in protecting and building the reputation of business. The trademark law provides for legal as well as economic benefits to its users. Firstly, a registered trademark holds value and may grow over time, hence called as valuable asset. Secondly, registering brand under trademark law will give a person the legal right to enforce action against anyone who violates their intellectual assets. Also, the trademark holder will be entitled to publicly display the brand is secured by applying

registered trademark symbol. This encourages a business to grow without fear and ability to pursue legal action, if deemed necessary. Thirdly, registered trademark can be utilized as a marketing tool, once registered the symbol can be used which gives a validity and creates trust in customers. Fourthly, trademark registration is also beneficial for licensing agreement or transfer of business, however, there are other benefits of registration too such as global registration that means registration in India creates a base for registration outside India<sup>8</sup>

### **Geographical Indication**

Geographical indication is a sign used on products that signifies geographical origin, quality, reputation or characteristics that are capable of being assigned to that place. It tells the consumer about the origin of the product and its uniqueness. Such tags are given in handmade products, agricultural products, industrial products, food items. These are known as sui generis protection. GI tags provide the right only to the registered persons. Other than the legal protection, it provides for exclusive right which protects from the unauthorized users. Any association of persons, producers or organization can be a registered user. A GI registration is given for a term of ten years with a renewal for another ten years on payment of the renewal fee. The concept of 'vocal for local' which is taken as a mantra in contemporary period has its origin in Gandhian era when India's goods were exploited. Therefore, in order to achieve the goal of vocal for local, the local producers need to be aware of the benefits that IP rights provide to get protection under the legal regime. So, the producers and the startups should focus on such products and include them to get the benefits. Another initiative of UP state government is the 'One District One Product' to encourage the art and craft which would promote the Micro, Small and Medium enterprises. Example Arunachal Orange, Khasi mandarin of Meghalaya etc. The application for GI can be filed by any union of persons or producers or any organisation or authority concerned with goods. The procedure starts with application to registrar followed by examination, acceptance or rejection, advertising in the GI journal.

### **Plant variety**

Plant variety commonly known as breeders right accorded to the breeder of a new variety. Any person who discovers a new plant variety or develops it can apply for the protection. Article 27 (3)(b) of the TRIPS Agreement, makes it compulsory for every member-state of the WTO to introduce such protection through domestic legislation. The protection is given on the basis of newness, distinctness from any existing variety, stability and uniformity. The Plant Variety Protection and Farmers Rights (PPVFR) Act, 2001 provides protection and give the rights of farmers as breeders, plant conservators, and as consumers or users of seeds. The uniformity as mentioned above is relaxed,

---

<sup>8</sup> Narayana, P. Intellectual Property Rights. Eastern Law House. New Delhi, 2015

permitting double the number of off-types like it permitted for other categories of variety. To become a holder of such right the farm size does not hold any relevance as it is applicable to all categories of farmers. Plant variety laws are considered threatening by farmers at the local level, so they need to understand that IPR, agriculture and sustainable development are interrelated so a balance of competing needs and societal innovation with rewards will be fruitful.<sup>9</sup>

### **Empowering India through Traditional Knowledge protection**

India is a rich country with various desert, hills, mountains, forest, grassland. It also presents three hotspot- western ghat, the Himalayas and the Indo Burma and many more as a result India is rich in traditional knowledge. Traditional knowledge has its roots in the culture, such knowledge includes the medicinal knowledge, agriculture related expression of folklore be it dance, music artwork etc which originated from intellectual activity. Such kind of knowledges are basically related with biological resources and it has the capacity to benefit the public at large by techniques or process. This helps the biotech in research and development. So the communities who are practicing such knowledge should get a share of profit whenever made. The younger generations from such community can start joint venture for conservation and utilization of resources and equitable sharing. The convention on bio diversity that is The Biological diversity Act, 2002 ensures the promotion of traditional knowledge is protected through specific laws and encourage the practice of such knowledge. The convention also ensures fair and equitable benefit for use of such knowledge. Another tool that was developed for defensive protection is the traditional knowledge digital library. This tool consists of documentation relating to knowledge of Ayurveda, Yoga, Unani, Siddha in five languages. This aims at preventing the traditional knowledge for unfair patent. India's thirty percent population is dependent directly on biological resources for food, natural medicine etc. During the covid pandemic when the world had no vaccine or solution India used the traditional methods of mixing herbs to make a drink called 'kadha' which benefited as immunity booster thus leveling local developmental needs with ecology to ease the nexus of poverty, population explosion and environmental degradation. North East India presents a captivating and unique context for ecology based new development and solutions, which combine traditional wisdom with contemporary ideas. Living root bridges in Meghalaya provides for such relationship between Khasi tribes and forest, which gives realistic plans for the future. These show the essential human value of living with sensitivity and respect for all life.<sup>10</sup>

### **IP success leading to increase in Self reliance**

---

<sup>9</sup> Ministry of Commerce and Industry, Department for Promotion of Industry and Internal Trade, Press Note No. 4 (2020),

<sup>10</sup> Sengupta, Nirmal. Knowledge in Modern India: Preservation, Promotion, Ethical Access and Benefit Sharing Mechanisms, Springer 15 October, 2018

- In India, where health treatment and life-saving medicines are expensive CIPLA, a pharmaceutical company based in India stated their goal to make India self-sufficient in health care and ensure that no patient shall be refused to have access of high-quality and affordable medicine and to support and achieve such they have fully utilized the patent system.
- Apple vs. Samsung: There had been a long fight between the famous companies Apple and Samsung. Samsung was accused of by apple of copying its idea of smartphones. This had been the most prominent case for the past decade linked to patent infringement of smartphones. Finally, the jury ordered Samsung to pay Apple for infringement of the patents. In India many startups have emerged and IP helps such startup to compete with large companies.
- The Indian Patent Act has been criticized on its time-consuming process for patent grant but with the introduction of expedient examination by the Amendment Act of 2003 and 2019 Indian Space Research Organization (ISRO) has been granted a patent in a time period of eight months by the Indian Patent Office, such positive changes in patent application and patent grants encouraged more patent filings in the future.
- Women are calculated to be less participating in the business arena, though various study shows that women are good innovators and inventors. In order to encourage such patent, rules are made where the patent seeker is a female or if any one applicant is female than such application gets some advantage or faster process. Women Scientist Scheme-C (KIRAN IPR) scheme contribute to 10% of active patent agents in India as it provides to women who have interest in science and technology a training program in IPR. Such created a suitable environment for women who were not able to pursue their interest resulting in human resources for science and technology. Another instance 'Darjeeling tea' was granted the GI status in October 2004 and it is the first application to be registered in India as a GI. Such tag helped in women employees in tea estate and also increased foreign export.
- The famous fabric of Madhya Pradesh Chanderi Silk was seen in Commonwealth Games, 2010 held at Delhi, winners were offered 'angavastram' that was crafted from Chanderi Silk. There was an order value worth Rs. 50 lakhs that resulted in large revenue for the weavers.

### **Legal Framework for Protection of Intellectual Property**

The Patent Act, 1970

This Act replaced the Patent and Designs Act 1911. However after signing various international agreements like TRIPS, Paris Convention and Patent Corporation Treaty, it was under obligation to change some of its provision

in order to cope up with such international dealings. On March 1999 patents amendment came and the second phase of such amendments was brought in patentable subjects and section 39 was reintroduced. India now is governed by the patent Act 1970 with amendment by 2005, patents Act 2006 rules and 2019. The patent head office is located in Kolkata and has branches too. The patent filing procedure starts with filing patent search, application, publication, examination, objection and finally grant of patent.

The Trademark Act, 1999

The trade mark act was based on common law system before 1940. Later trademark and merchandise Act came in 1958 but got repealed by Trademark Act 1999 which is the present legislation governing India with effect from 2003 as it complies with the provision of TRIPS. The procedure for registration of trademark is firstly Trademark search followed by Trademark application, consisting of all details of the owner, class of the mark, description of goods, trademark examination, publication and registration.

The Copyright Act, 1957

The first copyright Act came in the year 1847 during the rule of East India Company, post-independence the copyright Act 1957 came into force. The copyright Act was amended many times in the year 1983, 1984, 1992, 1994, 1999, 2012. The copyright amendment rules were introduced in 2021. Though copyright generates automatically, registration gives a better protection to the work if infringed by violator.

The Design Act, 2000

The history can be traced in the British period when the first Patent and Design Act 1872 came in force, later The Design Act 2011 came in compliance with TRIPS and many changes in the definition of articles, design, registration, quantum of penalty, period of registration from five to ten years were made. India was with no laws for geographical indication until 1999 but the cases relating to basmati rice, turmeric and neem brought a huge concern for India which brought the Geographical Indication Act 1999 with objective to prohibit an unauthorized person from misusing indications and also help consumer from any confusion. It also aims to promote exports of the goods. Indian goods having GI tag.

### **Conclusion**

India is known as the fastest growing nation and to keep that pace there is dire necessity of a framework which encourages people to enhance creativity and build new opportunities. Intellectual Property laws serve as a base for such invention, innovation, creativity resulting in social, economic and cultural development of the nation and enhancing the concept Vocal for Local into Vocal for Local and Local to Global. Therefore, a positive relationship of human effort with Intellectual property rights is utmost necessary to make India Atmanirbhar.

**NEW HISTORICIST READING OF ALEX  
RUTHERFORD'S MUGHAL HISTORICAL FICTION  
*RAIDERS FROM THE NORTH***

**DR. LINET SEBASTIAN**

Assistant Professor

Department of English

St. Joseph's College (Autonomous)

Irinjalakuda Thrissur Kerala India

**Abstract**

In the postmodern times, history as a discipline has been a venue for challenging interrogations. The factuality of facts, historical sources were questioned by the postmodern philosophers of history. They have argued for a more flexible and inclusive history. Novelists of historical fiction has ventured to recreate history through their works. Historiographic metafiction rereads history from various angles and emphasized the pluralistic nature of history. New Historicism prefers both the literary and the historical elements of a text. Alex Rutherford rereads the life and times of Babur in the historical novel *Raiders from the North*. This paper makes an attempt to understand the unique blending of facts and fiction in this novel. The study contextualises the novel with the theoretical background of New Historicism.

**Key Words:** Historical fiction, New Historicism, Plurality of history, historiography

**Introduction**

In the postmodern scenario, history as a discipline turned to be multicentric and interpersonal. A paradigm shift happened in the case of historical representation. The philosophers of history have argued for a more pluralistic, inclusive and argumentative history. They interpreted history as an amalgamation of fact, fiction and fabrication. For them a rereading of history is an unavoidable act in order to do justice to the representation of the past. The horizon of historical enquiry has widened in the recent times and reexamination of historiography revealed new insights. The emergence of

historiographic metafiction in the 20<sup>th</sup> century is the consequence of the postmodern philosophy which believed in the deconstruction of the traditional academic history. The validity of the historical sources and the factuality of historical facts were doubtful. Historical fiction imagines a more possible past and it reconstructs the interpretation of past in multiple ways. Galda and Cullinan relate fiction about the past as an interesting genre consisting of "imaginative stories grounded in the facts of our past" (205). They further add that:

Historical fiction differs from nonfiction in that it not only presents facts or re-creates a time and place, but also weaves the facts into a fictional story. Historical fiction is realistic-the events could have occurred and people portrayed could have lived-but it differs from contemporary realistic fiction in that the stories are set in the past rather than the present. (205)

This paper examines the New Historicist strategy in the analysis of historical fiction *Raiders from the North* written by Alex Rutherford. Through a unique interblend of fact and fiction, Rutherford has innovatively reinterpreted the Grand Mughal Empire. It looks at the way historical fiction reconstructs the past by providing an imaginary past through fiction. Alex Rutherford establishes an argumentative past through *Empire of the Moghul Series*. Plurality and multiplicity should be maintained as the touch stones of history as a discipline. Historical novelists create plurality of the past through their fictions to incorporate divergent voices or the unheard past. Rushdie writes about the ambiguity in history as: "History is always ambiguous. Facts are hard to establish and capable of being given many meanings. Reality is built on our prejudices, misconceptions, and ignorance as well as our perceptiveness and knowledge. (Imaginary Homelands 25).

Rutherford's novel in this series presents the magnificent Mughal reign in manifold ways and presents the challenging questions about the Grand Narrative of history. Alex Rutherford is the pen name of the couple writers Diana Preston and Michael Preston. They studied at the University of Oxford. Both of them wrote fiction and nonfiction under the Pseudonym of Alex Rutherford. This couple writers are global travellers and visited more than 140 countries. These travels across the world have given them the inputs for their fictions and non-fictions. India was one of their the favourite countries to write about. Both of them were enamoured by the magnificent Taj Mahal, which instilled them to create fictions about Mughal Empire. Alex Rutherford has spent almost two years in India researching every private and public aspects of the Mughal rule in India, examining the chronicles, battles, deaths, executions, diaries, and letters. These searches revealed before them the persuasive and gripping tales of the Mughal times.

Rutherford 's internationally best-selling series *Empire of the Moghul* depicts the rise and fall of the great Mughal Empire, the social scenario of the time, and the inner politics of the court that is beyond the purview of the historians. In their interview with *The Hindu*, Alex Rutherford revealed their mechanism

of writing together as: “We have always enjoyed working together, and we found that the process came relatively naturally. A real bonus is that writing can sometimes be a lonely business. It is great to have someone to share the highs and lows and talk through difficulties with. It’s harder for two writers to get writer’s block than one.”

*The Empire of the Moghul* series is a quintet. The novels in this series are, *Raiders from the North*, *Brothers at War*, *Ruler of the World*, *The Tainted Throne*, *The Serpent’s Tooth*, and *Traitors in the Shadow*. Through the novels in this series, Rutherford reconstructs the life and times of six major Mughal Emperors. The nonfiction works written under the pseudonym Alex Rutherford include, *A Pirate of Exquisite Mind: Explorer, Naturalist, and Buccaneer*, *The Life of William Dampier*, *Taj Mahal: Passion and Genius at the Heart of the Moghul Empire*, and *A Teardrop on the Cheek of Time: The Story of the Taj Mahal*.

Alex Rutherford has gone through all the available historical sources while reconstructing the Mughal world. While going through these resources, Rutherford recognised the inevitability of rereading the Mughal past. Historian Abul Faisi’s (1551-1602) *Akbarnama* is a prime historical record about the reign of Akbar. Babur’s autobiography, the first Islamic autobiography *Baburnama* evokes a living picture of the commencement of Mughal rule in India. Badauni, a noted historian and an orthodox Muslim of the Mughal court writes critically about the secular policies adopted by Akbar. *Tuzuk I Jahangiri*, the memoir written by Jahangir is a significant source to explore the dynamics of Jahangir’s time. Gulbadan Begum, the daughter of Humayun wrote *Humayunnama*, an account about the reign of Emperor Humayun gives a detailed account of the position of royal women in the court and their significance. ShahJahan’s eldest daughter Princess Jahanara Begum’s autobiographical Sufi treatise *Risala-i-Sahibiyah* gives the pen picture of the impact of Sufi order among the Mughal Emperors and queens.

The first novel in the series is *Raiders from the North*, which tells the compelling and exuberant history of Babur, the founder of the Empire in India. Babur is a daring conqueror and a descendant of Genghis Khan and Tamburlaine of Central Asia. The novel traces all facets of Mughal reign in India; the complete life of Babur, the imperial women, significance of Babur’s mother and grandmother in the administration, court life, preparations of war, political decisions, annexations, religious beliefs, climate, rivers, water sources, luxuries of court lives, women’s quarters, cuisines, the flora and fauna of the Mughal world and so on. Rutherford’s *Raiders from the North* gives a tenable social history of the time. New Historicist reading gives equal importance to the literary and historical narratives. As historical fiction is an intermix of fact and fiction, it supplements the academic history too. New Historicism perceives literary works as potential source to recreate history. It was a new reading strategy propagated by Stephen Greenblatt and Louis Montross.

New Historicism rose to the limelight with Stephen J. Greenblatt's publication of *Renaissance Self-Fashioning: From More to Shakespeare* (1980). His other works that studied the undercurrents of power relations in the Renaissance culture and act as a catalyst to the New Historicist movements include *The Forms of Power and the Power of Forms in the Renaissance* (1982), *Shakespearean Negotiations: The Circulation of Social Energy in Renaissance England* (1988), *Learning to Curse* (1990) and *Marvellous Possession: The Wonder of the New World* (1991). The chief theoretical artifice to understand the polyphonic nature of historiography was laid down by New Historicism and Cultural Materialism, postmodernism, and the ideas put forward by Foucault. The practitioners of New Historicism and Cultural Materialism believed that the past can be chiselled from various sources as Brannigan says, "legal, medical and penal documents, anecdotes, travel writings, ethnological and anthropological narratives and of course literary texts!" (3). While writing *Empire of the Moghul Series*, apart from official sources, Rutherford has depended upon autobiographies, biographies and other court records. New Historicist alleged literary texts as active by products of the socio- historical condition of its time. New Historicists and Cultural Materialists see literature as a powerful tool to study the past. For them, — literary texts are vehicles of power which act as useful objects of study in that they contain the same potential for power and subversion as existing in society generally. For them, the past constitutes the present and literature becomes a domain of politics.

H.Aram Veerer in *New Historicism* has identified and listed the key assumptions of New Historicism as:

- 1) that every expressive act is embedded in a network of material practices;
- 2) that every act of unmasking, critique, and opposition uses the tools it condemns risks falling prey to the practice it exposes;
- 3) that literary and non-literary texts circulate inseparably;
- 4) that no discourse, imaginative or archival gives access to unchanging truths nor express inalterable human nature;
- 5) Finally, a historical method and a language adequate to describe culture under capitalism participate in the economy they describe. (xi)

When Rutherford recreated the life and times of Babur in *Raiders from the North* The most trusted source was Babur's autobiography *Baburnama*. In this personal memoir Babur has a break from 1508 to 1519. Historiographers filled this gap with a poetical recreation just as novelists do. In *Raiders from the North*, Rutherford presents Babur as constantly resorts to his mother and his grandmother Khanzada Begum, his sister for taking political decisions. The novel commences by describing the greatness and achievement of Babur's father and the heroic legacy of their ancestor Timur. Some historians portray Timur as a barbarian, but in the novel, he is presented as a generous and honest war hero, "not that Timur was barbarian my son" (4).

The narrative of the novel *The Raiders from the North* begins in Central Asia in 1494. Babur was compelled to be the boy king at the age of twelve after the

unexpected demise of his father. With the help of his mother and grandmother, Babur ruled the country. But soon he lost power and became a king without a kingdom. From Kabul Babur turned his eyes towards Hindustan. He made several attempts to conquer it, but his fifth attempt was successful. In 1525, Babur's army could overthrow the Lodi Dynasty led by Ibrahim Lodi. Subsequently, Babur could achieve decisive victories against Rajputs and Afghans. Babur laid the foundation for Mughal dynasty. But his immense contributions in the growth and strengthening of Mughal dynasty came to a sudden end with the death of Babur on 28<sup>th</sup> December 1530, he was only forty-seven years then. Babur was very compassionate and a very charismatic character. His unique autobiographical sketch *Baburnama* is evidence of his literary skills and scholastic accomplishments and it is a true classic of world literature.

Babur gives a vivid description of his home places like Ferghana, Samarkand, and Kabul in his memoir. Alex Rutherford while giving the pen picture of Babur's early life uses these descriptions of his memoir as a source. Rutherford describes the beautiful nature of Samarkand in *Raiders from the North*: "...and Samarkand lay on the great Silk Route between China and Persia, surrounded by fertile fruit orchards and the fields of wheat and cotton, the richest of all the Timurid possessions. It's a very name meant Fat City while the Zarafshan River, which ran past its walls was called Gold Bearing".(37). Rutherford describes the natural beauty, eco system, birds and animals of Samarkand.

...and Samarkand lay on the great Silk Route between China and Persia, surrounded by fertile fruit orchards and the fields of wheat and cotton, the richest of all the Timurid possessions. It's a very name meant Fat City while the Zarafshan River, which ran past its walls was called Gold Bearing.

Alex Rutherford heavily depended upon the available historical sources for the reconstruction of the Mughal world. As an afterword to the novel Alex Rutherford writes about the composition of the novel, "I have described the principal events in their historical sequence, though condensing, combining or omitting some incidents and compressing some timescales"(491). At the same time Rutherford explains the poetic license in the creation of the novel as;

Babur's grandmother Esan Daulat – whose advice he says in the Baburnama, he relied on upon his youth -his mother KutlughNigar and his sister Khanzada all existed, as did his traitorous half-brother Jahangir. Babur's father indeed fell to his death from his dovecote at Akhsi when the battlements collapsed beneath him. Similarly, Babur's main enemies – Shah Ismail of Persia, Sulthan Ibrahim of Delhi, and Uzbek warlord Shaibani Khan, who did carry off Khanzada, are also historical. However, I have used the liberties afforded to historical novelists to flesh out some of the other characters or to create new ones based on the combination of real people important in Babur's life. Wazir Khan and Baisanghar fall into these categories, as indeed does Baburi – though in his memoirs Babur fondly of a market boy of that name. (492)

Alex Rutherford has contextualised their historical fictions with history, historical narrativity, and history fiction interface as an all-in-one mixture with a pluralistic narrative paradigm. Literary texts which reflect the socio historical background of the society is capable to generate history of that time. They created a kaleidoscopic aesthetic experience for the readers. These writers present themselves in the different historical context of Mughal India, revealing an extensive polychromatic view of the grand, colourful, and yet cast down the history of the Great Mughal Empire. *Raiders from the North* presents a veritable experience of Mughal world. It portrays the domestic as well as the public domain of the Mughal world. The novel unravels the charismatic personality of Babur and the challenges that he faced while establishing a robust dynasty in India.

**PROSPECTS AND IMPEDIMENTS OF CONFLICT  
RESOLUTION IN ASSAM WITH SPECIAL REFERENCE  
TO U.L.F.A.**

**DR. CHANDANA BHATTACHARJYA**

Assistant Professor of Political Science

University of Science & Technology

Meghalaya India

**Abstract:**

Conflict is a part of most of the states of modern time. With the passage of time conflict changes its nature. In case of India there are problem of insurgency in most of its parts. The insurgency in India starts soon after it got independence from the British's. The insurgency in North-East India is one of the oldest problems confronting modern India. Due to cultural differences and ignorance insurgency started in the region in early 90's. Assam which is very much part and parcel of the North-EastIndia, witnessed its first insurgent group in the name of United Liberation Front of Asom (ULFA) in April, 1979. After almost four decade the ULFA conflict is not yet fully solved though there is talk going on in between some of the members of ULFA and government. The present paper will try to look into the various prospects and impediments of the peace process in Assam with special reference to ULFA conflict.

**Key Words:** Conflict, State, Peace, ULFA, Civil Society

**Introduction**

Conflict is an inherent and ubiquitous element of human society. There is no human group or society in which life moves along in harmony at all times. Individuals do not always do what society expects them to do, and they frequently behave in ways that disrupt the social order. Every society is aware of the repercussions of unresolved conflicts. Consequently, every human group has developed informal and formal mechanisms to bring about conflict resolution. According to classical conflict resolution theory, "conflict is an intrinsic aspect of social change, but the way we deal with conflict is a matter of habit and choice". (Ramsbotham, Woodhouse, Miall. 2005:13)Though

conflict is always there between state and non-state actors, sometimes these conflicts resulted in violent incidents' and movements, which can be referred as insurgent movements. These insurgent movements created law and order problems and tried to change the existing system of the state. The problem of insurgency is one of the most significant questions confronting modern states. Although the problem of insurgency can be found in most of the countries in the world, the nature of the insurgency is not always the same. It has differed in form and intensity in various parts of the world at different times. It is seen that those who resort to insurgency almost seeks to overthrow the existing social, economic or political order and replace it by one of their choice.(Eriksson, Wallenstein, 2003: 593-602.)

The Ahoms ruled Assam for more than 600 years. In this long period, Assam has developed its own culture and political beliefs. Emergence of Sankardev and the Neo Voishnavite movement brought a lot of changes to the Assamese society. A greater Assamese nationality emerged in that period itself. In Assam the ULFA took birth in 7<sup>th</sup> April, 1979 as the first insurgent group of Assam. Most of the members of that time belonged to Asom Jatiyotabadi Yubo Chatra Parisad (AJYCP). The group was banned under the Unlawful Activities (Prevention) Act, 1967, by the government of India as it demands a sovereign Assam. The geographical difference from the main land India, strong desire of some tribal groups to make an independent state before India's Independence, the breakdown of Ahom Kingdom, immigration, the growing nationalist feelings amongst the middle class of Assam, the nature of India's central government, feeling of deprivation of the people of Assam and the various movements against imperialism in other parts of the world are some of the most important reasons of the birth of ULFA. The demand of an independent Nagaland by the people of Nagaland also played an important role in creating the feeling of alienation in the minds of a large section of peoples from Assam. In the 1970s when the Naxalite movement was very strong in India, Assam also came under its influence. Many educated youth of Assam were attracted to the ideology of ULFA and during the period 1985-87 more than 500 members joined ULFA including girls. Many people got their training in Kachin. ULFA established a very good relation with National Socialist Council of Nagaland (NSCN) which is being regarded as the mother of all insurgent movements of North-East. The first connection of ULFA with undivided NSCN was established in 1982 in an interior village of Ukhrul District of Manipur where the NSCN agreed to provide training to the ULFA cadres. By 1985, ULFA became a popular name among the youth of Assam. ULFA's relationship with AJYCP to begin with, was the most important factor behind such popularity. It is through various branches of AJYCP that ULFA became a household name in Assam. According to one estimate, by the time Assam Accord was signed, ULFA had a total strength of 1,500 cadres. Till date there was three massive army operation was done by the Indian army against

ULFA, these operations weakened ULFA to quite a large extent but not able to eradicate it completely. For the interest of the people of Assam it is very important to resolve the ULFA issue with peace processes, as the use of violence from both government and ULFA harasses the common masses.

**Objective of the study:**

1. To study the necessity of the peace process with ULFA
2. To study the prospects and impediments of the ongoing peace process.

**Methodology:**

The methodology for this study is primarily descriptive and analytical. The data for the study was collected from primary and secondary sources. The Primary data has been collected through interviews with civil society members and ULFA leaders. The Secondary sources include books, articles, newspapers, magazines and journals that present commentaries of Civil Society, ULFA and Government policies. Qualitative analysis of the data was done

Conflict directed against the state and the state's responses to such conflicts are a processual couple. Each shapes the other in a continuing process of unequal reciprocation of experience and apprehension. (Ray: 1991:14) To resolve various kinds of conflicts, the state's possible choices can be categorized as conflict regulation, conflict repression and conflict resolution. The government of India has its own methods and techniques in dealing with the various insurgent movements. Using of military and para military forces are the most important technique of the Indian government against the insurgents. The Union as well as the States Government of India takes these movements of secessionism with serious concern. They treat these issues as a great threat towards the national integration of India. The central government of India believes in tackling these issues with strong hands and no mercy is shown against those who engage in these kinds of activities. The government of India takes these issues as anti-state and anti-integration. These activities are being banned through various laws passed by the Indian parliament. Union government gives strict instructions to the state governments to deal strongly with insurgent movements. To fight against the insurgency led by ULFA government of India strikes with the following army operations-  
Operation Bajrang in 1990:

This is the first army operation launched against ULFA when they started targeting the tea lobby of Assam. This operation was unsuccessful as the ULFA leaders and cadres went underground. The mass support helped ULFA at that time. They got the information about the operation from the people enmeshed in the bureaucracy beforehand. This Operation shows the nexus between ULFA and the government officials. An hour before the Operation was launched ULFA leaders were informed about the Operation. The strong network of ULFA with the officials including Assam police helped ULFA in surviving at that time. The wide range of connection with the state government helped ULFA members safely hide out from it.

Operation Rhino in 1991:

The second Army Operation against ULFA regarded as a success from the point of view of the government. This Operation was launched when ULFA started killing and kidnapping the engineers from the ONGC and OIL. Most of the ULFA camps were destroyed, many cadres were being killed.

Operation All-Clear in 2001:

In 2001 Indian Army with the help of Royal Bhutan Army started Operation against ULFA in the forest of Bhutan. It was one of the most successful operations of Indian Army against ULFA. Most of the ULFA leaders were arrested or get killed. This was the biggest Army Operation against ULFA. Most of the ULFA camps which were situated in the deep forest of Bhutan were destroyed.

The army operations worsen the situation in Assam and ULFA became more aggressive which led to gross human rights violation and created severe law and order situation in Assam. After a decade long violence and terror The Indian government was successful in arresting the top brass of ULFA leaders in Bangladesh. The change in Bangladesh politics with the leadership of Sheikh Hasina of Awami League as the prime minister of it helped Indian government in attaining some diplomatic relations with its neighboring country. After the arrest of almost all the senior members of ULFA excluding its Commander-in-chief Paresh Barua, the central government putted them behind the bars. The civil society of Assam competes against this decision of the government. They wanted both the conflicting parties to sit in the negotiation table for the greater and sustainable peace in Assam. At first both government and arrested ULFA leaders were rejecting the view of the civil society on their own ground, but with the strong intervention of the Assamese intellectual section with the leadership of Prof. Hiren Gohain central government and ULFA leaders agrees to the peace talk. The talk started from 2012 which is still continuing without any prior outcome.

#### **Responses of ULFA towards peace process:**

ULFA was totally broken after the third Army Operation. In the year 2005, ULFA initiated talks with the government of India from its own side and formed People's Consultative Groups (PCG). The discussion between PCG and government of India ended into a failure after having three rounds of talks, as both the Government and ULFA violated the norms of the peace process. Another peace initiative was taken up by the 28 battalion of ULFA in the year 2008 when the battalion announces cease fire with the Government. (Mahanta, 2013:148) The A and C company of the battalion declared cease-fire with the government and the cadres of the groups started living in the designated camps of Kakopathar. The most important event which changed the position as well as divided ULFA in to two sections happened when the top brass of ULFA leaders including its Chairmen, Deputy Commander-in- Chief, Foreign Secretary and Finance Secretary were arrested by Bangladesh Army in the

border areas of Bangladesh in the year 2010. The arrested leaders were handed over to India are now indulging in peace process where the Commander-in-Chief of ULFA Paresh Baruah who is still subversive and opposes the talks and declares the other group as unconstitutional according to the constitution of ULFA. Irrespective of the opposition comes from some of the radical ULFA members; most of the senior leaders of the group are indulging themselves with the peace process started by the government of India with the help of the civil society of Assam.

**The prospects and impediments in the peace process:**

Though the peace process is going on in between Government of India and the leaders of ULFA there are many obstructions in its success. The ongoing peace process between Government and ULFA is the most anticipated issue for the people of Assam. This is the first peace process where the ULFA leaders are directly involved in the four decades of ULFA history. Though there were many initiatives to start a peace process between ULFA and government not a single initiative was successful yet. The pressures from the civil society of Assam upon the ULFA leaders, arrest of top brass of ULFA are the most important factors for this development.

The present peace process brings lot of hope not only for the people of Assam but also for the ULFA leaders who are engaged in the peace process. The approach taken by the ULFA leaders can be regarded as a positive sign for the peace process. Since 1990, the government has taken initiative to start the peace talk. In this regard some success was achieved by the government when some sections of the ULFA leader came forward to talk. The most positive impact is that it able to bring the ULFA to the negotiation table without any pre-conditions. There is a growing weariness among the common people of the state and an increasing demand for peace. The civil society intervention has brought about a sea change in peace process of Assam. Suffice it to say that in order to restore peace in Assam, the active participation of these civil society organizations is essential and the various civil society organizations are moving in the right direction in spite of the various structural constraints. Thus, the involvement of civil society organization in the peace process is considered as necessary and a positive step in order to restore peace in Assam.

Yet, this view is fundamentally at odds with the position favored by the Assamese public, which is that the conflict must be settled through negotiations and compromise. Despite ample evidence of a significantly weakened ULFA, no one expects a sudden outbreak of peace in Assam. This presents us with a paradox of sorts-continued conflict irrespective of the government's military success against the armed insurgent group and the groups own internal weakening. Even though the Operation All Clear was a severe setback to ULFA, however, it could not write ULFA's epitaph. (Mahanta, 2013:112)

Now the state is applying diplomatic tools to solve the issue. It agreed to the demands of the civil society groups to release the ULFA leaders from the jail so that they can freely join the peace process. This approach of the state brings a positive environment for the peace process. Despite this attitude of the state some allegations are also there about the role of the state in the whole peace process. Delaying in the peace process can be seen as one of the impediments of the peace process. The peace process has already crossed 10 years but till now no constructive outcome is there. The reluctance shown by the government in the process creates doubts in the minds of the people of Assam as well as the ULFA leaders who are involved in the process. On the other hand government has its own reasons for the delaying of the peace process. But on the other hand government is denied deliberate delaying of the process. As there is a change in the central government so the process delayed due to some official concern.

The weak role of government of Assam is also regarded as one of the major impediments in the conflict resolution process with ULFA. According to the constitution of India solving a matter of dispute with the insurgents comes under the central list which is why the government of Assam is not eligible to intervene in the process. In India the state government can only prepare the grounds for talk; once the peace process starts it is being handled by the central government.

The absence of ULFA's Commander in chief Paresh Barua in the peace process can be regarded as the most important impediment of the peace process. He is continuously taking stand against this peace talk. The government and the ULFA pro talk group are inviting him to join the peace process but he refused to come out without discussing the matter of sovereignty. The non-compromising attitude of Paresh Baruah divides ULFA into two groups. There are very chances of creating disturbances from his side to make the process unsuccessful. Peace process would be in right tract only when the whole group of ULFA comes forward to hold direct talk with the government. The division between ULFA can create more tensions in the coming years. To mobilize each and every cadres of the group is more important. The people who are still in the path of violence should also understand the reality. The people who are now indulging in peace process are arrested people, but to bring the other members of the group is more important and challenging. Without the participation of all the members of ULFA the process will remain incomplete. If the process fails it will strengthen the hands of Paresh Baruah.

Many observers and analysts contend that the ULFA's decision to enter the peace process is a significant move. However, the impediments to peace process bring a big question mark in the success of it. There is a need of the Union and Assam government to remain cautious on the possibility of the anti-talk ULFA faction led by Paresh Baruah Commander in Chief who engaged in violent activities in order to derail the peace process of Assam. A

negotiated settlement to the ULFA problem is possible only when there is an abandonment of certain demands, from both sides. If the ULFA gives up the issue of sovereignty and manage it within the constitutional framework, peace is possible as per the government. Furthermore, the ULFA also must be sincere and abjure violence. On the other hand, the government must also give up some of its hard steps, like the army operations; though risky, it would make easier to facilitate direct talks with the group. The previous talks were unproductive as both sides relentlessly pursued confidence destroying measures, such as political violence on ULFA's part and counterinsurgency operations by the government. Thus, there was little chance of building the kind of trust necessary for the talks to succeed.

**Conclusion:**

The peace process can be a successful one if both the parties come to an agreement. The role of the Indian government is more important here. The process can be faster if the government wishes. The participation of the state government of Assam can also speed up the whole process; the state government is restricted to take part in any peace talks with the rebel groups as national security comes under the central list of Indian constitution. But for the durable peace in Assam this constraint can be lessened. The issues which are been raised by ULFA apart from sovereignty of Assam are the basic demands of the people of Assam which can be solved within a short period of time. To remove all the impediments to the peace process, both state and ULFA have to work together as it will have a major implication on the lives of the people of Assam. The ongoing peace process which is a most awaited one for the people of Assam can end a forty decades old conflict between the ULFA and the government.

## **KUWAIT AND GULF WAR: A HISTORICAL CONTEXT**

**DR. SURESH KUMAR**

Associate Professor of History  
Pt. N. R. S. Government College  
Rohtak India

### **Abstract**

Kuwait is a Sovereign Republic but as described in the preceding chapter1 Saddam Hussein left no stone unturned to bring it under his tyrannical rule. He claimed Kuwait as an integral part of Iraq. In 1965, Iraq's foreign minister discussed his Government's demand with the Kuwait's Foreign Minister. Iraq wanted that Kuwait should atleast give up the two islands of Warba and Bebyan and territory that Kuwait occupied close to Iraq's unmarked border. At that time Kuwait's Foreign Minister refused the demand saying that his Government might agree to the idea of renting Warba island to Iraq for 99 years. Prom 1974 to 1977, several meetings were held between Iraq and Kuwait, but none of them reached fruition. The Sheikhs of Kuwait under prodding from Washington, wanted to change the character of the area adjacent to the Iraqi border by setting up police posts, farms, plantations, embankments and drilling of Wells 'to pump out Oil from Iraqi Oil Fields of Rumaila. Algiers Summit of 1988 added fuel to the fire. The Iraqi Foreign Minister informed the Kuwaitis that Saddam Hussein desired to solve the Iraqi-Kuwait border issue once and for all. The offer was evaded by the Kuwaitis. All these factors were piling up as explosives.

**Key words:** Kuwait, Gulf war, Oil fields

### **Introduction**

In meantime Iraq was reeling under financial problem. At the Baghdad Arab Summit. Saddam told his peers from other Arab Countries that a drop in oil prices by one dollar a barrel would cast Iraq one billion dollar a year. Iraqi officials now contend that only hours after the Jedd ah meeting of representatives of Saudi Arabia, Kuwait and U.A.E. when it was decided that oil price should be fixed at \$18 a barrel, Kuwait said that it would ask for an increased quota at October 1990, OPEC meeting to assure the U05. and

Britain that Jeddeh decision Was not final. The truth is that the average Oil production by the Arab States is 14 million barrels a day. The deterioration of prices between 1981-1990 led to a loss by the Arabs of nearly 500 billion barrels, 89 billion of which was suffered by Iraq alone.

“Iraqi anger against Kuwait further rested on the premise that the latter was extracting oil from the Iraqi side of Rumails field to the extent of \$2,400 million at the prices prevailing between 1980 and 1990. Iraq presently wants every dollar it can save, considering that during its eight—year war with Iran it spent \$102 billion in purchasing arms from the West. During the Iran War the West gained both ways.<sup>11</sup>

The opulence and glitter of Kuwait attracted Saddam and he invaded Kuwait bring about pillage of Kuwait at exorbitant scale : “Saddam ordered his men to bring home everything undamaged. The pillage had been at the two levels: at the level of occupation government for National gain and at the level of Iraqi Troops for individual gain.<sup>12</sup> The Iraqi soldiers took full advantage of Saddam’s vendict. They toolted the royal palace, plundered the Central Bank of Kuwait, carted off the food stock pile to Iraq and stripped the country bare, The hungry Iraqi soldiers shot and ate every edible animal in Kuwait’s city zoo. The Iraqi’s were not considerate to the sick even. Saddam ordered his troops to adopt scorched earth tactics in Kuwait. Before Iraqi invasion Kuwait had been pumping crude oil from nearly 1000 oil wells, Saddam’s agents put 500 of them on fire and damaged the rest of them completely. Saddam used oil as a war-weapon and declared an unholy wax upon the ecosystem of the Gulf and the entire West-Asian region. He ordered his men to open the spigots of Kuwaits main super tanker and more than one billion litres of oil found its way into the Gulf. “Saddam wanted to achieve a number of objectives by this unprecedented oil spill:

- (a) to spoil the chances of an amphibious invasion by the US marines upon Kuwait;
- (b) to force Saudi Arabia to shut down its desalination plants on the Gulf, thus cutting the supply of drinking water to the Eastern province of Saudi Arabia and the Allied forces encamped in the Area;
- (c) To compel Saudi Arabia to close down its power stations and oil refineries on the Gulf by denying them a proper supply of sea water for cooling purposes; and
- (d) to spread eco terror in the entire region by causing risk of life for millions of creatures that inhabit the Gulf region.<sup>13</sup>

<sup>11</sup>. Khanna O.P.: *Disastrous War in Gulf : Ruins, Myths & Miscalculations*, The Competition Master : March, 1991, P : 556.

<sup>12</sup>. Mittal N.S.: *An Unfinished War : Saddam Under Sieze* New Delhi, 1991, P 77

<sup>13</sup>. Mittal N.S.: *An Unfinished War : Saddam Under Siege*, New Delhi, 1991, P : 78

AS Saddam failed to acquire the desired Oil Fields of Rumaila and two islands on long lease from Kuwait by fair means; I he stooped to foul means and acquired his objectives at the cost of innocent lives.

Iraq's occupation of Kuwait in such a manner was opposed by Security Council.

“There have been 12 Security Council resolutions against Iraq following its unprovoked occupation of Kuwait on August 2, 1990. However, Israel which has always been condemned internationally due to its defiance of the UN Charter and resolutions, should not be an example to be followed by Iraq. Aggression can never be rectified by another aggression.<sup>14</sup>

In August 1990, many resolutions were passed by President Bush. The UN Security Council called its member countries to impose economic and Military sanctions against Iraq. It was believed that Iraq would be pressurized by UN to withdraw its forces from Kuwait.

The US and the British forces became alert even before the Security Council asked Iraqi President to take out his forces from Kuwait and said that, “the UN member states could otherwise use all necessary measures to secure the objective. The US has stated that all necessary measures include the use of Military forces.<sup>15</sup>

In the meantime, Saddam Hussein had taken all necessary measures to create terror in Kuwait. He put into execution his home policy in Kuwait too.

“It is estimated that more than 200 Kuwaitis had been murdered by the Iraqi intelligence and troops. According to Mrs. Awadi, an authority on international law, more than 100,000 Kuwaitis had been taken away to Iraq as hostages and about 17,000 detained in Prisoners of War Camps.<sup>16</sup>

Saddam Hussein acted as a hypocrite on the issue of the withdrawal of Iraqi army from Kuwait. Saddam Hussein refused to comply with the directives of the US President and declared that he would not be dictated by the US or any other nation regarding the dates for talks while President Bush agreed to change the dates for commencing talks, President Saddam Hussein announced on January 4, his willingness to start talks in Geneva, Saddam Hussein sought an assurance that the U.S. would not launch a military strike against Iraq while Mr. Bush insisted on Iraq's unconditional pull-out from Kuwait. The deadline of January 15, 1991, for withdrawal of Iraqi forces was not observed by President Saddam Hussein. The month of July 1990, had already sown the seeds of Gulf War. The forcible entry of Iraqi troops in Kuwait, Saddam's forcible acquisition of the Oil Fields of Rumaila and the

<sup>15</sup>. Khanna O.P.: *Disastrous War in Gulf: Ruins, Myths & Miscalculations*, The Competition Master: March, 1991, P : 558.

<sup>16</sup>. Mittal N.S.: *An Unfinished War : Saddam Under Siege*, New Delhi, 1991, P : 78.

efforts of U.N. Security Council to likenate Kuwait, aggravated the situation further. In October 1990, the Iraqi Offer to sell Oil at half rates added fuel to the fire. Russia and France stressed on settling the Gulf crisis peacefully while “The U.S. Senate passed 96—3, a resolution supporting Military Deployment in the Gulf.<sup>17</sup> The month of November and December 1990 set the pot of hot-question boiling to a great extent. The first sixteen days of new year came as premonition of War. All efforts to end the cold war with a peace treaty failed to pacify the blood-thirsty Saddam Hussein. Various efforts were made to establish peace between Iraq and U.S. which are enumerated below :

- (a) UN Secretary General Javier Perez de Cuellar meets with President Hussein in Baghdad.
- (b) Perez de Cuellar says he had not made any ‘progress’ during his talks with Hussein. Bush signs the congressional resolution authorising use of force against Iraq.
- (c) UN Security Council dead locked over French peace plan.
- (d) De Cuellar asked for an Iraqi commitment to Kuwait to pull-out in return for a promise of a comprehensive UN review of the Palestine issue.
- (e) President Bush starts hostilities against Iraq.<sup>18</sup>

Ultimately, the darkness of January 18, 1991 was enlightened by the operation Desert Storm for which “President Bush declared, there are times in life when we confront values worth dying for. This is one such time. At this Saddam’s retout Was, Should the Americans become. embroiled, we will make them swim in their Blood, God willing.<sup>19</sup>

**Conclusion:**

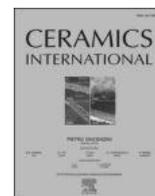

As the Gulf War took momentum, five of the Arab nations- Algeria, Morocco, Tunisia, Libya and Moritania put forth an earnest appeal to the UN Security Council to call for a cease fire But Saddam turned down their request in a high-handed manner. By February the Gulf War had engulfed the peace of the whole world. Those who were directly involved lived in constant fear of death while the others involved indirectly with War apprehended the destruction of Mother Earth. Saddam adopted certain measures for open purchase of Military weapons from Russia and believed in clandestine purchase of arms and apprehended from the West, specially from the U.S. Saddam Hussein sneaked away 5% of Iraq’s Oil Currency and deposited it in secret Swiss Banks. This money was utilized for purchasing Military hardware on clandestine ground.

Silica nanoparticles

## ABSTRACT

Over the past few decades, the study of superhydrophobic coatings (SHCs) gained the significant interest of worldwide researchers due to their tremendous applications in various sectors including, the metal industry, membrane industry, automation, structures, marine, defense, and medicines. The literature is full of review papers on the basics of SHCs, their synthesis methods, and their applications. But, minimal reviews are available on silica nanoparticles-based SHCs. However, silica nanoparticles are well-known material for SHCs due to their abundance, economical, transparency and ease of surface modification by various surface-functionalizing agents compared to other nanomaterials. Furthermore, silica nanoparticles are the most preferred material for the generation of nano-level roughness in the coatings to exhibit superhydrophobicity. Therefore, there is a great need to work in this direction. This work is dedicated to the challenges, recent progress and applications of silica nanoparticles-based superhydrophobic coatings.

## 1. Introduction

In the past few decades, superhydrophobic (SH) surfaces gained significant attention from researchers around the globe due to their tremendous applications in various sectors including, the metal industry, membrane industry, automation, structures, marine, defense, and medicines. The water repellent properties of SH surfaces are an effective area of exploration. The water droplets can bounce and slide off easily over the SH surfaces due to low contact angle (CA) hysteresis [1–4]. Superhydrophobicity can be achieved by controlling two crucial parameters such as (i) surface energy and (ii) surface geometrical structure. Surface energy and hydrophobicity are inversely proportional to each other. The chemical compositions of a solid surface decide its surface energy and significantly influences its wetting behavior [5]. Under certain circumstances, diminishing the surface energy is not enough to achieve superhydrophobicity. This concept was realized long back by Nishino et al. [6], who reported the  $-CF_3$ - terminated smooth surface with the lowest free energy exhibits good hydrophobicity with a maximum CA of  $120^\circ$  only. So, that surface cannot be converted into SH surface without introducing new features in it. However, the novel element in terms of micro-nano hierarchical roughness and low surface

energy jointly can enhance the CA angle beyond  $150^\circ$ , converting the hydrophobic surface into a SH surface. Therefore, the dust accumulation problem on solar panels can be solved effectively by coating the solar cell cover glass with SHCs. Due to the superhydrophobicity, the adhesive force between water and solid surface is significantly reduced and makes the collection of dust particles easy for the water droplets during their rolling off from the surface. The rolling of water droplets with dust particles clears the solid surface and this phenomenon is known as the self-cleaning mechanism of the SH surfaces. The micro-nano hierarchical roughness can be created by introducing nanostructures into the surface material [7,8]. Over the past few decades, SH surfaces have been prepared using a variety of nanostructures such as nanoparticles, carbon nanotubes (CNTs) and nanoflakes. Due to the presence of nanostructures, such surfaces generates nano-level roughness and their surface energy can be reduced by using low surface energy functionalizing agents [7–11].

According to Wenzel, the liquid follows the surface roughness. The liquid drops create good contact almost at all the points of the solid surface that means it completely fills and wets the grooves of the rough solid surface [12]. According to Cassie and Baxter, low CA hysteresis and high water CA on a surface consisting of nano-pores are owing to air

trapped between these nano-pores. The entrapped air in nano-pores leads to the generation of a layer of air between the liquid and solid surface, resulting in a shrinking contact area between them. The trapped air reduces the bonding of a subsequent layer of dust and significantly diminishes dust accumulation on the solid surface. Hence, the SH nanocomposite coatings on solid surfaces show anti-dust deposition potential. Some low surface energy materials like tetra-fluoro-ethylene and organo-poly-siloxane, which modify polymer-based coatings, demonstrated a significant reduction in dust deposition and can be considered as efficient candidates for self-cleaning coatings. For energy conversion devices, like a solar panel, an indestructible and eco-friendly coating can be employed as the inherent coating to sustain its efficiency by obstructing the dust deposition. Besides the durability of the coating, optical transparency is also crucial for the solar panel because with the increase in transmission of solar radiation, solar efficiency increases. The SH coatings exhibit surface roughness, which can cause the scattering of light and thereby hampers the efficiency of solar panels. Superhydrophobicity and transparency are contradictory properties. Therefore to develop transparent superhydrophobic coatings for solar panels, a precise balance between surface roughness and transparency of the coating is essential.

However, silica nanoparticles are well-known material for SHCs due to their abundance, economical, transparency and ease of surface modification by various surface-functionalizing agents compared to other nanomaterials [13–19]. However, hardly any reviews are available in the literature focused on silica nanoparticles-based superhydrophobic coatings. Therefore, in the present work, the challenges, recent progress and applications of silica nanoparticles based superhydrophobic coatings are presented.

## 2. Challenges in the development of SHCs

Over the past few years, the development in the field of SHCs is quite impressive due to their wide range of applications in various sectors. However, the adoption of developed SHCs in the real world is limited due to various challenges with the coatings [20]. Some major challenges associated with the SHCs are described below:

- (a) **Surface strength and stability:** In the modern technical era, synthesis of the SHCs is not an issue. The main problem is maintaining and ensuring surface strength and stability when the coatings are exposed to harsh environmental situations. As the hydrostatic pressure-induced underwater at a depth of a few meters is enough to weaken the stability of the surface of the coating supporting the shift from Cassie to Wenzel state of the coating. Till now, no mechanism has evoked which can annul this change. Coating strength preservation is a significant concern for photovoltaic cells and self-cleaning windows. Abrasion and degradation of the coating lead to contamination and loss of the superhydrophobicity of the coating [21]. Moreover, SH coatings start degrading under harsh conditions [22,23]. Further research is needed to improve the strength and stability of SH surfaces to enhance their industrial and research relevance.
- (b) **Mechanical robustness and durability:** Usually, mechanical characteristics of smooth surfaces are better than uneven or rough surfaces. To attain a perfect SH structure similar to a set of needles or a pillars-like design approachable but exhibit inadequate stiffness that is not appropriate for robust applications. The required stiffness can be attained through a hemisphere-like structure, but that increases the area of contact, which becomes an issue for SH characteristics [22,24]. Micro-nano structures are mostly used to develop the SH surfaces that exhibit sensitivity towards the mechanical strain or stretch. The friction produced on the coatings due to rain, dirt and strong winds for a longer duration can destroy SH coatings easily. Passive regeneration and active repairing methods are suitable to control such damage.

Moreover, further research is imperative for the synthesis of such robust SH coatings [25,26].

- (c) **Multi-functionality relevance:** For some applications, it becomes challenging to combine both SH character and surface functionality simultaneously. For instance, in the optical industry, high transparency of components is a primary requirement. But, for transparent SHCs, light scattering is a severe concern because of the roughness of the coatings. If the roughness of the SHC is larger than 100 nm then the superhydrophobicity will increase but transparency will decrease and vice-versa. The visible light has a wavelength in the range of 400 nm–750 nm, but transparent SHC requires surface roughness less than 100 nm [25, 27–29]. Therefore, a precise balance between surface roughness and transparency of the coating is essential to achieve the multi-functionality of the SHCs.
- (d) **Defining new physical quantities:** Novel techniques are desired to measure the properties of SHCs. For instance, the CA fails to define the abrasion of liquid droplets over the surface, which demands the measurement of the physical quantity that explains irregular scaling and abrasion. Another quantity known as slip length can be defined as the ratio of surface velocity to surface shear rate that also needs to be defined in the case of SHCs. Moreover, further research is desired to obtain more physical quantities to know more about SHCs.
- (e) **Expensive materials:** Generally, the precursors required to produce SHCs are expensive. Even the transition processes for obtaining micron to nano topography desired for SHCs are costly. Some methods such as photolithography used to produce SHCs are expensive [30]. Some methods are cheap but produce non-durable SHCs. The overall expenditure to fabricate robust SHCs for large surfaces is quite costly. Therefore, there is a need to identify low-cost materials and methods to produce economical SHCs for large scale.
- (f) **Precipitation:** if the temperature goes down even from dew level to the point where condensation happens over the SHC, then the SHC becomes wet, leading to a transparent layer to behave as a non-repellent coating. SHCs repel water, which is a well-known concept but can they repel water vapors? Such issues need to be resolved by further research in this area.
- (g) **Air arrest issue:** Air trapped in micro/nano grooves of a SHC can be removed or reduced via exposing the coatings underwater jets with high pressure. The entrapped air can be removed via two techniques one is a confined creek of water, and another is wearing away of the surface submerged in water. It is well-known that superhydrophobicity is a surface characteristic, so a minor surface intrusion can create imperfections at the contact site [31]. Thus, permanent air capturing in micro/nano grooves is required via the self-healing coating concept to maintain the superhydrophobicity for longer duration.

## 3. Progress in silica nanoparticles based SHCs

Over the past few decades, an active investigation on SHCs has been performed due to their wide range of applications [32–36]. SHCs have been developed using a variety of synthesis methods, such as plasma treatment [37–41], lithography [14,30,37,42–44], sol-gel process [13, 45–53], chemical vapor deposition [54–58], electrospinning [52, 59–65], and colloidal assemblies [66–70]. However, the stability and durability of SHCs are critical to their widespread use. Researchers and manufacturers have used various nanoparticles such as silica, zinc oxide, alumina, titania, etc. to synthesize robust, stable and durable SHCs [13, 58,71–93]. In the present scenario, the selection of SiO<sub>2</sub> nanoparticles to synthesize SHCs are most preferred due to its abundance, economical, transparency and ease of converting it to superhydrophobic material. Therefore, in this review article, silica nanoparticles-based SHCs are reviewed and discussed in detail. Processing methods and properties of

silica nanoparticles-based SHCs are presented in Table 1.

Liu et al. [94] reported a simple and innovative sol-gel route to generate SH coating on a glass substrate using raspberry-like silica nanoparticles for self-cleaning application. A schematic illustration displaying the preparation of hydrophobic SiO<sub>2</sub> particles, SHC, and self-cleaning with water jet impact test is shown in Fig. 1. The coating was synthesized via fluoroalkoxysilane, which was allowed to condensate in ethanol at ambient temperature. Fig. 1(a–c) is displaying the optical photograph of raspberry, raspberry fruit-like silica particle and SH behavior of the coating. The water droplets on the developed coating revealed a spherical shape, with a CA of  $152 \pm 2^\circ$  and SA of  $10 \pm 0.5^\circ$  presenting the superhydrophobic character as shown in Fig. 1(d). The deposited dirt particles on the SHCs were efficiently cleaned by sliding water droplets. Fig. 1(e) illustrates the self-cleaning mechanism via the rapidly buckling of particles by water droplets due to low SA on SHC (Fig. 1(f)).

During the mechanical durability test, the SHC was exposed to a stream of the water jet for 30 s continuously (Fig. 1(g)) that indicating the easy repulsion of the water stream due to the SH nature of the surface. After the water jet impact test, the SEM images revealed negligible damage to the SHC at the micron level (Fig. 1(i)). However, during the increased exposure of water jet (120 s) the coating becomes unstable (Fig. 1(h)), resulting in wetting of the coated surface with decreased WCA of  $105^\circ$ , as clearly visible in the SEM Images (Fig. 1(j)). To stabilize the developed SHC, more research is needed in terms of optimizing nanoparticle size.

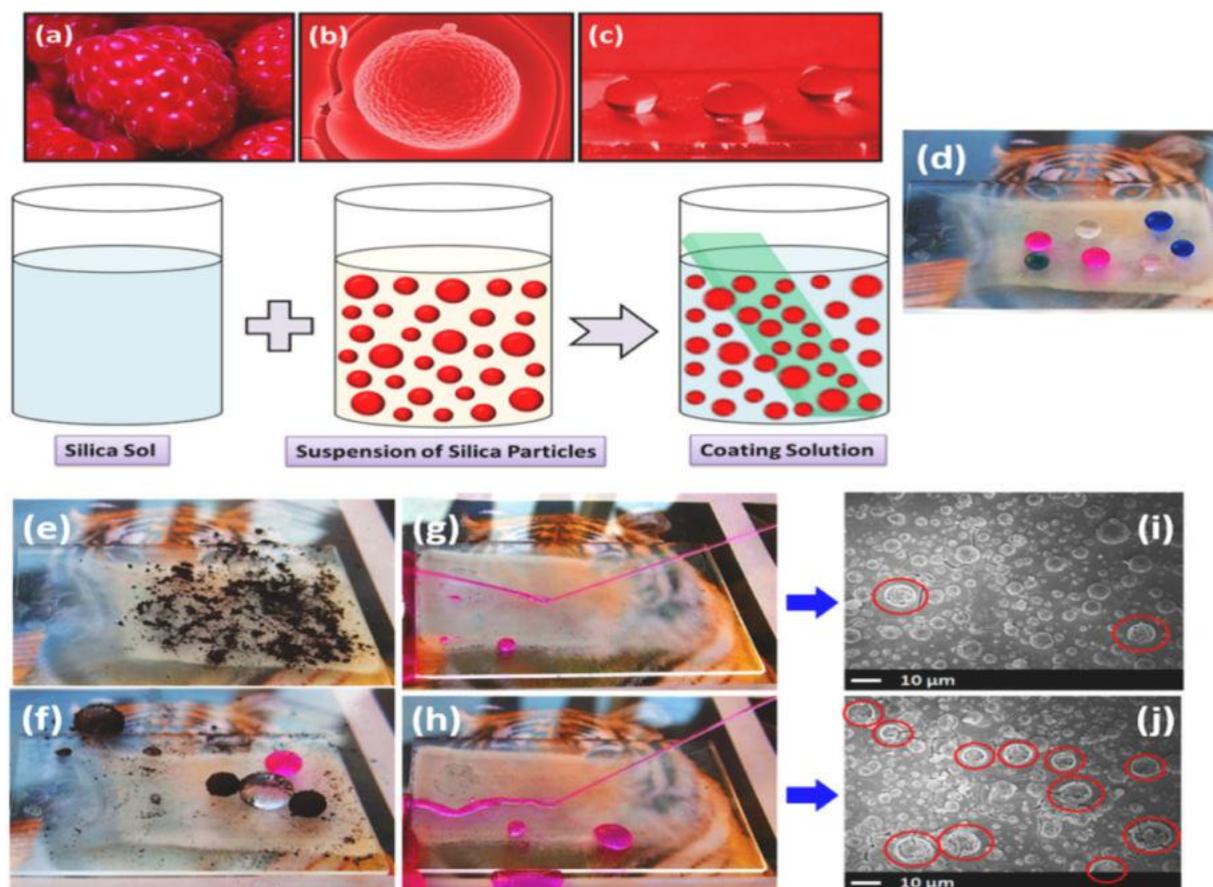

In another study, Mahato et al. [47] reported the preparation of environment-friendly highly hydrophobic coating on glass substrate using polystyrene (PS) as the base matrix. A silane agent 3-mercaptopropyltrimethoxy was used as an accumulating agent to obtain expected surface roughness. Another silane agent, chloro-trimethyl silane, was used to prepare the coating. Fig. 2 shows 2D and 3D AFM images of

PS/SiO<sub>2</sub> coatings with a 1% and a 5% content of SiO<sub>2</sub> nanoparticles. Fig. 2(a) shows an estimated roughness of 5 nm for PS/SiO<sub>2</sub>(1%). However, the significant rise in surface roughness shown in Fig. 2(b) for PS/SiO<sub>2</sub>(5%) suggests that surface roughness increases up to an optimal concentration of silica nanoparticles. It's not possible to increase CA any further without treating the nanoparticles or coating the surface with low-energy materials. However, the durability of the developed coating was not investigated.

In another study, Cui et al. [95] reported a novel and environment-friendly PVDF-PDA-SiO<sub>2</sub> membrane. To create the PVDF-PDA-SiO<sub>2</sub> nanostructure surface, phase inversion was used to coat polyvinylidene fluoride (PVDF) with polydopamine surface-modified with SiO<sub>2</sub>. Nanocomposites with polydopamine coatings have improved long-term stability as well as homogeneous SiO<sub>2</sub> dispersion on the membrane surface. Because of its unique micro nanostructure and pore-induced capillarity, the developed coating exhibits advanced super-hydrophilic/underwater superoleophobic characteristics as well as stunning antifouling oil performance. The hydrophobicity of several films was evaluated using the WCA values presented in Fig. 3. Purified PVDF has a WCA of  $132 \pm 2^\circ$  when mixed with 5  $\mu$ L of air-borne water, demonstrating that PVDF has a very hydrophobic membrane surface due to the enormous quantity of fluorine bonded to it as shown in Fig. 3(a). With a layer of dopamine on top of the film represented in Fig. 3(b), the film transitioned from hydrophobic to hydrophilic, with a WCA of about  $87 \pm 2^\circ$ , showing the dramatic recovery in the film's hydrophilic character from the film's hydrophobic character. Within 9 s of contact with a water drop on the PVDF-PDA-SiO<sub>2</sub> nanostructure surface, WCA dropped to  $0^\circ$  from  $18 \pm 2^\circ$ , demonstrating the material's remarkable hydrophilic nature as shown in Fig. 3(c). A novel micro-nano structure in the PVDF-PDA-SiO<sub>2</sub> nanostructure film provided exceptional hydrophilicity. A high value of CA at  $154 \pm 2^\circ$  was found in Fig. 3(d) having 5  $\mu$ L of dichloroethane, and images showed no change in CA as the exposure

period increased. This proves that nano-films are also antifouling. According to the results, the new nanostructure film possessed hydrophilic and superoleophobic properties, both of which are beneficial for improving oil-water emulsion separation.

Further, the mechanical stability of the PVDF-PDA- $\text{SiO}_2$  membrane was examined, and the membrane demonstrated outstanding efficiency of 98% even after ten cycles of dichloroethane-water emulsions devoid of surfactants and stabilized by surfactants.

In another work, Zhao et al. [96] reported durable anticorrosive SHCs for metals. They introduced an efficient method to develop SHCs. To make composite nanoparticles with a positive charge, several ultra-filtration criteria were utilized. The smooth surface of the steel substrate was converted to a rough surface with micro-nano level roughness by the sol-gel electro-decomposition technique. To customize the surface, researchers employed a fluorine-free reagent stearic acid with decreasing surface energy. Non-coated metal surface revealed a uniform surface with a WCA of  $69^\circ$  that is hydrophilic. However, the metal surface coated with modified  $\text{Al}_2\text{O}_3$ -KH560- $\text{SiO}_2$  shows a WCA of  $158.3^\circ$  indicating its superhydrophobic character. Film thickness was controlled by electrodeposition time. The electrodeposition time significantly affected the microstructure and roughness of the coating. Fig. 4(a) represents the electrodeposition time effectiveness on the super-hydrophobic character of the surface. The CA increases as the surface roughness increases, reaching  $158.3^\circ$  from  $147.5^\circ$ , but then it drops to  $144.6^\circ$ , which might be the consequence of a change in its roughness, as seen in Fig. 4(b and c). The nanoparticle deposition on metal was reduced because of the short deposition times, and the resulting surface roughness was unable to withstand water drops. Moreover, if deposition time increases, a large number of nanoparticles

were deposited on the metal surface, developing a thick layer that decreases the WCA presented in Fig. 4(c–f). The nanoparticle deposited metal substrate exhibited the highest CA of  $158.3^\circ$ . Later, (a.c.) impedance and polarization curves were used to assess the coating's anti-adhesion property in corrosive liquid. The specimens exhibited good SH properties at depositions of 3 min. However, the superhydrophobicity and surface deformation of the coated substrates occurred after 120 days in a corrosive environment exhibiting the excellent durability of the coating in a corrosive environment for a few months.

In another interesting work, Xu et al. [97] reported the preparation of a highly transparent, stable superhydrophobic coating via a facile sol-gel dip-coating route. Silica colloid particles of 60 nm were aggregated via  $\gamma$ -Aminopropyltriethoxysilane (APS) aggregating agent. Superhydrophobicity with high transparency and good thermal stability ( $20$ – $90^\circ\text{C}$ ) was achieved in a single coating. The surface features, transparency, and superhydrophobicity of the coating were tuned by controlling the concentration of the APS. An optimal quantity of APS (0.36%) results in a CA of  $155^\circ$ , with SA  $< 2^\circ$  and maximum transmittance of 88%. Optical images of water droplets on superhydrophobic coatings consisting different concentrations of APS (0.12%, 0.36%, 0.48% and 0.6%) are depicted in Fig. 5(a–d). However, the sliding of water droplets on the corresponding coatings (tilted at an angle less than  $2^\circ$ ) is displayed in Fig. 5(e–h).

The results indicate good thermal stability of the transparent superhydrophobic coatings useful for various optical applications.

Parale et al. [98] reported a simplistic and cost-effective method for preparing SHCs on various metal surfaces through a sol-gel/dip-coating method at ambient temperature. The root-mean-square (RMS) surface

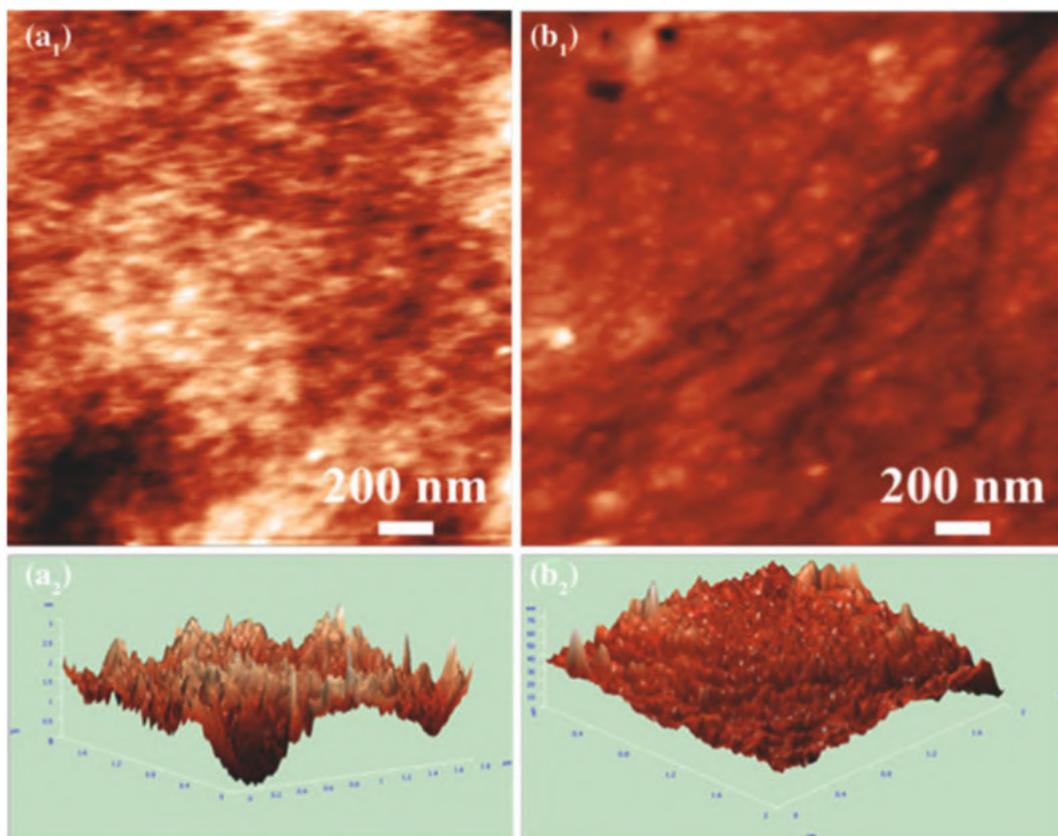

Fig. 2. AFM 2D and 3D pictures of (a) PS/SiO<sub>2</sub> (1%) and (b) PS/SiO<sub>2</sub> (5%) coatings [47].

roughness of 10.67, 15.06, and 0.41  $\mu\text{m}$  was obtained for different metal substrates layered with silica such as aluminium, copper, and bronze, respectively. The rough surfaces were found responsible for the

superhydrophobicity of the coated metals. Moreover, the silica nanoparticles did not exhibit any aggregation revealed by FESEM images of the substrates, as shown in Fig. 6. All the coated metal substrates exhibit

**Fig. 4.** (a) The variation in a WCA with the deposition time of nanoparticles, (b) SEM analysis at 0.5 min deposition, (c) 6 min deposition, (d) Si particle, (e) Fe particle (f) Cr particle with 6 min deposition [96].

**Fig. 5.** Optical images of water droplets on superhydrophobic coatings consisting different concentrations of APS (a) 0.12%, (b) 0.36%, (c) 0.48% and (d) 0.6%. The sliding of water droplets on the corresponding coatings (e–h) 0.6% (tilted at an angle less than 2°) [97].

$CA > 150^\circ$ . The FESEM micrographs presented that the coated surfaces were rough and had porous deformations. Additionally, anticorrosive properties were investigated through a chemical aging test. They have demonstrated direct exposure of metal surface layered with the film under corrosion species. Their sol-gel-derived coatings show anti-corrosion efficiency when exposed to 50% of HCl mixture for 100 h.

Moreover, the exposure of the coating for about 120 h in acid results in reduced WCA by  $10^\circ$  to  $15^\circ$ . They demonstrated merged surface shows large CAs due to an air/water interface that exhibits SH characteristics.

Anitha et al. [99] reported Salvinia-inspired fluorine-free SHCs via the introduction of nano  $\text{SiO}_2$ ,  $\text{TiO}_2$ , and aluminum stearate with metal silicates in silicone resin. The air spray method was used to prepare

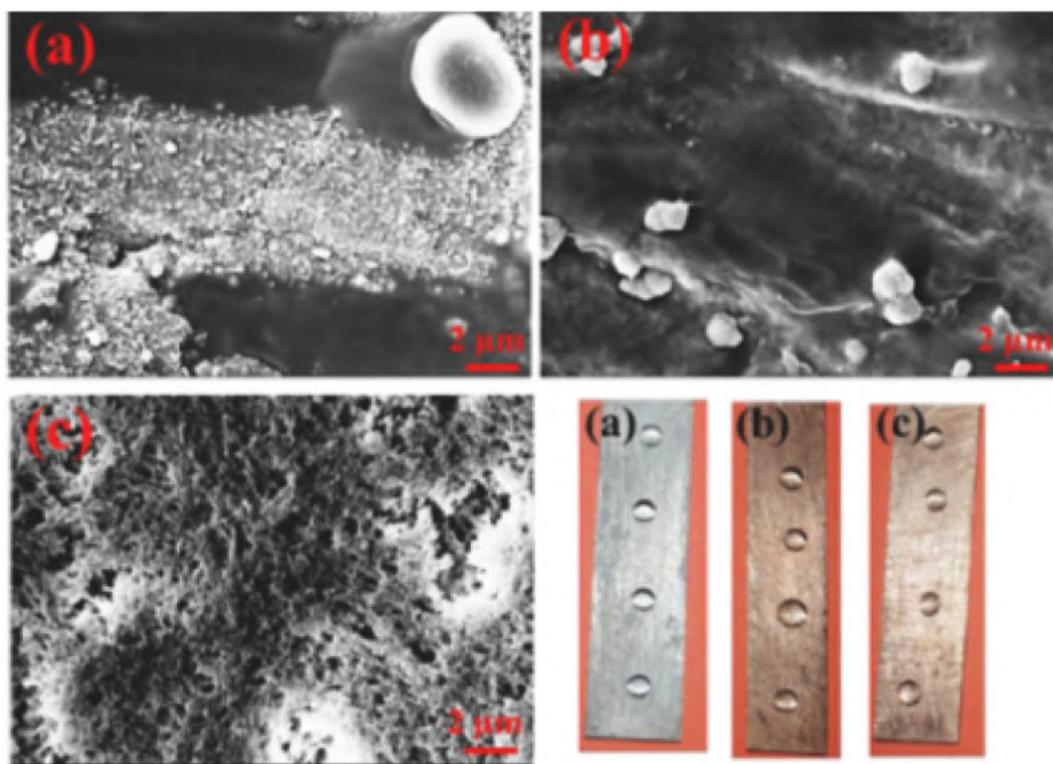

Fig. 6. FESEM images of silica nanoparticles consisting of layers over (a) aluminum, (b) bronze, (c), and copper substrates [98].

coatings of various compositions on mild steel. Virgin resin exhibits hydrophobic nature with a CA of  $93.5^\circ$  and SA of  $60^\circ$ . On introducing metal silicates and nano-silica, nano-titania, and aluminium stearate, the CA increases to  $156.8^\circ$ , and SA is reduced to  $28^\circ$ . Pigments with physical and chemical intimacy were found responsible for generating SHCs. A polymer binder helps pigments and additives to stay bound. Salvinia effect was found responsible for attaching liquid drops, which were applied to synthesize and accumulate silica pigments that exhibit hydrophilicity for cobalt silicate, copper silicate, iron silicate, and nickel silicate with WCA of  $62.0^\circ$ ,  $65.5^\circ$ ,  $84.6^\circ$ , and  $66.1^\circ$ , respectively. The hydrophilicity present among silicates was because of hydroxyl chains. The micro/nano dual roughness of the films was achieved by incorporating micro and nanoparticles which were found responsible for imparting SH property to the films. Additionally, anti-corrosion, adherence, water intake, and water vapor diffusion studies of the developed films were performed and it was realized that the films are reliable up to a certain extent and can be utilized for practical applications.

Fourmentin et al. [100] reported the synthesis of fluorine-free bio-stimulated silica packed cross-linked photo polyurethane-acrylate (PUA) nanostructure films. The loading of silica from 0 to 60 wt%, element composition and surface deformation at various scales including wetting properties of nanocomposite films were investigated. Fig. 7(a) shows different wettability characteristics of PUA nanocomposite based on silica content. The low content of silica up to 30 wt% exhibits the hydrophilic character of the nanocomposite, this is the Wenzel regime (Fig. 7(b)). However, silica content of 40 wt% shows prominent polar characteristics with micron-size roughness not enough to generate superhydrophobicity. However, the silica content of more than 50 wt% is found responsible for the superhydrophobic character of the nanocomposite with a WCA larger than  $150^\circ$ . The introduction of polydimethylsiloxane (PDMS) in the nanocomposite films increases the deformation of the nanostructure surface and hydrophobicity. The surface of nanocomposite films rotated through  $90^\circ$  revealed that the water drops sticking with the surface (Fig. 7(b)), such unusual wetting

behavior is the Cassie regime, and it shows the “rose petal effect”. The nanocomposite films with 60 wt% silica show zero water and coating interactions; this can be linked to variation from the Wenzel region to Cassie-Baxter region (Fig. 7(b)). In this regime, the adhesive nature of water decreases. For the surface of the coating, air cavities are produced in two scales – among primary silica that is nano-scale and fused silica that is micro-scale. At this level, water can't get inside air cavities that decrease major water contact regions over the surface. Roughness exposed to water is zero. Synthesized slippery and sticky nanostructure films showed long-lasting wettability performances.

Tavakoli et al. [101] reported the preparation of hydrophobic nanostructure of poly-dimethyl-siloxane (PDMS)- $\text{SiO}_2$ -CuO. A wet chemical technique was employed followed by a dip-coating process to prepare CuO and  $\text{SiO}_2$  nanopowders consisting of PDMS- $\text{SiO}_2$ -CuO (PSC) coatings. The developed superhydrophobic coating turns steel into biological compatible, anticorrosive, and anti-bacterial. Accumulating silica content enhances a WCA to  $89.5^\circ$ . Moreover, the WCA was promoted to  $142.8^\circ$  with the increase of CuO particle to  $<2$  wt% because of the surface roughness. The PDMS- $\text{SiO}_2$ -1wt%-Cu (PSC1) showed the highest hydrophobic behavior with a WCA  $146.8^\circ$ . However, PSC-0.5 wt% coating offers a maximum adhesive capability that is almost equivalent to a PDMS film as CuO accumulates more than silane content over the surface. The increase in CuO content up to 1 wt% (PSC-1 wt%) results in a magnificent reduction of corrosion current ( $I_{\text{corr}}$ ) values, and adding CuO content improves surface roughness from 1.14 to 2.49  $\mu\text{m}$ . Hence air can be trapped between microchannels under the coating to safeguard the surface from corrosion. However, the accumulation of CuO increases and develops micro openings over the surface. That deformation helps the corroded mixture get diffused in coating and reaches the steel surface to increase corrosion. The merging of CuO nanoparticles  $<2$  wt% enhanced the anti-corrosion property of steel. The developed PDMS- $\text{SiO}_2$ -CuO nanostructure coating is also useful in biomedical implants. However, the stability studies of the coating were not performed which is very much desired for their practical applications.

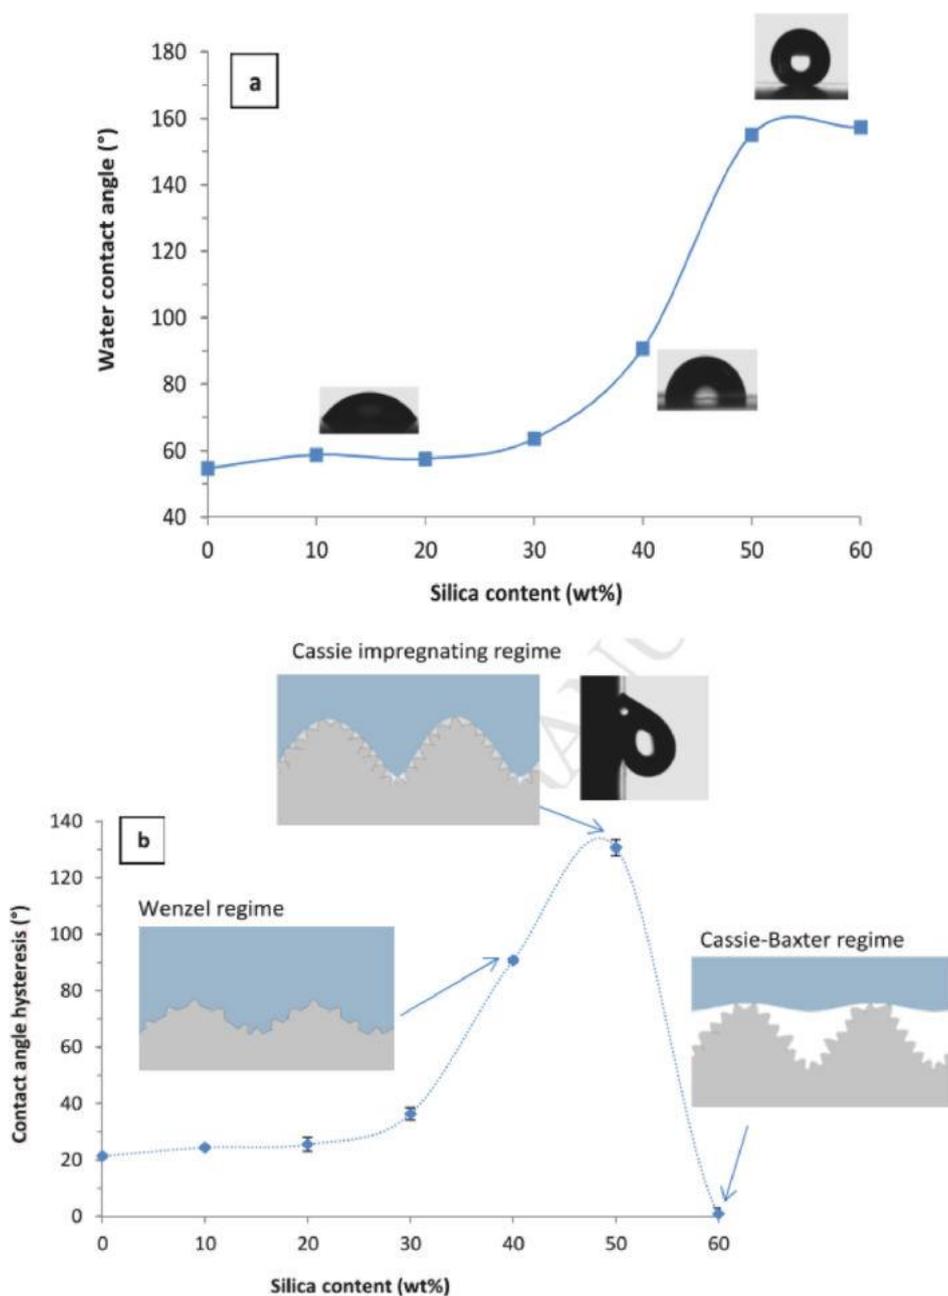

Fig. 7. (a) The variation of WCA with silica particle content, (b) the WCA hysteresis versus silica particle content. A graphic presentation of wettability systems [100].

Wang et al. [102] reported the integration of cotton fiber fabric epoxy composites: the composites containing hydrophobic nano  $\text{SiO}_2$ , polyfluoroalkoxy (PFA), and polyurethane (PU) to develop long-lasting wear-resistant SHC. Fig. 8(a and b) revealed surface morphologies of plain cotton fabrics and cotton fabrics processed through etching, and cotton with hydrophobicity was observed through SEM, which indicates that plain cotton had a closely packed structure and having stuck out the fabric. That shows some roughness of fiber, but the magnified picture shows raw cotton having an even surface. Fig. 8(c) tells that a chemically-etched cotton structure can entrap air in good quantity so that water drops can be rolled off. Fig. 8(d) reveals that pits above fiber contributed towards micro-scale roughness. So, the cotton processed through etching can exhibit super hydrophilicity (Fig. 8(e)). The hydrophobic cotton shows a rough surface having a PDMS cluster among gaps. But that doesn't create any variation to the rough surface of the etched and processed fabric (Fig. 8(f)). Such deformation of the surface

and less surface energy makes cotton more water repellent. Fig. 8(g and h) showed that the WCA of prepared films increases with increasing the value of PFA. With PFA as a single component in the epoxy mixture, nano-film had no SH characteristics and weak anti-corrosion property. However, PFA and silica in the epoxy mixture jointly showed SH characteristics but without corrosion resistance properties. However, mixing PU in the epoxy mixture with PFA and silica exhibits anticorrosive properties but with a small WCA. The PFA decreases the surface energy and helps to make a graded structure for increasing surface roughness, and makes the combination responsible for SH characteristics. At the same time, the presence of PU in the SHC offers good corrosion resistance. The relation between the WCA versus pH of the SHC is shown in Fig. 9. The findings show that pH change has no impact on the SHC's wetting capabilities. As a result, the developed coating has exceptional corrosion resistance even under extreme circumstances. Such anti-corrosion superhydrophobic coatings are of great interest to the

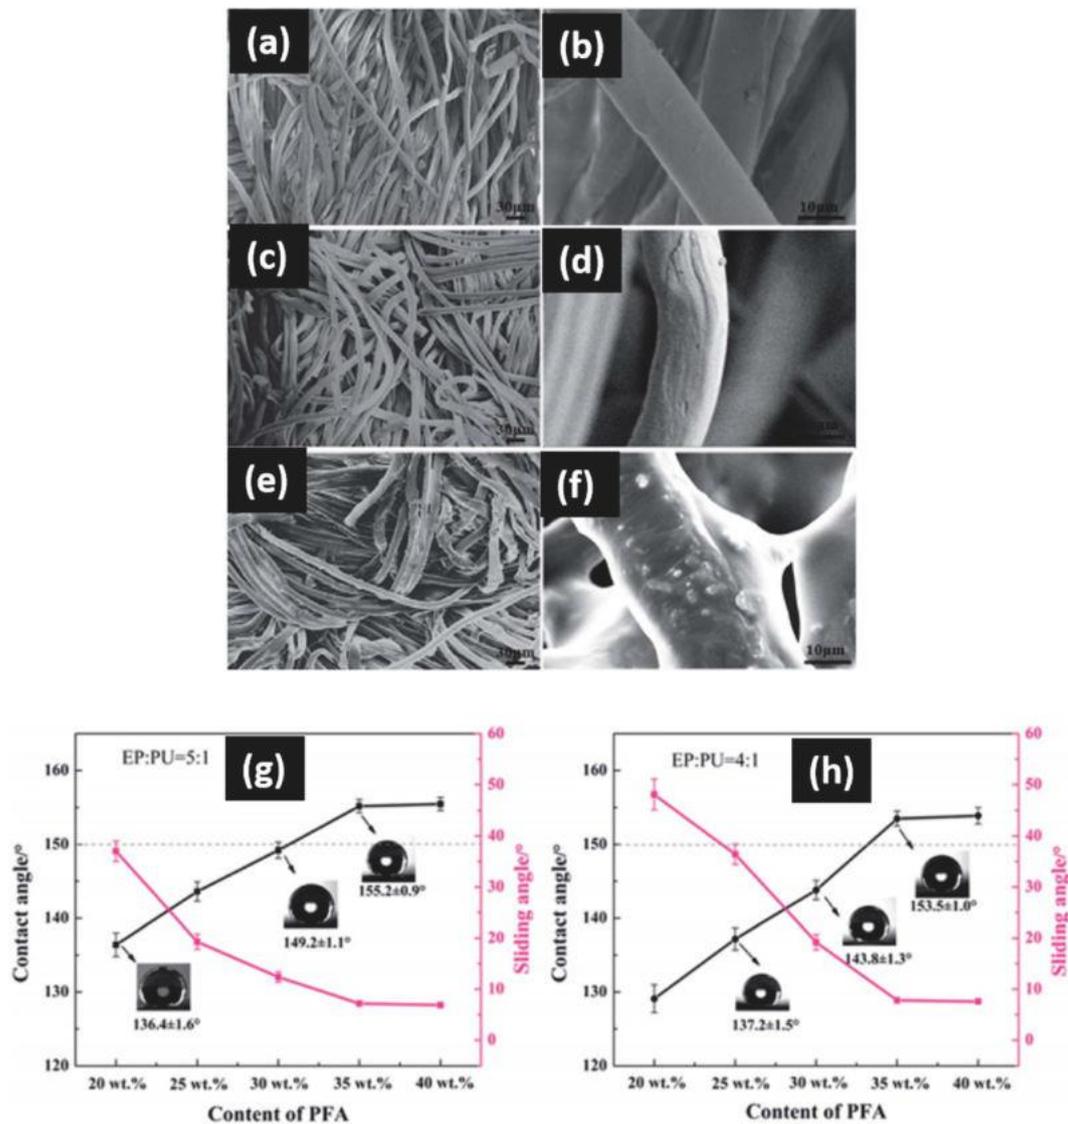

Fig. 8. SEM images of (a) as received cotton fabric, (c) E-fabric and (e) S-E-fabric, and (b), (d), (f) are the corresponding magnified images of (a), (c), and (e), respectively. The variation of CA of fiber fabric/epoxy composites coatings is affected by the content of PFA and ratios of EP/PU ((g) 5: 1, (h) 4: 1) [102].

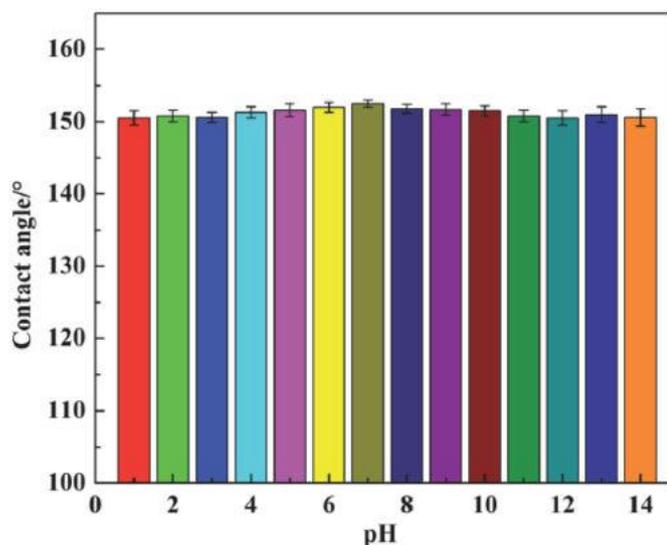

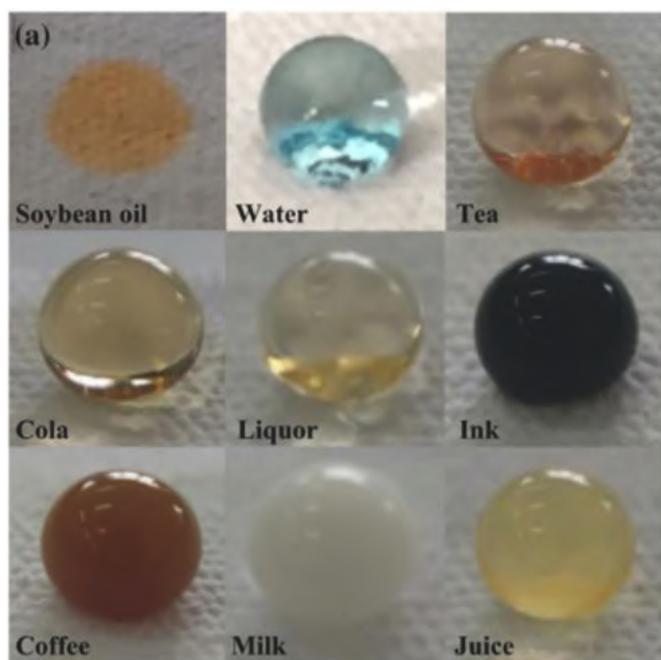

Fig. 9. The relation between the WCA versus pH of the SHC [102].

industry if their fabrication cost can be minimized.

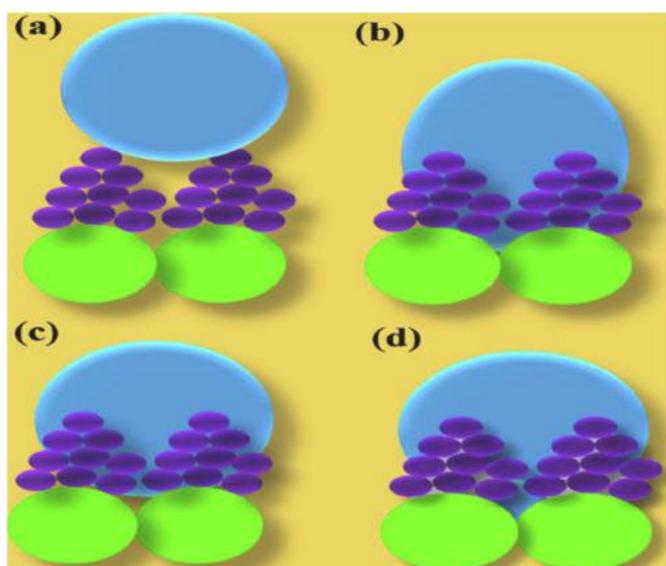

Seeharaj et al. [103] discovered a simple method for silanizing SH silica (SiO<sub>2</sub>) surfaces by employing double alkylsilanes as silanized. In the cotton fabric, the dual silanization was shown to reduce the surface energy while increasing the hierarchical micro-nano-scale roughness. To produce a CA of 156° ± 1°, a dual silanized SiO<sub>2</sub>/polystyrene (PS) composite was applied to the cotton fabric in a 2:1 ratio. As a result, the fiber gains superhydrophobicity. Water repellency and oil/water separation capacity were found to be exceptional with the newly designed cotton fabric-based filters due to their reusability. Fig. 10 depicts the wetting behavior of superhydrophobic cotton fabric filters following a drop test with soybean oil, water, tea, cola, liquor, ink, coffee, milk, and juice. After the soybean oil test, the surface becomes flat and the oil is filtered through the top layer of the test tube instantly. Droplets of a spherical form, on the other hand, will roll down an inclined surface. In order to be effective in oil/water separation, the designed filters must have a superoleophilic and superhydrophobic nature. The developed silica consisting filters have the potential to be treated as reliable filters for recovery of various oils.

Anitha et al. [104] reported the preparation of fluorine-free SHCs using various particle-sized silica. Different compositions of various sized silica accompanying nano titania and aluminum stearate blended

**Fig. 10.** Images of soybean oil, water, tea, cola, liquor, ink, coffee, milk, and juice droplets on superhydrophobic cotton fabric filters [103].

in a matrix of silicone adhesive to synthesize the SHCs. The developed coating revealed a WCA of  $152.5^\circ$  with micro-nano roughness that enhances adhesion, abrasion, and impact resistance of the coating. The coating was fabricated by evaporating the solvent during spraying. Water immersion analysis was performed to estimate the lifetime of air trapped in the coating. The results showed that SA decline due to the increased content of bigger size nanoparticles. However, the SA increases with the increase of small-sized nanoparticles, leading to the different wetting states as displayed in Fig. 11. Additionally, almost all the coatings presented outstanding corrosion resistance that can stand up to 1000 h of salt spray test. This research contributes to a better understanding of dual-scale roughness as well as the manufacturing of SH surfaces with optimal design and a stable Cassie-Baxter interface.

**Fig. 11.** The various wetting regimes involved in multi-scale roughness (a) Micro-nano scale Cassie Regime, (b) Micro-nano scale Wenzel regime, (c) Micro Cassie-nano Wenzel regime (d) Micro-Wenzel-nano Cassie regime [104].

The developed coating can be treated as a highly reliable corrosion-resistant SHC and is very useful for industrial applications.

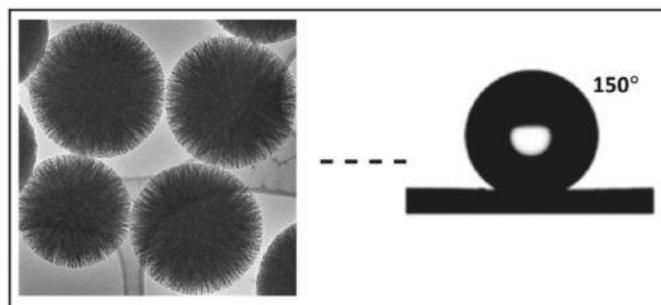

Fihri et al. [107] reported a facile method for the development of fibrous SH silica using economic and adaptable criteria. Alkyl chains can change the hydrophilic character of silica nanoparticles to hydrophobic ones. But unique deformation of the silica sustains even after alteration with alkoxy-silane reagents. The roughness of the surfaces was achieved using micro nano-structured particles trapping on the surface of adhesive. A high-resolution TEM image of hydrophobic nanoparticles and an optical image of CA of superhydrophobic coating are shown in Fig. 12.

Additionally, the SHC is found long-lasting and stable against corrosion tests. Developed SHCs show firm water resistance surfaces, admirable durability, and an anti-corrosion surface. It was reported that air-filled voids in the coating behave like dielectric that is a parallel plate capacitor and safeguard the transferring of electrons from electrolytes to a surface of the carbon steel. That enhances the anti-corrosion characteristics of the SHC.

Gao et al. [110] reported the fabrication of hierarchical fluorinated carbon nanotube (F-CNT)/SiO<sub>2</sub> nanostructure-based SHC on an elastic tape via a facile spraying method. The corrosion resistance of SHCs was evaluated by submerging them in a liquid solution with pH values ranging between 1 and 13. While the pH changes, the WCA remains above  $150^\circ$ , indicating the anti-corrosive capability of the coatings. The endurance of the anticorrosive layer was examined using black elastic tape coated with F-CNT/SiO<sub>2</sub> and immersed in a strongly acidic solution (pH = 1). The results demonstrate that the WCAs and surface conductivity of the SHCs have a minor variation (Fig. 13(a and b)). Further, Fig. 13(c) shows that strain on elastic tape increases from 0% to 100% with no change in the WCA which remains above  $150^\circ$ . Even after repeated sandpaper abrasion, the coating maintains its superhydrophobic properties, demonstrating its long-term durability as shown in Fig. 13(d).

In another work, Zhang et al. [105] reported a one-step electro-spinning method to fabricate hydrophobic polycaprolactone (PCL) membrane with a hierarchical structure. They anticipated enhancing the hydrophobicity of the PCL membrane by embedding liquid methyl silicone (MSO) and hydrophobic silica (SiO<sub>2</sub>) nanoparticles. As a result, they achieved a WCA of  $151.6^\circ \pm 1.7^\circ$  and SA of  $7.4^\circ \pm 1.2^\circ$  for PCL/MSO/SiO<sub>2</sub> composite membrane by generating outstanding surface roughness as well as air-pocket ability on the membranes. Additionally, the developed membrane displayed adequate oil adsorption and oil-water separation. The developed superhydrophobic membrane showed good reliability in terms of oil-water separation application.

Cui et al. [106] reported a new approach of interlinking nano SiO<sub>2</sub> and multiple branched hydrophobic polymer such as poly(dimethylolbutanoic acid-glycidyl ester of versatic acid) (poly(di-MBA-TM10)) to develop a SHC. An embedding approach was employed to develop the SHC which maintains its hydrophobicity even after 100 cycles of sandpaper abrasion and knife-scoring tests. The developed SHC exhibited a WCA of  $169.7^\circ$  and displayed resistance to neutral, alkaline, and acidic media. In addition, the SHC revealed binary micro and nanostructures

**Fig. 12.** TEM images of SH fibrous silica nanoparticles and CA of the alkyl chains introduced fibrous silica nanoparticles-based coating [107].

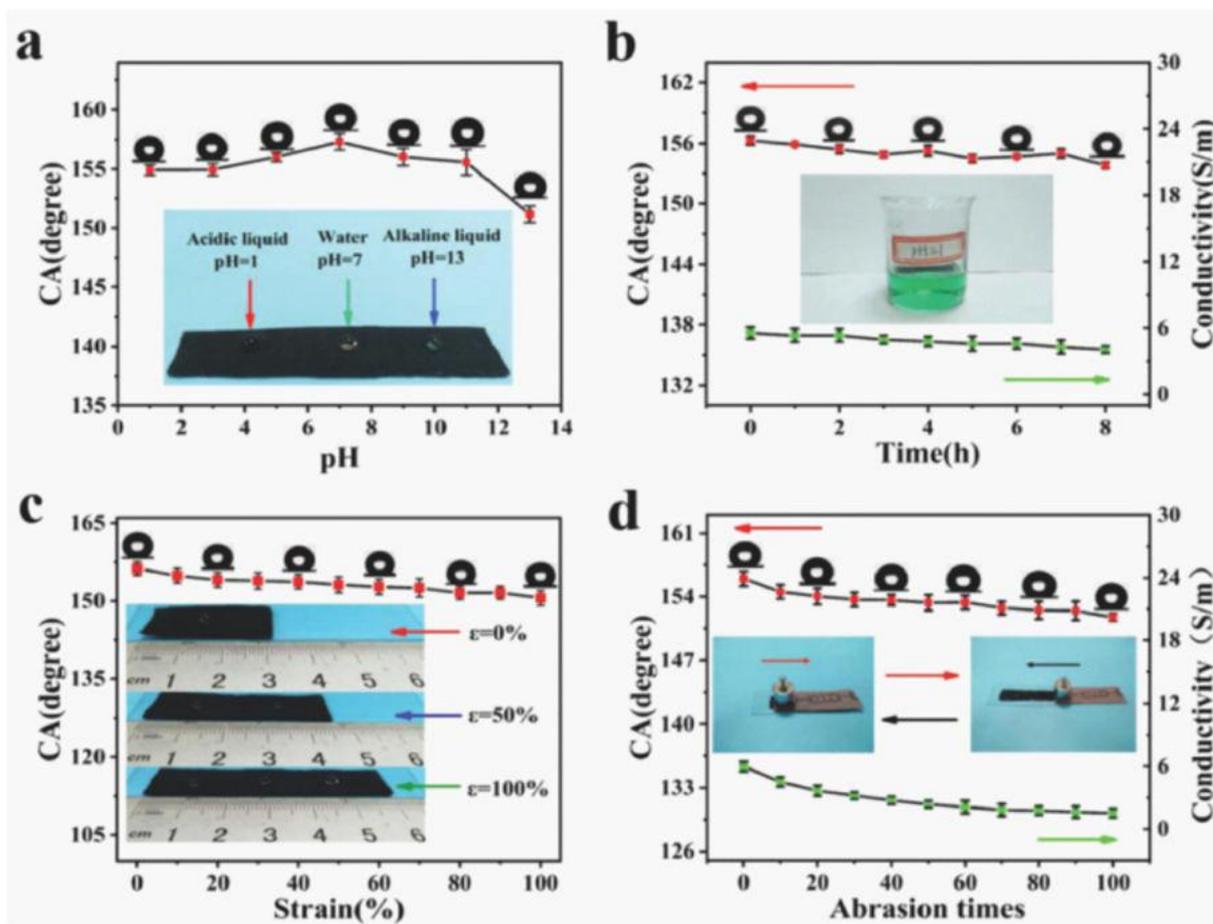

Fig. 13. (a) The WCAs with various pH for the F-CNT/SiO<sub>2</sub> coating, (b) the WCA and conductivity of the coating immersed in an acidic solution with pH = 1 for multiple times, (c) the WCAs of the specimen with various strain (%) values, (d) the WCA and conductivity of the coating versus sandpaper abrasion times with a weight of 20 g [110].

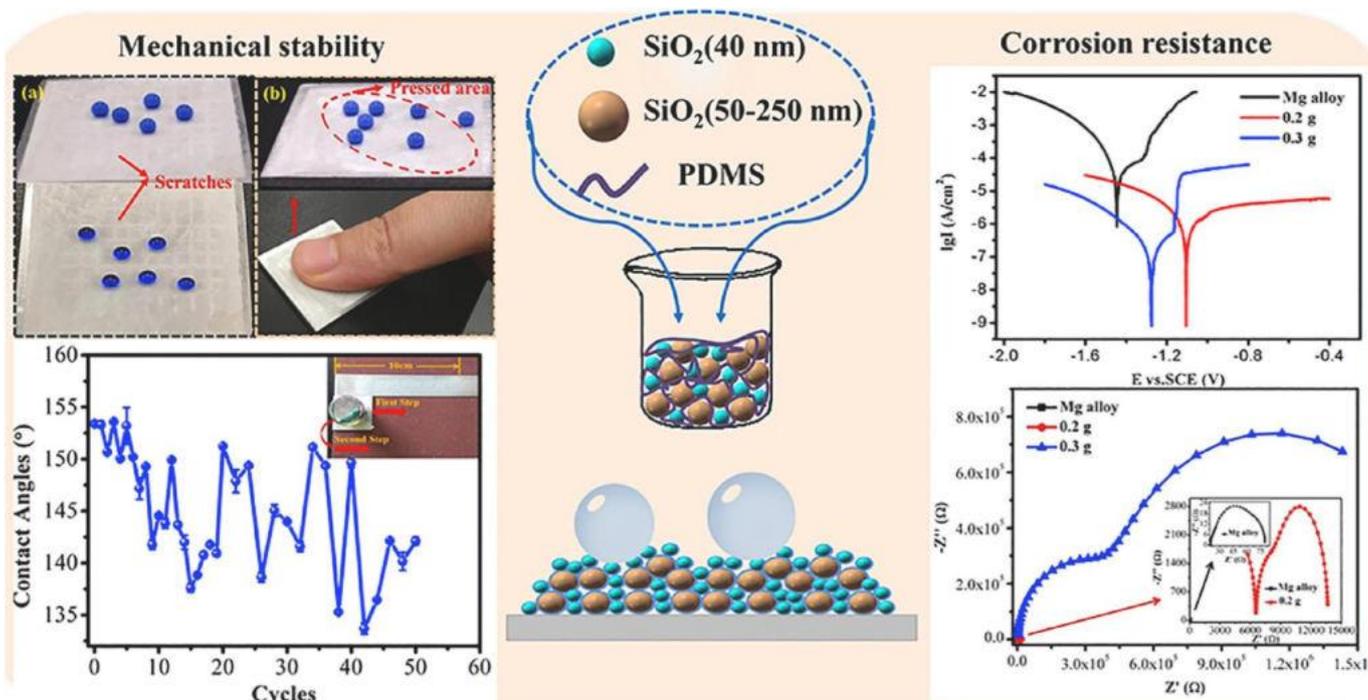

Fig. 14. Mechanical stability, wear performance and corrosion resistance of PDMS/SiO<sub>2</sub> nanocomposite SHC [108].

on its surface. The developed SHC needs further improvement to maintain the superhydrophobicity even after multiple sand abrasion and knife-scoring tests.

Xie et al. [108] reported the fabrication of poly-di-methyl-siloxane/silicon dioxide (PDMS/SiO<sub>2</sub>) films with micro-nano structures via a basic painting process on a magnesium alloy substrate. The SiO<sub>2</sub> nanoparticles of two different size ranges, such as 40 nm and 50–250 nm, were used to develop SHCs with abrasion and corrosion resistance properties (Fig. 14). The size of SiO<sub>2</sub> nanoparticles significantly affects the hydrophobic character of the developed films. Additionally, PDMS/SiO<sub>2</sub> films prepared under optimized process parameters exhibited mechanical stability and superhydrophobicity. The SHCs had maintained high WCAs (138°–150° and 133°–153°) even after 50 sandpaper abrasion cycles. The developed SHC showed excellent mechanical strength and good resistance to finger touching and knife damaging tests. Additionally, electrochemical investigation exhibited that the SHCs can ominously enhance the corrosion resistance of magnesium alloys. The unique robust SHCs can be espoused as corrosion and wear-resistant coatings for magnesium alloys.

Cuia et al. [109] reported the spraying of various percentages of hydrophobic SiO<sub>2</sub> nanoparticles on the aluminum surface to develop SHCs with convenient water repellency and corrosion resistance. The electrochemical experiment was performed on SHCs with dissimilar water adhesion to expose the effect of water sickness on corrosion-resistant ability. The SHCs were immersed in a 3.5 wt % NaCl mixture. The results displayed that the water adhesion on SHC significantly controls the anti-corrosion property of the coating. The developed SHC revealed a unique way to study the anti-corrosion property concerning water adhesion property.

Huang and Yu et al. [111] reported a fluorinated epoxy-silica (FEP-S), multifunctional coating with outstanding mechanical and chemical stability. The developed coating still maintained high amphiphobicity after 10 min of wear testing, indicating great mechanical stability. The coating's superhydrophobic ability remained even after 50 wear cycles, suggesting that the WCA remained higher than 150° as shown in Fig. 15. When the coating was placed in acidic or basic media, the WCAs were compared to determine its chemical stability. The results demonstrate that the coating didn't cling to the droplets as they rolled over it easily. So, the coating revealed highly water-repellent and corrosion resistance (Fig. 15). Additionally, the developed coating exhibited excellent self-cleaning property as shown in Fig. 16. The development of such multifunctional robust coatings can be adopted for industrial applications after further optimization.

Wu et al. [112] fabricated a flexible and robust superhydrophobic coating, F-SiO<sub>2</sub>/PDMS through a simple spraying technique. The inclusion of PDMS improves the dispersion of silica nanoparticles; moreover, the PDMS layer contributes to the achievement of improved mechanical flexibility. The novel superhydrophobic material demonstrated a high WCA of 156.5° and a low SA of 2°, indicating the

significant potential of the SHC for self-cleaning applications (Fig. 17). The anticorrosive characteristics of SHCs were evaluated at various pH ranging from 1 to 14 (Fig. 18(a)), however, the WCA remained over 150°. A sandpaper abrasion test was performed to determine the durability of the SHC which retained its superior hydrophobicity even after five continuous abrasion cycles (Fig. 18(b)). Additionally, F-SiO<sub>2</sub>/PDMS SHC coating exhibited drag reduction application. The development of such robust coatings will be of great use for researchers and manufacturers.

#### 4. Applications of SH coatings

The SHCs or surfaces have a wide range of applications, most notably in the energy industry, where they provide anti-corrosion, anti-freezing, anti-frosting, anti-icing, anti-adhesion, and self-cleaning properties [113–125]. Fig. 19 shows the most typical use of superhydrophobicity. Photovoltaic cells, airplanes, ships, power grids, glass windows, solar panels, submarines, and other related technologies have the potential to fully use the superhydrophobic characteristics for increased durability, robustness, flexibility, and longevity. Superhydrophobic coating made of silica helps accomplish some of these goals.

Developing self-cleaning superhydrophobic structures with little contaminant adhesion has been a long-term study goal for scientists. APS aggregated silica colloid particles [97] and raspberry-like superhydrophobic silica coating [94] created by researchers might be a solution for optical applications, such as self-cleaning solar panels, glass windows, lenses, and mirrors, where rolling water droplets off a superhydrophobic surface removes dust and contaminants. In recent times, flexible self-cleaning superhydrophobic surfaces have been a popular topic for use in electrical and wearable devices as well as sensors. Flexible self-cleaning coatings can be accomplished using a facile SiO<sub>2</sub>/PDMS [112] SHCs.

Corrosion has touched nearly every aspect of life, from the home to numerous sectors, and its prevention is necessary to extend the life of materials and equipment as much as possible. The application of silica-based superhydrophobic coating assists in the development of anti-corrosive characteristics. Researchers have produced several significant silica-based coatings including long-term stable Al<sub>2</sub>O<sub>3</sub>-KH560-SiO<sub>2</sub> coating [96], multifunctional PDMS-SiO<sub>2</sub>-CuO coating [101] that contribute to the growth of anticorrosive properties.

Icing affects people worldwide, and it has a commensurate economic impact. When ice forms on electrical equipment, such as porcelain insulators, energy harvesting devices such as solar panels and wind turbines, aircraft surfaces, offshore installations, and pipelines, it causes major problems. Anti-icing methods like superhydrophobic coatings employ surface modification techniques to keep ice from accumulating on solid surfaces. As a multifunctional SHC, an anti-icing coating composed of fluorinated epoxy-silica (FEP-S) [111] has demonstrated great potential.

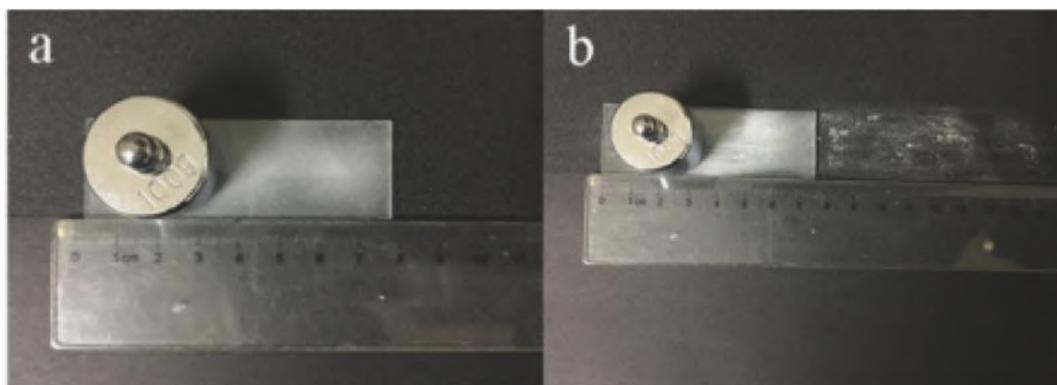

Fig. 15. Fluorinated epoxy-silica (FEP-S) coating before (a) and after (b) sand abrasion test (10 min) [111].

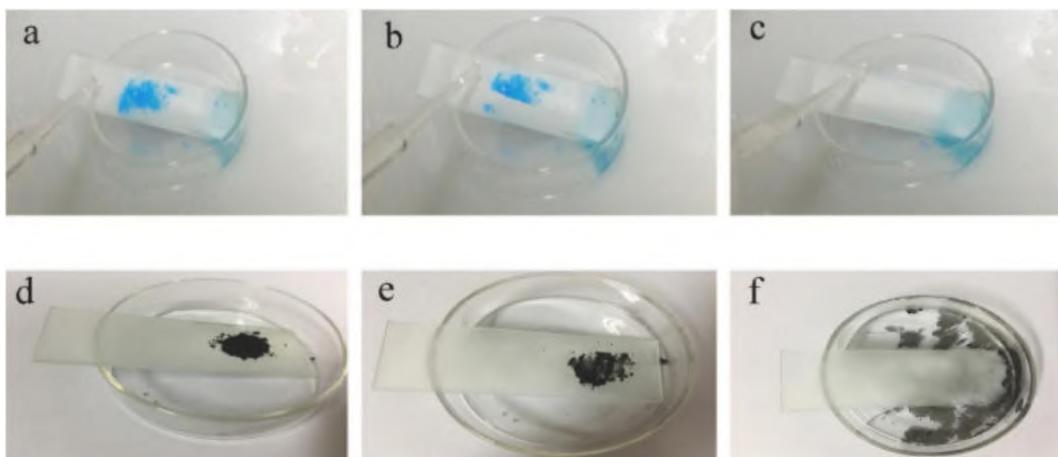

Fig. 16. Self-cleaning performance of FEP-S coating in the presence of (a–c)  $\text{CuSO}_4$  powder and (d–f) carbon black powder [111].

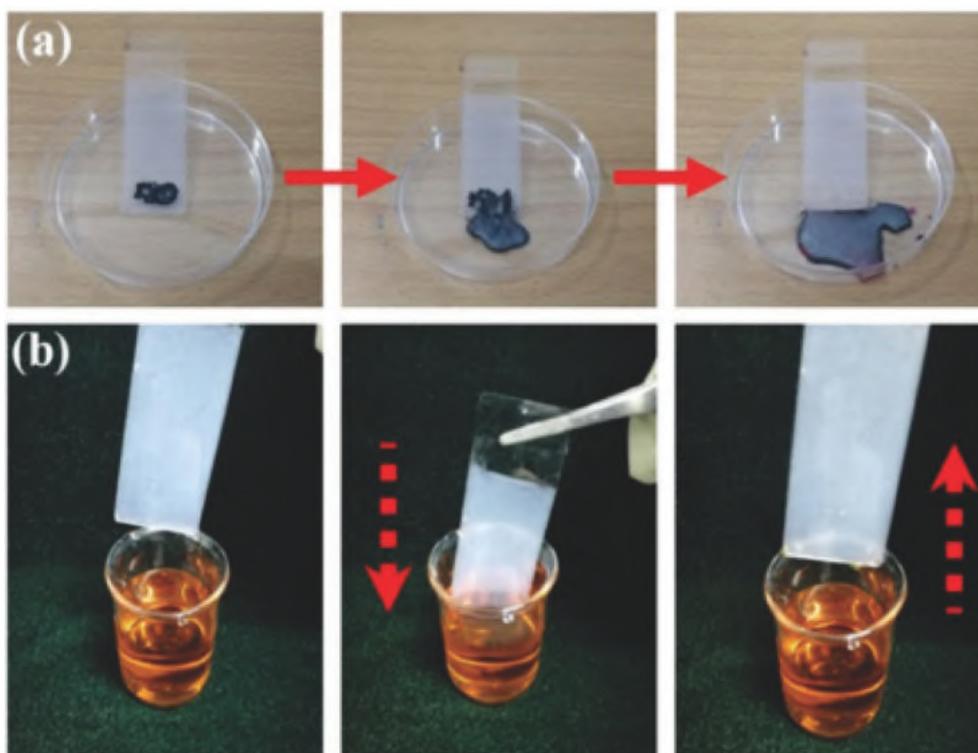

Fig. 17. Self-cleaning properties of  $\text{SiO}_2/\text{PDMS}$  coating (a) water droplets eliminating debris from the coating (b) coated glass before and after colored water soaking [112].

Industrial oil spills and oily wastewater are wreaking havoc on the environment and ecosystem. The application of superhydrophobic coatings such as  $\text{SiO}_2/\text{poly-dopamine}$  [95],  $\text{SiO}_2/\text{octadecyltri-chlorosilane/chlorotrimethylsilane}$  [103], and  $\text{SiO}_2/\text{methyl silicone oil}$  [105], may alleviate these problems while assisting the separation of an oil-in-water emulsion and creating economic value.

## 5. Conclusions

The basics of superhydrophobicity were described in detail. Surface-free energy and surface tension were recognized as the vital factors to play with the wettability of any matter. The SHCs must exhibit WCA from  $150^\circ$  to  $180^\circ$  and SA from  $10^\circ$  to  $0^\circ$ . Many scientists and firms copycat the existing natural superhydrophobic surfaces in various applications. However, the proposed theory-based wetting models require

advancement to meet the requirements of real-world applications of SHCs. The main hurdles to prepare SHCs are mechanical stability and durability of SH surfaces, multi-functionality relevance, lack of novel techniques useful for industrial-scale, expensive superhydrophobic materials, precipitation issue at very low-temperature environments, problems in making permanent air packets into the coating, oil-dripping challenge, etc. The most preferred, cost-effective, and industrially viable routes for the preparation of SHCs are sol-gel, sol-gel followed by spraying, phase inversion, electrodeposition, chemical etching, wet-chemical, and blending of nanomaterials into a polymer matrix by mechanical means. Future works should focus on identifying economical surface modifying agents or production methods of superhydrophobic silica nanoparticles that are highly desired to reduce the development cost of SHCs. Moreover, the silica nanoparticles consisting SHCs are significantly required for anti-corrosion, anti-freezing, anti-frosting,

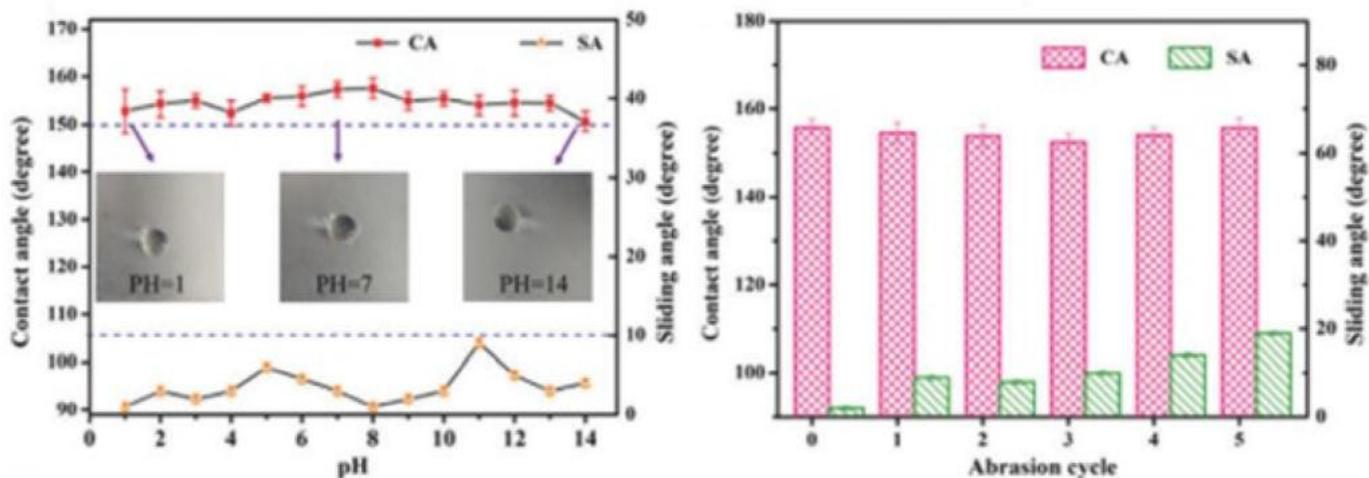

Fig. 18. (a) Plot of WCA and SA of SiO<sub>2</sub>/PDMS coating at varying pH (b) Plot of WCA and SA of SiO<sub>2</sub>/PDMS coating after five abrasion cycles [112].

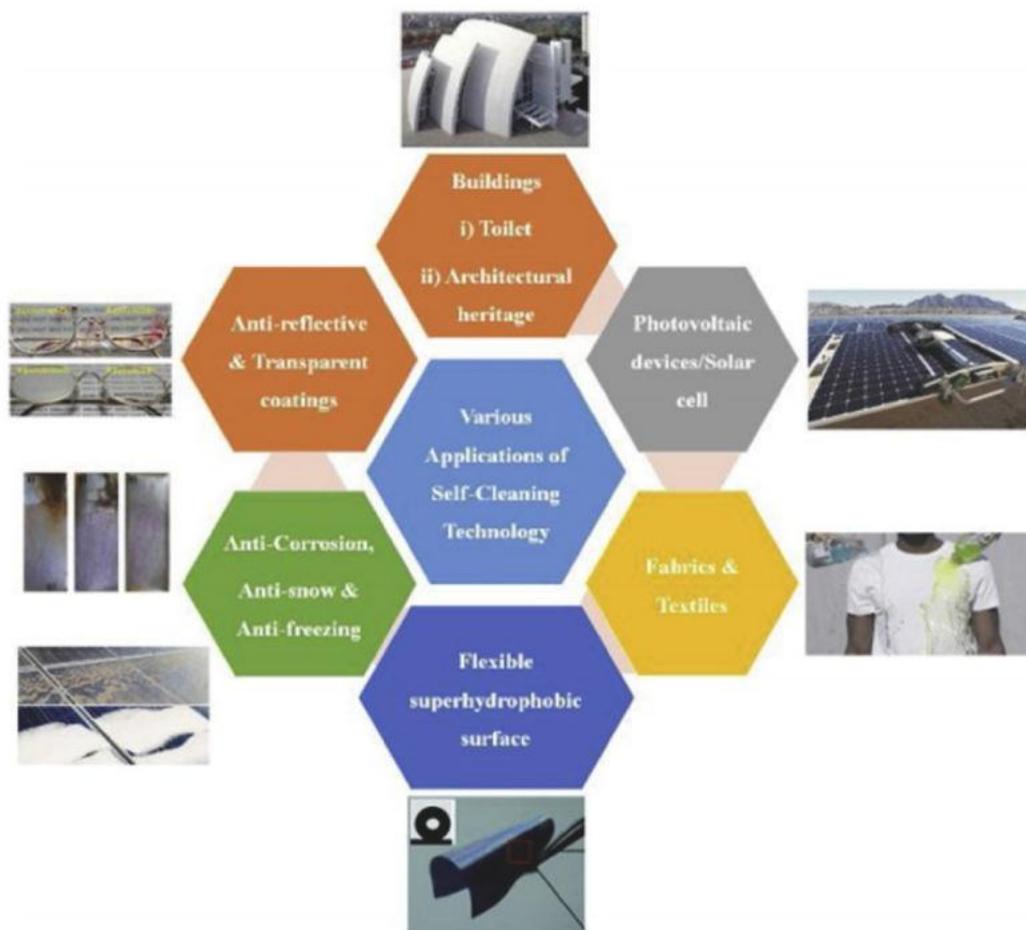

Fig. 19. Potential applications of the SHCs [123].

anti-icing, anti-adhesion, self-cleaning applications. The durability of silica nanoparticles consisting SHCs needs to be improved using better durability valuation techniques. New durability assessment approaches should mimic the actual exposure conditions of the superhydrophobic coatings.

## **“Laddishah”: A Conceptual Analysis and Study of Kashmiri Folklore**

**Dr Hanan Khalid Khan<sup>1\*</sup>, Misbha Mehrj<sup>2</sup>**

<sup>1</sup>Assistant Professor & Research Head, Lingayas University, Faridabad, Haryana, INDIA

<sup>2</sup>B.A Hon's Student, Lady Shri Ram College for Women, University of Delhi, INDIA

### ABSTRACT

India is land of cultural diversities; every region in India has its own form of folk music. This rich tradition of folk music is very much alive in not just rural India but also in some metro cities. Like other parts of the country, Kashmir has also a rich and pure socio cultural background, which is quite visible in its folk forms and folklores. Kashmir has been a grand arena of folk music, since time immemorial there have been poets, writers, Musicians, Dramatists, dancers etc., who have attained glory in the literacy and art world of Kashmir. From the very beginning Kashmiri people love singing and dancing and have always been a part of their literary culture. Festivals, fairs, marriages, receptions each have a particular folk style to suit the occasion. The characteristic feature of Kashmiri folk songs like “Laddishah” has its direct mass appeal. Laddishah” the folk songs of Kashmir carries the message of nature, mind and soul of the simple and pure Kashmiri people.

Keywords: Laddishah, Idiosyncratic, Mantras, Purity, Kashmiri language

### 1. Introduction

Laddishah is a literary term which has multiple meaning. Ladi means a row or line; shah has been added after wards with the advent of Muslim rulers. “Laddishah” has a very significant historical background. The said genre especially flourished during the region of imperialism and colonialism, when our state was under the control of Non- Residents or outsiders. In those grim days “Laddishah” used to provide some sort of entertainment and pleasure to the native Kashmiri’s even though the pleasure was temporary. Laddishah used to wear some typical things such as, turban on his head, a hanging piece of cotton cloth, white in colour, on his right shoulder a long white robe traditional sort of Kashmiri sleeper made of dry paddy and long moustaches, all these typical things were the identity of a “Laddishah”.

The idiosyncratic feature of Kashmiri folk songs like “Laddishah” lies in its direct mass appeal. These folk songs become a medium of conveying the serenity and purity of Kashmiri people. The rhythms are slow and controlled yet full of enlightenment. Kashmiri folk songs sustain within them a bewitching and aesthetic charm which transforms it into something engrossing and thought-provoking. These folk songs not only manifest the melodic traditions of Kashmir but also carry a sense of inspiration and motivation for the indigenous masses.

### 2. Origin and Meaning

Most of the researchers are of the opinion that “Laddishah” might have been a village “Faqir”(mendicant) who hailed from “Ler” a village in district ‘Pulwama’. Since the village “Ler” fell in a flood prone area it could have been possible that due to the catastrophic consequences of the inundation, some elderly members of the Shah family( professional folk singers) of “Ler” village might have composed a poem explaining the devastation caused. A

\* Corresponding author.

E-mail address: [hanan.mewar@gmail.com](mailto:hanan.mewar@gmail.com)

legendary figure Nishat Ansari considers that Ladishah is not at all the contribution of folk literature while as famous scholar Dr. Farooq Fayaz keeps Ladishah within the domain of folk literature.

According to Dr. Farooq Fayaz, "It is slightly similar to ShahrAshoob of Urdu poetic form, which is a folk ballad caustically comic-cum-satire in text and historically acting as a representative to voice people's genuine grievances which has proved to be a source of mental consolation for the enslaved folk". He adds, "the originality/ charm of this folk gets lost when it is written so its originality lies in oral form only."

However, Zareef Ahmad Zareef, disagrees and says, "The word "Laddishah" originated from 'Ladi' which means a row or line and 'Shah' has been added with the passage of time with the coming of Muslim rulers. In spite of being uneducated "Laddishah" were the best history describers." Zareef further adds, "Although, "Laddishah" was an important part of Kashmiri culture with hundreds of years of history. Laddishah were an institution in themselves as they were the real communicators with the mastery of conveying serious messages blended with satire and humor".

Dr. Farooq Fayaz nevertheless argues, "There is no reference of "Laddishah" in Rajtarangini so it is believed that Laddishah came into existence in late eighteenth century or early nineteenth century. And most probably in the late eighteenth century when natural calamities like floods, drought and famines were on rise, which ultimately remained the focus of Laddishah rhythms for a long time".

The historical background of Laddishah is quite noteworthy. Garbed in a pheran, white trousers and a white turban, Laddishah would arrive with his musical instrument known as "Trum-Trum" and nowadays known as "DEHRA". The genre is believed to have flourished during the barbaric eras of colonialism and imperialism when Kashmir was under the occupation of outsiders.

Dr. Farooq Fayaz says that in that era the natives of Kashmir were divided into two segments or classes; the elite who were religious and political, familiar with the religious Scriptures and controlling literature and the common masses who were sufferers. From 1585 to 1947, Kashmir was ruled by non-local rulers who institutionalised a feudal government having no connectivity with their subjects. The authoritative government in order to seek legitimacy carried out illegitimate political mechanisms which along with natural calamities resulted in utter misery of Kashmiri people.

In this perspective that Laddishah would enter the streets of a village or someone's courtyard or in the paddy fields hitting his musical instrument and would sing poems on various themes like buniyl- nam'e (earthquake), sehlab-nam'e (flood), AngrezQanoon (Colonialism) and on special occasions like Eid, religious festivals and marriages. The poems were full of messages about the social, cultural and political vandalism. LaddiShah sang against the barbarity of the Kashmiri rulers to show his resentment, was a classical character of Kashmiri literature and a staunch believer of constructive criticism.

#### **Some of the famous verses composed by Laddi Shah are:**

**1: "AsalamAlaikumLadishahaav  
Kadamthavpatharhaezkanmekunthav"**

Meaning

Ladishah has arrived wishing you the best. Come on sit and listen to me.

**2: "IllahirahamkarmiskeenunKumkumkarkaersehlaban"**

Meaning

Oh God save poor people of Kashmir.

Let there be no floods it caused havoc. God save us and our country.

**3: "Mulki Kashmir KyahWanithaavShersingh drag mokulbanithaav"**

Meaning

When Sher Singh was the governor of Kashmir natural calamities skyrocketed in Kashmir.

Despite carrying a sense of resentment and abhorrence towards the imperialist regimes, Laddi Shah's poems were full of satire which made people laugh. It entertained them but simultaneously was a derision on the existing occupation. The language of Laddi Shah used to be simple and lucid so the listeners could comprehend it easily. The term itself inclined towards a folk artist who opted for comical, critical and tragical verses. Thus, simplicity used to be the hallmark of Laddi Shah's poems. In those grim days, Laddi Shah used to provide some sort of entertainment and pleasure to the natives of Kashmir although the bliss was temporary. As soon as Laddi Shah made his way into a village or town, in a very short span of time almost the whole village folk assembled there to entertain themselves with his lively and comical performance. As a token of love and reward, the singer was given a handful of rice grains.

---

### 3. Conclusion

There was a time indeed when majority of the Kashmiri's were illiterate and same was the case of the folk artists. Those artists presented their performances without the support of piece of paper. Memorization is also important in the sense that it provides opportunity for the artists to use good body gestures and facial expressions. The language of "Laddishah" should be simple and lucid which would become easy for viewers and listeners to comprehend. So simplicity of the language is the hall mark of "Laddishah". One can conclude by saying that Laddi Shah represents an interesting and significant part of Kashmiri music tradition and so being the genre of folk poetry should be passed on to the next generations. It must be provided patronage by the government and other private institutions. Dr. Farooq says, "A careful analysis of these songs of "Laddishah" is sure to help in understanding the otherwise hidden aspects of Kashmiri social life as we can find names of places, local names, flora and fauna mentioned in different "Laddishah" folklores which helps in building up local history." He adds, "History doesn't revolve only around literate class now, we have the local history in different folktales."

### Abstract

Indian freedom fighters have struggled for years to attain the freedom we have today. Unfortunately many of these freedom fighters remain unsung to date. One such unlauded freedom fighter was Rani Velu Nachiyar. Born in the era where only men used to rule, she was skilled in handling weapons and martial arts. She was married to the prince of Sivagangai in 1746. In 1772, the British attacked her kingdom, killing her husband and forcing her to flee from her kingdom. But, this did not stop her and she planned to fight against the British to win her kingdom back. Her army commander Kuyili set herself on fire and jumped in British's ammunitions store to destroy every bit of it and became the first suicide bomber in Indian History. In 1780, she fought with the British and took the command in her hand once again.

**Keywords:** Velu Nachiyar, Sivagangai, Freedom Fighter

### 1. Introduction

When the British (East India Company) came to Surat, India in 1608 (seventeenth century), who would have thought that the foreigners whom they were welcoming for trade and burgeoning of Indian economy, were actually yearning for under laying their rule over our country. As the trade started to flourish, the power of British also started to expand. By 1750, the East India Company started intervening in the Indian Political system.

Soon the British government took direct control over the East India Company. Slowly and steadily the British government spread its dominance over the Indian land starting from Gujarat, Maharashtra, Bengal and reaching to the Northern, Southern and Eastern tips of India. The kings who agreed to work under the British rule were safe but the rulers who refused to be ruled by the British were grappled and executed. Many kings and queens fought with the British to save their kingdoms, some of them were killed and some had to hide themselves.

Rulers such as Tipu Sultan, Rani Laxmi Bai, Puli Thevar, Yashwantrao Holkar and many more fought with the British. Even before the first war of Indian Independence in 1857 took place or Tipu Sultan, Rani Laxmi Bai and other freedom fighters gallantly fought against the British rule, some obscure Indian warriors had already initiated the struggle of freedom against the British.

The history books frequently focus on the contribution of the Indian kings in the independence of our country, overlooking the hardships experienced by the queens, even when the queens have played an equal role if not any bigger, overcoming the stereotypes and prejudices, going against their families and people of their kingdoms and winning their reign back<sup>1</sup>.

One such queen was **Velu Nachiyar**, the chivalrous Indian warrior who fought against the British tanks with sword and spear.

## 2. Literature Review

Born in the kingdom of Ramanathapuram, she was the only child to Raja Chellamuthu Vijayaragunatha Sethupathy and Rani Sakandimuthal of the Ramnad kingdom. Since her childhood she was interested in learning new languages and fighting techniques, She was raised like a male heir and was trained in She was also acquainted in assorted languages including Urdu, French and English and was known by many because of her talents.

But many people criticized their parenting and were against the idea of a woman learning the skills that only the men were supposed to learn. The king and the queen disregarding what the people said, continued to teach their daughter the 'manly adroitness'. Her upbringing molded her into a strong and vigorous woman. She always dreamed of being free from the control of the British. She was also against the practice untouchability and did not support discriminating others on the basis of their caste<sup>2</sup>.

### After Marriage

At the age of 16, she was married to Muthuvadugananthur Udaiya Thevar, son of the King of Sivagangai, Sasivarna Periya Udaiya Thevar with whom she had a daughter, Vellachi. Even after getting married, she did not step down from practicing the languages and martial arts she had learnt. After being separated from the kingdom for Ramnad in 1680, the first ruler of Sivagangai was Sasivarna Thevar followed by Muthuvadugananthur Thevar<sup>3</sup>.

They ruled over their kingdom for over two decades from 1750 to 1770. They lived in their own contented world until 1772, when King Muthuvadugananthur Udaiyathevar along with his second wife, his children and many of his ministers was killed in the 'Kalaiyar Kovil War' against the British army led by Colonel Joseph Smith, and the son of Nawab of Arcot who wanted to expand his kingdom to the Southern India<sup>4</sup>.

### The Kalaiyar Kovil War

Nawab's army could not manage to compete with the ferocious Thevar army but with the help of the British army and modern British ammunitions, they managed to get through to Thevar's defence forces. They assassinated all those who came in front of them and did not even reprove the children and killed them ruthlessly. Her bodyguard Udaiyaal fought with the British to save the queen.

She was taken as a prisoner, was asked to tell the queen's location again and again and was tortured mercilessly, when she did not tell anything even after days of interrogation<sup>5</sup>, the Nawab beheaded her. Rani Velu Nachiyar built up an all-women army to honor her valor and perseverance and named

it 'Udaiyaal' and trained these women in different types of warfare. After taking the control over the kingdom of Sivagangai, the Nawab changed the name to Hussain Nagar<sup>6</sup>.

### The Escape from Sivagangai

After the death of her husband, she had to flee from her kingdom with her daughter. She hurriedly went to a nearby temple at Kollangudi where two of the late king's loyal chieftains the Marudhu Pandiyar brothers found them and helped her in finding a safe place for them. Marudhu brothers were commanders under the leadership of Muthuvadugananthur Thevar. They were the king's most faithful commanders.

She found a retreat at Verupakshi in Dindigul under the sanctuary of Palayakaarar Kopala Nayaker. She stayed there for eight years. She was overwhelmed with different types of emotions like shock, despair and woe but she did not let this stop her or become a barrier between her and her objective of reclaiming her kingdom from the British.

### Years in Dindigul

In Dindigul, she met Haider Ali, the then ruler of Mysore. He was very influenced by her hold on various languages especially Urdu, her courage and her perseverance. She accumulated support from Palayakaarar Kopala Nayaker and Haider Ali who pledged to be with her in her fight against the British. The king also built a temple in his place as a symbol of their friendship. In addition to this, he also provided the queen with a monthly financial support of 400 Pounds and 5000 infantry and cavalry troops each.

His support in finances, cavalry troops and weapons helped the queen in assembling a powerful army to fight against the British. The Marudhu Pandiyar brothers raised an army<sup>4</sup> but she believed that the army made by them was not enough to defeat the British and built a robust army. She did not believe in the caste system and her army comprised of Kshatriyas, Vaishyas and Shudra. She included everyone in the infantry, men and women. She kept changing her base to baffle the British.

### The Planning For Her Vengeance

Determined than ever before, the queen vigorously fought with the British in 1780. While the planning the attack, she realized that the walls of the fort were so high that it would be very difficult for the soldiers to climb up on them and could easily be pushed by the Indian sepoys and British army guarding the Fort. This left her with two choices, firstly, forcing the army to come outside the fort, which was nearly impossible, secondly, destroying their ammunitions to weaken them. As a result, she planned a suicide attack in the ammunition store of the British. Kuyili, her army commander and a staunch acolyte, stepped forward and carried out this attack. Many people also believe that Kuyili was the queen's adopted daughter.

The Ambush on the British Coincidentally, the occasion of Vijaydashami was only a few days away. Traditionally the women from all the nearby villages would come to pray in the temple situated in the fort. She entered the fort along with some of her female soldiers disguised as rural women, soaked herself in ghee, set herself on fire, jumped in the British's ammunition store and demolished every bit of it, becoming the first suicide bomber in the Indian history.

The explosion hit the others by a surprise and before they could realize anything, the women of her army slashed the Indian and the British soldiers. Rani Nachiyar waiting outside for the signal entered the fort annihilating every soldier she could see. Helpless by the brawly attacks of joined forces of Rani Velu Nachiyar, Marudhu Pandiyar brothers, Palayakaarar Kopala Nayaker and Haider Ali, the British and the Nawab of Arcot could not do nothing but run away and capitulate to Velu Nachiyar and she regained her power in the kingdom of Sivagangai.

#### Return to the Kingdom Of Sivagangai

Rani Velu Nachiyar along with her daughter and the Marudhu brothers returned back to her kingdom. The first change she made was changing the name of her kingdom back to Sivagangai. She started to govern Sivagangai. She recognized the work of the Marudhu Pandiyar brothers by appointing the older Marudhu brother, Periya Marudhu as Commander in Chief and the younger Marudhu brother, Chinna Marudhu as her Chief Minister. Thereafter, she succeeded her husband from 1780.

After re-establishing her rule over Sivagangai, she expressed her gratefulness to Sultan Haider Ali by constructing a Mosque and Church at Saragani. Even after regaining her power, she maintained good relations with Haider Ali and considered his son, Tipu Sultan as her brother<sup>7</sup>. Even after witnessing her immense valor and brawn, some people did want to accept her still. Despite all these stumbling blocks, she was able to rule over her kingdom. She ruled the kingdom Sivagangai for ten years from 1780 - 1790 and then she was succeeded by her daughter Vellachi who ruled the kingdom from 1790 – 1793.

During her 10 years of dominion over the kingdom of Sivagangai, the land was never attacked by the British or Mughals. Frightened by her vengeance on the Nawab and the British, no ruler could ever plan an attack on the kingdom for many years. She passed away in 1796 at the age of 66 because of heart problems and had even been treated in France.

She became the first woman of Indian origin to fight against the British and one of the few Indian rulers to recapture her kingdom from the British. She is also known by the name ‘Veeramangai’ which means a brave woman<sup>8</sup>. Although she is not known by many people but she has played a very eminent role in the freedom of India from the British control. She also became the first female warrior to raise the victory flag of Indian war for independence.

### 3. Conclusion

The renowned author, Prof. S. Sanjeevi mentioned in his book ‘Maruthiruvar’ that Rani Velu Nachiyar was a ‘Joan of Arc’<sup>9</sup>. She rose from all the stereotypes, prejudices, hardships and travail. She is an inspiration not just for women but also all the people out there. At the time when even seeking for equal rights respect for women was nothing less than a sin, Rani Velu Nachiyar shattered the gender roles. This may also be marked as one of the first fights in opposition to the discrimination against women.

Although she is not known by a large part of the country, but she is treasured, glorified and venerated by the people of the Southern India especially Tamil Nadu. The famous Indian - American hip-hop artist, Prof. A.L.I. dedicated the song ‘Our Queen’ of her album Tamilmatic to Rani Nachiyar. The

philosopher Lt. Sriram Sharma researched about her life and directed a ballet performed in Naradha Gana Sabha, Chennai followed by another grand ballet performed by the OVM Dance Academy in Chennai narrating the life of the Brave queen.

On December 31, 2008, a stamp was released in her remembrance. On 14 July, 2014, the former Chief Minister of Tamil Nadu, late J. Jayalalitha inaugurated a six-foot tall bronze statue of the queen as a tribute to her. It was also announced that January 3<sup>rd</sup> will be celebrated as her birth anniversary.

## Insights into Second Language Teaching and Learning – An Analysis to Enhance Learner Competency

Ms. Lavanya Paluri<sup>1</sup>, Ms. Vandana Kaushik<sup>2</sup>, Dr. P. Justin Sudhakar(PhD)<sup>3</sup>,Dr. Rashmi Maniar<sup>4</sup>,Ms. Archana Sharma<sup>5</sup>

### Abstract

The globalized business arena has brought about the need for employees who are excellently skilled in their English language skills. To compete with business worldwide, corporate organizations are always on the look for employees with adequate language skills. This has thrust the need for adopting effective language teaching methods in educational establishments. When language acquisition pedagogies are implemented efficiently in classrooms, the tertiary learners are facilitated to become proficient in their language skills. Imparting effective skills amongst these learners has become the paramount need for educational institutions. These institutions have to focus on both technical and language skills in order to make the learners employable in esteemed organizations. For language acquisition to materialize meritoriously, both teachers and the learners play a prominent role. The teachers and the learners equally contribute to the language learning process. This paper focuses on analyzing the effectual language teaching and learning concepts that enhance learners' language proficiency and competency.

## **Introduction**

The globalized economy has boosted the need for producing graduates with effective language proficiency. Business organizations expect their employees to be competent in the English language skills (listening, speaking, reading and writing), in order to contribute to the company effectively. “Activities like emails, online chat, business presentations require ‘above average’ language skills in order to have unambiguous and clear-cut transfer of information to all participants”, (Clement A and T Murugavel, 2018 p 1). Studies have shown that the language skills of corporate employees are not adequate to meet the requirements of the business establishments. Poor language skills not only affect the employee’s professional growth but also his/her companies’ communication processes and business advancements.

Poor language skills of corporate employees have accelerated the importance of effective language teaching and learning processes. Palacios Martínez, Ignacio M(1996) while mentioning Rubin and Wenden refers to the main features in the second language learning. He points out that tactics are important for language learning, the learners are the real means in the choice of procedures, language learning is adopted and problem-solving techniques are to be used and that learning strategies are flexible.

In order to impart language learning, implementing theories in learning contexts is important. Of the many learning theories, Stephen D Krashen’s Monitor Model (1985) is of utmost importance to enhance second language learners’ learning competency. This theory puts forth five hypothesis: The acquisition-learning hypothesis (acquisition happens naturally), The natural order hypothesis (learners acquire grammatical structures in a foreseeable order), The monitor model hypothesis (learners make use of their already learnt knowledge), The input hypothesis (learner acquisition happens when inputs are given in the target language), and The affective filter hypothesis (low filter occurs when there is high motivation and confidence amongst learners, while learners with low motivation and confidence receive less input).

## **Language Learning and Teaching Approaches**

To enhance learner competency, certain methods of language learning and teaching can be adopted. Adopted from (Saraswathi V, 2012)

1. Languages are learned predominantly through imitation.

Imitation is an important means to learn language. It is one of the most important ways to learn a language. Imitation is a process, which starts from infancy and continues for a lifetime. In the infancy of babies, they learn the language from the environment that they live in. They listen to the voices around them. Unconsciously the language is recorded in their mind and then they start uttering a few words. After which the baby learns to talk. The child learns reading and writing skills from the kindergarten, as it starts going to school. Saraswathi V (2012) points out Behaviorism theory (B F Skinner). The theory contains major tenets of behaviorism. Saraswathi V (2012, p 18) points out that “language learning is behavior. It is not a mental phenomenon. Language acquisition by human beings is equated with the learning process of animals”. Imitation helps the learners to build new skills. Through the imitation method, higher skills are also gained. At the graduate level, language can be learnt when socializing with academic circle. Conversing in an academic setup makes it comfortable to break the starting trouble, which most learners have. The students who come are greatly influenced by their vernacular and they have the fear to speak in English. Imitating the speaking, tone and style of academicians around, enables the learners to learn the speaking skill. Saraswathi V (2012, p 18) further states that “language acquisition depends on a chain of stimulus-response activities, in which imitation, repetition, memorization, rewards and reinforcement play a significant role”.

Parents usually correct children when they make grammatical mistakes. Children’s speaking skill is developed from their homes. As children hear the sounds of the language, unconsciously the vocabulary, style, tone and the grammatical components are registered in the mind. Whenever children commit grammatical errors, parents correct the faults. Parents play a vital role in developing children’s language skills. They help the children (kindergarten) to not only speak clearly but also motivate the children to read and write.

Persons with extraordinary IQs are good language learners. Good language learners are not only organized and creative but also possess excellent IQ. “In a nutshell, classroom based learning of a second language requires sensitivity to rules, processing speed and considerable powers of memorization in the area of verbal skills. It makes demands that can only be met by those with higher than average levels of ‘academic’ power, in other words of the intelligence that IQ tests aim to measure” says (Bonar B Martin, 2005 p 14).

Motivation is the most significant prerequisite for success in second language acquisition. Motivation is an essential factor to stimulate human beings to act positively. For learning to

take place effectively, motivation plays a vital role. In the learning context, motivation plays a forceful role enhance the learners' language skills. AlizadehMitra (2016 p 11), points out to Pourhosein Gilakjani, Leong, and Saburi, "the success of any action is dependent on the extent to which persons try to get their goal, along with their desire to do so". Motivation is the blend of effortin addition to desire to attain the objective of acquiring the language. In the second language milieu motivation depends to the extent to which the learner works, due to his or her inward desire and the satisfaction to do the task. Huitt (2001) says, learners (who are not inherently driven) can be motivated when they give more attention to the importance of learning the language. LucasRI (2010) says that "learners are intrinsically motivated to learn speaking and reading skills and are also intrinsically motivated through knowledge and achievement". Adding to this, (Alizadeh, Mitra, 2016 p 14) points out that learners' motivation can go up and down depending on the context of language learning. Motivation has a key role in the development of language skills. Teachers can play a significant role in motivating learners to the learning of a second/foreign language". Thus it is important that learners are motivated in order to enhance their language learning skills.

The timelier the children are acquainted to second language in school, the better the prospects of attainment in engrossing it. The beginning years of school education is an important phase when the cognitive skill of learners are developed. During this phase, the learners' level of observation and keenness is extraordinary and this enables them to absorb the language more quickly. Research has shown that bilingual learners are good at problem-solving, cognitive retention, attentiveness and educative growth. "Following a 'topic centred' and 'game-based' approach proved to be a very useful way to teach 'intentional' communication in a semi-natural context, and an attractive option for teaching English to the specific group of young learners. It has been indicated that language learning performed in a 'playful' atmosphere resulted into a) stimulating student's motivation, b) making students feel confident and c) creating their positive attitudes to foreign language learning" say Grivaa Eleni, Klio Semogloua and Athina Geladaria (2010, p 3703). The study points out that the young learners were exposed to various learning contexts. This helped the young learners to conceive and cultivate verbal proficiency. Role-plays were conducted during the study. It made the learning process flexible and enhanced in the cognitive absorption. Including games in the learning process brought in a relaxed environment, reduced stress, fear, and facilitated the learning progression to be successful. Grivaa Eleni, Klio Semogloua and Athina Geladaria (2010, p 3700) opine (Pinter)'s view as "Ages 'between' 5 to 8 can be considered as a sensitive and critical period for the

acquisition of basic skills in a second language as well as for the development of perceptual-motor skills. Very young learners are keen and enthusiastic, active and interested in exploration, and they are usually less anxious and less inhibited than older language learners”.

Learners commit grammatical mistakes predominantly due to their mother tongue interferences. Falla-Wood, Julia (2017) says “According to behaviourists learning theory of language, language learning is a habit formation, and the errors are due to habits already formed in L1. These behaviours interfere in the process forming habits already formed in the L2 (p 2). Touchie Hanna Y (1986) notes that research in applied linguistics consider errors as an indication of an inventive process in language learning. Further she says that interlingual errors (errors caused due to mother tongue) and developmental errors occur due to the difficulty of the second language. Interlingual and developmental factors include simplification, overgeneralisation, hypercorrection, faulty teaching, fossilization, avoidance, inadequate learning and false concepts (Touchie Hanna Y 1986).

The teachers need to focus on grammatical rules one by one. They must introduce the concept and then give exercises to the students. The need to teach grammar has become mandatory. Today, the writing skill has been the most neglected one. Making learners to understand the importance of effective writing is one of the paramount tasks of the English teachers. Effective writing is essential in all formal contexts like workplace, business and the academic arena. Formal writing with grammatical errors cause employees to lose jobs and businesses to close. “It is exact that putting grammar in the foreground in second language teaching, because language knowledge of grammar and vocabulary is the base of English language. Grammatical competence is one of communicative competence. Communicative competence involves knowing how to use the grammar and vocabulary of the language to achieve communicative goals, and knowing how to do this in a socially appropriate way” says Zhang Jianyun (2009, p 184). Zhang Jianyun (2009) points out that grammar, which is essential for effective writing, cannot be learnt naturally, but has to be imparted. Further, grammar is not a set of rules but a cluster of meaningful forms. Grammar is the foundation for the English language and mastering the nuances of the language is also important for tertiary learners. Thus it has become vital that effective grammar teaching methods are adopted in classrooms. The English teacher plays an important role in imparting grammar knowledge to the young and tertiary learners. Over the years, grammar teaching methods like grammar translation method, transformational generative grammar method etc., have been adopted. “Instead of teaching grammar, usage, and

as a prescriptive way to reach a uniformity of correctness, we should approach it descriptively, exploring and celebrating the many discourses that students bring to class” says Shafer Gregory, 2012 p 69. Teaching grammar has to be done systematically; therefore imparting the grammatical the knowledge needs to be one by one. The teacher can focus on one topic at a time. This will enable even the slow learners to get a hold of the basic concepts in grammar.

“Teachers should teach simple grammatical structures before complex ones”, says Saraswati V 2012 p17. The psychological and cognitive aspects of the learners need to be considered while teaching grammar. The grammatical forms have to be conceptualised with the daily communicative usage. Teaching grammar through dialogue method is an effective way to reach out to learners. “The use of dialogues in grammar teaching is useful because the use of dialogues generally matches learners’ expectations of how language is used in the real world: people use language primarily to talk to each other” (Thornbury, 1999 p76). Contextual teaching of grammar will enable the learners to relate the concepts to real life situations and enhance their knowledge. “Teaching grammar through context will help learners perceive the structures of the language effectively. If learners are given grammatical structures in context, they will be able to master the language better” says Mart Çağrı Tugrul, 2013 p 128. Teaching grammar in a simple method motivates the learners to learn the language without difficulty. The fun way method is one of the methods that lowers fear and stress in learners and enables them to learn the grammatical components better. The dreary grammatical rules can be made more interesting when fun activities are included in the teaching methodology. “Language games are an invaluable tool as they offer the elements of fun and meaningfulness in language learning. They are also a means of motivating students to learn, as well as sustaining their interest and focus in the learning itself. When learning grammar is formatted into a game, it removes the monotony that seemingly relates to it” say Metom Lilly, Amelia Alfred Tom and Saira Joe, 2013 p 402. Teaching grammar through games has proved to be a valuable method to ease the learners’ psych and enables them to grasp the concepts without difficulty. To avoid difficulties when conducting games, the following tips may be useful:

- The classroom activity should be organised. The teacher should focus on the learners’ age, level of language proficiency and interest in the learning activity.
- If the class gets boisterous, the teacher can change the activity in order to bring decorum.
- The teacher should choose activities or games that appeal to all kinds of learning patterns and modify the activities as per the need of the learners.

- For certain activities or games, the teacher can set up an established method of conducting the activity.
- The teacher has to inform the rules of the activities with clarity and understanding. The learners should have clarity on the activities given to them.

(adopted from Cam Lien and Thi Minh Thu Tran, 2017 p 68)

The teachers need to check the errors committed by the learners immediately in order to avoid the development of faulty practices. The learners need to be taught not only the right way of writing but also unlearn the wrong writing practises which they would have imbibed over the years. This is not an easy task. It involves patience and meticulous teaching on the part of the teacher. Since error correction is an indispensable part of classroom learning, utmost importance and keenness has to be to it by the teachers. Error correction should not be postponed but it has to be made as early as possible. The duty of the teacher is not only correcting the errors but doing it immediately after the activity is over. Pointing out errors instantly, helps the learner to correct his or her mistakes at once. When corrections are made at the beginning stage, complex errors at the later stage of writing or speaking can be avoided. When the teacher gives immediate feedback, it can motivate the learner to avoid mistakes and learn from the errors. Almuhimedi, Rana Abdulrahman and Yousif A. Alshumaimeri (2015, p 127) point out Long, “reactivefeedback that reacts a problem is effective in facilitating second language acquisition: it distinguishes a grammatical from an ungrammatical one, adjusts the input to match the learners’ proficiency level, and it draws attention to inter-language gaps, and motivates learners to modify the output”.

Academic resources are useful tools in presenting and conducting effective classroom teaching. Today, resources are not just in the form of papers, but also as websites, word documents, blogs, etc. The modern learners are updated in the technological advancement. Subsequently, it is even more necessary that teachers are updated in recommending technological resources to the learners. Teachers need to use knowledgeable resources to enable better learning and also the learners should be shown to the language patterns which they have been taught already. It is the utmost responsibility of the teachers to educate the learners on a concept and then build on it using examples and exercises. For example, in a class when the topic - concord is taught, the teacher should give more examples and exercises pertaining only to that topic. This brings in clarity and helps the learners to understand a particular topic thoroughly. Using resources in classroom is an important aid to the teachers. If ample resources or materials are not used, the students will lose concentration and the purpose of the class will be lost. It creates interest and

motivates the learners to learn new concepts. Resources help in achieving the educative goals and enhances the learning acquisition process. (Busljeta, R 2013) brings in the following shared aims to use resources in classrooms:

1. To motivate students
2. To develop students' creativity
3. To recollect the past information
4. To Inspire the process of understanding, interpreting, organising and blending the educational subject, logical thinking, and reasoning, communication and interaction, and
5. To Contribute to the progression of diverse skills amongst students.

When learners are permitted to intermingle freely in classroom, they study from their peers' errors. Classrooms are not just a one way communicative context (lecture), but a place where academic interactions happen amongst the faculty and learners and also between learners. Classrooms are not just places of theoretical interpretations but also interactive sessions of learning. When students interact with each other and participate in activities, the fear factor in learning is removed and effective learning is promoted. Though teachers spend hours and hours in lecturing, effective learning will not happen unless learners participate in the learning process. One such means to imbibe knowledge is through interaction. "Generating new knowledge and revealing gaps in knowledge through peer instruction, then, effectively supports students' ability to solve novel problems. Peer instruction can be an effective tool to generate new knowledge through discussion between peers and improve student understanding and metacognition" say Tullis-Jonathan G and Robert L. Goldstone (2020 p 10). Sometimes, in large-sized classrooms, teaching and learning becomes demanding. Such challenges can be overcome when the learners are allowed to do group activities. The teacher can divide the groups as four or five in a group. The groups can comprise of intelligent, average, and below-average learners. When learners of different cognitive levels are put together in a group, knowledge sharing would happen successfully. Also, these group-activity sessions enhance the problem-solving skills and critical thinking skills of the learners. Moreover learners' satisfaction in learning new concepts is also achieved. Knowledge enhancement happens amongst both slow learners and quick learners. "To achieve a critical instructional process, interaction is important. The involvement of all class members in the instructional interaction

between teacher-student, teacher-teacher, and student-student has a positive impact on the classroom environment”, say (Rasmitadila, Zulela and Endry Boeriswati, 2017 p 904).

“Learners learn what they are taught” says Saraswati V, 2012 p 17. The teaching process exhibited in the classrooms are of utmost importance. Only in a classroom setup, the learners are given the opportunity to gain knowledge and further their academic competence. Only when the fundamental concepts in language skills are taught and practised in the classroom, the learners will be able to implement it in a workplace context. The classrooms are places of active learning and knowledge gaining platforms. So, it is the ardent duty of the teachers and facilitators to impart the language skills that are essential for the learners.

### **Conclusion**

The modern technological world has become demanding and competitive. Only employees with high language proficiency are considered appropriate for organizational growth and benefit. In order to possess proficient language skills, the process has to onset from the tertiary level itself. The college English or the English taught at the tertiary level is of great importance, since it is from the colleges that learners move to the workforce. “In college English teaching, based on second language acquisition theories, teachers should establish a student-centered class teaching pattern to deliver intercultural communication knowledge, cultivate students’ intercultural communication abilities, create language acquisition environment, fully consider students’ emotional factors, and improve the teaching quality and learning effect of college English” says (Li, Changyu 2009 p 60). This paper focuses on the language learning methods and ideas to enhance tertiary learners’ language acquisition. The various methods that enable learners to acquire English language skills have been discussed in this paper.

TECHNICAL ARTICLE

# Triethoxyoctylsilane-Modified SiO<sub>2</sub> Nanoparticle-Based Superhydrophobic Coating for Corrosion Resistance of Mild Steel

Konica Sharma, M.K. Malik, Amrita Hooda, Kailash Pandey, Jaishree Sharma, and M.S. Goyat

Submitted: 30 June 2022 / Revised: 18 September 2022 / Accepted: 14 October 2022

In this work, SiO<sub>2</sub> nanoparticles-based corrosion-resistant superhydrophobic coating for mild steel has been developed. A wire electrical discharge machine (EDM) was used to cut micro-patterned mild steel followed by chemical etching via Piranha solution. The etched metal was coated with triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles via the solution method to generate the hierarchical micro-nano roughness with low surface energy. The developed coating exhibited micro-nano hierarchical roughness due to SiO<sub>2</sub> nanoparticles and their clusters, verified by atomic force microscope (AFM) and field-emission scanning electron microscope (FESEM) analysis. The maximum water contact angle (CA) of  $153 \pm 2^\circ$  with a sliding angle (SA) of  $5 \pm 2^\circ$  was obtained for the coated mild steel. The electrochemical impedance spectroscopy (EIS) plots confirmed the noteworthy corrosion resistance performance of coated metal over the uncoated one. Thus, the modified SiO<sub>2</sub> nanoparticles-based superhydrophobic coating could be a good option for inhibiting the corrosion of mild steel.

**Keywords** corrosion resistance, mild steel, SiO<sub>2</sub> nanoparticles, superhydrophobic coating, triethoxyoctylsilane

## 1. Introduction

Mild steel is one of the extensively utilized types of steel due to its low-cost and exhibits such properties, which are suitable for a wide range of applications like transportation, construction and oil and gas pipelines (Ref 1). Conversely, worldwide every year, billions of dollars are spent on repairing or replacing corroded mild steel. It is well acknowledged that mild steel suffers from corrosion when exposed to moisture and air (Ref 2). Moisture protection of mild steel is more challenging forcing the researchers to manufacture water-resistant mild steel using the fundamental concepts of hydrophobicity (Ref 3). Lotus leaves, bird feathers and water strider legs are natural water-resistant objects (Ref 4, 5). Such objects exhibit superhydrophobicity. The superhydrophobic surfaces of any material have a static water contact angle  $> 150^\circ$ , which results in the bouncing of water droplets on their surface or displaying non-wetting behavior. Several researchers mimic these types of natural superhydrophobic features on

artificial surfaces to utilize their benefits for various applications, such as anti-corrosion, anti-oxidation, water drag reduction, anti-soiling and anti-icing (Ref 5-8). Superhydrophobic surfaces have unique features such as low surface energy and micro-nano scale structures (Ref 9). Numerous methods were tried out in the past to generate micro-nano level roughness on the metals using well-known techniques such as electrodeposition, sandblasting, plasma etching, chemical etching, lithography and nanoparticle deposition (Ref 3). However, the most economical and feasible routes are chemical etching and micro-nanoparticle deposition (Ref 10-12). For the generation of superhydrophobicity on metallic surfaces, low surface energy of the surface is required which can be obtained easily on a chemically etched surface by the deposition of surface-functionalized nanoparticles. Over the past few years, various nanoparticles, such as carbon nanotubes, ZnO (Ref 12), TiO<sub>2</sub> (Ref 13), and SiO<sub>2</sub> (Ref 9, 14), were explored to generate nano-scale roughness to achieve superhydrophobicity. However, SiO<sub>2</sub> nanoparticles are most commonly used for superhydrophobic surfaces because of their low cost, ease of fabrication, ease of functionalization and low density compared to other nanoparticles (Ref 15). Such properties make these nanoparticles an ideal choice for manufacturing superhydrophobic surfaces. However, the use of surface-functionalized SiO<sub>2</sub> nanoparticles on chemically etched metallic surfaces is not been fully explored yet (Ref 9).

In the present study, a unique approach was employed to protect the mild steel from corrosion. A wire electrical discharge machine (EDM) was used to generate a micro-pattern on mild steel followed by chemical etching via Piranha solution. The wire EDM and chemical etching produced micron-level roughness on the surface of the mild steel. Then the etched metal was coated with triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles to generate the hierarchical micro-nano roughness with low surface energy. The superhydrophobicity

and anti-corrosion performance of the samples produced promising results, which can be very useful for the metal industry.

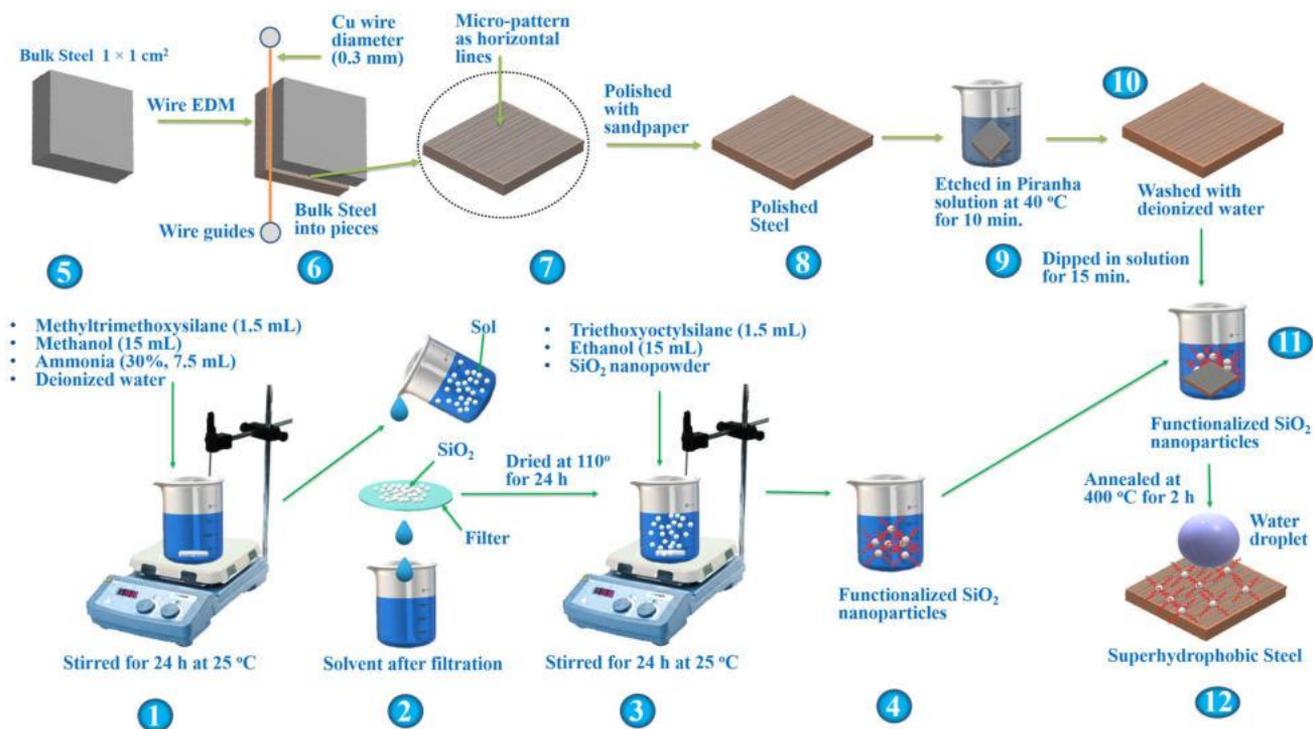

## 2. Experimental

### 2.1 Fabrication of Superhydrophobic Coating on Mild Steel

The fabrication of functionalized SiO<sub>2</sub> nanoparticles-based superhydrophobic coating on mild steel is schematically illustrated in Fig. 1. Methyltrimethoxysilane (1.5 mL), Methanol (15 mL), Ammonia (30%, 7.5 mL) and deionized water were continuously stirred for 24 h at 25 °C to obtain the silica sol. The silica sol was then filtered and dried at 110 °C for 24 h and collected as silica nanopowder. The surface of SiO<sub>2</sub> nanoparticles was functionalized by blending triethoxyoctylsilane (1.5 mL) and ethanol (15 mL) with the nanoparticles followed by magnetic stirring for 24 h at 25 °C. On the other hand, the mild steel of 1 × 1 cm<sup>2</sup> size was cut from the bulk sample using wire EDM (Ezeewin). The wire EDM created a micro-pattern in form of parallel lines over the metal substrate, which was further polished with 400-1200 Grit sandpapers. The polished substrate was ultrasonically cleaned in acetone for 30 min. The polished substrate was etched in a Piranha solution (Ref 16) (concentrated H<sub>2</sub>SO<sub>4</sub>, 98% and H<sub>2</sub>O<sub>2</sub>, 30%. Ratio 7:3) at 40 °C for 10 min. The etched substrate was washed with deionized water several times and dried at room temperature. The etched metal substrate was dipped in the solution of functionalized nanoparticles for 15 min. Later on, the coated substrate was annealed at 400 °C for 2 h to obtain the superhydrophobic mild steel.

### 2.2 Characterization

The morphology of triethoxyoctylsilane functionalized SiO<sub>2</sub> nanoparticles and deposited coatings were characterized using a high-resolution scanning electron microscope (FESEM, Quanta 200F, FEI, USA). The surface modification or functionalization of the nanoparticles by triethoxyoctylsilane was characterized by a Fourier transform infrared (FTIR) spectroscopy (Perkin Elmer FTIR/FIR Frontier, Spectrometer, USA). Both the functionalized and non-functionalized SiO<sub>2</sub> powder samples were separately mixed with high purity potassium bromide (purity 99.9%, Sigma-Aldrich) using a pestle motor and converted into transparent films using a stainless steel die and a hydraulic press. The infrared spectra of the transparent thin films was recorded at ambient conditions. Bruker D8 Advance Diffractometer (Germany) carried out the structural characterization of the samples with a Cu-K $\alpha$  radiation source. The optical micrographs of the samples were recorded using Nikon Eclipse MA200 optical microscope. The wettability of the samples was characterized using a drop shape analyzer (DSA 100, Krüss GmbH, Germany). An atomic force microscope (AFM, NT-MDT, Ntegra) was used to investigate the roughness and surface morphology of the samples. An electrochemical workstation (CHI 660E, CH Instruments, USA) was used to obtain polarization curves with a low scan rate of 0.2 mVs<sup>-1</sup>. The samples were immersed in corrosive salt solution (3.5% NaCl) to obtain polarization curves. The corrosion resistance of the samples was characterized using electrochemical impedance spectroscopy (EIS) from 200 kHz to 50 MHz frequency and via excitation of sinusoidal wave amplitude of  $\pm 5$  mV.

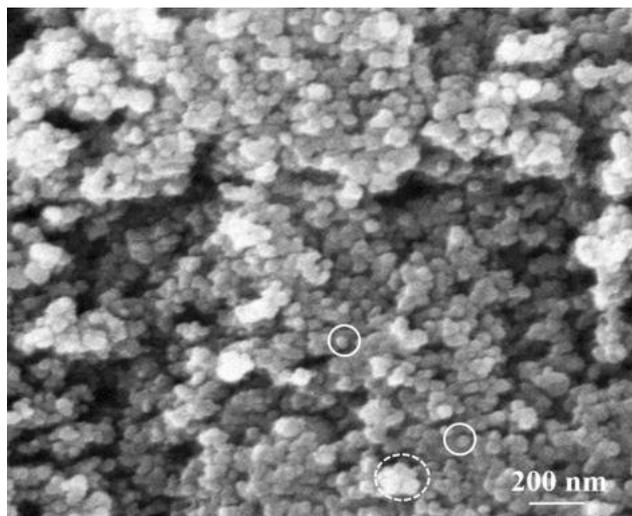

**Fig. 1** Schematic illustration of the systematic fabrication of functionalized SiO<sub>2</sub> nanoparticles-based superhydrophobic coating on micro-patterned and chemically etched mild steel

### 3. Results and Discussion

The FESEM image of triethoxyoctylsilane functionalized silica nanoparticles is shown in Fig. 2. The FESEM images revealed a very smooth spherical shape of the SiO<sub>2</sub> nanoparticles with an average size of ~ 30 nm. However, very limited large size clustered particles can be seen but most of the individual round shape particles are revealed by the FESEM image. This indicates the successful functionalization of the nanoparticle surface because the functionalization agent significantly reduced the clustering of nanoparticles (Ref 12). The particles in solid circles indicate the individual particles, and the particles in the dotted circle indicate the clustered particles (Fig. 2).

FTIR spectra of SiO<sub>2</sub> nanoparticles and triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles are shown in Fig. 3. Both the unmodified and modified SiO<sub>2</sub> nanoparticles reveal sharp absorption peaks at 1103 and 802 cm<sup>-1</sup>, which are designated as anti-symmetric and symmetric vibrational peaks of the Si-O-Si bond, respectively (Ref 17-19). A very broad peak centered at 3421 cm<sup>-1</sup>, which is common in both the spectra and a small peak at 966 cm<sup>-1</sup> in the case of unmodified nanoparticles are corresponding to the stretching vibration of Si-OH groups indicating the presence of hydroxyl groups on the surface of nanoparticles (Ref 19). In the case of modified nanoparticle spectra, the change in the position of absorption peak from 966 to 882 cm<sup>-1</sup> and the generation of new peaks at 2978, 2921 and 1381 cm<sup>-1</sup> are corresponding to C-H, CH<sub>3</sub> and C-O functional groups, confirming the surface modification of SiO<sub>2</sub> nanoparticles by long chain triethoxyoctylsilane (Ref 9, 19-22).

X-ray diffraction (XRD) pattern of uncoated and coated mild steel samples is shown in Fig. 4. The XRD analysis was performed to investigate the effect of the presence of SiO<sub>2</sub> nanoparticles-based coating on the crystallinity of the mild steel. The 2θ values were matched to the standard International Centre for Diffraction Data (ICDD) data card (04-014-0360). The XRD pattern of both the uncoated and coated mild steel samples revealed one sharp peak at 2θ = 45.26° corresponding to a plane (110) and one low-intensity peak at 2θ = 65.30° corresponding to a plane (200), which indicates polycrystalline

**Fig. 2** FESEM image of triethoxyoctylsilane functionalized silica nanoparticles

nature and body-centered-cubic (bcc) structure of mild steel (Ref 23, 24). However, the SiO<sub>2</sub> nanoparticles-based coating does not reveal any new peaks except a low-intensity peak at 2θ = 27.30°, which may be due to some impurity of the sample. Nevertheless, the relative intensity of the coated samples was reduced due to the coating on the mild steel substrate. The generation of no new peaks may be due to the amorphous nature of the SiO<sub>2</sub> nanoparticles. Thus, the coating does not change the basic structural characteristics of the steel substrate.

Optical microscopic images of polished mild steel and etched steel substrate at different magnifications such as 20X and 100X with their corresponding water contact angles (CAs) are shown in Fig. 5. The polished sample revealed parallel microscopic lines on the surface due to the use of wire EDM. The surface seems smooth and exhibits a water CA of 92° as depicted in the inset of Fig. 5(a). The water CA > 90° indicates the hydrophobic nature of the metallic substrate. However, the Piranha solution etching of the metallic substrate generates roughness on the surface, which makes the microscopic parallel lines diffused. However, the etching of the metallic surface results in a significant increase in the surface roughness from 90 to 110 nm which remarkably increased the water CA from 92° to 123° as shown in the inset of Fig. 5(c), which is in close agreement with the results reported by others (Ref 11). Thus, the etched metallic substrate exhibits a more hydrophobic character compared to the polished metallic substrate.

Optical microscopic images of the coated mild steel at different magnifications such as 20X and 100X with corresponding water CA are shown in Fig. 6. Due to the coating, the surface of mild steel seems very smooth with uniform surface roughness. The coated substrate exhibits a water CA of 153° as depicted in the inset of Fig. 6(a). Thus, the superhydrophobic character of the coated mild steel has been generated because of the presence of surface-functionalized SiO<sub>2</sub> nanoparticles. The surface functionalization of the nanoparticles reduced the surface energy of the particles and the nano-size of the particles offered nanoscale roughness. Thus, the combination of these two transformed the hydrophobic mild steel into the superhydrophobic one (Ref 12, 14).

AFM analysis was performed to characterize the topography and surface roughness of the polished, etched and coated mild steel samples. The 2-dimensional (2D) and 3-dimensional (3D) images of the polished and etched mild steel are shown in Fig. 7. The polished mild steel is revealing micro-patterned morphology (Fig. 7a, b). The parallel vertical lines with some cavities are exposed by the 2D image and uniform surface roughness is revealed by the 3D image. However, the etched mild steel is revealing a completely different morphology, which is obvious as the chemical etched away the metallic surface. The 2D and 3D images of etched mild steel reveal the non-uniform roughness and significant variation in the surface roughness compared to polished steel (Fig. 7c, d).

The 2D and 3D AFM images of coated mild steel at different magnifications are shown in Fig. 8. The 2D (Fig. 8a, c) and corresponding 3D (Fig. 8b, d) images revealed the presence of significant but uniform surface roughness on the coated mild steel. Additionally, the higher magnification AFM image (Fig. 8c) revealed the presence of individual nanoparticles and their agglomerates on the coated surface of mild steel, which is producing a combination of micro-nano hierarchical surface roughness responsible for the superhydrophobic behav-

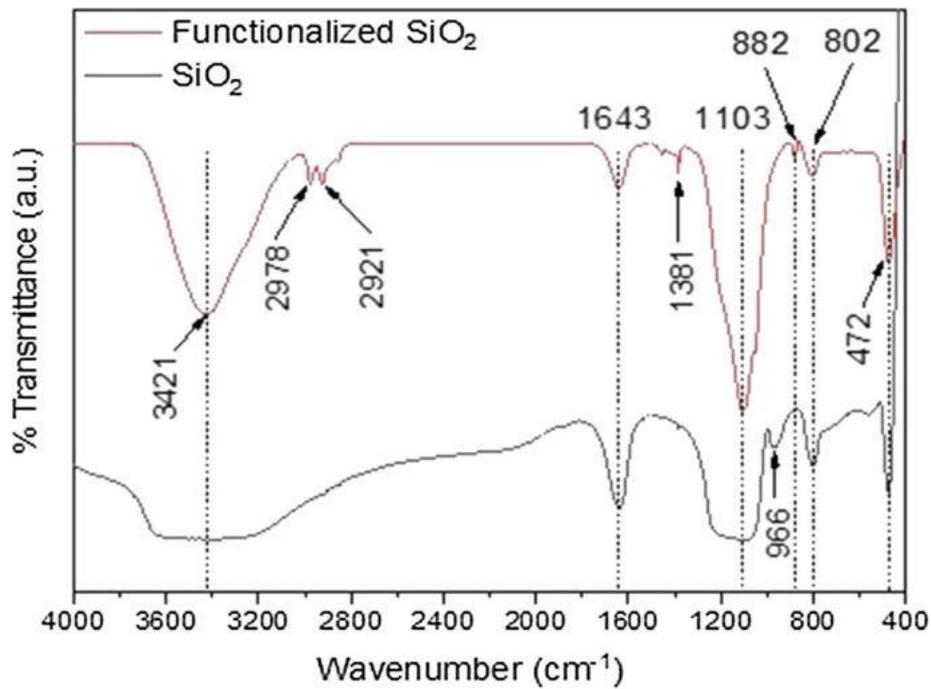

Fig. 3 FTIR spectra of SiO<sub>2</sub> nanoparticles and triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles

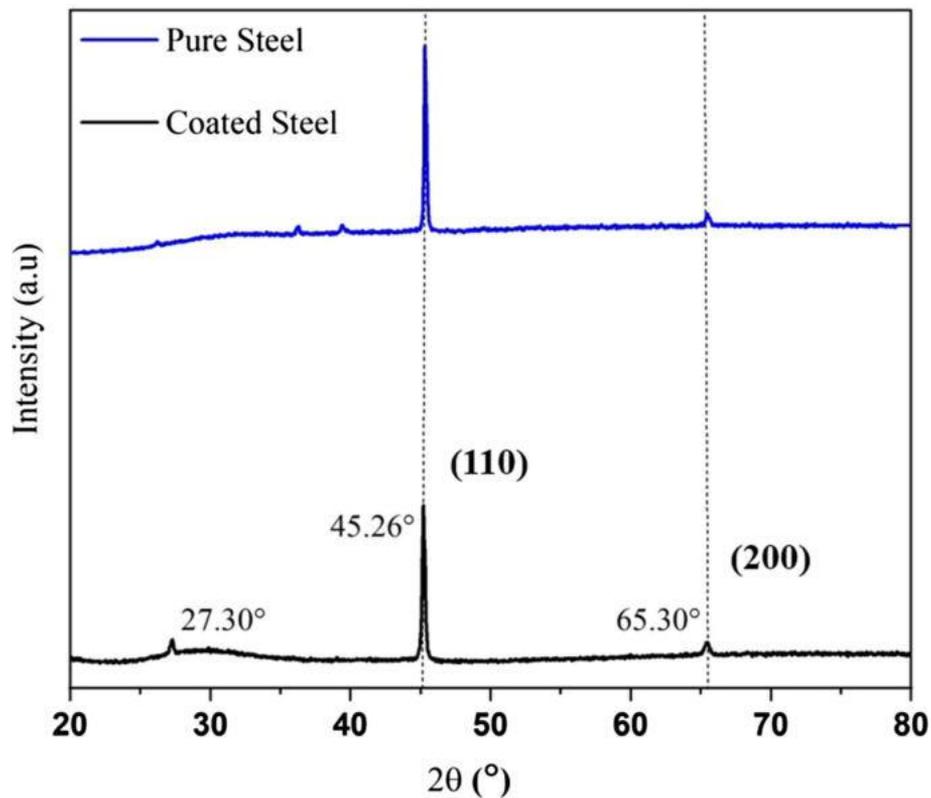

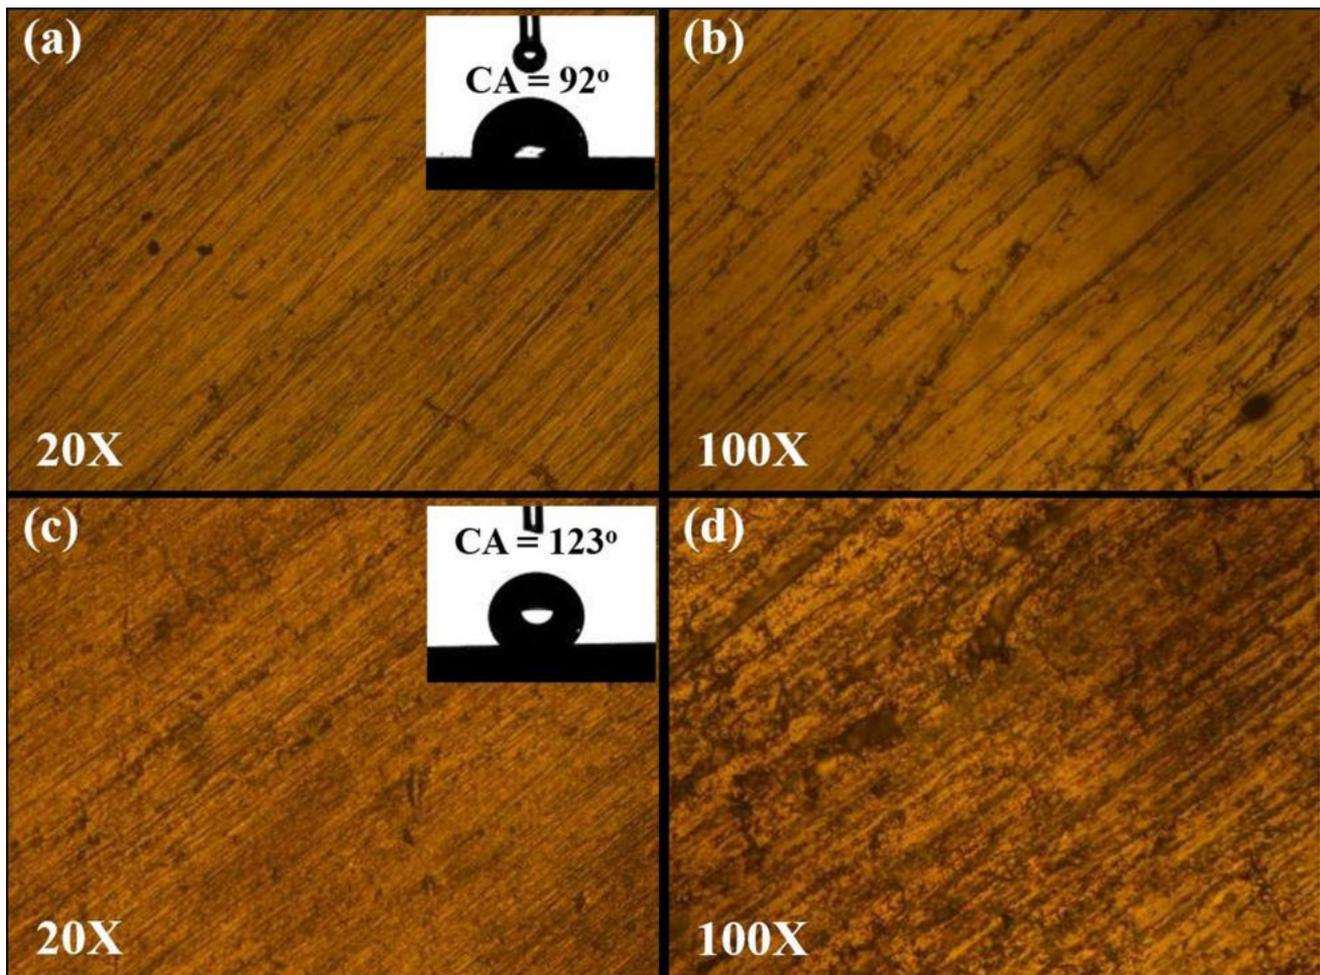

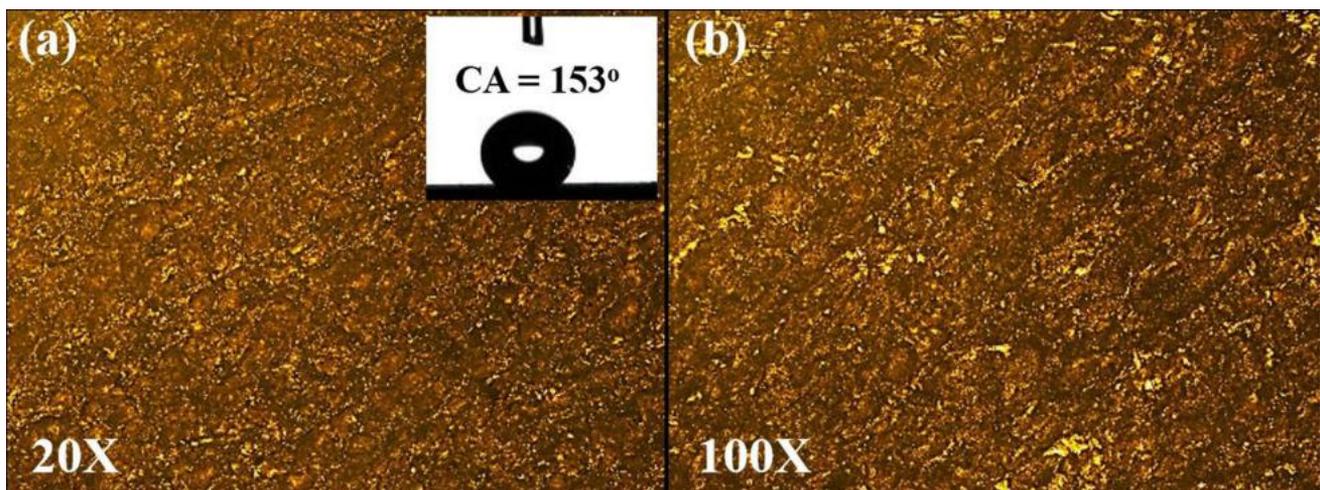

Fig. 4 X-ray diffraction (XRD) pattern of uncoated (pure steel) and coated mild steel samples

ior of the coating. The relation between an average surface roughness ( $R_{avg}$ ) and contact angle (CA) with sliding angle (SA) of the polished, etched and coated mild steel is shown in Table 1. It is evident from Table 1 that etched mild steel has higher  $R_{avg}$  (110 nm) compared to polished steel  $R_{avg}$  (60 nm)

which is obvious because the chemical eats away some portion of the metal (Ref 11). Similarly, the coated mild steel exhibits higher  $R_{avg}$  (193 nm) compared to the etched mild steel. A similar trend is followed by the water CA, because as per the literature if the  $R_{avg}$  of a surface increases then the water CA

**Fig. 5** Optical micrographs of (a, b) polished mild steel and (c, d) etched mild steel substrates at 20X and 100X with their corresponding contact angles (inset of a and c)

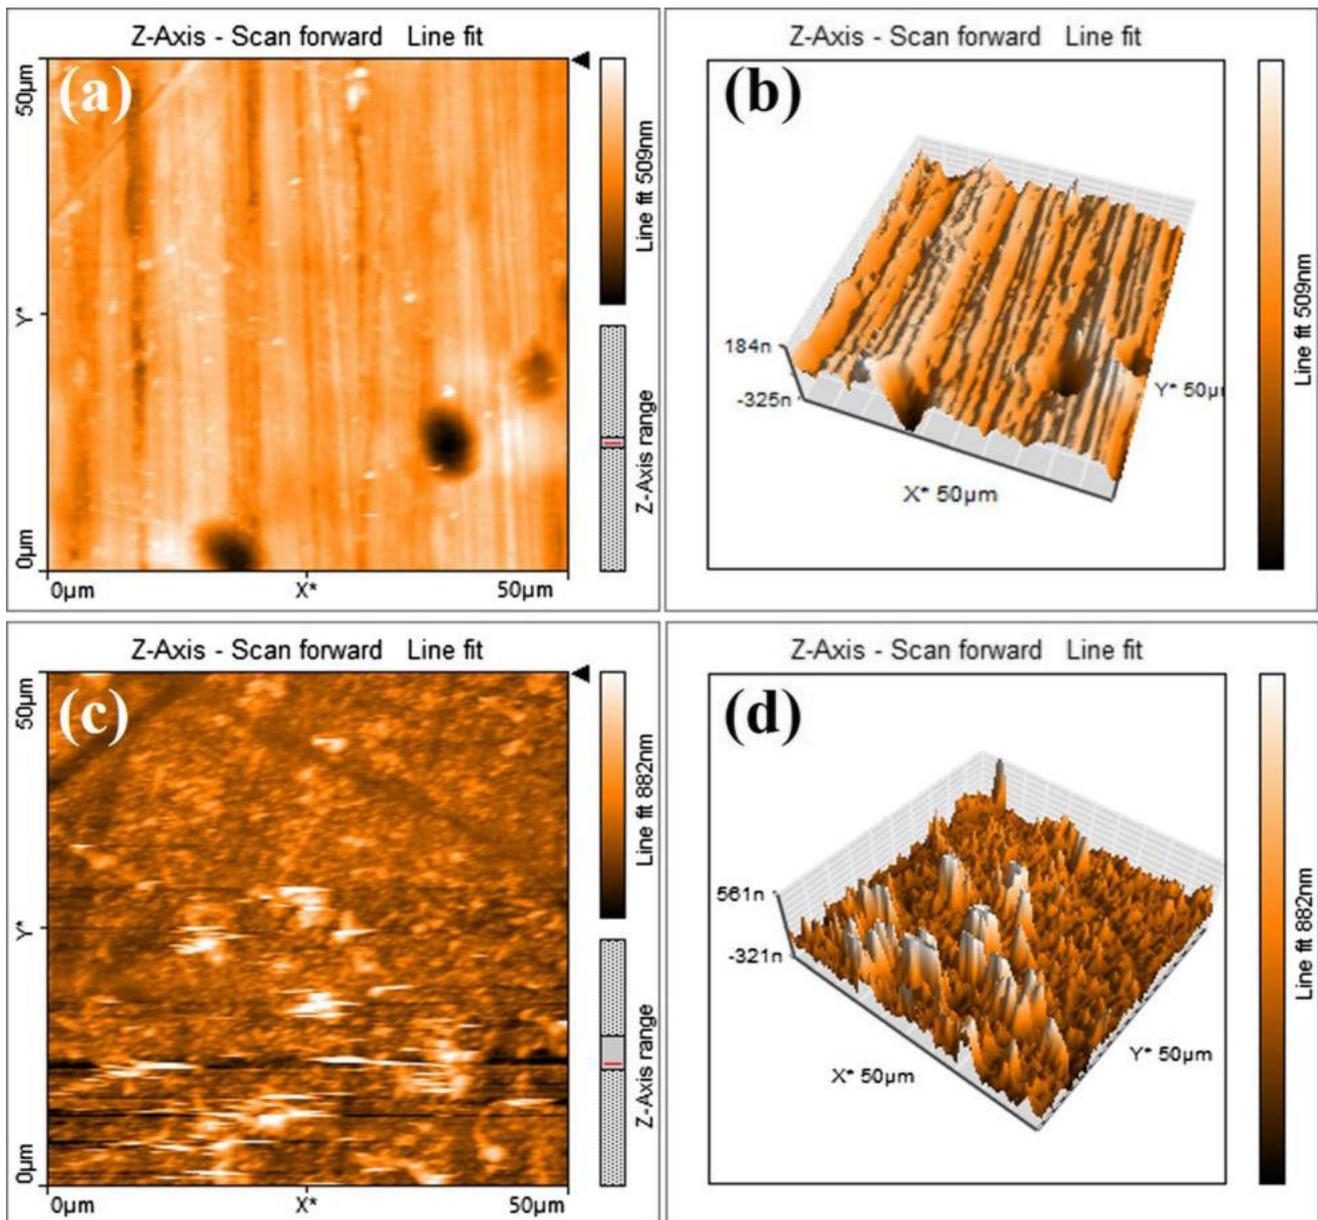

**Fig. 6** Optical micrographs of (a, b) coated mild steel at 20X and 100X with their corresponding contact angle (inset of a)

also increases (Ref 12, 14). However, with the increase in surface roughness, the SA goes on decreasing which is in close agreement with the results published by others (Ref 16). Thus, in the current study, the surface-functionalized  $\text{SiO}_2$  nanopar-

ticles are found responsible for the increased roughness of the mild steel in different situations.

FESEM analysis was performed to characterize the morphology of the coated mild steel. The FESEM images of coated

**Fig. 7** The 2D and 3D AFM images of (a, b) polished and (c, d) etched mild steel

mild steel at different magnifications are shown in Fig. 9. The lower magnification image is showing a quite rough surface of the coated mild steel. The high roughness is in close agreement with the AFM results. However, the high magnification FESEM image is showing individual nanoparticles (solid white circle) and their large size spherical agglomerates (dotted white circle) on the coated surface of mild steel. The presence of nanoparticles and their micron or sub-micron size clusters jointly produce a micro-nano hierarchical surface roughness, which is in close agreement with the AFM results. Thus, this hierarchical roughness leads to the superhydrophobic surface formation on the metallic substrate. That can be very effective in controlling the corrosion of mild steel.

The corrosion resistance of the uncoated and coated mild steel samples was characterized by immersing the samples in a corrosive salt solution (3.5% NaCl) for 30 days. Optical images of uncoated and coated mild steel after dipping in a corrosive

salt solution for a 1-month under ambient conditions are shown in Fig. 10. The physical appearance is revealing that the uncoated substrate corroded significantly, while the coated substrate remains almost non-corroded. However, the coating is damaged a little bit and reveals partially inflated spots on the surface. The water droplet sitting on coated mild steel after a 1-month corrosion test is shown in Fig. 11. The CA of the coated mild steel substrate was reduced to  $\sim 135 \pm 3^\circ$  from  $153 \pm 2^\circ$  after the 1-month corrosion test, which is obvious as the coating was found little bit damaged due to corrosive salt. Thus, it indicates the reliability of the coating and its efficiency as corrosion resistance material for mild steel.

The corrosion resistance performance of uncoated and coated mild steel samples was estimated using Nyquist plots and potentiodynamic polarization curves of EIS (Fig. 12). Figure 12(a) shows that the impedance of coated mild steel is significantly higher than that of uncoated mild steel, signifying

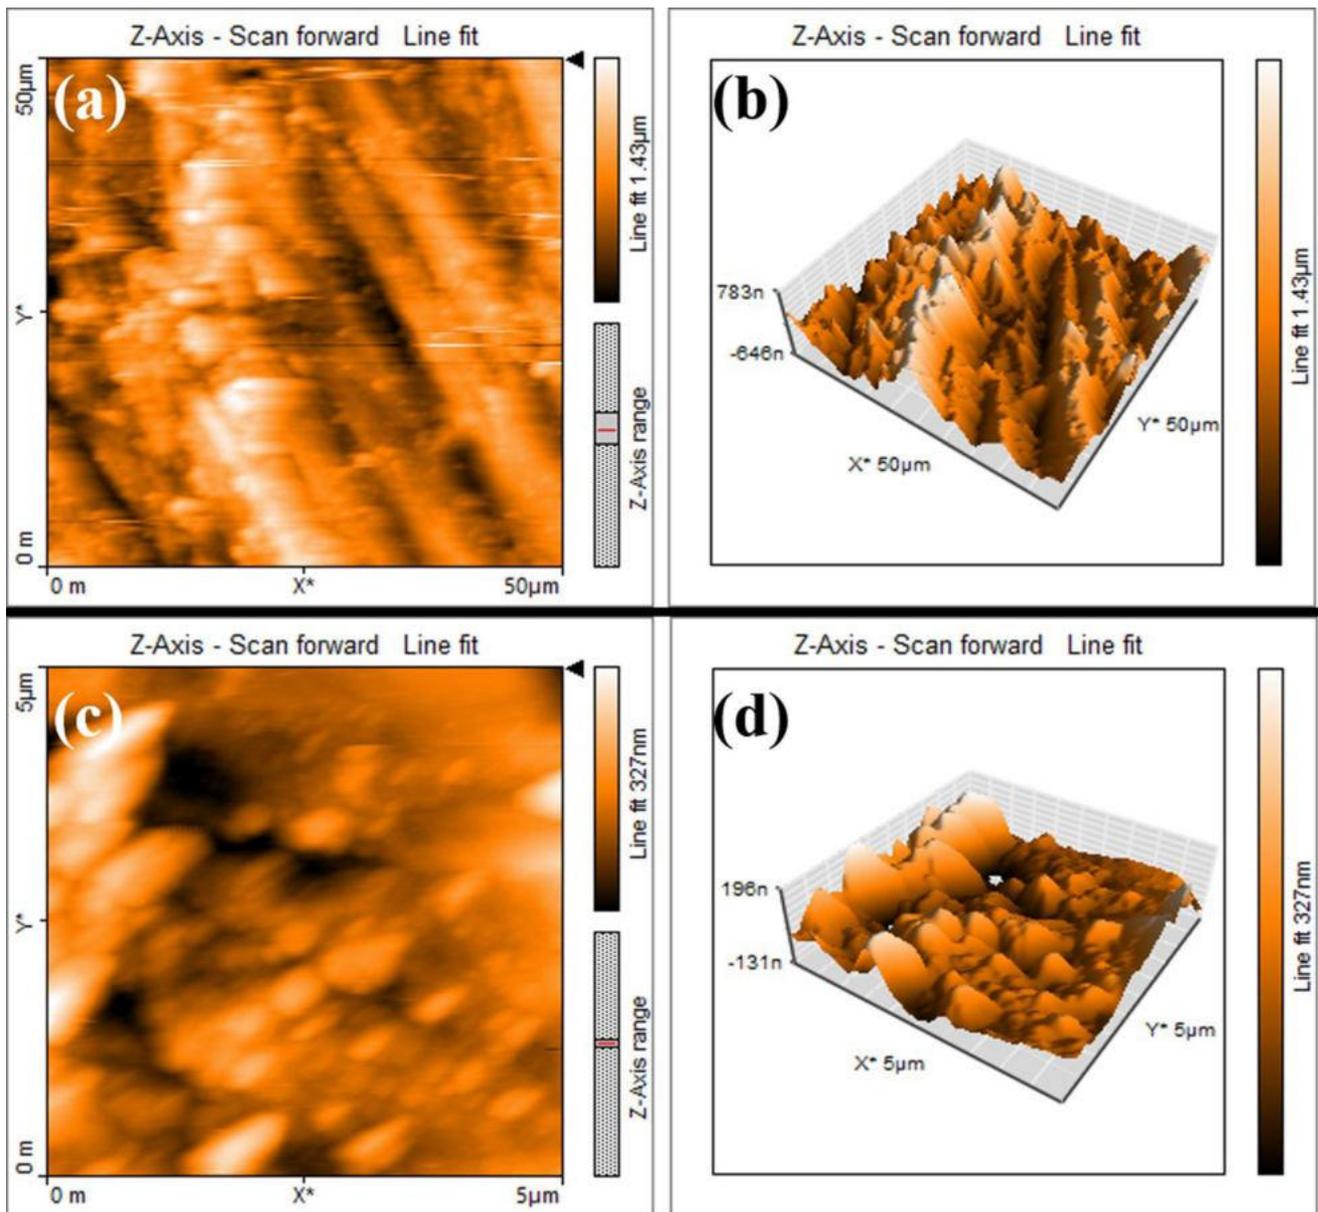

Fig. 8 The 2D (a, c) and 3D (b, d) AFM images of coated mild steel at lower and higher magnifications

Table 1 The relation between  $R_{avg}$  and CA with sliding angle (SA) of the polished, etched and coated mild steel

Metallic substrate	Avg. roughness, nm	CA, °	SA, °
Polished Steel	60	$92 \pm 2$	$50 \pm 5$
Etched Steel	110	$123 \pm 3$	$28 \pm 3$
Coated Steel	193	$153 \pm 2$	$5 \pm 2$

that the corrosion confrontation of coated mild steel is very high compared to the uncoated mild steel (Ref 16, 25). The polarization curves of coated sample (Fig. 12b) demonstrating the low current density ( $I_{corr}$ ) and high  $E_{corr}$  compared to the uncoated one specified the higher corrosion resistance due to the superhydrophobic coating (Ref 16, 25). The corrosion properties of uncoated and coated mild steel are illustrated in

Table 2. The EIS Nyquist plots exhibit typical semi-circle for mild steel and semi-circle type arc with tail for coated mild steel, therefore EIS data was fitted using two equivalent electric circuit models (Fig. 12c and d), which are typically used for bare and coated mild steel (Ref 25, 26). The fitted EIS data of uncoated and coated mild steel is shown in Table 3. Where  $R_s$  is solution resistance,  $R_{pro}$  is the resistance of corrosion products,  $CPE_1$  is the coating constant phase element which corresponds double-layer capacitance at the interface of metal and coating.  $CPE_{dl}$  corresponds to double layer capacitance occurred at the interface of metal and solution (corroded area) and  $R_{ct}$  is charge transfer resistance.  $R_s$  depends on the geometry of the area through which current is flowing as well as on the resistivity of electrolyte.  $R_s$  is technically not the main component as it is not representing the property of a coating during coating performance analysis (Ref 25). The use of modified nanoparticles-based coating on mild steel-enhanced  $R_{ct}$  value almost 8 times

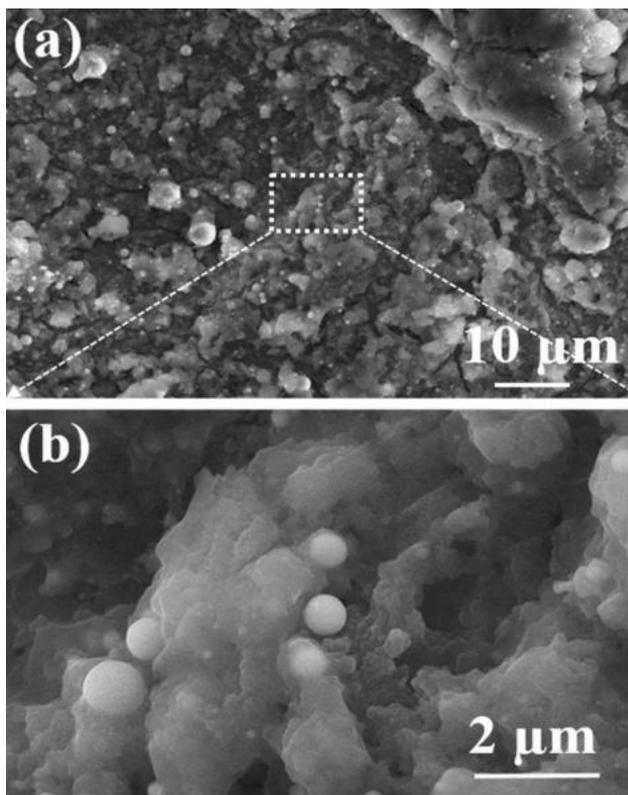

higher than the mild steel whereas diminished double layer capacitance  $CPE_{dl}$ . The low value of  $CPE_{dl}$  signified decreased coating porosity as well as better corrosion resistance performance for coated steel substrate, which is in close agreement with the results reported by others (Ref 25, 26).

Usually, low  $I_{corr}$  means a low corrosion rate. Silica is a well-known coupling element for the corrosion resistance of metals for ages. This may be due to the formation of a layer of Si-O metal bonds over the sample surface, which dominates the

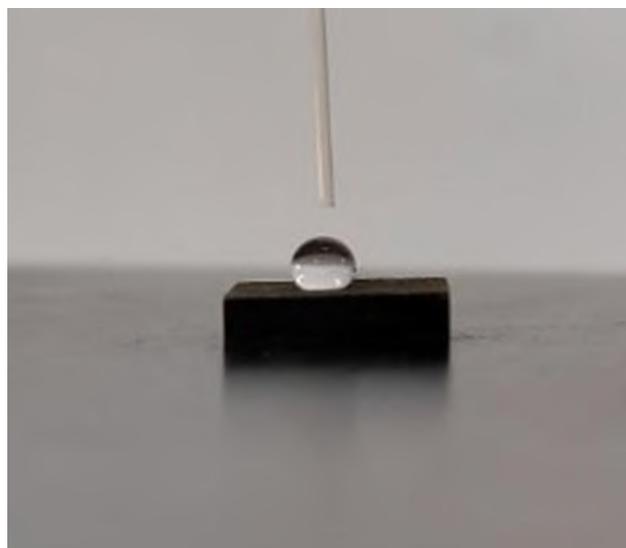

corrosion reaction and decrease its speed, even if the substrate does not possess superhydrophobic properties (Ref 27). The cathodic and anodic current goes down and corrosion potential ( $E_{corr}$ ) goes toward a positive value due to superhydrophobic coating (Ref 28, 29). Thus, the superhydrophobic coating has an inordinate potential to resist the corrosion of mild steel or other metals.

#### 4. Conclusions

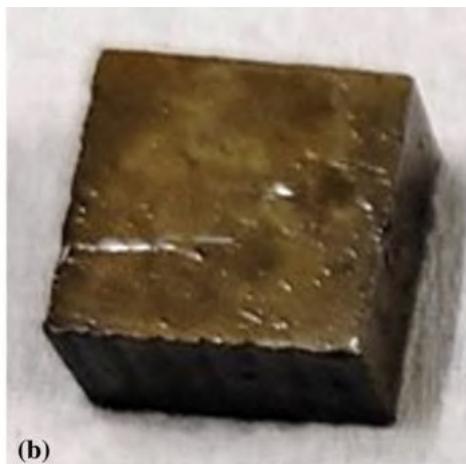

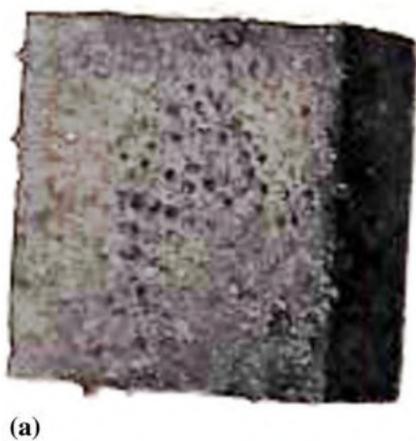

Triethoxyoctylsilane-modified  $SiO_2$  nanoparticles-based superhydrophobic coating was successfully prepared via solution method to prevent the corrosion of mild steel. The developed coating exhibited micro-nano hierarchical roughness due to the presence of individual nanoparticles and their micron size clusters as verified by AFM and FESEM analysis. The hierarchical roughness of the coating resulted in the superhy-

drophobicity of the mild steel. The maximum water CA of  $153 \pm 2^\circ$  with a SA of  $5 \pm 2^\circ$  was obtained for the coated mild steel compared to the uncoated mild steel (CA of  $92 \pm 2^\circ$  with

SA of  $50 \pm 5^\circ$ ). The EIS plots confirmed the significant corrosion resistance performance of coated metal over the uncoated one. Thus, the developed superhydrophobic coating can play a vital role in controlling the corrosion of metals. However, there is a great need to study the mechanical and thermal stability of such coatings for industrial applications.

**ARTICLE HISTORY** Received 2 February 2022; Accepted 3 July 2022

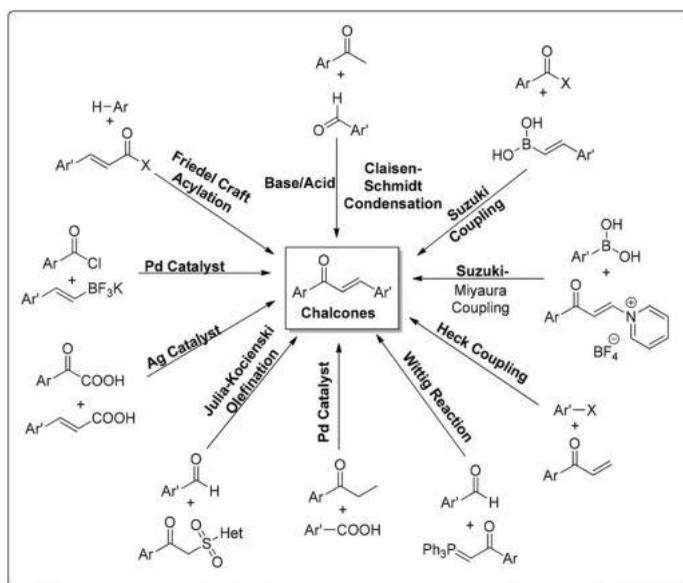

The presence of heterocyclic units as central structural features in both natural products and synthetic molecules has been long recognized in preparative organic chemistry.<sup>1</sup> Among heterocycles, some pyrazoles have been successfully commercialized as medicines or pesticides,<sup>2–5</sup> and, as a class, pyrazoles exhibit a wide range of pharmacological properties. The latter represent remarkably divergent areas, including antimalarial, anti-glaucoma, antihypercholesterolemia, antihyperglycemic, antihypertensive, analgesic, anti-Parkinson, antipsychotic, antimicrobial, anti-inflammatory, anticonvulsant, anticancer, and estrogen receptor (ER) ligand activities.<sup>4–10</sup> Consequently, pyrazole chemistry is a mature field and occupies a prime place in organic synthesis.<sup>11</sup>

Chalcones are key synthons used to design heterocyclic compounds in drug development. It is believed that the broad range of biological activities of chalcones is due, at least in part, to the presence of the ethylene unit in conjugation with the carbonyl functionality, as removal of this functionality makes them inactive. Such biological properties as anticancer,<sup>12–14</sup> anti-oxidant,<sup>15–18</sup> anti-inflammatory,<sup>19–21</sup> antimicrobial,<sup>22</sup> antitubercular,<sup>23</sup> antileishmanial,<sup>24</sup> antimalarial,<sup>25</sup> anthelmintic,<sup>16</sup> and osteogenic<sup>26</sup> activities of chalcones are well known in the literature. The synthesis of chalcones remains a crucial area of research for synthetic organic and medicinal chemists. Several synthetic protocols are reported in the literature for the synthesis of chalcones (Figure 1). The most common involves acid or base mediated Claisen-Schmidt condensation under homogeneous conditions.<sup>27,28</sup> The search for new synthetic protocols with such advantages as shortened reaction times, high yields, and eco-friendliness remains challenging.<sup>29</sup> The advent of microwave-assisted synthesis of heterocyclic compounds has the potential to assist in this search because it offers many of the needed advantages.<sup>30–34</sup>

In our ongoing investigations into the synthesis of pyrazoles<sup>35–47</sup> we have considered Me<sub>3</sub>SiI in its role as a promising promoter and water scavenger. We now report an

 Supplemental data for this article can be accessed online at <https://doi.org/10.1080/00304948.2022.2099199>.

**Figure 1.** Some synthetic methods used for chalcone synthesis.

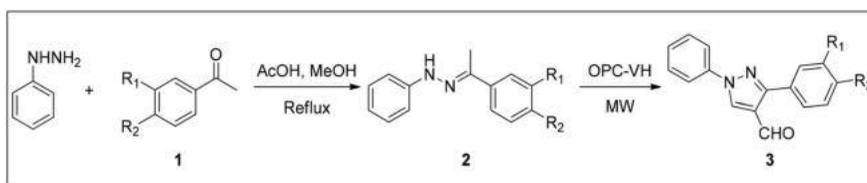

optimized microwave-assisted  $\text{Me}_3\text{SiI}$ -promoted synthetic procedure for pyrazolyl chalcones.

This closely relates to our prior work on the Vilsmeier-Haack reagent OPC-VH (prepared from phthaloyl dichloride (OPC) and DMF), enabling in a convenient way the reaction of acetophenone hydrazones to give 4-formylpyrazoles **3** (Scheme 1).<sup>35,41,48,49</sup>

Having in hand the 4-formylpyrazoles **3** prepared by this method, we sought to use them to prepare the title pyrazolyl chalcones. First, as a model, 1,3-diphenyl-1*H*-pyrazole-4-carbaldehyde **3a** (1.0 equiv.) was subjected to Claisen-Schmidt condensation with propiophenone (1.2 equiv.) to prepare pyrazolyl chalcone **5a** under the conditions noted in Table 1. Under a variety of conventional conditions (Entries 1-6) compound **5a** was formed only in yields of 30-45%. The use of dimethylformamide (DMF), higher temperatures and  $\text{Me}_3\text{SiI}$  offered encouraging improvements in the yield (Entries 7-12). Finally, the reaction of **3a** and propiophenone with 3 equivalents of  $\text{Me}_3\text{SiI}$  in DMF for 10 min at 100 °C using microwave irradiation gave 88% of the pyrazolyl chalcone **5a** (Entry 13). The great reduction in reaction time made possible by microwave irradiation is noteworthy.

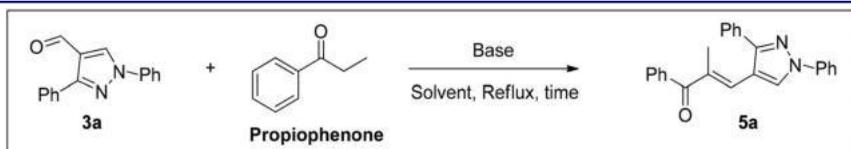

Having established the optimized reaction conditions, we extended the scope and generality of the procedure with different substituents at the aryl moieties as shown in Table 2. Each of the pyrazolyl chalcones **5a-l** could easily be prepared within 15 minutes (yields 76-93%, mean 85%). It was found that the reactions proceeded smoothly when either electron donating or withdrawing groups were present at the aryl rings. All of the novel compounds were rigorously characterized (see Experimental section).

In summary, this study presents a microwave-assisted iodotrimethylsilane-promoted synthesis of novel pyrazolyl chalcones. Hallmarks of this method include operational simplicity, easy work up procedures, very good yields and short reaction times. Now that pyrazolyl chalcones are readily available with the structural complexity

**Scheme 1.** Synthesis of 4-formylpyrazoles **3** using microwave assisted OPC-VH reaction.

**Table 1.** Optimization of reaction conditions.

<sup>b</sup>Conventional heating (Method A) and Microwave irradiation (Method B).

demonstrated here, we hope that our methods will promote further investigation of their useful properties.

## Experimental section

Chemicals were obtained from commercial sources and used without further purification. Melting points were determined in open glass capillaries on a Fisher-Johns melting point apparatus and are uncorrected. <sup>1</sup>H NMR (400 MHz) spectra were recorded at room temperature in CDCl<sub>3</sub> as solvent and tetramethylsilane (TMS) as an internal standard. Coupling constants (*J*) are reported in Hz; those for common alkyl groups were in the expected range and are not separately marked. <sup>13</sup>C NMR (100 MHz) spectra were recorded in CDCl<sub>3</sub> solutions with TMS as internal standard. The mass spectra were recorded on a JOEL JMS 600 mass spectrometer at an ionizing potential of 70eV (EI) in the electron impact ionization mode using the direct inlet system. All the reactions were monitored by thin-layer chromatography (TLC) on pre-coated silica gel 60 F254 (mesh); spots were visualised under UV light at 254 nm. Elemental analyses were obtained using a Carlo Erba EA1108 microanalyzer. Infrared (IR) spectra were obtained

### 1,3-Disubstituted-4-formylpyrazoles<sup>35</sup>

Vilsmeier-Haack reagent (OPC-VH reagent)<sup>35</sup> (0.73 g, 5.76 mmol) at 0 °C was added to a solution of the appropriate hydrazone **2** (1.92 mmol) in dimethylformamide (10 mL) in a microwave vial. The vial was closed with a Teflon septum and aluminium crimp by using a suitable crimping tool. The vial was then irradiated in the microwave and the temperature was steadily raised from room temperature to 60 °C in the interval of 10 minutes. The reaction mixture was cooled down and the crude product was poured into ice water. The crude product was neutralized with saturated NaHCO<sub>3</sub> solution and extraction of the target compound was done with ethyl acetate (2 × 50 mL). The ethyl acetate layer was washed with brine solution (2 × 15 mL), then dried over anhyd. Na<sub>2</sub>SO<sub>4</sub>, filtered and the solvent was evaporated under reduced pressure to afford crude compound **3** which was recrystallized with refluxing CHCl<sub>3</sub>-EtOH. The physical data of all 4-formylpyrazoles are provided in Table 3.

### 3-(3-Aryl-1-phenyl-1*H*-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-ones (**5**)

#### Method A (Conventional conditions)

Propiophenone (0.064 g, 0.48 mmol) and 1,3-diphenyl-1*H*-pyrazole-4-carbaldehyde (0.10 g, 0.40 mmol) were placed in a 20 mL tube and dissolved in DMF (5.0 mL).

**Table 3.** Physical data of 4-formylpyrazoles (**3a-f**).

Entry	Compound	R	Mol. Formula	Mol. Wt	%Yield	m.p. <sup>35</sup>

Iodotrimethylsilane (TMSI) (0.24 g, 1.20 mmol) was added dropwise to the solution. The tube was sealed tightly and heated at 100 °C for 10 h. The reaction progress was monitored by TLC (20% ethyl acetate in pet ether). On completion, the sealed tube was cooled and the reaction mixture was poured onto crushed ice. The organic compound was extracted into ethyl acetate (2 x 50 mL). The organic layer was washed with brine solution (2 x 20 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and the filtrate was concentrated under reduced pressure to afford crude 3-(1,3-diphenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one **5a**. The crude compound was purified by column chromatography using silica gel (100-200 mesh, 10% ethyl acetate in pet-ether) and afforded **5a** as an off-white solid in 71% yield.

#### **Method B (Microwave irradiation)**

All compounds **5** were synthesized using an Anton Paar Monowave-300 reactor (Gaas, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850W. The reactions were carried out in a G-4 borosilicate glass vial sealed with a Teflon septum and placed in a microwave cavity. Sufficient power was used to ramp up from room temperature to the desired temperature. Once this temperature was attained, the process vial was held at this temperature for the required time. The reactions were continuously stirred. Temperature was measured by an IR sensor. After the experiments, a cooling jet cooled the reaction vessel to ambient temperature. In a representative case, to a mixture of propiophenone (0.064 g, 0.48 mmol) and 1,3-diphenyl-1H-pyrazole-4-carbaldehyde (0.10 g, 0.40 mmol) in DMF (3.0 ml) in a microwave vial was added TMSI (0.24 g, 1.20 mmol) at room temperature and the mixture was stirred for 1 min. The vial was sealed with the Teflon septum and aluminium crimp, using an appropriate crimping tool. The vial was then subjected to microwave irradiation and the temperature was ramped from room temperature to 100 °C with the holding time of 10 min. The reaction was brought to room temperature, and the reaction mixture was poured into ice-water, and then extracted with ethyl acetate (2 x 20 mL). The organic layer was washed with brine solution (2 x 10 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and the filtrate was concentrated under reduced pressure to afford crude **5a**. The crude compound was purified as before to afford as an off-white solid in 88% yield.

#### **3-(1,3-Diphenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one (5a)**

## Microwave-Assisted OPC-VH Mediated Synthesis of 2-Amino-1,3,4-thiadiazoles

Parmod Kumar<sup>a</sup>, Harshita Phougat<sup>b,c</sup>, Anil Kumar<sup>b</sup>, Anurakshee Verma<sup>a</sup>, and Karan Singh<sup>c</sup> 

<sup>a</sup>Department of Chemistry, School of Basic and Applied Sciences, Lingaya's Vidyapeeth, Faridabad, Haryana, India; <sup>b</sup>Department of Chemistry, Akal College of Basic Sciences, Eternal University, Baru Sahib, Himachal Pradesh, India; <sup>c</sup>Department of Chemistry, Indira Gandhi University, Meerpur, Rewari, Haryana, India

**ARTICLE HISTORY** Received 11 March 2022; Accepted 23 August 2022

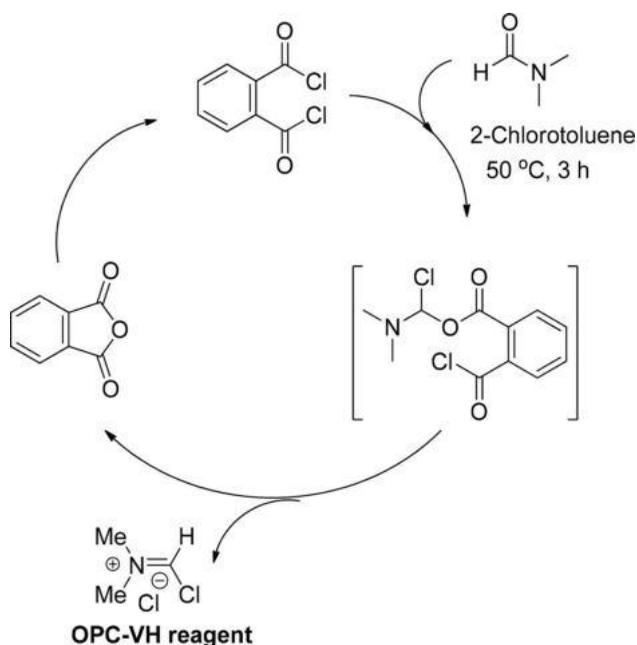

Bioactive thiadiazoles represent an indispensable class of nitrogen and sulfur containing heterocycles, in part due to their extensive applications in medicinal chemistry.<sup>1</sup> It is generally assumed that the biological activities of thiadiazoles are due to the presence of the =N-C-S- moiety and the aromaticity of the ring, responsible for the *in vivo* stability and low toxicity for higher vertebrates.<sup>2,3</sup>

Indeed, the thiadiazole ring represents a remarkably divergent scaffold responsible for numerous biological properties including antimicrobial,<sup>4</sup> antituberculosis,<sup>5</sup> antiviral,<sup>6</sup> analgesic,<sup>7</sup> antidepressant,<sup>8</sup> antihypertensive,<sup>9</sup> local anesthetic and kinesin inhibitory activities.<sup>10,11</sup> Consequently, 1,3,4-thiadiazole chemistry is a mature field and occupies an important niche in heterocyclic chemistry. The unit serves as a vital synthon for the preparation of more elaborate bioactive molecules.

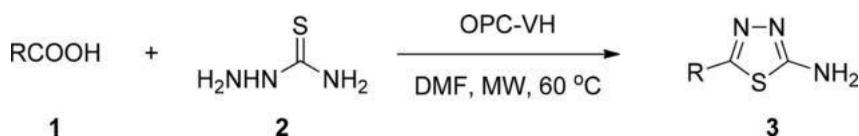

Several synthetic approaches are well known in the literature for the synthesis of 1,3,4-thiadiazoles. Some one-pot synthetic methods involve the reaction between carboxylic acids and thiosemicarbazides using (i) ionic liquids;<sup>12</sup> (ii) excess POCl<sub>3</sub>;<sup>13</sup> (iii) polyphosphoric acid;<sup>14</sup> (iv) a mixture of P<sub>2</sub>O<sub>5</sub> and MeSO<sub>3</sub>H;<sup>15</sup> and (v) polyphosphate ester (PPE).<sup>16</sup> However, high production costs, reagent toxicity, and by-product formation are disadvantages of some of the known methods.<sup>16</sup> Given the movement of the field towards greener, more efficient and lower cost methods,<sup>17</sup> microwave-assisted construction of heterocycles has truly come into its own.<sup>18–20</sup>

Recently, the Vilsmeier–Haack reagent (Scheme 1, OPC-VH) prepared by Kimura and his team<sup>21,22</sup> using *o*-phthaloyl dichloride and dimethylformamide was employed by us for the synthesis of 4-functional pyrazoles.<sup>23–26</sup> Taking into account our interest in the construction of heterocycles<sup>27–32</sup> and in light of the versatility of OPC-VH reagent, we sought a method to produce 2-amino-1,3,4-thiadiazoles, which may then be used to introduce substituents on the 5-position of the heterocycle. We now report an optimized microwave-assisted OPC-VH mediated synthetic approach for the needed 2-amino-1,3,4-thiadiazole derivatives.

**Scheme 1.** Preparation of OPC-VH reagent.

**Scheme 2.** Construction of 2-amino-1,3,4-thiadiazoles **3** using OPC-VH reagent.

The OPC-VH reagent was first prepared from phthaloyl dichloride (OPC) and dimethylformamide (DMF) using Kimura's procedures.<sup>21,22</sup> The reagent was obtained in pure form, obviating the use of toxic  $\text{POCl}_3$ . The phthalic anhydride formed as a by-product may in its own turn be reused in the preparation of phthaloyl dichloride (Scheme 1).

Recently, the conversion has been reported in the literature of numerous hydrazones to 4-formyl pyrazoles and 4-formyl pyrazoles to 4-cyanopyrazoles using OPC-VH reagent.<sup>23,24,26</sup> These results encouraged us to study the synthesis shown in Scheme 2.

We further hoped that the microwave method would increase the rate of reaction as well as improve the overall yield of the products.<sup>31</sup> As a model experiment, the one-pot reaction of benzoic acid and thiosemicarbazide using OPC-VH (2.5 equiv.) at 60 °C in acetonitrile for 3 hours afforded the desired thiadiazole **3a** (**3**, R = Ph) in 54% yield (Table 1, entry 1). The reaction was also attempted with *o*-phthaloyl dichloride (2.5 equiv.) at 60 °C in acetonitrile for 6 hours but no desired product **3a** was observed (entry 2). Microwave irradiation, operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850 W, was next studied, varying the solvent, temperature, and the amount of OPC-VH reagent.

**Table 1.** Optimization of OPC-VH mediated synthesis of 2-amino-1,3,4-thiadiazole.

Entry	OPC-VH (equiv.)	Solvent	Temp (°C)	Reaction time	Yield (%) <sup>a</sup>

The formation of the desired product **3a** in 60% yield within 5 minutes at the same temperature demonstrated the efficiency of microwave irradiation in this setting (entry 5, Table 1). In the absence of OPC-VH reagent, no product was observed. The reaction carried out in dry DMF at 60 °C for 5 minutes in microwave irradiation was best as it gave 85% yield (entry 9). We thus extended the reaction conditions of entry 9 of Table 1 to further exploration of preparing compounds **3** having different substituents at the 5-position. The results are summarized in Table 2. Under the optimized conditions, the yields of isolated 1,3,4-thiadiazole derivatives **3a-j** were uniformly good (72 – 87%) and did not depend much on the given substituents.

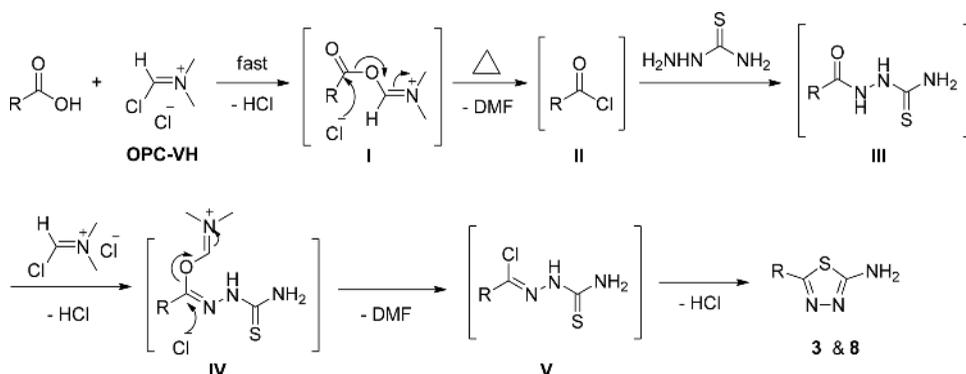

The investigation was further extended to prepare a series of pyrazolylthiadiazoles **8a-e**. The pyrazole-4-carboxylic acids **7** needed were prepared from pyrazole-4-carbaldehydes **6** using vanadium catalyst in the presence of 30% H<sub>2</sub>O<sub>2</sub> in acetonitrile as shown in Scheme 3.<sup>34</sup> The treatment of aryl methyl ketones **4** with phenylhydrazine in refluxing methanol using acidic conditions afforded the corresponding hydrazones **5**. The microwave-assisted cyclization of hydrazones **5** using OPC-VH reagent in DMF at 60 °C within 10 minutes afforded the corresponding pyrazole-4-carbaldehydes **6**.<sup>35</sup> The pyrazole-4-carboxylic acids **7** were further subjected to the optimal reaction conditions

**Scheme 3.** Microwave synthesis of pyrazolythiadiazoles **8a-e** using Vilsmeier–Haack reagent (OPC-VH).

**Table 3.** Yield of a series of pyrazolythiadiazoles **8a-e**.

**Scheme 4.** Plausible mechanism of the OPC-VH mediated synthesis of 2-amino-1,3,4-thiadiazoles **3** and **8**.

used for **3a** to obtain novel pyrazole-1,3,4-thiadiazoles **8** in good yield (75–85%) and the results are summarized in [Table 3](#). Compounds **8** were rigorously characterized.

The IR spectrum of 5-(1,3-diphenyl-1*H*-pyrazol-4-yl)-1,3,4-thiadiazole-2-amine **8a** showed bands at 3321 and 3265 cm<sup>-1</sup> (NH stretching), 1632 (C=C), 1598 (C=N thiadiazole) and 698 (C-S-C). In the <sup>1</sup>H NMR spectra, compound **8a** showed a singlet at  $\delta$  6.89 due to the –NH<sub>2</sub> protons. In the <sup>13</sup>C NMR spectra, the C=N carbons appeared at  $\delta$  173.1 and 160.2, deshielded due to the adjacent sulfur atom. The mass spectral analysis of **8a** showed the molecular ion peak at  $m/z$  320.19 (M + H)<sup>+</sup>.

In considering a plausible mechanism ([Scheme 4](#)), we believe that the intermediate **I** might be quickly formed in the reaction of the carboxylic acid with the OPC-VH reagent. After that, the chloride anion attacks the intermediate **I** to afford the acid chloride **II**. On reacting with thiosemicarbazide the acid chloride yields thiosemicarbazone **III**. The subsequent reaction of thiosemicarbazone **III** with OPC-VH reagent forms intermediate **IV**, on

which chloride ion attacks to produce the intermediate **V**. Upon cyclization compound **3** or **8** is obtained.

In summary, an efficient microwave assisted OPC-VH mediated synthesis of 2-amino-5-substituted-1,3,4-thiadiazoles from corresponding carboxylic acids has been reported. The operational simplicity, avoidance of toxic materials, easy work up and feedback into the process of a generated by-product are the advantages of this approach. Given the practicality of this method, it is our hope that pyrazolythiadiazole-2-amines can be further investigated for the development of pyrazole-based drugs.

## Experimental section

Melting points were determined in open glass capillaries on a Fisher-Johns melting point apparatus and are uncorrected.  $^1\text{H}$  NMR (400MHz) spectra were recorded at room temperature in  $\text{CDCl}_3$  as solvent and tetramethylsilane (TMS) as an internal standard. Coupling constants ( $J$ ) are reported in Hz; those for common alkyl groups were in the expected range and are not separately marked.  $^{13}\text{C}$  NMR (100 MHz) spectra were recorded in  $\text{CDCl}_3$  solutions with TMS as internal standard. The mass spectra were recorded on a JOEL JMS 600 mass spectrometer at an ionizing potential of 70eV (EI) in the electron impact ionization mode using the direct inlet system. All the reactions were monitored by thin-layer chromatography (TLC) on pre-coated silica gel 60 F254 (mesh); spots were visualized under UV light at 254 nm. Elemental analyses were obtained using a Carlo Erba EA1108 microanalyzer. Microwave irradiation was done using an Anton Paar Monowave-300 Reactor (Gaas, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850W.

### **Synthesis of 2-amino-5-substituted-1,3,4-thiadiazoles (3 and 8)**

These compounds were synthesized using an Anton Paar Monowave-300 Reactor (Gaas, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850W. The reactions were carried out in a G-4 borosilicate glass vial sealed with a Teflon septum and placed in a microwave cavity. Sufficient power was used to ramp up from room temperature to the desired temperature. Once this temperature was attained, the process vial was held at this temperature for the required time. The reactions were continuously stirred. Temperature was measured by an IR sensor. After the experiments, a cooling jet cooled the reaction vessel to ambient temperature.

For the representative preparation of compound **3a**, to a mixture of benzoic acid (0.10 g, 0.82 mmol) and thiosemicarbazide (0.082 g, 0.90 mmol) in DMF (5.0 ml) in a microwave vial was added OPC-VH (2.05 mmol) at room temperature and the mixture was stirred for 1 min. The vial was sealed with the Teflon septum and aluminium crimp, using an appropriate crimping tool. The vial was then subjected to microwave irradiation, and the temperature was ramped from room temperature to 60 °C with the holding time of 5 min. The reaction was then brought to room temperature, and the crude product was poured into ice water (approximately 15 mL), then extracted with ethyl acetate (2 x 15 mL). The organic layer was washed with brine solution (2 x 15 mL). The organic layer was dried over anhydrous  $\text{Na}_2\text{SO}_4$ , filtered and the filtrate was

concentrated under reduced pressure to afford crude 5-phenyl-1,3,4-thiadiazol-2-amine **3a**. The crude compound was purified by column chromatography using silica gel (100-200 mesh, eluting solvent 10% ethyl acetate in pet-ether) and concentrated under reduced pressure to afford 5-phenyl-1,3,4-thiadiazol-2-amine **3a** as an off white solid in 85% yield. Compounds **3** are known materials, identified on the basis of comparing their melting points with those available in the literature, as specified in Table 2.

For the preparation of representative compound **8a**, the known compound 1,3-diphenyl-1*H*-pyrazole-4-carboxylic acid **7a**<sup>34</sup> (0.200 g, 0.76 mmol) was mixed with thiosemicarbazide (0.076 g, 0.84 mmol) in DMF (5.0 ml) in a microwave vial, to which was added OPC-VH (2.05 mmol) at room temperature, and the mixture was stirred for 1 min. The vial was sealed with the Teflon septum and aluminium crimp, using an appropriate crimping tool. The vial was then subjected to microwave irradiation, and the temperature was ramped from room temperature to 60 °C with the holding time of 5 min. The reaction was then brought to room temperature, and the crude product was poured into ice (approximately 25 g), then extracted with ethyl acetate (2 x 20 mL). The organic layer was washed with brine solution (2 x 15 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and the filtrate was concentrated under reduced pressure to afford crude compound **8a**. The crude compound was purified by column chromatography using silica gel (100-200 mesh, eluting solvent 12% ethyl acetate in pet-ether) and concentrated under reduced pressure to afford 5-(1,3-diphenyl-1*H*-pyrazol-4-yl)-1,3,4-thiadiazol-2-amine **8a** as an off white solid in 75% yield.

The other derivatives **8b-e** were prepared by following the above procedure. Compounds **8** are novel and were fully characterized as shown below.

#### **5-(1,3-Diphenyl-1*H*-pyrazol-4-yl)-1,3,4-thiadiazol-2-amine (8a)**

## ABSTRACT

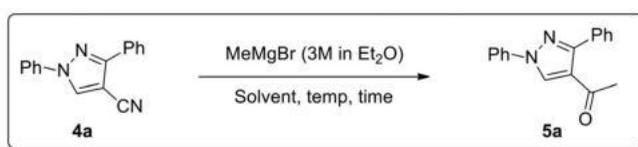

In this article, an efficient and practicable synthesis of 1,3,4-trisubstituted pyrazoles with an acyl functionality attached on the 4-position of the pyrazole scaffolds is reported. The precursor 4-cyanopyrazoles used for the fabrication of target compounds were synthesized from 4-formylpyrazoles *via* oxime formation followed by reaction with Vilsmeier–Haack reagent. The reaction of 4-cyanopyrazoles with various Grignard reagents afforded the corresponding 1,3,4-trisubstituted pyrazoles in 71–88% yield. The operational simplicity, economical starting materials, and high efficiency compared to reported methods are the advantages of this approach. All the pyrazole derivatives have been screened for antimicrobial activity and some of the derivatives exhibit significant activity against bacterial and fungal isolates. Further, time resolved photoluminescence studies for **5d**, **5h**, & **5o** were carried out using pulsed nitrogen laser as the source with a pulse width of few nanoseconds and wavelength of 337 nm. The spectrum was observed in microsecond time domain in all the cases, however, fluorescent lifetime is found to be higher in **5d** & **5h**.

## ARTICLE HISTORY

Received 30 November 2021

## KEYWORDS

1,3,4-Trisubstituted pyrazoles; 4-formylpyrazoles; 4-cyanopyrazoles; antimicrobial; Vilsmeier–Haack reagent

## Introduction

The introduction of new functional moieties at the various positions of the pyrazoles has been a great deal of interest for the researchers owing to the potential synthetic and biological significance of functional pyrazoles.<sup>1–7</sup> The literature survey revealed that out of 1,3,4-trisubstituted pyrazoles, the 4-acetylpyrazoles are proved precious synthons to fabricate a large number of organic compounds and heterocycles, for instance, thiazolylpyrazoles, pyrazolines, pyrazolylpyridines,

chalcones, pyrrolo[3,4-c]pyrazoles, pyrazolylpyrimidine, pyrazolylthiazolopyrimidineones, pyrazolyl-pyrido-triazolo-pyrimidinones (Figure 1).<sup>8</sup>

In the recent past, the significant progress has been achieved in the construction of 1,3,4-trisubstituted pyrazoles. The reaction of electron-deficient *N*-arylhydrazones with nitroolefins resulted into regioselective synthesis of 1,3,5-trisubstituted pyrazoles.<sup>9</sup> The substituted 4-acylpyrazoles were prepared from *N*-propynylsulfonyl hydrazide and diaryl iodide salts.<sup>10</sup> Recently, an alternative approach involving the free radical reaction independently for the development of this type of pyrazoles has been reported.<sup>11–13</sup> Duan's group<sup>14</sup> designed a synthetic approach to synthesize 1,3,4-tri- and 1,3,4,5-tetra-substituted pyrazoles *via* methanesulfonic acid (MSA)-catalyzed reaction and excellent regioselectivity has been gained on the reaction of hydrazones with enamines (Scheme 1).

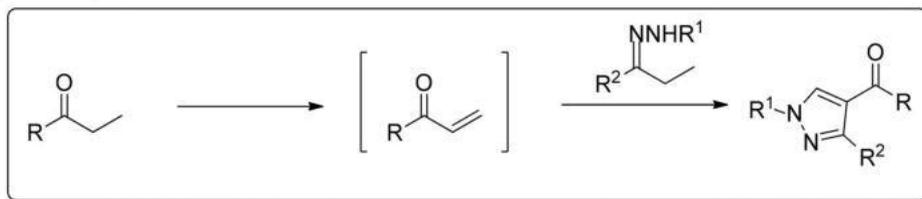

However, the developing of a new and versatile approach for the construction of 1,3,4-trisubstituted pyrazoles from economical and readily available starting materials remains a very challenging and thrust area of research for an organic chemist. Owing the potential applications and in continuation of our program,<sup>15–22</sup> the synthesis and antimicrobial evaluation of 1,3,4-trisubstituted pyrazole derivatives have been reported here along with Time Resolved Studies of selected derivatives.

## Results and discussion

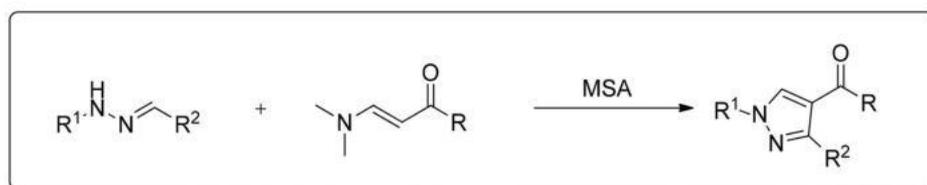

Recently, our group has been reported the conversion of 4-formylpyrazoles to 4-cyanopyrazoles using hydroxylamine hydrochloride followed by treatment with Vilsmeier–Haack reagent.<sup>16,23</sup> The 4-formylpyrazoles<sup>24–26</sup> required for the present investigation were constructed by the condensation of aryl methyl ketones with phenyl hydrazine using acidic condition followed by cyclization of hydrazones using OPC-VH reagent (prepared from phthaloyl dichloride with DMF) as outlined in Scheme 2.

Having 4-cyanopyrazoles **4** in hand, the study of transformation of carbonitrile **4a** into 4-acetylpyrazole **5a** was purposed as a model reaction. A series of experiments were carried out for optimization of the reaction conditions (Table 1).

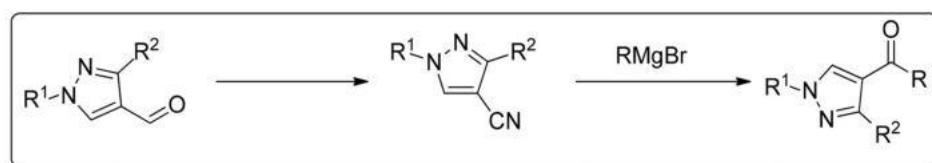

## a) Tian's protocol

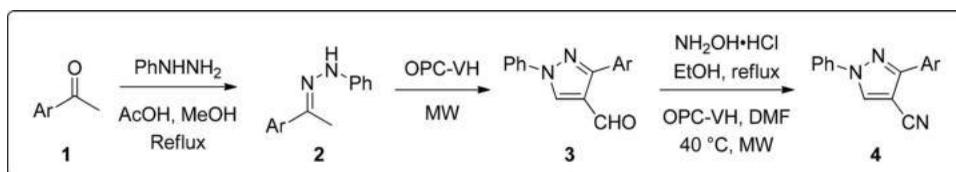

## b) Duan's protocol

## c) This protocol

Scheme 1. Previous protocols and this protocol.

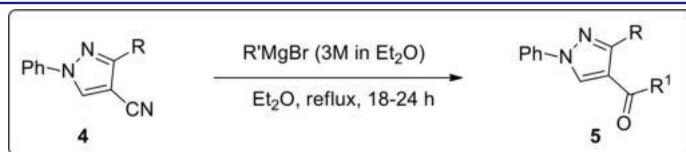

Scheme 2. Synthetic protocol of 4-cyanopyrazoles 4 from 4-formylpyrazoles 3.

Initial exposure of pyrazole-4-carbonitrile **4a** to MeMgBr (3 M in Et<sub>2</sub>O), in THF for 24 h at room temperature in an inert atmosphere afforded the desired 4-acetylpyrazole **5a** (entries 1 & 2, Table 1) in traces. On increasing the amount from 2 to 5 equivalents of methyl magnesium bromide and temperature up to reflux afforded the desired 4-acetylpyrazole **5a** in 41% yield (entries 3 & 4, Table 1). When the reaction was executed with methyl magnesium bromide in Et<sub>2</sub>O at room temperature for 24 h, substantial improvement in the yield (entries 5 & 6, Table 1) was observed. The 5.0 equivalents of MeMgBr (3 M in Et<sub>2</sub>O) in refluxing diethyl ether for 24 h afforded the acetyl product in 79% yield (entry 7, Table 1). Further increasing the reaction time from 30 h to 48 h, a significant decrease of the product yields was observed (entries 8 & 9, Table 1). Thus after screening the various parameters, the best optimized condition (entry 7, Table 1) was identified for carbonitrile transformation into acetyl functionality.

The structure of **5a** has been established through a vigorous analysis of its IR, <sup>1</sup>H NMR <sup>13</sup>C NMR, and ESI-MS. The purity of **5a** was further determined by its elemental analysis. The IR spectrum of **5a** showed a strong band at 1664 cm<sup>-1</sup> due to C=O stretching which recommended the existence of ketone functionality in compound **5a**. <sup>1</sup>H NMR spectrum (CDCl<sub>3</sub>, 400 MHz) revealed the existence of a one-proton singlet at δ 8.45 which was ascribed to the pyrazole-*H*.

Table 1. Optimization of reaction conditions.

Entry	MeMgBr (3M in Et <sub>2</sub> O) (equiv.)	Solvent (dry)	Temp (°C)	Reaction time (h)	Yield <sup>a</sup> (%)
1	1.0	THF	rt	24	Traces

<sup>a</sup>Isolated yield.

The aromatic protons of both phenyl rings appeared as a complex multiplets in the region  $\delta$  7.73–7.78 (4H) and 7.42–7.51 (5H) and one proton triplet appeared at  $\delta$  7.36 ( $J=8.4$  Hz). The remaining three protons of the acetyl- $CH_3$  appeared as a sharp singlet at  $\delta$  2.38. <sup>13</sup>C NMR spectrum showed the prominent peak at  $\delta$  192.3 further confirms the formation of the target compound **5a**. The structure of **5a** was further supported by its ESI-MS spectrum which exhibited its molecular ion peak as the base peak of the spectrum at  $m/z$  263.21 [ $M + H$ ]<sup>+</sup>.

Having accomplished the optimal conditions for the Grignard reaction, we set out to evaluate the scope and generality of this novel pyrazole synthesis by varying the substituents on 3-position of the pyrazole precursors. Thus, the Grignard reaction was equally facile with electron-withdrawing and electron-donating substituents on the aromatic ring substituted at the 3-position of pyrazole moiety and yielding 4-acetylpyrazoles in good to excellent yields (Table 2, entries 1–7). Also by employing appropriate 3-aryl/(het)aryl-substituted pyrazole-4-carbonitrile precursors (**5h–l**), the approach could also be extended for the synthesis of 1,3,4-trisubstituted pyrazoles bearing phenyl ketone at 4-position of the pyrazole ring (Table 2, entries 8–12). It is noted that 1,3,4-trisubstituted pyrazoles containing both aryl and (het)aryl rings on the 3-position of the pyrazole moiety could be prepared efficiently in good yield by following this procedure.

Further extension of the reaction to a range of commercially available Grignard reagents revealed that a wide variety of substitution is tolerated as shown in Table 2. Thus, 4-acyl-1,3-diphenylpyrazoles (**5m–u**) containing both electron donating and electron withdrawing substituents or bearing heteroaryl moiety could be prepared efficiently with good to excellent yields.

A plausible mechanism for the synthesis of 4-acylpyrazole derivatives has been given in Scheme 3. The structure of Grignard reagent indicates that electron density is larger on alkyl/aryl group as compared to the magnesium bromide part. The formation of imine salt occurs through nucleophilic attack of alkyl/aryl group of Grignard reagent on  $C\equiv N$  bond. This imine salt is hydrolyzed further by water afford the corresponding ketone.

## Antimicrobial activities

The Minimum inhibitory concentrations (MICs) of the target compounds **5a–u** were evaluated against *Bacillus cereus*, *Staphylococcus aureus*, *Escherichia coli*, and *Yersinia enterocolitica* bacterial strains, and against *Aspergillus flavus*, *Aspergillus niger*, *Candida albicans* fungal strains by broth macrodilution method<sup>23</sup> using standard drugs ampicillin and miconazole and the results have

been shared in Table 3. As shown in Table 3, the compound **5d** showed superior activity and the compounds **5c**, **5e**, **5j–n**, and **5q** exhibited equipotent activity to the reference standard ampicillin against the Gram (-ve) bacterial strain *E. coli* evidenced by minimum inhibitory concentration of 78.1  $\mu\text{g/mL}$ . While compounds **5c–e**, **5k**, **5l**, **5n**, and **5q** exhibited MIC of 39.06  $\mu\text{g/mL}$  against the Gram (-ve) bacterial strain *Y. enterocolitica*. The MIC value of these compounds was found equipotent to the reference standard ampicillin. The compounds **5a**, **5c–g**, **5j–n**, **5p**, and **5q** were having MIC of 78.01  $\mu\text{g/mL}$  against the Gram (+ve) bacterial strains *S. aureus*. The compounds **5d**, **5l**, and **5q** were found excellent compounds to be active against all Gram (-ve) and Gram (+ve) bacterial strains *E. coli*, *Y. enterocolitica*, *B. cereus*, and *S. aureus*. Regarding the antifungal evaluation, the compound **5d** exhibited equipotent antifungal activity against *A. niger* and *C. albicans* with MIC 39.06 & 78.1  $\mu\text{g/mL}$ , respectively as compared to reference standard miconazole. All other compounds displayed lower activity against all bacterial and fungal isolates.

To get the more efficacious antimicrobial lead molecules, there is still a need to investigate further alteration in 1,3,4-trisubstituted pyrazole structure. Moreover, there is a strong need for cytotoxicity evaluation on test microorganisms and mammalian cell lines to establish correlation between antimicrobial potential and therapeutic safety of these 1,3,4-trisubstituted pyrazoles which is under investigation. Follow-up studies with most promising and non-cytotoxic derivatives are important to elucidate their possible molecular mechanism of action.

### Time resolved studies

Expectedly, most pyrazoles are blue to green light emitting fluorophores that can be investigated by laser induced time resolved photoluminescence spectroscopy<sup>27–29</sup> for the future development of tailor-made emitters in OLED applications and fluorescence labeling of biomolecules. In these studies, time resolved photoluminescence studies were done using pulsed nitrogen laser as the source with a pulse width of few nanoseconds and wavelength of 337 nm. The time resolved

studies were done at a fixed emission wavelength of 440 nm which is a central emission in blue spectra (420–460 nm). The emission wavelength was selected by a high resolution spectrometer. The optical signal was converted into the electrical signal using photo multiplier tube (PMT). The samples with the highest yield were selected one each from the group of known and unknown samples for time resolved studies. The time resolved photoluminescence spectra for compounds 5d, 5h, & 5o has been shown in Figure 2. The spectra was observed in microsecond time domain in all the cases however fluorescent lifetime is found to higher in the compounds 5d & 5h with a  $-\text{COCH}_3$  and  $-\text{COC}_6\text{H}_5$  group at 4-position of the pyrazole ring. Lower fluorescent lifetime in case of compound 5o is attributed to the quenching of luminescence due to strong electron withdrawing group [ $-\text{CO}(4\text{-NO}_2\text{Ph})$ ] attached to the 4-position of the pyrazole ring.

In summary a practical and efficient synthesis of 1,3,4-trisubstituted pyrazoles with an acyl unit attached on the 4-position of the pyrazole scaffolds has been demonstrated. A range of various pyrazole-4-carbonitriles and Grignard reagents were used while affording in good to excellent yields. The operational simplicity, economical starting materials, and high efficiency compared to the existing methods are the advantages of this synthetic method and may be expected to use widely in the heterocyclic transformations. All the pyrazole derivatives have been screened for antimicrobial activity and the compounds **5d**, **5l**, and **5q** were found excellent compounds to be active against all Gram (-ve) and Gram (+ve) bacterial strains *E. coli*, *Y. enterocolitica*, *B. cereus*, and *S. aureus*. The compound **5d** exhibited equipotent antifungal activity against *A. niger* and *C. albicans* with MIC 39.06 & 78.1 µg/mL, respectively, as compared to reference standard miconazole. Further, time resolved photoluminescence studies for **5d**, **5h**, & **5o** were carried out using pulsed nitrogen laser as the source with a pulse width of few nanoseconds and wavelength of 337 nm. The spectrum was observed in microsecond time domain in all the cases, however, fluorescent lifetime is found to higher in **5d** & **5h**.

### Materials and methods

Melting points were determined in open glass capillaries on a Fisher–Johns melting point apparatus and are uncorrected. <sup>1</sup>H NMR (400 MHz) spectra were recorded at room temperature in CDCl<sub>3</sub> as solvent and tetramethylsilane (TMS) as an internal standard. Coupling constants (*J*) are reported in Hz; those for common alkyl groups were in the expected range and are not separately marked. <sup>13</sup>C NMR (100 MHz) spectra were recorded in CDCl<sub>3</sub> solutions with TMS as internal standard. The mass spectra were recorded on a JOEL JMS 600 mass spectrometer at an ionizing

**Figure 2.** The time resolved photoluminescence spectra for compounds 5d, 5h, & 5o.

potential of 70 eV (EI) electron impact ionization mode using the direct inlet system. All the reactions were monitored by thin-layer chromatography (TLC) on pre-coated silica gel 60 F254 (mesh); spots were visualized under UV light at 254 nm. Elemental analyses were obtained using a Carlo ErbaEA1108 microanalyser. Known compounds were identified by matching their melting points with those in the appropriate references cited in the tables.

### General procedure of 4-formylpyrazoles (3)

All compounds **3** were synthesized using Anton Paar Monowave-300 reactor (Gaas, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850 W.<sup>24</sup> The reactions were carried out in a G-4 borosilicate glass vial sealed with Teflon septum and placed in a microwave cavity. Initially, microwave of required power was used, and temperature was being ramped from room temperature to the desired temperature. Once this temperature was attained, the process vial was held at this temperature for a required time. The reactions were continuously stirred. Temperature was measured by an IR sensor. After the experiments, a cooling-jet cooled the reaction vessel to ambient temperature.

A mixture of hydrazones **2** (1.92 mmol) in DMF (10 mL) in a microwave vial was added OPC-VH reagent (0.73 g, 5.76 mmol) at 0 °C and stirred for 1 min. The vial was sealed with the Teflon septum and aluminum crimp, using an appropriate crimping tool. The vial was then subjected to microwave irradiation and the temperature was being ramped from room temperature to 90 °C with the holding time of 10 min. The reaction was brought to room temperature, and then crude product was poured into ice-bath, neutralized with a saturated NaHCO<sub>3</sub> solution, and then, extracted with ethyl acetate (2 × 50 mL). The organic layer was washed with brine solution (2 × 15 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered, and the filtrate was concentrated under reduced pressure to afford crude compounds **3** which were recrystallized with CHCl<sub>3</sub>-EtOH. The physical data of 4-formylpyrazoles (3a-i) has been provided in Table 4.

### General procedure of pyrazole-4-carbonitriles (4)

All compounds **4** were synthesized using Anton Paar Monowave-300 reactor (Gaas, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850 W.<sup>23</sup> The

reactions were carried out in a G-4 borosilicate glass vial sealed with Teflon septum and placed in a microwave cavity. Initially, microwave of required power was used, and temperature was being ramped from room temperature to the desired temperature. Once this temperature was attained, the process vial was held at this temperature for a required time. The reactions were continuously stirred. Temperature was measured by an IR sensor. After the experiments, a cooling-jet cooled the reaction vessel to ambient temperature.

A mixture of pyrazole-4-carbaldehydes **3** (0.938 mmol) and hydroxylamine hydrochloride (0.091 g, 1.311 mmol) in ethanol (5 mL) was refluxed for 6 h. The reaction mixture was cooled to room temperature. The separated solid was filtered and dried. A mixture of separated solid in DMF (2 mL) in a microwave vial was added OPC-VH reagent (0.18 g, 1.408 mmol) at 0 °C and stirred for 1 min. The reaction mixture was placed in the Anton Paar Monowave-300 reactor and was irradiated at 40 °C for 2 min. The reaction mixture was cooled to 0 °C and poured into ice-cooled water. The solid separated on cooling was filtered, washed with water, and dried under vacuum. The crude compound was crystallized from ethanol to get pure compound **4**. The physical data of 4-cyanopyrazoles (**4a-i**) has been provided in Table 5.

### General procedure of 1,3,4-trisubstituted pyrazoles (**5**)

To a cooled solution of 1,3-diphenyl-1H-pyrazole-4-carbonitrile **4a** (10.0 g, 40.82 mmol) in dry Et<sub>2</sub>O (100 mL) was added methyl magnesium bromide (3 M in Et<sub>2</sub>O, 204.08 mmol) carefully under N<sub>2</sub> atmosphere and refluxed for 24 h. The reaction progress was monitored by thin layer chromatography. After completion of reaction, the reaction mixture was cooled and treated with 0.5 M sulfuric acid and stirred for 5 min. After evaporation of most of the diethyl ether under vacuum on rotaevaporator, the mixture was basified with aqueous ammonia solution and extracted with chloroform. The organic layer was separated using separating funnel and washed two times with water. The organic layer was dried over anhydrous sodium sulfate and evaporated under vacuum to get crude compound which was purified by column chromatography (13% EtOAc in pet-ether) to obtain pure 1-(1,3-diphenyl-1H-pyrazol-4-yl)ethanone **5a** (8.44 g, 79%).

Similarly, all other analogous were synthesized by following the same procedure.

#### 1-(1,3-Diphenyl-1H-pyrazol-4-yl)ethanone **5a**

Light yellow solid; 79% yield; m.p. 97–99 °C [100–103 °C].<sup>14</sup> IR ( $\nu$  cm<sup>-1</sup>, KBr): 1664 (C=O str). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  8.45 (s, 1H, Pyrazole-H), 7.73–7.78 (m, 4H, ArH), 7.42–7.51 (m, 5H, ArH), 7.36 (t,  $J$  = 8.4 Hz, 1H, ArH), 2.38 (s, 3H, -COCH<sub>3</sub>). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  192.3 (C=O), 152.5 (C=N), 139.2, 134.8, 132.8, 130.0, 129.5, 128.9, 128.2, 127.8, 122.2, 119.4, 29.7 (CH<sub>3</sub>). ESI-MS ( $m/z$ ): 263.21 [M + H]<sup>+</sup>, 247.11, 219.12, 144.08, 116.09. Anal. Calcd for C<sub>17</sub>H<sub>14</sub>N<sub>2</sub>O: C, 77.84; H, 5.38%. Found: C, 77.79; H, 5.35%.

#### 1-(3-(4-Chlorophenyl)-1-phenyl-1H-pyrazol-4-yl)ethanone **5b**

Yellow solid; 82% yield; m.p. 101–103 °C. IR ( $\nu$  cm<sup>-1</sup>, KBr): 1665 (C=O str). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  8.43 (s, 1H, Pyrazole-H), 7.76 (d,  $J$  = 8.4 Hz, 4H, ArH), 7.50 (t,  $J$  = 8.0 Hz, 2H, ArH), 7.36–7.42 (m, 3H, ArH), 2.41 (s, 3H, -COCH<sub>3</sub>). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  193.5 (C=O), 152.1 (C=N), 139.2, 134.9 (C-Cl), 131.7, 130.1, 129.1, 129.0, 128.3, 126.8, 120.2, 114.1, 29.7 (CH<sub>3</sub>). ESI-MS ( $m/z$ ): 298.98 [M + H, <sup>37</sup>Cl]<sup>+</sup>, 297.03 [M + H, <sup>35</sup>Cl]<sup>+</sup>, 281.05, 253.09, 144.08, 116.09. Anal. Calcd for C<sub>17</sub>H<sub>13</sub>ClN<sub>2</sub>O: C, 68.81; H, 4.42%. Found: C, 68.85; H, 4.37%.

**1-(1-Phenyl-3-(p-tolyl)-1H-pyrazol-4-yl)ethanone 5c**

Brown solid; 75% yield; m.p. 93–95 °C. ## Biological assay

### Test microorganisms

Bacterial cultures (*Bacillus cereus* MTCC1272, *Staphylococcus aureus* MTCC737, *Escherichia coli* MTCC118, *Yersinia enterocolitica* MTCC861) and fungus *Aspergillus flavus* MTCC2798, *Aspergillus niger* MTCC872, *Candida albicans* MTCC227 were obtained from Microbial Type Culture Collection, IMTECH, Chandigarh (India). Cultures were regularly maintained in the laboratory using standard media and incubation conditions.

### Antimicrobial activity

The title compounds **5a–u** were evaluated for their antimicrobial activities by broth macrodilution method as described previously by Sood et al.<sup>23</sup> Briefly, to prepare the stock solution, 10 mg of the test compounds were dissolved in DMSO (4 mL) and similarly, the standard drugs ampicillin and miconazole were dissolved in appropriate quantity of sterile distilled water (2.5 mg/mL). The bacterial and fungal inocula were made in saline solution (0.85% NaCl) and cell counts were adjusted to  $5 \times 10^7$  cfu/mL by using 0.5 McFarland standard. MICs of test compounds and test drugs were determined in sterile test tubes containing 2.0 mL of nutrient broth or Mueller–Hinton broth (for *bacteria*) and Sabouraud dextrose broth (for *fungus*). Two mL stock solution of test compounds and standard antimicrobial agents were added to first tube of their respective series and diluted serially to obtain different concentrations. The resultant diluted concentrations of test compounds and standard antimicrobial agents were 2500, 1250, 625, 312.5, 156.25, 78.1, 39.06, 19.53, 9.76  $\mu$ g/mL. Broth tubes were inoculated with 10  $\mu$ L of microbial suspension so that final counts were  $5 \times 10^5$  cfu/mL. Tubes containing medium or medium plus DMSO, and tubes without microbial inoculum served as growth and sterility controls, respectively. Broth tubes were incubated at 35–37 °C for 24 h and examined for the presence or absence of growth. The minimum concentration of test compounds and standard antimicrobials that resulted in complete growth inhibition was recorded as MIC.

### Disclosure statement

No potential conflict of interest was reported by the authors.

### Acknowledgment

The authors would like to acknowledge Regional Sophisticated Instrumentation Centre, Punjab University, Chandigarh, for recording the analytical data during this study.

### Funding

The authors are grateful to Prof. H.S. Dhaliwal, Vice-Chancellor, Eternal University, Baru Sahib, for providing facilities and financial assistance.

The term folklore is comprised of two terms, that is folk and lore. Folk refers to the regional people and lore means stories. So, folklore refers to the stories of people of a particular region or area. It also defines popular beliefs, faiths and ways of life. In its current meaning folklore includes myths, legends, folktales, jokes, proverbs, riddles, chants, charms, blessings, curses, oaths, insults, retorts, taunts, tongue-twisters, greeting and leave-taking formulas. It also includes folk costume, folk dance, folk drama, folk arts, folk belief, folk medicine, folk instrumental music, folk song, folk similes etc.

Though the study of folklore gained importance in the nineteenth century but the interest in it can be dated back to the ancient times when the works of Herodotus, Livy and Pliny made references to popular beliefs and practices in ancient Greece and Rome. Indian literature played a vital role in the upholding and propagation of folklore. Sama Veda, to name one, can be considered as one of the oldest forms of folk music that has survived through the ages. India is a culturally enriched country with each region having its peculiar folklore.

Folklore in Jammu, likewise, has its own uniqueness and distinctiveness. The *Duggarland* today is known for its rich culture, heritage and traditions. According to Shivanath, "Dogri folk literature is universal in two ways: Firstly, its subjects are universal and the strands in which these subjects are woven are common, and secondly, it appears in the same forms all

over Duggar” (9). In Jammu also, there are differences in case of language, lifestyle, customs, physical features, behaviour. Still, it is interesting to find a fundamental unity among all the divergent cultures prevailing in each region or political unit. Dr. Seema Sharma in her Doctoral thesis writes “...It is interesting to study an emotional synthesis in the diverse elements and this issues forth in music, dances, rituals and ceremonies at places of worship, *dargahasand* shrines of faquirs and saints” (25).

The folklore elements in the Jammu region encompass folk songs, folk dances, ballads, folk tales, folk epics, idioms and phrases, enchantment and witchcraft and folk theatre. The folk songs of Jammu are the preferred form of oral literature in the region. Every aspect of the socio-cultural and religious life of the people of the Jammu region is found manifested in their folk songs. These songs are divided as religious songs, ceremonial songs, seasonal songs, festival songs, lullabies, play songs, and workers’ songs. Commenting on the nature of Dogri folk songs Narain and Baru were of the opinion Dogri folk songs are living repositories of human emotions and they help us understand the Dogra minds and their lifestyles in a clear manner” (26). One finds a wide variety of Dogri folk songs in Jammu. Beginning with the religious folk songs which are further divided into; *Bhishanpatte*, *Bhainta*, *Aarti*, *Gujari*.

*Bhishanpatte* or *Vaishnav Pad* are like bhajans, which are sung in praise of Lord Krishna or His incarnation in the form of their miraculous acts and descriptions of their lives. *Bhishanpatte* and *Bhainta* have the same structure and they are parallel in rhyme and subject matter as both are associated with admiration of God. An example of *Bhishanpata* is:

No one is able to understand you, Lord Krishna, (He is known for playing mesmerizing flute)

I have searched for you in the fairs, asked the gypsies too...

(Translation, *Duggar kaSanskritikItihas*, 537-538)

The above-mentioned song glorifies God whose mysterious deeds and secrets are beyond human perception.

There are very enthralling *Dogri* folk songs, directly linked with sowing and reaping and other rural jobs. The songs stimulate the workers with a particular beat or a refrain. *Gharlohdi* is one of the types of songs, sung while people are doing arduous work so that they stay energetic and motivated. An example of this type from *Dogri Lok Geet* volume seventeen is as under:

Say, young man – go ahead!

Live long- go ahead!...

Apply the force- go ahead!... (163)

On festivals like ‘*Lohri*’ and ‘*Rut Rade*’, songs and couplets are sung to express the curiosity, joy and pleasure of people celebrating them together.

To quote from *Dogri Lok Geet* volume fifteen:

Lohri has come, brother Lohri has come,

Everywhere peanuts and jaggery candies have come!

(Translation 33)

There are satirical verses called '*Tapkolian*' to mock others. These may be called non-sense verses because the words are twisted in a way that they sound meaningless. There are folk songs connected with the cycle of seasons which makes them more joyous. *Dholru* are songs sung on the occasion of the change of season. An example of *Dholru* from *Dogri Lok Geet* volume fifteen is as under:

First the name of Lord Ram will be taken,  
Who has created this world... (Translation 60)

There are satirical verses called '*Tapkolian*' to mock others. These may be called non-sense verses because the words are twisted in a way that they sound meaningless. There are folk songs connected with the cycle of seasons which makes them more joyous. *Dholru* are songs sung on the occasion of the change of season. An example of *Dholru* from *Dogri Lok Geet* volume fifteen is as under:

First the name of Lord Ram will be taken,  
Who has created this world...  
It is the religion that is always hailed! (60)

There are ceremonial songs like *Suhag* (on the marriage of a girl), *Ghodi* (on the marriage of a boy), *Doli* (when the bride is about to leave).

An example of *Suhag* from *Dogri Lok Geet* volume eleven is as under:

We are like sparrows my father, we will fly!  
Our flight is very long, which place shall we to go? (Translation 6)

On the birth of a *child* (male), *mundan* (head shaving ceremony of the child), *sutra* (tying the auspicious thread to make the child part of a particular clan), going on a pilgrimage and occupying a newly built house; songs are sung to congratulate and these are called '*Vadhais*' (*Bihaiyan*). An example of a *Vadhai* or *Bihaiyif* from *Duggar da Sanskritik Itihasis* as under:

My sister-in-law has given birth to a diamond, a son is born,  
What gifts will you offer to your sister-in-law (*nanad*), my dear sister-in-law! (Translation, 529)

*Sithanis* are also known as *Bolian* which are sung in an innocuous manner against the bridegroom and his relatives by the family members of the bride. The following example from *Dogri Lok Geet* volume ten brings out the essence of such ceremonial songs:

Mangoes have ripened and buds have grown on the stems,  
My Brother-in-law has gone to sell his mother! (Translation 223)

Like *Sithanis*, there are also folk songs known as *Chhand*, sung by the bridegroom on being forced by the bride's friends to tease the bride and her relatives.

*Luhani* and *Palla* are folk songs sung on death. *Luhani* is also called *Luhan*. Women of a particular class called '*marasan*' sing these songs while women of the house beat their chests.

For Example: Cut the sandalwood tree,

**Abstract:**

The female self is seen on the verge of Shift as gets revealed in the studies made during post-independence times. In this regard, the women writers are gaining much recognition due to their emphasis to study the self of the women protagonists. Undoubtedly, the conflicts are perennial but the strategy to combat with 'Self' and 'Society' differs from individual to individual. In this regard, the women novelists namely Gloria Naylor and ManjuKapur have been taken to study the exploration of selves in their respective novels namely *The Women of Brewster Place* and *Bailey's Café, A Married Woman & Difficult Daughters*. The blend of two authors with different cultural contexts would help in forming a better viewpoint about the changing images of 'Self' to get a rightful approach to rectify the wrong perception prevalent in the societies with respect to women.

Through their female characters namely Astha, Peeplika, Mattie, Esther, Eve, Sadie, Virmati, Eda and Kasturi, the twin authors have tried to do mind mapping of various female protagonists who have been confronted with dilemmas throughout their existence in this male dominated world. They try to idealize their dreams within the social framework. We come to know about two different cultural contexts during post-colonial period, where the treatment of women is taken altogether different. They assume different

responsibilities for 'Self-Fulfillment'. They are constantly on the verge of losing their morality. With growing times, the rigidity of being charged with sex-taboo goes at the back side of the mind of the female protagonists. They try to listen to their inner voices, thereby breaking the conventionality and do not follow patriarchy. They act thoughtfully and do confront with the quintessential question of survival. Thus, the images of Women are seen in a flux and truly indicate towards the feministic vision of both Indian and Afro-American female writers. The coping strategy of the protagonists differ to in order to make a fine balance to their lives and hence forth the 'Self-Image' also gets reconstructed.

Key Words: Perennial, Mapping, Dilemmas, Patriarchy, Existence, Feministic & Self-Image.

**Introduction:-**The early twentieth century writers glorified the beauty of the black colour and showed that they were proud of their black identity. The modern black novelists focus on the complexity of the individual attainment of his self as it is submerged in the false selves stacked on it by the destructive images and typecasts of the society. The Afro-American fiction basically deals with the mistreatment of the black particularly sexual exploitation of the black women and loyalty to the country which never gave them a chance to enjoy the basic principles of liberty, equality, and justice enshrined in its constitution. The antagonism of the white American culture induces the blacks to search for dignity and identity. The American Negro came into sight from this exceptional situation in America-a person self-esteemed, self-confident with a complete identity and as good as an individual as any white.

A black American is a Negro and an American as well. The origins of Afro-American culture do not propose appearance of any diverse social culture and institutions but a network of social relationship of a group and the actions of the members generally correspond to one another. An Afro-American is thus an exaggerated American. Their identity is denied not only by the white men but also by the black men. The Negro in America has happened to develop an identity for himself which exists without a regular past. Their domestic designs are varied, but still show women's edged alternatives in a patriarchal society. Black women in America are triply burdened and this burden curbs them from a fuller and significant participation in American society.

The theory of Feminine Aesthetics gives a new dimension to the understanding of female psyche. "For the Indian woman the home had been the entire world for many centuries." Woman is torn between cultural conditioning as a woman and feministic aspirations for autonomy and selfhood.

"Why do we travel not in straight lines but in circles?" Do we come to the same point again and again?"

The educated Indian woman is living in the suffocating atmosphere of deep psychic repression, economic exploitation and the tyranny of obsolete conventions and rituals. Yet she carries the indelible imprint of Indian

sensibility and culture in her blood and consciousness. Daring attempts by woman to break the laws lead to nothing but fear and guilt. She sometimes becomes powerless to conquer her own consciousness. In this battle of Self-predicament, she emerges herself in a new image that is Self- contradictory.

**Self Image in ManjuKapur:-**The impact of education becomes prominent in the three generations women in the novel 'Difficult Daughters' by ManjuKapur where Ida seems to formulate altogether a different image as a daughter whose ideological variation brings for her lack of acceptability and distort the traditional image of a daughter who is only obedient to fulfil the age-old practices who gets married in a well to do family to uphold the family honour. The new education and the life of Kasturi generate a new urge and emotion in Virmatito get herself free from the bondage of patriarchy that denies or deserts her freedom and choice. Her marriage is final with Inderjit but is postponed because of the death of her father. She does not think of the marriage and child bearing just after the high school qualification. She falls in love with the romantic oxford-returned professor Harish Chandra who lives next door and is already married. Thus, Virmati's self-affirmation leads a turning point in her life and in a way she draws a new image of herself before her family and creates contradiction in her daughter's mind Ida. Ida does not like to be a replica of her mother and imbibes the values at her own pace.

In ManjuKapur's 'A Married woman' the protagonist is seen torn between duty and responsibility, faith and fact, history and contemporaneity, public ethos and personal ethics, Asthathinks, " tired women cannot make good wives" (154), She fights for her self-assertions. Unlike many unmarried girls she had her infatuations of adolescent love for Bunty, a boy of another colony and for Rohan who left for overseas for a better career. But her real story of love and marriage started with Hemant, the son of a successful government official in Delhi. Soon after marriage Astha gets disillusioned about human nature in general and politics of the country in particular. Sharing her feeling, " we should struggle with her, agonize together with her about her choices and weep with her once she has made them."

Astha's family affairs are also not so good and nothing is right with her. As a married woman she becomes an enduring wife and sacrificing mother. Her temperamental incompatibility with her corporate thinking husband compels her to play the role of mother and father for her children. This denies her self-fulfilment and leads to the collapse of the institution of marriage. Discontentment leads her to defiance and restlessness. Her anxiety, discomfort, loneliness and isolation don't encourage her to give voice to her unhappiness over her troubled relationship, rather it prompts her to develop the feelings of guilt, negativity and lack of self-esteem in facing the challenges in her life. Astha understandsthat a married woman's place in the family is taken to be that of an unpaid servant or a slave and the thought of divorce brings social and economic death in her Indian status. She realizes for herself that , "A willing body at night, a willing pair of hands and feet in the day and

an obedient mouth.”(231) If Astha becomes the victim of male passion, Pipeelika becomes the victim of communal riot and for the mistakes in history. While the lesbian attempts drag Pipeelika to the world of forgetfulness, Astha takes a sweet revenge on her husband. In this act of vengeance, unnatural sex, little excitement, little impatience and much imagination, she has a big jerk in her mind and this cripples her married life. Astha is Kapur’s New Woman, “conscious, introspective, educated, wants to carve a life for herself, to some extent she even conveys a personal vision of womanhood by violating current social codes.”She canonizes and commemorates her insulted feminine sensibility raising the male tantrum to socially transform a society.

Thus, ManjuKapur embedded in feminism has well made her point of view clear that a woman’s basic solidarity needs to be tackled in relation to the socio-cultural situation.“ A woman should be aware, self-controlled, strong-willed, self-reliant and rational, having faith in the inner strength of womanhood. A meaningful change can be brought only from within by being free in the deeper psychic sense.”

**Self-Image in Gloria Naylor:-**InAfro-American context, during post-colonial times, the women writes are telling the real stories, stories of their own lives and struggles. This has made them even stronger and since they are progressing on the way to a more activist feminist stand. An ardent appeal for this is made by Virginia Wolf through her essay *A Room of One’s Own* (1929). Zora Neal Hurston wrote *Their Eyes were Watching God* in 1937. It was an ethnically supported journeying of black female selfhood and proved world-shattering. As a result, it paved the path for many upcoming writers.Fiction in the late 1970’s and 1980’s broke the ascendancy of poetry and drama. During this new period women were the primary writers Toni Morrison, Gayle Jones, Alice Walker, Toni Cade Bambara, Paul Marshall and Gloria Naylor. Glorification of the African women by the African writers in colonial and post-colonial Africa gave rise to woman as an icon but it frequently channels to stereotyping her role and contradicting her position outside her home.

The black woman at the intersection of the sharp blades of the swords of race, sex and class is relegated to the inferior position of denominators that influence group membership. And therefore, she remains neglected and unnoticeable in the ‘dominant, mute, passive and suppressive’ American society. Naylor’s fourth novel *Bailey’s café* is composed of several mini-plots. Each chapter details the life struggle of a different character. From these collective stories the reader confronts once again the depths of human struggle and survival despite the odds. *Bailey’s Cafe* serves as a sanctuary for those who have been forsaken or who have been denied the solace of human compassion. It is a way station where customers are left to their own devices without interference from others. They can interact if they wish, or they can sit quietly to contemplate their condition. Because the customers have been exploited either emotionally or physically, *Bailey’s* offers them a place where

they can try to function unmolested until they can figure out their next alternative. Throughout the stories what echoes is female subjectivity to male desires.

Gloria Naylor's novel 'The Women of Brewster Place' interweaves the story about seven women in a squalid urban neighbourhood, just when she began her graduate work at Yale. This novel introduced the privileged Americans to the struggles and sufferings of those who will never see the American Dream because for them survival itself is victory. There are different stories about different women in the novel. Each story is linked to the next in some way or the other. These women whether Mattie Michael, Etta, Mae Johnson, Kishwana Browne, Lucielia, Kora Lee or Theresa or Lorraine all go through difficult circumstances in their lives, they face several problems and with the support of each other finally survive in life. These women are the residents of Brewster Place, which according to the author is 'the bastard child of several clandestine meetings...' Like its residents the place is now neglected and aloof from the main city by a wall.

Mattie Michael when declares her pregnancy before her father is beaten badly and does not expect her father to understand the real cause of her pregnancy. His attitude is a complete contrast to that of his wife, the mother of Mattie, when Mattie says,

Oh! Mama, I 'm so ashamed.' her mother replies, 'Ain't nothing to be ashamed of havin' a baby is the most natural thing there is .... What's going on in your belly now ain't nothing to hang your head about-you remember that.'

This incidence clearly indicates how differently men and women look at the same issue of child bearing. After the showdown with her father Mattie decides to leave her hometown. She goes to Ashville in North Carolina and works day and night to bring up her son, Basil, all alone, supported by her inner strength. Her only dream and reality now is to give the best of life to her son. Another resident of Brewster Place is Kishwana Browne, who rebels against her middle class parents to realize and assert her black hood. She dwells at Brewster Place to accomplish this purpose and to help the other Blacks living there. Kishwana's mother understands the feelings of her daughter but does not support her because she has no doubt regarding her identity. According to her,

.... She is alive because of the blood of proud people who never scraped or begged or apologized for what they were. They lived asking only one thing of this world.... to be allowed to be. And I (the mother) learned through the blood of this people that black isn't beautiful and it isn't ugly....black is! It is not kinky hair and it is not straight hair....it just is!

There are immeasurable slum streets like Brewster, streets will prolong to be criticised and to die but there will be other streets to whose decay the women of Brewster will adhere. Though misapprehensions about factual motherhood are moreover apparent, there is habitually a glorification of motherhood and of

women who are in distress but will struggle and survive exclusively for their children. Thus, black women turn over all the fallacies associated with them. The female protagonists of Gloria Naylor like any other black women are doubly oppressed. This subjugation they have to face both in their home and outside their homes. Therefore, in these cases the struggle is not for acquirement of mere quality but for acceptance as human beings. Through her stories Naylor also presents that the Afro-American would not have been able to survive as a race without the female values of commonality, sharing and nurturing. The Afro-American women had to bond with each other in order to survive and prove their selves.

Conclusion:-Man is a social animal. He is constantly seen in a flux. He is considered as the harbinger of cultural legacy. Manju Kapur's heroines are assertive who dare to break the threshold and achieve self-accomplishments despite facing a lot of contradictions. They are able to establish their unique identities and fit themselves into different roles as daughters, mothers and wives. Their journey of creating a new self -image is not an easy one but they made it possible through their struggle with self and society. On the contrary, the women in Afro-American culture have to face triple jeopardy and they are able to cherish their identities not within the family convention. They are taken for commodities by their male counterparts and in an alien culture. They are constantly seen struggling through their experiences and are able to heal their tormented selves through sisterhood and compassion which gives a meaning for their survival and are able to create motherly image that itself becomes iconic.

## ABSTRACT

Folk theatre has been neglected and undocumented for centuries even though it is a very vital part of the culture & identity of the people. Folklore is a western concept and can't be applied in toto to the folk performances in India; *Saang* theatre being one example of it. Lakhmi Chand has been considered the greatest exponents of *Saang* theatre. He uses stories from local history, mythology and folklore and uses them as vehicles to reinforce local culture and beliefs. The *Saangs* thus become important documents of the cultural identity of people.

**Keywords:** Saang theatre, undocumented, history mythology, culture identity

---

## Introduction

In his book **Rethinking Folk Drama**, Steve Tillis declares that "Traditions of folk Drama exist throughout the world, ranging from simple forms that involve few people, rudimentary texts, and crude performance practices, to complex forms involving entire towns, highly elaborated texts, and performance practices that have developed over hundreds of years. Yet folk Drama lacks, to this day, a full-length study from the perspectives of either folkloristics or Drama studies." What he says holds true for India as well.

India is known all over the world for its cultural diversity and heritage. It has the oldest and richest tradition of theatre. And yet, for long, studies of culture or tradition have been dealing with the established or classical forms of literature, dance, Drama and music. Folk culture has been systematically neglected and undocumented for many centuries even though Folk theatre has played a vivid and lively role in Indian culture. India's repertoire of folk theatre is large and varied. Every corner of India is home to a different kind of performance tradition. While everyone would agree with Steve Tillis about the existence and need for studying folk Drama, there is little consensus about the basic terms or approaches or ideas. The history of the word folk itself is long and difficult. The word folk originated from the German word 'Volk' and was used to refer to common people whose culture was handed down orally. However, it entered the academic language when British antiquarian William J. Thoms (1803-1885) used it in 1846 published by the London Journal *Athenaeum* in 1846. The online dictionary defines folk as "The common people of a society or region considered as the representatives of a traditional way of life and especially as the originators or carriers of the customs, beliefs, and arts that make up a distinctive culture" and their culture may be referred to as folk culture. However, that is to simplify a very complex debate because folklorists as well as anthropologists have been divided over what constitutes folk culture.

---

---

Norbert F. Riedal 'Folklore and the Study of Material Aspects of Folk culture' (Oct-Dec 1966) rightly points out, "so far no consensus seems to have been reached, and the various and often conflicting interpretations of "folklore" that have been brought forth by folklorists as well as anthropologists have caused much consternation, frustration and even alienation between the two disciplines" (1).

### **Difficulties in imposing western theoretical frameworks on Indian theatrical traditions**

Folklore is an inseparable part of culture but the relationship between folklore and dominant culture is not very simple because folklore or folk traditions not only reflect the culture of their folk and are also used as tools to emphasize and reinforce existing power equations but also question dominant social ideologies. The issue gets further complicated when we discuss issues of *Indian* folk tradition in relation to folkloristic as an academic enterprise, which started in the west.

As Lisa Gabart points out in her article Folk Drama

It easily imposes frameworks of interpretations that are not necessarily grounded in local understandings. When used in non-western contexts, for example, the term imposes western understandings of Drama on traditions that may be more profitably understood as something else, such as worship, sacred retellings, or a visitation by deity, thus drawing disparate performance traditions into the same interpretive sphere. (1)

Indian theorists and researchers too voice the same difficulties.

According to K N Panikkar

"We often come across Western scholars who approach Indian artistic traditions in a meticulously analytical way and create theories on our theatre concepts after their own fashion. I have all respect for their analytical approach which helps them make their own deductions. But the question which baffles anyone in theatre is whether these deductions can be taken as guidelines for the practice of Indian theatre. A theory is generalised from our experience of doing a thing. Even when an artist practices an art after thoroughly learning its grammar, he cannot neglect the creative impulse which springs up from within, necessarily paving the way for further enlargement of theory."

In Western countries they consider folk forms as rudimentary, as fossils of some bygone age. Many theorists see folk as primarily low-class activity, belonging to illiterate people. It is hardly seen as literature.

As Lisa Gabert posits in her article Folk Drama,

"In the nineteenth century, scholars were interested in the origins of cultural forms they considered to be "folk Drama," which largely was conceptualized as ancient but degenerated plays that continued to exist in the modern era primarily among the European peasant classes. The plays themselves were presumed to be "survivals,"—that is, leftovers from an earlier era in which fuller, more complete versions had flourished, and where the functions they fulfilled were supposedly more holistically incorporated into society"

---

But in India the scenario is different. The folk forms are not dead and gone. True that they have suffered setbacks with the coming in of satellite TV and internet but they are not history as yet. According to J C Mathur

"In these circumstances, the question arises how did the contemporary traditional and folk forms arise? In the West the folk form is considered only a community activity of an amateurish kind. This is not so in India because our traditional and folk Drama has very important and strict traditions in some cases and is far more sophisticated than the Western folk Drama. While editing jointly with my friend Dashrath Ojha some medieval plays on North India and Nepal (C 1300 A D - C 1625 AD) I (J C Mathur) came to realise that those plays along with similar contemporary traditional forms in other parts of India, actually belong to the corpus of a Dramatic genre which has received scant attention from historians of Drama, including Keith who has rejected them as merely "irregular plays." The same attitude is disclosed in a recent work called "Sanskrit Drama- Its Origin and Decline" by Shekar (published in the Netherlands) "

In India, there is a great variety and richness to be found in the different forms of folk theatres that have developed in different parts of the country. The Folk artists combine legends and myth with song and dance to create a vibrant theatre in every region of India. Folk theatre is known by various names in the different states of India. In Kashmir, it is known as *BhandPather*, in Panjab as *Nakkaal*, in Rajasthan as *khyaal*, in U.P. as *Nautanki or Raas* and in Haryana as *Swaang or Saang* to name a few. These performance practices are different from each other not just in name but also in terms of the tools they employ. They have evolved over the centuries and have a unique identity because they perform different sociological functions in the community to which they belong. Rooting a cultural practice is very important because any form of theatre is rooted in its context. By context we don't really mean the time and place of the performance but the social and political scenario it reflects or encourages. The story that the performance is telling may be taken from popular culture or epics like Ramayana or Mahabharata but its meaning and implications differ because of the socio- political circumstances of the people who stage it and the people who are watching it. In fact, there is a spontaneity about folk performances that is missing in classical theatre. The folk performer considers it his right to make changes to the performance sometimes mid performance also depending upon the demands and responses of his audience, something you would not find anywhere else, as elsewhere lines are vigorously memorised and performances are meticulously rehearsed. Also, the folk performances function within a paradigm and framework which may seem odd to an outsider but which make perfect sense to the local audience. They are trying to reinforce some age-old values and traditions, may not bear scrutiny using popular literary and cultural theories but reach directly to the heart and minds of their audience.

#### **Evolution of Saang and its uniqueness**

Swang or *Saang* developed in the north Indian state of Haryana. Haryana as a state may be of a recent creation (Haryana was constituted on **November 1, 1966**, as a result of the partition of the former state of Punjab into two separate states—Punjabi-speaking Punjab and Hindi-speaking Haryana.) but the history of the people of Haryana goes back to time immemorial. In fact, the whole reason that the Govt of India found it necessary to create a separate state is reason enough to agree that the distinctiveness of the Haryanvi people was too much to ignore and could not be brushed aside under the carpet of a common state with the Punjabis. Haryana has existed as a separate unit with its own distinct identity and distinct folk culture. It has unique folk practices and

performances which take place at villages, at temples, at road crossings, at fields and granaries, marriage ceremonies, festivals etc; and are an inseparable part of the lives of the people. It includes *Saangs* also which are performed on a particular kind of stage or platforms with usual themes of legendary story, historical event or love story at its centre and can keep the public or audience enraptured for the whole night. *Saang* is a balanced combination of acting, dialogues, music, dance, songs, plot, worship and spirituality.

Though the history of folk performance traditions in north India has much in common, the *Saang* from of Haryana (erstwhile Punjab) is unique and different from other performance traditions practiced in the area. *Saang* may be called folk theatre but its status as theatre remains disputed. First of all, as stage it uses a platform of about three and a half meters which is open on all four sides. As Balwant Gargi points out in Folk Theatre of India, “life in India is in the streets. Shops, stalls, rituals, bathrooms, all are exposed to the sun and to the glare of people, so is the folk theatre.” (6) There are no curtains or green room attached to the stage and *Saang* hardly uses any props during performance. It is the main narrator or the *sutradhar* who describes to the audience what the stage stands for e.g. a palace, forest, or riverside depending on the scene. Though the characters are well delineated, there are no dialogues; the exchanges between the characters are sung and these songs are called *Ragini*. The performers are all male and sometimes they wear costumes but that is a rarity and in fact a recent practice. Thus, for *Saang*, all the three important constituents of theatre—acting, dialogues and stage are markedly different from practices of the theatre. *Saangs* is also quite distinct from other performing arts in the region. While on the one hand we have narrative traditions like *Alha* which sing epic poetry and the Nath jogis who narrate folk stories to an audience, on the other hand we have the Naqqals and Behrups. While Behrup performers disguise and move from village to, the Naqqal performers usually perform little skits based on imitation. Therefore, if *Alha* is about musical rendering of poetry, Behrup is purely about costume and acting. As per this categorization, *Saang* would fall somewhere in between because it incorporates elements of both. Like the *Alha*, the *Saangis* sing their *Raginis* and like Behrup, the staged performance tells a story using costumes and acting.

Usually the man playing the lead female character is dressed up as a woman, but the onus of creating the scene and retaining the interest of the audience is primarily on the poet who composes the *Raginis* and who is also the lead actor who sings them. The one after whom the *Saang* troupe is known is more often than not the composer and the lead singer/actor. The *Raginis* are accompanied by *Sarangi* and *Nakkara*. The performances demand great skill and stamina from the artists who perform for as long as six hours and usually there are no loud speakers to amplify their sound. An hour or so before the performance, the musicians begin to create the atmosphere and the artistes sing some religious or other songs connected with the performance till such time when the ‘Guru’ appears and the artistes touch his feet to seek his blessings. The *Saang* begins with the recitation of a *bhet* as pointed out by Ved Prakash Vatuk and Sylvia Vatuk in their article the ‘Ethnography of *Saang*’,

Om(a) nam(a) sab(a) tai bada	the name of aum is the
greatest	
Ustai bada na koy(a)	no one is greater than he
Jo uska sumiran(a) karai	one who remembers Om
Sudha at(a)ma hoy(a)	his soul is purified
Ari bhavani bas(a) kar(a)	oh bhavani, come and live in me,
Ghat(a) ke par(a)de khol(a)	open the gates of my heart,
Ras(a)na par(a) basa karo	stay on my tongue, oh mother

Mai suddha sabad(a) mukh(a) and speak the correct words  
 Bol(a) through my mouth.  
 Manai sumar(a) liye jag(a) dis(a) I remember the lord  
 Sat(a) guru mile is my guru  
 Kahu charan(a) vakai sis(a) I bow to his feet. (23)

With a brief introduction about the play, the performance starts.

Of *Saang*'s exponents, Pt. Lakhmi Chand (1901-1945) is the most celebrated. Shashi Bhushan Singal as quoted by Puran Chand Sharma in his book *Lakhmi Chand Granthavali* describes his contribution to the form of *Saang* as, "Pandit Lakhmi Chand freed the themes of the '*Saang*' from religious and puranic subjects to which they had become confined and included in them a blend of love themes and of youth. Thus the '*Saang*' was made more ornate (17). Lakhmi Chand has been called a 'luminous bard', 'Kalidas', and 'Shakespeare of India' by his numerous fans and followers. It is difficult to even imagine the kind of cult following he inspired in the people of his state. People walked for days or travelled in their bullock carts to see him perform and listen to him. It was no less than a pilgrimage for most people, with the only difference that while on pilgrimages women and whole family travelled, only men had the prerogative to attend performances like *Saang*.

When modern academia thinks of 'popular literature' all that they are thinking about is literature that has been written down and recorded. Although in India we have had a long and illustrious oral tradition as the Vedas and puranas and the other religious and semi religious texts too were handed down the generations for thousands of years before they were finally written down, oral literature is not taken seriously. In fact, the whole thing is quite contradictory as the people who wrote belonged to and wrote about the people occupying the upper rungs of social ladder and it was not popular in the truest sense of the word as it did not represent or was appreciated by the populace. However, that doesn't mean that the common people didn't have a literature. They also created exceptionally rich tradition of oral literature. The folk forms like *Saang* gave the common people a medium and means of expressing their sentiments.

### **Lakhmi Chand: the *Saangi* extraordinaire**

*Saangis* like Lakhmi Chand created a huge body of literature but that has been systematically ignored and sidelined simply because he was not writing it down.

Just like Shakespeare, Lakhmi Chand picked up stories from popular mythology folklore, legends, scriptures and created his *Saangs* around them. His stories are generally either fragments of bigger stories from the epics like Ramayana or Mahabharata or local stories and qissas as were called. Most of the people knew the story from popular literature. So, there was no dramatic suspense of the 'what happened next' kind to keep the audience interested. Then how did the poet composer sustain the interest of the audience. When the people already knew what was going to happen in the story what made them hang on to every word that was uttered. And that is where Lakhmi Chand's genius as a poet composer and Dramatist comes into play. One of the reasons for his huge popularity was that as a master dramatist he wove his stories in such a manner that even though the audience knew the meta narrative of the tale served as the basis of the composition, the rendition of the tale was always new. The genius lay in how everything was said. As a master dramatist Lakhmi Chand knew how to first create and then sustain dramatic conflict even when the story was a familiar one. For example, in Shakespeare's plays too the stories were well known to people. The audience knew that Macbeth would kill Duncan but even then, everybody was enthralled when the play opened with the three witches dancing on the barren heath and singing "thrice to thine, thrice to mine and thrice again to make up nine."

Before we look at specific example it is pertinent to note the general structure of the *Saang* compositions. The *Saang* generally opened with a tranquil time...like ‘once there lived a king and queen...’. When everything was peaceful. It is from this tranquil situation that conflict is introduced. The conflict can be man-made like designs of a scheming villain, or supernatural like the falling of misfortune due to some god or goddess or some supernatural character. Since in the *Saang* the dialogues were sung as *Raginis*, the characters are introduced in pairs. In every scene the pairs sing their part as protagonist or antagonist. Even supporting characters get classified as good or bad depending upon which side they are supporting. The growing misfortunes of the protagonist lead to rising conflict and finally comes the climax. It is during the climax that the cause of conflict is revealed and the conflict is resolved with the help of other characters leading to a happy ending. However that is not to say that every *Saang* had a happy ending. *Saangs* were chosen according to the occasion and the demands of the audience. If it was happy occasion like a wedding love stories were performed. However, if it was a religious festival religious, didactic stories were performed. However, both were not mutually exclusive. Even love stories were many a time taken from religious stories and carried didactic elements. And sometimes even love stories were staged at religious festivals because of the social and moral message they carried. It was the poet composer’s prerogative as to how he appropriated the story for his purpose. To look at some examples, Pandit Lakhmi Chand used to begin his compositions with *varta*. An excerpt from one of his *Saang*, “Heer Ranjha”:

“Sajjano! Punjab prant mein ek sheher tha Takhat Hazara. Us sheher mein ek moola jaat rehta tha, jiske bete ka naam tha- Ranjha. Udhar Jhang sheher mein Chuchak ke ghar ek ladki hui, jiska naam tha-Heer. Thode se din mein dono jawan ho gye. Ek raat sapne mein Heer ko Ranjha dikhayi diya. Usne Ranjha ko apne ghar bulwa liya. Ranjha Heer ke ghar bhainso ka pali ban k rehne laga. . . . Ab har roz Heer Ranjhe ka khana lekar khrak mein jaya karti thi. Ek din Heer kharak mein jakar ranjhe se kya kehti hai”(313).

Gentlemen! once there was a city by the name Takht Hazara, in the state of Punjab. In that city a rich Jaat lived. He had a son named Ranjha. In another city nearby named Jhang, a man named Chuchak, had a daughter named Heer. After some time both them grew up. One night Heer dreamed of Ranjha. She called Ranjha to her house. Ranjha went and started living in her house as a caretaker of the cattle... Now every day Heer used to carry food for Ranjha. One day while giving food for Ranjha Heer says to him...

In this manner the *Saang* began and the characters were introduced. *Saangs* were long narratives and continues for many days. In such a scenario how did the *Saangi* maintain the audience’s interest. Since the story is already known to the audience, the composer’s used a lot of rhetoric devices. This method made the audience a part of the story. The situation faced by the character was the situation faced by the audience also and the questions posed before the characters were also posed before the audience.

The poet also used language to evoke the emotions of the audience. Everyone knows that Raja Harish Chandra is the story of the dire tests King Harish Chandra had to face. The story of his pain is well known as misfortune after misfortune befell him and he lost everything. However, when Queen Madanawat hears that her son Rohtaas has been bitten by a snake and died, she is unable to control her tears and breaks down. In that situation the Gardner comes and tells her that it is no use crying over the dead.

Jeete ji ka mail, marre pe Kiska daawa ho se  
 Bakhat beet jya, gayi baatan ka ke pachtawa ho se.  
 Bade bade ut niput digargaye, tu sai kon bichari  
 Is din nai ek saar bana diye, raja aur bhikhari  
 Jaise koi kumhar banawe maat matakne jhari  
 Ghar ghar putle alag tek de chitan kare kumhari  
 Koi pakjya koi phutjya maati ka panjawa ho sai ((2))

One has relations with people only till they are alive and no one has any claim over the dead. Similarly, when a time is past it is no use feeling regret for anything. Lot of Rich and big people have gone the way of death, why are you feeling so sad. In fact, death has equated the King to the beggar. Just like a potter makes different kinds of pots and his wife decorates them similarly people are created by God and given different destinies. Some flourish and some meet misfortune depending upon their destiny. So it is no use crying over what is already past.

When this scene is depicted not an eye used to remain dry in the audience and everyone could feel how it must have felt to lose one's child.

Similarly, the composer used flowery language to depict the beauty of the heroine, the masculinity of the hero, the scheming depravity of the villain and so on. As a result, the audience always looked forward to the performance not in terms of what would happen next but in terms of how it would proceed.

Before Lakhmi Chand *Saangs* were looked down upon by the self-proclaimed custodians of society who declared such entertainment to be obscene and vulgar. All through history folk entertainments had to battle against discrimination as they were looked down upon by the so called literati and respectable high society people. Lakhmi Chand also brought *Saangs* to repute. Not to say that he didn't face any resistance. He did. But slowly he could lift the *Saang* form from the depths of neglect to the height of such popularity that no social occasion was considered complete without his performances. Though he was illiterate himself he didn't let that come in the way of his education. In fact, he kept Tika Ram with himself as his guru, for the purpose of instructing him and teaching him the scriptures. He was able to pour his experience and knowledge in his poetry that he is looked upon not just as a poet composer but as a wise man in the state of Harayana. Other than the *Saangs* he composed lots of Bhajans, and his bhajans have been compiled and recorded in many volumes as 'Lakhmi Chand ka Braham Gyan' or 'Lakhmi Chand's Divine Knowledge'. One of his most famous *Saangs* Nal Damyanti has left an indelible imprint on the psyches of the local people. Nal- Damyanti is a originally a story from Mahabharata.

It is a popular story in literature and there are hundreds or rather thousands of versions of this story. From Himachal Pradesh to Rajasthan to Gujarat to Tamil Nadu, the story can be found in different formats. In fact, the story of Nal Damyanti is a popular story in Persian literature also. As David Shulman points out in his article Damyanti and Nala: the many lives of a story

In The *Mahabharata* episode known as the *Nalopakhyana* is an elegant, fast-paced narrative.... Moreover, the story it tells is one of the most

popular in India, existing in all Indian languages, often in many versions in each language. Hundreds, perhaps thousands of Nala stories exist. Wherever one goes in the sub-continent, Nala was there first. (1)

The story is equally popular in folk literature, with every region having its own version. When we are talking about different versions of the story. Sometimes it is told as a love story, sometimes as court drama, sometimes as a tale displaying fortitude in the face of adversity at other times it is a cautionary tale about going against the wishes of gods, sometimes it is about predestination. In the original story it was narrated by the rishis visiting Yudhishtir when he was living in the jungle. One day he was feeling particularly sorry for himself, wailing at his misfortune. He complained to the rishis about his misfortune and said that no one was probably more unfortunate than him. It was in response to Yudhishtira's wailing and complaining that the Rishis tell him the story of Raja Nala. They tell him that there was one more who suffered more than you and urge him to thank God that even in jungle he is surrounded by his brothers and his wife, while Raja Nala had to battle adversity and misfortune all alone, after losing all his wealth and kingdom. Thus, originally the story of Raja Nala is narrated to Yudhishtira to make him stronger, to have fortitude and to make him count his blessings. The story is narrated to give him hope for a better future and courage to face the difficult time that was coming ahead. However, every Nala story doesn't have the same motive.

In this context it becomes important to analyse how Lakhmi Chand tells his Story. The *Saang* begins by a *Ragini* where Lakhmi Chand talks about the loss of goodness and honesty in the people and how it has led to various misfortunes befalling the people of Haryana.

*Jab te gaarat mahabhart mein attharah akshohini dal hoya*

*yagya hawan tap daan chhoot gayenyun bharat pe jaal pade*

*indra bhi varsha kam karte jal bin soone taal pade*

*bawan janak huye brahma gyani ved dharam ke khyal pade*

It is after the end of the first *Ragini* that the sutra Dhār tells the context of the story. How the story was first narrated by rishi to Yudhishtira in Mahabharat. But the motives of Lakhmi chand's story is far different from the motive of the rishi as we get to know as the *Saang* progresses. Lakhmi chand's story is a love story. In the initial *Raginis* there is prevalence of the romantic element. The poet gives evocative descriptions of the beauty of both raja Nala and Damayanti as both were famous in all three realms for their beauty. Another thing that the poet stresses is Nala's honesty and piousness. In the Lakhmi chand Granthawali, Pt Poorna Chand Sharma has ended Lakhmi Chand's *Saang* at the point when Nala abandons Damyanti and grief stricken Damayanti is roaming in the jungle searching for her husband. She tries to follow his footsteps and does so till the end of the day. Then the night falls and she is forced to abandon her quest. The next morning when the sun comes up, she realises that she is lost. The heroines pain and bafflement have been very poignantly expressed by the poet but after this the *Saang* ends abruptly .

Pooran Chand Sharma has given a note from Lakhmi Chand's son Pt Tuleram that Lakhmi Chand never performed the *Saang* after this. However, the researcher herself has heard some more *Ragini*'s while growing up ascribed to pt. Lakhmi Chand and dealing with latter part of the story. One very popular one is

Uti ganga pahad chadi aur utla chalya paani

Daasi banke rehna lag-gi khud damaynti raani

(The river Ganga is climbing up the mountain and the water is flowing in reverse direction as the queen Damayanti herself has started living like a maid.)

The *Ragini* starts by comparing the descent of queen Damayanti to the station of a common maid to the reversal of natural order. It is as unnatural as a river climbing up the mountain or water flowing from down to up. The *Ragini* further describes the problems that the queen faces, living a life of want and subservience. The queen Damayanti who was a princess before she was a queen and who has never seen hardship in her life and yet her love for her husband is such that she is ready to face any amount of adversity in order to continue her search for her husband. This *Ragini* deals with the part when Damayanti has been abandoned by Nala and reaches the kingdom of Cedi and starts living with the queen as a maid(dasi)

Ja kite toh le raja Nal ne, main kyun garib sataya gaya

Nal te bhi suthra pati mile, tera Swayam Var pher rachaya gaya

(Go and look for Raja Nala! Why are you tormenting me, a poor man? And now that your Swayam Var has been organised again, you would probably find a man better looking than king Nala also.)

This *Ragini* belongs to the time in story when Nala has been living as an ugly deformed servant of the king of Ajodhya, Rituparna. He is tricked into coming to Vidarbha by Damayanti who sends an invitation to the king for her *Swayam Vara*, letting it be known that she is planning to marry a second time, now that there is no hope of her husband Nala to be found. However, she sends the invite at such a short notice that she is sure that only Nala himself would be able to make it in time with the Ajodhya king as the distance is far and time very less. Nala with his expertise of horsemanship would be the only likely candidate. When Rituparna manages to reach Vidarbha on time Damayanti's suspicion is confirmed but the sight of Nala as *Bahuka* makes it difficult to believe. She tries to talk to him to find out the truth but Nala chides her and tells her to leave him, a poor man alone. In the *Ragini* on one hand he urges her to go and look for Nala her husband instead of bothering him. On the other hand, he taunts her about her second *Swayam Var* and hopes that she finds and a husband better looking than Nala himself.

But even if one ignores these other *Raginis*, which the scholars doubt to have been composed by other composers but named after Lakhmi Chand, one thing becomes clear that Lakhmi Chand has appropriated these stories for the purpose of his own representations. In fact, there is significant evidence that every performance used to be unique and a change in emphasis probably changed the message of the story.

Thus, one can see that *Saang* has been the theatre of the people of Haryana. Before television and print media invaded every aspect of our lives, the simple people of villages learned and communicated through the *Saangs*. As WhatsApp has become a university to millions of people of India, *Saang* was a university to the people of villages as it was not just a medium of entertainment but also a source of education to the common people who could neither read nor write. It was a showcase for the local as well as universal problems of life. In fact, the *Saang* were performed by people who shared similar social and

cultural backgrounds and so the connect with the audiences was immediate and complete. Lakhmi Chand was one of the biggest exponents of *Saang* and his popularity lay in the fact that he depicted the men as well as the morals of the society in manner that everyone could feel entertained as well connected with the life of the kings and queens that were depicted on the *Saang* stage.

**Abstract**

The present paper is a critical analysis of three *Saangs*-Raja Harish Chandra, Pooranmal, Jaani Chor: composed, sung and performed by Pandit Lakhmi Chand (1901-1945), poet, composer and *Saang* performer of Haryana. The paper analyses the major themes and content of these *Saangs* to answer questions on representation of culture, society and morality. Is the bard reinforcing the morality of the tales taken from local history, mythology, and folk legends or is he appropriating the tales to convey some other message?

**Introduction**

Art is not a mirror held up to reality but a hammer with which to shape it. This statement commonly attributed to the master dramatist Bertolt Brecht is proof of the fact that any dramatic performance is as much a product of the society which created it, as it helps in creating a new society. Lakhmi Chand has been called (Sharma, KC, 1990) 'aluminous bard', 'Kalidas', and 'Shakespeare of India' by his numerous fans and followers. It is difficult to even imagine the kind of cult following he inspired in the people of his state. People walked for days or travelled in their bullock carts to see him perform and listen to him. It was no less than a pilgrimage for most people, with the only difference that

while on pilgrimages women and whole family travelled, only men had the prerogative to attend performances like *Saang*.

The historical and mythological tales, *Qissas*, and narratives represented on the *Saang* stage were not only modes of entertainment and mediums of expression for the rural audiences but also vehicles of projecting and upholding models of behaviour for the young. These seemingly innocuous representations built the framework of values that were imbibed by the new generations not only in their own behaviour but also used as moral yardsticks to judge the behaviour of the others around them. The patterns of their lives, their expectations, their ideals, their understanding of society and reality, their models of conduct, their desires and their dreams were shaped by the behaviours held up in these stories, myths and legends.

When modern academia thinks of 'popular literature' all that they are thinking about is literature that has been written down and recorded. Although in India we have had a long and illustrious oral tradition as the Vedas, Puranas and the other religious and semi religious texts too were orally handed down the generations for thousands of years before they were finally written down, oral literature is not taken seriously. In fact, the whole thing is quite contradictory as the people who wrote 'popular literature' belonged to and wrote about the people occupying the upper rungs of social ladder and it was not popular in the truest sense of the word as it did not represent or was appreciated by the populace. However, that doesn't mean that the common people didn't have a literature. They also created exceptionally rich tradition of oral literature. The folk forms like *Saang* gave the common people a medium and means of expressing their sentiments. Folk Performers like Lakhmi Chand created a huge body of literature that has been systematically ignored and side-lined simply because he was not writing it down.

### **Themes**

The tales of *Saangs* are a source of tales which make up the popular culture of the people of north India. The plays encompass a broad range of themes drawing upon various sources like the Hindu scriptures, stories from Persian literature regional legends or historical events. Confined to only male arenas they are lewd and vulgar at one level while as propagators of values they are deeply conservative and very utopian at another level too. They raise issues that are quite central to Indian thought and way of living- like the nature of truth and untruth, value of chastity, conflict between love and family, nature of kingship and finally the struggle between good and evil.

Through an analysis of the tales performed in the *Saangs* of Lakhmi Chand we can get deep insight into the popular culture of the present Haryana and erstwhile Punjab and the way of living upheld during those times. There are various plays dealing with the men and morals of those times. One set of plays that one notices deal with the what (Hanson Kathryn, 1992, pg-118) calls "the basis of political authority and its relation with moral conduct and spiritual perfection". These stories are taken from the Hindu puranas like *Satyavaadi Harishchandra*, local legend like Puran Bhagat, Etc. The purpose of these

stories is to promote a fear and unpredictability of fate or divine agencies, moral edification, propagation of certain value system, adventure stories edifying heroism of certain heroic characters or sometimes just pure entertainment. Depending upon the type of tale the source of conflict also varies. One set of stories that one sees are the stories of kings or figures of authority who lose their kingship and wealth and have to face deprivation and degradation. Ramayana being the most popular example where Ram the good son, pupil, citizen, husband is deprived of his rightful kingship and has to go into exile due to the scheming step mother. Such stories are popular not just in north India but all across the country. One may find some variation or the other of this in every part of India. In South India one has the legend of King Mahabali, where the King falls prey to the plotting by gods against him and loses not just his kingdom but his life too. In these stories the boundaries between the kings and common people are destroyed and as the kings are forced to live the life of the common people on the street, these plays raise some of the most fundamental questions – like what is the difference between a common person and a king, wherein lies the real source of political authority, what a king should be like, what should be the dharma of a king? Did the main characters deserve their sufferings? Are the gods really so capricious? And if the Gods are so capricious as to punish the rich and powerful and morally steadfast in such a manner than what is the position of the common people? Do they really have no reason to lament their fate? Do they really stand a chance of happiness?

### ***Raja Harish Chandra***

It becomes clearer when we look at the tales of Raja Harish Chandra? He is an ideal king if there can be one- he is idealistic, knowledgeable, just to his people, devoted to his kingly duties and utterly a worshipper of Truth. Here the capitalized truth stands for not just an abhorrence of lies but also a belief in fundamental transcendent spiritual reality and righteousness. He is really generous and a man of his word. Naturally the king of Gods Indra feels threatened by such kings and feels that Harishchandra is probably plotting something to overtake the kingdom of Indra.

In ancient Indian history, King Harishchandra represents the pinnacle of honesty and virtue. He is well-known for his honesty and dedication. However, it is his virtues that lead to his downfall. It is due to his devotion to truth and his large-hearted generosity that he is tricked into giving more than he has. He is instigated by Vishwamitra, who is disguised as a brahmin, to donate his kingdom and all his wealth to. He surrenders everything he possesses, to Sage Vishwamitra in order to give *Dakshina* (gift) for his *Rajasuya Yajna*. Despite donating all his wealth, he is unable to fulfil his promise to the Sage and has to sell himself and his wife Madanawat and his son Rohtaas in the market at Banaras to fulfil his vow. The whole scene of the auction of the king and his queen is quite shocking. In fact, in Lakhmi Chand's *Saang* while the queen is put up for sale in the market, a prostitute is also looking to buy woman for her trade. Madanawat is shocked beyond belief as she had never seen such a

woman with her retinue before, while the audience is also shocked to wonder what would happen if the fair and righteous queen is bought by a woman of the trade. Luckily, the queen along with her son is sold in the household of a brahmin while the king Harishchandra who calls himself Hariya, now that he is a slave is bought by a *Chandal*, belonging to the caste of untouchables.

So here Harishchandra suffers triply- first because now he has to do hard labour like a common man which he never did before in life. Secondly, he has to serve under an untouchable and thirdly, because he is unable to protect or help his wife, whom he had vowed to protect all his life as part of his marriage vows, or child. One moment he was the wealthiest and most virtuous king, the protector of all his people and the next he is reduced to the most helpless being on the earth. However, his degradation is still not complete. The *Chandal* who bought him puts him to the task of fetching water from the river Ganga. Hariya hardly gets to eat the kind of food he was used to and the hard labour that he has to do slowly takes its toll on his body. He is reduced to a sack of bones very quickly. So much so that one day he is unable to lift the filled pot on his shoulders. As chance would have it, he comes across Madanawat who has also come to the river Ganga to fetch some water flowers for the brahmin's worship. He is very happy to his former queen and asks her for help as described by Lakhmi Chand in the following Ragini as penned down by Sharma, Pooran Chand (2006. Pg 528)

“Daya Kari dono pai Har ne, Darshan pawan ki,  
Kad ka dekhoon baat ghat pai, Manas ke awan ki,  
Kaabu mein mera gaat nahin sai, chain pade din raat nahin sai,  
Ghada thuwade koi baat nahin sai, bilkul sarmawan ki,  
Chinta ghoont jigar nai kha sai, nueai din raat fikar main ja sai  
Tere pati mein shardana sai, matka thawan ki  
Itna ehsaan mere pai dhar de, dawai mere zakhm mein bhar de  
Himmat karke kirpa karde, ek haath lawan ki  
Guru bin kon gyan ka dewa, aake paar laga di khewa  
Guru Mansingh ki karke sewa, lai kaar seekh gawan ki

God has been very kind to both of us for this chance meeting. I have been waiting a long time on the river front waiting for someone. I have no strength left on my body. I have not been getting any relief in day or night. Please don't feel shy or hesitant, just help me lift this pot.

Worries have been eating at my heart. My days and night are full of fear. Your husband now has no strength to lift this pot of water. Oblige me. Your hand would be like a balm to my bruised body. Be kind and lend me a hand with this heavy task. Guru/ teacher is the one who gives your knowledge and wisdom and helps you steer your boat in the right direction, as my teacher Man Singh taught me the art of singing. (Translation mine)

However, despite the moving plea, Madanawat tries to avoid Hariya. Once again, the audience is shocked. Hariya expects and pleads to Madanawat to help him lift the pot of water but she completely refuses. She argues that since she is now a servant at a Brahmin's house, she has to stay away from even the

shadow of Harishchandra, since he is working in the household of an untouchable. Here the relation of husband and wife seems to take a beating because the characters are now trying to be true to their new caste identities. So, the main characters and thus the *Saang* don't really question the existing social order of caste and class when they move across this social spectrum but blindly accept. In fact, they seem to believe that their Dharma and trueness lies in now following their new caste identity. Here one can see a similarity with the beliefs of the Elizabethan world. Just like the Elizabethans, the characters seem to believe that everything has its place in the universe and it is duty of humans to live as per their place. If due to some misfortune you are pushed up and down the rungs of social ladder than you must accept your fate and try to live according to what is expected of you as per your new place in the social order. It was this world order that justified the divine right of kings to rule. The similar kind of belief in the divine order can be seen here. The characters accept the identity that is forced on them and seem to believe that to follow what is expected of them in that identity is their true Dharma. King Harishchandra was a true and generous king but now he has to prove himself true as the slave of the untouchable *Chandal* also. When he was king, Madanawat was his wife and the queen. But as per their new caste identity Madanawat must stay away from him and can't really touch him or she will be polluted. Thus, when the king falls down the social ladder questions are not asked about the injustices perpetrated in the name of caste. nobody seems to ask as to why human beings should have such different places in society. All that one seems to be asking is what did the king do to deserve such a fate. Thus, the *Saang* reinforces the same morals and the same social codes to its audiences. The plays thus are not really raising questions about meritocracy or why the kings are the kings. As Hansen, Kathryn (1992, pg-120) says in her seminal book *Grounds for play*:

“The display of Harishchandra's forbearance had become a set piece, comparable to the labours of Sisyphus or the torments of Job. The king's suffering induces pathos because of its lack of provocation; it comes upon him randomly, as every good person's hour of trial seems to come. If even the most mighty and lauded individual in the land can suddenly find himself shorn of all privilege, degraded and outcast, how tenuous the happiness of any human being must be. The story reverberates with familiar slogans on the inscrutability of destiny. It recommends a course of action that rewards acceptance of subjugation and diligent perseverance—if not in this birth, then surely in the next.”

The figure of the queen and the prince are used as centres of the plays' emotional appeal. If in the first instance the queen refuses to help the king with his pot for fear of coming in contact with an untouchable, the next reversal sees the queen asking the king for pity as her son has died bitten by a snake and she has no money to pay the tax at the cemetery to perform her son's last rites. The king Harishchandra has been put on duty by the *Chandal* at the *Shamshan Ghat*(cemetery) to collect tax from all those who come to

perform the last rites of their loved ones. Now here the king instead of mourning the death of his beloved son and heir must exact the tax from the bereaved and penniless queen of his in order to prove himself true to the work that he has been assigned. The audience is left gasping and in tears as the queen offers to give half her saree the only possession that she has and the king must take that as a tribute even if it means that the queen hardly has enough cloth to cover her body. However, that is not the end of Harishchandra's trials. He must face further descent into the quagmire created by gods for him. What is most heartrending here is that all of it seems totally unjustified and unprovoked. In the next major scene in the play Harishchandra is called upon to execute his own wife. For when he takes her saree to the *Chandal* and tells him how he has extracted this tribute from a hapless woman, even the *Chandal* is moved to tears that what kind of unfortunate woman had to sacrifice the clothes on her body in order to pay tribute to cremate her only son. He tells Harishchandra to return her saree and tells him that he may be a *Chandal* but even he is not so heartless. However, the Gods still haven't had enough. And while the grieving, heartbroken, and bitterly weeping queen falls asleep in a corner of the crematorium, her face is smeared in blood and she is accused of being a witch and of having eaten a young man. As the *Chandal's* slave Harishchandra is called upon to be the executioner for his wife too. As Kathryn Hanson points out in her book (1992, pg-121-122)

“Through the reversals written into the story line, the narrative dismantles pat metaphysical explanations, exposing the contradictions at the heart of the moral system. It is not enough that the king pursue truth with utmost vigour. The drama deconstructs the very concept of truth, distilling its ultimate cruelty and blindness to human desire. Let us take the most memorable scene in the drama, when Harishchandra is called upon to execute his own wife. The act of beheading Taravati (Madanawat in Lakhmi Chand's version) has the radical potential to undermine the truth of the king. It dramatizes the possibility that his descent to untouchability has destroyed his former capacity for virtue: he is beyond the pale socially and morally, not only unable to do good but compelled to do evil. The wife's murder is necessary as the logical extension of the reversal in the king's fortunes, denying the accumulation of goodness as much as wealth. However, the king is prevented from reaching this outer limit of truth—now equated with the murder of a virtuous woman by her husband, a most despicable untruth—by the *Deus ex machina*. Harishchandra's acceptance of the patently immoral act of wife-slaughter as a moral imperative consummates his surrender to the gods; they are satisfied and demand no further sacrifice. For both the king and the audience that identifies with him, the prospect of that horrific deed is sufficient to effect a transformation of awareness. Truth itself is unknowable, difficult to discern, and irrevocably intermixed with untruth.”

### ***Pooranmal***

In the long list of *Saangs* that deal with ascetic kings known for their virtues and kings losing their wealth and power another notable one is the *Saang* of

Pooranmal. In the introduction the *Sutra Dhar* explains the setting of the *Saang* to be Punjab province and the city of Sialkot. King Saleman had two queens the older one was Icchraade and younger one was called Nunade. Queen Icchraade gave birth to Prince Pooran as a result of a boon from Guru Gorakh Nath. As instructed by Guru Gorakh, the king brings up Pooran as an ascetic, away from the life and luxuries of the palace. Pooran is kept strictly isolated and he studies rigorously for twelve years. After twelve years he is brought back to the court. After meeting his father, Pooran is asked to meet his younger step mother first, as a sign of respect. However, the young Stepmother is attracted and drawn by the beauty of Pooran and tries to seduce him. Pooran being the ascetic prince that he is refuses to be seduced by Nunade and reminds her that she is his step mother.

Here one notices that the king marrying twice is quite acceptable. However, the king is old while the stepmother is quite young. While trying to convince Pooran, Nunade says how is she unhappy being saddled with an old man. However, the guilt of the unhappy relationship and the moral transgression is shifted to the step mother's desire rather than the old king who is unable to keep her happy. In the encounter between Pooran and Nunade, the young man is the ascetic or the Bali, who is in control of his senses like a yogi, while the woman is the seductress who tries everything in her power to control him. The audience here roots for the young yogi.

The situation is described very tellingly by Hanson "The situation is thus set for an explosive confrontation between Phulan and Puran. Phulan's chief vice, according to the morality prescribed for women, is that she does not suppress her own desires. She takes the initiative, drawing in the young Puran who is close to her in age and a fitter partner than the decrepit king. Her playful attraction is soon converted under his resistance into humiliation and anger. As she fights back at his affront to her pride, she employs the strategy of Potiphar's wife—accusing him of seducing her when she made the advances. Phulan's intentions, given the information available in the story, may not really be so terrible, but she comes across as a wicked mother, crazed by lust, vicious, out of control. Despite this negative characterization, it is important to note that her sexuality becomes dangerous within the context of the polygynous family, her proximity in age to Puran, and her distance from and unhappiness with the king."

However, no matter what Nunade does she is unable to seduce Pooran. He is the idol of chastity. In the Hindu scriptures Chastity is held up to be an ideal to aspire for. Not only the scripture but these ideals were being fiercely upheld and advocated by the biggest public figures of the pre-independence times. Alter, Joseph (2010, pg -1) argues that there was a celebration of celibacy as a model code of conduct and popular leaders like mahatma Gandhi and swami Vivekananda not only popularized but also upheld it as a model to be followed.

"It is well known that Mahatma Gandhi felt that sexuality and desire were intimately connected to social life and politics, and that self-control

translated directly into power of various kinds, both public and private. Gandhi's enigmatic genius and his popular appeal among India's masses may be attributed, at least in part, to the degree he was able to embody a powerful ideal of sexual self-control that linked his socio-political projects to pervasive Hindu notions of renunciation. Affecting the persona of a world-renouncer, Gandhi was able to mix political, religious, and moral power, thus translating personal self-control into radical social criticism and nationalist goals. Gandhi's mass appeal was partly effected on a visceral level at which many Hindu men were able to fully appreciate the logic of celibacy as a means to psychological security, self-improvement, and national reform.”

In such a scenario it is highly likely that these notions percolated down to folk arenas and found expression in folk performances also. In fact, the folk stories performed on the *Saang* stages acted as connecting points for the Morals, and culture advocated in the Scriptures and the one being advocated by the leaders of the independence. The tales were thus establishing a continuum of culture and society and making people realise that they were a civilisation that was thousands of years old and if they could find and go back to their roots, they could be strong and independent again. Chastity is one of the greatest preoccupations in the stories put up by *Saangs*. What is interesting to note here is that chastity is not just for the woman but for the man also. There is lot of pressure on the men too to remain celibate and not give in to the schemes and mechanisations of women who want to seduce them. In another book written by JS Alter (1992) he has pointed out how in the social context of India celibacy and holding of the semen was connected to power. The wrestlers were taught to practise celibacy in order to be powerful.

The Wrestler's Body tells the story of a way of life organized in terms of physical self-development. While Indian wrestlers are competitive athletes, they are also moral reformers whose conception of self and society is fundamentally somatic. Using the insights of anthropology, Joseph Alter writes ethnography of the wrestler's physique that elucidates the somatic structure of the wrestler's identity and ideology.

In the *Saang* Pooran Bhagat the hero is a young man who refutes the advances made by his step mother, because that would be threatening of the incest taboo but also because he is an ascetic who holds up celibacy as a great virtue. His semen is a source of his power. His practice of *Brahmacharya* give him the resilience to bear all the unjust punishment that his father forces on him under the influence of his step mother. The concept of *Brahmacharya* as it relates to gender and politics and the male concern for celibacy is couched in terms of truth. Pooran Singh is considered to be truthful because he is celibate. The celibate body is considered to be supremely fit. Sex is regarded both distracting and defiling. Kings and sages who take vows of chastity become a threat to Gods. Like in another popular *Saang* Hoor Maneka, which is story from the puranas, Sage Vishwamitra is deep in meditation. So much so that the king of Gods Indra starts feeling threatened thinking that Vishwa Mitra has designs for his throne. He sends the celestial Nymph Maneka to earth to

disturb Vishwa Mitra's meditation. The implication is that if Maneka is able to entice Vishwamitra to sleep with her not only would his sadhana be discontinued, he would also not be able to do it again because he it would be debasing in nature and he would lose all his power. The difference between both the stories is that while Maneka is able to disturb Vishwa Mitra, and sway him from his path, Nunade is not able to do so in the *Saang Pooranmal*. A lot of contemporary literature was published in small booklets on the practice of *Brahmacharya* by small regional presses in small towns of India. These booklets are prescriptive in nature and give details about not only a regimen of diet exercise and rest but also prescribe how to control desire and stay healthy. These *Saangs* and these booklets were very popular also as Haryana being an agrarian economy the young men were encouraged to be physically fit and wrestling was the most popular sport.

### ***Jaani Chor***

Another theme that is very popular in the folk stories of the region is the story of the clever man who outwits his opponents to help the helpless. A young man may be a bright spark or a dullard depending on the version of the story that we are looking at. If he is a bright spark, he generally outwits his opponents using his mind while if he is a dullard, he overcomes his opponents using sheer luck or some supernatural help. In other cases, he gets help from some supernatural elements that gives him power, plus his own mind. Such stories have been a part of the literature of north India since the time of *Panchatantra*. In *Panchatantra* there are various such stories but the foremost that comes to mind is the story of the clever fox that outwits the ferocious lion using her presence of mind or poor Brahmin that saves his bullocks from a mean thief and a vicious monster using his wits. Down the ages one sees the same theme repeated in the stories of Akbar and Birbal, in Tenali Rama or if looks at the Persian literature than in the stories of Khwaza/Mulla Nasruddin.

On the *Saang* stage one sees one such story in the *Saang* of Jaani Chor. Jaani Chor and Nar Sultan were both sworn brothers. They also had a sworn sister Marwan, who was married in Narwargarh. Both Jaani and Nar Sultan were going to her sister's home to attend a wedding. On the way they were resting near the river Abu when they saw a message written on slate float down the river. The message read, "I am a Hindu warrior woman (*Kshatrani*). Adlikhan Pathaan has captured me. If there is true Hindu, who might save me otherwise Adli khan would make me his (wife) Begum. It was signed Mehakde. After seeing this message both, Jaani and Sultan get into a row. Sultan wants that they should pay their respects at the sister's wedding as she would be expecting her brothers and afterwards, they can go and save Mehakde while Jaani feels that they should save Mehakde first as her situation is more dire. Finally, they decide to part ways. While Nar Sultan goes to the sister's house to attend the wedding and fulfil a brother's duties, Jaani moves towards the kingdom of Adli khan.

On his way he meets four sages who are fighting over four relics of their Guru/ teacher. Jaani asks them what they are? They tell him that all the four

things are very precious and powerful. The first one is a pestle that can destroy your enemies. The second one is a mortar which can be used to break anything, the third one is the wisdom blanket using which you can disguise yourself as anyone and fourth is magic sandals, which can take you anywhere you want. Jaani offers to intervene and settle their quarrel. He fires four shots in four directions and tells the sages that whoever would bring the arrow fired by him first will get all the things. As the sages run behind the arrows in four different directions. Jaani bags all the four wonderful things. He first uses the magic sandals and asks to be taken to the kingdom of Adlikhan and reaches there within moments.

As one can see the audience is with the main protagonist right from the beginning. They totally identify with the cocky young man and derive great pleasure from his exploits as he outwits the so-called wise men to increase his power. Also there seems to be a pointer towards the general habit of Muslim rulers to abduct beautiful young women. The people of the area were very familiar with such practices and resented them very much. However, the poet has tried to balance the religious sentiment by making Jaani's sworn brother Nar Sultan, who evidently is a Muslim. Performers during this time tried to remain secular and to pass the message of religious tolerance instead of instigating enmity between the two religions- both covertly as well as overtly. Also, during this time Hindus and Muslims were ruled and oppressed by the British so both communities were united in their oppression and hatred for the British instead of hating each other.

Once there Jaani pastes a note on the palace of Adli Khan challenging him that he would release Mehakde from his imprisonment. Adlikhan is obviously furious when he reads the message and asks his courtiers as to who is ready to take up the challenge and capture Jaani. The challenge is picked by Dhammal *Sunar* (goldsmith). He declares that he will arrest Jaani and present him before Adli Khan. Jaani on the other hand sleeps peacefully in one of the gardens of the city after having spent the night on his exploits outside Adli's palace. However, he is woken up by the wife of the gardener who uses her whip on him when she sees a strange man sleeping in her gardens. Jaani wakes up and very quickly comes to his senses. When the gardener's wife questions him further, he says that he has come here to meet his aunt, his mother's sister. Meanwhile he takes up the disguise of the Gardner's wife's nephew using his supernatural powers. The Gardner's wife is convinced and treats him kindly. He extracts information from her about Dhammal goldsmith and departs for his house. The Goldsmith's wife was alone at home when Jaani disguised as an astrologer knocks at her door. However, the Goldsmith is not the only one who has to face defeat and ignominy at the hands of Jaani. Jaani also outsmarts a *Daroga* or police inspector and finally Adli Khan himself and manages to release the dame Mehakde. The various turns in the plot are guaranteed to bring the underclass hero with flying colours. That he is doing it help a damsel in distress is further to his credit. *Saangs* such as these made Lakhmi Chand very popular among the youth because for once the young men

could see themselves winning over the usual hurdles that obstructed their happiness in real life. Hanson (1992, p.138) calls heroes like these “upstart warrior whose fame and prowess bring him a modicum of respect” (underlining mine)

### **Conclusion**

Lakhmi Chand has used tales and *Qissas* from local history, myths and folk legends to base his folk performances. His stories may have been familiar to the audience but Lakhmi Chand’s treatment of them differs. He uses the tales to present his own point of view or the point of the people at large, during those times. The broad facts of the stories that he has appropriated remain the same but Lakhmi Chand chooses not to take the full tale for his performance. His primary task was to deliver full entertainment to the young men that came in hoards to watch his performances but while entertaining he was also delivering a moral code which became the touchstone to model their own behaviour and to use as a yardstick to judge the behaviour of others. Lakhmi Chand’s characters have been taken from the ancient culture but they represent the struggles and the moral questions that plagued the minds of his contemporaries and seem to be valid even today. In fact, his choice of stories gives his voice a timelessness and universality that made him very popular and a voice that the people of Haryana swear by till today. When we talk about Indian culture as an entity that has been in existence for thousands of years, it is Folk performers like Lakhmi Chand that have given it a continuum and we need to study their oral literature and performances to study the society of those times. The tales that they staged were not just tales of entertainment but also show us of the culture, society and morality of those times.

**Abstract:** The professional instructors and their fundamental functions can't be disregarded in establishing a nation's human capital. Basic education, especially in developing countries, focuses on these key functions. However, the functions of training managers with programmed instructions can appear to be very nearly substituted in the field of training equipment. Teachers are certainly still the major supervisors of information in rising economies such as India. In any nation, economic development is primarily driven by a competent, knowledge-based trained workforce. The research aims to ascertain the variables that contribute to teacher attrition as a result of frequent staff turnover in school and widespread dissatisfaction amongst educators in India and across the globe. The research examines the variables that contribute to teacher attrition and retention in schools, particularly in India, by consulting a variety of periodicals, journals, internet sources, library, and newspapers. The research indicates that instructors must be adequately evaluated in order to maintain their expertise in particular management issues that affect teacher education. Additionally, the research recommends the utilisation of staff training programmes and the development of curricula for educational administrators. This is critical and essential for academics to be well prepared to offer sufficient pay, welfare benefits, and a positive work environment, as is possible in other professions.

**Keywords:** Attrition , Education , Retention, , School, Secondary Education, Teacher.

## **I. INTRODUCTION**

Generally, the teacher is regarded as the primary element in determining a student's success while under the jurisdiction of a school. Additionally, it is well-known that, especially during the first 5 years, teachers have a turnover range of approximately 50%. The research has placed a greater focus on recruiting and retention as a result of Ingersoll's work, which emphasises

The "revolving door" of education and the demands of No Child Left Behind for highly educated instructors in each school. Growing interest in attracting and keeping teachers has resulted in the publication of a sizable proportion of literary works during the past fifteen years. In this research, a variety of factors affecting teacher and movement preferences were evident, including school and student characteristics and a variety of work situations. While research helps explain teachers' general labour market trends and why schools are difficult to run, it makes little sense to explain instructors' specific compromise decisions. There is a shortage of highly quality research that results in the value that a teacher places on many non-monetary aspects and that also establishes them.

Organizations in several industries appear to be struggling to recruit and retain the right talent either because of economic declines. Results from prior study results showed that a loss of expert staff can lead to organizations' bad performance and damage the results of such companies. Depending on the circumstances, employee sales are seen in different ways. Employee turnover refers to the rate at which workers in school and with instructors leave after a certain period of time. If one or two instructors quit the course for a variety of reasons, the effect will be minimal and will not jeopardise the school's coherence. Western nations, namely the United States and the United Kingdom, have adopted policies to avert massive employee losses. Every teacher who leaves the professional education area considerably reduces his budget and determines whether or not pupils reach a high level of studies. The National Academy of Education's White Paper on Teacher Quality included standard evaluations at the middle school level for students from poor socioeconomic backgrounds who were taught for three consecutive years by highly effective elementary school teachers. Research also shows, however, that for 3 years, all pupils are 'academically disadvantaged' as a result of poor education regardless of their circumstances. A school's success needs competent instructors who are willing and dedicated to educating a diverse group of kids and who can make a positive impact in each student's life.

Many schools have no teacher who is new, is teaching out of their certification area, failed a certification exam on their first attempt, or who graduated from the least competitive undergraduate colleges (10th percentile or below). On the other hand, many other schools (90th percentile or above) have a substantial portion of teachers who are brand new teachers (18%), who are only teaching courses for which they are not certified (24%), or who failed a

certification exam on their first attempt (about one third). In some schools less than half of the teachers are permanently certified in all of the courses they teach while in other schools this figure is nearly 90%. Clearly, the qualifications of teachers are not evenly distributed across schools (Lankford, H., Loeb, S., & Wyckoff, J. (2002))

The first step in assisting teachers is to refrain from blaming them. The majority of schools want to assist their teachers but are unable to do so owing to inadequate resources. Several schools have sought private financing through alumni and parents throughout the years; nevertheless, the majority of institutions are compelled to rely on public funding. However, schools may assist by improving management. This also applies to the curriculum. Schools may provide instructors with more freedom in planning and delivering courses, while also minimising administrative work. This may help teachers manage their workloads more effectively and promote a healthier work-life balance. Another approach is to offer ongoing educators, keeping them informed about new teaching technologies and methods that may help them manage their workloads more effectively. Much has been written regarding teacher technology resources. However, it is critical that schools take the time to determine which resources would best meet their budgetary requirements. For instance, a school with a limited budget may benefit more from a virtual learning aid that can be accessible through a number of devices than from a product targeted for learning. Additionally, teaching tools that are flexible to a range of pedagogical approaches are more valuable than those that must be continually updated or extended to accommodate changing student populations.

There are some missing configurations of early career decisions coupled with quality of teaching practice among the five we have identified here in terms of what readers might expect to find in a study like this. For example, there's no configuration that captures the experiences of strong teachers who leave the profession—perhaps to take up administrative positions or enter graduate school or because they are so dissatisfied with their teaching situations that they exit (Gleeson, a. M. (2012)).

Research on teaching turnover comparing disparities in teachers' wages and disparities between school and school in the resources to enable teaching are also documented. The key interest moderator factors included:

- Medium size class.
- Teacher-student ratio.
- Accompanying school expenses per instructor.
- School costs for resources for instruction.
- Assistant teacher or assistant teacher.
- Expenditure on education.
- Expenditure per pupil.
- Wage of teacher.

Special education teachers with less experience are less likely to leave than their more experienced colleagues. However, many people, including many

teachers emerging from alternative routes, begin teaching when they are older, so age, while highly correlated with teaching experience, should be controlled for when examining experience (Connelly, V., & Graham, S. (2009)).

### **Teacher Retention Management**

According to Elfers et al. (2006), teacher retention management should prioritise techniques that enhance employee retention as well as staff unity, productivity, and dedication. Easley describes five retention management ideas that have the ability to increase employee satisfaction, loyalty, and performance (2006). According to him, employees must feel appreciated and trusted. Employers must also understand their role in their employees' growth and development. (Bamisaye, 1998; Baike,2002; Long et al., 2012a) this may lead to workers remaining with the company because it shows that the company cares about the safety of its people Many workers want to stay at their jobs for an extended period of time, and they are better educated and responsible at every stage of their careers. Abakpa and Agbo-Egwuassert that a real company would encourage its employees to maintain a continuous emphasis on performance and outcomes. Employers offer workers with extra skills in particular areas of expertise and capability. With this in mind, workers acquire more knowledge and responsibility as their job progresses (Azuka,2003; Anderson and Olson, 2005). Along with uniqueness and innovation, the authors believe that this mentality exists among organisational workers.

### **Factors that contribute to teacher retention**

Policymakers and educators must take specific steps to stop the flow of teacher attrition and their desire to leave their positions. This notion is applicable not only to destitute nations or areas, but also to affluent countries and locations.

### **Teacher Remuneration:**

Numerous studies from across the globe have consistently identified teacher compensation as a critical factor in teacher retention. The significance of the salary was determined using publicly accessible data from government sources, since it has an effect on instructors' intentions to continue teaching. Goldhaber et al. strengthen the case for higher compensation based on both teacher quality and retention rates (2007). The remuneration has a substantial effect for instructors and could even be used to select whether or not to stay, according to DeAngelis and Presley (2007).Glableck and Bax (2004) developed a sample of respondents in the United States who agreed to continue working in their schools provided compensation increases.

### **Leaders' Personalities:**

Loeb et al. investigate the effect of school styles on teachers' retention intentions (2005). However, the idea of management lacks a generally accepted definition, since what it expects can be rude at times. Long et al. (2012a) identified the leadership characteristics that enable individuals to carry out their responsibilities more effectively and efficiently. According to Knappetal. (2006), school heads are successful in their professions because

they possess a variety of professional skills and are essential in evaluating their schools' affairs. According to school administrators are critical in pursuing forward-thinking initiatives, establishing shared missions, and deciding on curriculum & teacher retention facilities.

This research examined the attrition rates of professors recognised by Indian universities and the causes for instructors' departures in order to ascertain why teachers are concerned about the stated rates. The leavers were asked qualitative and quantitative questions about their choice of not staying in class in order to check the correctness of their answer. Stayers were also questioned about why they chose to stay in the classroom. This provided information on the teacher's retention and compared it to leavers' comments. Finally, demographic variables have been investigated as potential determinants of a person's attrition.

### **Conclusions**

The research's findings are based on a self-reported study sent by the Indian University Teacher Education Program to all certified instructors, with a total of 2,388 questionnaires and 1,031 responses, representing a response rate of about 43%. The poll revealed factors that influence teachers' decisions to quit or stay in the classroom. Data was gathered from a variety of sources, both qualitative and quantitative. Additionally, numerous demographic questions were addressed to ascertain potential determinants of teacher attrition. Each responder was interrogated. The findings demonstrate the critical role of compensation and leadership in keeping teachers. Earnings are the most significant predictor of teacher attrition, as shown by the statistics. Additionally, education leadership is a factor in teacher attrition. The results indicate that a greater proportion of respondents stayed in the teaching profession, while they also cited practical reasons, the majority of which were emotional. Additionally, the research demonstrates that certain demographic variables may be used to forecast attrition. This section presents and discusses the study's findings.

**Abstract**— “Art is not a mirror held up to reality, but a hammer with which to shape it.” this dictum attributed to famous playwright Bertolt Brecht as quoted by Bleeker et al., (2019) sums up the interdependence and correlation between art and literature and society. The world has never been a singular entity. There have always been groups that lived a powerful, privileged existence and it is their experience that has passed down the generations as literature, as the core narrative of human existence at a given time. For long ‘Literature’ did not include ‘Folk’ or their culture as was relegated to the peripheries of academic discourse as belonging to the savage, subaltern people. However, it is now increasingly being recognised as an archive of vernacular knowledge systems and a great contributor to the social and cultural development of the people. Both social space and folk literature affect and mould each other. What happens in social space gets reflected in folk literature and what folk literature depicts becomes part of social space. Saang as a form of folk performance tradition has been the source of or a defining influence on the various forms of Folk performance traditions of North India. It has been called “a north Indian Folk Opera” by Vatuk, V. P., & Vatuk, S. (1967) because the dialogues between characters are sung. Taking it as a representative form of North Indian folk performative tradition, my paper attempts to analyse issues of representation of culture, society and morality on the Saang stage. The paper, would focus on some selected Saangs of Lakhmi Chand (1905-1945), as compiled by Sharma, P. Chand. (2006) in *Lakhmi Chand Granthavali*. He is known as the greatest exponent of the Saang form and often referred to as the Shakespeare of North India. His Saangs invariably represent the values and experiences that formed the core of the society of his times. He has taken tales from history, myth and local legends as the basis for his performances. The present paper analyses the content of some Saangs composed and performed by Lakhmi Chand to analyse the knotty question of representation of culture and morality and how one can see reflected in the tales performed by the Saangi, the major social concerns of the times.

## INTRODUCTION

“Art is not a mirror held up to reality, but a hammer with which to shape it.” this dictum attributed to famous playwright Bertolt Brecht as quoted by Bleeker et al., (2019) sums up the interdependence and correlation

between art and literature and society. The world has never been a singular entity. There have always been groups that lived a powerful, privileged existence and it is their experience that has passed down the generations as literature, as the core narrative of human existence at a given time. For long ‘Literature’ did not include ‘Folk’ or

their culture as was relegated to the peripheries of academic discourse as belonging to the savage, subaltern people. However, it is now increasingly being recognized as an archive of vernacular knowledge systems and a great contributor to the social and cultural development of the people. Both social space and folk literature affect and mould each other. What happens in social space gets reflected in folk literature and what folk literature depicts becomes part of social space.

### **Marginalisation of Folk literature**

The online dictionary defines folk as “The common people of a society or region considered as the representatives of a traditional way of life and especially as the originators or carriers of the customs, beliefs, and arts that make up a distinctive culture” and their culture may be referred to as folk culture. However, that is to simplify a very complex debate because folklorists as well as anthropologists have been divided over what constitutes folk culture. Norbert F. Riedal ‘Folklore and the Study of Material Aspects of Folk culture’ (Oct-Dec 1966) rightly points out, “so far no consensus seems to have been reached, and the various and often conflicting interpretations of “folklore” that have been brought forth by folklorists as well as anthropologists have caused much consternation, frustration and even alienation between the two disciplines” (1). Folklore is an inseparable part of culture but the relationship between folklore and dominant culture is not very simple because folklore or folk traditions not only reflect the culture of their folk and are also used as tools to emphasize and reinforce existing power equations but also question dominant social ideologies. The issue gets further complicated when we discuss issues of Indian folk tradition in relation to folkloristic as an academic enterprise, which started in the west.

As Lisa Gabart points out in her article Folk Drama

It easily imposes frameworks of interpretations that are not necessarily grounded in local understandings. When used in non-western contexts, for example, the term imposes western understandings of Drama on traditions that may be more profitably understood as something else, such as worship, sacred retellings, or a visitation by deity, thus drawing disparate performance traditions into the same interpretive sphere. (1)

Indian theorists and researchers too voice the same difficulties.

According to K N Panikkar

"We often come across Western scholars who approach Indian artistic traditions in a meticulously analytical way and create theories on our theatre concepts after their own fashion. I have all respect for their

analytical approach which helps them make their own deductions. But the question which baffles anyone in theatre is whether these deductions can be taken as guidelines for the practice of Indian theatre. A theory is generalised from our experience of doing a thing. Even when an artist practices an art after thoroughly learning its grammar, he cannot neglect the creative impulse which springs up from within, necessarily paving the way for further enlargement of theory."

In Western countries they consider folk forms as rudimentary, as fossils of some bygone age. Many theorists see folk as primarily low-class activity, belonging to illiterate people. It is hardly seen as literature.

As Lisa Gabert posits in her article Folk Drama,

"In the nineteenth century, scholars were interested in the origins of cultural forms they considered to be “folk Drama,” which largely was conceptualized as ancient but degenerated plays that continued to exist in the modern era primarily among the European peasant classes. The plays themselves were presumed to be “survivals,”—that is, leftovers from an earlier era in which fuller, more complete versions had flourished, and where the functions they fulfilled were supposedly more holistically incorporated into society”

But in India the scenario is different. The folk forms are not dead and gone. True that they have suffered setbacks with the coming in of satellite TV and internet but they are not history as yet. According to J C Mathur

"In these circumstances, the question arises how did the contemporary traditional and folk forms arise? In the West the folk form is considered only a community activity of an amateurish kind. This is not so in India because our traditional and folk Drama has very important and strict traditions in some cases and is far more sophisticated than the Western folk Drama. While editing jointly with my friend Dashrath Ojha some medieval plays on North India and Nepal (C 1 300 A D - C 1 625 AD) I (J C Mathur) came to realise that those plays along with similar contemporary traditional forms in other parts of India, actually belong to the corpus of a Dramatic genre which has received scant attention from historians of Drama, including Keith who has rejected them as merely "irregular plays." The same attitude is disclosed in a recent work called “Sanskrit Drama- Its Origin and Decline” by Shekar (published in the Netherlands) "

### **Saang -as a unique Performance Tradition of North India**

Swang or *Saang* developed in the north Indian state of Haryana. Haryana as a state may be of a recent creation (Haryana was constituted on **November 1, 1966**, as a

result of the partition of the former state of Punjab into two separate states—Punjabi-speaking Punjab and Hindi-speaking Haryana.) but the history of the people of Haryana goes back to time immemorial. In fact, the whole reason that the Govt of India found it necessary to create a separate state is reason enough to agree that the distinctiveness of the Haryanvi people was too much to ignore and could not be brushed aside under the carpet of a common state with the Punjabis. Haryana has existed as a separate unit with its own distinct identity and distinct folk culture. It has unique folk practices and performances which take place at villages, at temples, at road crossings, at fields and granaries, marriage ceremonies, festivals etc; and are an inseparable part of the lives of the people. It includes *Saangs* also which are performed on a particular kind of stage or platforms with usual themes of legendary story, historical event or love story at its centre and can keep the public or audience enraptured for the whole night. *Saang* is a balanced combination of acting, dialogues, music, dance, songs, plot, worship and spirituality.

Though the history of folk performance traditions in north India has much in common, the *Saang* from of Haryana (erstwhile Punjab) is unique and different from other performance traditions practiced in the area. *Saang* may be called folk theatre but its status as theatre remains disputed. First of all, as stage it uses a platform of about three and a half meters which is open on all four sides. As Balwant Gargi points out in *Folk Theatre of India*, “life in India is in the streets. Shops, stalls, rituals, bathrooms, all are exposed to the sun and to the glare of people, so is the folk theatre.” (6) There are no curtains or green room attached to the stage and *Saang* hardly uses any props during performance. It is the main narrator or the *sutradhar* who describes to the audience what the stage stands for e.g., a palace, forest, or riverside depending on the scene. Though the characters are well delineated, there are no dialogues; the exchanges between the characters are sung and these songs are called *Ragini*. The performers are all male and sometimes they wear costumes but that is a rarity and in fact a recent practice. Thus, for *Saang*, all the three important constituents of theatre—acting, dialogues and stage are markedly different from practices of the theatre. *Saangs* is also quite distinct from other performing arts in the region. While on the one hand we have narrative traditions like *Alha* which sing epic poetry and the *Nath jogis* who narrate folk stories to an audience, on the other hand we have the *Naqqals* and *Behrups*. While *Behrup* performers disguise and move from village to, the *Naqqal* performers usually perform little skits based on imitation. Therefore, if *Alha* is about musical rendering of poetry, *Behrup* is purely about costume and acting. As per this categorization, *Saang* would fall somewhere in between

because it incorporates elements of both. Like the *Alha*, the *Saangis* sing their *Raginis* and like *Behrup*, the staged performance tells a story using costumes and acting.

Usually, the man playing the lead female character is dressed up as a woman, but the onus of creating the scene and retaining the interest of the audience is primarily on the poet who composes the *Raginis* and who is also the lead actor who sings them. The one after whom the *Saang* troupe is known is more often than not the composer and the lead singer/actor. The *Raginis* are accompanied by *Sarangi* and *Nakkara*. The performances demand great skill and stamina from the artists who perform for as long as six hours and usually there are no loud speakers to amplify their sound. An hour or so before the performance, the musicians begin to create the atmosphere and the artistes sing some religious or other songs connected with the performance till such time when the ‘Guru’ appears and the artistes touch his feet to seek his blessings. The *Saang* begins with the recitation of a *bhet* as pointed out by Ved Prakash Vatuk and Sylvia Vatuk in their article the ‘Ethnography of *Saang*’,

Om(a) Nam(a) sab(a) tai Bada the name of aum is the greatest

Ustai bada na koy(a) no one is greater than he

Jo uska sumiran(a) karai one who remembers Om

Sudha at(a)ma hoy(a) his soul is purified

Ari bhavani bas(a) kar(a) oh bhavani, come and live in me,

Ghat(a) ke par(a)de khol(a) open the gates of my heart,

Ras(a)na par(a) basa karo stay on my tongue, oh mother

Mai suddha sabad(a) mukh(a) and speak the correct words

Bol(a) through my mouth.

Manai sumar(a) liye jag(a) dis(a) I remember the lord

Sat(a) guru mile is my guru

Kahu charan(a) vakai sis(a) I bow to his feet. (23)

With a brief introduction about the play, the performance starts.

### **Lakhmi Chand’s performances as Folk literature and Chronicles of Social Space**

Of *Saang*’s exponents, Pt. Lakhmi Chand (1901-1945) is the most celebrated. Shashi Bhushan Singal as quoted by Puran Chand Sharma in his book *Lakhmi Chand Granthavali* describes his contribution to the form of *Saang* as, “Pandit Lakhmi Chand freed the themes of the ‘*Saang*’ from religious and puranic subjects to which they had become confined and included in them a blend of love

themes and of youth. Thus the 'Saang' was made more ornate (17). Lakhmi Chand has been called a 'luminous bard', 'Kalidas', and 'Shakespeare of India' by his numerous fans and followers. It is difficult to even imagine the kind of cult following he inspired in the people of his state. People walked for days or travelled in their bullock carts to see him perform and listen to him. It was no less than a pilgrimage for most people, with the only difference that while on pilgrimages women and whole family travelled, only men had the prerogative to attend performances like *Saang*.

Before Lakhmi Chand *Saangs* were looked down upon by the self-proclaimed custodians of society who declared such entertainment to be obscene and vulgar. All through history folk entertainments had to battle against discrimination as they were looked down upon by the so called literati and respectable high society people. Lakhmi Chand also brought *Saangs* to repute. Not to say that he didn't face any resistance. He did. But slowly he could lift the *Saang* form from the depths of neglect to the height of such popularity that no social occasion was considered complete without his performances. Though he was illiterate himself he didn't let that come in the way of his education. In fact, he kept Tika Ram with himself as his guru, for the purpose of instructing him and teaching him the scriptures. He was able to pour his experience and knowledge in his poetry that he is looked upon not just as a poet composer but as a wise man in the state of Harayana. Other than the *Saangs* he composed lots of Bhajans, and his bhajans have been compiled and recorded in many volumes as 'Lakhmi Chand ka Brahmgyan' or 'Lakhmi Chand's Divine Knowledge'.

One of his most famous *Saangs* Nala Damyanti has left an indelible imprint on the psyches of the local people. Nala-Damayanti is originally a story from Mahabharata.

It is a popular story in literature and there are hundreds or rather thousands of versions of this story. From Himachal Pradesh to Rajasthan to Gujarat to Tamil Nadu, the story can be found in different formats. In fact, the story of Nala Damayanti is a popular story in Persian literature also. As David Shulman points out in his article Damayanti and Nala: The Many lives of a Story

In The *Mahabharata* episode known as the *Nalaopakhyana* is an elegant, fast-paced narrative.... Moreover, the story it tells is one of the most popular in India, existing in all Indian languages, often in many versions in each language. Hundreds, perhaps thousands of Nala stories exist. Wherever one goes in the sub-continent, Nala was there first. (1)

The story is equally popular in folk literature, with every region having its own version. When we are talking about

different versions of the story. Sometimes it is told as a love story, sometimes as court drama, sometimes as a tale displaying fortitude in the face of adversity at other times it is a cautionary tale about going against the wishes of gods, sometimes it is about predestination. In the original story it was narrated by the rishis visiting Yudhishtir when he was living in the jungle. One day he was feeling particularly sorry for himself, wailing at his misfortune. He complained to the rishis about his misfortune and said that no one was probably more unfortunate than him. It was in response to Yudhishtira's wailing and complaining that the Rishis tell him the story of Raja Nala. They tell him that there was one more who suffered more than you and urge him to thank God that even in jungle he is surrounded by his brothers and his wife, while Raja Nala had to battle adversity and misfortune all alone, after losing all his wealth and kingdom. Thus, originally the story of Raja Nala is narrated to Yudhishtira to make him stronger, to have fortitude and to make him count his blessings. The story is narrated to give him hope for a better future and courage to face the difficult time that was coming ahead. However, every Nala story doesn't have the same motive.

In this context it becomes important to analyse how Lakhmi Chand tells his Story. The *Saang* begins by a *Ragini* where Lakhmi Chand talks about the loss of goodness and honesty in the people and how it has led to various misfortunes befalling the people of Haryana.

*Jab te gaarat mahabhart mein attharah akshohini  
dal hoya*

*yagya hawan tap daan chhoot gayenyun bharat  
pe jaal pade*

*indra bhi varsha kam karte jal bin soone taal  
pade*

*bawan janak huye brahma gyani ved dharam ke  
khyal pade*

It is after the end of the first *Ragini* that the sutra Dhār tells the context of the story. How the story was first narrated by rishi to Yudhishtira in Mahabharat. But the motives of Lakhmi chand's story is far different from the motive of the rishi as we get to know as the *Saang* progresses. Lakhmi chand's story is a love story. In the initial *Raginis* there is prevalence of the romantic element. The poet gives evocative descriptions of the beauty of both raja Nala and Damayanti as both were famous in all three realms for their beauty. Another thing that the poet stresses is Nala's honesty and piousness. In the Lakhmi chand Granthawali, Pt Poorna Chand Sharma has ended Lakhmi Chand's *Saang* at the point when Nala abandons Damayanti and grief-stricken Damayanti is roaming in the jungle searching for her husband. She tries to follow his footsteps and does so till the end of the day. Then the night

falls and she is forced to abandon her quest. The next morning when the sun comes up, she realises that she is lost. The heroine's pain and bafflement have been very poignantly expressed by the poet but after this the *Saang* ends abruptly.

Pooran Chand Sharma has given a note from Lakhmi Chand's son Pt Tuleram that Lakhmi Chand never performed the *Saang* after this. However, the researcher herself has heard some more *Ragini*'s while growing up ascribed to Pt. Lakhmi Chand and dealing with latter part of the story. One very popular one is

Ulta ganga pahad chadi aur ulta chalya paani  
Daasi banke rehna lag-gi khud damaynti raani

(The river Ganga is climbing up the mountain and the water is flowing in reverse direction as the queen Damayanti herself has started living like a maid.)

The *Ragini* starts by comparing the descent of queen Damayanti to the station of a common maid to the reversal of natural order. It is as unnatural as a river climbing up the mountain or water flowing from down to up. The *Ragini* further describes the problems that the queen faces, living a life of want and subservience. The queen Damayanti who was a princess before she was a queen and who has never seen hardship in her life and yet her love for her husband is such that she is ready to face any amount of adversity in order to continue her search for her husband. This *Ragini* deals with the part when Damayanti has been abandoned by Nala and reaches the kingdom of Cedi and starts living with the queen as a maid (daasi)

Ja kite toh le raja Nala ne, main kyun garib sataya gaya  
Nala te bhi suthra pati mile, tera swayamvar pher rachaya gaya

(Go and look for Raja Nala! Why are you tormenting me, a poor man? And now that your *swayamvar* has been organised again, you would probably find a man better looking than king Nala also.)

This *Ragini* belongs to the time in story when Nala has been living as an ugly deformed servant of the king of Ajodhya, Rituparna. He is tricked into coming to Vidarbha by Damayanti who sends an invitation to the king for her *Swayamvara*, letting it be known that she is planning to marry a second time, now that there is no hope of her husband Nala to be found. However, she sends the invite at such a short notice that she is sure that only Nala himself would be able to make it in time with the Ajodhya king as the distance is far and time very less. Nala with his expertise of horsemanship would be the only likely candidate. When Rituparna manages to reach Vidarbha on time Damayanti's suspicion is confirmed but the sight of

Nala as *Bahuka* makes it difficult to believe. She tries to talk to him to find out the truth but Nala chides her and tells her to leave him, a poor man alone. In the *Ragini* on one hand he urges her to go and look for Nala her husband instead of bothering him. On the other hand, he taunts her about her second *Swayamvar* and hopes that she finds and a husband better looking than Nala himself.

But even if one ignores these other *Raginis*, which the scholars doubt to have been composed by other composers but named after Lakhmi Chand, one thing becomes clear that Lakhmi Chand has appropriated these stories for the purpose of his own representations. In fact, there is significant evidence that every performance used to be unique and a change in emphasis probably changed the message of the story.

## CONCLUSION

Thus, one can see that *Saang* has been the theatre of the people of Haryana. Before television and print media invaded every aspect of our lives, the simple people of villages learned and communicated through the *Saangs*. As WhatsApp has become a university to millions of people of India, *Saang* was a university to the people of villages as it was not just a medium of entertainment but also a source of education to the common people who could neither read nor write. It was a showcase for the local as well as universal problems of life. In fact, the *Saang* were performed by people who shared similar social and cultural backgrounds and so the connect with the audiences was immediate and complete. Lakhmi Chand was one of the biggest exponents of *Saang* and his popularity lay in the fact that he not only depicted the men as well as the morals of the society but also challenged some age-old norms and reinforced the message of good life through his performances.

**Eco-feminism in Jhaverchand Meghani's 'Charan Kanya'**

Dr. Rashmi Maniar<sup>1</sup>, Ms. Vandana Kaushik<sup>2</sup>, Dr. Hanan Khalid Khan<sup>3</sup>, Ms. Lavanya Paluri<sup>4</sup>, Dr. Priya Raghav<sup>5</sup>

**Abstract**

Literature and poetry are an important part of the Charan identity, literature written primarily during times of peace or shortly after returning from battle, and particularly to record the exploits of fellow warriors. Charani literature is a literary genre in its own right. This caste is primarily responsible for the Dingal language and literature. Jhaverchand Meghani was a prolific Gujarati novelist, critic, and journalist who lived from 1897 to 1947. This paper focuses on his pioneering work in Gujarati folk literature, especially his popular poem "Charan kanya," about a charan girl's valour in saving her calf. Meghani spent many years travelling across Saurashtra, gathering and recording oral culture repositories through folk tales, songs, ballads, and other traditional types. People from different professions, castes, genders, and social classes served as his sources. This paper attempts to analyse the poem "Charan Kanya" through an eco-feminist perspective.

**Key words:** Eco-sophy, Eco-feminism, eco-criticism, Charan girl, valour

Ecological interconnectedness research offers a window into dual and nondual structures for the bio-culturally rooted human identity. This field is part of a broader academic move towards a transdisciplinary, holistic philosophy of science. Before the Covid pandemic, central topics of national debates were related to inequality, war, climate change, environmental destruction, and extinction. We are nearer to the latter topic of near extinction, going by the current mortality rate. There's no doubt that mankind has invited this pandemic upon itself, majorly, due to pan-global industrial capitalism that is being rapidly modernised, interconnected—and fragile.

Continuity and disparity are the epitomes of two indirectly divergent deep ecology perspectives. Despite the fact that they both talk of human–nature union through ecological selfhood, they take different paths to the same source, with mixed results. According to Naess and Rothenberg (1989), eco-sophical self-realisation is closely related to identification with the atman, described as 'self' in the Bhagawad Gita.

The other point is summed up by John Seed's well-known exclamation (cited in Merchant 2005: 111):

I am rainforest... You destroy me so carelessly, tearing down so many of my trees for a few planks... You cause my thick layer of precious topsoil to wash away, destroying the coral reefs that fringe me... Your screaming machines tear through my trunks, rip my flesh, reducing me to sawdust and furniture.

This verse, through the personification of a rainforest, describes human existence as coinciding with the Earth, driving home the brutal act of denudation by using the first person about something that is usually spoken in the third person. Trees, planks, topsoil, reefs, machines, flesh, sawdust, and furniture are all descriptors that refer to material part of nature. The transformation of a living tree into non-living furniture is described in a very macabre language. In the Bhagavad Gita, Arjuna synchronises with universal dharma by allowing Krishna to direct his chariot of body, mind, and senses, and by enacting his own dharma as warrior. In theory, these two systems of deep ecology and Hindu philosophy seem to be identical.

When Seed says that the rainforest is being destroyed, it does not mean that nature or Gaia as a whole is being destroyed; however, it could be interpreted as a metaphor for that outcome. The debate invokes ideologies such as the death of nature alongside the sacred feminine, and God's Greening (Merchant 1989; Shelldrake 1994; Roszak et al. 1995). As indicated by Seed, the emergence of the "screaming machine" defines a weakening larger Self through the loss or dissolution of many other smaller selves.

According to a post-colonial ecofeminist interpretation of our history, the entire material world in general was meant for the consumption of the white man, the industrial capitalist system who exploited, raped and denuded the weaker countries they dominated. The vibrant ecosystems of the oppressed nations became the "raw materials" for the "machine" that drove modernity, the global west feminised and demonised the global east. This can be compared to the tyranny of the male, the industrialised West of subjugation of the feminine East, replete with her rich cultural heritage and biodiversity.

In 1974, Françoise d' Eaubonne, a feminist from France, coined the word "ecofeminism." Subjugation and inequality of women, people of colour, and the poor, she claims, was inseparably related to environmental degradation, as, both resulted from patriarchal domination. Ecofeminist ideals are incorporated into today's climate change movement by those who consciously campaign for sustainable change for environment and society.

The fundamental tenets of ecofeminism are that oppression of the oppressed communities and oppression of nature are caused by the same thing. Our culture of exploitation culture to be replaced with a caring culture. All forms of oppression are mistaken they're all interconnected. For unbiased reform, it's crucial to understand these links. It becomes imperative to admire the intrinsic value of everything in nature and develop deep respect for the natural, cultivate biocentrism, rather an anthropocentric approach to the natural world. Thus, the aim of ecofeminism is to empower the downtrodden and to restore the health of the planet.

Ecofeminists promote ancient rituals based on the Mother Goddess, the moon, animals, and the female reproductive system in order to honour the bond between women and nature. An evolving patriarchal culture of male gods to whom female deities were subservient dethroned this prehistoric

period, which was focused on goddess worship. The Scientific Revolution of the 17th century further degraded nature by replacing the nurturing earth with the "metaphor of a computer to be regulated and repaired from the outside...The earth is to be ruled by male created and controlled technology, research, and industry" (Merchant 1992, p. 191).

It is during this time that a poem like 'Charan Kanya' warms the inner cockles of the heart when the poet, Jhaverchand Meghani, glorifies the valour of a young girl of the Charan community and also sings about the pristine beauty of the forests of Gir and its presiding residents, its majestic lions. The poet waxes eloquent about the protective, nurturing nature of women towards their cows, calves, towards the weaker sections and how the motherly instinct of a young girl of the 'charan' community comes to the fore and stands its stead in front of danger to the self before a ferocious lion. Without the use of machines, guns, fire or any other weapons the feminine oppressed protects those under her protection and drives away the savage male oppressor. She successfully subjugates him without the use of any violence.

Zaverchand Meghani was born in the Surendranagar district of Gujarat, in the Chotila town. His father, Kalidas, was a police officer who was frequently transferred, so Zaverchand spent the majority of his childhood in Rajkot. Lalchand and Prabhaskar were his two younger siblings. At the age of 24, he married Damyanti, and after her death, he married Chitradevi, at the age of 36. He had nine children. His college friends nicknamed him *Raja Janak* because of his plain and simple lifestyle. His everyday wardrobe consisted of a white long coat, a dhoti that reached far below the knees, and a turban tied around his head. His matriculation was completed in 1912, and his B.A. was completed in 1917. He went to work for Jivanlal Ltd, an aluminium company in Kolkatta, for nearly three years, during which time he travelled to England. He returned to Bagasra in 1921 after leaving this job. In 1922 he married Damyantiben, in Jetpur. From his youth, Zaverchand Meghani was immersed in Gujarati literature. His stay in Kolkatta introduced him to Bengali literature.

Meghani, who referred to himself as "a boy of the Saurashtra mountains," spent nine to ten years collecting and recording oral culture storehouses through folk tales, songs, ballads, and other types of traditional memory. He recorded them in bits and pieces as he came across them in a wide range of linguistic regional inflections, including Sorathi, Kutchi, and dozens of other dialects, all of which were interwoven with his own knowledge of chaste or shisht scholarly Gujarati. He worked as a journalist, publisher, and writer at the same time, writing for the newly founded journal 'Saurashtra' on some days and travelling and collecting folktales on others. His notes were then freely edited, expanded, and rewritten into the final form of the book 'Saurashtra ni Rasdhar'. Details of the setting, the time of the incident, and dialogue were also inserted into the story to give it the feel of an oral narrative in writing (Doshi 220).

His 'Kurbani ni Kathao,' was the first book to be published in book form followed by 'Saurashtra Ni Rasdhar'. In addition, he began translating Bengali works. He was given the title of 'Raashtreya Shaayar' by Mahatma Gandhi at the spur of the moment (National Poet). He also won several literary awards, including the Ranjitram Suvarna Chandrak and the Mahida Parritoshik. More than 100 books were written by him. However, he died of a major heart attack at his Botad home on March 9, 1947, at the age of 50.

Meghani's works are dominated by the term "Shaurya rasa" (valour). His poems are energising, inspiring, and full of courage. Charan Kanya is a masterpiece that prominently features Shaurya Rasa. It tells the story of Heerbai, a 14-year-old girl from Gujarat's Charan tribe. Raw grit is still

a distinguishing characteristic of many Gujarati tribes, including the Charan. They used to live in the Girnar foothills, which were home to ferocious Lions. The Charan community has great poets, they not only respect women but go a step further, and deify their women. Charan history is replete with how the Rajputs, fierce warriors, who could not be daunted by a naked double-edged sword, were weary of a Charan's sharp tongue which could make or break a man. The community worships cows, they protect their cattle, consider them to be family members. Fearless and proudly independent, the Charan's are praised for their bravery.

Meghani was present watching the struggle between the male and female, between the man and the beast, between the oppressor and the oppressed. He was so taken aback that he is said to be speechless. He uses words to paint an image of what he saw. Meghani's words convey emotion, anger, grit, and bravery.

*Lion roars!*

*The King of the Jungle roars! (lines 1-2)*

The structure of the poem is such that it paints a vivid picture of the ferocious fight between the girl and the lion and the unexpected result of the girl driving the beast away. Written in free verse, the poem is replete with repetition and imagery, the poet's ample use of anaphora makes the poem a feast for the mind and soul. This is the reason that the poem is enjoyed and narrated or sung in many a 'Dayra' or social gathering, to this day.

The Lion's ferocity is discussed in the first half of the poem, including his spine-chilling roar, fire flaming eyes, and the fear he instils in the hearts of people and animals alike. He himself was death personified. The "angan" or the courtyard of the house where Heerbai lived is invaded by such a terrifying lion who grabbed one of the tethered calves. Cows and calves have hold a special place in the hearts and minds of Hindus of all communities and creed since the beginning of time. The level of affection and respect is comparable to, if not greater than, that which dog owners have for their pets. Cows are more likely than other species to reciprocate human feelings, not only by providing milk and ghee, but also by providing bulls to tend the farms.

*Roars in the babul tree*

*Roars in the hills*

*Roars in the fields of cannabis*

.....

*Roars in the river cliffs*

*Roar in the gems of the hills.....(lines 10-16)(rough, self translation)*

The lion is free to roam about in the hills and valleys, jungles and babul thickets of the Gir in Gujarat. Even the leaves start trembling at the lion's roar.

*Start trembling!*

...

*Birds tremble at midnight*

*Leaves tremble on trees...(lines 17-18) )(rough, self translation)*

### Eco-feminism in Jhaverchand Meghani's 'Charan Kanya'

While having lions as neighbours isn't exactly a fantasy, it does have a lion-like quality to it. On Heerbai, they certainly did. As a result, when the lion dares to reach her property and scoops up her calf, the young Heerbai, enraged and unfazed, chases the lion with only a stick.

It's no surprise that when Heerbai saw her calf being carried away, she lost her temper. She ran towards the Lion, swinging a stick in her hand, without flinching or hesitation— how dare he strike her calf, how dare he approach her beloved cat. She's not going to let the calf die until she's confident in her own skin. She roars, burns, and leaps in front of the Lion like Durga. The Lion loses his vigour due to her terrifying spirit and courageous determination. He reverses his course and walks forward, leaving the calf behind.

*...Lioness, your brave ran away!*

*Coward, left the battlefield... (lines 24-25) (rough, self translation)*

The poet beautifully, melodiously tells the story of how the weak can overpower the brave and ferocious and chase him away with a mite of a stick and a mighty courage. The resolve of the feminine nature to protect her young calf from becoming the meal of a hungry male beast embodies the tenets of ecofeminism.

The society in general, is a social structure dominated by men, their women are marginalised. The selected poem demonstrates the poet's love for the inherent worth of everything in nature as well as appreciation for the natural environment, demonstrating a biocentrism rather than anthropocentric approach to the natural world. There has always been a plethora of descriptions of nature and her residents. Yet, as a poet, Meghani transforms the mundane into the divine. The corpus of his literary work is made up of ordinary incidents in his personal wanderings in search of folk tales and poetry. He has a remarkable ability to transform the personal into the radical using a subjective tone.

When one examines the numerous protest movements, it is shown that ecofeminists' claim that women have a special relationship with nature is false. Women's interactions with nature and responses to environmental degradation needs to be examined and contextualised within the material reality of gender, caste, and race-based labour, property, and power divisions. Women are both victims and agents of environmental degradation. The loss of indigenous information structures and subsistence strategies, which poor, rural women depend on, reflects the negative class-gender impact of these processes. But, the poem under study refutes all of the above-mentioned claims of ecofeminists. Women do have a special relationship with nature, in fact this poem stands up for the fact that a woman is capable of fighting the fiercest of beasts, she can fight the male dominance, can overturn the patriarchal society upside down on its toes and fight for what is hers, if she decides to do so.

The poem is a supreme ode to women's influence. A poem that needs to be read in order to be felt and lived. It is indeed a poem whose each line screams the doctrines of ecofeminism.

**Abstract:** This article has a motive to derive a new class of differential equations and associated integral equations for some hybrid families of Laguerre–Gould–Hopper-based Sheffer polynomials. We derive recurrence relations, differential equation, integro-differential equation, and integral equation for the Laguerre–Gould–Hopper-based Sheffer polynomials by using the factorization method.

**Keywords:** Laguerre–Gould–Hopper-based Sheffer polynomials; factorization method; generating function; differential equation; integral equation

## 1. Introduction and Preliminaries

The class of Sheffer polynomial sequences is one of the significant classes of the polynomial sequences [1–3]. The Sheffer polynomial sequences emerge in many fields of applied mathematics, mathematical physics, engineering sciences, estimation theory, and various branches of applied sciences. The class of Sheffer sequences is a group of non-abelian type with reference to the umbral calculus.

During recent years, the generalized and multi-variable varieties of the special functions have remained as notable key functions in the development of mathematical physics. The special functions of two variables are the solutions of differential equations which are encountered in many different fields.

By Roman [4], the Sheffer sequence is elaborated by the generating relation

$$\frac{e^{af^{-1}(t)}}{g(f^{-1}(t))} = \sum_{n=0}^{\infty} S_n(a) \frac{t^n}{n!}, \quad (1)$$

$\forall a$  in  $\mathbb{C}$ , where  $f^{-1}(t)$  is the compositional inverse of  $f(t)$  and  $f(t)$  are uniquely determined by two power series.

Let  $f(t)$  be a delta,  $g(t)$  be an invertible series given by

$$f(t) = \sum_{n=0}^{\infty} f_n \frac{t^n}{n!}, f_1 \neq 0, f_0 = 0, \quad (2)$$

and

$$g(t) = \sum_{n=0}^{\infty} g_n \frac{t^n}{n!}, g_0 \neq 0. \quad (3)$$

Then,  $\exists$  a sequence  $s_n(x)$  of polynomials satisfy the orthogonality condition

$$\langle g(t)f(t)^k | s_n(x) \rangle = n! \delta_{n,k}, \forall n, k \geq 0.$$

For ( $g(t) = 1$ ), it is the associated Sheffer sequence and with condition ( $f(t) = t$ ), it becomes the Appell sequence [5].

Some important sequences of polynomials, such as Hermite, Laguerre, Bessel, etc., are the special cases of the Sheffer polynomial sequence. These polynomials are very useful in mathematical physics, and various fields of engineering.

In 2012, Khan et al. [6] presented the 3-variables Laguerre–Gould–Hopper polynomials by the following generating relation

$$J_0(-at^p)e^{(bt+ct^s)} = \sum_{n=0}^{\infty} {}_LH_n^{(p,s)}(a, b, c) \frac{t^n}{n!}, \quad (4)$$

where  $J_0(x)$  is a Bessel–Tricomi function of 0th order.  $J_n(x)$  is  $n$ th order Bessel–Tricomi function, which can be defined by the generating function

$$\exp\left(t - \frac{x}{t}\right) = \sum_{n=0}^{\infty} J_n(x)t^n, \quad (5)$$

for  $t \neq 0$  and  $\forall$  finite  $x$ .

In 2016, Raza et al. [7] presented a new class of Laguerre–Gould–Hopper–Sheffer polynomials (3VLGHSP)  ${}_LH_n^{(p,s)}S_n(a, b, c)$  by using the generating function. The development and properties of hybrid special polynomials [8–10] have been most substantial theme in applied mathematics in last decades. The generating function of Laguerre–Gould–Hopper–Sheffer polynomials (3VLGHSP)  ${}_LH_n^{(p,s)}S_n(a, b, c)$  [7] can be given as follows

$$\frac{1}{g(f^{-1}(t))} \exp\left(b(f^{-1}(t)) + D_a^{-1}(f^{-1}(t))^p + c(f^{-1}(t))^s\right) = \sum_{n=0}^{\infty} {}_LH_n^{(p,s)}S_n(a, b, c) \frac{t^n}{n!}, \quad (6)$$

$J_0(ax)$  is Bessel–Tricomi function of order zero [11].

Since

$$J_n(xt) = \sum_{r=0}^{\infty} \frac{(-1)^r (xt)^n}{r^2!},$$

where  $D_a^{-1}$  denotes the inverse derivative operator  $D_a = \frac{\partial}{\partial a}$  and is defined by

$$D_a^{-1}\{f(a)\} = \int_0^a f(\xi)d\xi.$$

The series representation of Laguerre–Gould–Hopper-based Sheffer polynomials of 3-variables (3VLGHSP)  ${}_LH_n^{(p,s)}S_n(a, b, c)$  is as follows

$${}_LH_n^{(p,s)}S_n(a, b, c) = \sum_{k=0}^n \binom{n}{k} {}_LH_{n-k}^{(p,s)}(a, b, c) S_k. \quad (7)$$

The factorization method [12,13] is used to derive the differential and integro-differential equations for Appell polynomial. Recently, the differential equations are investigated for hybrid forms of Appell polynomials (see, example [14–18]). In 2020, Wani et al. [19] used an idea to derive the differential equations, recurrence relations and integral equations for Laguerre–Gould–Hopper-based Appell and related polynomials by factorization method. We mention here a few preliminaries associated with the factorization technique.

Let  $\{p_n(x)\}_{k=0}^\infty$  be a sequence of polynomials as the degree of  $(p_n(x)) = n (p_n \in \mathbb{N}_0 := 0, 1, 2, 3, \dots)$ . The operators satisfying the following relations

$$\Phi_n^- p_n(x) = p_{n-1}(x), \tag{8}$$

$$\Phi_n^+ p_n(x) = p_{n+1}(x), \tag{9}$$

are known as the derivative operator and multiplicative operators, respectively. Dattoli et al. [20–24] used the monomiality principle and operational rules to derive new classes of hybrid polynomials and their properties.

The differential equation of hybrid polynomials

$$(\Phi_{n+1}^- \Phi_n^+) p_n(x) = p_n(x), \tag{10}$$

can be derived using the  $\Phi_n^-$  and  $\Phi_n^+$  operators. For finding the derivative  $\Phi_n^-$  and multiplicative  $\Phi_n^+$  operator, we use the factorization technique [25] as the Equation (10) holds.

### 2. Recurrence Relation and Differential Equations for Laguerre–Gould–Hopper-Based Sheffer Polynomial (3VLGHSP) ${}_{LH(p,s)}S_n(a, b, c)$

First, we derive the recurrence relation for the Laguerre–Gould–Hopper-based Sheffer polynomial (3VLGHSP)  ${}_{LH(p,s)}S_n(a, b, c)$ .

**Theorem 1.** *The Laguerre–Gould–Hopper–Sheffer polynomials  ${}_{LH(p,s)}S_n(a, b, c)$  satisfy the recurrence relation*

$$\begin{aligned} {}_{LH(p,s)}S_{n+1}(a, b, c) &= \left( (b + \alpha_0) {}_{LH(p,s)}S_n(a, b, c) \right. \\ &+ \sum_{k=1}^n \binom{n}{k} \alpha_k {}_{LH(p,s)}S_{n-k}(a, b, c) \\ &+ \frac{n!}{(n-p+1)!} p D_a^{-1} {}_{LH(p,s)}S_{n-p+1}(a, b, c) \\ &\left. + \frac{n!}{(n-s+1)!} s c {}_{LH(p,s)}S_{n-s+1}(a, b, c) \right) \frac{1}{f'(t)}, \end{aligned} \tag{11}$$

where the coefficients  $\{a_k\}_{k \in \mathbb{N}_0}$  are given by the expansion

$$\frac{g'(t)}{g(t)} = \sum_{k=0}^\infty \frac{a_k}{k!} t^k. \tag{12}$$

**Proof.** Differentiating the each sides of generating relation (6) of Laguerre–Gould–Hopper-based Sheffer polynomials  ${}_{LH(p,s)}S_n(a, b, c)$  (3VLGHSP) with respect to  $t$ , we have

$$\begin{aligned} &\sum_{n=0}^\infty {}_{LH(p,s)}S_{n+1}(a, b, c) \frac{t^n}{n!} \\ &= \frac{1}{g(f^{-1}(t))} \exp\left(D_b^{-1}(f^{-1}(t))^s + a f^{-1}(t)\right) \\ &\quad \times \left( b + p D_a^{-1}\left(f^{-1}(t)\right)^{p-1} c s (f^{-1}(t))^{s-1} + \frac{g'(f^{-1}(t))}{g(f^{-1}(t))} \right) \frac{1}{f'(f^{-1}(t))}. \end{aligned}$$

Using the Equations (6) and (12) in the above equation, and then applying the cauchy product rule in the left-hand side of the resultant equation, we obtain

$$\begin{aligned} \sum_{n=0}^{\infty} {}_{LH^{(p,s)}}S_{n+1}(a, b, c) \frac{t^n}{n!} &= \sum_{n=0}^{\infty} \left( \sum_{k=0}^n \binom{n}{k} \alpha_k {}_{LH^{(p,s)}}S_{n-k}(a, b, c) \right. \\ &+ b {}_{LH^{(p,s)}}S_n(a, b, c) \\ &+ \frac{n!}{(n-p+1)!} p D_a^{-1} {}_{LH^{(p,s)}}S_{n-p+1}(a, b, c) \\ &\left. + \frac{n}{(n-s+1)!} c S_{{LH^{(p,s)}}} S_n(a, b, c) \right) \frac{t^n}{n!} \frac{1}{f'(f^{-1}(t))}. \end{aligned} \quad (13)$$

Now, comparing the coefficients of equal powers of  $t$  on both sides of the above equation and solving the resultant equation for  $t = f^{-1}(t)$ , then we get the Equation (11).  $\square$

Furthermore, we derive the shift operators for Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)  ${}_{LH^{(p,s)}}S_n(a, b, c)$ .

**Theorem 2.** *The Shift operators for the Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)  ${}_{LH^{(p,s)}}S_n(a, b, c)$  are given by*

$${}_a \mathcal{E}_n^- = \frac{1}{n} D_a D_b^{-(p-1)}, \quad (14)$$

$${}_b \mathcal{E}_n^- = \frac{1}{n} D_b, \quad (15)$$

$${}_c \mathcal{E}_n^- = \frac{1}{n} D_c D_b^{-(p-1)}, \quad (16)$$

$$\begin{aligned} {}_a \mathcal{E}_n^+ &= \left( (b + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_a^k D_b^{-k(p-1)} + p D_a^{p-2} D_b^{-(p-1)^2} \right. \\ &\left. + s c D_a^{s-1} D_b^{(1-r)(p-1)} \right) \frac{1}{f'(t)}, \end{aligned} \quad (17)$$

$${}_b \mathcal{E}_n^+ = \left( (b + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^k + p D_a^{-1} D_b^{p-1} + s c D_a^{(s-1)} \right) \frac{1}{f'(t)}, \quad (18)$$

$$\begin{aligned} {}_c \mathcal{E}_n^+ &= \left( (b + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_c^k D_b^{k(s-1)} + p D_a^{-1} D_b^{(p-1)(1-s)} D_c^{p-1} \right. \\ &\left. + s c D_c^{(s-1)} D^{-(s-1)^2} \right) \frac{1}{f'(t)}, \end{aligned} \quad (19)$$

where  $D_a = \frac{\partial}{\partial a}$ ,  $D_b = \frac{\partial}{\partial b}$ ,  $D_c = \frac{\partial}{\partial c}$ , and  $D_x^{-1} = \int_0^x f(\zeta) d\zeta$ .

**Proof.** Differentiating the generating function of (3VLGHSP) with respect to  $b$ , and then equating the coefficients of same powers of  $t$  from both sides, then we get

$$\frac{\partial}{\partial b} \left( {}_{LH^{(p,s)}}S_n(a, b, c) \right) = n {}_{LH^{(p,s)}}S_{n-1}(a, b, c), \quad (20)$$

so that

$$\frac{1}{n} \frac{\partial}{\partial b} \left( {}_{LH^{(p,s)}}S_n(a, b, c) \right) = {}_{LH^{(p,s)}}S_{n-1}(a, b, c). \quad (21)$$

Consequently,

$${}_b \mathcal{E}_n^- \{ {}_{LH^{(p,s)}}S_n(a, b, c) \} = \frac{1}{n} D_b \{ {}_{LH^{(p,s)}}S_n(a, b, c) \} = {}_{LH^{(p,s)}}S_{n-1}(a, b, c), \quad (22)$$

which proves (15).

Next, differentiating the generating relation (6) with respect to  $a$ , and then equating the same powers of  $t$  from both sides, we obtain

$$\frac{\partial}{\partial a} \{ {}_L H^{(p,s)} S_n(a, b, c) \} = \frac{n!}{(n-p)!} \{ {}_L H^{(p,s)} S_{n-p}(a, b, c) \}. \tag{23}$$

From the Equation (20), it may be written as

$$\frac{\partial}{\partial a} \{ {}_L H^{(p,s)} S_n(a, b, c) \} = n \frac{\partial^{p-1}}{\partial b^{p-1}} = n \{ {}_L H^{p,s} S_{n-1}(a, b, c) \}, \tag{24}$$

$$\begin{aligned} {}_a \mathcal{E}_n^- \{ {}_L H^{(p,s)} S_n(a, b, c) \} &= \frac{1}{n} D_a D_b^{-(p-1)} \{ {}_L H^{(p,s)} S_n(a, b, c) \} \\ &= {}_L H^{(p,s)} S_{n-1}(a, b, c). \end{aligned} \tag{25}$$

Consequently,

$${}_a \mathcal{E}_n^- = \frac{1}{n!} D_a D_b^{-(p-1)},$$

which proves (14).

Again differentiating the generating relation (6) with respect to  $c$  and comparing the coefficients of equal powers of  $t$ , we obtain

$$\frac{\partial}{\partial c} \{ {}_L H^{(p,s)} S_n(a, b, c) \} = \frac{n!}{(n-s)!} \{ {}_L H^{(p,s)} S_{n-s}(a, b, c) \}, \tag{26}$$

which, in view of Equation (20), may be written as

$$\frac{\partial}{\partial c} \{ {}_L H^{(p,s)} S_n(a, b, c) \} = n \frac{\partial^{s-1}}{\partial b^{s-1}} = n \{ {}_L H^{(p,s)} S_{n-1}(a, b, c) \}. \tag{27}$$

Consequently,

$${}_c \mathcal{E}_n^- [ {}_L H^{(p,s)} S_n(a, b, c) ] = \frac{1}{n} D_c D_b^{-(s-1)} \{ {}_L H^{(p,s)} S_n(a, b, c) \} = {}_L H^{(p,s)} S_{n-1}(a, b, c), \tag{28}$$

which proves assertion (16).

Next, to find the raising operator for  ${}_b \mathcal{E}_n^+$

$${}_L H^{(p,s)} S_{n-k}(a, b, c) = \left( {}_b \mathcal{E}_{n-k+1}^- {}_b \mathcal{E}_{n-k+2}^- \dots {}_b \mathcal{E}_n^- \right) {}_L H^{(p,s)} S_n(a, b, c),$$

which, on using Equation (22), may be written as

$${}_L H^{(p,s)} S_{n-k}(a, b, c) = \frac{(n-k)!}{n!} D_b^k \{ {}_L H^{(p,s)} S_n(a, b, c) \}, \tag{29}$$

by the use of this equation in recurrence relation in view of the fact that

$${}_b \mathcal{E}_n^+ \{ {}_L H^{(p,s)} S_n(a, b, c) \} = {}_L H^{(p,s)} S_{n+1}(a, b, c),$$

$${}_b \mathcal{E}_n^+ = \left( (b + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^k + p D_a^{-1} D_b^{(p-1)} + s c D_b^{s-1} \right) \frac{1}{f'(t)},$$

which proves (18) equation.

Next, to find the raising operator for  ${}_a \mathcal{E}_n^+$

$${}_L H^{(p,s)} S_{n-k}(a, b, c) = \left( {}_a \mathcal{E}_{n-k+1}^- {}_a \mathcal{E}_{n-k+2}^- \dots {}_a \mathcal{E}_n^- \right) {}_L H^{(p,s)} S_n(a, b, c),$$

which, on using Equation (25), can be presented as

$${}_L H^{(p,s)} S_{n-k}(a, b, c) = \frac{(n-k)!}{n!} D_b^{k-(p-1)} D_a \{ {}_L H^{(p,s)} S_n(a, b, c) \}, \tag{30}$$

by using this equation in recurrence relation in view of the fact that

$${}_a \mathcal{E}_n^+ \{ {}_L H^{(p,s)} S_n(a, b, c) \} = {}_L H^{(p,s)} S_{n+1}(a, b, c).$$

We have

$${}_a \mathcal{E}_n^+ = \left( (b + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_a^k D_b^{-k(p-1)} + p D_a^{p-2} D_b^{-(p-1)^2} + sc D_a^{s-1} D_b^{(1-s)(p-1)} \right) \frac{1}{f'(t)},$$

which proves (17) equation.

Now, finally, the raising operator for  ${}_c \mathcal{E}_n^+$

$${}_L H^{(p,s)} S_{n-k}(a, b, c) = \left( {}_c \mathcal{E}_{n-k+1}^- \dots {}_c \mathcal{E}_{n-k+1}^- \right) {}_L H^{(p,s)} S_{n-k}(a, b, c),$$

which, on using the Equation (28), can be written as

$${}_L H^{p,s} S_{n-k}(a, b, c) = \frac{(n-k)!}{n!} D_c^k D_b^{k(1-s)} \{ {}_L H^{(p,s)} S_n(a, b, c) \}. \tag{31}$$

By using the Equation (31) in recurrence relation in view of the fact that

$${}_c \mathcal{E}_n^+ \{ {}_L H^{p,s} S_n(a, b, c) \} = {}_L H^{(p,s)} S_{n+1}(a, b, c).$$

We find

$${}_c \mathcal{E}_n^+ = \left( (b + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_c^k D_b^{-k(s-1)} + p D_a^{(-1)} D_b^{-(1-s)(p-1)} D_c^{p-1} + sc D_c^{s-1} D_b^{-(1-s)^2} \right) \frac{1}{f'(t)},$$

which proves assertion (19). □

Now, we derive the differential equation for Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)  ${}_L H^{(p,s)} S_n(a, b, c)$ .

**Theorem 3.** *The differential equation for Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)  ${}_L H^{(p,s)} S_n(a, b, c)$  can be given as follows*

$$\left( \{ (b + \alpha_0) D_b + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{k+1} + p D_a^{-1} D_b^p + sc D_b^s \} \frac{1}{f'(t)} - n \right) {}_L H^{(p,s)} S_n(a, b, c) = 0. \tag{32}$$

**Proof.** Now, we use the factorization method to derive the differential equation

$${}_b \mathcal{E}_{n+1}^- {}_a \mathcal{E}_n^+ \{ {}_L H^{(p,s)} S_n(a, b, c) \} = {}_L H^{(p,s)} S_n(a, b, c).$$

Putting the values of the shift operators from Equations (15) and (18) in the left-hand side of the above equation

$$\left( \{(b + \alpha_0)D_b + \sum_{k=1}^n \frac{\alpha_k}{k!} D_a^{k+1} + pD_a^{-1}D_b^p + scD_b^s\} \frac{1}{f'(t)} - n \right) {}_{LH(p,s)}S_n(a, b, c) = 0,$$

which proves (32). Using the relation  $D_b^p = D_a a D_a$  [6], we get

$$\left( \{(b + \alpha_0)D_b + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{k+1} + paD_a + scD_b^s\} \frac{1}{f'(t)} - n \right) {}_{LH(p,s)}S_n(a, b, c) = 0.$$

□

### 3. Integro-Differential Equation for Laguerre–Gould–Hopper-Based Sheffer Polynomial (3VLGHSP)

**Theorem 4.** The integro-differential equations of Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)  ${}_{LH}S_n(a, b, c)$  are given as the follows equations

$$(i) \quad \left( \{(b + \alpha_0)D_a + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{-k(p-1)} D_a^{k+1} + pD_b^{(p-1)^2} D_a^{(m-1)} + scD_b^{-(s-1)(1-p)} D_a^s\} \frac{1}{f'(t)} - (n+1)D_b^{p-1} \right) {}_{LH(p,s)}S_n(a, b, c) = 0. \quad (33)$$

$$(ii) \quad \left( \{(b + \alpha_0)D_c + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{-k(s-1)} D_c^{k+1} + pD_b^{-(1-s)(1-p)} D_a^{-1} D_c^p + scD_b^{-(1-s)^2} D_c^s + sD_b^{-(1-s)^2} D_c^{s-1}\} \frac{1}{f'(t)} - (n+1)D_b^{s-1} \right) {}_{LH(p,s)}S_n(a, b, c) = 0. \quad (34)$$

$$(iii) \quad \left( \{(b + \alpha_0)D_a + \sum_{k=1}^n \frac{\alpha_k}{k!} D_a D_c^k D_b^{-k(s-1)} + pD_b^{-(1-s)(1-p)} D_c^{p-1} + scD_b^{-(1-s)^2} D_c^{s-1} D_a\} \frac{1}{f'(t)} - (n+1)D_b^{p-1} \right) {}_{LH(p,s)}S_n(a, b, c) = 0. \quad (35)$$

$$(iv) \quad \left( \{(b + \alpha_0)D_c + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{-k(p-1)} D_a^k D_c + pD_b^{-(1-p)^2} D_c D_x^{p-2} + scD_b^{-(1-s)(1-p)} D_a^{s-1} + sD_b^{-(1-s)(1-p)} D_a^{s-1} D_c\} \frac{1}{f'(t)} - (n+1)D_b^{s-1} \right) {}_{LH(p,s)}S_n(a, b, c) = 0. \quad (36)$$

**Proof.** By using the factorization method

$$\mathcal{E}_{n+1}^- \mathcal{E}_n^+ \{ {}_{LH(p,s)}S_n(a, b, c) \} = {}_{LH(p,s)}S_n(a, b, c). \quad (37)$$

By using the shift operators expressions (14); (16) and (17); (19) in Equation (37), we find the integro-differential Equations (33) and (34), respectively. By the same process, taking the pair of shift operators (14); (16) and (19), (17) in the relation (37) and we find the integro-differential Equations (35) and (36) respectively. □

**Remark 1.** The partial differential equations for the Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)  ${}_{LH(p,s)}S_n(a, b, c)$  are calculated as the following consequence of Theorem 4.

**Corollary 1.** *By differentiating the Equation (33) integro-differential equation  $n(p - 1)$ -times with respect to  $b$  then we get a partial differential equation of Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)*

$$(i) \quad \left( \{ (b + \alpha_0) D_a D_b^{n(p-1)} + n(p-1) D_b^{np-n-1} D_a + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{n-k(p-1)} D_a^{k+1} + p D_b^{(p-1)(n-p+1)} D_a^{(p-1)} + s c D_b^{(p-1)(n-s+1)} D_a^s \} \frac{1}{f'(t)} - (n+1) D_b^{p-1} \right)_{LH(p,s)} S_n(a, b, c) = 0. \tag{38}$$

*By differentiating Equation (34) integro-differential equation  $n(s - 1)$ -times with respect to  $b$ , then we get a partial differential equation of Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)*

$$(ii) \quad \left( \{ (b + \alpha_0) D_c D_b^{n(s-1)} + n(s-1) D_b^{ns-n-1} D_c + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{(n-k)(s-1)} D_c^{k+1} + p D_a^{-1} D_b^{(s-1)(n-p+1)} D_c^p + s c D_b^{(r-1)(n-s+1)} D_c^s + s D_b^{-(1-s)^2+n(s-1)} D_c^{s-1} \} \frac{1}{f'(t)} - (n+1) D_b^{(s-1)+n(s-1)} \right)_{LH(p,s)} S_n(a, b, c) = 0. \tag{39}$$

*By differentiating Equation (35) integro-differential equation  $n(s - 1)$ -times with respect to  $b$ , then we get a partial differential equation of Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)*

$$(iii) \quad \left( \{ (b + \alpha_0) D_a D_b^{n(s-1)} + n(s-1) D_b^{ns-n-1} D_a + \sum_{k=1}^n \frac{\alpha_k}{k!} D_a D_b^{(n-k)(s-1)} D_c^k + p D_b^{(s-1)(n-p+1)} D_c^{p-1} + s c D_b^{(s-1)(n-s+1)} D_c^{s-1} D_a \} \frac{1}{f'(t)} - (n+1) D_b^{(p-1)+n(s-1)} \right)_{LH(p,s)} S_n(a, b, c) = 0. \tag{40}$$

*By differentiating equation of (36) integro-differential equation  $n(p - 1)$ -times with respect to  $b$ , we get a partial differential equation of Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)*

$$(iv) \quad \left( \{ (b + \alpha_0) D_c D_b^{n(p-1)} + n(p-1) D_b^{np-n-1} D_c + \sum_{k=1}^n \frac{\alpha_k}{k!} D_b^{(n-k)(p-1)} D_a^k D_c + p D_b^{(p-1)(n-p+1)} D_c D_a^{p-2} + s c D_b^{(p-1)(n-s+1)} D_a^{s-1} + s D_b^{(p-1)(n-s+1)} D_a^{s-1} D_c \} \frac{1}{f'(t)} - (n+1) D_b^{n(s-1)+(p-1)} \right)_{LH(p,s)} S_n(a, b, c) = 0. \tag{41}$$

**Proof.** Differentiating the integro-differential Equation (33) by  $n(p - 1)$ -times with respect to  $b$ , then we get a partial differential equation of Laguerre–Gould–Hopper-based Sheffer polynomials and differentiating the Equation (34) by  $n(s - 1)$ -times, with respect to  $b$ ; then, we get a partial differential equation of Laguerre–Gould–Hopper-based Sheffer polynomials. By the same process, the partial differential Equation (40) can be obtained by taking the derivatives of the integro-differential Equation (35)  $n(s - 1)$ -times with respect to  $b$  and Equation (41) can be obtained by taking the derivatives of the integro-differential Equation (36)  $n(p - 1)$ -times with respect to  $b$ .  $\square$

#### 4. Integral Equation of the Laguerre–Gould–Hopper-Based Sheffer Polynomial (3VLGHSP)

Here, we derive the integral equations for the Laguerre–Gould–Hopper-based Sheffer polynomial. The importance of these integral equations of the Laguerre–Gould–Hopper-based Sheffer polynomials may be observed in different engineering sciences.

**Theorem 5.** *Following homogeneous volterra integral equation for the Laguerre–Gould–Hopper-based Sheffer polynomials (3VLGHSP)  ${}_{LH(p,s)}S_n(a, b, c)$  holds true*

$$\begin{aligned}
 \phi(b, c) = & -\frac{\alpha_1}{sc} \left( \mathbb{P}_{s-2} \frac{b^{s-3}}{(s-3)!} + \mathbb{P}_{s-3} \frac{b^{s-4}}{(s-4)!} + \dots + \mathbb{P}_2(b) + \mathbb{P}_1 \right) \\
 & -\frac{\alpha_0}{sc} \left( \mathbb{P}_{s-2} \frac{b^{s-2}}{(s-2)!} + \mathbb{P}_{s-3} \frac{b^{s-3}}{(s-3)!} \right. \\
 & \quad \left. + \dots + \mathbb{P}_2 \frac{a^2}{2!} + \mathbb{P}b + n\mathbb{R}_{n-1} \right) - \frac{1}{sc} \left( \mathbb{P}_{s-2} \frac{b^{s-1}}{(s-1)!} + \mathbb{P}_{s-3} \frac{b^{s-2}}{(s-2)!} \right. \\
 & \quad \left. + \dots + \mathbb{P}_2 \frac{b^3}{2!} \mathbb{P}_1 b^2 + n\mathbb{R}_n - 1b \right) \\
 & + \frac{nf'(t) - paD_a}{sc} \left( \mathbb{P}_{s-2} \frac{b^{s-1}}{(s-1)!} + \mathbb{P}_{s-3} \frac{b^{s-2}}{(s-2)!} \right. \\
 & \quad \left. + \dots + \mathbb{P}_2 \frac{b^3}{3!} + \mathbb{P}_1 \frac{b^2}{2!} + n\mathbb{R}_{n-1}b + \mathbb{R}_n \right) \\
 & - \frac{1}{sc} \int_0^b \left( \alpha_1 \frac{(b-\xi)^{s-3}}{(s-3)!} + (b + \alpha_0) \frac{(b-\xi)^{s-2}}{(s-2)!} \right. \\
 & \quad \left. + (paD_a - nf'(t)) \frac{(b-\xi)^{s-1}}{(s-1)!} \right) \phi(\xi, c) d\xi,
 \end{aligned} \tag{42}$$

where

$$\begin{aligned}
 {}_{LH(p,s)}S_n(0, b, c) &= S_n(b, c) = {}_{H^s}S_n(b, c) = \mathbb{R}_n, \\
 \mathbb{P}_{s-q} &= \prod_{k=0}^{s-q} (n-k) \mathbb{R}_{n-s+(q-1)}, \quad q = s-1, s-2, \dots, 3, 2.
 \end{aligned}$$

**Proof.** Now, we take the differential equation with  $k = 1$ ,

$$\left( [D_b^s + \{b + \alpha_0 + \alpha_1 D_b^2 + paD_a\} \frac{1}{sc}] \frac{1}{f'(t)} - n \frac{1}{sc} \right) {}_{LH(p,s)}S_n(a, b, c) = 0, \tag{43}$$

from the generating function (6) with  $a = 0$

$$\begin{aligned}
 & \frac{1}{g(f^{-1}(t))} \exp(bf^{-1}(t) + D_a^{-1}(f'(t))^p + c(f'(t))^s) \\
 &= \sum_{n=0}^{\infty} {}_{LH(p,s)}S_n(0, b, c) \frac{t^n}{n!} = \sum_{n=0}^{\infty} {}_{H^s}S_n(b, c) \frac{t^n}{n!}.
 \end{aligned}$$

Since, by  $A(t) = \frac{1}{g(f^{-1}(t))}$  ([26], (p. 923)) and expanding the exponential in the left-hand side and then using the cauchy product rule in the left-hand side in the resultant equation, we have the following presentation of  ${}_{H^s}S_n(b, c)$

$${}_{H^s}S_n(b, c) = n! \sum_{k=0}^n \sum_{l=0}^k \frac{S_{n-kl} \gamma^{k-sl}}{(n-k)! l! (k-sl)!} \tag{44}$$

The initial condition obtained

$${}_L H^{(p,s)} S_n(0, b, c) = S_n(b, c) = {}_H^s S_n(b, c) = \mathbb{R}_n,$$

and letting  ${}_H^s S_n(b, c) = \mathbb{R}_n$

$$\begin{aligned} \frac{d}{db} {}_L H^{(p,s)} S_n(0, b, c) &= D_b \{ {}_H^s S_n(b, c) \} = n \mathbb{R}_{n-1}, \\ \frac{d^2}{d^2 b} {}_L H^{(p,s)} S_n(0, b, c) &= D_b^2 \{ {}_H^s S_n(b, c) \} \\ &= n(n-1) \mathbb{R}_{n-2} = \prod_{k=0}^1 (n-k) \mathbb{R}_{n-2} = \mathbb{P}_1. \\ D_b^{s-2} \{ {}_L H^{(p,s)} S_n(0, b, c) \} &= n(n-1)(n-2)\dots(n-s+3) \mathbb{R}_{n-s+2} \\ &= \mathbb{P}_{s-3} = \prod_{k=0}^{s-3} (n-k) \mathbb{R}_{n-s+2}, \\ D_b^{s-1} \{ {}_L H^{(p,s)} S_n(0, b, c) \} &= n(n-1)(n-2)\dots(n-s+1) \mathbb{R}_{n-s+1} \\ &= \mathbb{P}_{s-2} = \prod_{k=0}^{s-2} (n-k) \mathbb{R}_{n-s+1}. \end{aligned} \quad (45)$$

Consider the equation

$$D_b^s \{ {}_L H^{(p,s)} S_n(a, b, c) \} = \phi(b, c). \quad (46)$$

Now, integrate the Equation (46) with the initial conditions

$$\begin{aligned} D_b^{s-1} \{ {}_L H^{(p,s)} S_n(a, b, c) \} &= \int_0^b \phi(\xi, c) d\xi + \mathbb{P}_{s-2} \\ D_b^{s-2} \{ {}_L H^{(p,s)} S_n(a, b, c) \} &= \int_0^a \phi(\xi, c) d^2 \xi + \mathbb{P}_{s-3} \\ D_b^2 \{ {}_L H^{(p,s)} S_n(a, b, c) \} &= \int_0^b \phi(\xi, c) d^2 \xi^{s-2} + \mathbb{P}_{s-2} \frac{b^{s-3}}{(s-3)!} + \mathbb{P}_{s-3} \frac{b^{s-4}}{(s-4)!} \\ &\quad + \dots + \mathbb{P}_2 b + \mathbb{P}_1 \\ D_b \{ {}_L H^{(p,s)} S_n(a, b, c) \} &= \int_0^b \phi(\xi, c) d^2 \xi^{s-1} + \mathbb{P}_{s-2} \frac{b^{s-2}}{(s-2)!} + \mathbb{P}_{s-3} \frac{b^{s-3}}{(s-3)!} \\ &\quad + \dots + \mathbb{P}_1 b + \dots + n \mathbb{R}_{n-1}, \\ {}_L H^{(p,s)} S_n(a, b, c) &= \int_0^b \phi(\xi, c) d^2 \xi^s + \mathbb{P}_{s-2} \frac{b^{s-1}}{(s-1)!} + \mathbb{P}_{s-3} \frac{b^{s-2}}{(s-2)!} \\ &\quad + \dots + \mathbb{P}_1 \frac{b^2}{2!} + n \mathbb{R}_{n-1} x + \mathbb{R}_n, \end{aligned} \quad (47)$$

where

$$\mathbb{P}_{s-q} = \prod_{k=0}^{s-q} (n-k) \mathbb{R}_{n-s+(q-1)}, \quad q = s-1, s-2, \dots, 3, 2. \quad (48)$$

Using the Equation (4) in Equation (43), we get

$$\begin{aligned} \phi(b, c) = & -\frac{(b + \alpha_0)}{sc} \left( \int_0^b \phi(\xi, c) d\xi^{s-1} + \mathbb{P}_{s-2} \frac{b^{s-2}}{(s-2)!} + \mathbb{P}_{s-3} \frac{b^{s-3}}{(s-3)!} \right. \\ & \left. + \dots + \mathbb{P}_2 \frac{b^2}{2!} + \mathbb{P}_1 \frac{b}{1!} + n\mathbb{R}_{n-1} \right) \\ & - \frac{\alpha_1}{sc} \left( \int_0^b \phi(\xi, c) d\xi^{s-2} + \mathbb{P}_{s-2} \frac{b^{s-3}}{(s-3)!} \right. \\ & \left. + \mathbb{P}_{s-3} \frac{b^{s-4}}{(s-4)!} + \dots + \mathbb{P}_2 b + \mathbb{P}_1 \right) \\ & + \frac{(paD_a - nf'(t))}{sc} \left( \int_0^b \phi(\xi, c) d\xi + \mathbb{P}_{s-2} \frac{b^{s-1}}{(s-1)!} + \mathbb{P}_{s-3} \frac{b^{s-2}}{(s-2)!} \right. \\ & \left. + \dots + \mathbb{P}_1 \frac{b^2}{2!} + n\mathbb{R}_{n-1} b + \mathbb{R}_n \right), \end{aligned}$$

which proves assertion (42).  $\square$

## 5. Conclusions

We derived differential equations, shift operators, and integral equations for the Laguerre–Gould–Hopper-based Sheffer polynomial by the factorization method in the present investigation. The development of these types of techniques may be useful in different scientific areas. The Laguerre–Gould–Hopper-based Sheffer polynomial and for their relatives can be taken in further investigations of mathematical and engineering sciences. Specifically, the integral, differential and integro-differential equations are of particular motivation of this paper for the applications purpose in engineering sciences.

**Author Contributions:** All the authors have contributed equally. All authors have read and agreed to the published version of the manuscript.

**Funding:** First author would like to thank the Deanship of Scientific Research, Qassim University, Saudi Arabia for funding publication of this project.

**Institutional Review Board Statement:** Not Applicable.

**Informed Consent Statement:** Not Applicable.

**Data Availability Statement:** Not Applicable.

**Acknowledgments:** Finally, we acknowledge the efforts of Jose Luis-Lopez Bonilla to improve the language of the manuscript. We are highly thankful to the reviewers for their precious comments and suggestions which led to the manuscript in its present form.

**Conflicts of Interest:** The authors declare no conflict of interest.

## CERTAIN INTEGRAL AND DIFFERENTIAL EQUATIONS INVOLVING HYBRID POLYNOMIALS VIA FACTORIZATION METHOD

RAZIYA SABRI, MOHAMMAD SHADAB, TAEKYUN KIM\*, JOSE LUIS LOPEZ-BONILLA AND  
BYUNG MOON KIM\*

ABSTRACT. This article has a motive to derive new classes of differential equations and associated integral equations for some hybrid families of truncated exponential-based Appell polynomials. We derive the recurrence relation, differential equation, integro-differential equation, and integral equation of the truncated exponential based Appell polynomials by using the factorization method. Finally, we also give some illustrative examples.

### 1. INTRODUCTION AND PRELIMINARIES

The class of the Appell polynomial sequence is one of the significant classes of polynomial sequences [1]. In applied mathematics, theoretical physics, approximation theory, and several other mathematical branches. The set of Appell polynomial sequence is closed under the operation of umbral composition of polynomial sequences. The Appell polynomial sequence can be given by the following generating function

$$A(x, t) = A(t)e^{xt} = \sum_{n=0}^{\infty} A_n(x) \frac{t^n}{n!}. \quad (1.1)$$

The power series  $A(t)$  is given by

$$A(t) = A_0 + \frac{t}{1!} + A_1 \frac{t^2}{2!} + A_2 + \dots + \frac{t^n}{n!} + \dots = \sum_{n=0}^{\infty} A_n \frac{t^n}{n!}, \quad (A_0 \neq 0), \quad (1.2)$$

where  $A_i \{i = 1, 2, 3, \dots\}$  are real coefficients. It is easy to see that for any  $A(t)$ , the derivative of  $A(t)$  satisfies

$$A'_n(x) = nA_{n-1}(x). \quad (1.3)$$

Some related numbers are shown in table 1.

TABLE 1. Certain members belonging to the Appell family.

S.No.	name of the polynomials and related numbers	$A(t)$	series definition	Generating functions
1.	Bernouli polynomials and numbers {10}	$\frac{t}{e^t-1}$	$B_n(x) = \sum_{k=0}^n B_k x^{n-k}$	$e^{yt} \left(\frac{t}{e^t-1}\right) = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!}$ $\frac{t}{e^t-1} = \sum_{n=0}^{\infty} B_n \frac{t^n}{n!}$
2.	Euler polynomials and numbers {10}	$\frac{2}{e^t+1}$	$E_n(x) = \sum_{k=0}^n \frac{E_k}{2^k} (x - \frac{1}{2})^{n-k}$	$\left(\frac{2}{e^t+1}\right)e^{yt} = \sum_{n=0}^{\infty} E_n(x) \frac{t^n}{n!}$ $\frac{2e^t}{e^t+1} = \sum_{n=0}^{\infty} E_n(x) \frac{t^n}{n!}$
3.	Genocchi polynomials and numbers {16}	$\frac{2t}{e^t+1}$	$G_n(x) = \sum_{k=0}^n G_k x^{n-k}$	$\left(\frac{2t}{e^t+1}\right)e^{yt} = \sum_{n=0}^{\infty} G_n(x) \frac{t^n}{n!}$ $\frac{2t}{e^t+1} = \sum_{n=0}^{\infty} G_n \frac{t^n}{n!}$

Note. It should be noted that in table 1, the Genocchi polynomials  $G_n(x)$  do not fulfill all requirements of Appell polynomials, for instance, the degree of  $G_n(x)$  is  $n - 1$ , though, the degree of Appell polynomials is  $n$ . Therefore, we may put  $G_n(x)$  in the class of polynomials sequences which are not considered Appell polynomials in the strong sense [2].

A family of truncated polynomials of noteworthy interest is provided by the series [7, p.597(14)]. These polynomials play an important role in the evaluation of the integral involving product of special functions and also appear in a wide variety of physical problems such as optics and quantum mechanics. The special polynomials of two variables are important from the view point of applications. The extension of two variables truncated exponential polynomials is given by series [7, p. 599(31)].

Truncated exponential polynomial  $e_n(x)$  defined by the series

$$e_n(x) = \sum_{k=0}^n \frac{x^k}{k!}. \tag{1.4}$$

Truncated exponential polynomials define by the generating function

$$\frac{e^{xt}}{(1-t)} = \sum_{n=0}^{\infty} e_n(x)t^n. \tag{1.5}$$

Generating function of Appell polynomials

$$A(t)e^{xt} = \sum_{n=0}^{\infty} A_n(x) \frac{t^n}{n!}. \tag{1.6}$$

We consider the 2-variable higher order truncated polynomials (2TEP) are defined by the series [8, p. 174(29)]

$$e_n^r(x, y) = n! \sum_{k=0}^{\frac{n}{r}} \frac{y^k x^{n-rk}}{(n-rk)!}, \tag{1.7}$$

and the generating function of (2VTP)

$$\frac{e^{xt}}{(1-yt^r)} = \sum_{n=0}^{\infty} e_n^r(x, y) \frac{t^n}{n!}. \tag{1.8}$$

**1.1. Truncated exponential based Appell polynomials.** 2-Variable truncated exponential based Appell polynomials (2VTEAP)  $e_n^r A_n(x, y)$  can be defined by the generating function [10]

$$A(t)exp(xt)C_0(-yt^r) = \sum_{n=0}^{\infty} e_n^r A_n(x, y) \frac{t^n}{n!}, \tag{1.9}$$

$$A(t)exp(xt)exp(D_y^{-1}t^r) = \sum_{n=0}^{\infty} e_n^r A_n(x, y) \frac{t^n}{n!}, \tag{1.10}$$

where  $C_0(ax)$  is Tricomi function of order zero [3].

Since  $C_n(xt) = \sum_{r=0}^{\infty} \frac{(-1)^r (xt)^n}{r! 2^r}$ , and where  $D_x^{-1}$  denotes the inverse derivate operator  $D_x = \frac{\partial}{\partial x}$  and is defined by  $D_x^{-1}\{f(x)\} = \int_0^x f(\xi)d\xi$ .

Truncated exponential based Appell polynomials (2VTEAP) can defined in series form as follows

$$e_n^r A_n(x, y) = n! \sum_{k=0}^{\frac{n}{r}} \frac{A_{n-rk} y^k}{(n - rk)!}.$$

In 2002, He and Ricci exploited the idea to derive the differential equations for the Appell polynomials by the factorization method in [14](see also, [16]). Recently, differential equations for mixed type Appell polynomials are derived by many authors [9, 18, 20]. The applications of recurrence relations, differential equations, and other results of these hybrid special polynomials [4, 11, 12, 13] can be observed in different branches of science as well as the solutions of the new emerging problems. This motivates to establish the differential equations for the truncated exponential Appell polynomials by using the factorization method. We retrace some preliminaries related to the factorization method

Let  $\{p_n(x)\}_{k=0}^{\infty}$  be a sequence of polynomials such that  $deg(p_n(x)) = n (p_n \in \mathbb{N}_0 := 0, 1, 2, 3, \dots)$ . These operators satisfying the properties

$$\Phi_n^- p_n(x) = p_{n-1}(x), \tag{1.11}$$

$$\Phi_n^+ p_n(x) = p_{n+1}(x), \tag{1.12}$$

are known as the derivative and multiplicative operators, respectively. Dattoli et. al used the monomiality principle [5, 19] and operational rules in [6] The polynomials sequences  $\{p(x)\}_{n=0}^{\infty}$  satisfying the above equations is then called quasi-monomial.

A property, like as the differential equation.

$$(\Phi_{n+1}^- \Phi_n^+) p_n(x) = p_n(x), \tag{1.13}$$

can be derived using the  $\Phi_n^-$  and  $\Phi_n^+$  operators. For finding the derivative operator  $\Phi_n^-$  and a multiplicative operator  $\Phi_n^+$  as the equation (1.13) holds. Above method used for driving the differential equations via equation(1.13) is known as the factorization method [15].

The article is consolidated as follows. The recurrence relation and the shift operator for the truncated exponential-Appell polynomials are established in section 2. Further, the differential equation, integro-differential equation, and partial differential equation for the family are derived. In section 3, corresponding results for the truncated-Bernoulli polynomials, truncated-Euler polynomials, and truncated-Genocchi polynomials are obtained as an example. The integral equation for the truncated-Appell polynomials and the certain members belonging to this family are derived in the last section.

## 2. RECURRENCE RELATIONS AND DIFFERENTIAL EQUATION

First, we recall the recurrence relation for the truncated exponential based Appell polynomials (2VTEAP)  $e_n^r A_n(x, y)$ .

**Theorem 1.** *The truncated exponential based Appell polynomials (2VTEAP)  $e_n^r A_n(x, y)$  satisfy the recurrence relation:*

$$e_n^r A_{n+1}(x, y) = (x + \alpha_0) e^r A_n(x, y) + \sum_{k=1}^n \binom{n}{k} \alpha_k e^r A_{n-k}(x, y) + \frac{n!}{(n-r+1)!} r D_y^{-1} e^r A_{n-r+1}(x, y), \quad (2.1)$$

where the coefficient  $\{\alpha_k\}_{k \in \mathbb{N}_0}$  are given by the expansion.

$$\frac{A'(t)}{A(t)} = \sum_{k=0}^{\infty} \frac{\alpha_k}{k!} t^k. \quad (2.2)$$

*Proof.* Differentiating both sides of generating function(1.10) of truncated exponential based Appell polynomials (2VTEAP) with respect to t, we have

$$\left( x + r D_y^{-1} t^{r-1} + \frac{A'(t)}{A(t)} \right) A(t) e^{xt + D_y^{-1} t^r} = \sum_{n=0}^{\infty} e_n^r A_{n+1}(x, y) \frac{t^n}{n!}. \quad (2.3)$$

Using the equation (2.2) and (1.10) in the above equation and then applying the cauchy product rule in left side of the resultant equation, it follows that

$$\sum_{n=0}^{\infty} e_n^r A_{n+1}(x, y) \frac{t^n}{n!} = \sum_{n=0}^{\infty} \left( \sum_{k=0}^n \binom{n}{k} \alpha_k e_n^r A_{n-k}(x, y) + x e_n^r A_n(x, y) + \frac{n!}{(n-r+1)!} r D_y^{-1} e_n^r A_{n-r+1}(x, y) \right) \frac{t^n}{n!}. \quad (2.4)$$

Now equating the coefficients of same power of  $t$  on the both sides of the above equation and the simplifying the resultant equation, then we get equation (2.1).  $\square$

Next, we find shift operators for truncated exponential-Appell polynomials.

**Theorem 2.** *The Shift operator for the truncated exponential based Appell polynomials (2VTEAP)  $e_n^r A_n(x, y)$  are given by;*

$${}_x \mathcal{L}_n^- = \frac{1}{n} D_x, \tag{2.5}$$

$${}_y \mathcal{L}_n^- = \frac{1}{n} D_y D_x^{-(r-1)}, \tag{2.6}$$

$${}_x \mathcal{L}_n^+ = (x + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_x^k + r D_y^{-1} D_x^{r-1}, \tag{2.7}$$

$${}_y \mathcal{L}_n^+ = (x + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_y^k D_x^{-k(r-1)} + r D_y^{r-2} D_x^{-(r-1)^2}, \tag{2.8}$$

where  $D_x = \frac{\partial}{\partial x}$ ,  $D_y = \frac{\partial}{\partial y}$ , and  $D_x^{-1} = \int_0^x f(\xi) d\xi$ .

*Proof.* Differentiating the generating function of truncated exponential based Appell polynomials (2VTEAP) with respect to  $x$  and the equating the coefficient of same power of  $t$  from both sides of equation, then we get

$$\frac{\partial}{\partial x} (e_n^r A_n(x, y)) = n e_n^r A_{n-1}(x, y), \tag{2.9}$$

so that

$$\frac{1}{n} \frac{\partial}{\partial x} (e_n^r A_n(x, y)) = e_n^r A_{n-1}(x, y).$$

Consequently, it follows that.

$${}_x \mathcal{L}_n^- [e_n^r A_n(x, y)] = \frac{1}{n} D_x \{e_n^r A_n(x, y)\} = e_n^r A_{n-1}(x, y), \tag{2.10}$$

Which proves (2.5)

Next, differentiating the generating function (1.10) with respect to  $y$  and then equating the same power of  $t$  from the both sides, then we get

$$\frac{\partial}{\partial y} \{e_n^r A_n(x, y)\} = \frac{n!}{(n-r)!} \{e_n^r A_{n-r}(x, y)\}, \tag{2.11}$$

from the equation (2.9), can be written as

$$\frac{\partial}{\partial y} \{e_n^r A_n(x, y)\} = n \frac{\partial^{r-1}}{\partial x^{r-1}} = n e_n^r A_{n-1}(x, y). \tag{2.12}$$

Thus,

$${}_y \mathcal{L}_n^- = \frac{1}{n!} D_y D_x^{-(r-1)}, \tag{2.13}$$

which proves (2.6).

Next, to find the raising operator

$$e_n^r A_{n-k}(x, y) = \left( {}_x \mathcal{L}_{n-k+1}^- {}_x \mathcal{L}_{n-k+2}^- \dots {}_x \mathcal{L}_n^- \right) e_n^r A_n(x, y),$$

**Abstract:** In this study, we investigate differential and integral equations of some hybrid families of truncated exponential-based Sheffer polynomials. We also derive some integro-differential equation and new recurrence relations for the truncated exponential based Sheffer polynomials by using the factorization method. We also discuss some special cases as illustrative examples.

**Keywords:** truncated exponential based Sheffer polynomials; factorization methods; differential equations; integral equations; integro-differential equation

**Mathematics Subject Classification:** 05A15, 33C45, 33E20, 44A45

---

### 1. Introduction and preliminaries

The family of Sheffer polynomial sequences was introduced by I. M. Sheffer. The Sheffer sequence is the one of the main classes of the polynomial sequence [20]. The Sheffer sequence arise in many fields of applied mathematics and other branches of mathematics. With reference to application of umbral composition of polynomial sequence, the set of Sheffer sequences is closed.

In physical problems, the class of 2-variable hybrid polynomials gives importance of its formation as solution of different important differential equations again and again encountered in [14, 15].

The pervasive investigation of Appell and Sheffer sequences along with the structure of modern umbral calculus collected by the Roman [19]. Roman [19] elaborated the following generating function

of Sheffer sequence.

$$\frac{e^{xf^{-1}(t)}}{g(f^{-1}(t))} = \sum_{n=0}^{\infty} S_n(x) \frac{t^n}{n!}, \quad (1.1)$$

for all  $x$  in  $\mathbb{C}$ , wherever  $f^{-1}(t)$  is the inverse function of  $f(t)$  and  $f(t)$  is differently fixed by 2-power series.

Let  $f(t)$  and  $g(t)$  be a delta and an invertible series respectively, are given by

$$f(t) = \sum_{n=0}^{\infty} f_n \frac{t^n}{n!}, f_1 \neq 0, f_0 = 0, \quad (1.2)$$

$$g(t) = \sum_{n=0}^{\infty} g_n \frac{t^n}{n!}, g_0 \neq 0. \quad (1.3)$$

If  $g(t) = 1$ , then the Sheffer sequence is the associated Sheffer sequence and for the Appell sequence  $g(t) = t$  [2]. These polynomials are appeared in number theory, physics, and various other branches of mathematics. The class of the Sheffer sequence has some valuable sequences as Hermite, Bessel, Laguerre polynomials etc. According to the physical applications, the Sheffer sequences are very useful.

By the series [6, p.597 (14)], a noteworthy interest of a group of truncated polynomials is presented. These polynomials [3, 18] come out in a vast variety of physical problems as optics, quantum mechanics problems and furthermore play a job in the assessment of the integral including result of special functions. 2-variables special polynomials are significant according to the applications.

This is the series of truncated exponential polynomials  $e_n(x)$ . [1]

$$e_n(x) = \sum_{k=0}^n \frac{x^k}{k!}. \quad (1.4)$$

This is the first  $(n + 1)$  terms of Maclaurin series for  $e^x$ . In many problems of quantum mechanics and optics, these polynomials appears. In the beginning Dattoli [6] gave the systematic research of these polynomials.

Generally, these polynomials have the properties which may be acquired by definition (1.4). Truncated exponential polynomials can be addressed by the generating function [6, p. 596 (4)],

$$\frac{e^{xt}}{(1-t)} = \sum_{n=0}^{\infty} e_n(x) t^n. \quad (1.5)$$

Now, we see the 2-variable higher order truncated polynomials are specified by the series [7, p. 174 (29)]

$$e_n^{(r)}(x, y) = \sum_{k=0}^{\lfloor \frac{n}{r} \rfloor} \frac{y^k x^{(n-rk)}}{(n-rk)!}, \quad (1.6)$$

the generating function of 2-variable truncated exponential polynomial (2VTP) [7, p.174 (30)]

$$\frac{e^{xt}}{(1-yt^r)} = \sum_{n=0}^{\infty} e_n^{(r)}(x, y) \frac{t^n}{n!}. \quad (1.7)$$

There are the integral representation of truncated exponential

$$e_n^{(r)}(x) = \frac{1}{n!} \int_0^{+\infty} e^{-\xi} (x + \xi)^n d\xi,$$

where

$$n! = \int_0^{\infty} e^{-\xi} \xi^n d\xi.$$

## 2. Truncated exponential based Sheffer polynomials

In 2014, Khan et al. introduced the two variables truncated-exponential-Sheffer polynomials (2VTESP) and derived with the frame of reference of the operational method

$$\frac{\exp(xf^{-1}(t))}{g(f^{-1}(t))(1-y(f^{-1}(t))^r)} = \sum_{n=0}^{\infty} e^{(r)}s_n(x, y) \frac{t^n}{n!}.$$

The generating function of Truncated exponential-Sheffer polynomial (2VTESP)  $e^{(r)}s_n(x, y)$

$$\frac{1}{g(f^{-1}(t))} e^{(xf^{-1}(t))} C_0(-y(f^{-1}(t))^r) = \sum_{n=0}^{\infty} e^{(r)}s_n(x, y) \frac{t^n}{n!}, \quad (2.1)$$

$$\frac{1}{g(f^{-1}(t))} e^{(xf^{-1}(t))} e^{(D_y^{-1}(f^{-1}(t))^r)} = \sum_{n=0}^{\infty} e^{(r)}s_n(x, y) \frac{t^n}{n!}, \quad (2.2)$$

where  $C_0(ax)$  is Tricomi function of order zero [1].

Since  $C_n(x) = \sum_{r=0}^{\infty} \frac{(-1^r)(x)^r}{r!(n+r)!}$ , and where  $D_y^{-1}$  is defined as the inverse derivative operator  $D_y = \frac{\partial}{\partial y}$ , and is specified by  $D_y^{-1}\{f(y)\} = \int_0^y f(\theta)d\theta$ .

The two variables truncated exponential-Sheffer polynomials (2VTESP)  $e^{(r)}s_n(x, y)$  are as stipulated by series

$$e^{(r)}s_n(x, y) = n! \sum_{k=0}^{\lfloor \frac{n}{r} \rfloor} \frac{S_{n-rk} y^k}{(n-rk)!}. \quad (2.3)$$

In 2002, He and Ricci exploited the idea to derive the differential equations by the factorization method for the Appell polynomials in [16] (see also, [17]). Recently, differential equations for confluent type Sheffer polynomials are investigated by many authors [9, 10, 14, 15, 21, 23]. This motivates to investigate the differential equations for the truncated exponential-Sheffer polynomials by apply the factorization technique. We retrace a few initially allied to the factorization technique.

The technique of factorization method is very useful to derive the differential and integro-differential equations of hybrid class of polynomials.

Now, let us suppose that  $\{P_n(x)\}_{k=0}^{\infty}$  be a sequence of polynomials like as the  $\deg(P_n(x)) = n, (n \in \mathbb{N}_0 := 0, 1, 2, 3, \dots)$ . The differential operators  $\mathbf{Q}_n^-$  and  $\mathbf{Q}_n^+$  holding the properties

$$\mathbf{Q}_n^- P_n(x) = P_{n-1}(x), \quad (2.4)$$

$$\mathbf{Q}_n^+ P_n(x) = P_{n+1}(x). \quad (2.5)$$

$\mathbf{Q}_n^-$  known as the derivative operator and  $\mathbf{Q}_n^+$  the multiplicative operator. The principle of monomiality [4, 22] and also related operational rules are applied in [5] to expand new families of cospectral which leads to non-trivial generalized polynomials.

The differential equation for the class of hybrid polynomials

$$(\mathbf{Q}_{n+1}^- \mathbf{Q}_n^+) P_n(x) = P_n(x), \quad (2.6)$$

will be derived by the application of the operators  $\mathbf{Q}_n^-$  and  $\mathbf{Q}_n^+$ . By applying this method for obtaining the differential equation through the Eq (2.6) is called factorization method [8]. The factorization method has the main purpose to present derivative operator  $\mathbf{Q}_n^-$  and multiplicative operator  $\mathbf{Q}_n^+$  as the Eq (2.6) holds.

### 3. Recurrence relation and differential equation

Now, we obtain some recurrence relations for the truncated exponential based Sheffer polynomials (2VTESP)  ${}_{e^r} S_n(x, y)$ .

**Theorem 3.1.** *The following recurrence relation for the truncated exponential-Sheffer polynomials (2VTESP)  ${}_{e^r} S_n(x, y)$  holds true*

$$\begin{aligned} {}_{e^r} S_{n+1}(x, y) = & \left( (x + \alpha_0) {}_{e^r} S_n(x, y) + \sum_{k=1}^n \binom{n}{k} \alpha_k {}_{e^r} S_{n-k}(x, y) \right. \\ & \left. + \frac{n!}{(n-r+1)!} r D_y^{-1} {}_{e^r} S_{n-r+1}(x, y) \right) \frac{1}{f'(t)}, \end{aligned} \quad (3.1)$$

coefficients  $\{\alpha_k\}_{k \in \mathbb{N}_0}$  can be express by

$$\frac{g'(t)}{g(t)} = \sum_{k=0}^{\infty} \frac{\alpha_k}{k!} t^k. \quad (3.2)$$

*Proof.* Differentiate the Eq (2.2) with respect to  $t$ , we have

$$\begin{aligned} \sum_{n=0}^{\infty} {}_{e^r} S_{n+1}(x, y) \frac{t^n}{n!} = & \frac{1}{g(f^{-1}(t))} \exp(D_y^{-1}(f^{-1}(t))^r + x f^{-1}(t)) \\ & \times \left( r D_y^{-1}(f^{-1}(t))^{r-1} + x + \frac{g'(f^{-1}(t))}{g(f^{-1}(t))} \right) \frac{1}{f'(f^{-1}(t))}. \end{aligned} \quad (3.3)$$

Using the Eqs (3.2) and (2.2) in the Eq (3.3), and then in the left hand side we use the Cauchy product rulers follows

$$\sum_{n=0}^{\infty} e^{(r)} S_{n+1}(x, y) \frac{t^n}{n!} = \sum_{n=0}^{\infty} \left( \sum_{k=0}^n \binom{n}{k} \alpha_k e^{r} S_{n-k}(x, y) + x e^{(r)} S_n(x, y) + \frac{n!}{(n-r+1)!} r D_y^{-1} e^{(r)} S_{n-r+1}(x, y) \right) \frac{t^n}{n!} \frac{1}{f'(f^{-1}(t))}.$$

On comparing the coefficients of equal power of  $t$ , on the both sides of the above equation and after that solving the equation with  $t = f^{-1}(t)$ , then we get Eq (3.1).  $\square$

Now, we derive shift operators for truncated exponential-Sheffer polynomial (2VTESP).

**Theorem 3.2.** *The shift operators for the truncated exponential-Sheffer polynomials (2VTESP)  $e^{(r)} S_n(x, y)$  are as follows*

$${}_x \mathfrak{F}_n^- = \frac{1}{n} D_x, \quad (3.4)$$

$${}_y \mathfrak{F}_n^- = \frac{1}{n} D_y D_x^{-(r-1)}, \quad (3.5)$$

$${}_x \mathfrak{F}_n^+ = \left( (x + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_x^k + r D_y^{-1} D_x^{r-1} \right) \frac{1}{f'(t)}, \quad (3.6)$$

$${}_y \mathfrak{F}_n^+ = \left( (x + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_y^k D_x^{-k(r-1)} + r D_y^{r-2} D_x^{-(r-1)^2} \right) \frac{1}{f'(t)}, \quad (3.7)$$

$$\text{where } D_x = \frac{\partial}{\partial x}, D_y = \frac{\partial}{\partial y} \text{ and } D_x^{-1} = \int_0^x f(\xi) d\xi.$$

*Proof.* First, the generating function of truncated exponential-Sheffer polynomials (2VTESP) will be differentiated and then comparing the coefficients of equal powers of  $t$ , we get

$$\frac{\partial}{\partial x} (e^{(r)} S_n(x, y)) = n e^{(r)} S_{n-1}(x, y). \quad (3.8)$$

So that

$$\frac{1}{n} \frac{\partial}{\partial x} (e^{(r)} S_n(x, y)) = e^{(r)} S_{n-1}(x, y).$$

Consequently,

$${}_x \mathfrak{F}_n^- [e^{(r)} S_n(x, y)] = \frac{1}{n} D_x \{e^{(r)} S_n(x, y)\} = e^{(r)} S_{n-1}(x, y), \quad (3.9)$$

which proves (3.4).

Next, differentiate the generating function (2.2) and then comparing the coefficients of equal powers of  $t$ , we get

$$\frac{\partial}{\partial y} \{e^{(r)} s_n(x, y)\} = \frac{n!}{(n-r)!} \{e^{(r)} s_{n-r}(x, y)\}. \quad (3.10)$$

From the Eq (3.8), it can be observed that

$$\frac{\partial}{\partial y} \{e^{(r)} s_n(x, y)\} = n \frac{\partial^{r-1}}{\partial x^{r-1}} e^{(r)} s_{n-1}(x, y).$$

Thus

$${}_y \mathfrak{F}_n^- [e^{(r)} s_n(x, y)] = \frac{1}{n!} D_y D_x^{-(r-1)} \{e^{(r)} s_n(x, y)\} = e^{(r)} s_{n-1}(x, y), \quad (3.11)$$

which proves (3.5).

Next, to obtain the raising operator

$$e^{(r)} s_{n-k}(x, y) = ({}_x \mathfrak{F}_{n-k+1}^- {}_x \mathfrak{F}_{n-k+2}^- \cdots {}_x \mathfrak{F}_n^-) e^{(r)} s_n(x, y),$$

which on using Eq (3.9), gives

$$e^{(r)} s_{n-k}(x, y) = \frac{(n-k)!}{n!} D_x^k e^{(r)} s_n(x, y). \quad (3.12)$$

Now, by using the Eq (3.12) in Eq (3.1)

$${}_x \mathfrak{F}_n^+ \{e^{(r)} s_n(x, y)\} = e^{(r)} s_{n+1}(x, y),$$

can be given by

$${}_x \mathfrak{F}_n^+ = \left( (x + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_x^k + r D_y^{-1} D_x^{(r-1)} \right) \frac{1}{f'(t)},$$

which proves (3.6).

Now, for  ${}_y \mathfrak{F}^+$  obtain the raising operator, considered the relation

$$e^{(r)} s_{n-k}(x, y) = ({}_y \mathfrak{F}_{n-k+1}^- {}_y \mathfrak{F}_{n-k+2}^- \cdots {}_y \mathfrak{F}_{n-k+1}^-) e^{(r)} s_n(x, y),$$

which on using Eq (3.11), gives

$$e^{(r)} s_{n-k}(x, y) = \frac{(n-k)!}{n!} D_y^k D_x^{k(1-r)} \{e^{(r)} s_n(x, y)\}. \quad (3.13)$$

Using above equation in (3.1), we obtain

$${}_y \mathfrak{F}_n^+ \{e^{(r)} s_n(x, y)\} = e^{(r)} s_{n+1}(x, y),$$

$${}_y \mathfrak{F}_n^+ = \left( (x + \alpha_0) + \sum_{k=1}^n \frac{\alpha_k}{k!} D_y^k D_x^{-k(r-2)} + r D_y^{(r-2)} D_x^{-(r-1)^2} \right) \frac{1}{f'(t)},$$

which proves Eq (3.7). □

**Theorem 3.3.** *The differential equation for truncated exponential-Sheffer polynomials (2VTESP)  ${}_{e^{(r)}}s_n(x, y)$  satisfy the following equation*

$$\left( \{(x + \alpha_0)D_x + \sum_{k=1}^n \frac{\alpha_k}{k!} D_x^{k+1} + ryD_x^r\} \frac{1}{f'(t)} - n \right) {}_{e^{(r)}}s_n(x, y) = 0. \quad (3.14)$$

*Proof.* Considering the factorization method for the derivation of differential equation

$${}_x\mathfrak{F}_{n+1}^- {}_y\mathfrak{F}_n^+ \{ {}_{e^{(r)}}s_n(x, y) \} = {}_{e^{(r)}}s_n(x, y),$$

Putting the values of the shift operators from Eqs (3.5) and (3.7), we get

$$\left( \{(x + \alpha_0)D_x + \sum_{k=1}^n \frac{\alpha_k}{k!} D_x^{k+1} + rD_y^{-1} D_x^{(r-1)} D_x\} \frac{1}{f'(t)} - n \right) {}_{e^{(r)}}s_n(x, y) = 0,$$

or

$$\left( \{(x + \alpha_0)D_x + \sum_{k=1}^n \frac{\alpha_k}{k!} D_x^{k+1} + rD_y^{-1} D_x^r\} \frac{1}{f'(t)} - n \right) {}_{e^{(r)}}s_n(x, y) = 0,$$

which proves (3.14). □

#### 4. Integro-differential equation for truncated exponential-Sheffer polynomials

**Theorem 4.1.** *The following integro-differential equation of truncated exponential-Sheffer polynomials holds true*

$$\left( \{(x + \alpha_0)D_x + \sum_{k=1}^n \frac{\alpha_k}{k!} D_y^k D_x D_x^{-k(r-1)} + rD_y^{(r-2)} D_x^{-(r-1)^2+1}\} \frac{1}{f'(t)} - nD_x \right) {}_{e^{(r)}}s_n(x, y) = 0. \quad (4.1)$$

*Proof.* By using the factorization method, and the pair of shift operators  ${}_x\mathfrak{F}_{n+1}^-$  and  ${}_y\mathfrak{F}_n^+$ , we have assertion

$${}_x\mathfrak{F}_{n+1}^- {}_y\mathfrak{F}_n^+ \{ {}_{e^{(r)}}s_n(x, y) \} = {}_{e^{(r)}}s_n(x, y).$$

Putting the value of shift operator in above equation, we get (4.1). □

**Corollary 4.1.** *By differentiating the equation of integro-differential equation  $n$ -times with respect to  $y$ , then we find a partial differential equation of truncated exponential-Sheffer polynomials*

$$\left( \{(x + \alpha_0)D_x D_y^n + \sum_{k=1}^n \frac{\alpha_k}{k!} D_y^{n+k} D_x^{-k(r-1)+1} + rD_y^{(r-2)+n} D_x^{(r-1)^2+1}\} \frac{1}{f'(t)} - nD_x D_y^n \right) {}_{e^{(r)}}s_n(x, y) = 0. \quad (4.2)$$

## 5. Integral equation for truncated exponential based Sheffer polynomials

Integral equations appear in engineering and logical applications. The applications of integral equations can be observed in different directions of scientific fields like quantum physics, water waves diffraction problems etc. [11, 13].

**Theorem 5.1.** *The following homogeneous Volterra integral equation of the truncated exponential-Sheffer polynomials holds true*

$$\begin{aligned} \phi(x) = & -\frac{\alpha_1}{ry} \left( \mathbb{P}_{r-2} \frac{x^{r-3}}{(r-3)!} + \mathbb{P}_{r-3} \frac{x^{r-4}}{(r-4)!} + \dots + \mathbb{P}_2(x) + \mathbb{P}_1 \right) \\ & -\frac{\alpha_0}{ry} \left( \mathbb{P}_{r-2} \frac{x^{r-2}}{(r-2)!} + \mathbb{P}_{r-3} \frac{x^{r-3}}{(r-3)!} + \mathbb{P}_2 \frac{x^2}{2!} + \mathbb{P}x + n\mathbb{R}_{n-1} \right) \\ & -\frac{1}{ry} \left( \mathbb{P}_{r-2} \frac{x^{r-1}}{(r-1)!} + \mathbb{P}_{r-3} \frac{x^{r-2}}{(r-2)!} + \dots + \mathbb{P}_2 \frac{x^3}{2!} + \mathbb{P}x^2 + n\mathbb{R}n - 1x \right) \\ & + \frac{nf'(t)}{ry} \left( \mathbb{P}_{r-2} \frac{x^{r-1}}{(r-1)!} + \mathbb{P}_{r-2} \frac{x^{r-2}}{(r-2)!} + \dots + \mathbb{P}_1 \frac{x^2}{2!} + n\mathbb{R}_{n-1}x + \mathbb{R}_n \right) \\ & -\frac{1}{ry} \int_0^x \left( \alpha_1 \frac{(x-\xi)^{r-3}}{(r-3)!} + (x+\alpha_0) \frac{(x-\xi)^{r-2}}{(r-2)!} - n \frac{(x-\xi)^{r-1}}{(r-1)!} \right) \phi(\xi) d\xi. \end{aligned} \quad (5.1)$$

*Proof.* Consider the differential equation of truncated exponential-Sheffer polynomial for  $k = 1$  in the following form

$$\left( [ryD_x^r + (x + \alpha_0)D_x + \alpha_1 D_x^2] \frac{1}{f'(t)} - n \right] \frac{1}{ry} e^{(r)} s_n(x, y) = 0. \quad (5.2)$$

The generating function (2.2) with  $y = 0$  can be presented

$$\frac{1}{g(f^{-1}(t))} e^{(x f^{-1}(t))} = \sum_{n=0}^{\infty} e^{(r)} s_n(x, 0) \frac{t^n}{n!} = \sum_{n=0}^{\infty} s_n(x) \frac{t^n}{n!}.$$

By using  $A(t) = \frac{1}{g(f^{-1}(t))}$  [12, p.923] with Substituting the series expression of exponential in left hand side and then apply Cauchy product rule, we have

$$s_n(x) = \sum_{k=0}^n \binom{n}{k} s_{n-k} x^k.$$

The initial condition can be obtained as

$$e^{(r)} s_n(x, 0) = s_n(x) = \sum_{k=0}^n \binom{n}{k} s_{n-k} x^k.$$

Letting  $s_n(x) = \mathbb{R}_n$ . Then the derivative of  $s_n(x)$  with respect to  $x$

$$\frac{d}{dx} e^{(r)} s_n(x, 0) = n s_{n-1}(x) = n \sum_{k=0}^{n-1} \binom{n-1}{k} s_{n-1-k} x^k = n \mathbb{R}_{n-1},$$

$$\frac{d^2}{dx^2} {}_{e^{(r)}}s_n(x, 0) = n(n-1)s_{n-2}(x) = \prod_{k=0}^1 (n-k)\mathbb{R}_{n-2} = \mathbb{P}_1.$$

Since  $\mathbb{R}_n = {}_{e^{(r)}}A_n(x) = s_n(x)$ , we have

$$D_x^{r-2} \{ {}_{e^{(r)}}s_n(x, 0) \} = n(n-1)(n-2)\dots(n-r+3)\mathbb{R}_{n-r+2} = \mathbb{P}_{r-3} = \prod_{k=0}^{r-3} (n-k)\mathbb{R}_{n-r+2},$$

$$D_x^{r-1} \{ {}_{e^{(r)}}s_n(x, 0) \} = n(n-1)(n-2)\dots(n-r+1)\mathbb{R}_{n-r+1} = \mathbb{P}_{r-2} = \prod_{k=0}^{r-2} (n-k)\mathbb{R}_{n-r+1}.$$

Consider the equation

$$D_x^r \{ {}_{e^{(r)}}s_n(x, y) \} = \phi(x). \quad (5.3)$$

On integrating the Eq (5.3) with initial conditions, we get

$$D_x^{r-1} \{ {}_{e^{(r)}}s_n(x, y) \} = \int_0^x \phi(\xi) d\xi + \mathbb{P}_{r-2},$$

$$D_x^{r-2} \{ {}_{e^{(r)}}s_n(x, y) \} = \int_0^x \phi(\xi) d^2\xi + \mathbb{P}_{r-3}.$$

$$D_x^2 \{ {}_{e^{(r)}}s_n(x, y) \} = \int_0^x \phi(\xi) d\xi^{r-2} + \mathbb{P}_{r-2} \frac{x^{r-3}}{(r-3)!} + \mathbb{P}_{r-3} \frac{x^{r-4}}{(r-4)!} + \dots + \mathbb{P}_2 x + \mathbb{P}_1,$$

$$D_x \{ {}_{e^{(r)}}s_n(x, y) \} = \int_0^x \phi(\xi) d\xi^{r-1} + \mathbb{P}_{r-2} \frac{x^{r-2}}{(r-2)!} + \mathbb{P}_{r-3} \frac{x^{r-3}}{(r-3)!} + \dots + \mathbb{P}_1 x + \dots + n\mathbb{R}_n - 1,$$

$${}_{e^{(r)}}s_n(x, y) = \int_0^x \phi(\xi) d\xi^r + \mathbb{P}r - 2 \frac{x^{r-1}}{(r-1)!} + \mathbb{P}_{r-3} \frac{x^{r-2}}{(r-2)!} + \dots + \mathbb{P}_1 \frac{x^2}{2!} + n\mathbb{R}_{n-1}x + \mathbb{R}_n, \quad (5.4)$$

where

$$\mathbb{P}_{r-s} = \prod_{k=0}^{r-s} (n-k)\mathbb{R}_{n-r+(s-1)}, \quad s = r-1, r-2, \dots, 3, 2.$$

Using the expression (5.4) in Eq (5.2), we obtain

$$\begin{aligned} \phi(x) = & -\frac{(x + \alpha_0)}{ry} \left( \int_0^x \phi(\xi) d\xi^{r-1} + \mathbb{P}_{r-2} \frac{x^{r-2}}{(r-2)!} + \mathbb{P}_{r-3} \frac{x^{r-3}}{(r-3)!} + \mathbb{P}_2 \frac{x^2}{2!} + \mathbb{P}_1 \frac{x}{1!} + n\mathbb{R}_{n-1} \right) \\ & - \frac{\alpha_1}{ry} \left( \int_0^x \phi(\xi) d\xi^{r-2} + \mathbb{P}_{r-2} \frac{x^{r-3}}{(r-3)!} + \mathbb{P}_{r-3} \frac{x^{r-4}}{(r-4)!} + \dots + \mathbb{P}_2 x + \mathbb{P}_1 \right) \\ & + \frac{nf'(t)}{ry} \left( \int_0^x \phi(\xi) d\xi + \mathbb{P}_{r-2} \frac{x^{r-1}}{(r-1)!} + \mathbb{P}_{r-3} \frac{x^{r-2}}{(r-2)!} + \dots + \mathbb{P}_1 \frac{x^2}{2!} + n\mathbb{R}_{n-1}x + \mathbb{R}_n \right), \end{aligned}$$

which proves assertion (5.1).  $\square$

## 6. Conclusions

We derive differential equation, shift operators, and integral equation for the truncated-exponential based Sheffer polynomials by the factorization method in the present investigation. The development of these type techniques may be useful in different scientific areas. The truncated exponential-Sheffer polynomials (2VTESP) and for their relatives can be taken in further investigations of mathematical and engineering sciences.

## Conflict of interest

The authors declare that there are no conflicts of interest.

## Abstract

In this work, the growth of enviro-friendly and biodegradable  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub>/C<sub>20</sub>H<sub>38</sub>O<sub>11</sub> nanocomposite is reported by means of a real time application to prolong the storage life of Tomato (*Solanum Lycopersicum*). A low temperature technique is used to prepare the  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> nanoparticles to obtain a crystalline nanopowder. XRD confirms the phase formation and crystalline nature of  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> nanoparticles. The surface morphology and elemental analysis of  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub>/C<sub>20</sub>H<sub>38</sub>O<sub>11</sub> nanocomposite is conducted by SEM and EDX. Nanocomposite exhibits excellent antimicrobial activity against *Klebsiella pneumoniae* and *Staphylococcus aureus* bacteria. Tomato fruit samples are coated with two different concentrations of  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub>/C<sub>20</sub>H<sub>38</sub>O<sub>11</sub> nanocomposite with 5% UC1A, UC2A and 3% UC1B, UC2B; and uncoated samples UC1, UC2 are stored at room temperature (25 ± 2 °C) and refrigerator temperature (4 °C) respectively for ascorbic acid (vitamin C) analysis on days 0, 4, 8, 12 and 16. Our study revealed that a 3% concentration of  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub>/C<sub>20</sub>H<sub>38</sub>O<sub>11</sub> nanocomposite material is quite potent in maintaining quality aspects of the tomato fruit with no decline in vitamin C under refrigerated conditions up to the 16th day. FTIR analysis of all samples was done to determine the functional groups present in tomato samples after storage. Atomic absorption spectrometer (AAS) was used to analyse the content of Fe in tomato samples.

## ABSTRACT

Polycrystalline samples of  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  (LBBGMO) ( $x = 0.25, 0.45, \text{ and } 0.65$ ) were prepared via using conventional solid–state reaction method. The preliminary structural studies were carried out by X-ray diffraction at room temperature (RT). Rietveld refinement analysis of diffraction data confirmed that for  $x = 0.25$  and  $0.45$ , the structure was orthorhombic but co-existence of orthorhombic and rhombohedral were observed for  $x = 0.65$ . The average crystallite size calculated from the  $W-H$  plot of all the samples and reported 20.4753 nm, 16.6014 nm, 16.0821 nm for  $x = 0.25, 0.45$  and  $0.65$  respectively. The dielectric constant for all samples had a negative value at low frequency and positive for higher frequency range. The presence of one semicircle in Nyquist plot were observed, which shows the grain effect in all ceramic materials. At all observed temperatures, the frequency dependence of impedance plots has been utilized to characterize the electrical conduction of the sample which demonstrated the NTCR character (Negative Temperature Coefficient of Resistance). The ac conductivity variation with frequency dependence was well fitted according to Jonscher's power law and ac conductivity increases with increasing temperature.

## 1. Introduction

During the past few years, a lot of attention has been likely to searching materials for both negative and positive electronic devices where the Manganese based mixed-valence materials  $\text{La}_{1-x}\text{A}_x\text{MnO}_3$  ( $\text{A} = \text{Ca}, \text{Sr}, \text{Ba}$ ) has been found the interesting magnetic, magneto transport and electrical properties [1–5]. Zener introduced a specific form of charge exchange interactions ( $\text{Mn}^{4+}$ ) and double exchange charge carriers which help to explicate the interaction mechanism between magnetic and transport properties, [6]. Due to the high interaction between the charge, orbital, and lattice degrees of freedom in these perovskites materials, they exist in several phases [7]. As a result, they have a large number of complex phenomena such as Colossal magnetic resistance (CMR), superconductivity, catalytic properties, photo-catalysis, magnetocaloric effect (MCE), and metal-insulator (MI) transition [8–13] and these all phenomena are used for technological applications such as storage devices and spintronics devices [14–16]. Some research work focused on calcium and barium doped lanthanum manganites ( $\text{La}_{0.6}\text{Ca}_{0.2}\text{Ba}_{0.2}\text{MnO}_3$ ) had been done in past few years and they found enhanced magnetic effect of magnetic materials which were used for magnetic cooling or green refrigeration, now it is very dynamic research field because it has more energy-efficient and less environmental impact [17]. Compared to vapor-compression technology, this approach achieves a substantially higher cooling efficiency.

The parent compound of our work is  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  perovskite-based magnetite material. By substitution of divalent cations ( $\text{A} = \text{Ca}^{2+}, \text{Sr}^{2+}$ ) and trivalent cation ( $\text{Ba}^{2+}$  and  $\text{Bi}^{3+}$ ) at  $\text{La}^{3+}$  cation site in manganites it possesses remarkable magnetic and electrical properties compared to those of undoped manganites [18–20]. Despite the fact,  $\text{BiMnO}_3$  has ferromagnetic ordering and  $\text{BaMnO}_3$  has antiferromagnetic ordering [21]. Even though the ionic radii and oxidation states of the  $\text{La}^{3+}$  and  $\text{Bi}^{3+}$  ions and  $\text{Ba}^{2+}$  ions are quite similar, the cause of this difference in magnetic and transport properties is of interest [22]. All these characteristics make this compound extraordinary compared to other manganites perovskites. Perovskite manganite is a family of materials that show colossal magnetoresistance [21,23,24]. Colossal magnetoresistance (CMR) materials have a significant number of technological applications i.e. cathode materials for solid fuel cells, new classes of memory devices and magnetic sensors etc. [25,26]. CMR materials feature a high negative magnetoresistance and a ferromagnetic–paramagnetic transition, as well as a metal-insulator transition. The CMR behavior is usually explained using the double exchange theory [27,28] and additional effect, e.g. the strong electron–phonon interaction [29,30]. Remarkably, multiple prior studies have identified  $\text{Gd}^{3+}$  doped compound as a promising electrolyte material due to its better ionic conductivity than (Yttria stabilized Zirconia-YSZ) YSZ electrolyte and the superior electrical characteristics of  $\text{Gd}^{3+}$  ions [31–33]. Some papers also reported the change of the structural and

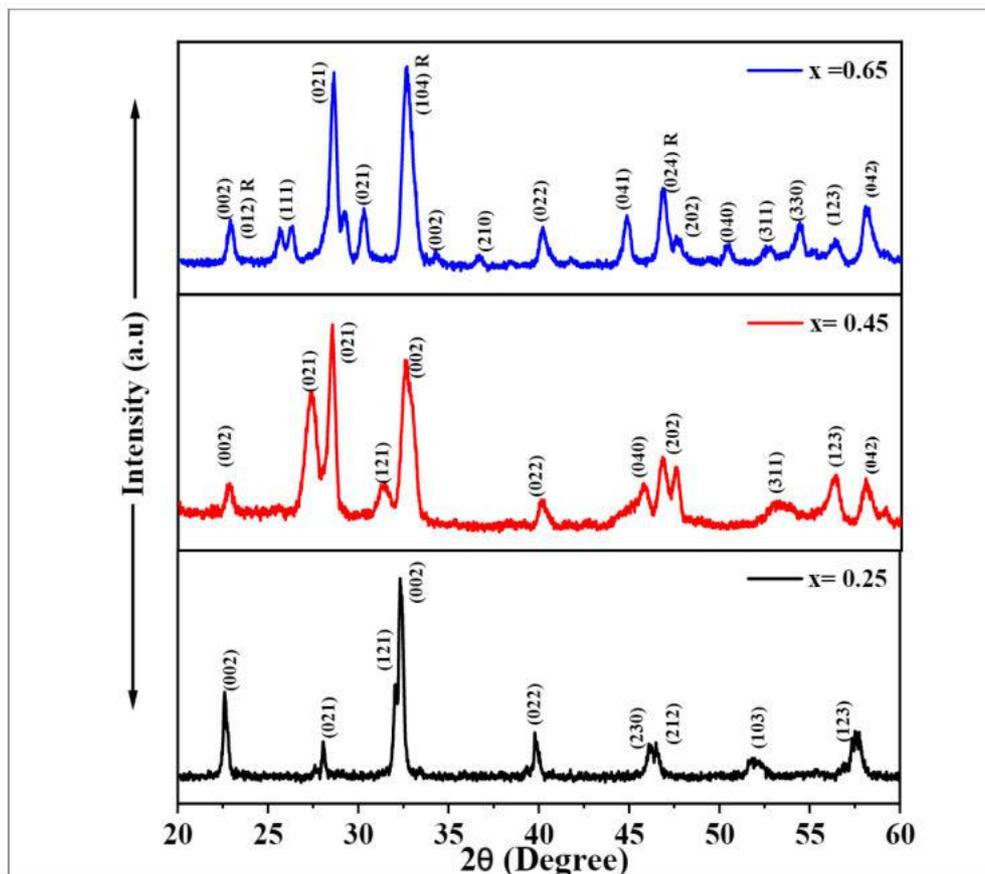

Fig. 1 – XRD pattern for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

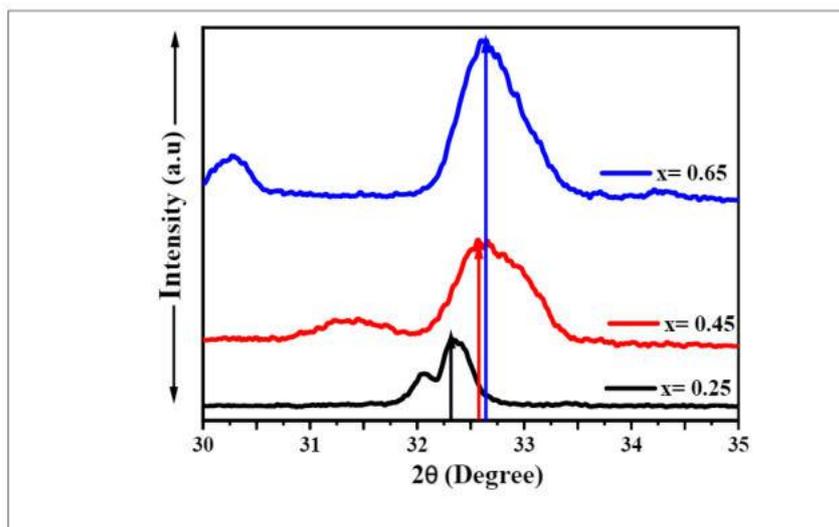

Fig. 2 – XRD Pattern of  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

electrical properties of  $\text{Gd}^{3+}$  ion doped at the Mn site ( $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{MnO}_3$ ) with better electrical characterizations [32,34,35]. With the help of Rietveld analysis and impedance spectroscopy we have studied the effect of  $\text{Gd}^{3+}$  ion doping on the structural and electrical properties of  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics synthesized by the solid-state reaction method.

## 2. Experimental

Polycrystalline samples of  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  (LBBGMO) ( $x = 0.25, 0.45$ , and  $0.65$ ) were prepared via using conventional solid-state reaction method. The starting materials were with proper stoichiometric proportion i.e.,  $\text{La}_2\text{O}_3$

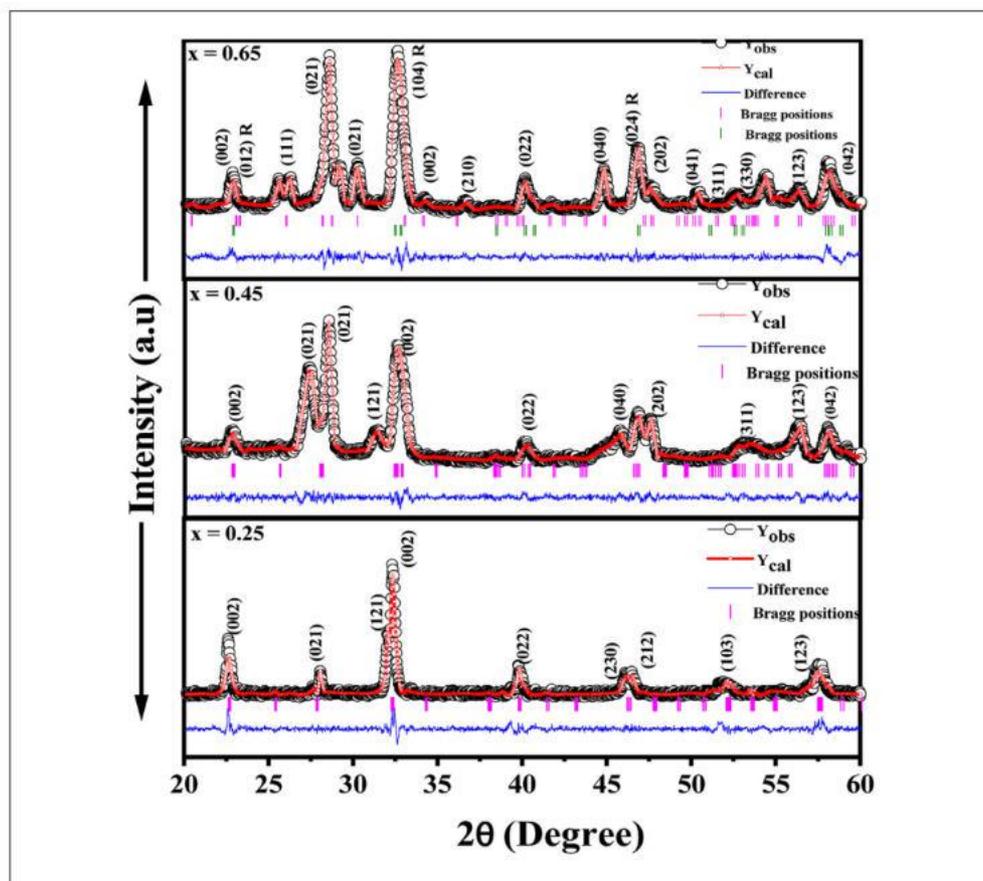

Fig. 3 – Rietveld refinement of XRD pattern of  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

(99.999%), Bi<sub>2</sub>O<sub>3</sub> (99.999%), BaCO<sub>3</sub> (99.999%), Gd<sub>2</sub>O<sub>3</sub> (99.999%), and MnO<sub>2</sub> (99.99%) were taken and mixed in ethanol medium at 6 h and the milled dry powder was calcined at 900 °C for 5 h. After the calcination, the powder was pressed into a disk with 2 wt. % polyvinyl alcohol (PVA as the binder) at 10 MPa pressure using the hydraulic press with 1 mm thickness and 10 mm diameter pellets. After that ceramic pellet were densified by sintering at 1000 °C for 4 h in an alumina crucible in the presence of air. The sintered pellets were polished with different mess size paper for smoothing both surfaces and then again washed in an ultrasonic bath for removing dust/impurities. For removing the mechanical strain (developed during Polishing), the pellets were again for heated at 500 °C for 1 h.

Powder-diffraction experiments was performed on the powder of synthesized ceramics at room temperature by using Panlytical X'pert Pro system equipped with the CuK<sub>α</sub> anode ( $\lambda = 1.5408 \text{ \AA}$ ) from 20°–60° at a scan speed of 2°/min with 0.02 step size. Rietveld analysis of all samples were done by using FullProf Suite software and the phase diagram of the

system was drowned with the help of VESTA software. For the dielectric spectroscopy, we polished pellet surfaces of the sintered samples and make the electrode on both side of the pellet by using silver paste. Impedance Analyzer (IM3570) was used to check the temperature and frequency dependence of impedance for all the samples with heating rate of 0.5 °C min<sup>-1</sup> with three-terminal sample holder at different frequencies (50 Hz–4MHz) and temperature range from RT to 450 °C.

### 3. Result and discussion

#### 3.1. X-ray diffraction analysis

X-ray diffraction pattern of the La<sub>0.665</sub>Bi<sub>0.33</sub>Ba<sub>0.005</sub>Gd<sub>x</sub>Mn<sub>1-x</sub>O<sub>3</sub> (where x = 0.25, 0.45, and 0.65) ceramics were shown in Fig. 1. The XRD data samples were checked using powder XRD at room temperature and it confirms perovskite structure with second phases. Fig. 2 shows that the intensity peak at ~32°

$x = 0.65$	32.96	0.45418	162.074	0.06235

shifted towards the higher angle with increase in the concentration of  $\text{Gd}_2\text{O}_3$  content. All the observed diffraction peaks were well indexed with the orthorhombic with Pbnm space group (JCPDS file #85-2218) and rhombohedral structure with

R3-c space group (JCPDS file #85-2219) [36]. For  $x = 0.25$  and  $0.45$ , the structure was orthorhombic but mixed phase structure were observed for  $x = 0.65$  (both orthorhombic and rhombohedral) and a slight splitting of peaks observed at  $\sim 22^\circ$ ,

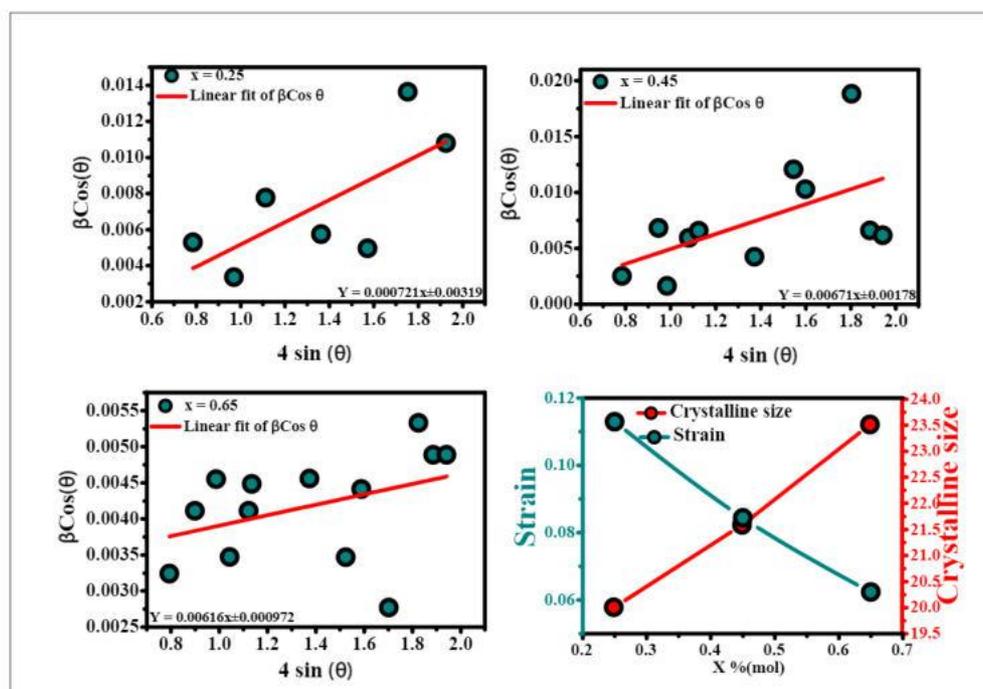

Fig. 5 – (a–c) W–H plots of  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics and (d) variation of strain and crystallite size with composition.

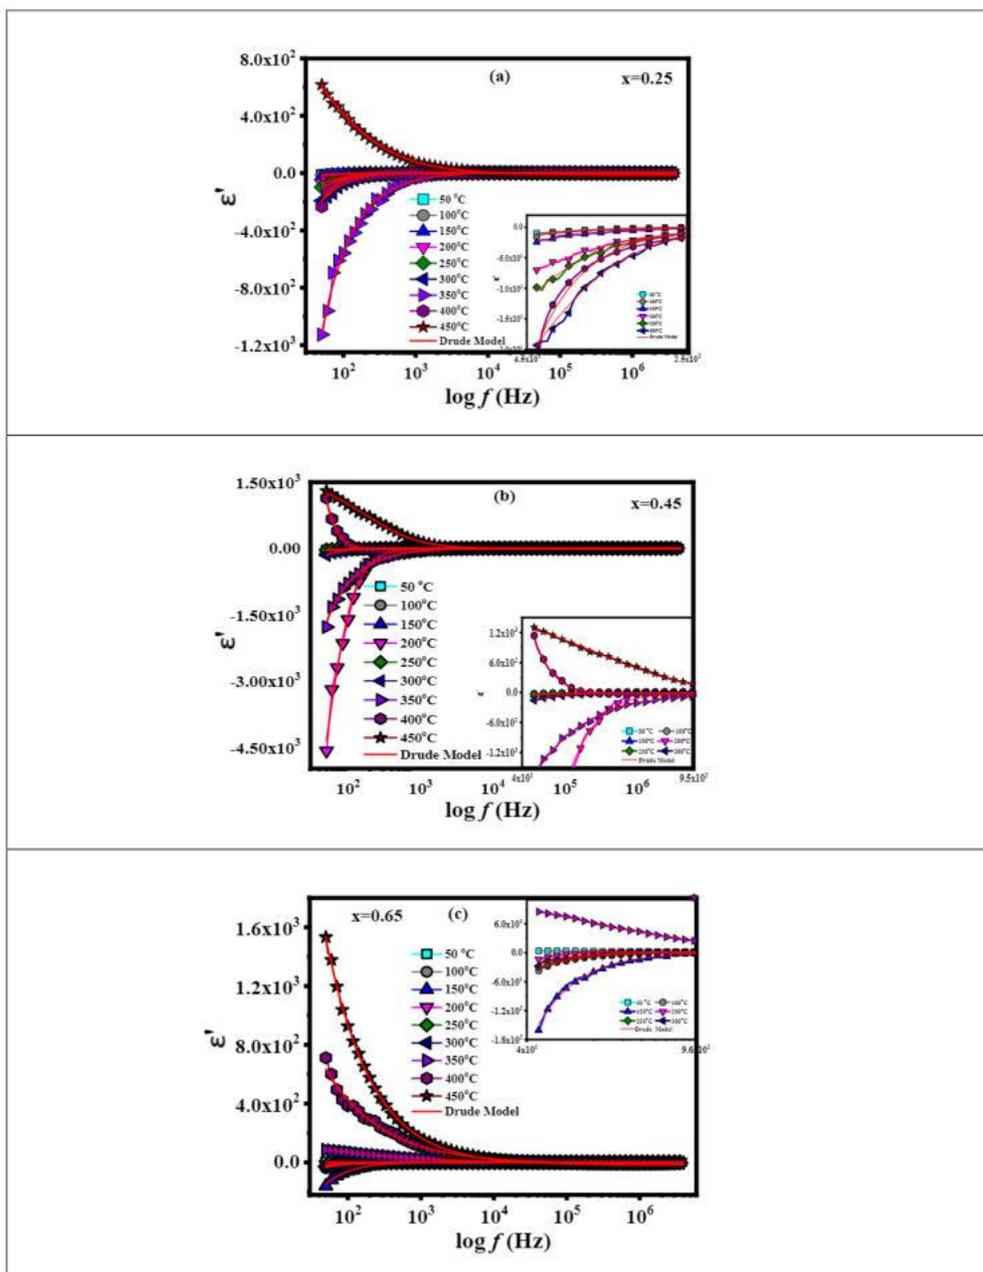

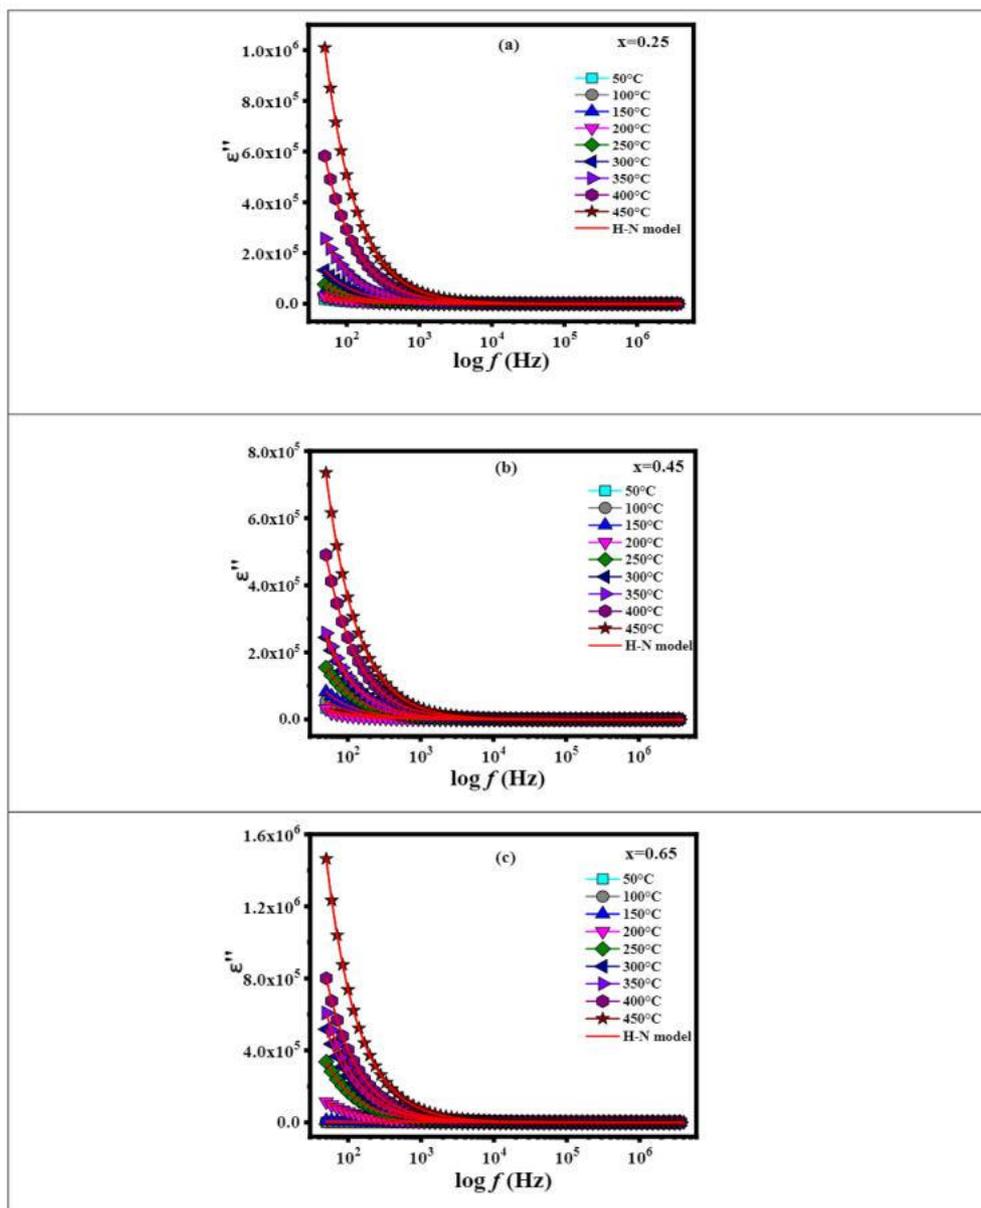

Fig. 6 – (a–c) Real part of dielectric constant vs.  $\log(f)$  for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

$\sim 33^\circ$ ,  $\sim 41^\circ$ ,  $48^\circ$ ,  $\sim 58^\circ$  [37]. In Fig. 3 by using Rietveld refinement the several structural parameters such as lattice parameters (a, b, c), atomic positions (x, y, z), profile residual factor ( $R_p$ ), expected weighted pattern factor ( $R_{\text{exp}}$ ), weighted profile factor ( $R_{\text{wp}}$ ), full width at half maximum intensity (FWHM) parameters (u, v, w), refinement factor ( $R_f$ ), Bragg factor ( $R_{\text{Bragg}}$ ) were refined several times and observed less than 5 goodness of fit (GoF). All these refined parameters of LBBGMO samples were reported in Table 1. Further VESTA software was used to obtain the crystallographic crystal structure (Fig. 4) of LBBGMO ceramics by employing these parameters. The sample with  $x = 0.25, 0.45$  shows the orthorhombic structure with parameters  $a = 5.421 \text{ \AA}$ ,  $b = 7.8498 \text{ \AA}$ ,  $c = 5.5356 \text{ \AA}$ ,  $v = 240.8227 \text{ \AA}$  and  $a = 5.4539 \text{ \AA}$ ,  $b = 7.7958 \text{ \AA}$ ,  $c = 5.5233 \text{ \AA}$  and  $v = 227.8457 \text{ \AA}$

respectively but with increase the doping concentration of  $\text{Gd}_2\text{O}_3$  as  $x = 0.65$  both orthorhombic and rhombohedral structure co-exist and there lattice parameters were  $a = 5.2533 \text{ \AA}$ ,  $b = 7.7026 \text{ \AA}$ ,  $c = 5.5567 \text{ \AA}$  and  $v = 224.8457 \text{ \AA}$  and  $a = b = 5.5121 \text{ \AA}$ ,  $c = 13.3015 \text{ \AA}$  and  $v = 349.9962 \text{ \AA}$  respectively. The volume of the unit cell decreases when the Gd concentration increases and such type of behavior exist due to the presence of higher radius of  $\text{Gd}^{3+}$  ion ( $0.94 \text{ \AA}$ ) compared to that of  $\text{Mn}^{3+}$  ( $0.53 \text{ \AA}$ ) and changes in the tolerance factor [38]. The tolerance factor of  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_{0.75}\text{Mn}_{0.25}\text{O}_3$  were calculated by using ionic radii ( $r_{\text{La}^{3+}} = 1.22 \text{ \AA}$ ,  $r_{\text{Ba}^{2+}} = 1.47 \text{ \AA}$ ,  $r_{\text{Bi}^{3+}} = 1.24 \text{ \AA}$ ,  $r_{\text{Mn}^{4+}} = 0.53 \text{ \AA}$ ,  $r_{\text{Gd}^{3+}} = 0.94 \text{ \AA}$  and  $r_{\text{O}^{2-}} = 1.35 \text{ \AA}$ ) and we found that the tolerance factor for  $x = 0.25, 0.45$  and  $0.65$  decreases as  $0.76, 0.72$ , and  $0.71$  respectively and clearly

**Fig. 7 – (a–c) Imaginary part of dielectric constant vs. log (f) for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.**

confirms that the sample has both orthorhombic and rhombohedra structure. The value of tolerance factor ( $t$ ) of  $\text{La}_{0.665}\text{Bi}_{0.033}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  were indexed in Table 1. The average crystallite size decreases with increasing  $\text{Gd}^{3+}$  concentration which is shown in Table 2. The decreasing size with increasing concentration may be attributed to induced strain caused by difference in ionic radius of  $\text{Gd}^{3+}$  (0.94 Å) and  $\text{Mn}^{3+}$  (0.53 Å). Micro strains and average crystallite size of all the samples were calculated and compared using the Williamson-Hall (W–H) method. In the XRD pattern, it is important to broadening the Bragg peaks to estimate the crystalline size and the lattice strain of the pattern [39,40]. XRD largely depends on the effect of the sample and the equipment and cause to broadening of a particular Bragg peak.

W–H plots for all the compositions ( $x = 0.25, 0.45, 0.65$ ) were shown in Fig. 5(a–c). Preferred Bragg peaks were selected

and plotted for  $\beta_{hkl} \cos \theta$  along Y-axis and  $4 \sin \theta$  along X-axis. As a result, the slope and intercept on the Y-axis of the linearly fitted line were used to determine strain ( $\epsilon$ ) and crystallite size ( $D$ ) [40]. The plots clearly show that the samples have a positive slope, indicating that the samples exhibit positive strain [41].

Further, the average crystallite size ( $D$ ) was calculated by the Debye–Scherrer equation:

$$D = \frac{K\lambda}{\beta \cos \theta} \tag{1}$$

where  $D$  in Eq. (1) represents crystallite size,  $K$  is shape factor usually take value 0.9,  $\lambda$  is wavelength of the source radiation (Cu,  $K\alpha$ ), i.e., 0.15406 nm,  $\beta_{hkl}$  is full width at half maximum (FWHM) of Bragg peaks corresponding  $hkl$  and strain was found by using Eq. (2)

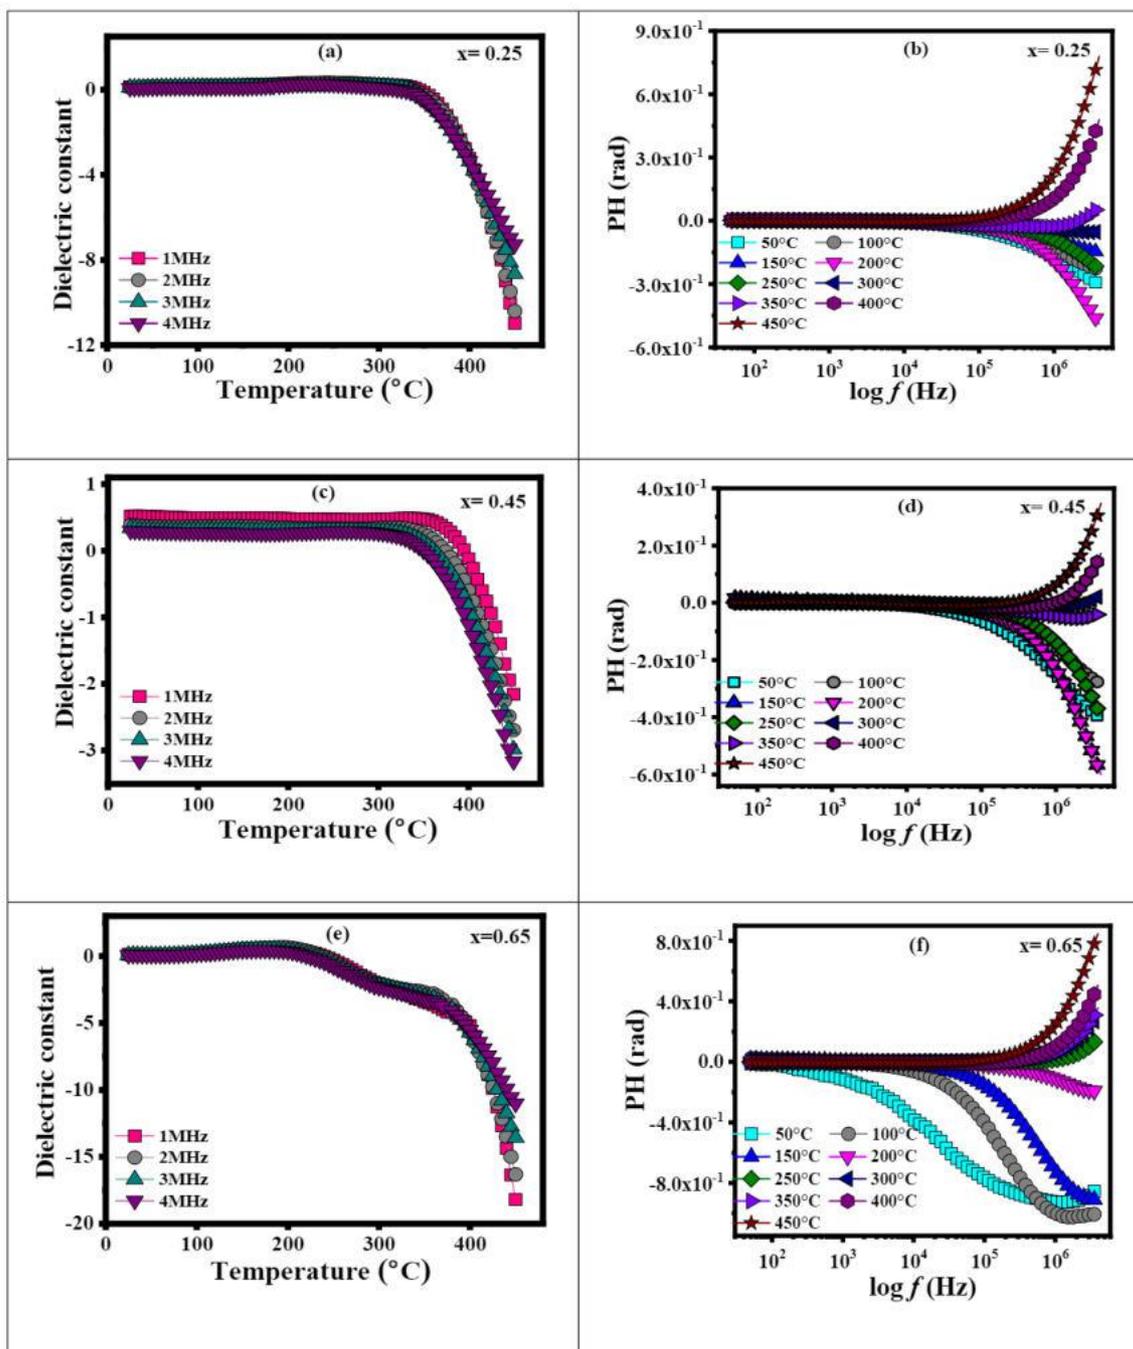

Fig. 8 – (a, c and e) Variation of dielectric constant vs. temperature at observed frequencies and (b, d and f) variation of phase vs.  $\log(f)$  for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

$$\beta_{hkl} \cos \theta = \left( \frac{K\lambda}{D} \right) + 4\epsilon \sin \theta \quad (2)$$

The lattice strain and crystalline size for  $x = 0.25, 0.45$  and  $0.65$  is  $0.1129$  and  $20.0854$  nm, and  $0.0843$  and  $21.5821$  nm and  $0.6235$  and  $23.5091$  nm respectively.

### 3.2. Dielectrics study

The frequency dependent real part of the dielectric permittivity was shown in Fig. 6(a–c) representing the variation of real part of dielectric constant with frequency at different

temperatures. From fig it was clear that at only  $450^\circ\text{C}$  temperature the +ve dielectric value exist in low frequency range. Below  $400^\circ\text{C}$  the dielectric constant has a –ve dielectric at low frequency. It means that samples had a low negative dielectric constant (NDC) at low frequency and positive for higher frequency ( $10^3$ – $10^6$  Hz) range. At low frequencies, the dielectric constant ( $\epsilon'$ ) decreases as the temperature increases, and as the temperature increases even higher, the dielectric constant becomes a negative value at certain temperatures and frequencies. However, at higher temperatures, the dielectric constant ( $\epsilon'$ ) becomes more negative, and the value of negative

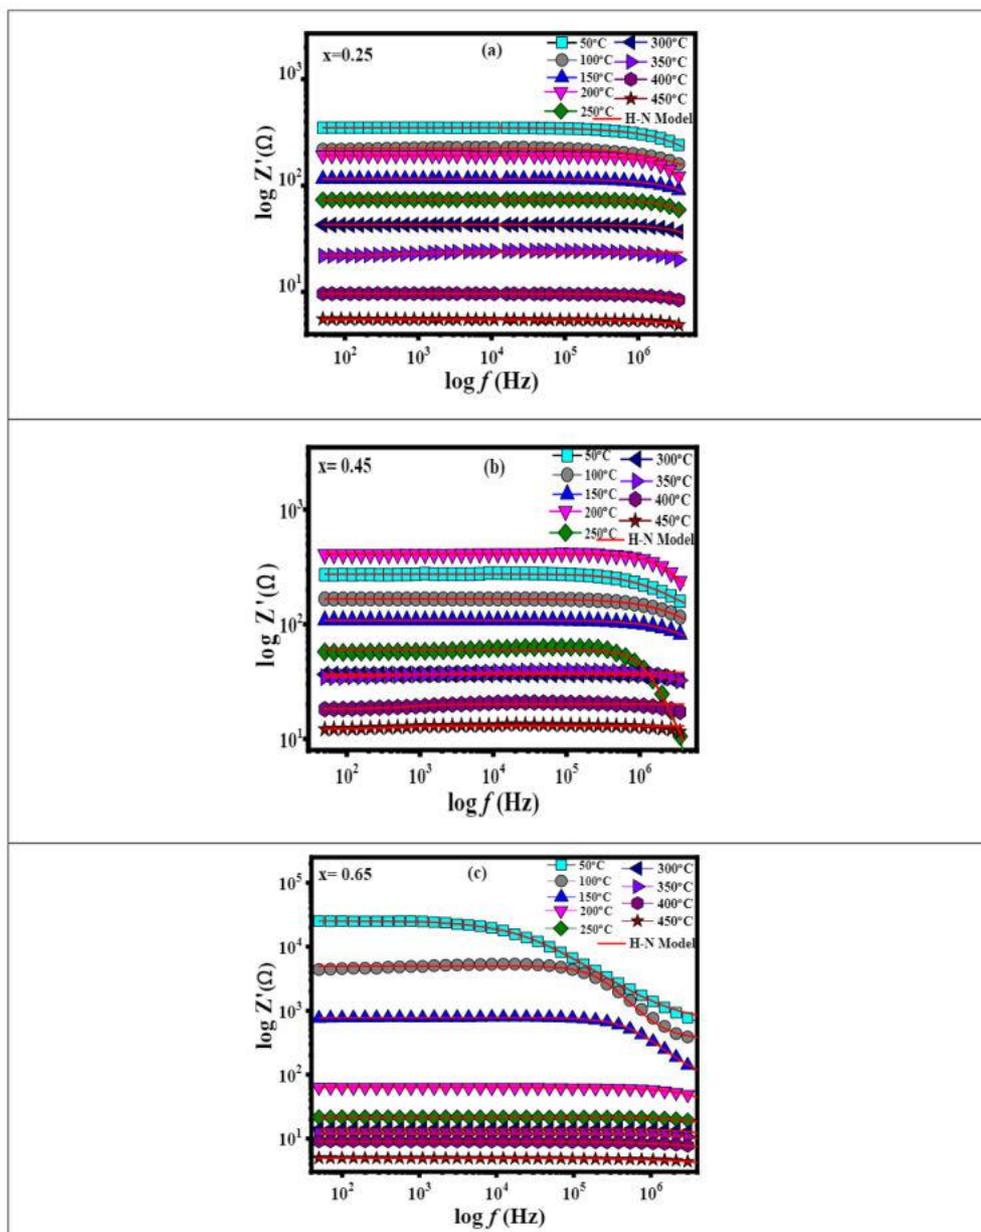

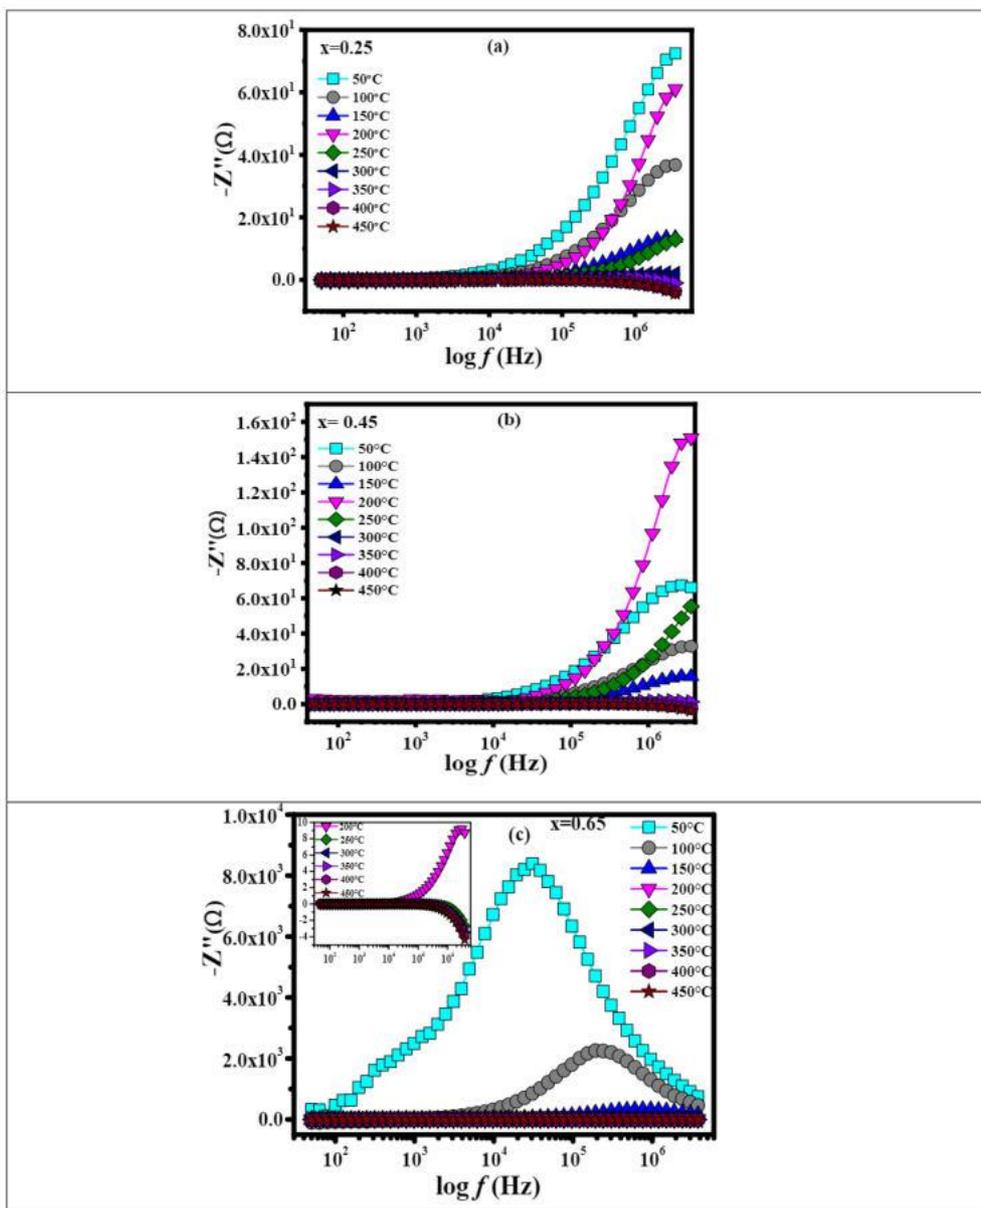

Fig. 9 – (a–c) Real component of impedance vs. log (f) for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

decreases as the frequency increases and the value of dielectric constant becomes positive after 350 °C. Because of large electric charge gathering, the composition's negative dielectric constant in the low frequency domain could be attributable to the gathering of space charge polarization and interfacial polarization effects [42]. According to Drude's classical hypothesis [43], the Negative Dielectric Constant (NDC) might develop if electrons–electrons unite by overcoming their repulsion (i.e. Coulombic force must be attractive) [44]. Coulomb's law describes the force between a system of charges as their product and inversely proportional to the square of the distance between them, as  $F = Kq_1q_2/\epsilon_r r^2$ , where  $\epsilon_r$  is relative permittivity of the medium. The sign of force indicates the nature; positive for repulsive and negative for attractive, If the force between like charges is to be attractive,

the only possibility to have a negative  $\epsilon_r$  value. The direction of the electric field developed in the sample is in the opposite direction of the applied electric field, resulting in a negative value of dielectric constant [45] i.e. the material's polarization is in the opposite direction as the applied electric field. NDC exemplifies polarization that opposes the applied electric field, like diamagnetic materials expelled magnetic field lines or (due to negative polarization) indicating the negative dielectric susceptibility [22]. The NDC can also be called the dielectric property of sample [46]. At low frequencies, the low-frequency plasmon of free electrons in the samples caused a plasma-like negative permittivity behavior. Negative permittivity was observed for Drude-type negative permittivity when the plasma oscillation frequency of delocalized electrons was larger than the frequency of the external electric field [47,48]

**Fig. 10 – (a–c) Imaginary component of impedance vs.  $\log(f)$  for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.**

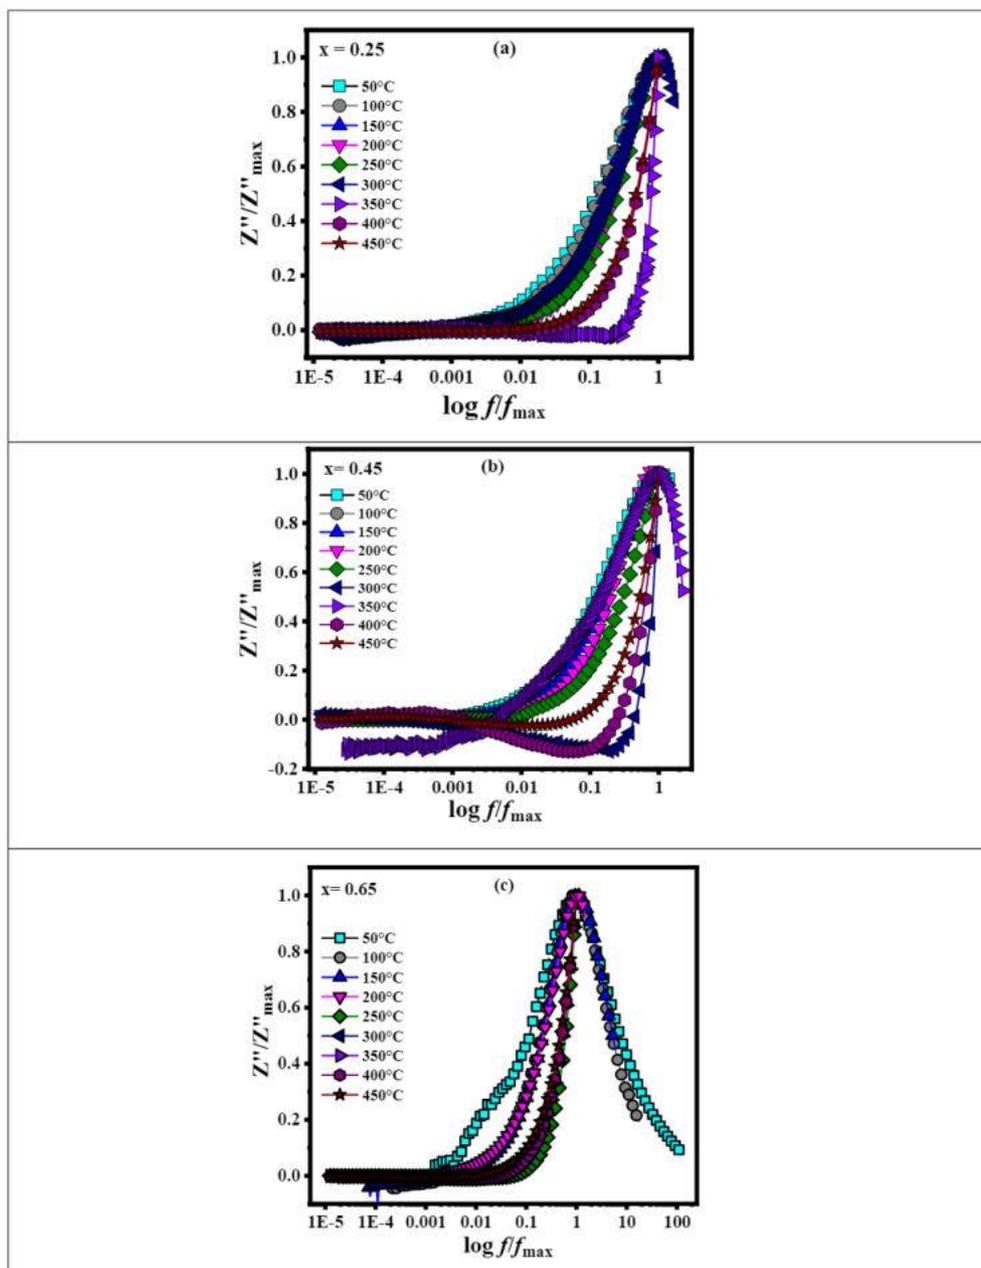

and the NDC decrease with increasing frequency and temperature above 350 °C. The following Drude model certainly explains permittivity's dispersion behavior [49].

$$\epsilon' = \epsilon_{\infty} - \frac{\omega_p^2}{\omega^2 + \Gamma_D^2} \quad (3)$$

$\epsilon_{\infty}$  is permittivity at high frequency limit,  $\omega_p$  is the plasmonic frequency and  $\Gamma_D$  is damping constant. The fitting curve matched with experimental curves of  $\epsilon'$  which indicating that drude model was fit with the samples.

Fig. 7(a–c) showing the variation of imaginary part of dielectric constant ( $\epsilon''$ ) with frequency and at various temperatures. This indicates that imaginary part ( $\epsilon''$ ) increases with increasing temperature and at high frequencies the magnitude was low. Imaginary part was inversely

proportional to frequency. In other words, the larger value of  $\epsilon''$  at lower frequencies and  $\epsilon''$  decreases gradually with increasing frequency and remains constant at higher frequencies and after 1 KHz it stay steady. The estimation of  $\epsilon''$  were larger at lower frequencies is considerably due to the contribution of ionic polarizations, space charge polarizations and interface polarizations. Imaginary part of dielectric constant ( $\epsilon''$ ) remains independent of frequency at higher frequencies; because at higher frequencies electric dipoles are unable to chase the quick change of alternating applied electric field [50]. Because the atomic and electronic polarizations remain unchanged at low frequencies, consequently the complex dielectric dispersion in the lower frequency range was attributed to interfacial polarization only [51].

**Fig. 11 – (a–c) Variation of  $Z''/Z''_{\max}$  vs.  $\log(f/f_{\max})$  for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45,$  and  $0.65$ ) ceramics at different temperatures.**

The imaginary part of the dielectric constant were well associated to conductivity of the material as,  $\sigma_{ac} = \omega\epsilon_0\epsilon''$  [52]. The experimental data were fitted to the Havriliak-Negami (H–N) model. Using this model, the observed dispersion of imaginary part of the dielectric constant can be demonstrated utilizing Eq. (4)

$$\epsilon'' = \epsilon_{\infty} + \frac{(\epsilon_s - \epsilon_{\infty})}{[1 + (i\omega\tau)^{\alpha\beta}]^{\beta}} \quad (4)$$

where  $\epsilon_{\infty}$  is the permittivity at the high frequency limit, where  $\epsilon_s$  is the static, low frequency permittivity, and  $\tau$  is the relaxation time, where  $0 < \alpha < 1$  and  $0 < \beta < 1$ ,  $\alpha$  and  $\beta$  describe the asymmetry and broadness of the spectra and  $\omega$  is the angular frequency.

Fig 8(a, c, e) shows the variation of dielectric constant ( $\epsilon'$ ) with temperature at different observed frequencies. The dielectric constant as a function of temperature is the tool for observing phase transition in the system. All these figures reveals that the dielectric constant was initially constant up to 300–350 °C temperature but after that it decreases with increasing temperature, and all samples shows a negative dielectric constant after a particular temperature at all the frequencies. The electrical character of tested sample may change from capacitive to inductive one. It can be assumed, by resemblance with a diamagnetic material in the magnetic field that the material with negative dielectric constant has dielectric properties i.e. the electric field inside the sample has the opposite direction to the applied external electric field.

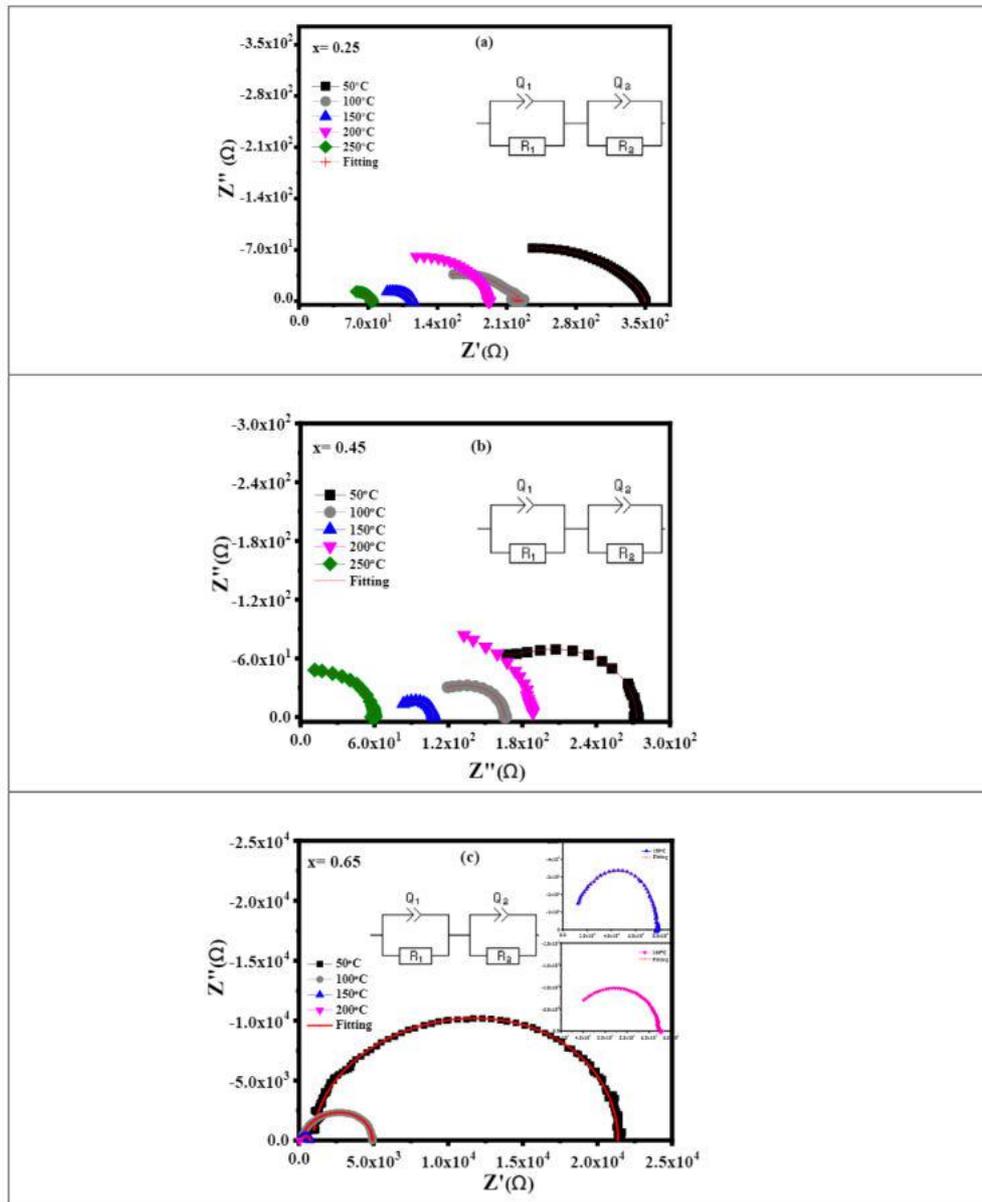

Fig. 12 – (a–c) Cole–cole plot for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics at temperature range  $50^\circ\text{C}$ – $250^\circ\text{C}$ .

Fig. 8(b, d, f) shows the variation of phase angle ( $\theta$ ) with frequency at different temperatures. The material was purely resistive, and the voltage and current were synchronous at  $\theta = 0^\circ$ . In capacitive or inductive materials, current and voltage are usually unsynchronized [53]. The voltage will lead current by  $\theta = 90^\circ$  in an inductive circuit; however, voltage lags current by  $90^\circ$  ( $\theta = -90^\circ$ ) in capacitive circuit. In our samples, the magnitude of  $\theta$  value less than  $10^1\text{ Hz}$ – $10^5\text{ Hz}$  region was not larger but phase angle below  $10^5$ – $10^6\text{ Hz}$  region shift from negative to positive value. Phase angle ( $\theta$ ) shifted from negative to positive with increasing temperature, indicate the occurrence of capacitive–inductive transition. From Fig. 8(b, d, f) it was clearly observed that the negative values of phase angle ( $\theta$ ) at temperature range  $50$ – $300^\circ\text{C}$  for  $x = 0.25$ , which indicating capacitive character and above this temperature phase angle had positive value which indicate the inductive

character of materials. Whereas with the increasing compositions capacitive–inductive transition happened at low temperatures. It was observed that Phase angle value of sample switched from negative to positive at  $\sim 350^\circ\text{C}$ ,  $300^\circ\text{C}$  and  $250^\circ\text{C}$  for compositions  $x = 0.25, 0.45$  and  $0.65$  respectively, in other words phase shifting occurs at above mentioned temperatures.

Fig. 9(a–c) shows the variation of real component of impedance ( $Z'$ ) with frequency at different temperatures for  $\text{La}_{0.665}\text{Bi}_{0.033}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$ , and  $0.65$ ) ceramics. The higher impedance values were observed at the lower frequency range. As we investigated impedance in higher frequency range with increasing temperature, the real component of impedance was observed decreases. This phenomenon is associated with increases in charge carrier mobility and a decrease in trapped charge density. The same

**Table 3 – The fitted parameters from Cole–Cole plots for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics in the range  $50\text{ }^\circ\text{C}$ – $250\text{ }^\circ\text{C}$ .**

phenomena of real part of impedance were observed in other polycrystalline samples also at lower frequencies [54]. A merging of  $Z'$  curves for different temperature was observed at high frequencies, indicating that space charge polarization is existent at high frequency range [55]. With increasing temperature, the magnitude of  $Z'$  decreases and merges at high frequencies, resulting in a constant value. This reduction reveals the semiconductor behavior of the compound [56].

The variation in the imaginary component of impedance with frequency at different temperatures shown in Fig. 10(a–c). The observed asymmetric peak clearly indicates that at increasing higher temperatures peak shifted towards the lower side. This phenomenon shows that the material possesses temperature dependent relaxations. The asymmetric peak is caused by the spread of relaxation time as temperature increases. The relaxation time decreases as the temperature increases; at lower frequencies, relaxation was caused by the presence of immobile charge carriers; at higher frequencies, relaxation was caused by charge carrier hopping or variation in local polar domains [57–59]. As the temperature increases,  $Z''$  shifts towards the higher frequencies side, because the materials exhibit an electrical relaxation phenomenon [60]. The center of the observed peak does not lie at the same frequency; which shows non-Debye type relaxation presence in all ceramic materials [61].

Fig. 11(a–c) shows the normalized plot of  $Z''/Z''_{\text{max}}$  vs.  $\log(f/f_{\text{max}})$  at various temperatures. All the curves at different temperatures were found to overlap with the same master curve. The overlapping of curves shows that the relaxation dynamics almost stay unchanged with the measurement temperature or dynamical processes shows temperature independent behavior. The curves shows the presence of non-Debye type of relaxation phenomenon [62,63].

In general, for the electrode/ceramic/electrode, the values of resistance  $R$  and capacitance  $C$  can be analyzed by an equivalent circuit of one parallel resistance–capacitance (RC) element. The complex impedance spectrum (Nyquist plot) i.e., variation of real and imaginary part of impedance, observed at different temperatures, were shown in Fig. 12(a–c). By impedance spectroscopy we analyzed the presence of the semicircular arcs, whose development pattern changes with

rise in temperature. The effect of temperature on impedance behavior is more important because as temperature increase, the symmetrical nature of the arcs increases and the arcs move towards the origin of the complex simple plot in the center of the arcs. The high frequency semicircle was due to the bulk property of the material and low frequency semicircle was due to the grain boundary effect. The decreasing value of grain boundary resistance with increasing temperature, indicates the Negative Temperature Coefficient Resistance (NTCR) which reveals a normal semiconductor behavior of the materials [64]. Fig. 12(a–c) shows the variation of real and imaginary part of impedance, measured at different temperatures ( $50\text{ }^\circ\text{C}$ – $2500\text{ }^\circ\text{C}$ ). It can clearly show that the semicircular arc is not obtained in higher frequency may be due to the grain melt during sintering and the lower frequency semicircles may corresponds to the grain boundary effect. The effect of temperature on impedance behavior is more important because semicircular nature of the arcs decreases as temperature increases.

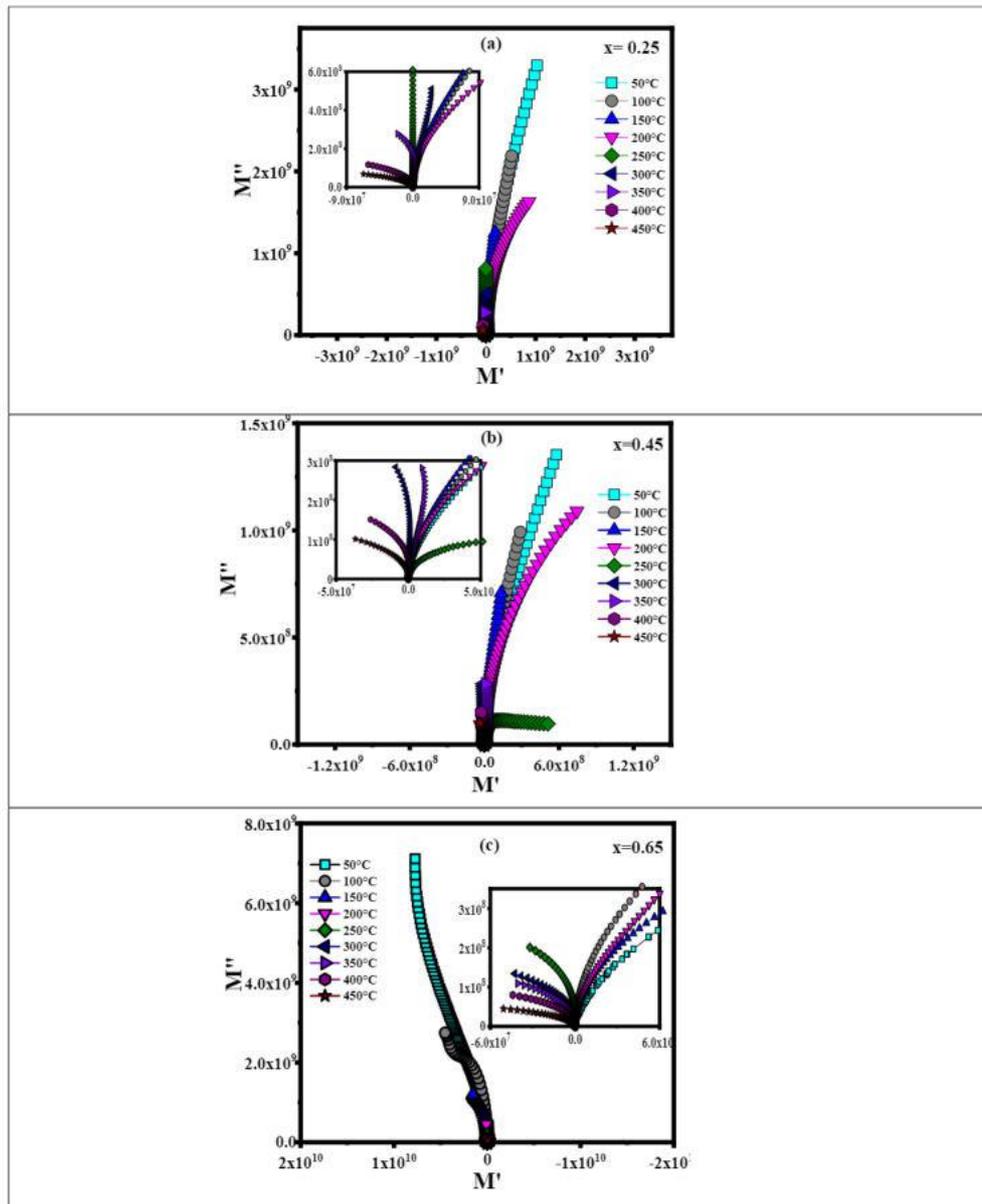

Single semi-circular arc was obtained in low frequency range, whose center lies below the real and the semi-circular arcs decreases with increasing temperature confirms the negative temperature coefficient (NTC) of resistance. The Cole–Cole plots were fitted with an equivalent circuit to confirm the individual contribution of grain and grain boundary. The expression for the complex impedance can be described as,

$$C = L_1 + R_1 + C_2/R_2 \tag{5}$$

The fitting values of inductance, capacitance and resistance for grain and grain boundary ( $L_1, R_1, C_2, R_2$ ) are obtained and listed in Table 3. The grain boundary resistance is more than the grain resistance at all temperatures except at  $250\text{ }^\circ\text{C}$ . The analysis of the curves shows that the semicircle shows some dispersion degree instead of a semicircle centered on the axis. This decentralization reflects the non-Debye-type relaxation.

Complex modulus plot for real and imaginary part of dielectric modulus ( $M'$  versus  $M''$ ), known as Cole–Cole plots, shown in Fig. 13(a–c). The Cole–Cole plot were used to investigate the presence of grain conduction and grain boundaries effect in the ceramic materials. From the graphs we have clearly observed there was phase transition in curves from first quadrant to second quadrant (+ve to -ve phase), these transitions were also observable in the phase vs. frequency graph, which is related to capacitive–inductive transitions [45,65,66].

Fig. 14(a–c) shows the variation of ac conductivity ( $\sigma_{\text{ac}}$ ) with frequency ( $50\text{ Hz}$ – $4\text{ MHz}$ ) for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45,$  and  $0.65$ ) ceramics at different observed temperatures. Graph shows that the conductivity spectra of each sample exhibits two distinct regions corresponding to (i) frequency independent conduction (plateau region) and (ii) frequency dependent ac conduction (dispersive region) [67]. At lower frequencies, a plateau or frequency-independent behavior of ac conductivity indicates the predominance of dc conductivity to conduction mechanism and the absence of hopping charge carrier polarization. Through a tunnelling process from one site to another site, electrons hopping

**Fig. 13 – (a–c) Complex modulus plot for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics at different temperatures.**

occurred between bound states. A drop in ac conductivity was observed after a particular frequency, which was attributed to a mismatch between the hopping frequency and applied frequencies. When the applied frequency exceeds the hopping frequency, hopping becomes out of phase with the applied frequency, and ac conductivity decreases as frequency increases. Deviations from ideal conditions were observed, and the system contained a small number of free charge carriers. The frequency dependence were analyzed by means of “Jonscher’s Universal Power Law” [68] and by using this law we calculated the fitting parameters. The hopping process between the charge carriers, according to Jonscher, is also

responsible for the frequency dependency of ac conduction. From Fig 14(a–c), it can be estimated that at low frequency  $\sigma_{ac}$  changes very slowly, and at high frequency, it increases as the temperature increases up to 350 °C and at the high frequency it decreases with the increase in temperature. The ac conductivity  $\sigma_{ac}$  curve shows an excellent fit (solid line) by the modified Jonscher model, as in Eqs. (6 and 7):

$$\sigma_{ac} = \sigma_{DC} + A1\omega^{S1} + A2\omega^{S2} \quad (6)$$

where  $A1$ ,  $A2$  are constants,  $S1$ ,  $S2$  are the frequency exponents and  $\sigma_{DC}$  is the DC conductivity which is associated with long-range motion of electrical charge carriers.

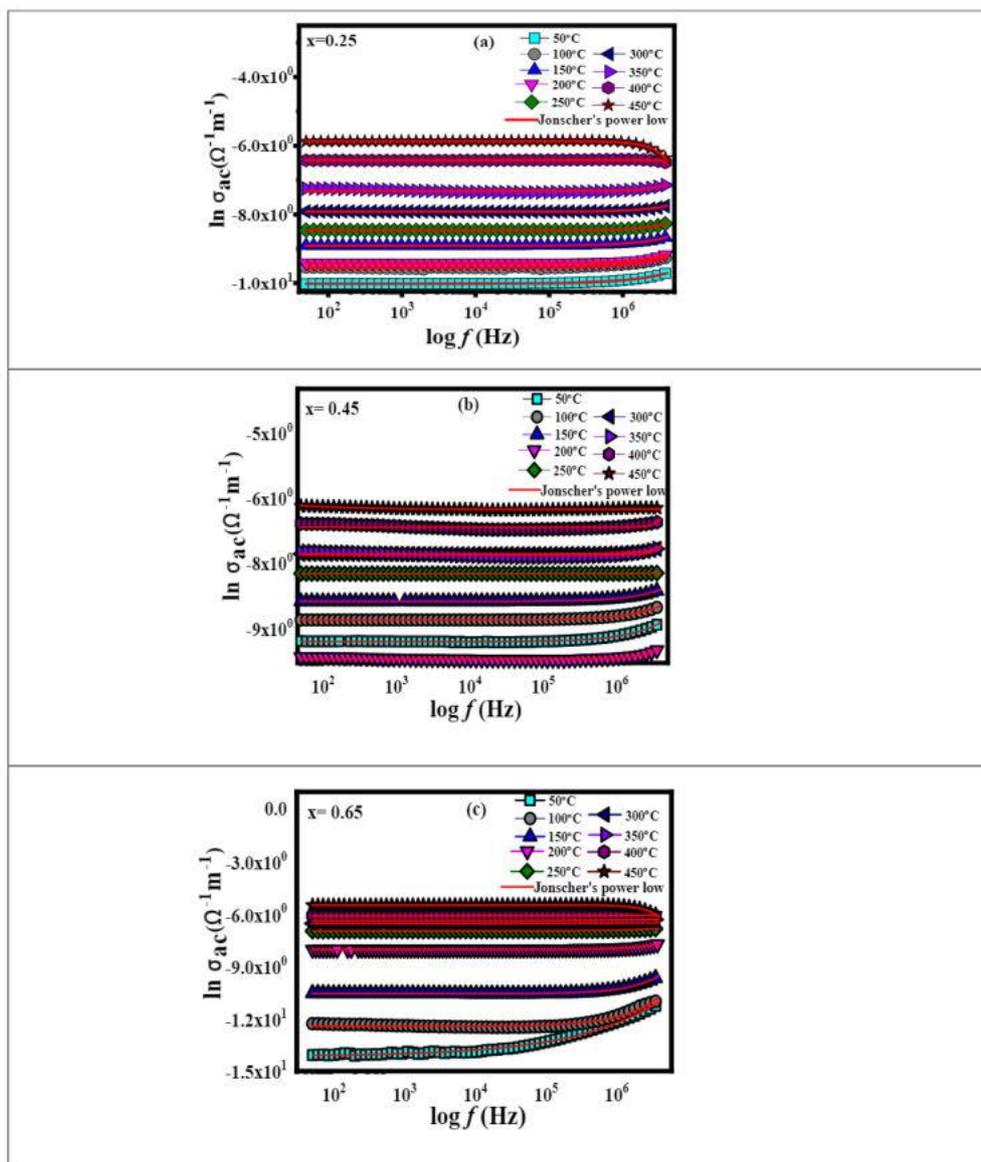

Fig. 14 – (a–c) AC conductivity vs. log (f) for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

Fig. 15(a–c) shows the variation of AC conductivity with temperature at high frequency range (1 MHz–4 MHz). It was observed that an increase in temperature causes an increase in the value of ac conductivity. The semiconductor behavior of the sample, as described in the impedance section, was supported by this behavior of these curves also. By using the Arrhenius equation given below

$$\sigma = \sigma_0 \exp\left(\frac{-E_a}{k_B T}\right) \quad (7)$$

$\sigma_0$  = pre-exponential factor,  $k_B$  = Boltzmann constant,  $E_a$  = activation energy,  $T$  = temperature, We analyzed the sample's activation energy by using the Arrhenius equation, and was temperature dependent. The calculated activation energy for all the samples was tabulated in Table

4. From the calculated values, it was observed that when frequency increases, the value of activation energy decreases, but ac conductivity increases with increasing temperature. This could be due to ionic solids having a limited number of mobile ions trapped in relatively stable potential wells during their movement through the solid at high temperatures. Donor cations play an important role in the conduction process because of a temperature increase. Hence, they get activated through small energy which is known as activation energy. The activation energy is essentially summarized by the energy given by charge carrier motion and the vacancies/defects generated at higher temperatures. However, as the frequency increases, the hopping probability of charge carriers increases, lowering the activation energy [69].

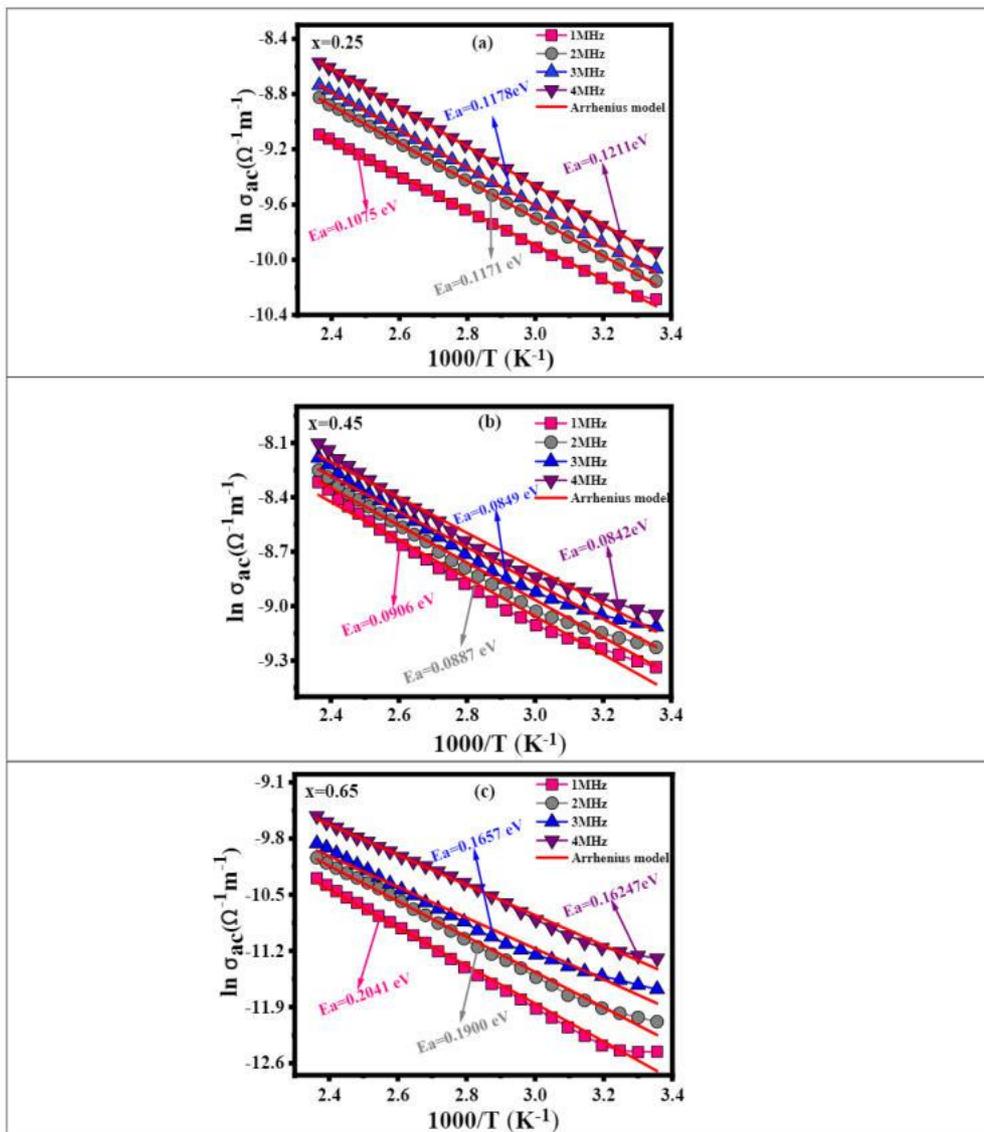

Fig. 15 – (a–c) Variation of AC conductivity with temperature for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45$  and  $0.65$ ) ceramics.

**Table 4 – Activation energy for  $\text{La}_{0.665}\text{Bi}_{0.33}\text{Ba}_{0.005}\text{Gd}_x\text{Mn}_{1-x}\text{O}_3$  ( $x = 0.25, 0.45, 0.65$ ) ceramics of different frequency for temperature range  $50\text{ }^\circ\text{C}–250\text{ }^\circ\text{C}$ .**

Frequency	$x=0.25$	$x=0.45$	$x=0.65$
1 MHz	$E_a = 0.1240\text{ eV}$	$E_a = 0.1010\text{ eV}$	$E_a = 0.2135\text{ eV}$
2 MHz	$E_a = 0.1247\text{ eV}$	$E_a = 0.0957\text{ eV}$	$E_a = 0.1948\text{ eV}$
3 MHz	$E_a = 0.1216\text{ eV}$	$E_a = 0.0929\text{ eV}$	$E_a = 0.1840\text{ eV}$
4 MHz	$E_a = 0.1210\text{ eV}$	$E_a = 0.0913\text{ eV}$	$E_a = 0.1779\text{ eV}$

#### 4. Conclusions

X-Ray diffraction of LBBGMO ( $x = 0.25, 0.45,$  and  $0.65$ ) were performed at room temperature and which confirmed the perovskite structure with second phases. Rietveld refinement of the XRD patterns was performed with best fit and different parameters were found and confirmed that for  $x = 0.25$  and

$0.45,$  had orthorhombic structure was but co-existence of orthorhombic and rhombohedral were observed for  $x = 0.65$ . It was also observed that for low frequency range the samples possessed Negative Dielectric Constant (NDC) behavior. Nyquist plot of the samples showed non-Debye type and NTCR behavior. The real part of impedance in higher frequency range decreases with increase in temperature indicating semiconducting behavior of the samples. Quantitative analysis of AC conductivity study showed a decrease in conductivity with increase in frequency. It was observed that when frequency increases, the value of activation energy decreases, and ac conductivity increases with increasing temperature. The ionic solids having a limited number of mobile ions trapped in relatively stable potential wells during their movement through the solid at high temperatures. The activation energy is essentially summarized by the energy given by charge carrier motion and the vacancies/defects generated at higher temperatures. On the basis of the structural and

dielectric analysis we can say that the composition of  $X = 0.25$  have a more single phase system and useful for the high frequency dielectric system.

## ABSTRACT

Lead-free perovskite materials Barium Magnesium Titanate (BMT) and composite of BMT/Ga<sub>2</sub>O<sub>3</sub> were prepared using environment friendly low temperature method. XRD peak profile analysis of pure BMT and nanocomposite of BMT/Ga<sub>2</sub>O<sub>3</sub> to determine the crystallite size have been carried out using various calculations methods like Scherrer, Williamson–Hall, and Size–Strain plot. The crystallite size was found to increase with the addition of Ga<sub>2</sub>O<sub>3</sub> in BMT. Moreover, XRD patterns reveal the pure and crystalline phase of the prepared samples. Raman study of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> are showing the tetragonal symmetry. SEM studies revealed that the addition of Ga<sub>2</sub>O<sub>3</sub> accelerates the grain growth of BMT whereas EDX indicated that there is no significant trace of any impurity and confirmed the stoichiometric presence of the expected elements within the sample. SAED patterns demonstrate broad concentric rings, which confirm the presence of crystalline powder. P–E hysteresis loop confirms the ferroelectric behaviour of the samples with increase in remnant polarization and the increase in coercive field.

## 1 Introduction

Perovskites exhibit a crystal structure described by the general formula ABO<sub>3</sub>, where twelve equidistant oxygen atoms surround by A cation, and six oxygen atoms surround the B cation. They can be further classified into two categories: Lead-based and Lead-free materials. Lead-based perovskite materials like PT (Lead Titanate) and PZT (Lead Zirconate Titanate) have gained widespread interest for various

microelectronic devices, such as sensors, capacitors, actuators, and transducers due to their remarkable piezoelectric properties [1–5]. However, considering the toxic nature of lead-based materials, researchers are focussing on developing lead-free perovskite materials [6]. Therefore, the development of lead-free perovskite ceramics is encouraged in recent years. Various lead-free systems have been explored in this context, such as BT, BNT, KNN, and BKT [7, 8]. Among these lead-free piezoelectric materials,

BaTiO<sub>3</sub> (Barium Titanate) based materials have been widely studied because of their ferroelectric properties, high dielectric constant, low dielectric loss, pyroelectric and piezoelectric behaviour [9–11].

Furthermore, the functional properties can also be tailored using suitable substitutions at different atomic sites. In addition, developing a suitable synthesis process and selection of dopants are crucial parameters to develop the desirable structure for structural analysis [12]. For BaTiO<sub>3</sub>, particularly, Sr, Ca, La, Mn and Zr doping can help improve their structural, ferroelectric, dielectric properties, and piezoelectric properties [13–15]. However, it is difficult to control their composition together with a difficult phase design. Moreover, traditional methods used for their preparation are not energy-efficient and requires long hours of calcination process. There are several routes which can be used to synthesize perovskite material, like solid-state reaction [16, 17], molten salt reaction [18], co-precipitation [19], sol–gel [20], spray and freeze drying [21, 22]. In the case of the solid-state reaction method and molten salt reaction, controlling the morphologies and size of the desired materials without ligand or organic molecule protection on the surface of particles is a huge challenge [23–25]. On the other hand, the sol–gel method involves high operational temperature, less control of the crystallisation, and morphology of the products lack uniformity, controllability, and dispersibility, which decline their functional properties dramatically [26–28]. The co-precipitation method yields low-quality ceramic powders and, therefore, cannot be easily scaled up to industrial demand. In addition, the slight amount of polar solvents results in the formation of bulk crystals instead of nanosize perovskites.

To overcome these problems, using the hydrothermal process is considered a viable and energy efficient method for preparing highly pure and homogeneous powder. The hydrothermal method is a powerful technique for the preparation of homogenous and very fine nanopowders with high purity. The main advantage of the hydrothermal method is to reduce the temperature level (100–200 °C) of reaction compared to the other conventional synthesis process [29]. The hydrothermal method is an environmentally benign process that operates at relatively low temperatures and is good at suppressing the compositional change. Recently, Ma et al. prepared a composite of BMT–Ga<sub>2</sub>O<sub>3</sub> ceramics

using the conventional solid-state reaction method. However, the calcination process was carried out at a very high temperature, i.e. 1250 °C. The synthesis process for the preparation of nanoparticles involving high calcination temperature usually suffers from several limitations such as poor homogeneity, high porosity, and non-uniform particle size, which affects the functional properties of the synthesized material [30]. Arshad et al. synthesized strontium-doped BT (Ba<sub>1-x</sub>Sr<sub>x</sub>TiO<sub>3</sub>) ceramics using the conventional solid-state method. The XRD and Raman studies reveal that Sr<sup>2+</sup> ions change lattice constant, unit cell volume, and tetragonality ratio of pure BaTiO<sub>3</sub>. Impedance spectroscopy revealed that BST ceramic shows relaxation behaviour and oxygen vacancies (OVs), and those (OVs) are responsible for conduction in prepared BST samples [13]. Slimani et al. prepared BaTiO<sub>3</sub>/ZnO based ceramic by solid-state technique. The substitution of ZnO in BT change the crystal symmetry from tetragonal to cubic. The grain size increases with the addition of ZnO and reduces the bandgap energy. The increasing concentration of ZnO improves the dielectric, electric, and optical properties of BT ceramics. Dong et al. prepared BaTiO<sub>3</sub>/YNbO<sub>4</sub> based ceramics using traditional solid-state method. XRD and Raman analysis reveals that the substitution of YNbO<sub>4</sub> in BT change the phase transition from tetragonal to pseudo-cubic. The grain size and unit cell volume increased with the addition of YNbO<sub>4</sub>. The increasing concentration of YNbO<sub>4</sub> moved curie temperature towards lower temperature side and exhibit para-electric phase. These results showed that the BaTiO<sub>3</sub>/YNbO<sub>4</sub> ceramics systems could be a capable alternate material for a high energy storage density capacitor [31].

The present investigation was carried out to study the effect of the addition of Ga<sub>2</sub>O<sub>3</sub> on structural and morphological properties of lead-free Ba<sub>0.85</sub>Mg<sub>0.15</sub>TiO<sub>3</sub> (or BMT) by hydrothermal method at low temperature. To the best of our knowledge, no work has been conducted on the composite of BMT/Ga<sub>2</sub>O<sub>3</sub> using the hydrothermal method. This paper is a continuation of our previous research work [32]. The characterisation results confirm the pure phase and crystalline nature of the prepared pristine BMT and composite BMT/Ga<sub>2</sub>O<sub>3</sub>.

## 2 Materials & Methods

Barium Magnesium Titanate Oxide (or  $\text{Ba}_{0.85}\text{Mg}_{0.15}\text{TiO}_3$ ), BMT was prepared by mixing powder oxides using the following raw materials; Barium Hydroxide Octahydrate,  $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$  (Sigma Aldrich, 99% purity) and Magnesium Acetate,  $(\text{CH}_3\text{COO})_2\text{Mg} \cdot 4\text{H}_2\text{O}$  (Sigma Aldrich, 99% purity), Titanium (IV) Isopropoxide ( $\text{C}_{12}\text{H}_{28}\text{O}_4\text{Ti}$ ) (Sigma Aldrich, 99% purity) were selected as initial materials with the molar ratios of Ba:Mg:Ti ions (0.5:0.3:1). The BMT nanoparticles synthesis was as follows:  $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ ,  $(\text{CH}_3\text{COO})_2\text{Mg} \cdot 4\text{H}_2\text{O}$ , and  $(\text{C}_{12}\text{H}_{28}\text{O}_4\text{Ti})$  were dissolved in 30 mL deionized water under constant stirring. After mixing the starting materials, few drops of KOH were added to the above solution, which helps to maintain its  $\text{pH} > 7$ . Teflon cup was fitted inside the autoclave and placed in the muffle furnace for reaction at 120 °C for 48 h. After the completion of reaction, it was allowed to naturally cool down at room temperature and thereafter, was transferred into a borosilicate beaker for ultrasonic cleaning for 30 min. The synthesized nanoparticles were washed in the presence of deionized water and centrifuged for 10 min at a speed of 400 rpm and dried in hot air oven for 5 h at 50 °C.  $(1-x)\text{BMT}-x\text{Ga}_2\text{O}_3$  ( $x = 0.05$ ) were prepared by mixing  $\text{Ga}_2\text{O}_3$  to hydrothermally synthesized BMT nanoparticles and calcined at 650 °C for 2 h. The structural properties were studied by XRD using PW3040 Philips X-ray diffractometer with  $\text{CuK}\alpha$  radiation ( $\lambda = 0.15406$  nm). The Rietveld refinement of the XRD data was carried out using FullProf 2019 software. The lattice morphology and elemental analysis were characterized by SEM (Hitachi SU8010 series).

## 3 Results & discussion

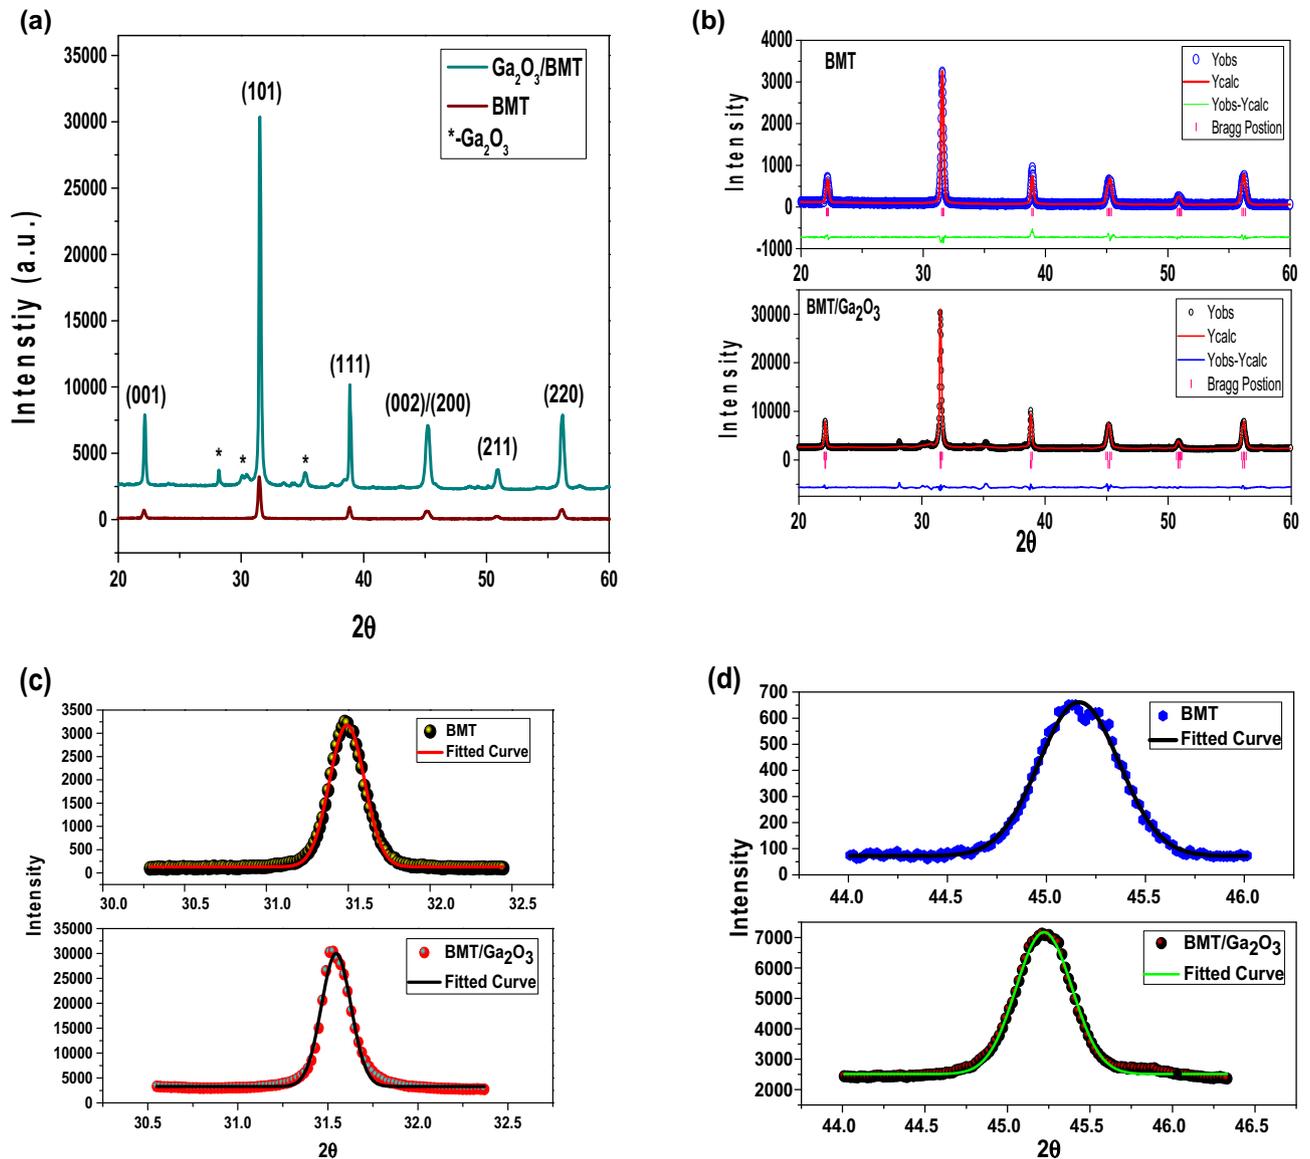

### 3.1 X-ray diffraction (XRD)

Figure 1 shows the XRD patterns of the prepared BMT and BMT/ $\text{Ga}_2\text{O}_3$  nanoparticles via the hydrothermal method at room temperature. The structural properties of the sample like lattice parameters ( $a$ ,  $b$ ,  $c$ ), the crystallite size ( $D$ ), volume of the unit cell ( $V$ ), stress ( $\sigma$ ), lattice strain ( $\epsilon$ ), energy density ( $u$ ), and young's modulus ( $E_{hkl}$ ) were determined by analysing the XRD patterns. It was observed that BMT exhibits a pure perovskite phase

with a tetragonal crystal structure. XRD patterns are in accordance with  $\text{BaTiO}_3$  (JCPDS #75-2121) with no impurity of secondary peaks. Moreover, on the addition of  $\text{Ga}_2\text{O}_3$ , the occurrences of additional peaks are also in good agreement with the JCPDS #76-0573 of  $\text{Ga}_2\text{O}_3$  and do not distort BMT's tetragonal symmetry. However, on the addition of  $\text{Ga}_2\text{O}_3$  in BMT, a slight shift towards higher diffraction angles is easily discernible. It might be due to the addition of  $\text{Ga}_2\text{O}_3$  within BMT, which leads to shrinkage of the host lattice. The lattice parameters for BMT were found to decrease from  $a = 4.0075\text{Å}$ ,  $c = 3.5899\text{Å}$ , and  $V = 57.65\text{Å}^3$  to  $a = 3.954\text{Å}$ ,  $c = 3.326\text{Å}$  and  $V = 51.999\text{Å}^3$  on the addition of  $\text{Ga}_2\text{O}_3$ . To obtain the detailed crystal structure data of the prepared sample, Rietveld refinements for XRD patterns of BMT and  $\text{Ga}_2\text{O}_3/\text{BMT}$  were performed using Fullprof software as shown in Fig. 1b. All Rietveld refinements were performed using a perovskite-type tetragonal structure and a space group (P4mm) using CIF file 1,513,252. A pseudo-Voigt function was chosen to fit the obtained XRD pattern of the samples. The results obtained from Rietveld refinement are tabulated in Table 1. According to Table 1, fitting parameters ( $R_p$ ,  $R_{wp}$ ,  $R_e$ ,  $R_f$ ,  $R_B$ , and  $\chi^2$ ) indicate good agreement between progressive and observed values XRD patterns for both samples [33–37]. The full width at half maxima (FWHM) for the most intense peaks of both BMT and BMT/ $\text{Ga}_2\text{O}_3$  are shown in Fig. 1c. It is visible that the FWHM decreases on the addition of gallium oxide within BMT, which indicates an increase in the crystallite size of the samples. The average crystallite size of the prepared nanoparticles was calculated from the reflection of the significant peaks in the XRD patterns using the Debye Scherrer formula as follows [32].

$$d = \frac{k\lambda}{\beta \cos\theta}, \quad (1)$$

where  $d$  is the crystallite size, and  $k$  is the Scherrer constant,  $\lambda$  is the X-ray wavelength (0.154 nm), and  $\theta$  is the Bragg angle of the reflection. The calculated average crystallite size for both samples from Eq. (1) are shown in Table 2. In addition, the peak broadening in the XRD patterns clearly contributes to the crystallite size. As the peak broadening decreases in BMT/ $\text{Ga}_2\text{O}_3$ , therefore, the value of crystallite size increases. Figure 2a shows a linear relationship between  $\cos\theta$  as  $y$ -axis versus  $1/\beta$  as the  $x$ -axis.

**Fig. 1** a XRD patterns, b Rietveld refinement, c Gaussian fit of XRD peak at  $2\theta = 31^\circ\text{--}33^\circ$ , and d  $2\theta = 44^\circ\text{--}46^\circ$  of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> nanoparticles synthesized *via* hydrothermal method

The lattice strain ( $\varepsilon$ ) within the material can also cause broadening of the XRD diffraction patterns [38] given by

$$\varepsilon = \frac{\beta_{hkl}}{4\sin\theta} \quad (2)$$

The line broadening according to the Williamson-Hall relationship is simply the sum of size-induced and strain-induced broadening given by:

$$\beta = \frac{k\lambda}{D\cos\theta} + 4\varepsilon\tan\theta. \quad (3)$$

By rearranging the Eq. (4), we simply get,

$$\beta\cos\theta = \frac{k\lambda}{D} + 4\varepsilon\sin\theta. \quad (4)$$

Figure 2b shows the plot between  $4\sin\theta$  along the x-axis and  $\beta\cos\theta$  along the y-axis with a straight line. The average crystallite size was extracted from the y-intercept and the values of lattice strain from the slope of the linear fit to the data points, as shown in Table 2.

Furthermore, the parameters like stress ( $\sigma$ ) and strain ( $\varepsilon$ ) are related to each other by Hooke's law by  $\sigma = Y_{hkl} \varepsilon$ , where  $Y_{hkl}$  is the Young's Modulus in the direction perpendicular to the set of the crystal lattice

**Table 1** Fullprof based Rietveld refinement parameters and calculated crystallographic parameters of the XRD pattern of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub>

Calculated crystallographic parameters		BMT	BMT/Ga <sub>2</sub> O <sub>3</sub>

**Table 2** Structural parameters of the prepared samples

Samples	Scherrer	Williamson–Hall method									SSP	
		UDM			USDM			UEDDM			D (nm)	ε × 10 <sup>-3</sup>
		D (nm)	D (nm)	ε × 10 <sup>-3</sup>	D (nm)	ε × 10 <sup>-3</sup>	σ (MPa)	D (nm)	ε × 10 <sup>-3</sup>	σ (MPa)		
BMT	33.2	46.04	1.5	45.6	1.6	220	46.04	1.7	224	165.6	47.2	1.6
BMT/Ga <sub>2</sub> O <sub>3</sub>	42.8	51.7	1.2	51.1	1.3	164	50.9	1.4	179	95.6	52.1	1.3

plane (hkl). It is assumed that a minor strain is present inside the sample. Therefore, the Hooke’s law approximation, Eq. (4) can be re-written as:

8.84 × 10<sup>-12</sup> m<sup>2</sup> N<sup>-1</sup>, respectively [40]. The values of the calculated Y<sub>hkl</sub> for pristine BMT and nanocomposite 0.95 BMT–0.05 Ga<sub>2</sub>O<sub>3</sub> are ~ 132GPa and ~

$$\frac{1}{Y_{hkl}} = \frac{s_{11}(h^4 + k^4) + (2s_{12} + s_{66})h^2k^2 + (2s_{13} + s_{44})(h^2 + k^2)(\frac{a}{c})^2 + s_{33}(\frac{a}{c})^4}{(h^2 + k^2 + (\frac{a}{c})^2)^2}, \tag{6}$$

$$\beta_{hkl} \cos\theta = \frac{k\lambda}{D} + \frac{4\sigma \sin\theta}{Y_{hkl}}. \tag{5}$$

A linear relationship between β cosθ as a function of 4sinθ/Y<sub>hkl</sub> is shown in Fig. 2c, wherein the value of σ was estimated from the slope of the fitted line and the importance of D from the y-intercept. Young’s Modulus (Y<sub>hkl</sub>) for a tetragonal crystal symmetry, is related to its elastic compliances, s<sub>ij</sub> by[39]:

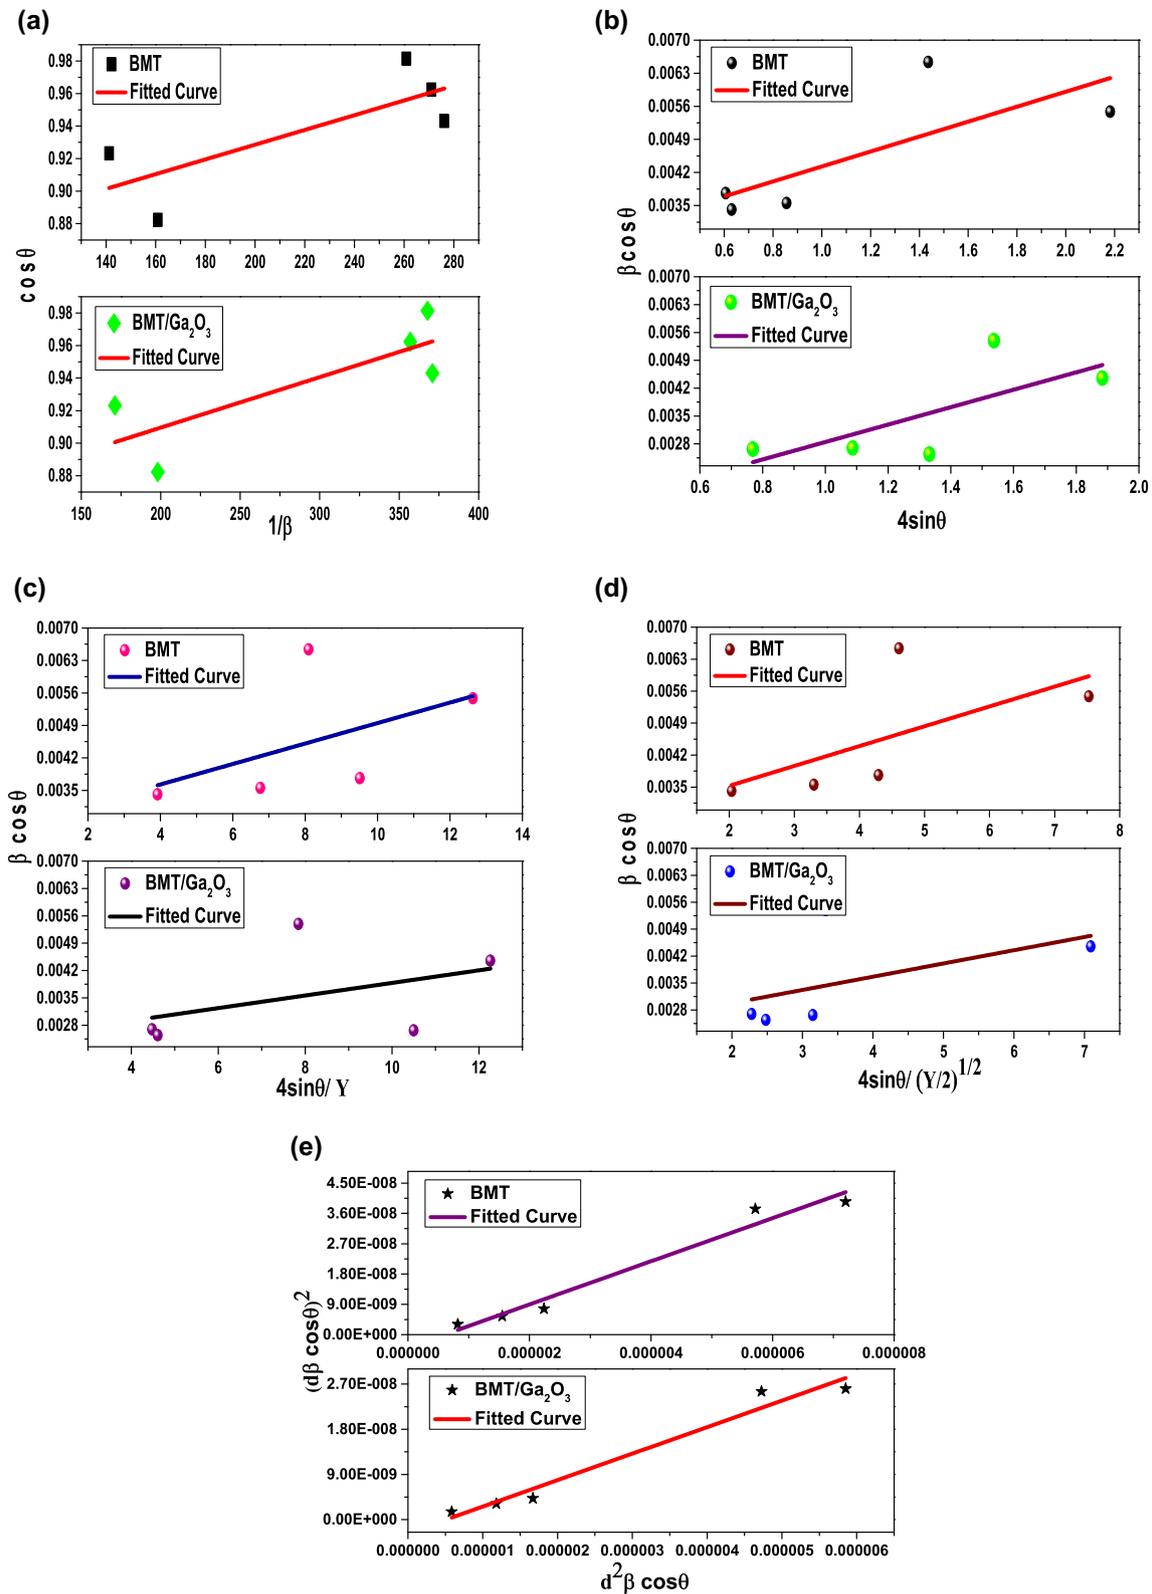

where the values of s<sub>11</sub>, s<sub>12</sub>, s<sub>13</sub>, s<sub>33</sub>, s<sub>44</sub>, and s<sub>66</sub> for BaTiO<sub>3</sub> are 8.05 × 10<sup>-12</sup>, - 2.35 × 10<sup>-12</sup>, - 5.24 × 10<sup>-12</sup>, 15.7 × 10<sup>-12</sup>, 18.4 × 10<sup>-12</sup>, and

125 GPa, respectively.

Furthermore, in order to calculate the energy density (u), Uniform Deformation Energy Density Model (UEDDM) analysis was taken into consideration. The energy density is a function of strain defined as: u = ε<sup>2</sup>Y<sub>hkl</sub>/2 for an elastic system. In this case, the Eq. (4) can be re-written as:

$$\beta \cos\theta = \frac{k\lambda}{D} + 4\sin\theta \sqrt{\frac{2u}{Y_{hkl}}}. \tag{7}$$

Figure 2d shows β cosθ as a function of 4sinθ√2/Y<sub>hkl</sub>. The linear fit of the data points reveals the value

**Fig. 2** a Scherrer plot, b Uniform Deformation Model (UDM) analysis, c Uniform Stress Deformation Model (USD) analysis, d UEDM analysis, and e SSP of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub>

of crystallite size which can be estimated from the y-intercept and the value of energy density can be measured from its slope.

Another way to determine the crystallite size and lattice strain of the crystal system is using Size–Strain plot (SSP); as shown in Eq. (8)

$$(d\beta\cos\theta)^2 = \frac{k}{D}(d^2\beta\cos\theta) + \left(\frac{\epsilon}{2}\right)^2, \quad (8)$$

where  $k$  is a constant and depends on the shape of particles. For spherical particles,  $k = 3/4$ . Figure 2e represents a linear graph plotted between  $(d\beta\cos\theta)^2$  as a function of  $d^2\beta\cos\theta$  for both samples. This method has a benefit that less importance is given to data from reflections at higher angles where the precision is usually lower.

In summary, the structural parameters were calculated various methods like Scherrer, Williamson–Hall method (UDM, USDM, and UDEDM), and SSP. Variations in the calculations of the Scherrer formula comes from the different FWHM values at each peak. The crystallite size of BMT/Ga<sub>2</sub>O<sub>3</sub> increases as the FWHM of the peak decreases since both entities, i.e.,  $D$  and  $\beta$ , are inversely proportional to each other. Furthermore, the result of W–H plots provides information about the crystallite size and strain of the crystal. In the case of the UDM plot, the line broadening is essentially isotropic, and the least-square points had a positive slope and a non-zero intercept. The lattice strain and crystallite size evaluated from W–H plots and SSP were found to be comparable and in agreement with each other. However, in the case of the SSP method, the data points lay much closer to the linear fit and, therefore, becomes more suitable than W–H plots [41, 42].

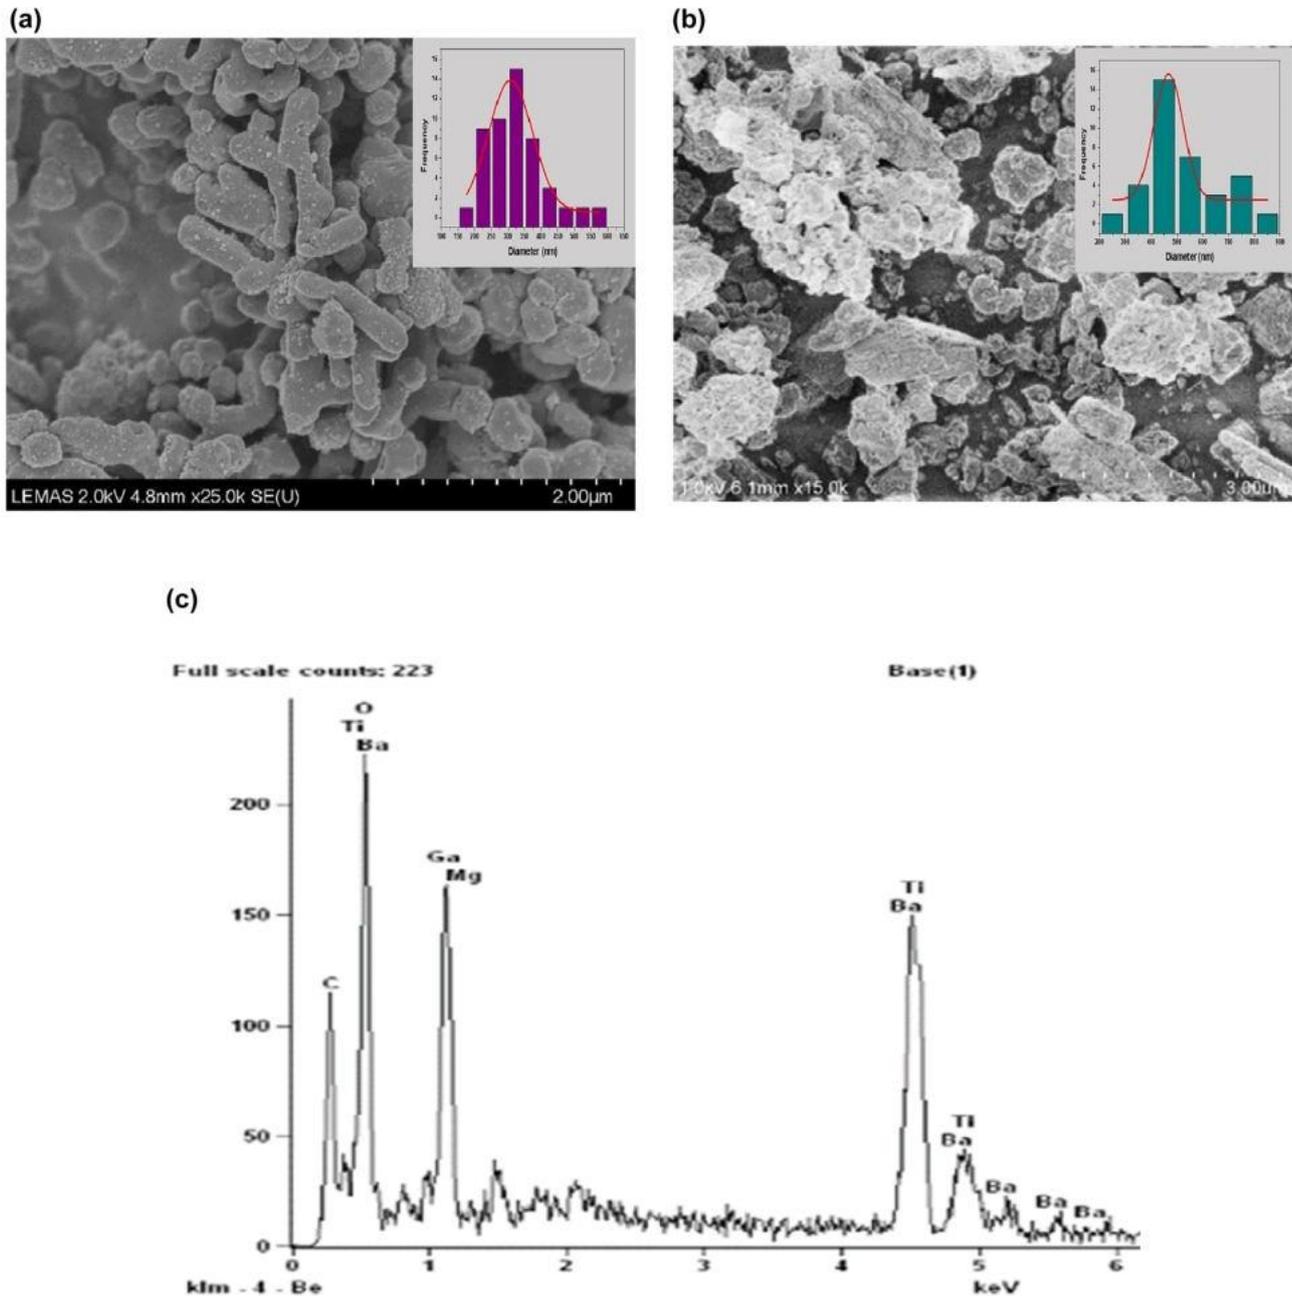

### 3.2 Scanning electron microscopy (SEM) analysis

Figure 3 shows the SEM micrographs of the synthesized BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> at room temperature, which provides further insight into the shape and size of the synthesized powder. Nucleation is the crucial step in the crystallisation process and plays a vital role in particle size distribution. In the hydrothermal method, the presence of solvent media facilitates the formation of better crystal nucleation, higher dispersion, and higher rates of reaction and, most importantly, better shape control of the nanoparticles [43, 44]. The chemical reaction starts in

the presence of pressure and temperature, which trails the non-classical crystal formation. Moreover, the preparation of ceramics in the presence of solvent media helps to control the size and shape of the ceramic [45, 46]. KOH acts both as a mineralised and surfactant in the hydrothermal process. The concentration of OH<sup>−</sup> ions plays a vital role in the crystal nucleation and crystal growth rate. If the concentration is low, then the driven force in the reaction system is not sufficient, resulting in disordered particles aggregation. In contrast, when the concentration is more, the crystal nucleation rate is higher due to the presence of more nucleated small clusters in the solution, yet the crystal growth rate is inhibited and the crystals aggregate randomly [47, 48]. Subsequently, OH<sup>−</sup> ions bind the particles together and facilitate the self-assembly process that is responsible for shape evolution and produces mesocrystals [49, 50]. Figure 3a shows the formation of well crystallised pristine BMT ceramic with dense, compact, soft agglomerated spherical and rod-like shaped morphology. The average particle size was found to be  $\sim 305 \pm 10$  nm as evident from the histogram presented in the inset of Fig. 3a. With the addition of gallium oxide, more mature and spherical shaped particles were formed with increased particle size to  $\sim 460 \pm 10$  nm as shown in the histogram presented in the inset of Fig. 3b. The particle size was estimated using ImageJ software. This might be ascribed to the incorporation of gallium oxide within BMT, which produces lattice distortion and is responsible for forming larger grains. Energy-dispersive X-ray spectrograph (EDX) analysis was used to confirm the presence of all elements within the prepared sample as shown in Fig. 3c. Shows the EDX spectra of the BMT/Ga<sub>2</sub>O<sub>3</sub> NPs synthesized by the one-step hydrothermal method, from which the elements Ba, Mg, Ti, Ga, and O were confirmed. Carbon tape used during the EDX analysis gives rise to a peak corresponding to carbon (C).

### 3.3 Transmission electron microscopy (TEM)

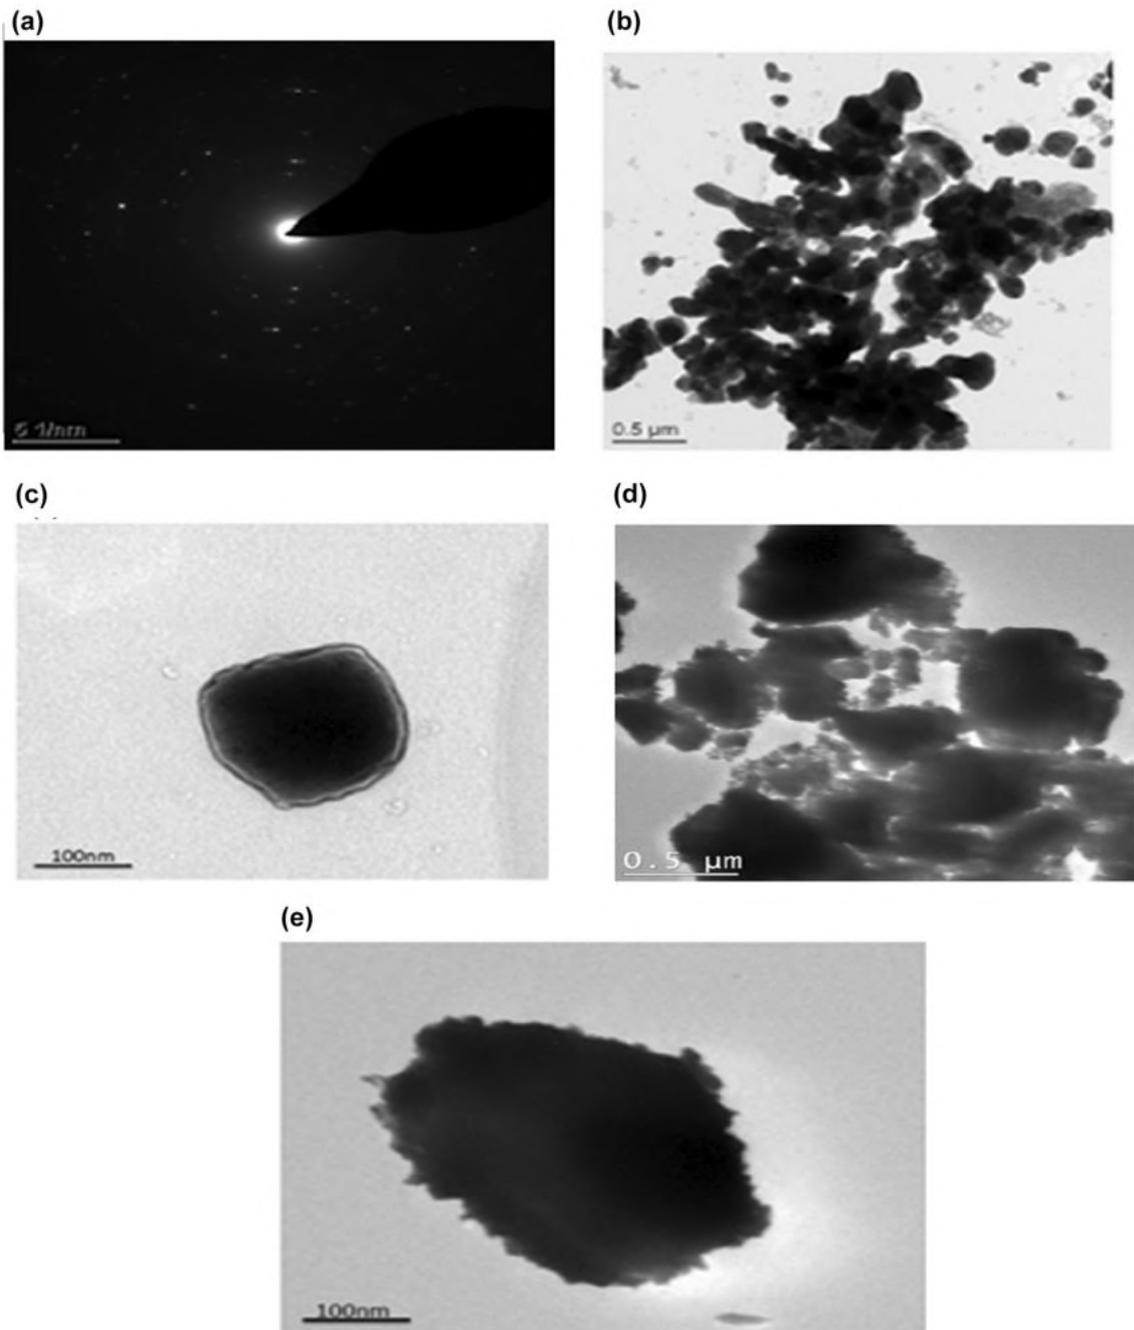

TEM was employed to analyse the crystal evolution of the sample at the atomic scale. The synthesized samples were placed onto the carbon-coated copper grids for TEM analysis. Furthermore, the Selected Area Electron Diffraction (SAED) analysis was performed to recognize crystal structures and observe

**Fig. 3** a SEM micrographs of BMT, b BMT/Ga<sub>2</sub>O<sub>3</sub>, and c EDX spectrograph of BMT/Ga<sub>2</sub>O<sub>3</sub> nanoparticles

crystal defects [51]. SAED patterns of such a spherical assembly demonstrate broad concentric rings, which confirm the presence of crystalline powder, as shown in Fig. 4a. TEM images show the formation of uniform and smooth surfaces of the nanoparticles with particle size distribution in the range of  $\sim 220 \pm 10$  nm as shown in Fig. 4b, c. The nanoparticles grow and nucleate to form spherical nanoparticles along with small particles on the surface of the microspheres due to the dissolution–recrystallization

process, which is often observed in the hydrothermal process [52, 53]. During the preparation of BMT nanoparticles, surfactant (KOH) is added to prevent the aggregation. Therefore, it is essential to adopt a reliable method for the preparation of uniform size nanoparticles [54]. Subsequently, on the addition of gallium oxide, it is evident that the size of nanoparticles increases to  $\sim 350 \pm 10$  nm as shown in Fig. 4d, e.

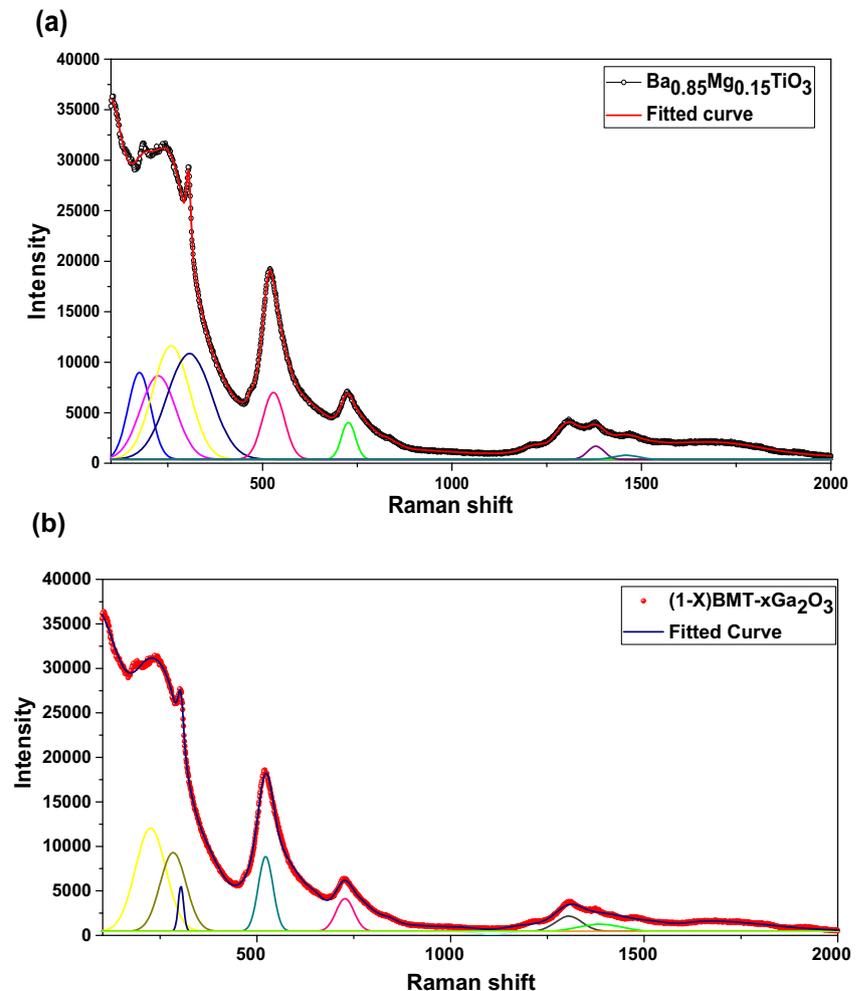

**Fig. 4** **a** SAED pattern, **b** TEM micrograph, and **c** enlarged TEM image of pristine BMT nanoparticles, **d** TEM micrograph, **e** enlarged TEM image of BMT/Ga<sub>2</sub>O<sub>3</sub> nanoparticles

### 3.4 Raman spectroscopy

Raman spectroscopy is an effective technique to investigate the structural changes of the prepared samples. Figure 5 shows the Raman spectrum of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> at room temperature. The Raman spectrum consists of five Raman active modes at 220 cm<sup>-1</sup>, 260 cm<sup>-1</sup>, 306 cm<sup>-1</sup>, 510 cm<sup>-1</sup> and

720 cm<sup>-1</sup>. The presence of Raman active modes ~ 220 cm<sup>-1</sup> occurs due to the local symmetry breaking (polar distortion/octahedral tilting) [55, 56]. A broad peak 280 cm<sup>-1</sup> represents A1TO mode. A small peak is observed at 720 cm<sup>-1</sup>, which represents the tetragonal phonon mode at A1TO<sub>3</sub>. A well-defined prominent peak can be noticed at 510 cm<sup>-1</sup> (TO

**Fig. 5** Raman spectra of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub>

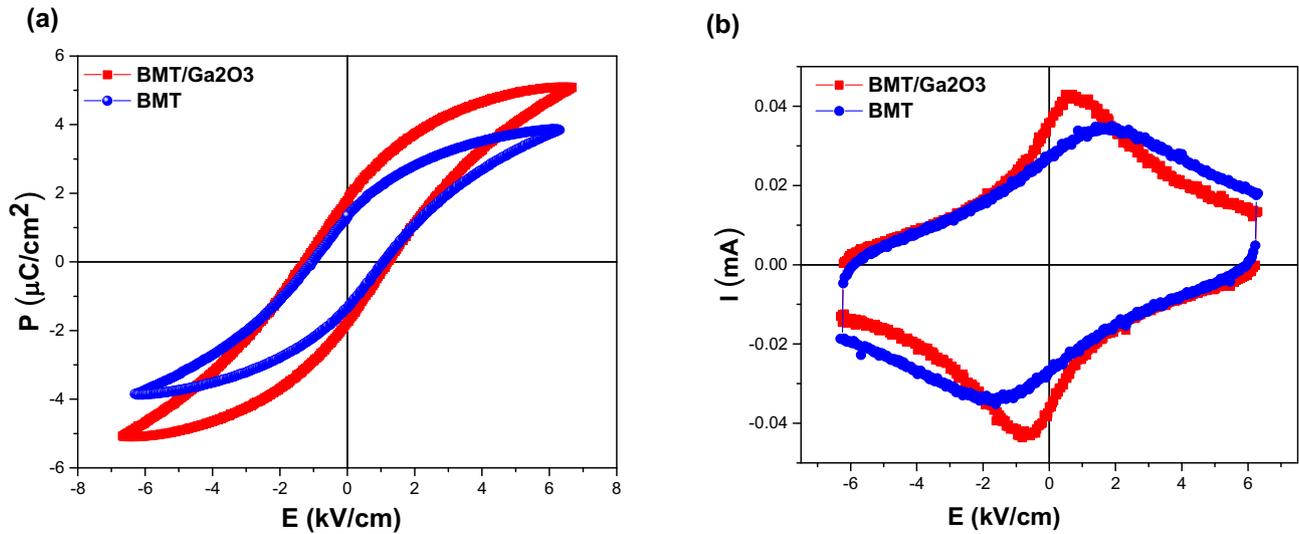

mode), which can be ascribed to the symmetry stretching of the O–Ti–O molecule. The material with perovskite structure exhibits such type of mode [57–59]. The tetragonal phase for BMT is confirmed from the ETO/B characteristics mode at 305 cm<sup>-1</sup>.

In contrast, a slight shift is easily evident from the Raman of the composite BMT/Ga<sub>2</sub>O<sub>3</sub>. This shift can be attributed to asymmetric TIO phonon vibration due to the incorporation of Ga<sub>2</sub>O<sub>3</sub> within BMT. Addition of Ga<sub>2</sub>O<sub>3</sub> increases the disorder in local symmetry shows the broadness in Raman peaks.

### 3.5 Ferroelectric study

Polarization vs Electric field (P–E hysteresis loop) confirms its ferroelectric behaviour of pure BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> ceramics at room temperature are shown in Fig. 6a. Both samples exhibited a well-saturated hysteresis loop with the value of remnant polarization ( $P_r$ ) ~ 2.1 and 1.8  $\mu\text{C cm}^{-2}$ , coercive fields

( $E_c$ ) ~ 1.5 and 1.3 kV cm<sup>-1</sup> and saturation polarization ( $P_s$ ) ~ 4.0125 and 5.023  $\mu\text{C cm}^{-2}$  for BMT and BMT/Ga<sub>2</sub>O<sub>3</sub>, respectively. The low coercivity of the pure BMT sample suggests that it is ferroelectrically soft and a small electric field is relevant to cause switching of domains [60]. The saturated polarization, remnant polarization, and coercive field increase with the addition of Ga<sub>2</sub>O<sub>3</sub>. BMT/Ga<sub>2</sub>O<sub>3</sub> sample shows the maximum polarization at room temperature. In the prepared sample, Ga<sub>2</sub>O<sub>3</sub> content increases the grain size, decreases the energy barriers and increases the number of grain boundaries [61]. The occurrence of remnant polarization at transition temperature and the ferroelectric region shows the thermal stability of the sample. The variation of polarization of current density with respect to the applied electric field shown in Fig. 6b the current density (J) express the peaking behaviour of (+)ve and (-)ve cycle of the applied electric field. The rate

**Fig. 6** **a** Ferroelectric loop and **b** Electric field dependence of polarization current of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> ceramics at room temperature

of change of current density ( $j$ ) in the direction of applied electric field ( $E$ ) given as

$$j \frac{dP_E}{dt} = \rho V_s \delta [\hat{E} \cdot P_s] T, \tag{9}$$

where  $dP_E$  is the change in polarization along electric field direction,  $\rho$  is the number of nucleation sites per unit volume,  $T$  is the rate of formation of nuclei,  $\delta$  is the angle between  $P_s$  and  $\hat{E}$ , and  $P_s$  is the spontaneous polarization [62]. The leakage current characteristics of BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> ceramics were also examined. BMT sample shows a lower value of current density than BMT/Ga<sub>2</sub>O<sub>3</sub> [63, 64]. In addition, BMT/Ga<sub>2</sub>O<sub>3</sub> ceramic show the presence of two peaks in the opposite direction to applied electric field which indicates the existence of two stable states with an opposite polarity. At the same time, the maximum current density ( $j$ ) is related to the polarization switching [65]. The slight increase in value of current density does not affect the tetragonal phase of BMT/Ga<sub>2</sub>O<sub>3</sub> ceramic.

## 4 Conclusion

BMT and BMT/Ga<sub>2</sub>O<sub>3</sub> nanoparticles were synthesized successfully via the hydrothermal method. XRD results reveal the pure perovskite phase of BMT with tetragonal symmetry, and the symmetry does not change on the incorporation of Ga<sub>2</sub>O<sub>3</sub>. This result is consistent with the Raman spectroscopy. Rietveld refinement plots confirm that the experimental peaks

are in good agreement with the calculated peak positions and intensities. Moreover, the average crystallite size of the prepared sample is increased with the addition of Ga<sub>2</sub>O<sub>3</sub> in BMT. SEM micrograph reveals the formation of large spherical shape grains, whereas the elemental analysis through EDX spectrograph confirmed the stoichiometric presence of the common elements within the sample. TEM analysis demonstrates that the particle size increases from  $220 \pm 10$  nm to  $350 \pm 10$  nm on the addition of Ga<sub>2</sub>O<sub>3</sub> within BMT nanoparticles. The well-defined P–E loop is observed with the increase in residual polarization and also increase in coercivity.

## ABSTRACT

Lead-Free composites of  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (BZT-BCT) were prepared using ferroelectric  $\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3$  and  $\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  by solid-state reaction method with different mole fractions of  $x$  ( $x = 0.15, 0.30$  and  $0.45$ ). The preliminary structural studies were carried out by X-ray diffraction at room temperature (RT). It revealed that the samples had both tetragonal and orthorhombic structures at room temperature. Rietveld refinement analysis of diffraction data confirmed the coexistence of the tetragonal and orthorhombic phases in the sintered samples. The average crystallite size calculated from the W–H plot of all the samples varies between  $0.0416$  and  $0.0293 \mu\text{m}$ . The dielectric and impedance relaxation properties of the  $(1-x)\text{BaZr}_{0.20}\text{Ti}_{0.80}\text{O}_3-(x)\text{Ba}_{0.70}\text{Ca}_{0.30}\text{TiO}_3$  ceramics were analysed from RT– $600^\circ\text{C}$  in the frequency range of  $100 \text{ Hz}–1 \text{ MHz}$ . The ac conductivity variation with frequency dependence was well fitted according to Jonscher's power law. While the diffusion factor increases from  $1.21$  to  $1.30$  with increase in  $x$  from  $0.15$  to  $0.45$ , indicating a composition-induced diffuse transition. The presence of two semicircles in Nyquist plot were observed, which shows the grain and grain boundary contribution in all samples. The existence of a non-Debye type of relaxation behaviour of the samples was also confirmed from impedance analysis as the centre of the semicircles lies below the real axis. At various temperatures, the frequency dependence of impedance plots has been utilized to characterize the electrical conduction of the sample which demonstrated the NTCR character (Negative Temperature Coefficient of Resistance).

## 1 Introduction

Lead-free ferroelectric materials like BT (Barium Titanate), BZT (Barium Zirconate Titanate), and BCT (Barium calcium Titanate) are very important due to their large value of piezoelectric and dielectric constant. The perovskite  $ABO_3$  type compounds are acknowledged due to their various applications in modern piezo- and ferroelectric devices like sensing and actuating systems, photocatalysis, photovoltaic, piezo-catalysis, pyro-catalysis, and energy harvesting, etc. [1–5]. Low Curie temperature and high dielectric constant make the use of BT feasible at low temperatures. Modifications in Curie temperature can be done by doping with other elements or by mixing BT with other perovskite lead-free ceramics. The lead (Pb) based ceramics such as  $Pb(ZrTi)O_3$  (PZT) shows high piezoelectric and dielectric constant with high Curie temperature and low dielectric loss [6, 7]. But the major drawback of materials with lead as one of its components is that they are very toxic to humans and not environment friendly [8]. Various lead free ferroelectrics namely  $BaTiO_3$ ,  $(K_{0.5}Na_{0.5})NbO_3$ ,  $(Bi_{0.5}Na_{0.5})TiO_3$ ,  $(Bi_{0.5}Na_{0.5})TiO_3$ - $BaTiO_3$ , alkali metal niobates  $ANbO_3$  ( $A = Li, Na, K$ ), etc. had been represented as replacement of lead-based materials [9]. Among them,  $BaTiO_3$  is a room temperature ferroelectric material that exhibits transition at  $120^\circ\text{C}$  (cubic-tetragonal), at  $5^\circ\text{C}$  (tetragonal-orthorhombic) and  $-90^\circ\text{C}$  (orthorhombic-rhombohedral) [10–12].  $Ca^{2+}$  and  $Zr^{4+}$  doped  $BaTiO_3$  ceramics had been recognized due to their technological importance for their high piezoelectric properties [13–16].  $Zr^{4+}$  substitution at the  $Ti^{4+}$  site in BT ceramics enhances the dielectric behaviour and  $Ca^{2+}$  substitution at  $Ba^{2+}$  site modified their Curie temperature with orthorhombic to tetragonal phase transition [17]. Various doped BT systems had been studied for its broad dielectric phenomenon near  $T_c$ , and piezoelectric properties [18]. Structural correlations in the enhancement of ferroelectric property of Sr doped  $BaTiO_3$  ceramics had been observed and reported the higher remnant electric polarization ( $P_r \sim 5 \mu\text{Ccm}^{-2}$  at room temperature and the maximum  $P_r \sim 8 \mu\text{Ccm}^{-2}$ ) of Sr doped  $BaTiO_3$  than pure  $BaTiO_3$  [19].

The motivation to work on BZT-BCT ceramics was due to their high dielectric constant, low loss, and high piezoelectric properties suitable for different applications.  $(x)\text{BZT}-(1-x)\text{BCT}$  composite with

$x = 0.5$  had drawn significant attention due to its appreciable dielectric properties along with the co-existence of tetragonal and rhombohedral phases near the morphotropic phase boundary (MPB) [20–22]. A majority of studies has been carried out on the different properties of BCZT-based materials on conventionally synthesised ceramics using the Solid-State reaction method, calcination temperature ( $\leq 1200^\circ\text{C}$  for 4–6 h) and sintering temperature ( $\geq 1450^\circ\text{C}$  for 2–4 h) [23–26]. Such type of fabrication approach appears to produce a coarse-grained microstructure that is mechanically unstable, limiting device miniaturisation. Sn doped BCZT ceramics investigation showed that the recoverable energy storage has been enhanced with Sn doping rate and reported the highest recoverable energy density and efficiency ( $W_{\text{rec}} = 19 \text{ mJ/cm}^3$ ,  $\eta = 81.65\%$ ). Synthesis of  $Ba_{0.85}Ca_{0.15}Zr_{0.1}Ti_{0.9}O_3$  ceramics by solid state method, sintering in air and nitrogen investigated for structure refinement and impedance analysis and reported the higher dielectric constant when sintered in air [27]. Multiferroic composite of  $SrFe_{12}O_{19}$  and  $Ba_{0.85}Ca_{0.15}Zr_{0.1}Ti_{0.9}O_3$  have been investigated and reported NTCR and non-Debye type behaviour of the ceramic materials [28]. Comparative study of dielectric and ferroelectric properties of  $Cu^{2+}$ - and  $Cu^{2+}/Bi^{3+}$ -doped BCZT ceramics have been studied and reported  $d_{33}$  value, which was  $54 \text{ pC/N}$  for pure BCZT, and  $140 \text{ pC/N}$ ,  $64 \text{ pC/N}$  for BCZTC and BCZTCB respectively [29].

In this paper, we present a structural, dielectric and impedance behaviour of a lead-free  $BaZr_{0.2}Ti_{0.8}O_3$ ,  $Ba_{0.7}Ca_{0.3}TiO_3$  and  $(1-x)BaZr_{0.2}Ti_{0.8}O_3-(x)Ba_{0.7}Ca_{0.3}TiO_3$ , (with  $x = 0.15, 0.30$  and  $0.45$ ) (BZT-BCT) system. Calcination and sintering temperature during the synthesis process have been optimized based on the literature review. Before the optimization of calcination and sintering temperature, we have fabricated the samples at different temperature and time. After the analysis of these data, we synthesised all the samples at  $1200^\circ\text{C}$  (calcination temperature) and  $1250^\circ\text{C}$  (sintering temperature) with the pure phase.

## 2 Materials and methods

$(1-x)BaZr_{0.2}Ti_{0.8}O_3-(x)Ba_{0.7}Ca_{0.3}TiO_3$  (BZT-BCT) (where  $x = 0.15, 0.30$  and  $0.45\%$ ) ceramics were prepared by solid-state reaction technique. Pure starting materials were used ( $BaCO_3$  ( $> 99\%$ ),  $ZrO_2$  ( $99\%$ ),  $TiO_2$

(> 99%), and  $\text{CaCO}_3$  (> 99%) with the above said stoichiometric proportion from Sigma Aldrich. The weighed chemicals were ball milled in the presence of zirconia balls for 12 h in acetone medium for the fine grinding of the particle. The mixed powder slurry was dried at 100 °C for 4 h. After drying, the powder mixtures were calcined at 1200 °C for 12 h. The powder was pressed into pellets of approximately 1 mm thickness and 10 mm diameter at a pressure of 10 MPa using a hydraulic press in the presence of a Polyvinyl alcohol binder by 2 wt. %. Sintering was performed at 1250 °C for 2 h in a closed alumina crucible in the presence of air. After sintering, the pellets were polished. Before measurements, the pellets were washed in the ultrasonic bath for removing dust. After all this treatment, the pellets were heating at 500 °C for 1 h to remove the mechanical strain in the pellets. A powder X-ray diffraction (XRD) study was carried out by using Panalytical X'pert Pro equipped with the  $\text{CuK}_\alpha$  anode ( $\lambda = 1.5408 \text{ \AA}$ ). The different phases were identified by using the diffraction peak refinement method.

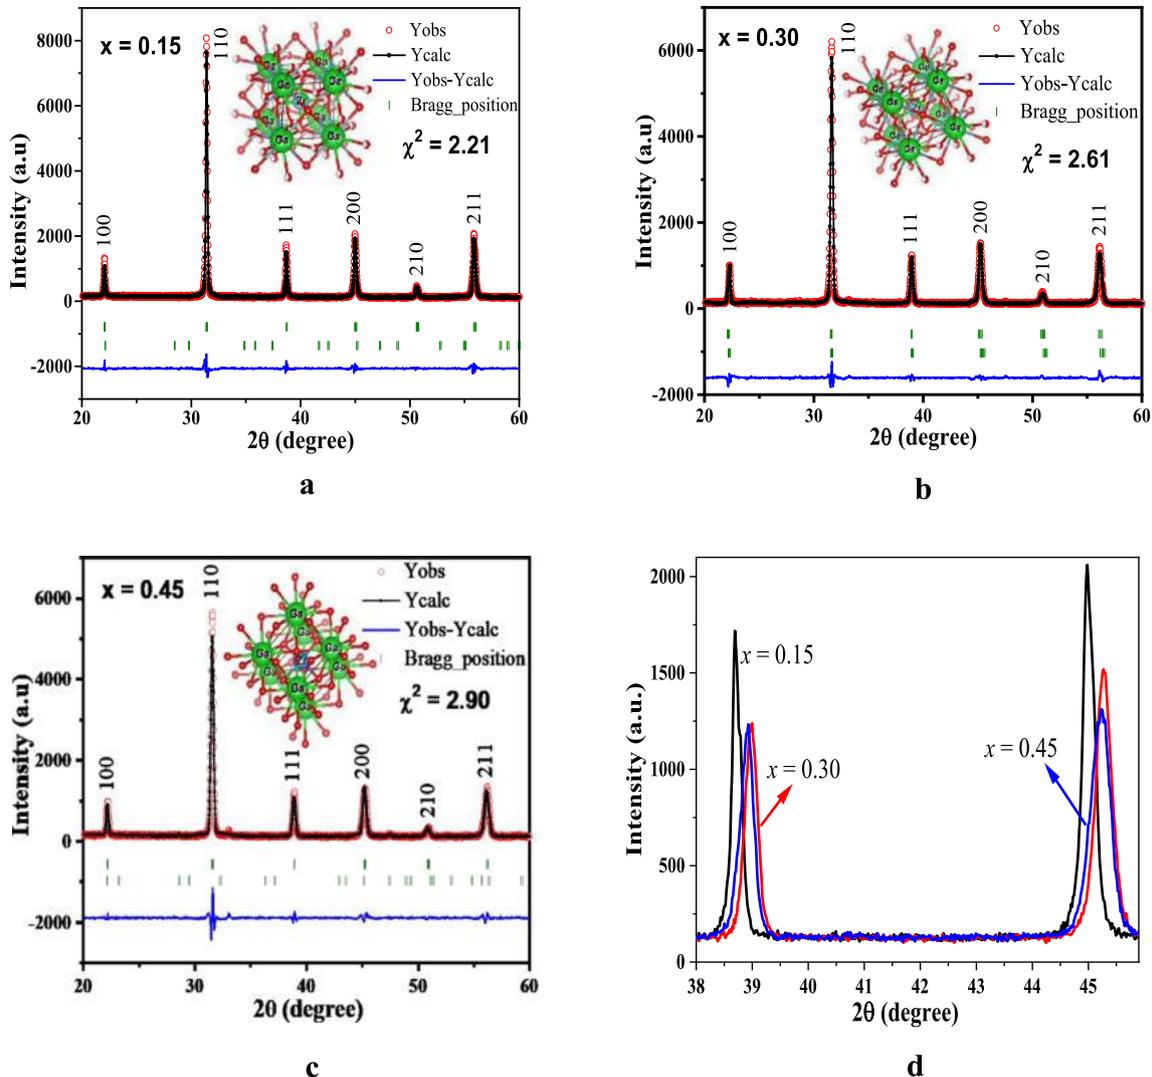

All XRD data were collected from 20° to 80° with a slow scan speed of 2 °/min. Rietveld analysis of all samples was done by using online available FullProf Suite software. Electrical and impedance analysis was taken using KEYSIGHT E4990A Impedance Analyzer (20 Hz -10 MHz) at different temperatures (RT - 500 °C) and different frequencies (100 Hz to 1 MHz). Ferroelectric hysteresis loop (P-E) was recorded on an Automatic PE Loop Tracer, Marine India at a frequency of 20 Hz with an optimal field of 30 kV/cm.

### 3 Results and discussion

#### 3.1 X-ray diffraction analysis

The normalized XRD patterns of all  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.00, 0.15, 0.30,$  and  $0.45$ ) ceramic powder are shown in Fig. 1a-d. XRD patterns confirmed that all the ceramic samples possessed a pure perovskite phase. The XRD lines presented in the patterns were identified as tetragonal and orthorhombic structures. The XRD data of BZT-BCT ceramics were simulated by Rietveld refinement based on pseudo-Voigt fitting function as shown in Fig. 1a-c. Rietveld refinement of XRD data of all samples was carried out in systemic order and the final refined structural parameters of the  $x = 0.00$

were taken as initial input structural parameters for the rest of the samples. In comparison, with increasing the  $x$  value, the (200) peak starts to shift towards the higher side near 45° Fig. 1d. The XRD analysis suggests the possible coexistence of both tetragonal (T) and orthorhombic (O) phases for all  $x$  values, according to the peak profile and fitting parameters. Rietveld's refined data indicates that fitting parameters were found to be well within the acceptable limits (as shown in Table 1). The low-value goodness of fit (GOF) (< 2.90) for all samples, indicating, the experimental and theoretical data were matched. Figure 1d shows the enlarged views of the main peaks in the  $2\theta$  range of 38–40° and 44–46°, respectively. No impurity phase exists with an increase of the BCT content in samples. The average crystallite size was calculated by Scherrer equation  $D = \frac{0.9\lambda}{\beta \cos\theta}$  where  $D$  = average crystallite size,  $\lambda$  = wavelength of the incident X-rays,  $\beta$  = full width at half maximum (FWHM), and  $\theta$  is the Bragg diffraction angle. The X-ray density ( $\rho$ ) was calculated by the equation,  $\rho = \frac{ZM}{NV}$  (where  $Z$  is the number of molecules per unit cell which is 12 for perovskite materials,  $M$  is the molecular weight,  $N$  is Avogadro number and  $V$  is the volume of the unit cell) [30]. For  $x = 0.30$  and  $0.45$  compositions, there was no clear splitting (the only hump and shifted towards a higher angle) observed. From the inset graph, we found that the peaks at 38° and 44° in  $x = 0.00, 0.15$  showed clear splitting. The peak intensity of these two peaks had also been found to change with increasing  $x$ . There is no splitting found in  $x = 0.30,$  and  $0.45$  samples. As the  $x$  content increased, the main diffraction peaks also merge in one intense peak (111) (200) and gradually shifted towards higher angles. For all the samples, the best fitting was obtained for the tetragonal crystal structure, which belongs to the  $P4mm$  space group. The refined structural parameters (lattice parameters, volume of the unit cell, atomic positions, R-factors (%), GoF, and tolerance factor) of all the samples are shown in Table 1. A lower value of GoF for all the samples confirmed an excellent match between the experimental and calculated results. The variation in unit cell parameters and unit cell volume value with  $x$  content is also shown in Table 1. From Table 1, with an increase in  $x$  content, for all the samples lattice parameters and cell volume decreases. This is also supported by the shifting of peaks towards higher angles with an increase in BZT-BCT samples. The

**Fig. 1** a–c XRD pattern of  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.15, 0.30$  and  $0.45$ ) ceramics (d) expanded XRD pattern of all samples for 111 and 200 reflection  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.15, 0.30$  and  $0.45$ ) ceramics

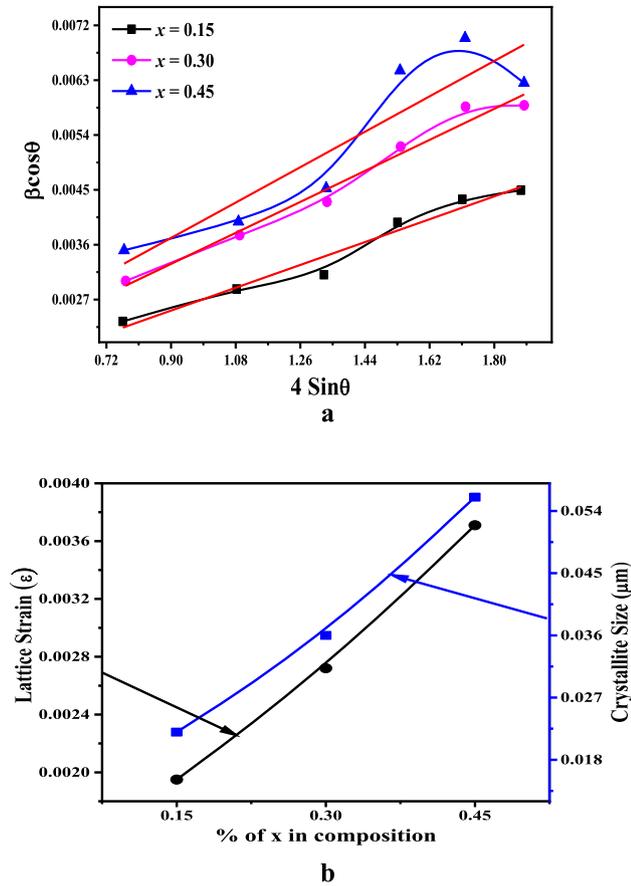

volume of the unit cell decreased with increasing  $x$  content. Bond distance and bond angle of  $\text{O}_1\text{-Zr-O}_2$  and  $\text{O}_1\text{-Ba-O}_2$  were found to decrease with an increase in BCT concentration. Structure and orbital ordering depend on the distortions in the lattice, oxygen content, and oxygen complex network in the perovskite lattice [31, 32]. There is no change in the  $c/a$  ratio with an increase in the  $x$  ratio, indicating the same tetragonal distortions.

It can be described by the Williamson-Hall uniform deformation model (UDM). The UDM plots for the  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.00, 0.15, 0.30,$  and  $0.45$ ) ceramics are shown in Fig. 2a. The graph was plotted between the  $\beta_{\text{hkl}} \cos\theta$  and  $4\sin\theta$ . The plots clearly showed that all the samples had a

positive slope, indicated that the samples had a positive strain or tensile strain. The increase in lattice parameters, which was also revealed by Rietveld’s analysis, could be attributed to this tensile strain. The lattice strain increases from 0.00195 to 0.00371 as  $x$  varies from 0.15 to 0.45 mol% of concentration. As per the figure, it affirms that, if the crystalline size increases, strain increases [33]. Further to that, the slope and intercept of the plot of Fig. 2a by the method of linear fitting were used to calculate strain ( $\epsilon$ ) and crystallite size ( $D$ ). Variation of these parameters were shown in Fig. 2b with respect to  $x$  mol% of concentration. The widening of Bragg peaks in the XRD pattern is noteworthy in evaluating the crystallite size and in the estimation of the lattice strain

[34]. The Bragg peak broadening generally depends on the sample and the instrument factor of XRD. The broadening of peaks demonstrated that there was a huge strain associated with the grain. According to, W–H plot the crystalline size increases with increasing the lattice strain [35]. In Table 2 parameters calculated from W–H plot had been reported. The existence of uniform tensile stress in the samples was suggested by the apparent shift (higher  $2\theta$ ) in the diffraction peaks with a concentration. From Fig. 1

**Fig. 5 a–c** Variation of  $\ln(1/\epsilon - 1/\epsilon_{\max})$  vs  $(T - T_{\max})$  in the paraelectric region  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.15, 0.30$  and  $0.45$ ) ceramics

we found that the XRD peaks shifted towards the higher side in 2theta, due to which the strain developed in samples with the change in the concentration.

**Dielectric study**

Figure 3a–c indicates the temperature dependence of the dielectric constant ( $\epsilon$ ) of  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.75}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.15, 0.30$  and  $0.45$ ) ceramics at different frequency ranging from 1 to 1000 kHz. It was observed that  $\epsilon$  decreased after the Curie temperature  $T_c$ .  $T_c$  was found to be shifted towards the high-temperature side with frequency. It was also observed that there were slight changes in the dielectric constant with frequency increases. The slope of the figure (broadening of peaks at  $T_c$ ) confirms that the transition was diffused type of phase transition (DPT). Figure 4a–c illustrates how dielectric loss varies with temperature ( $\tan \delta$ ) for  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.15, 0.30$  and  $0.45$ ) ceramics at different frequencies. The value of  $\tan \delta$  increased with an increase in temperature, and after that, it decreased showing an anomaly. From Fig. 5a–c the equation  $\ln(1/\epsilon - 1/\epsilon_{\text{max}})$  vs  $(T - T_{\text{max}})$  was used to measure the degree of disorder or diffuseness (i.e. diffusivity) in the phase transition of BZT–BCT, where  $\epsilon$  is the dielectric constant at temperature  $T$  and  $\epsilon_{\text{max}}$  is its maximum value at  $T_{\text{max}}$ . The maximum value of diffusivity calculated from the graph was found to be 1.30 for  $x = 0.45$  composition. This demonstrates that in materials with a high degree of disorder, a diffused phase transition occurs. The value of  $\gamma$  was found to increase with increasing  $x$  content. The occurrence of disordering in this system can thus be interpreted as a deviation from the Curie–Weiss type of phase transition behaviour. Detail of parameters calculated from dielectric studies had been reported in Table 3.

**3.2 Impedance study**

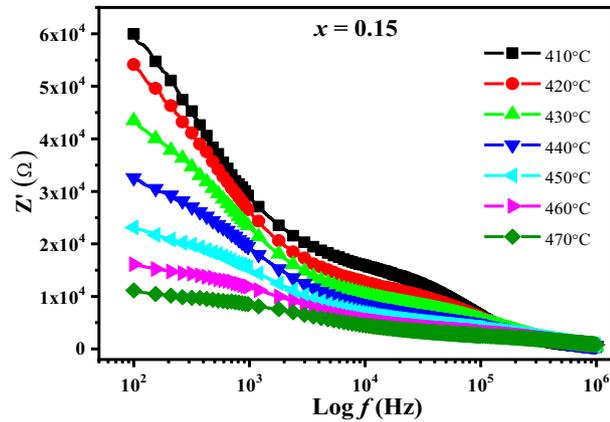

Figure 6a–c shows  $Z'$  (real part of impedance) as a function of frequency. It was found that  $Z'$  decreases as temperature increases which shows the Negative temperature coefficient resistance (NTCR) behavior

of the samples. At a lower frequency,  $Z'$  possessed higher values while it decreased at a higher frequency. Figure 7a–c shows the deviation of  $Z''$  (imaginary part of impedance) as a function of frequency at different temperature ranges. It was observed that the imaginary part of impedance decreases as frequency increases. It is clear from the figure as we moved towards the high frequency, all the curves merged at a point. The peak shifted towards the high-frequency side with increasing temperature. The decreasing magnitude of the imaginary part of impedance ( $Z''$ ) with increasing temperature indicated a reduction in the resistive behavior of the samples. The existence of a temperature-dependent electrical relaxation phenomenon is indicated by the shifting of peaks with increasing temperature [36, 37].

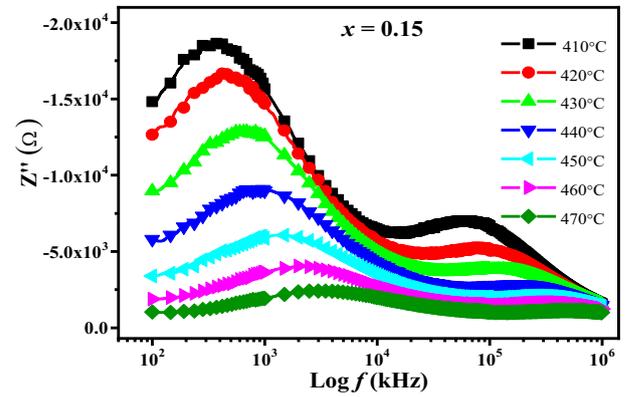

Figure 8a–c shows the frequency dependence of  $M'$  (real component of dielectric modulus) at different temperatures over a broad range of frequencies of  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  composites with  $x = 0.15, 0.30, 0.45$  materials. From the observed experimental results, we found that the value of  $M'$  is lower at lower frequencies, gradually increases with increasing frequency, and eventually saturates at higher frequencies for all temperature ranges. The short-range mobility of charge carriers is responsible for this type of saturation behaviour. Figure 9(a–c) shows the discrepancy of  $M''$  (imaginary part of the modulus) with the frequency at different observed temperatures of all the samples. At both low and high frequencies, the peaks were found to be asymmetric and broad. The lower frequency peak indicates that ions can move long distances, while the high-frequency peak indicates that ions are confined within their potential well. With increasing temperature, the peak value ( $M''_{\text{max}}$ ) imaginary part of modules shifts towards a higher frequency, as shown in the figure. This demonstrates  $M''$  strong reliance on temperature and frequency when it comes to correlating the motion of mobile charge carriers [38].

**Table 3** Details of the physical parameters of  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.15, 0.30$  and  $0.45$ ) ceramics at 1 kHz

**Fig. 13** a–c Modulus scaling behaviour of compounds in the master curves of  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  (where  $x = 0.15, 0.30$  and  $0.45$ ) of the ceramic materials at different temperature

temperature dependence of the complex modulus spectrum of all samples at different temperatures. The pattern was characterized by the presence of little asymmetric and single semicircular arcs whose center does not lie on the real axis. This type of behavior confirms the non-Debye type of relaxation in all ceramic materials. With an increase in temperature, these semicircular arcs on the real axis appear to shift towards the lower value of  $M'$  [28].

The sample's scaling nature was investigated by plotting the normalized plots of  $Z''/Z''_{\max}$  and  $M''/M''_{\max}$  as a function of the normalized frequency at various temperatures for all ceramic materials and shown in Fig. 12(a–c) and Fig. 13(a–c). At different temperatures, the normalized plot overlaps on a single master curve. The modulus scaling behavior reveals information about the dielectric processes taking place within the material. The FWHM calculated from the normalized spectrum is greater than the  $\log \frac{2+\sqrt{3}}{2-\sqrt{3}}$ , indicating non-Debye behavior, which was confirmed by a complex impedance graph. With increasing temperature, the peak shifts and broadening were observed at higher frequencies. The emergence of temperature-dependent peaks ( $Z''_{\max}$  and  $M''_{\max}$ ) at a specific frequency ( $\omega_{\max} = 2\pi f_{\max}$ ) suggested the presence of a temperature-dependent relaxation process [39]. These relaxation processes could be influenced by defects that were mobile at high temperatures and remained immobile at low temperatures. With increasing temperature, the peaks shifted and broadened at higher frequencies.

## 4 Conclusion

In summary, the complex perovskite oxide  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  ceramics (with  $x = 0.15, 0.30,$  and  $0.45$ ) were fabricated by a solid-state reaction method.  $(1-x)\text{BaZr}_{0.2}\text{Ti}_{0.8}\text{O}_3-(x)\text{Ba}_{0.7}\text{Ca}_{0.3}\text{TiO}_3$  ceramics (with  $x = 0.15, 0.30,$  and  $0.45$ ) crystallized both in the tetragonal and orthorhombic crystal system. The temperature dependence of the dielectric constant showed the presence of diffused phase transition in the BZT-BCT system. By varying BCT content in samples, the lattice parameters and cell volume get suppressed. Due to grain and grain boundary effects in all samples, the complex impedance and modulus plot found two semicircles over the frequency range of 100 Hz–1 MHz. Complex

impedance analysis also confirmed the existence of a non-Debye type of relaxation. The low dielectric loss is experienced in all the samples. The transition temperature ( $T_c$ ) was also found to shift towards the high-temperature side as the frequency was increased from 1 to 1000 kHz. It was also observed that  $T_c$  shifted towards the high-temperature side with an increase of frequency from 1 to 1000 kHz. It was observed that all the compositions had a value of  $\gamma$  between 1 and 2 which indicated a diffused ferroelectric behavior. Further, these composites show the transitions to be a diffuse phase transition. The complex impedance study suggested the NTCR behavior of the system indicating the semiconducting nature of the material. We have demonstrated that a composite material can prove to be an effective way to further improve the temperature stability range, dielectric, and ferroelectric properties to meet specific requirements for applications. These materials can be used for the piezoelectric and energy harvesting devices. Such type of ceramics is very useful for the electrocaloric/ fluorescence and energy storage devices.

## ABSTRACT

Arsenic is a naturally occurring toxic metalloid present worldwide. Arsenic in its inorganic form is the most hazardous and is responsible for causing different diseases like cancer, skin disease, and many neurological disorders in humans which can be demonstrated by several experimental models. Contamination of the drinking water by metal toxins has been a major problem worldwide in which arsenic is one of the major. For the past few decades, there has been increased concern about the health risk due to arsenic and lots of epidemiological studies have been done suggesting an arsenic role in developing neurotoxicity. They also suggest the neurological damage caused by arsenic in children. In this current work, we are trying to explore the different mechanisms involved in arsenic neuropathy and the effects of arsenic-contaminated water on the spatial memory, frontal cortex, and hippocampal ultra-structures, and many other different regions of the brain disrupted by arsenic. Additionally, this review will guide the viewer to determine their future directions for the remission of developing arsenic neuropathy.

**Keywords:** Arsenic · Oxidative stress · Neurotoxicity · Frontal cortex · Hippocampus

## I. INTRODUCTION

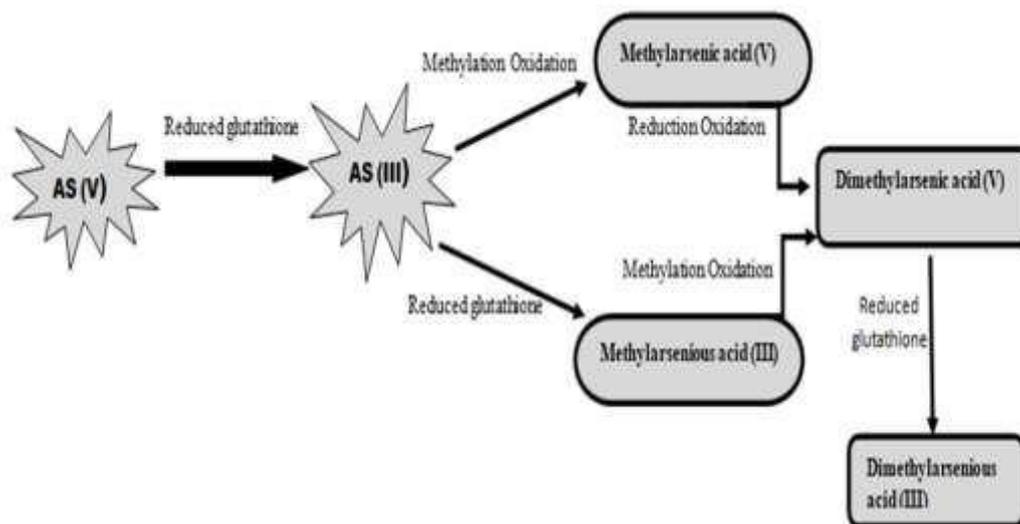

Arsenic, a metalloid occurring worldwide found in the environment from various natural and anthropogenic sources [1] at an average concentration of 1.8 ppm [2]. Arsenic is first of all the toxicants posing a significant known or direct and indirect potential threat to humans [3]. It is a co-carcinogen and in lower concentration also known to increase cognitive impairment [4]. It exists both in plants and animals, naturally, it occurs in its organic form which is less toxic [5]. Most exposure to humans occurs from the consumption of water in the form of inorganic arsenic (iAs) i.e., arsenite (As [III]) and arsenate (As[V]), which is abundantly available in water and

the most toxic form of arsenic [6]. The presence of arsenic in the groundwater is a major health problem globally, due to its various ailing effects [7, 8, 9]. Therefore, the identification of new regions with arsenic contamination in Asia has aroused great concern, as the large population is at risk of exposure [10, 11, 12]. Around 140 million people all over the world are exposed to arsenic-contaminated water [13]. Besides, its anthropogenic uses as an alloy, different semiconductor, transistors, metal adhesives and pigment factories [14, 15], mining, fossil fuels burning, natural weathering, and volcano eruptions also introduce arsenic to the environment [16] and therefore the presence of arsenic in the environment enhances the risk of exposure to humans which arises a need to explore its possible clinical effects and its various other links and other environmental sources.

Consumption of arsenic-containing water above 50g/l during pregnancy enhances the risk of fetal loss [17, 18]. It is also found to enhance immune suppression and incident to various infectious diseases in both mother and child [18, 19]. Peripheral neuropathies are quite common in arsenic-exposed individuals [20]. Neurological deficits in children and adults have been reported as the consequences of environmental and occupational exposure to arsenic [21, 22]. Arsenic exposure (>10 µg/L), the permissible water arsenic concentration considered safe by the WHO which can lead to declines in its different ailing effects.

### 1.1 Arsenic metabolism

The most common valence state of inorganic arsenic (AsV) is its arsenate form whereas arsenite is potentially found in groundwater in the form of sodium arsenite (Na<sub>3</sub>AsO<sub>3</sub>) due to the interaction with aquifer minerals and physiochemical conditions favoring its release.

**Figure 1. Proposed metabolic pathway of conversion of inorganic arsenic to organic arsenic**

The proposed metabolic pathway of Arsenic is shown in Figure 1 [23, 24]. Glutathione conjugation and Oxidative methylation are known to be the primary pathways of Arsenic metabolism [25]. Inorganic Arsenic (V) is reduced to Arsenic (III). Inorganic Arsenic (III) is methylated to methyl arsenic acid (V) and methylarsenious acid (III) which is reduced and methylated to Dimethylarsenic acid respectively. Dimethylarsenic acid formed by oxidation and reduction of As(III) and As(v) forms Dimethylarsenious acid (III).

Higher occurrence of skin lesions, cancer, neurological disorders, impairment of psychological and mental health, cardiovascular disorders, and infertility problems are reported in countries like Colombia, Argentina, Japan, Mexico, Bangladesh, and Taiwan where consumption of groundwater is high [26, 27, 28, 29, 30, 31]. Rising evidence of animal and human studies indicates that arsenic has toxic effects on the central and peripheral nervous systems [32, 33]. Presently, the concern over the increasing neurotoxicity of arsenic has been raised. [34, 35]. Development of physiological abnormalities including decreased growth rate, neural defects, malformation [36, 37, 38], and other behavioral changes as arsenic can directly reach the brain as it can cross the blood-brain barrier and placental barrier freely [39, 40, 41, 42, 43]. Several epidemiological studies have demonstrated that arsenic exposure leads to poor, impaired cognitive, and neuropsychological functioning suggesting its role in brain dysfunctions [44- 47]. Infertility, Neural tube defects, neonatal deaths, spontaneous abortion were reported in pregnant women consuming water

contaminated with high arsenic content [36, 48, 49, 50]. Arsenic levels are also found in the breast milk of Bangladeshi women which can adversely affect the infant's health [51]. This finding suggests arsenic may cause impaired fetal growth and can also affect infant health adversely. The underlying mechanism of arsenic-induced neurotoxicity is not clearly known, though several mechanisms have been proposed from various animal and human studies. Arsenic metabolites cause the inactivation of the enzymes involved in the cellular pathways as well as the formation and repair of DNA is the target of the metabolites formed [52], oxidative stress, thiamine deficiency, and decreased acetylcholinesterase activity are some of the mechanisms involved in the arsenic-induced neurotoxicity.

## II. EXPERIMENTAL AND EPIDEMIOLOGICAL EVIDENCES OF ARSENIC INDUCED NEUROTOXICITY

### 2.1 Experimental evidences

Long-term arsenic exposure to humans has been associated with impaired intellectual function in children and adults. Various In vitro and In vivo studies have been conducted as epidemiological evidence of As-induced impaired cognition.

Several studies have been conducted that in mice providing evidence for the toxic effects of arsenic on the entire brain [53, 54] and its discrete regions [55, 56]. Studies also support the evidence that assures the effect of acute and chronic exposure of arsenic develops deficits in spatial

working memory, short term, and long term memory impairment, and damaging different neurological regions responsible for memory impairment. The study indicates the effects of arsenic-containing drinking water on different regions of brain hippocampal ultra-structures, spatial memory, and N-methyl-d-aspartate receptor expression in SD rats [57]. Some studies also indicate that Postnatal exposure to low-concentration of arsenic induces autism-like behavior and affects the frontal cortex in the brain of rats [58].

A. Anwar-Mohamed et. al. investigated and found that acute arsenite (As(III)) exposure can lead to a decrease in cytosolic phospholipase A2 (cPLA2) with a subsequent decrease in brain catalytic activity of mice. It also alters CYP epoxygenases and CYP -hydroxylases, increases expression of cyclooxygenase-2 (COX-2), 5-lipoxygenase (5-LOX), and 15-LOX mRNA while decreasing prostaglandins F2 (PGF2) and PGJ2. This altered state of the different enzymes affects brain development and neurochemistry [59].

## 2.2 Epidemiological evidences

Many Epidemiological investigations found that low level and chronic exposure to arsenic can be broadly related to serious toxic effects on intellectual functions and early exposure to arsenic can cause full memory deficit by interfering with different brain functions.

In children, adverse neurobehavioral outcomes have been associated with acute and chronic arsenic exposure. A meta-analysis in arsenic-exposed children indicated intelligence deficits; considering 4 cross-sectional studies in China on arsenic exposure and IQ effects, this analysis found that the overall mean IQ score of children who lived in arsenic-exposed areas was more than 6 points lower than the mean score in unexposed children.36 Indeed, a growing number of studies are confirming intellectual deficits associated with arsenic exposure in children as young as 5 years of age [60-68].

A cross-sectional study conducted on older age relates to chronic arsenic exposure in adolescents. The study found that adolescent exposure to the arsenic-contaminated water in early life performed poorly in 3 of 4 neurological subtests when compared with the unexposed control groups, indicating an alteration in neurobehavioral development in later life might be due to the exposure during childhood exposure [69].

A study on the geriatric population exposed with long term low-level arsenic exposure (average 6.33 mg/L), estimated by the geographic information system (GIS)-based models was significantly associated with impaired executive functioning, slower processing speed, diminished visuospatial skills, poorer global cognition, slower processing speed, reduced language and reduced short term memory [70].

A study on 6-8year old school children in Mexico suggested that arsenic toxicity can lead to different neurological alterations including memory, problem-solving ability, and attention span [63]. A longitudinal cohort study was conducted on children in Bangladesh suggested that there was a reduction in verbal IQ and full-scale IQ associated with arsenic exposure [71].

Urinary arsenic has been inversely associated with full and verbal IQ in 6-8yr old children in Mexico [60]. Finally, arsenic in drinking water has been associated with decreased full IQ scores in children 6- to 10 years of age [62]. In a meta-analysis, including 15 studies evaluating the effect of arsenic on neurodevelopment, in which 13 articles showed a significant effect on neurodevelopment in children of age between 5-15years. In separate meta-analysis assessing arsenic exposure in urine (n ¼ 6) and those that studying drinking water (n ¼ 4), observed that combined effect suggests that a 50% increase in arsenic level in urine would cause a reduced IQ level by 0.39 points, whereas 50% increase in water causes a significant reduction in full-scale IQ by 0.65 points [72]. The timing of exposure to arsenic seems to affect the outcome.

In a study that directly quantified water arsenic exposure, above-median early prenatal maternal arsenic exposure in drinking water was found to be associated with a decreased verbal IQ in children, and late gestational maternal arsenic exposure was associated with a decreased performance IQ in children at 5 years of age [51].

## III. MECHANISMS INVOLVEMENT IN NEURODEGENERATION AND MEMORY IMPAIRMENT OF ARSENIC

**3.1Oxidative stress and intracellular pathways activation :**In vivo studies have demonstrated that high iAs concentration (i.e., 4 mg/L), leads to neurological damage-inducing oxidative stress and decreased amount of superoxide dismutase, 8-nitroguanine and peroxiredoxin 2 and expression in the neurological tissue of exposed rodents [73],

glutathione after exposure to 50mg/L [74] and increased expression of superoxide anion, singlet oxygen, hydrogen peroxide, hydroxyl radical, and peroxy radicals in different cells [75, 76, 77]. The main signal transduction pathways altered by ROS are: (i) the tyrosine phosphorylation system; (ii) transcription factor families, including the activating protein-1 (AP-1) and nuclear factor-kB (NF-kb); and (iii) mitogen-activated protein kinases (MAPKs) like ERK1/2 [78].

**3.2 Pro-inflammatory mediators:** Fry et al., found that iAs in concentrations higher than 10mg/L are known to cause overexpression of NF-Kb and IL-1B in the umbilical cord of newborns which causes the overproduction of the inflammatory mediators in urothelial cells [79]. An increase in different inflammatory markers – such as TNF-a, IL-1a, IL-8, and IL6 are also get increased in human and rodents peripheral blood [80, 81, 82].

**3.3 Neurotransmitter synthesis and regulation:** Arsenic has been found to produce decreased levels of different neurotransmitters, such as norepinephrine (NE), epinephrine (EPN), Dopamine (DA), serotonin (5-HT), and acetylcholine in the different regions of rats brain exposed to sodium arsenite(20mg/L p.o) [83], whereas glutamate expression also gets reduced in the brain when rats are being exposed to sodium arsenite(70mg/L) [84]. As arsenic activates multiple pro-inflammatory signaling pathways which in turn activates indoleamine 2,3-dioxygenase or IDO leading to a reduction in serotonin availability increasing KP's (kynurenine pathway) intermediates which negatively modulates the release of different neurotransmitters including Ach, dopamine, GABA, and glutamate [85]. Therefore, KP impairment may impose a negative impact on the brain and can lead to many neurological and neurodegenerative diseases and also cognitive deficits [86].

**3.4 Mitochondrial Dysfunction:** There are several studies that support the damage in the mitochondrial region of the brain region by arsenic at different concentrations in rats that are 2 mg /kg BW for 10 weeks [87], 2.5 mg /Kg BW for 4weeks [88], 20 mg/Kg BW for 28 days [89], 10 mg/ kg BW for 16 weeks [90] and 100 ppm for GD 6 to PND 21, 28 and 3 months [91] and found that there is an increase in ROS, lipid peroxidation in the frontal cortex

and hippocampus region of the brain and reduced content of GSH, MnSOD and CAT, GPx and GST in rats and pups respectively in the mitochondria of the cerebral cortex, cerebellum and hippocampus regions of the brain.

**3.5 Autophagy impairment:** Studies show that autophagy plays an important role in regulating pathophysiology [92], as there are many neurodegenerative diseases associated with impaired autophagy such as Parkinson's, Autism, Alzheimer's, and Huntington's where defective BBB plays a major role [93]. Ram Kumar Manthari et.al. found that the leaky BBB in the cerebral cortex and hippocampus may facilitate the transfer of As and induces autophagy by inhibiting PI3K/Akt/mTOR signaling pathway that causes the rats at PND21 more vulnerable to As-induced neurotoxicity [94]. Qi et al., found that sodium arsenite (0.25mM) inhibited autophagy in human bronchial epithelial cells [95].

**3.6 Ultra-structural changes in Brain and accumulation of proteins:** Ultrastructural changes in neurons and endothelial cells in the hippocampus, found when the rats are being chronically exposed to sodium arsenite. The expressions of NMDAR subunits in the hippocampus were decreased and there was a reduction in NR2A mRNA levels in the hippocampus after arsenic exposure [96]. Many In vitro and In vivo studies showed that the metabolites induce tau protein hyperphosphorylation, which is acytoskel biomarker for different neurological disorders [97,98]. As arsenic is known to cause oxidative stress which can lead to lead to the activation of kinases, including GSK-3and p38, which phosphorylates tau proteins leading to disassembling of microtubules and is responsible for the formation of tau oligomers [99]. Sodium arsenite has also been reported to decrease PPARg expression while increasing TNF-a and NF-kb contributing to the formation of reactive species and Ab oligomers.

**3.7 Impaired expressions of proteins:** Studies have shown that arsenic in its trioxide form at 0.15 mg or 1.5 mg or 15 mg doses when administered from gestational to lactational and continued to the pups till PND42 in

drinking water causes declined mRNA expression of TJ proteins, Occludin protein, PI3K, Akt, mTOR, and p62 [94].

**3.8 Endoplasmic reticulum stress:**Endoplasmic reticulum stress: Accumulation of misfolded proteins triggers unfolded protein response (UPR). An impaired UPR, leading to apoptosis. In brain protein aggregation, improper synaptic function, impair signal transduction contributes to the development of several neurodegenerative diseases. AD, PD, HD, and ALS besides their protein folding and aggregation are also characterized by increased ER stress and UPR activation [100]. The ability of sodium arsenite and metabolites in rat liver cells was also demonstrated [101]. Bolt et al. established that In vitro 1.5mM sodium arsenite activates the ER stress in three-pathways: protein kinase-like endoplasmic reticulum kinase (PERK), inositol requiring enzyme (IRE-1) in human B lymphoblastoid cell line, and activating transcription factor 6 (ATF6) [102]. Chiu et al. found that programmed cell death was induced on exposure to arsenic trioxide through the stimulation of ER stress. It was also found to suppresses the ubiquitin-proteasome system and Akt/mTOR signaling pathways in human sarcoma cells [102, 103].

Studies indicate that arsenic-induced ER stress is associated with both ROS-dependent and ROS-independent pathways, and includes phosphorylation of eIF2 $\alpha$  (the translation initiation factor) and over-expression of chaperones [101,104,105]. Also, involve activation of JNK/Erk pathway has been found to be involved in ER-related cellular apoptosis [104].

Some of the In vitro studies account that iAs also disrupt mitochondrial membrane potential, increasing intracellular calcium level and increased cytochrome C level and impair Akt expression and activation leading to arise different mechanisms for the development of arsenic toxicity activation [106,107,104].

#### IV. CONCLUSION

Several experiments have been conducted in the last few decades which shows arsenic is one of the major toxins contaminating water and it seems that it is the major cause behind many neurodegenerative diseases and cognitive impairment in adults as well as in children. On analysis, the mechanism underlying the

neurotoxicity include neurotransmitter synthesis and their transmission, Protein accumulation and their impaired expressions, increased oxidative stress, production of pro-inflammatory mediators, impaired autophagy. Based on these, we can conclude that arsenic via the above-discussed mechanisms may lead to imposing neurotoxic effects on different regions of the brain that may lead to neurodegeneration and cognitive impairment.

Professor, Lingaya's Vidyapeeth, Faridabad, Haryana

### **Abstract:**

**Purpose** – To investigate the factors that influence working women's purchase choices regarding personal care items in the National Capital Region.

**Research Design/Methodology** – A survey with 200 participants was conducted, and the data was later analysed using SPSS to discover the variables influencing the purchasing choices of working women.

**Findings** – The study's significant results indicate that the brand of the product influences the purchase behaviour of working women based on age. In contrast, the working women's income does not affect the factors of purchase consideration for the study.

**Managerial Implications:** The research findings help understand the factors influencing the purchase decisions of working women in purchasing personal care products and for companies to develop holistic and workable strategies catering to the needs of the present-day market.

**Limitations:** The research is limited to analysing the variables impacting the purchasing decisions of women consumers in the National Capital Region; however, other research in this relevant field might examine consumers' purchasing decisions in a variety of geographical regions.

**Keywords** – Purchase Behaviour, National Capital Region, Personal Care products, Working Women,

### **Introduction:**

Consumer behavior consists of all human behavior that go in making purchase decisions and it involves psychological factors, which of men and women are not same. Women take on variety of different roles in purchasing decisions and should be treated this way by marketers and advertisers.

Having a good understanding of how the purchasing function is organized in families by women makes marketers to give best efforts on segmentation of markets on the basis of women consumers. Changing roles of women at work and home have led business leaders to recognize women as the largest and most important market. Women make 83% of all consumer purchases and 80% of health care-related decisions in their household.

In general, personal care products are those that a customer uses for maintaining self-care & hygiene. Among the items are soaps, hair shampoo, talcum powder, cold cream, toothpaste, toothbrushes (aromatherapy), antiperspirant (hair oil), cleanser (skin care), newborn care (care for newborn babies), and beauty care (beauty care). There are specific functions & benefits of these products.

Consumers are willing to spend more money on a well-known and prestigious brand for their specific needs. Social media, lifestyle and advertising have played a vital role in increasing interest among consumers about a product usefulness and benefits. Customers living in urban, semi-urban or rural cities have become much more brand conscious, as higher brand image represents, better quality of product and value for money.

By 2025, it is expected that India's personal care industry would exceed US\$ 20 billion from the current level of US\$ 6.5 billion. This is due to the so-called upward spike in disposable income for the middle classes, as well as growing expectations of customers to live a quality and healthy lifestyle. FMCG companies are exploring and introducing various product categories with great price ranges to cater to big disparities in buying power. According to many researchers the rural population is becoming much more brand conscious and is more willing to try out new brands & experience the premium quality personal care products as multinational companies are penetrating extensively into the rural markets to fuel growth through their franchise expansion. More than 68 per cent of younger people say that utilizing grooming items helps them to feel more confident in their appearance and makes them feel more socially acceptable among their peers.

## II. LITERATURE REVIEW

R. Lavuri and D. Sreeramulu (2019) examined the purchasing behavior of female customers when it comes to personal care items. The research discovered that product attributes such as brand loyalty, brand recognition, and product quality all had a substantial correlation with respondents' purchasing behavior. Additionally, it was revealed that brand ambassadors and Family & Friend recommendations positively correlate with personal care product purchases.

Rajarajan.M., Birundha.G. (2016) is a solid believer that if the investigation's suggestions are properly evaluated, the affected parties will take necessary action. The demands of the responders may appear as expected, and both consumers and producers will feel soothed, placated, and free to act in their natural manner.

Sumesh. R. Anu (2016) analyses a similar examination of consumer identification and purchase behaviour for individual consideration items. Buyer behaviour refers to how individuals, groups, and associations pick, acquire, utilise, and discard items, administrations, ideas, or experiences to meet

their requirements and wants. The research revealed that the market's growth is being driven by a rising trend of various restorative goods, exceptional care products, healthy skincare items, and hair care items, among other things.

Suganya S and Beena Joice M (2016) consider efforts to understand women's purchasing behaviour and identify the elements that influence their purchasing behaviour. By using the comfort inspecting technique, a poll was constructed and sent to female purchasers. The ad hoc sample comprises 150 people who answered the survey questions. There are several components to the assessment. The assessment gives proof and morsels of information examined and reveals that brand loyalty, temperament, attributes, and conviction significantly impact drive females gaining. The findings demonstrate that motivation has a favourable influence on purchase behaviour.

Sanjeev Kumar, Savita Maan, and Vandana Sabharwal (2014) discuss the utilisation of examples, factors, and brand ownership regarding women's beauty care goods. Additionally, it studies the factors that influence women's purchase decisions for cosmetics products. All females cited brand as their top factor while shopping. The purchase of healthy skin products is influenced by many aspects, including quality, anticipation, and fit for one's skin type. According to the study's findings, the cream is the most often used moisturiser across all age categories. Male Toners, who were antagonistic to the process of maturation, were honoured to be desired by developed females.

Dr D.K. Sinha and Siddhartha Shriram Shimp (2012) investigated and evaluated the dispositions, brands, and values that influence female purchase behaviour. The analysis provides evidence and comprehension of the many aspects examined and reveals that confidence, self-introduction, and unity have contributed to women attaining increased prominence. Each person has a unique approach to obtaining the process; nonetheless, they are all influenced by distinct factors.

Sushil Mohan, M.D. (2012) When it comes to female consumers' purchasing behavior, status branding, brand thinking, paying a premium for marked clothing, self-image, and reference groups all have a favorable impact while also enhancing female consumer inclusion in fashion items. Customers' practices are impacted by several criteria, such as culture, social class, reference group affiliation, family, income level and income independence, and age. As a consequence of these influences, customers display a variety of client behaviours. Eighty-eight per cent of motivational buying has been based on a buyer's statistical profile. The indicator factors' quality revealed that teaching was unimportant but had the most significant influence on customer buying. Personality has a crucial impact on consumer purchasing behaviour since each consumer has unique personality qualities that reflect their purchasing behaviour. Agbo Onu, J. C. (2014).

### **Research Objectives:**

- The main objective is to understand the purchase behaviour of the working women while purchasing personal care products at the National Capital Region.
- To identify the key factors influencing the purchase of personal care products from the available literature.
- To test the factors affecting the purchase behaviour of working women while purchasing personal care products based on age and income.

## METHODOLOGY

**Research design:** The research is exploratory; a survey approach was used.

**Sample design:** The convenience sampling methodology was used to choose a representative sample of 200 respondents.

**Questionnaire design and pre-test:** The data were obtained using a structured questionnaire, and a primary analysis was undertaken to ensure that the questionnaire gathered sufficient information.

**Sampling Area:** National Capital Region

**Data Collection:** The researcher collected the requisite data by the researcher by visiting the stores in the months of December-2020, January and February-2021.

**Measurement:** The questionnaire includes five factors, namely preferred place of purchase, the reason for purchase, brand, quality, and innovation are collected. The collected data were analysed using statistical tools like percentage, chi-square and ANOVA test.

**Reliability and Validity:** Cronbach's Alpha test was used to determine the data's reliability and validity. The estimated values, as shown in the Table, are more than 0.6. As a result, the scale's dependability has been established.

**Table-1: Reliability Statistics**

Cronbach's Alpha	Cronbach's Alpha Based on Standardised Items	No of Items
.895	.896	42

### Research Hypothesis:

H<sub>1</sub>: There is no difference in the factors considered for the purchase of personal care products.

H<sub>2</sub>: There is no influence of age of working women on purchasing personal care products.

H<sub>3</sub>: There is no influence of income of working women on purchasing personal care products.

### Analysis and Discussion:

**Table-2: Profile of the Respondents**

	Particulars	Number of Respondents	Percentage
<b>Age Group (in Years)</b>	Less than 20	42	21
	21 – 30	86	43
	31 -40	34	17
	41 – 50	22	11
	Above 50	16	8
	<b>Total</b>	<b>200</b>	<b>100</b>
<b>Occupation</b>	Professional	18	9
	Business/ Self-employed	16	8

	Private Employee	78	39
	Government Employee	32	16
	Others	56	28
	<b>Total</b>	<b>200</b>	<b>100</b>
<b>Income level</b>	Less than ₹ 20000	45	22.5
	₹ 20001 – ₹ 30000	76	38
	₹ 30001 – ₹ 40000	37	18.5
	₹ 40001 – ₹ 50000	20	10
	More than ₹ 50,000	22	11
	<b>Total</b>	<b>200</b>	<b>100</b>
<b>Education</b>	SSC /Intermediate	34	17
	Bachelor's degree	80	40
	Postgraduate	52	26
	Diploma	22	11
	Others	12	6
	<b>Total</b>	<b>200</b>	<b>100</b>

As shown in Table-2, the plurality of respondents (43%) are between the ages of 21-30 years, followed by 21% between the ages of less than 20 years and 17% between the ages of 31-40 years. As can be seen, slightly more than 80% of the whole sample is under 40. According to the respondents' educational backgrounds, most respondents (40 per cent of the model) have a bachelor's degree, followed by respondents having a master's degree (26 per cent of the sample). In contrast, 17% of respondents have completed the SSC/Intermediate level. Income is typically seen as a crucial factor in an individual's buying behaviour. Around 38% of respondents earn between ₹20,000 and ₹40,000 per month, while 22.5 per cent make less than ₹20,000 and 18.5 per cent make between ₹30,000 and ₹40,000. According to the respondents' occupations, 39% work in the private sector, while 28% work in another category. By contrast, 16% of respondents are government workers.

**Table-3: Preferred Place of Purchase**

S. No.	Particulars	Number of Respondents	Percentage
1	Departmental Store	34	17
2	Super Markets	26	13
3	Special Beauty Store	54	27
4	Beauty Salon/ Parlours	21	11
5	Professional (Cosmetologist/Doctor)	32	16
6	Online	33	17
	<b>Total</b>	<b>200</b>	<b>100</b>

It can be observed from Table-3 that out of the total respondents, 27 per cent of respondents prefer to buy the personal care products at the special beauty store, followed by an identical percentage of respondents, i.e., 17 per cent chooses to purchase either through the departmental store or through online. Respondents' preference of Professional run store to buy personal care products represents 16 per cent. Some of the respondents from the total sample representing 13 per cent and 11 per cent prefers to buy the personal care products at supermarkets and Beauty Salon/ Parlours, respectively. It can be inferred that most working women prefer to buy personal care products from special beauty stores.

**Table-4: Reasons for Purchase of Personal Care Products**

S. No.	Particulars	Number of Respondents	Percentage
1	To improve personality	72	36
2	Social influence	34	17
3	Fashion and status symbol	18	9
4	Health care	45	23
5	Psychological Satisfaction	14	7
6	Habitual Action	17	9
	<b>Total</b>	<b>200</b>	<b>100</b>

It can be observed from Table-4 that out of the total respondents, 36 per cent of the respondents said the reason for purchase is to improve their personality, followed by 23 per cent of the respondents who said that the main reason is for health care. Some of the respondents representing 17 per cent said that the social influence as a reason for purchase, an identical percentage of respondents, i.e., nine per cent, have said either the reason as fashion and status symbol or habitual action. The remaining seven per cent of respondents said that psychological satisfaction is the main reason. It can be inferred that most working women preferred personal care products for improving their personality or for healthcare.

**Table-5: Brand Preference for Purchase of personal care products**

S. No.	Reason for purchase of Branded Product	No. of Respondents	Percent -age	Overall Percent -age	Reason for purchase of Non-Branded Product	No. of Respondents	Percent -age	Overall Percent -age
1	Gives social status	41	29	21	Affordable price	16	28	8
2	Non-Availability of Non-	6	4	3	Easy availability	8	14	4

	branded products							
3	High quality	23	16	12	More Varieties	6	10	3
4	Durability	15	11	8	Better performance	5	9	3
5	Brand image	46	32	23	Promotional Offers	9	16	5
6	After sales support	11	8	6	Suggested by Peers	14	24	7
	<b>Total</b>	<b>142</b>	<b>100</b>	<b>71</b>	<b>Total</b>	<b>58</b>	<b>100</b>	<b>29</b>

As shown in Table-5, 71% of respondents prefer to purchase branded items, whereas 29% prefer to purchase non-branded items. Among the respondents who buy branded products, 32 per cent of respondents prefer to buy the branded products because of the brand image, followed by 29 per cent of the respondents who purchase the products as they give them the social status. Some of the respondents representing 16 per cent opined that the branded products produce high-quality products and 11 per cent opined that durability is the reason for the purchase of branded products. A small number of respondents, i.e., eight per cent of respondents, prefer them because of after-sales support. The remaining four per cent said that non-availability of non-branded products makes them purchase branded products.

Among the respondents who purchase non-branded products, 28 per cent said that affordable price is the main reason for purchase, followed by 24 per cent of the respondents' purchases the non-branded products because of the suggestion they got from their peers. Some of the respondents representing 16 per cent buy non-branded products due to promotional offers, and 14 per cent of the respondents purchase them because of the availability. Few of the respondents representing ten per cent opined that more variety of products to choose from in the category make them go for non-branded products. The remaining nine per cent of the respondents said that better performance is a reason for opting non-branded products.

It can be inferred that the primary reasons for purchasing the branded products are the brand image and the social status the respondents perceive with the branded products. In contrast, for non-branded products, the price of the product and the suggestion by the peers are the main reasons.

**Table-6: Perception of Respondents on Quality of Personal Care Products**

S. No.	Particulars	Number of Respondents	Percentage
1	High Price	28	14
2	Brand Name	37	19
3	Presence of Particular Ingredient	75	38
4	Packaging	18	9

5	Attributes of the product	22	11
6	Green Product	20	10
	<b>Total</b>	<b>200</b>	<b>100</b>

It can be seen from Table-6 that out of the total respondents, 38 per cent perceived that the presence of a particular ingredient is the quality, followed by 19 per cent perceived that the brand name of the product signifies the quality of the product. Some of the respondents representing 14 per cent perceived that high price indicates the quality for them, and 11 per cent said that the product's attributes indicate the quality. Few respondents representing ten per cent perceived that if the product is green, it shows quality for them, and the remaining nine per cent perceived that final packaging indicates quality for them. It can be inferred that most working women perceive a particular ingredient's presence as a quality for them.

**Table-7: Response of Respondents on Innovation of Product**

S. No.	Particulars	Number of Respondents	Percentage
1	Easy to use	87	44
2	Attractive Container	9	5
3	Eco Friendly packaging	35	18
4	Product Form	27	14
5	Associated Service benefit	18	9
6	New Ingredient	24	12
	<b>Total</b>	<b>200</b>	<b>100</b>

It can be seen from Table-7 that out of the total respondents, 44 per cent of the respondents felt that easy to use the product is the innovation for them, followed by 18 per cent opined that eco-friendly packaging is an innovation. Some of the respondents representing 14 per cent said that the product form is innovation, and 12 per cent of the respondents felt a new ingredient in the product is an innovation. Few respondents representing nine per cent said that associated service benefit as innovation, and the remaining five per cent of the respondents opined that an attractive container for the product is an innovation.

### **Hypothesis Testing:**

H<sub>1</sub>: There is no difference in the factors considered for the purchase of personal care products.

**Table-8: Chi-Square Test**

Hypothesis	Factors of purchase	Degrees of Freedom	Calculated Chi-Square Value	p-value	Result
H <sub>1a</sub>	Preferred Place of Purchase	5	19.06	0.00187	Rejected
H <sub>1b</sub>	Reasons for Purchase	5	75.22	8.32E-15	Rejected

H <sub>1c</sub>	Brand	11	121.96	7.31E-21	Rejected
H <sub>1d</sub>	Quality	5	69.58	1.25E-13	Rejected
H <sub>1e</sub>	Innovation of the product	5	115.12	3.39E-23	Rejected

It can be observed from Table-8 that the calculated value of chi-square at the critical value of five per cent level of significance is greater than the critical value, so we reject the null hypothesis. It indicates that the factors considered for the study are different.

H<sub>2</sub>: There is no influence of age of working women on purchasing personal care products.

**Table-9: Age and Factors of purchase**

Hypothesis	Factors of purchase	F-Value	p-value	Result
H <sub>2a</sub>	Preferred Place of Purchase	0.295532533	0.599901744	Accepted
H <sub>2b</sub>	Reasons for Purchase	0.196089112	0.668348145	Accepted
H <sub>2c</sub>	Brand	3.903195	0.044958	Rejected
H <sub>2d</sub>	Quality	0.202947245	0.663008759	Accepted
H <sub>2e</sub>	Innovation of the product	0.158255671	0.700038517	Accepted

The significance level of p is considered to be as 0.05. By observing the above Table, the p-value for the factors, preferred place of purchase, reasons for purchase, quality and innovation of the product are greater than the significant level. So, the null hypothesis can be accepted. It can be interpreted that there is no statistical significance between the age and the above-said factors of purchase in the purchase behaviour of working women. In the purchase of branded products, the calculated p-value is less than the significance value, which indicates that the null hypothesis is rejected. It can be inferred that their age influences the purchase of branded products. Overall, age is not an influencer on the purchase behaviour of working women while purchasing personal care products.

H<sub>3</sub>: There is no influence of working women's income on purchasing personal care products.

**Table-10: Income and Factors of Purchase**

Hypothesis	Factors of purchase	F-Value	p-value	Result
H <sub>3a</sub>	Preferred Place of Purchase	0.405643	0.540049	Accepted
H <sub>3b</sub>	Reasons for Purchase	0.239165	0.636507	Accepted
H <sub>3c</sub>	Brand	1.925181	0.198677	Accepted
H <sub>3d</sub>	Quality	0.249446	0.629447	Accepted
H <sub>3e</sub>	Innovation of the product	0.185172	0.677086	Accepted

The test static value for all the factors is greater than the significant value of 0.05. It indicates that we accept the null hypothesis. It can be interpreted that there is no statistical significance between the working women's income and the factors of purchase of personal care products.

### Findings of the study:

1. Most of the working women prefer to buy personal care products from Special Beauty stores.
2. The main reasons for purchasing personal care products by working women are improving their personality and healthcare.
3. The primary reasons for purchasing a branded product are the brand image and the social status associated with that while purchasing non-branded products is the affordable price and the suggestion by peers.
4. Most of the working women felt that the presence of a particular ingredient is the quality for them
5. A good number of working women indicate that the ease of use is the innovation of the product.
6. Based on the study, the brand image influences the working women based on age, whereas the other factors don't influence purchase decisions.
7. Surprisingly, the income of the respondents doesn't have any influence on the purchase behaviour of the working women.

### **Conclusion:**

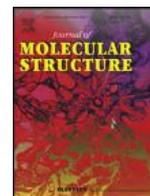

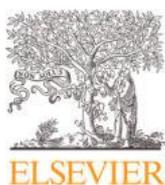

Personal cleanliness is critical for both personal health and societal well-being. The personal-care goods sector exists to improve people's appearance and self-esteem. It develops, produces, and distributes products for personal care, beauty, and hygiene. By 2025, the Personal Care industry is estimated to have 347.0 million consumers. The study's objective is to ascertain the parameters influencing working women's purchases of personal care items in the National Capital Region. This study gives valuable information for retailers and makers of personal care products by revealing that most working women have similar purchasing habits. According to the findings of this survey, the majority of working women choose to purchase personal care items to enhance their personality and health.

Additionally, the survey discovered that working women prefer to purchase personal care goods in speciality retailers. The majority of working women say that product innovation should prioritise simplicity of use. As a consequence of this research, merchants and manufacturers should design efficient marketing strategies stressing natural beauty and simplicity of use to attract new consumers. Additionally, this study indicates that age and wealth have little influence on the purchasing behaviour of working women in the National Capital Region.

## ABSTRACT

The conjugated polymers-based graft copolymer is significantly explored due to their potential applications in sensing devices posing with notable optical and physiological properties. The current preliminary investigation presents for the first time the synthesis of grafted copolymer Poly (DAP-g-Th) from 2,6-diaminopyridine (DAP) and thiophene (Th) via chemical oxidative copolymerization using ferric chloride as an oxidizing agent for enhancing its photoluminescence properties. Modifications via copolymerization were confirmed by optical, morphological, and spectral analysis through FT-IR, UV-Visible, XRD, fluorescence studies. Increased value of oscillator strength, molar extinction coefficient, and lowered bandgap were observed in the case of poly(DAP-g-Th). FT-IR results showing alteration in the properties of polymer lying intermediate between individual monomers confirming copolymerization. Intermediate quantum yield value disclosing transformations in the electronic structure of the poly(DAP-g-Th). Morphological studies also suggested the intermediate property of copolymer. Poly(DAP-g-Th) showed the best antioxidant activity against DPPH free radical assay and its IC<sub>50</sub> value was reported 0.024 ± 0.001 mg/ml.

## 1. Introduction

Intrinsically conducting organic nano polymeric particles which include polyaniline (PAni) [1,2], polythiophene (PTh) [3], polypyrrole (PPy) [4], poly(o-phenylenediamine) (POPD) [5,6], poly(1-naphthyl amine) (PNA) [7], poly(carbazole) (PCz) [8] have procured notable recognition latterly in the sphere of optoelectronics namely in sensors, solar cells, electrochromic displays, OLEDs, and rechargeable batteries. Tremendous efforts have been employed to design extremely efficient conjugated polymers with improved chemiluminescence and prompt charge generation properties. To accomplish the desired properties significantly different from the homopolymers, copolymerization is solely the frequently employed method for tailoring different types of monomers carrying distinct functionalities. Ample literature has been outlined on the electrochemical and chemical oxidative synthesis of copolymers of polyaniline (PAni) [9], polypyrrole (PPy), polycarbazole (PCz),

polyfluorene (PF), and its derivatives [10]. Amongst them, polythiophene and its copolymers are extensively explored in chemical sensors, solar cells, flexible displays, catalysis, supercapacitors, and field-effect transistors for fabricating efficient electrode materials possessing remarkable photophysical properties including thermal resistance, environment sustainability, processibility, photo-luminescence, a highly stable transient framework of both doped and undoped configuration. Copolymers of thiophene with indole [11,12], fluorene [12], pyrrole [13,14] are listed in literature. In recent times Poly(2,6-diamino pyridine) (PDAP) is widely investigated as a highly efficient sensing device in nitrite sensor reported by wang et al. [13], a potential glucose sensor reported by Qin et al. [14] and in the extraction of various toxic heavy metal ions [15,16]. Functionalization of PDAP with different variety of electron acceptor substituents can be easily carried out due to the presence of electron donor amino groups which in turn helps in tuning the HOMO-LUMO bandgap by regulating electron /hole injecting ability to achieve the required emissive fluorescent range. This work is executed following the evaluation of the literature despite the exceedingly efficient performance of these conjugated

polymers no literature is reported until now on the copolymerization of these monomers and encouraged from the above possibilities, the present study reports the chemical oxidative copolymerization of thiophene and 2,6-diaminopyridine using anhydrous ferric chloride as an oxidizing agent. Spectral, thermal, and morphological properties of the grafted copolymer Poly(DAP-g-Th) were analysed using FTIR, UV-Vis, XRD, fluorescence spectroscopy. The antioxidant property of the copolymer was also investigated using DPPH and hydrogen peroxide assay.

## 2. Experimental

### 2.1. Materials

Thiophene(Molecular formula: C<sub>4</sub>H<sub>4</sub>S, Molar mass:84.14 g/mol) (Sigma Aldrich, USA), 2,6-diaminopyridine(Molecular formula: C<sub>5</sub>H<sub>7</sub>N<sub>3</sub>, Molar mass:109.129g/mol) (Sigma Aldrich, USA), N-methyl-2-pyrillidone (Molecular formula: C<sub>5</sub>H<sub>9</sub>NO, Molar mass: 99.13 g/mol) (Sigma Aldrich, USA), THF (Molecular formula: C<sub>4</sub>H<sub>8</sub>O, Molar mass: 72.11 g/mol)) (Sigma Aldrich, USA), Ferric Chloride (FeCl<sub>3</sub>, molar mass: 162.2 g/mol) (Sigma Aldrich, U.S.A.), Ethanol(C<sub>2</sub>H<sub>5</sub>OH, molar mass: 46.07g/mol) (Sigma Aldrich, U.S.A.),(Potassium Ferricyanide (C<sub>6</sub>N<sub>6</sub>FeK<sub>3</sub>, molar mas:329.24g/mol) (Sigma Aldrich, U.S.A.)Sulfuric acid (H<sub>2</sub>SO<sub>4</sub>, molar mass: 98.079 g/mol) (Sigma Aldrich, U.S.A.), Dimethyl sulfoxide (Molecular formula: (CH<sub>3</sub>)<sub>2</sub>SO, Molar mass: 78.13g/mol) (Sigma Aldrich, USA), N, N-Dimethylformamide (Molecular formula: HCON(CH<sub>3</sub>)<sub>2</sub>, Molar mass: 73.09g/mol) (Sigma Aldrich, USA).

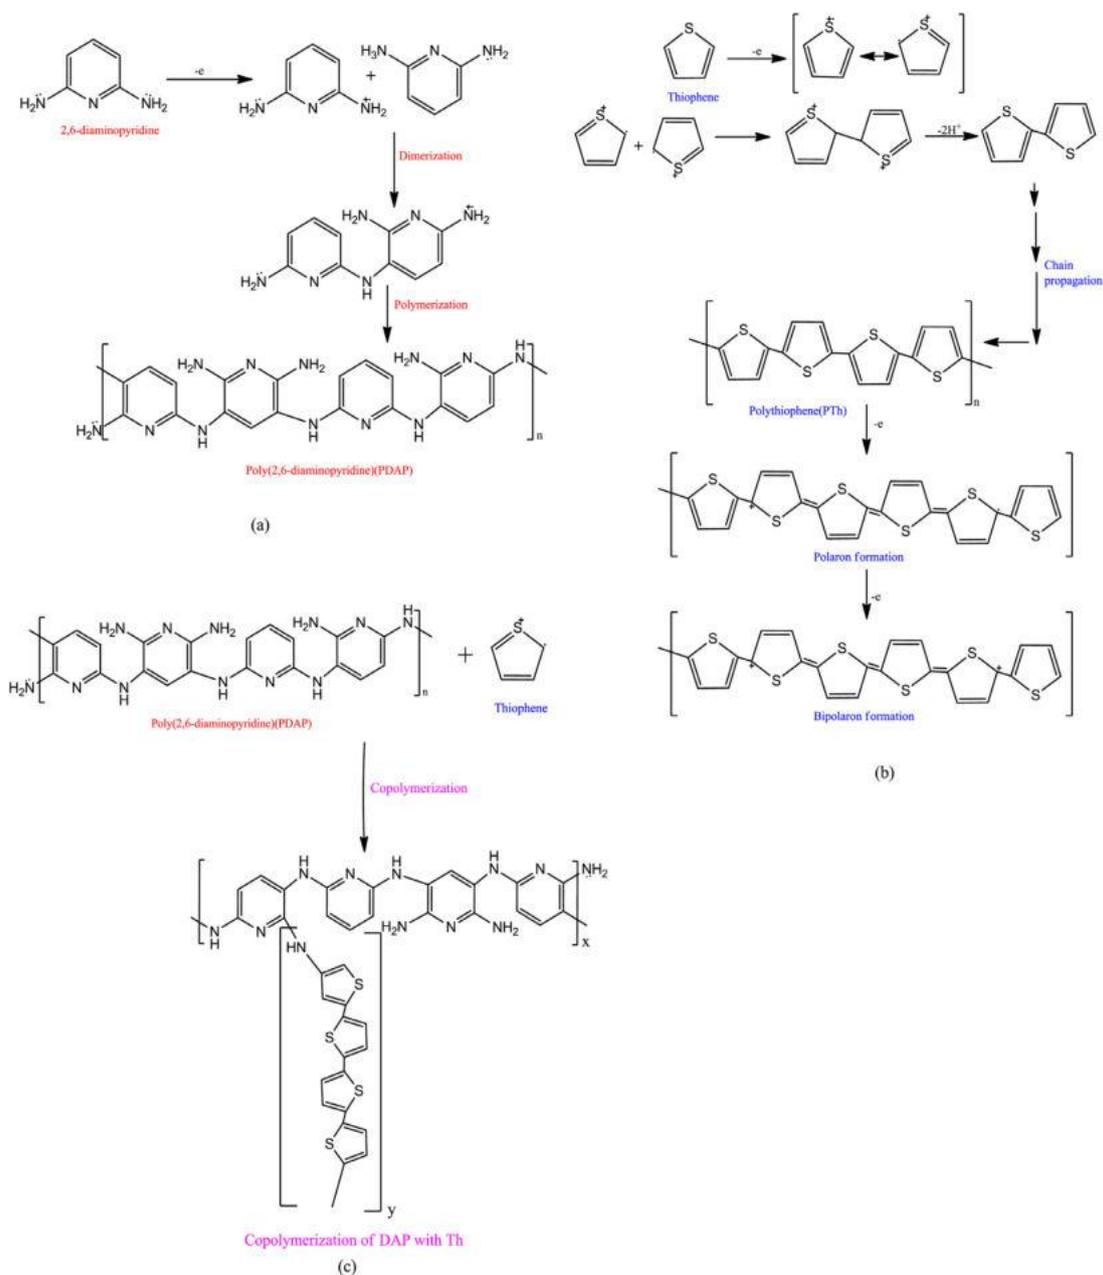

### 2.2. Synthesis of homopolymers Poly(2,6-diaminopyridine) (PDAP), Polythiophene (PTh)

2,6-diaminopyridine monomer (DAP) (2g, 0.0183mol) in 2ml acetic acid and 50ml deionized water was taken in a 250ml Erlenmeyer flask. The solution was stirred for 20 min at room temperature. A Ferric chloride solution (2.972g, 0.0183mol) dissolved in 30ml deionized water was added to the reaction mixture dropwise. The solution mixture was then magnetically stirred for more than 3 hours maintaining a temperature of 5°C. The solution mixture color turned greenish-black. The polymer solution was then kept in a deep freezer for 24 hours at-5°C and then centrifuged with distilled water and ethanol several times to ensure complete removal of excess ferric chloride which is further confirmed by filtrate testing using potassium ferricyanide. The procured Polymer was vacuum dried for 72 hours at 70°C.

Monomer thiophene (Th)5ml (5.315g, 0.0631mol) in 2.5ml ethanol was dispersed in 50ml deionized water was taken in a 250 ml Erlenmeyer flask. To this, a solution of prepared ferric chloride (10.246g, 0.0631mol) in 50ml deionized water was added dropwise with constant stirring. The above solution was stirred for 4 hours on a magnetic stirrer. The color of the solution turned pinkish purple. The solution was deep freeze overnight at-5°C and then washed several times with deionized water and ethanol ensuring removal of excess ferric chloride by testing the filtrate using potassium ferricyanide. The obtained polymer was dried in a vacuum oven at70°C for 3 days.

### 2.3. Synthesis of grafted copolymer Poly(DAP-g-Th)

Monomer 2,6-diaminopyridine (DAP) (2.762g,0.0253) in 2ml acetic acid in 50ml deionized water was taken in a 250ml Erlenmeyer flask to the above solution 2ml thiophene (Th) (2.13g,0.0253mol) was added drop by drop and kept on a magnetic stirrer for 20min. (1:1 monomer ratio). After 20 min prepared solution of ferric chloride (3.97g, 0.0244mol) in 50ml distilled water was added dropwise. The polymer solution mixture was magnetically stirred on an ice bath for more than 4 hours. The solution turned dark green which is then kept for deep freezing overnight at-5°C. The polymer solution was then washed several times to remove excess ferric chloride with deionized water and ethanol using a centrifuge. The filtrate was tested with potassium ferricyanide to certify that excess ferric chloride was removed. The polymer so obtained was vacuum dried at 70°C for 72 hours. The polymer was assigned as Poly(DAP-g-Th).

**Scheme 1.** Proposed scheme for the synthesis of homopolymers (a) PDAP, (b) PTh and copolymer (c) poly (DAP-g-Th).

### 3. Characterization

UV-Vis spectrophotometer model SPECORD 210 plus was employed to investigate the UV-Vis spectra of the synthesized homopolymers and copolymer in solution form, with NMP as a solvent. For precise analytical determination, the integrated absorption coefficient was employed against the absorption coefficient at wavelength maxima ( $\lambda_{max}$ ). The integrated area ( $\int \alpha d\nu$ ) under the transition peak was determined using Origin 2020b by standardizing to Gaussian-Lorentzian shape. The molar extinction coefficient and oscillator strength were determined as reported in the literature [17]. FT-IR spectra of conjugated polymeric nanoparticles were recorded using the FT-IR spectrophotometer model Shimadzu IRA affinity-1 in the form of pellets. The IRA affinity-1 software, through Gaussian-Lorentzian curve fittings, was used to calculate the integrated absorption coefficient ( $\int \alpha d\nu$ ). The fluorescence spectra of the prepared homopolymers and copolymer so-

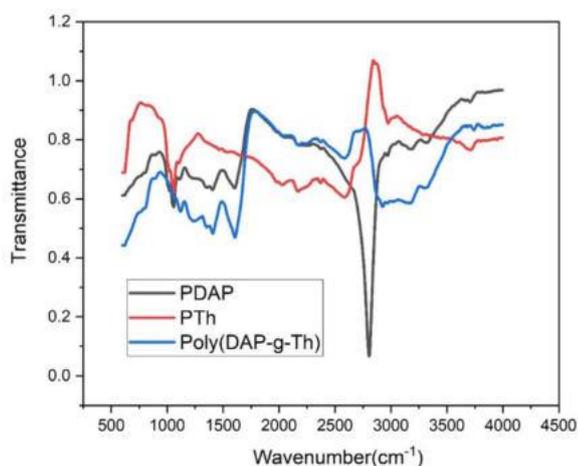

lution in NMP (N-Methyl-2-pyrrolidone) were taken on the spectrofluorometer model Cary eclipse. The Quantum yield ( $\phi$ ) was determined using the equation and reference material as Rhodamine B [15,16].

$$\Phi_{sample} = \Phi_{ref} \left( \frac{I_{sample}}{I_{ref}} \right) \left( \frac{n_{sample}^2}{n_{ref}^2} \right) \left( \frac{A_{ref}}{A_{sample}} \right)$$

X-ray diffraction patterns of the synthesized conjugated polymeric nanoparticles were recorded on Philips PW3710 powder diffractometer (Nickel filtered Cu-K $\alpha$  radiations). The d spacing (D) was evaluated using Bragg's equation and the crystallite size was determined using the Scherrer equation [18] For sharp intense crystalline peak, interchain separation length was calculated by employing the Klug-Alexander equation [17] ( $R = \frac{5\lambda}{8\sin\theta}$ ). The viscosity average molecular weight was determined using Mark-Houwink equation  $[\eta] = KM_v^a$ , where  $M_v$  is viscosity average molecular weight, and K and a are Mark-Houwink constants ( $K = 2.0 \times 10^{-2}$

**Table 3**

and  $a = 0.3176$  [8]. Prepared 0.2 wt.% solution of the polymers in NMP (N-Methyl-2-pyrrolidone) was taken for measuring the viscosity using ubbelohde viscometer. For morphological analysis TECNAI, 200 kV TEM (Fei, Electron Optics) was used for High-resolution transmission electron micrographs (HRTEM).

## 4. Antioxidant Studies

### 4.1. DPPH free radical antioxidant activity

2, 2-diphenyl-1-picryl-hydrazyl (DPPH) free radical has been used to estimate the antioxidant activity of (PDAP, PTh, and Poly(DAP-g-Th) by reported methods [19,20]. The increasing amount of test compounds (0.1-0.6 ml) was mixed with 2 ml of DPPH (0.1 mM) and incubates for 1 hour in dark. By using a UV-visible spectrophotometer, absorbance was recorded at 509 nm and it was inferred that absorbance was decreased after the addition of test compounds. Ascorbic acid was treated as a positive standard. The minimum concentration of test compound to scavenge DPPH free radical by 50% (IC<sub>50</sub>, mg/ml), was determined from the linear graph plotted between % antioxidant activity v/s concentrations. All the experiments were done in triplicate and % antioxidant activity was measured by using the following equation:

$$\% \text{Inhibition} = \frac{A_{\text{Control}} - A_{\text{Sample}}}{A_{\text{Control}}} \times 100$$

Where  $A_{\text{control}}$  = absorbance of DPPH free radical in methanol without an antioxidant and  $A_{\text{sample}}$  = absorbance of DPPH free radical in the presence of an antioxidant.

### 4.2. Hydrogen peroxide antioxidant assay

The antioxidant property of (PDAP, PTh, and Poly(DAP-g-Th) were also estimated against hydrogen peroxide [21]. 2 mM of hydrogen peroxide (1.8 ml) in phosphate buffer was added to increasing concentrations of each test compounds (0.1-0.6 mg/mL). After the incubation of 10 minutes at room temperature, a decrease in absorbance was recorded at 240 nm by UV-Vis spectrophotometer. The ability of test samples to scavenge the hydrogen peroxide was measured by using the following equation.

$$\% \text{Inhibition} = \frac{A_B - A_T}{A_B} \times 100$$

Where  $A_B$  was the absorbance of blank (without compounds) and  $A_T$  was the absorbance of tested samples.

## 5. Results and discussion

### 5.1. Solubility and intrinsic viscosity analysis

The ease of solubility of PDAP was found to be mostly in polar aprotic solvents while in polar protic solvents PDAP was partially soluble. Homopolymer PDAP has the highest intrinsic viscosity revealing facile arbitrary orientation of the polymeric units with highly expanded polymeric chain arrangement while for PTh with minimal intrinsic viscosity had a close-packed  $\pi$ - $\pi$  stacked orientation. Polythiophene was easily or partly soluble in most of the polar aprotic solvents but insolubility is seen in the case of most of the ordinary polar protic solvents making it less processible. However, upon copolymerization Table 1, the grafted copolymer becomes partly soluble in most of the commonly employed polar protic solvents like ethanol and methanol due to the presence of polar and neutral amino side chains of PDAP attached to the  $\pi$ -conjugated backbone of polythiophene and thereby confirming modifications in chain orientation and enhancing its processibility that can be utilized as a promising material in optoelectronic devices. Mark-Houwink equation  $[\eta] = KMv^a$  was used to determine the Viscosity average molar mass ( $M_v$ ) and Intrinsic viscosity ( $\eta$ ) where  $K$  ( $2.0 \times 10^{-2}$ ) and  $a$  (0.3176) are Mark-Houwink constants  $M_v$  is viscosity average molar mass and  $\eta$  is intrinsic viscosity.

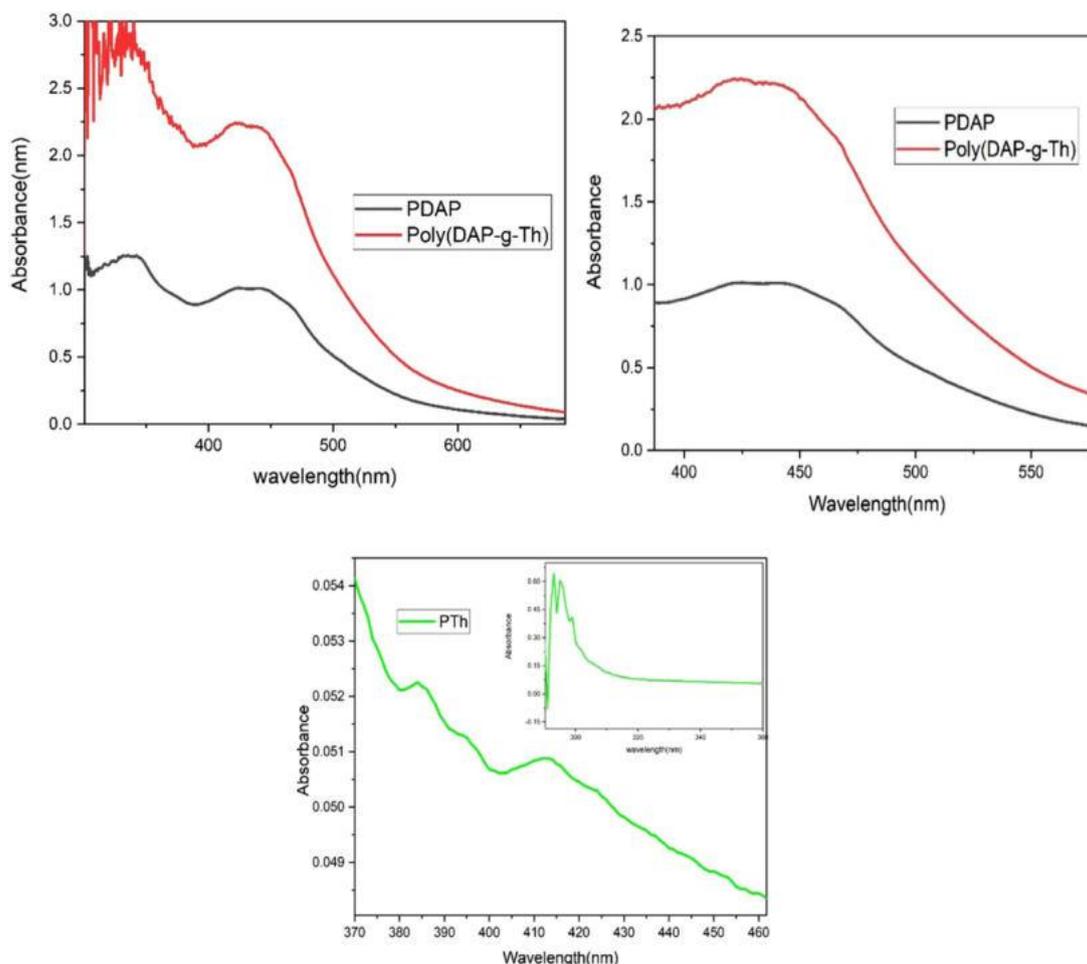

Fig. 3. UV-Visible spectra of PDAP, PTh, and Poly(DAP-g-Th).

Table 4

Calculated Molar extinction coefficient and oscillator strength for PDAP, PTh, Poly(DAP-g-Th).

Sample	$\lambda_{\max}$ (nm)	Absorbance	$\int \text{ad}\nu$ Integrated absorption coefficient ( $\text{cm}^{-2}$ )	Molar Extinction Coefficient	Oscillator strength
PDAP	343	1.25	947.88	15243.9	0.0499
	444	1	1713	12195.12	0.0902
PTh	385	0.05	7.1	1785.71	0.0011
	424	0.05	14.88	1785.71	0.0023
Poly(DAP-g-Th)	345	2.79	1588	34024.39	0.0837
	447	2.17	5145	26463.41	0.2711

By dilute solution viscometric method, taking 0.2 wt % solution of PDAP, PTh, and Poly(DAP-g-Th) in NMP the viscosities were measured using Ubbelohde Viscometer. Intermediate viscosity average molar mass as compared to their pristine homopolymers was observed for Poly(DAP-g-Th) having conjugated polymeric backbone of PDAP with PTh randomly grafted onto the backbone possessing the properties of both the individual monomers. While the inflated molar mass of PDAP indicating the highly extended and compact architecture of the polymeric chain. The polymeric chain of the obtained grafted copolymer can be optimized by varying the monomer feed content. For the synthesized homopolymers and copolymer C,H,N, S %, and the empirical formula were calculated using viscosity average molar mass, Table 2.

A similar trend was observed in the case of intrinsic viscosities for PDAP, PTh, and Poly(DAP-g-Th) depicted in Fig. 1 with increasing molar mass intrinsic viscosity increases with the highest value corresponding to PDAP and lowest for PTh and Poly(DAP-g-Th), the intrinsic viscosity value lies midway validating that with increasing

DAP monomer feed proportions, intrinsic viscosity providing with a closely packed compact array that attributes to the rigidity of the polymeric framework.

The proposed Scheme 1, illustrates the formation of homopolymers and grafted copolymer PDAP, PTh, and Poly(DAP-g-Th).

## 5.2. FT-IR spectral analysis

FT-IR spectrum Fig. 2 of PDAP revealed a band at  $3465\text{cm}^{-1}$  corresponding to NH stretching vibration while the ring puckering vibration peaks of the quinonoid and the benzenoid are observed at  $1537\text{cm}^{-1}$  and  $1439\text{cm}^{-1}$  respectively. The benzenoid to the quinonoid ratio (B/Q) for PDAP was found to be 1.06. The imine stretching peak was observed at  $1646\text{cm}^{-1}$ . PTh showed a characteristic C-S bending peak centered at  $686\text{cm}^{-1}$ . The band observed at  $2976\text{cm}^{-1}$  corresponds to C-H stretching band while the C-H out of the plane bending band appeared at  $1060\text{cm}^{-1}$ .

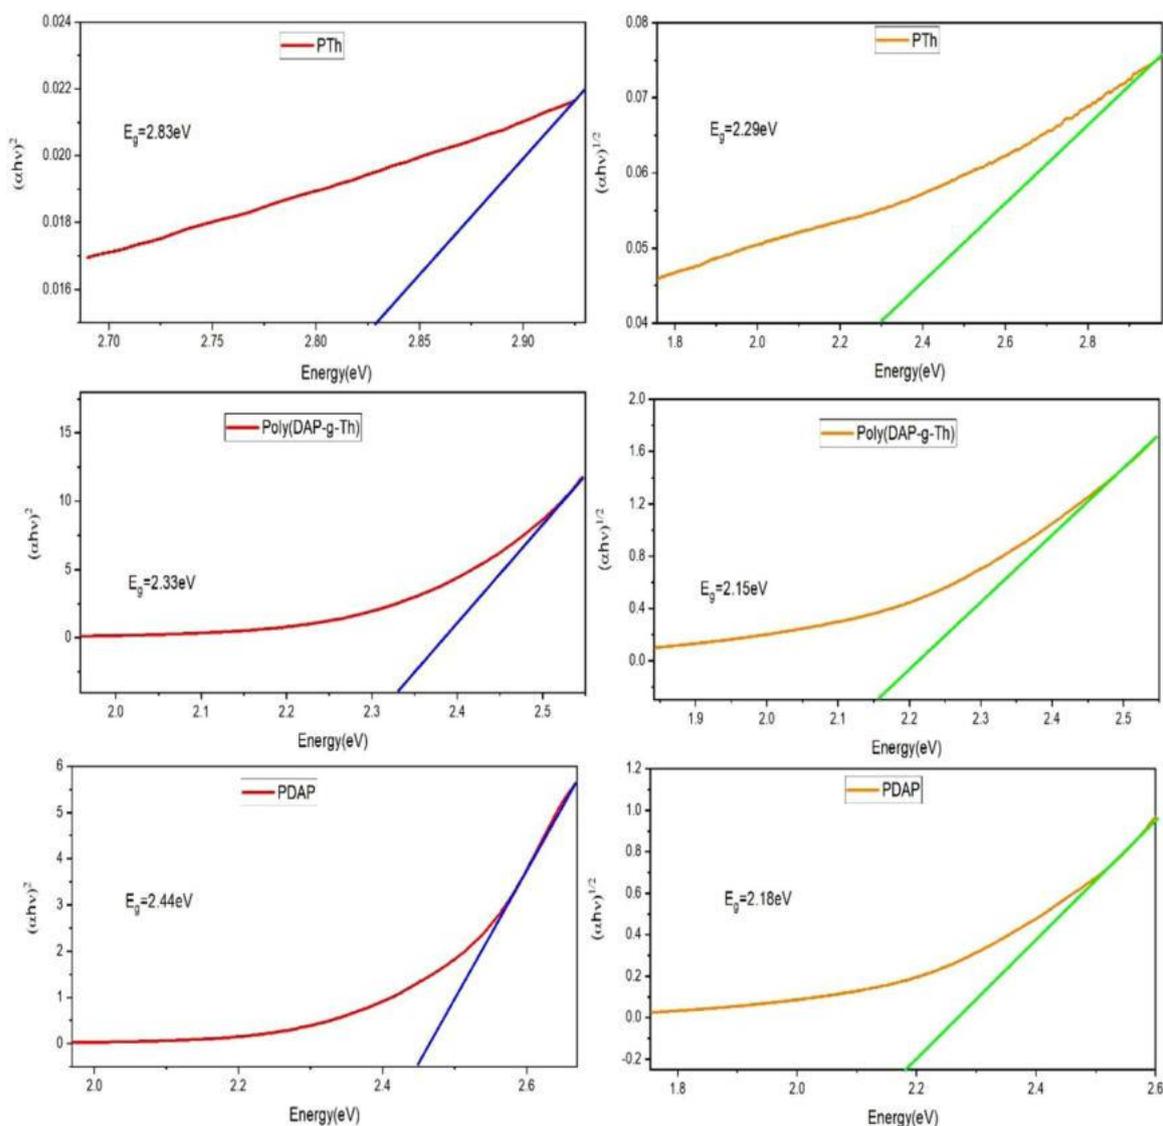

Fig. 4. TAUC plots of Direct and Indirect bandgap for PDAP, PTh, and Poly(DAP-g-Th).

**Table 5**  
Calculated bandgap (direct and indirect) energies using tauc plot.

Sample	$\lambda_{\max}$ (nm)	Absorbance	Direct Band gap (eV)	Indirect Band gap (eV)
PDAP	444	1	2.44	2.18
PTh	414	0.05	2.83	2.29
Poly(DAP-g-Th)	447	1.25	2.33	2.15

The C-C stretching vibration peaks of the quinonoid and the benzenoid for PTh showed a slight shift towards a higher wavenumber with peaks centered at  $1540\text{ cm}^{-1}$  and  $1466\text{ cm}^{-1}$ . The above-noticed peaks confirm the polymerization of homopolymers PDAP and PTh. Grafted copolymer poly (DAP-g-Th) revealed NH stretching peak at  $3469\text{ cm}^{-1}$  while the vibration peaks due to ring puckering of quinonoid and the benzenoid appeared at  $1536\text{ cm}^{-1}$  and  $1445\text{ cm}^{-1}$  and the peak at  $1645\text{ cm}^{-1}$  corresponding to the imine stretching peak are almost commonly centered but with pronounced peak intensity revealing a higher proportion of PDAP indicating modifications with grafting where PDAP is acting as the main polymeric backbone onto which PTh has been grafted. The structural modifications in poly (DAP-g-Th) are further confirmed by the presence of bands centered around  $2925\text{ cm}^{-1}$  and  $764\text{ cm}^{-1}$  corresponding to C-H stretching and C-H out of plane bending (2,5-disubstituted) of PTh units.

The (B/Q) ratio for the grafted copolymer was found to be 1.04 indicating that the copolymer is having an almost equal fraction of quinonoid and the benzenoid moieties revealing its conducting character. The above observations closely resemble the proposed structural framework of the homopolymers and the copolymer. Table 3 summarising the peak positions of various stretching and bending vibrations of the functional groups present in the homopolymers and the grafted copolymer.

### 5.3. UV-Visible spectral analysis

The UV-Vis spectrum of the homopolymers and grafted copolymer in NMP are illustrated in Fig. 3 in which the peak at 444 nm corresponds to an excitonic transition in the visible region which can be correlated with the conjugation of conducting transition state with lone pair of electrons on the amino groups [22]. The

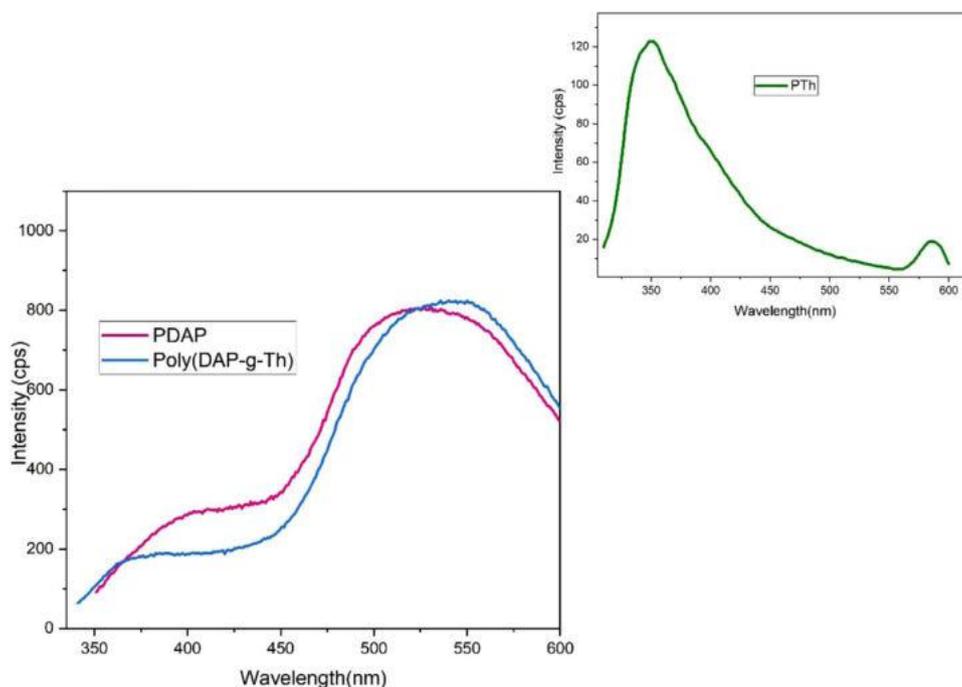

Fig. 5. Fluorescence spectra of PDAP, PTh, and Poly(DAP-g-Th).

**Table 6**  
Quantum Yield ( $\phi$ ) calculations values using fluorescence data.

Sample	$\lambda_{\text{max}}$ (nm)	$A_{\text{sample}}$	Integrated area ( $I_{\text{sample}}$ )	Quantum Yield ( $\phi_{\text{sample}}$ )
PDAP	400	0.9142	7.32E+06	2.73E-03
	529	0.3259	3.96E+06	4.14E-03
PTh	341	0.0645	3.10E+06	1.64E-02
	416	0.0507	7.10E+06	4.77E-02
	586	0.0495	2.28E+06	1.57E-02
Poly(DAP-g-Th)	387	2.0784	1.24E+07	2.03E-03
	540	0.6017	4.45E+07	2.52E-02

spectra of PTh revealed peaks at 293 nm, 385 nm are associated with  $\pi$ - $\pi^*$  transition and polaronic transition at 424 nm. Variation in the intensities is observed upon copolymerization with inflated peak intensity for the copolymer at 447 nm for the polaronic transition than the individual homopolymers PDAP and PTh at 444 nm and 424 nm inferring tailoring of the polymeric structure [23].

Increased peak intensities of  $\pi$ - $\pi^*$  transition and the polaronic transition at 345 nm and 447 nm are attributed to escalated molar extinction coefficient and oscillator strength value depicted in Table 4. As compared to their original pristine homopolymers revealing efficient HOMO-LUMO configuration resulting in better electron transition ability. The improved modifications in the copolymer optical properties displaying the formation of random copolymer which can be effectively tuned to achieve enviable optoelectronic properties.

Using the Tauc equation, the energy bandgap can be evaluated by estimating the intercept for the linear portion of the plot.

$$\alpha h\nu = B[h\nu - E_g]^r$$

The optical energy band gap is determined by extrapolating the Tauc plot [24] to the baseline. For direct bandgap, the plot was made between  $(\alpha h\nu)^2$  versus  $h\nu$ , whereas for indirect bandgap, it was plotted between  $(\alpha h\nu)^{1/2}$  and  $h\nu$  for PDAP, PTh, and Poly(DAP-g-Th) as shown in Fig. 4. The bandgap values of direct as well as indirect cases for grafted copolymer Poly(DAP-g-Th) i.e., 2.33eV and 2.15eV respectively, Table 5 were found to be decreased, confirming copolymerization.

The lowest energy bandgap for the copolymer than the pristine homopolymers substantiates a longer conjugation length to the polymeric backbone while for PTh and PDAP with higher bandgap lowered conjugation length at the backbone inferring for the changes in the structural architecture of the polymeric chain [23] and thereby making the resulting copolymer more promising material and widens its scope for use in several optoelectronic applications.

#### 5.4. Fluorescence studies

The emission spectrum of PDAP, PTh, Poly(DAP-g-Th) was analyzed using NMP solvent in solution form is presented in Fig. 5. The samples were excited at 330 nm and the emissive spectrum was recorded from 350-650 nm.

In the fluorescence spectra of pure PDAP peaks were observed at 400 nm and 529 nm. A broad peak centered at 529 nm corresponds to  $S_1 \rightarrow S_0$  transition [22]. The transition peak with a modest increase in the intensity was noticed with a slight bathochromic shift in the peak value at 540 nm, for the copolymer, and the emissive region was plunged towards the near IR region upon copolymerization attributing to the customization in the electronic transition structure. A sharp PTh peak was observed at 341 nm, which attributes to  $S_2 \rightarrow S_0$  transition. Peak broadness was observed at 416 nm for PTh in the visible region depicting the conducting state for polaron and bipolaron formation in PTh and the peak centered at 586 nm with lowered transition intensity corresponds to  $S_1 \rightarrow S_0$  transition. The lowering in the transition inten-

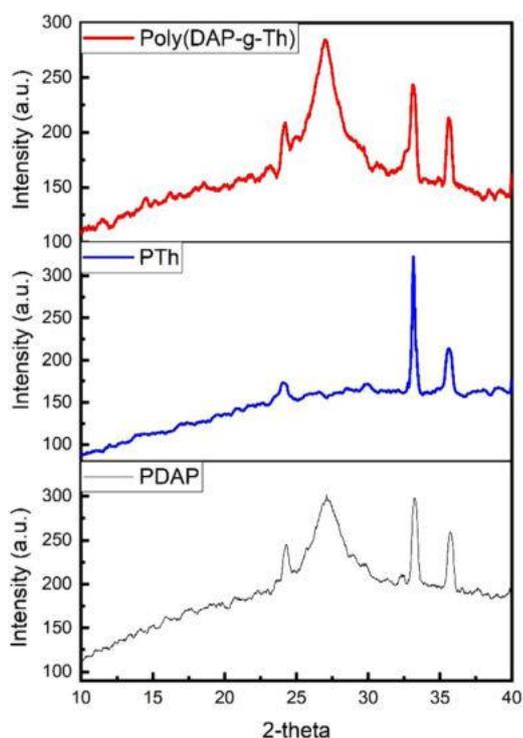

Fig. 6. XRD spectra of PDAP, PTh, and Poly(DAP-g-Th).

sity can be correlated with the lowered integrated area and quantum yield ( $\phi$ ). Modified copolymer at 540 nm showed the highest quantum yield as compared to their pristine forms i.e. PTh and PDAP at 586 nm and 529 nm respectively, which can be correlated with the highest integrated area closely resembles the intensity of fluorescence peak resulting from effective overlapping of HOMO – LUMO orbitals, promoting donor-acceptor interactions through radiationless energy transfer [25] imparting tailorable fluorescence properties which can be attained by varying the monomer feed ratio. The quantum yield ( $\phi_{\text{sample}}$ ) values for pristine PDAP, PTh, and the grafted polymer are given in Table 6.

### 5.5. Morphological studies

X-ray diffraction patterns of the homopolymers (PDAP and PTh) and the grafted copolymer poly(DAP-g-Th) are demonstrated in Fig. 6. The diffractogram of PDAP revealed various small broad peaks and some intense pronounced peaks at  $2\theta = 24.27^\circ, 27.18^\circ, 33.23^\circ$ , and  $35.71^\circ$  indicating semicrystalline behavior. Broad peaks centered at  $2\theta = 24.27^\circ, 27.18^\circ$  corroborates to close-packed structure indicating  $\pi$ - $\pi$  stacking in the molecules while intense peaks attribute to crystallinity. Crystalline peaks in case of PTh were observed at  $2\theta = 33.16^\circ, 35.61^\circ$  with the peak centered at  $2\theta = 33.16^\circ$  being the highly intense sharp peak for which the interchain separation length (R) was found to be  $3.37 \text{ \AA}$  and crystallite size ( $\tau$ ) determined using Scherer equation [18]

$$\tau = \frac{K\lambda}{\beta \cos\theta}$$

is  $26.62 \text{ nm}$  indicating a highly ordered and compact array of the polymeric chain.

The above-mentioned variation in the crystalline behavior can also be attributed to their molar masses obtained from intrinsic viscosity measurements having the highest molar mass value for PDAP and lowest value for PTh indicating its crystalline behavior. Crystallinity being customized in case grafted copolymer poly(DAP-g-Th) showing intermediate interchain separation length(R)

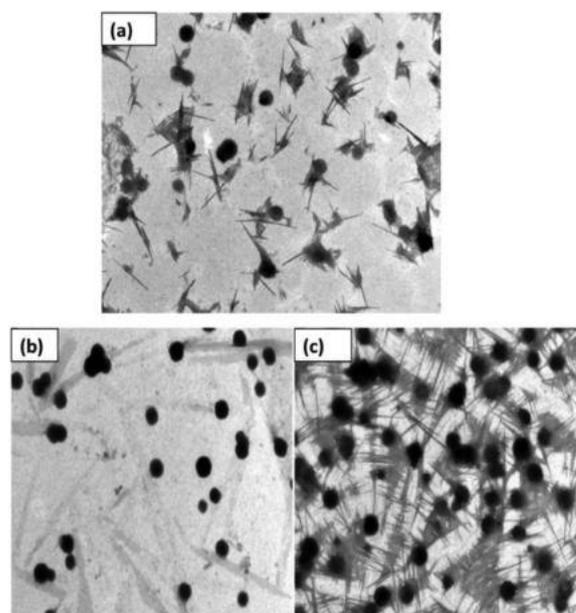

Fig. 7. TEM Micrographs of (a) PDAP, (b) PTh, and (c) Poly(DAP-g-Th).

of  $3.15 \text{ \AA}$  and crystallite size( $\tau$ ) of  $18.31 \text{ nm}$  for an intense crystalline sharp peak at  $2\theta = 35.64^\circ$  as compared to their pristine form homopolymers. The broadening of the peaks at  $2\theta = 27.18^\circ$  and  $27.01^\circ$  can be correlated with lattice strain determined using the equation [26].

$$\beta = 4\varepsilon \tan\theta$$

where  $\beta$  is FWHM and  $\varepsilon$  is the induced lattice strain showing decrement in lattice strain value from PDAP to poly(DAP-g-Th) depicting semicrystalline behavior with calculated XRD spectral data demonstrated in Table 7.

### 5.6. TEM Analysis

The HRTEM micrograph of PDAP Fig. 7 (a) revealed needle clusters and some distorted spherical particles. The morphology of polythiophene Fig. 7(b) showed small spherical particles some of which are combined to form smaller aggregates. Mixed morphology for poly(DAP-g-Th) was depicted in Fig. 7 (c) with dense needle clusters in almost a triangular fashion and evenly distributed spherical particles onto the needle clusters. The procured size of the particles of PDAP, PTh, and Poly(DAP-g-Th) was  $200 \text{ nm}$ . The morphologies of the homopolymers and copolymer well attribute to the XRD studies illustrating semicrystalline behavior for the copolymer which is appropriated from the copolymer fostering the morphology of both the homopolymers PTh and PDAP .

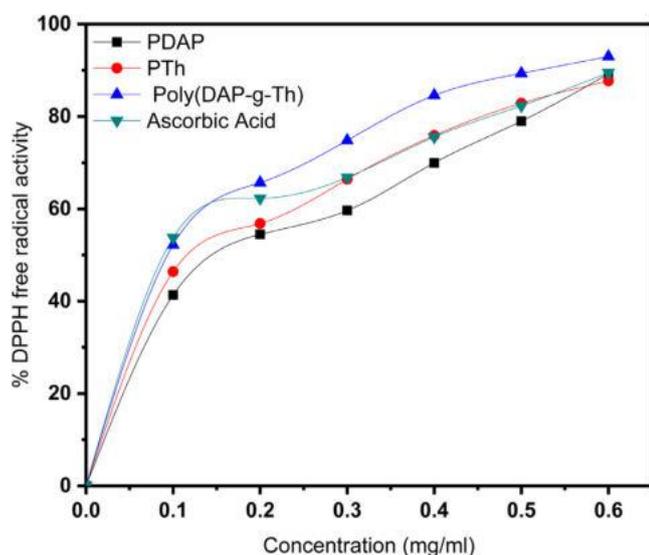

### 5.7. Antioxidant studies

#### 5.7.1. DPPH Free radical antioxidant assay

Antioxidant activity of (PDAP, PTh, and Poly(DAP-g-Th) were evaluated using DPPH free radical assay [27,28]. After the incubation period of 1 hr, a change in color from violet to yellow was noted which confirms the presence of antioxidant moiety in our compound.  $IC_{50}$  values were calculated for (PDAP, PTh, and Poly(DAP-g-Th) by plotting the graph (Fig. 8) which was found to be  $0.18 \pm 0.002$ ,  $0.12 \pm 0.001$ , and  $0.024 \pm 0.001 \text{ mg/ml}$  respectively. Results showed that test compounds exhibited significant activity as compared to standard ascorbic acid ( $0.109 \pm 0.011 \text{ mg/ml}$ ) and Poly(DAP-g-Th) showed the best antioxidant activity [29]

**Table 7**  
XRD spectral data of PDAP, PTh, and Poly(DAP-g-Th).

Sample	2 $\theta$ (deg)	Interchainlength (R) 10 <sup>-10</sup> m	Lattice Strain	FWHM	d = $n\lambda/2\sin\theta$ (m)	Crystallite size( $\tau$ ) (nm)
PDAP	24.27	4.58	0.0146	0.7194	3.6647	11.80
	27.18	4.10	0.0484	2.684	3.2786	3.18
	33.23	3.37	0.0063	0.432	2.6942	20.05

	35.64	3.15	0.0065	0.4763	2.5173	18.31

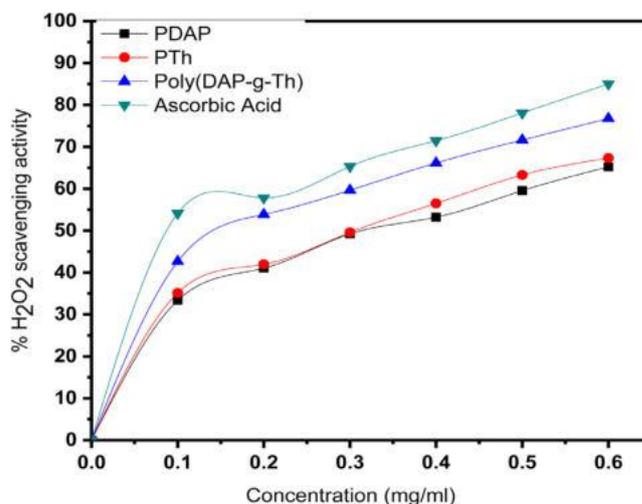

**Fig. 8.** DPPH Free radical scavenging assay of the PDAP, PTh, and Poly(DAP-g-Th).

### 5.7.2. Hydrogen peroxide antioxidant assay

Hydrogen peroxide is a very reactive oxygen-containing species used for the evaluation of the antioxidant properties of the (PDAP, PTh, and Poly(DAP-g-Th)) [30,31]. A fixed amount of hydrogen peroxide (2 ml) in phosphate buffer was added to increasing concentrations of the test compounds (0.1-0.6 ml). The test samples were incubated for 30 minutes and absorbance was recorded using a UV-Vis spectrophotometer at 240 nm. Results showed that absorbance was decreased after the addition of hydrogen peroxide [30]. IC<sub>50</sub> values of the (PDAP, PTh, Poly(DAP-g-Th) and ascorbic acid) were calculated as  $0.37 \pm 0.02$  mg/mL,  $0.32 \pm 0.009$  mg/mL,  $0.17 \pm 0.005$  mg/ml, and  $0.057 \pm 0.005$  mg/mL, respectively Fig. 9 Results exhibited that Poly(DAP-g-Th) showed better activity as compared to other compounds because of the presence of amine groups in DAP which are acting as effective stabilizers when introduced in low concentrations [29] and results were in accordance with DPPH activity.

## 6. Conclusion

Grafted copolymer Poly(DAP-g-Th) was successfully synthesized via chemical oxidative copolymerization and its spectral, morphological, and optical properties were investigated for confirming the customization in the structure on copolymerization. UV-Vis spectral studies reveal structural modifications with the highest oscillator strength and lowered energy bandgap for the resulting copolymer. Viscosity measurements revealed intermediate intrinsic viscosity and molar mass for the copolymer, while elemental,

**Fig. 9.** Hydrogen peroxide scavenging assay of the PDAP, PTh, and Poly(DAP-g-Th).

and FTIR analysis confirmed copolymerization. XRD diffractogram showed crystalline morphology for PTh and semi-crystalline behavior for PDAP and the grafted copolymer. Fluorescence studies revealed monomer feed ratio dependency with intermediate quantum yield value for the copolymer as compared with their homopolymers. Poly(Dap-g-Th) showed better antioxidant scavenging assay against DPPH and hydrogen peroxide radical assay. The above results suggest that synthesized poly(DAP-g-Th) copolymer can be employed in various high-end optoelectronic devices with a tunable bandgap.

Motion and lubricants

## ABSTRACT

The hydrodynamic compliant journal bearings are operating with hydrodynamic lubrication which is generally used to carry radial loads at higher working speed where the standard bearings cannot exist with operation. The both system (journal and bearing) are hold up by a thin lubricating film (fume) due to the distribution of pressure (hydrodynamic). The performance framework prediction of journal bearing, the Reynolds equation (compressible) can be solved by Finite Analysis (FA) method, new Modified Parabolic Approximation and Infinitely Long Approximation. The Modified Parabolic Approximation method converts Reynolds's equation (classical) into a differential equation which is known as ordinary differential equation. Numerical solutions and a suitable equation are produced for Reynolds's equation (compressible) using modified parabolic approximation method. The dynamic characteristics study of a gas bearing with this method can be extended which could further help to understand and design of newer generation of journal bearings.

## 1. Introduction

The hydrodynamic compliant journal bearing has greater significance according to present scenario due to their special purpose of functioning and its various practical/industrial applications. It is also called as foil bearings. When we will compare to compliant journal bearings with conventional rigid journal bearings, then it has various usefulness in form of lesser power loss, higher load carrying capacity, better endurance and stability. These are self-acting bearings which can be work with atmospheric air or any working gas lubricating fluid. For significant weight reduction and lower maintenance, a complex lubrication system is eliminated. The ambient air is most commonly used as lubricant which availability is plentiful. Whereas the conventional oil-based lubricants fail to work but ambient air (as lubricants) can be operated at increasing temperature because, with increase in temperature its viscosity start exponentially decreasing. The journal bearing is a mechanical machinery element by which the friction force is reduces and also the relative motion is restricted between rotating elements for the required motion. For example, a bearing designed for free rotation around a fixed axis or for free aligned motion of the rotating parts. This motion can be prevented by controlling the normal vector

forces that can bear by rotating parts. It may also be possible that some bearings simplify the motion of journal bearing, it may be happen by minimizing friction [1–5].

## 2. Working principle

Animation of ball bearing is given which is without a cage. In ball bearing the internal ring is rotating part while external ring is stationary part.

There are six general principles of (Figs. 1-3) operation of ball bearing:

- (i) The most basic principle of ball bearing is to minimize the friction and make rotation smoother.
- (ii) In ball bearing we use balls to maintain the gap between races of bearing.
- (iii) In Jewel bearing, working load on journal bearing is hold up by rolling axle which is set slightly to the off-center [6–8].
- (iv) In fluid journal bearing, working load is hold up by liquid or gas.

### 2.1. Motions

The general motion for bearings permitted by:

**Nomenclature**

<b>D</b>	mean diameter of bearing (mm)	$w_a, w_b$	squeeze components
<b>N</b>	rotational speed of bearing (rpm)	$x, y, z$	cartesian coordinates
<b>S</b>	bump pitch (m)	$\rho$	air density (in $\text{kg/m}^3$ )
<b>H</b>	film thickness of fluid (m)	<b>C</b>	radial clearance (m)
$h_{\min}$	minimum fluid film thickness (m)	<b>D</b>	diameter of shaft (m)
<b>e</b>	eccentricity of shaft (m)	<b>E</b>	modulus of elasticity
$e_f$	eccentricity of compliant bearing shaft (m)	<b>R</b>	radius of shaft (m)
$e_r$	eccentricity of rigid bearing shaft (m)	$u_a, u_b$	sliding velocity
<b>l</b>	half bump length (m)	<b>W</b>	Carrying capacity of load (N)
<b>L</b>	length of bearing (m)	$W_r$	Carrying capacity of load of bearing (rigid) (N)
<b>T</b>	Time (hrs.)	$W_f$	Carrying capacity of load of compliant/ foil bearing(N)
$t_f$	top foil thickness (m)	$\epsilon_f$	eccentricity ratio for compliant/ foil bearing
$t_b$	bump foil thickness (m)	$\epsilon_r$	eccentricity ratio for bearing (rigid)
<b>P</b>	hydrodynamic pressure (Pa)		
$P_a$	ambient pressure (Pa)		

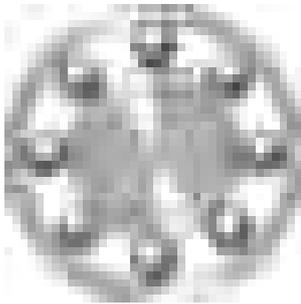

Fig. 1. Diagram of ball bearing.

Fig. 3. Diagram of peak and Bump Foils.

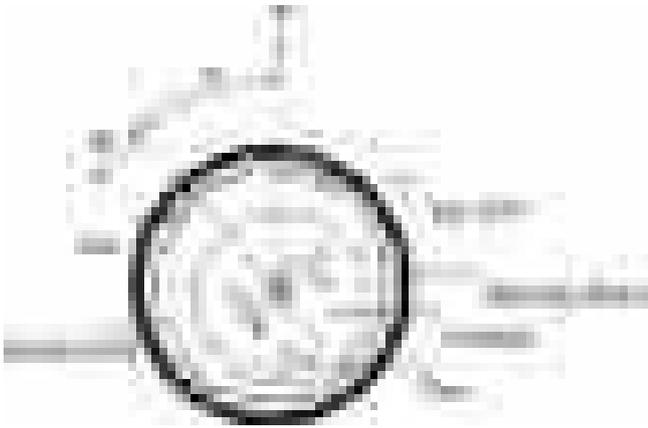

Fig. 2. Diagram of Compliant/Foil Journal Bearing.

- (i) Free circular rotation around a fixed axis (Example: **shaft rotation**).
- (ii) Free linear motion of the moving part (Example: **Drawer**).
- (iii) Spherical rotation (Example: **Socket and ball joint**).

**2.2. Friction**

In bearings the reducing friction plays an important role for efficiency, to reduce wear and tear it should be used at higher speeds & to avoid premature failure and overheating of the journal bearing. Fundamentally, the friction can be decreases by a bearing by merit of its material or by shape or surfaces separated by an elec-

tromagnetic field or by containing & introducing a fluid between the surfaces [9–15].

- (i) **Shape:** The spheres or rollers shape usually gains advantage, or by making flexure bearings.
- (ii) **Materials:** Material using in exploits the behavior / nature of bearing used. (Example: plastics are using which has low surface friction).
- (iii) **Fluid:** Fluid exploits the layer of low viscos fluid, such as a pressurized medium (fumes) that is work as lubricants to prevent the 2 solid parts from contacting each other or by reduced to minimum normal force between both mating parts [16–20].

**2.3. Applied load/ forces**

To a rolling bearing (radial), an external load is applied which is distributed amongst all the rolling elements. The internal load distribution on bearing in various applications can be adapted by the deformation elastically of rings of bearing. The adaption of this application can be enhancing the life of bearing. The size and directions of forces can vary for the bearings that they providing support. The applied loads on bearing can be mainly radial thrust, axial thrust or bending moments which is normal to the principal axis.

### 2.4. Speed

Each and every category of bearings have various limits of its working speed. Generally, speed is identified as maximum speed on relative surface, commonly identified as m/s. The performance of rotational bearings generally narrates in productive terms of (D) & (N) where 'D' is the Bearing diameter (mm) and 'N' is the Rotational speed of bearing (rpm).

Commonly there is a substantial range of speed which is overlap amongst various types of bearing. Generally, at lower speeds only plain bearings and at higher speed rolling journal bearings works properly, which is follow-up by the fluid bearings and ultimately magnetic bearings which are modified by centripetal force by which the strength of bearing material can be overcome.

### 3. Reynolds Equation's derivation for journal bearings

The assumptions are listed below for deriving the Reynolds Equation.

- (i) The lubrication fluid which is used to be assumed as Newtonian fluid where shear stress is directly proportional to the shearing velocity.
- (ii) The acting Inertia and forces on elements are supposed to be negligible as compared to viscous terms.
- (iii) Across the film, the variation of pressure is to be assumed as to much small.
- (iv) The flow of fluid as laminar flow.
- (v) The effect of curvature on fluids are negligible.

A three dimensional slider bearing configuration is indicated in Fig. 4 which has a clearance between film of  $g(x) = g(x,y)$ . The upper most and lower most, both plates are assumed to undergoes as sliding movement (velocity)  $u_a$  and  $u_b$ . A squeezing motion which is normal to the x-y plane may exist in the z- direction. The squeezing elements are indicated by  $w_a$  and  $w_b$ .

Momentum equation along the direction of X is given below as;

$$\frac{\partial p}{\partial x} = \frac{\partial}{\partial z} \left( \mu \frac{\partial u}{\partial z} \right) \quad (1)$$

Momentum equation along the direction of Y is given below as;

$$\frac{\partial p}{\partial y} = \frac{\partial}{\partial z} \left( \mu \frac{\partial v}{\partial z} \right) \quad (2)$$

Momentum equation along the direction of Z is given below as;

$$\frac{\partial p}{\partial y} = 0 \quad (3)$$

The pressure variation over the whole film is to be considered as to much small.

Integrating equation (1) and (2) and twice too with the boundary conditions given below;

Fig. 4. Diagram of Slider Bearing.

$$u = u_a, v = 0, w = w_a, atz = 0$$

$$u = u_b, v = 0, w = w_b, atz = h$$

$$u = \frac{1}{2\mu} \frac{\partial p}{\partial x} (z^2 - zh) + \left(1 - \frac{z}{h}\right) u_a + \frac{z}{h} u_b \quad (4)$$

$$\frac{1}{2\mu} \frac{\partial p}{\partial x} (z^2 - zh) \rightarrow \text{Poiseuille flow term}$$

$$\left(1 - \frac{z}{h}\right) u_a + \frac{z}{h} u_b \rightarrow \text{Couette flow term}$$

The velocity profile represented by Equation (4) which is composed of the term Poiseuille by pressure gradient along the direction of X and term Couette flow by surface motion.

$$v = \frac{1}{2\mu} \frac{\partial p}{\partial y} (z^2 - zh) \quad (5)$$

The velocity in flow direction is represented by Equation (5) which shows the leaking out fluid velocity profile on both sides of slider journal bearing. By integrating equations (4) and (5) across the gap respectively, the rate of volumetric flow along direction of sliding and leakage rate of flow can be calculated.

The generalized equation for conservation of mass is;

$$\frac{\partial \rho}{\partial t} + \frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z} = 0 \quad (6)$$

By integrating the equation (6) over the whole film thickness;

$$\int_0^h \frac{\partial \rho}{\partial t} dz + \int_0^h \frac{\partial(\rho u)}{\partial x} dz + \int_0^h \frac{\partial(\rho v)}{\partial y} dz + \int_0^h \frac{\partial(\rho w)}{\partial z} dz = 0 \quad (7)$$

The resulting equation is;

$$h \frac{\partial \rho}{\partial t} + \frac{\partial}{\partial x} \left( -\frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial t} \right) + \frac{1}{2} \frac{\partial}{\partial x} [\rho(u_a - u_b)h] - u_b \rho \frac{\partial h}{\partial x} + \frac{\partial}{\partial y} \left( -\frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial y} \right) + \rho(w_a - w_b) = 0 \quad (8)$$

Rearranging above equation;

$$\frac{\partial}{\partial x} \left( \frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial t} \right) + \frac{\partial}{\partial y} \left( \frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial y} \right) = \frac{1}{2} \frac{\partial}{\partial x} [\rho(u_a - u_b)h] - u_b \rho \frac{\partial h}{\partial x} + \rho(w_a - w_b) + h \frac{\partial \rho}{\partial t} \quad (9)$$

Neglect the stretchable terms, the density terms and the general expansive terms of equation (9) which reduces in final generalized Reynolds's equation that is broadly using for greatly industrial applications.

Fig. 5. Diagram of a Journal Bearing.

$$\frac{\partial}{\partial x} \left( \frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial x} \right) + \frac{\partial}{\partial y} \left( \frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial y} \right) = \frac{1}{2} [\rho(u_a - u_b)] \frac{\partial h}{\partial x} + \rho(w_a - w_b) + h \frac{\partial \rho}{\partial t} \quad (10)$$

Fig. 5, a journal bearing configuration is shown below in which fixed element is bearing sleeve and rotating element is journal. There are no any conditions where the thickness of film may vary with time by the conditions given below;

$$u_a = 0, w_a = 0 \text{ and } u_b = u \text{ and } w_b = w \neq 0$$

Now finalized Reynolds equation is reduced in;

$$\frac{\partial}{\partial x} \left( \frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial x} \right) + \frac{\partial}{\partial y} \left( \frac{\rho h^3}{12\mu} \frac{\partial \rho}{\partial y} \right) = \frac{1}{2} U \frac{\partial(\rho h)}{\partial x} + \frac{\partial(\rho h)}{\partial t} \quad (11)$$

#### 4. Results

The properties of compliant journal bearing are listed in Table 1 and 25,000 rpm is its operating speed. In compliant journal bearing the ambient air is used as lubricants and its properties are listed in Table 2. It is assumed to be compare the rigid journal bearing of same dimensions, same properties of lubricants using and the same working speeds [21]. The compliant journal bearing (foil bearing) pressure distribution profile which spreads over a greater area when it will be compared by counterpart of their rigid bearing which results a heavier load supporting' capacity.

From Fig. 7 we are representing the comparison of profile of film thickness between a rigid bearing with a on larger area by distortion of this foils. The concept of least thickness of film that may converged with an equivalent to 10 μm (10 μm) where angle of attitude (h<sub>min r</sub>, h<sub>min r</sub>) for compliant journal bearing [φ<sub>r</sub> = 36] and for the rigid bearing [φ<sub>r</sub> = 42.3] with a total load bearing capacity which is equal to 120 N. This report is compared with experiments performed by Strom (1987).

Figs. 6 and 7 shows the profile of pressure and film thickness in which we compare a journal bearing (rigid) with 1st generation compliant journal bearing runs at 40000 rpm. It changed into a least thickness of film i.e. 9 μm, pitch(attitude) angle φ<sub>r</sub> = 30° and for rigid bearing φ<sub>r</sub> = 35° which has carrying load capacity is 210. This report is compared with experiments performed by Strom (1987).

From N. Kawabata 1987, The Numerical Analysis of Reynolds Equation, it has some unique features with regards the compliant journal bearing operation which eccentricity ratio is greater than one. The rigid journal bearing has eccentricity which is similar to exculpated (clearance). The approach angle, in the case of compliant journal bearings is comparing by its counterpart of rigid bearing, it may improve the overall firmness of operation (Peng and Khonsari, 2004). To understand the bearing performance at higher speed, the numerical code has developed for further testing. It can be simulated for the maximum speed (in rpm) near about 4,00,000.

**Table 1**  
Experimental data of Compliant/Foil Bearing (Peng, 2003).

Bump/encounter foil Poisson's Ratio (ν)	0.30
Pitch for bump (s)	4.57 × 10 <sup>-3</sup> m
Thickness top foil (t <sub>r</sub> )	0.101 × 10 <sup>-3</sup> m
Nominal radial clearance (C)	50 × 10 <sup>-6</sup> m
Radius of shaft (R)	19.05 × 10 <sup>-3</sup> m
Length of bump (2 l)	3.55 × 10 <sup>-3</sup> m
Young's modulus (E) for bump foil	200 × 10 <sup>9</sup> Pa
Length of bearing (L)	38.09 × 10 <sup>-3</sup> m
Thickness of bump foil (t <sub>b</sub> )	0.101 × 10 <sup>-3</sup> m

**Table 2**  
Properties of lubricants used (ambient air) (Peng, 2003).

Density (ρ)	1.161 kg/m <sup>3</sup>
Viscosity (μ)	184.6 × 10 <sup>-7</sup> N-s/m <sup>2</sup>

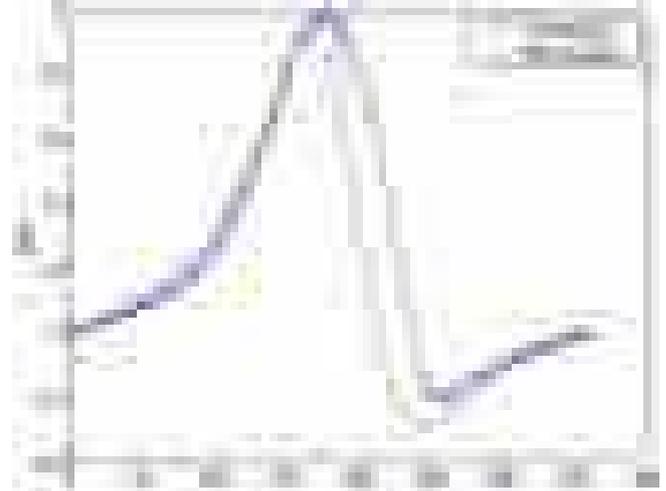

Fig. 6. Comparison of Rigid and Foil/Compliant Bearing at 25,000 rpm.

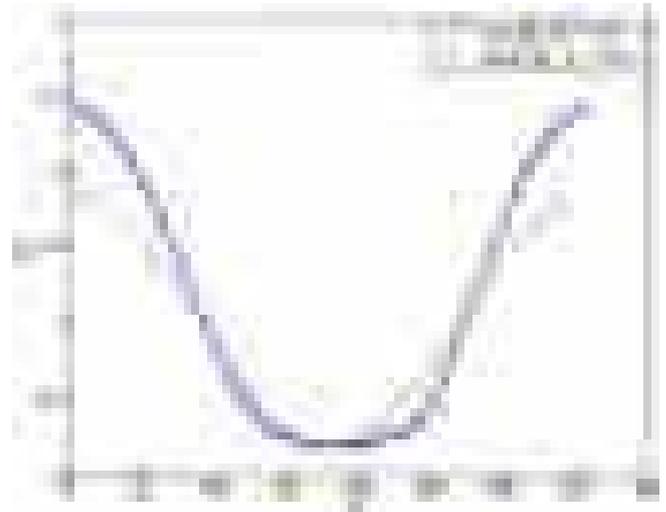

Fig. 7. Comparison of profile of film thickness of attitude angle for Rigid and foil Bearing at 25,000 rpm.

When we will compare the profile of film thickness of attitude angle for Rigid and foil Bearing given in Fig. 7 which shows the genuine worth throughout a range of eccentricity ratio.

#### 5. Conclusions

The current requirements of aerospace in which the energetic & efficient turbines, rotating machineries, and other machineries which are pushing-up the existing knowledge in development and design of bearings that can be operated at extreme speed and high temperature. According to requirement, the hydrodynamic compliant/foil journal bearings plays an important role in design and development. Then this concept of compliant journal

bearing is most important first to understand their fundamentals and then its operational characteristics and also its limitations to guide for industrial designers and manufacturers [22–25].

In this report I am presenting a model with the help of mathematics for compliant/foil journal bearings which is based on Reynolds Classical equation. Initially this non-linear equation is computed mathematically by ILA (infinitely-long approximation) method to predict & understand the performance parameter of compliant journal bearings.

An assumption regarding the pressure is based on Reynolds classical equation (partial-differential) which is manipulated into an equation i.e. ordinary differential. These all bunch of equations are too much simpler than others to compute numerical problems by the MPA (modified-parabolic approximation) method which is explained in this report to predict the performance parameters of compliant and rigid journal bearings. The agreement of this obtained results is with the finite analysis (FA).

A bunch of data for journal bearing (rigid) is explained which is based on important factors of non-dimensional parameters. These non-dimensional parameters are the eccentricity ratio, ratio of length to diameter for the bearing and bearing numbers. With the help of these data the non-dimensional force/load is obtained for different-different bearing no. and also obtained the criteria for eccentricity ratios to the proportionate exponential which is necessary to the Modified Parabolic Approximation analysis.

## COPYRIGHTS AND ARTIFICIAL INTELLIGENCE

**ISH-PREET SINGH**

ASSISTANT PROFESSOR SCHOOL OF LAW, LINGAYA'S VIDYAPEETH

**VISHWAJEET SINGH TARKAR,**

ADVOCATE, DELHI HIGH COURT

### **Introduction**

The first time this word came up in a conference in the year 1956 and Mr. John Mccarthy who studied computer science was the man who had given the world this term 'Artificial Intelligence'. He described it as the notion of a program, working, formulating and acting on any given information or input in the same way as a rational human being would respond on such thing. WIPO (World Intellectual Property Organization) identified and gave the existence of three types of Artificial Intelligence categories i.e., expert systems, perception systems and natural language systems<sup>1</sup>

Expert systems are basically used to do creative work related to art and other. They diagnose and solve problems in some particular field of science or that requires a particular knowledge such as diagnosing medical conditions, treatment of a disease, geological conditions etc. Perception systems are those systems that perceive the world by the use of sight and hearing and is needed by topologists, word context experts etc. A natural language program uses a dictionary database and used to know the meaning of words of different languages.

### **Copyright Concept**

In India, Copyright can be understood as a right which is given to a person who is creator or author of literary, musical, dramatic and artistic work. Copyright is basically a bundle of rights which includes that work can be adapted, translated, reproduced, communicated etc. the test for a work to be given copyright protection is that the work should be original. Copyright act protects the expression of an idea and just an idea. Hence for a work to be given copyright protection in India, it must be original and must be expressed in some form.

### **Can Copyright Law recognize Artificial Intelligence generated works?**

Only the original creation by authors i.e., composers, artists, writers etc. is covered and granted protection under the Copyright act of most of the countries. However when it comes to the work done by using machines or computers as in the case of Artificial Intelligence, the question is who the Author is? The computer or the human? This has to be understood with regard to the statutory provisions and case laws in various countries.

### **Position under United Kingdom Legislation**

In the united kingdom, section 9 of the copyright, designs and Patents Act 1988, the author of a work is the person who creates it.

Section 11 of the CDPA says that copyright belongs to the author unless it is made by an employee who is in the course of employment and in that case the author is the employer.

For computer-generated works, Section 9(3) CDPA states that :

---

<sup>1</sup> www.wipo.org

In case of literary, dramatic, musical or artistic work which is computer generated, the author shall be taken to be the person by whom the arrangements necessary for the creation of the work are undertaken.

Authorship is given to the programmer of these programs in countries lie India, UK, Ireland, New Zealand , Hong Kong.

The UK Copyright, Designs and Patent Act (CDPA) added a clause in the statute, section 178 that allowed authorship of computer generated works where work is made by computer and there is absence of any human author to vest in the ‘ person by whom the arrangements necessary for the creation of work are undertaken ’.<sup>2</sup>

In the case of Express Newspapers Plc v. Liverpool Daily Post & Echo Plc<sup>3</sup>, the issue was there was a grid copied which was used in the newspaper lottery. Computer software was used to generate the grids. The High Court of England and Wales said that computer was nothing more than a tool which was used by the author to make the work just like the work to an artist’s pen or typewriter. The reason was that the computer does not create the work by using human input but act as s conduit to manifest the expression of the human author.

In Nova Productions Ltd v Mazooma Games Ltd<sup>4</sup>, the question before High Court was whether the bitmap files which were used to generate the elements of a computer video game which were made by a computer programmer were the authorship of the programmer or not. The court said that the composite frames produced by the PC program were the initiation of the software engineer as ‘... he conceived the presence of the different components of the diversion and the standards and rationale by which each edge and frame is created and he composed the important PC program’. He along these lines ‘... is the individual by whom the game plans essential for the production of the works were embraced and in this way is considered to be the author’, following the present provisions of the CDPA. The problem here was that just making of the arrangement necessary for the creation of the works could lead to a virtual monopoly in the Artificial Intelligence – created works and thus there should be a difference in the computer related works and the work which is made by using the assistance of computers.

### **Position under European Union Legislation**

Artificial Intelligence authorship is also doubtful. In the case of Infopaq International A/s v Danske Dagbaldes Forening , the CJEU ( Court of Justice of the EU) held that the Copyright can be given to work that reflect the authors own intellectual creation to mean works where ‘... its author communicates his imaginative capacity in a unique way by settling on free and inventive choices ... and accordingly stamps his "own touch" [on the works]’. Clearly AI would come up short in the above test, as it would not be classed as an author, and the works it makes would not be viewed as original creative works and given copyright protection.

To expand the protection of copyrights, the Copyright Directive was established in the European Union in the year 2001. The primary focus was on Information Society. It did not want to replace the national laws. It was based upon the Berne Convention of the year 1886. Article 2 of the Copyright Directive has the notion of an author for which all member states must provide exclusive rights to authorize or prohibit direct or indirect, temporary or permanent,

---

<sup>2</sup>Copyright, Designs and Patents Act 1978

<sup>3</sup> 1985 3 ALL ER 680

<sup>4</sup> [2007] EWCA Civ 219, [2007] Bus LR 1032

reproduction by any way of any work partly or wholly. The directive by itself does not exclude any non human authors but the judgments do so. In the landmark decision of Infopaq (Infopaq International A/S v Danske Dagblades Forening), the CJEU decided that authors own intellectual creation must be seen in the original work of the work. Thus the European standard of originality was established in this case.<sup>5</sup>

### **Position in India**

Copyright Law has not given neither any rules regarding Artificial Intelligence nor given any provision regarding the ownership of the work created by computer or machines. There are certain rights which are provided to other tangible things as Artificial Intelligence do not have somatic existence and not regarded as entities in conventional sense.

The main point in granting legal personhood lies in the fact that whether such entity has any right to own property and capacity to sue or be sued. Courts in India have not decided any matters related to work created by Artificial Intelligence. Indian law has although granted legal personhood status to entities other than human such as companies and corporate houses.

### **Who should be the author?**

There is no clear cut answer to this as the law is more authors centric and not really protects individual works in isolation. But if more focus is driven towards individual works in isolation, it would lead to flexibility in terms of level of protection and also mitigate against mass production of works for the enforcement of rights. A report on robotics by EU suggested that electronic personhood could be created or maybe a specific set of rights for AI to own the right in the particular work that is created by it. One opinion is that the work created by Artificial Intelligence should be treated as works for hire. This would give the rights to the person who had made the AI to create any work.

### **Challenges for Intellectual Property wrt Artificial Intelligence**

1. Third Party Rights: The breach of third party intellectual property rights is an issue for companies who will undoubtedly be seeking to protect their business. A copyright can only be infringed by persons and hence artificial intelligence will not be covered here. The way forward is that the developers should develop their soft ware's so as to respect the rights of third parties.
2. Content Creation: the use of Artificial Intelligence will reduce or completely finish the need for human input. As copyright only covers human authors, hence it is not possible for an artificial intelligence system to be classed as an author. Original work is made by a human and the work made by artificial intelligence cannot be compared to that which is made by a human as artificial intelligence system cannot exercise the same diligence, labor and judgment. The only possible source of originality in artificial intelligence systems is the way in which the skills or intellectual creation is expanded within the training process of the system as it allows artificial intelligence to create specific type of work only.
3. Patent ownership: another challenge is that who will be the owner of the patent of the idea generated. Can the ownership be given to Artificial Intelligence? It would be wise to solve this issue by way of agreement as opposed to leaving it on courts to decide.

---

<sup>5</sup> www.Wipo.org

<sup>6</sup> www.lawctopus.com

To tackle the issues tended to over an extensive Legislation is required. This Legislation must determine the issue of non-human creators to dodge the diminishing of investment into AI, which would obstruct progress. Rethinking authorship, as some worldwide researchers have recommended (Abbot, 2016; David, 2011), like the purview in the UK may comprise a sensible arrangement.

Be that as it may, challenges lie ahead which requests additionally inquire about. For example, the equivocalness of authorship prompts the accompanying inquiries: Who can be credited the copyright of an AI-creation when numerous gatherings are included? Answers to this inquiry incorporate the developer who composed the AI, the end-client who set the parameters, and the makers of the preparation information, who might be on account of The Next Rembrandt, the effectively dead Rembrandt himself.

The extent of this article can't build up a broad examination of this unpredictable point. The effect appraisal must be considered unmistakably comprehensively and from a financial viewpoint as well as from a social and natural perspective. Besides, the separation of AI as an apparatus which bolsters a human creator in its creation and AI which self-sufficiently and recursively makes work is obscured. The characterization of AI may recommend an intriguing further research question with broad results.

The impact of AI is yet to take off. With fast approaching advances in registering power in sight (Anthony, 2016) it won't take hundreds of years yet decades until the point that we won't have the capacity to recognize human-made and machine-made manifestations. To be prepared for this quick paced condition exact legislation is important.

# DEFECTIVE INTERPRETATIVE METHODOLOGY - A CRITICAL ANALYSIS OF THE CASE SATISH RAGDE V. STATE OF MAHARASHTRA

- Divya, Assistant Professor, Lingaya's Vidyapeeth, Haryana.

## I. INTRODUCTION

Sexual abuse and sexual exploitation of children is the major concern of global level. Each state wants to protect its countries children from these heinous crimes. Therefore, on 11th December 1992, the UN convention on rights of the child (CRC) was ratified by India. The states who are members of this convention were asked to give protection to the children of their countries from heinous crimes like Sexual abuse, Sexual Harassment, and child pornography. It was the obligation of each member state in this convention to take all appropriate measures to protect children from Unlawful sexual practices. Therefore, “the POCSO Act, 2012” was the result of the CRC<sup>1</sup>.

The main aim of the protection of children from sexual offenses Act (POCSO), 2012 is to provide protection to children from sexual offenses and to provide the establishment of Special courts for the trial of those offenses. Additionally, the goal of the act is to provide minors with an additional layer of protection in issues of sexual offenses. It was also meant to fill some loopholes in the existing criminal laws regulating sexual offenses under the Indian Penal Code, 1860 but this very safeguard was ignored in the recent cases where the justice Pushpa V. Ganediwala delivered a judgment that set a dangerous precedent for defining sexual assault in courts. Bombay High Court of India held that section 7 of the Act requires skin-to-skin contact and the act which is committed by the accused does not fall under the Ambit of section 7 of the act.

“The Section 7 of the POCSO Act, 2012,” says that if any person with having sexual intention touches the vagina, anus, breast, penis of a minor or does any other act with sexual intent is said to have committed the offense of sexual assault and section 354 of IPC talks about outraging the modesty of a woman.

---

<sup>1</sup> VIKASPEDIA, <https://vikaspedia.in/education/policies-and-schemes/protection-of-children-from-sexual-offences-act>, (last visited March 18, 2021).

The main difference between “section 354 of IPC, 1860” and section “7 of POCSO Act, 2012” is that the latter attracts the lesser punishment of one year only while “section 7 of POCSO” Act attracts the greater Punishment up to three years.

In a span of one week, only Justice Sushma V Ganediwala delivered three controversial judgments. The first one was given on 14th January, In *Jagar Singh v. State of Himachal Pradesh*<sup>2</sup> she acquitted the convict of the offense under “section 376(2) of IPC” and section 5 punishable under “section 6 of POCSO Act, 2012” on the basis that there was nothing to support the case of prosecution for rape. The second one was given on January 15 2021 in *Linbus Vs. State of Maharashtra*.<sup>3</sup> In this case, the Nagpur bench of Bombay High court acquitted the convict on the basis that holding the hands of the minor over pants while the zip of the pants of the accused remains open at the same time does not amount to Sexual assault and the third one was given on January 19, 2021, in the case of *Satish Ragde Vs. State of Maharashtra*<sup>4</sup> in which the Honorable Court held that pressing the breast of a minor over her top does not amount to Sexual Assault.<sup>5</sup>

This article will be mainly focusing on the case *Satish Ragde v. the State of Maharashtra*. According to the police complaint the incident took place in December 2016 when a 12-year-old girl went out of the house to buy some guavas but didn't return for a period sufficiently long to alarm her mother, who continued to wander about to search. Her mother was informed by the neighbor that she saw a person who took the girl into his house then the mother went to the house of the accused person and start looking for her daughter in the house when she went to the first floor she saw that one room was bolted from the outside. After opening that door she discovered that her daughter had been locked in that room her daughter was crying continuously and told her mother that under the pretext of giving her guava the accused baited her into his house and started pressing her breast and attempted to remove her salwar then immediately thereafter a first information report was lodged.

### **WHAT WAS THE ISSUE IN THE CASE?**

<sup>2</sup> *Jagar Singh v. State of Himachal Pradesh*, Cr. M.P. (M) No. 1112 of 2014 (criminal appeal filed in High Court of Himachal Pradesh).

<sup>3</sup> *Linbus v. State*, Criminal Appeal no. 445 OF 2020 (Criminal appeal filed in High Court of Bombay).

<sup>4</sup> *Satish Ragde v. State of Maharashtra*, Criminal Appeal no. 161 OF 2020 (criminal appeal filed in High Court of Bombay).

<sup>5</sup> Legal Service India, <http://www.legalserviceindia.com/legal/article-4835-two-judgements-disrobing-pocso-act.html> (last visited February 15, 2021).

Whether groping a child's breast over her clothes without skin-to-skin or direct touch comes under the meaning of physical contact which is defined in “section 7 of the POCSO Act, 2012.” It was found by the session court that the accused was guilty under “section 354(Assault or criminal force to woman with intent to outrage her modesty), Section 363(Punishment for Kidnapping), Section 342(Punishment for wrongful Confinement) of Indian Penal Code, 1860” and “Section 8(Punishment for Sexual Assault) of POCSO Act, 2012.” The 39-year-old Bandu Ragde (Accused) was convicted under “section 8 of POCSO Act” and got the punishment of 3 years in prison by the session court.

“Section 7 of the POCSO Act” talks about Sexual Assault and section 8 prescribes the punishment of Sexual Assault.

The decision of the session court was reversed by the Bombay high court. Instead of Convicting the accused under the “POCSO act, 2012” the court convicted him under the “Indian Penal Code, 1860” for a lesser offense. It was said by justice Pushpa V. Ganediwala that the charge was not genuine enough to attract the greater punishment prescribed under the law. The Bombay High Court upheld the conviction under the section that conveyed a lesser sentence of one year under the IPC. This ruling by the high court of Bombay drew criticism for its limited and restricted interpretation of the offense and highlights the idea of minimum sentencing in legislation including “POCSO Act, 2012.”

The reason given by the High Court was that the POCSO act constitutes a higher punishment and to convict a person under the POCSO act then it would require a higher standard of proof and allegation that were more genuine. According to “Section 7 of POCSO Act” whoever with sexual intent touches the vagina, penis, anus, or breast of the child or make the child touch the vagina, penis, anus, or breast of such person or any other person, or does any other act with sexual intent which involves physical contact without penetration is said to commit sexual assault. Therefore there are two essential ingredients in section 7-i) Physical contact. ii) Intention.<sup>6</sup> The court said that since the Convict grabbed the girl over her garments this indirect contact would not amount to established sexual assault. The same thing also happened in *State v. Bijender* case in which a man was convicted under the sections of IPC instead of being convicted under the POCSO act. In this case, a 7-year-old girl had informed that the Convict

<sup>6</sup> BAR AND BENCH, <https://www.barandbench.com/columns/the-bombay-high-court-judgment-on-sexual-assault-a-serious-matter>, (last visited March 18, 2021).

brought her into the restroom forcibly, slapped her, and tore her pants. The court held that tearing of garments did not establish the actual contact regardless of sexual intention was there.<sup>7</sup> The controversial decision which was taken on 19 January 2021 by the justice Sushma V. Ganediwala of the Bombay High court was stayed by the Supreme court by the bench led by the chief justice of India Sharad A. Bobde after Attorney general K.K Venugopal mentioned the case after noticing that the decision of the High court would be set as a bad precedent and diminish the intention of the POCSO act, 2012.

“This Decision of the Bombay High court” related to “POCSO Act, 2012” risks making the law superfluous. The main aim behind the enactment of the POCSO act is to give protection to children against sexual assault and harassment. The proportionality rule is a significant guideline in criminal law. While considering the seriousness of the offense the Bombay High court has not given a lot of thought that the minor girl is required to more prominent protection. The punishment which is severe given under this Act is not because of the seriousness of the act or offense but because it has been committed against the child who is vulnerable. The act considers the vulnerability of minor victims and gives special protection to them. One specific concern is that the understanding of the court seems to nullify the point of “the POCSO act, 2012.”

It seems that while giving this judgment the Honorable court has forgotten the objective of the “POCSO Act” and applied the ambit of IPC instead. The precedents set down by the Bombay High court would lessen the punishment of the crime for the accused or culprits. Consequently, the given understanding by the court conflicts with the idea of the enactment.

Instead of convicting the accused person under “section 7 of POCSO Act” the court convicted him under “section 354 of IPC” which attracts the lesser punishment of one year while the latter has the greater punishment. The reasons given by the Honorable court for doing so were that firstly, the prosecution has not argued that the accused has inserted his hands into the top of the victim before molesting the victim sexually. Secondly, it is unclear that whether the accused inserted his hands inside the top of the victim so therefore there is no proof of direct skin to skin touch and thirdly to attract the case under the ambit of “section 7 of POCSO Act” it is required higher edge of claims and evidence and in this case they are absent. So because of all these reasons, the court convicted the accused under “section 354 of IPC” instead of convicting him under “section 7 of POCSO Act.”

<sup>7</sup> THE DAILY GUARDIAN, <https://theguardian.com/satish-ragde-vs-state-of-maharashtra-misconceived-interpretation-of-section-7-of-the-pocso-act-contrary-to-the-legislative-intent/> (last visited March 22, 2021).

## II. DEFECTIVE INTERPRETIVE METHODOLOGY

According to the honorable court 'skin to skin' touch is a precondition to establishing an offense of rape or "Sexual Harassment under section 7 of POCSO Act." This interpretation of the court is problematic for certain reasons.

Firstly, the POCSO Act is silent on the requirement of 'skin to skin' touch. Section 7 just says that if a person does an act with sexual intent and involves physical contact even without penetration is said to commit a sexual assault. Here, the Honorable court has misinterpreted the term 'physical contact' as 'skin to skin' touch. Moreover, section 7 starts with the expression "whoever with sexual intent touches...". Here also the term 'touch' does not imply 'skin to skin' touch. Thus, in this case, accused pressed the breast of the victim therefore the offense of

sexual assault was complete irrespective of whether the sexual harassment was happened over or under the clothes. Although the distinction created by the Bombay High court is unprecedented in India. It is interesting to note that the common law country England does not make any difference between the term 'Physical Contact' and Skin to skin' contact. Section 79(8) of the Sexual Offences Act of the United Kingdom describes three-fold definition of the term 'Touching'. Firstly, "with any part of the body", Secondly, "with anything else" and thirdly and most importantly "through anything else".<sup>8</sup>

In the case of *R v H*,<sup>9</sup> the court held that where a person is wearing the clothing we consider that touching over the clothes constitutes touching.<sup>10</sup>

Secondly, According to section 29 of the POCSO Act, the burden of proof lies on the accused. Considering the special nature of the legislation, the rule of "innocent till proven guilty" shifts, and the burden of proof is placed on the accused. According to section 29 of the POCSO Act, if a person is prosecuted under sections 3, 5, 7 and 9 of the Act, it is important for the court to assume that the accused has committed an attempt to commit the offense until the opposite is proved.

In *Justin Renjith v. Union of India*<sup>11</sup>, the High court of Kerala while maintaining the constitutionality of section 29 of the POCSO Act, held that if the molestation committed by the accused against the victim being a child is established then the burden of proof lies on the defendant to rebut those claims. Therefore, in this case, it was established that the accused had molested the victim and the victim was a child, the reasoning of the court that, to convict an

<sup>9</sup> *R v. H*, (2005) 1 WLR, (UK).

<sup>10</sup> LAW TEACHER, <https://www.lawteacher.net/cases/r-v-h-2005.php> (last visited April 5, 2021).

<sup>11</sup> *Renjith J.V v. State Of Kerala*, WP(C).No.4753 OF 2020(T) (Writ petition filed in High court of Kerala).

accused of an offense under section 7 of the POCSO Act requires a higher edge of claims and evidence is incorrect as according to section 29 the burden of proof always lies on the accused. Lastly, the judgment of the Bombay High court sets the bad precedent by making ‘skin-to-skin touch a necessary requirement to constitute an offense under section 7 of the POCSO Act. It will effectively allow the molesters to grab a child over his/her clothes. The act of touching the child under his/her clothes will work as an excuse for the molesters to get away from the criminal liability. This bad interpretation of the Bombay High court, in this case, has led to the miscarriage of justice as the Honorable court has forgotten the true intention and objective of the POCSO Act, 2012 i.e to save or protect a child from sexual offenses by imposing stricter punishment to the accused.

### **III. ROLE OF NATIONAL COMMISSION OF WOMEN**

On 27th January the Honorable court had stayed the decision of High court given by Justice Sushma V Ganediwala after when Attorney general noticed that the judgment was “unprecedented” and will likely set a bad precedent.

On January 25th the National Commission for Protection of Child Rights had entreated the Maharashtra Government to file an urgent appeal against the decision of the High court because of the bad interpretation of what constitutes Sexual assault of a minor. The body for children’s right said that the judgment of the High court needed to be reviewed because it has the bad interpretation of the law and it is disrespectful to the minor.<sup>12</sup> Several activists and child rights bodies had shown criticism of this judgment. They are naming it totally unsuitable, obnoxious, outrageous, and unacceptable.

NCW filed an appeal against the decision of the Bombay High court in this case which was given by the Sushma V Ganediwala. NCW has said that this interpretation of the law by the Honorable Court is unreasonable and bad in law. The plea said that by a plain reading of section 7 it is cleared that Sexual assault in terms of section 7 is predominantly a touch by the offender. The plea further said that if an accused touches a victim or the body part of the victim with sexual intent then the offense of sexual assault is complete. No further classification of the term ‘Physical contact’ is to be done in this regard. The petition added that actual contact cannot be given a bad understanding of touch or contact without clothes.

<sup>12</sup> LIVE LAW, <https://www.livelaw.in/top-stories/pocso-skin-to-skin-judgment-supreme-court-national-commission-for-women-bombay-high-court-skin-to-skin-judgment-168911>, (last visited March 18, 2021).

#### **IV. CONCLUSION**

In this case, the honorable court acknowledged that punishment should always be proportionate to the seriousness of an offense but it had forgotten the main objective and intention of the legislation that juveniles need much more protection because of their vulnerability, and because of this motive only the POCSO Act, 2012 was enacted to provide adequate protection and safety to the children i.e the most vulnerable section of the society. To fulfill this motive said the legislation provides a more serious punishment than the IPC. POCSO Act talks about both genders whereas the Indian Penal Code is women-centric. The reasons which were given by the Honorable court, in this case, go against the intent of the POCSO Act, 2012. It was made to protect and safeguard the child from the heinous crime of sexual abuse and harassment. The POCSO Act was amended in 2019 to provide and ensure the healthy, physical, mental, emotional, intellectual, social development of the child but because of bad interpretation of the law, the court made the law obsolete and set a bad precedent for the future cases. This was not the only case in which the intention of the POCSO Act was ignored but within a span of one week only Justice Sushma V Ganediwala delivered three judgment and in all the three judgments the intention of the POCSO Act was ignored, the accused in these three cases were convicted under the IPC instead of being convicted under POCSO Act which inflicts the severe punishment. If the legislature wanted to restrict the scope of “section 7 of the POCSO Act” then it would have mentioned the requirement of ‘skin-to-skin touch explicitly. Therefore, the court by itself does not apply the defective interpretative methodology to restrict the punitive scope of section 7 of the POCSO Act, 2012. By seeing these problematic observations of the Bombay High court the National Commission for women has thus, decided to challenge the judgment in the apex court i.e Supreme Court. However, the Honorable Supreme Court after the submission of the Attorney General stayed the judgment of the High court for now as it will be likely to set a bad precedent. The appeal filed in the Supreme Court will provide an opportunity to the court to give a better interpretation of the legislature by keeping the intention of the POCSO Act in mind for the safety and wellbeing of juveniles.

## Journal of Personality and Social Psychology

### Special Section

Journal of Personality and Social Psychology, 1997, Vol. 72, No. 4, 481–491

#### Editorial

Journal of Personality and Social Psychology, 1997, Vol. 72, No. 4, 481–491

The Journal of Personality and Social Psychology is pleased to announce the publication of the Special Section on "The Psychology of the 1990s." This section is a collection of articles that reflect the current state of the field and the challenges it faces. The articles in this section are: "The Psychology of the 1990s: A Review of the Field" by David A. Gosling and "The Psychology of the 1990s: A Review of the Field" by David A. Gosling. The first article provides a comprehensive overview of the field, highlighting the major trends and issues that have shaped the discipline over the past decade. The second article offers a more detailed look at the challenges facing the field, including the need for more rigorous research methods and the importance of addressing social and cultural issues in psychological research. Together, these articles provide a valuable resource for researchers and students alike, offering insights into the current state of the field and the challenges it faces.

The second article, "The Psychology of the 1990s: A Review of the Field" by David A. Gosling, provides a more detailed look at the challenges facing the field. Gosling discusses the need for more rigorous research methods, including the use of experimental designs and the importance of replication. He also emphasizes the importance of addressing social and cultural issues in psychological research, arguing that these issues are central to understanding human behavior. Gosling's article is a call to action for researchers to embrace these challenges and to work towards a more rigorous and socially relevant psychology.

The first article, "The Psychology of the 1990s: A Review of the Field" by David A. Gosling, provides a comprehensive overview of the field. Gosling discusses the major trends and issues that have shaped the discipline over the past decade, including the rise of cognitive psychology, the importance of social and cultural issues, and the need for more rigorous research methods. He also highlights the challenges facing the field, including the need for more rigorous research methods and the importance of addressing social and cultural issues in psychological research.

2007). In addition, a number of the authors of the book have been involved in the development of the book's content, and the book is a result of their ongoing collaboration.

The book is a comprehensive and up-to-date text that is designed to be used in a variety of ways. It can be used as a primary text for a course in organizational behavior, or it can be used as a supplementary text for a course in management. The book is also suitable for use as a reference work for students and professionals alike. The book is written in a clear and concise style, and it includes a wealth of examples and case studies to illustrate the concepts discussed. The book is also rich in research, and it includes a number of empirical studies that support the authors' arguments. The book is a valuable resource for anyone interested in the field of organizational behavior.

## The Need for Gym Exercises and the Imminent Benefits

**Sarita<sup>1</sup>, Dr.Richa khugshal<sup>2</sup>**

<sup>1</sup>Research scholar( Lingaya's vidyapeeth, Faridabad Haryana)

<sup>2</sup>Professor(Lingaya'svidyapeeth,FaridabadHaryana)

### Abstract

Exercising of any type and in any form comes under the regular physical activity, which helps in keeping you fit, in order and far more energetic than you may otherwise think. Exercise is important in maintaining health, and creating difference in the field of activities that one may like to get involved into. The long and short term benefits of undergoing exercises are enormous, and this enormity is just far more exciting than can be thought about.

The research and review paper showcases significant benefits of exercising on your body systems and the temperament levels. In fact it is not only the body systems that show improved performance, but thinking also gets improved too.

The research paper finds out the ways of reducing the stress, anxiety and strain from the muscles and the brain through the means of exercising. The positive impact of all of this can be seen in the form improvement in the self-esteem, upgrading of the self-confidence and moreover there is sharpening of the memory.

Exercising on regular basis is also instrumental in development of the muscle as well as the bone strength. There is also less chance of reducing the heart disease, occurrence of fluctuations in the blood sugar levels, and extremely reduced chances of occurrence of cardiovascular diseases.

Aerobic exercises are above all other forms of exercising regimen, and this also includes the cardio exercises. Most of the aerobic exercises like the ones which include brisk walking are effective enough in reducing osteoporosis. In short, it means that people who exercise are always healthy, irrespective of their age or gender. The research paper has its focus on taking into the view the idea that roles behind concept of exercising, and the key changes that are undertaken when people start exercising within the artificial subsystem or in their natural surroundings.

**Keywords:** *Exercising, Aerobic Exercises, Exercising Benefits, Gym Exercises*

## Introduction

Physical activity is basically the name given to the movement of body and change in posture resulting from the skeletal muscles. This movement requires spending of energy. It is significant to point here that “Physical Activity” does not mean you are exercising. However, physical activity involves exercising, which is indeed one of the inherent parts. Exercise follows a very structured approach, and has the purpose behind it. As the popular saying goes – “Body with Sound Health Has a Sound Thinking” and it is quite right.

If your mind is not balanced you cannot reap the benefits of exercise in true sense, and all your efforts would not produce any worthwhile results whatsoever. People, who are weak, appear to be dull or problems in walking are not fit for the exercising.

People having a strict and regular exercising regimen would always be ahead of others in every sense. Regular exercising activity makes the individual happy too. But, it is very important to understand that exercise does not necessarily mean that you have to make visits to the gym or any formalized exercising club. Exercise is valuable in averting and even paying for critical health issues like coronary heart disease, osteoporosis, obesity, depression and for that matter any form of diabetes.

Cardiac restoration exercises are highly special and innovative means of physical activity, which advances cardiovascular system for inhibition and convalescence of cardiac disorders and diseases. A properly designed exercise program will improve the overall health, build patience, and dawdling many of the effects of aging.

Regardless of your age or the type of your body build up, exercising always helps an individual to remain in shape and be perfect.

Maintaining the routine exercising module also helps in keeping the cholesterol levels at bay and well managed. When we exercise on regular basis we are reducing the excess of our body weight and also dropping the blood pressure.

Exercise offers a pleasurable way of spending their amazing time. Leading an inactive life without the presence of exercise will bring the life to a complete standstill. By including a regular exercising schedule in your daily life, you are taking the step ahead towards building a good and balanced life.

Preserving physical fitness and keeping the exercising regimen held together would give rise to physiological benefits.

## II –Literature Review

Proper exercising helps in maintaining the body balances and biochemical reactions inside the body. Light weight exercises are useful for keeping everything in far more organized way than otherwise. Here is the review of literature that showcases development of research and the outcome of exercises over the period of years.

Long term exercise module will bring phenomenal changes in depression and anxiety (Morgan and Goldston 1987). Exercising in a more detailed way would reduce the anxiety and there is a physiological enhancement

lasting for almost 4 hours (Hannum and Kasch, 1981; Raglin and Morgan 1987). Anxiety reduced by means of exercises followed by brief interventions brings relaxation (Bharke and Morgan in 1979).

Physical activity is crucial for advancement of regular and normal human functionalities and this is also essential in adding to the longevity. Gordon Larsen et al (2007). Entertaining activities aid in the development of social skills and keeps the balance of motor functions and all of it further enhances the development of real creativity (Gleave & Cole-Hamilton, 2012). Introducing a strong physical regimen early in childhood through the maintenance of muscular fitness as well as cardio respiratory system leads to good results. On the other hand inactive children grow and become inactive (Janssen & Leblanc, 2010).

There are several instances where the physical activity either in the home or elsewhere will help in keeping the chronic diseases at bay or protect the body on all times. (Warburton, Nichol & Bredin, 2006). Maintaining regular activities in adults helps in the development of stamina and vigor and ensures betterment of life in the adults for more than decade in the adult population of the UK (DH, 1996). Following a sedentary and sitting lifestyle has deep effect on the mental wellbeing of the population and may result in the stress, anxiety and other kinds of social and physical problems (Netz, Wu, Becker, & Tenenbaum, 2005). Irregular or absence of physical activities from the life of individuals may result into obesity and many other types of severe malfunctioning and diseases. Such diseases may often be considered as irreversible in nature. (King et al, 2001); (Hu et al, 2004).

Many people who visit the gyms for physical activities and exercising with the intention to improve the quality of life may are often mistaken by irrelevant idea (WHO, 2004). Only a mere 30 minutes of moderate physical activity undertaken by the individuals in the premises of gyms do not cause any substantial control over the weight gain in adults (DH, 2004, Blair, Lamonte & Nichaman, 2004). Due to more stress laid on the children and growing adults in the schools and colleges, less and less number of students is spending their time in the physical activities, Hardman and Stensil (2003).

People who are consistent with the physical activities are capable of maintaining their functional fitness as they continue to grow old and become grappled by the infirmities (O'Brien-Cousins & Gillis, 2004; Leino-Arjas,

Solovieva, Riihima`ki, Kirjonen&Telama, 2004. Regular exercising in gyms or elsewhere in the natural surroundings is known to cause reduction in physical effects related to the human aging process,(McMurdo,2000). People falling in the lower social strata have lower accessibility to physical activities and it is for this reason they show lower rate of inactivity (Hillsdon, Foster, Naidoo& Crombie2004). In the similar fashion, Rowe, Beasley and Adams (2004) found out that people who symbolized the lower socio-economic set of patterns were leading a slow and sluggish lifestyle in comparison to the higher status groups.

Health activities and exercising in the leisure time has a direct proportion to the income generated by men and womenHealth for England Survey (1998). It is also suggested that physical activities undertaken during the time of leisure is useful in reducing all kinds of risks associated with the early death. Further, for maintaining the health, it is essential to maintain regular kind of physical activities (Harvard Alumni Study, 1978, 1986, 2000. Health Professionals'Follow-up Study, 1996. Aerobics Longitudinal Study, 1998,Nurses HealthStudy, 1997, Whitehall Study, 2000).

### **III. Objectives**

The principle objectives of this research paper are drawn here:

- 1) to search for the gyms where weight management is practiced, adding to health benefits;
- 2) to explore the benefits of new age gyms on health understanding of the youth;
- 3) to exploit the ease of doing exercises in hi tech gyms;
- 4) to assess the approachability of gym goers to the gyms.

### **Physical Activity and Different Perspectives**

A good maintenance of physical activity on daily routine basis would be influential and useful in the development of body and maintaining the posture for long times to come. Such an activity will reduce the occurrence of several types of chronic diseases including the occurrence of type II diabetes, cancer and the cardiovascular diseases on the whole. Individuals who do not indulge in any kind of physical activity will result in the reduction of their cognitive thinking as much as it results in extensive lethargy.

Physical activity and gym exercising is important for the grown-ups and the older population, however the extent and frequency to which these exercises are to be done vary from one point of time to another. The effect of physical activity on cognition helps in building up of higher values and noteworthy increases in cardiorespiratory fitness although this fitness may not be considered at par with the older population. The strength and physical fitness of individuals who come under the younger population is quite high over the other group of people who do not exercise or are poor in exercising.

The neurocognitive functions related to physical exercising can be ascertained on much higher terrain as compared to people who are not exercising at all. The cerebral cortex shows an increased activity among the exercise takers, while those who are on the passive mode of exercising or gym activity show a remarkable downsizing. As the result, the memory functions as well as the power to memorize shows a lower rate among the people who do not exercise or show a kind of inconsistency.

The biological mechanisms through which means the perception about a particular activity is heightened by means of physical exercise training is far more enormous than one could actually think about. In point of view of the Spirduso, is known to ameliorate the health conditions in the individuals and such amelioration are going to happen on an elaborate scale.

A few of the early and most convincing results about physical exercising comes from the real fact that exercising, here in case of animals, it is the active running, there is going to be induced synaptogenesis, which means that new neurons are built up consistently and these are integrated within the network, ultimately resulting into active functions and overall development.

The reality of life is that while young people are moving gradually towards a hi tech life style, they also need to be sure that moving to such a direction would eventually put their physical fitness on a complete halt. Young have to show the quality of their lives, and this is when gym exercises as well as other forms of exercising activities would bring the change and young people show their prolonged fitness.

### Research Methodology

It is noteworthy to recognise the sentiments of the individuals who go out openly for the advanced gyms look for style and advancements as much as they look for cool workouts. The research methodology realized for studying as well as analysis of the need of gym and exercising in the hi-technology environments is based on internet research and comparison. All such research and comparison will be undertaken by forming an interpretation of secondary resources. Apart from the secondary resources, a few primary resources were also consulted to form a conclusive statement and drive home the points of understanding.

However, it is also to be noted that there were no conceptual or other type of references were made with respect to the research conducted on the basis of primary data. Furthermore, the extent of studies and research methodologies that were incorporated in the preparation of this research paper is focused on the patterns and the gym equipment used thereof.

During the process of writing research paper, all the necessary secondary data has been analysed, corroborated following various literatures, online magazines, and several other journals, besides consulting the gym owners to find out exact and latest data.

Since the incidence of COVID 19 there has been only a limited obtainability of the material and other form of evidence available about the need of young population to visit the gyms. In fact, the critical COVID 19 situation has also restricted flow of realistic data about on type of products that the prospective gym goes like to go around with.

## Comparing and Analysis of the Gyms in Delhi

Name	Gym Features	About the Gym	Parking	Guests/Visitors
<b>Fitness First, Connaught Place</b>	Weight management, Goal Specific Workouts, TRX Suspension, Strength & Endurance, Body building, Dance, Aerobics, Zumba, Spinning and Indoor Cycling, Yoga, Cross Functional, good cardio equipment and a perfect techno gym.	Fitness First is an international gym operating in at least 16 different countries. The fascinating part of gym is that it operates with 7 international standard clubs.	Not much of parking, although the gym is quite close to metro station.	Males/Females Toddlers/Grownups
<b>Chisel, Punjabi Bagh</b>	Bodybuilding, Workout and Weight Training with Personal trainers, General trainers and helpers. However, the gym has Dumbbells up to 50 kilogram. 2: No decline bench. 3: Weight plates	Chisel is the state of the art and the new age wellness brand with branding from Virat Kohli.	Spacious parking facility, but not in the vicinity of metro station.	Males/Females Toddlers/Grownups
<b>Olympia , Greater Kailash 2</b>	Spinning, Group Classes, Power Yoga, Combine Training, TRX Training, Cardio Equipment, Strength Training Equipment, Stretching Area, Music and Video Entertainment, Zumba Classes Yoga, Zumba Aerobics, Pilates Core And Abs Cardio Gym Kick Boxing, Mixed Martial Arts The trainers are friendly and highly qualified, and the facilities are great. The variety of gym equipment is limited.	It is superb and innovative gymnasium and fitness centre, spread over 15000 sq.ft. and 3 stories. It is one of the biggest gyms with enough of spacing facility.	Good parking facility, although it is not spacious. The gym is not in the vicinity of metro line.	Males/Females Toddlers/Grownups
<b>Gold Gym, East of Kailash</b>	Spinning, Personal Training, Free Trial for 7 Days, A Week Certified Trainers Group Classes, Indoor Steam and Sauna Power, Yoga, Cardio Equipment, Strength Training Equipment, Stretching Area Music And Video Entertainment, Zumba Classes, Yoga, Zumba, Dance Aerobics, MMA and Kickboxing, Cardio Air Conditioned, Gym Kick Boxing Mixed Martial Arts	The Gym began its functioning in the Venice California in 1965, and soon became the hotbed for the development of training techniques, equipment and nutritional concepts leading to the foundation for modern fitness revolution. In 1975, Gold's Gym received international attention when it was featured in the major motion picture, 'Pumping Iron,' becoming the 'Mecca of Bodybuilding'. The Gym has more than 700 facilities across the globe with exclusive heritage, and involvement as being the specialist in fitness and lifestyle.	Gold Gym has a superb parking facility, and it is next to Kailash Colony Metro Station	Males/Females Toddlers/Grownups

## Analysis and Discussion

The gyms in Delhi have an international character, and these are also equipped with the best and innovative methodologies and equipment, which is essential for the overall development of body and physique. The younger lot, and this includes both males and females are regular goers to these hi-tech gyms and attracted to the methodologies and innovation out there. There is no point of contention here that the modern gyms of Delhi hold a special place in the young population for many obvious reasons. Much of it also relates to the lifestyle requirements as much as the gyms have to do with work outs and maintaining the overall well-being of the individuals. The gyms that were researched and the data collated in respect of that shows that gyms do not provide direct connectivity to the members. These are the regular gym goers, which reach the gym site on their private vehicles. Almost every gym has got new age exercising equipment, and the best guides, which provide customized training to its members. The ultimate need of exercising in these high tech gyms is therefore settled and fulfilled.

The benefits of exercising in these gyms are also complemented by the idea that the atmosphere and the inner climates are spacious with plenty of room space that allows comfortable walking. These gyms are also supplied by the state of the art gym and yoga equipment. Almost every hi tech and corporate gym is offering facilities like the TRX Training, Strength Training along with Gym Kick Boxing as well as mixed martial arts. There is a mix and match of the activities carried out in these gyms, which means that the individual gym goers are enjoying the music and video entertainment, Ab and Cardio Exercises.

In this respect, the need of exercising and carrying the regular work outs has always been the right way and means to overcome monotonous lifestyle, stress and social obligations within the typical Indian family. Since the gyms are flexible with regard to their working hours, this is indeed one of the key beneficial factors to think about. Regardless of the areas where these gyms are located in Delhi, almost each one of these gyms have the same exercising facilities, entertainment and much of everything alike.

The best thing about exercising in such gyms is that individuals feel relaxed and contented. The options to exercise are unlimited, and all such options are available at one place. And above all, gyms have maintained an international character, which is the right way of treating the body.

The innovative and hi-tech gyms in Delhi are valuable addition to the quality of life, and at the same time, such gyms bring an overall change in the personality and thought of the individuals, leading to better life management.

### Suggestions

The new millennium has given a new way of life for the younger lot, who have out of sheer curiosity taken towards the development of their physicality, and engage in lifestyle activities that brings a completely changed personality and a broader outlook. However, these new age and innovative exercise modeling centers also need to be looked from a different perspective, especially as discussed in the context of changing times and health challenges, like the COVID 19 situations.

While the size and style of the hi- tech gyms cannot be undermined, there is always the need to take the current COVID 19 situation into consideration. India has already become the second in line as far as the active COVID 19 cases are looked. Through the online research and the literature studied, these gyms do not have an efficient and regular testing of the COVID 19. It means that the individuals who are regular visitors are not checked in a legitimate way on about their COVID condition. The only method used is temperature monitoring, and if the individual who enters the gym space does not have high temperature, it is understood that that the individual is healthy and fine and allowed to go for the work outs.

Therefore, it is suggested that only such individuals or members are allowed into the gym who have the certificate from government body or local dispensary that shows that the individual is free from Corona Virus. In this manner, a diseased free and congenial environment for the work outs could be maintained, and a consistent healthy atmosphere is created thereof.

Another factor to look into is that although the hi technology and new age gyms are offering spinning, group Classes, power yoga, Combine Training, TRX Training, and provided with Cardio Equipment, Strength Training Equipment, Stretching Area, Music and Video Entertainment, Zumba Classes Yoga, there is always a unique need for every member, and this should be judged by gym authorities on various parameters. One of the suggestions

therefore is that these gyms should not only work on the general parameters but specific parameters should be looked inside on all occasions.

And finally the trainers working out here are friendly and have the necessary qualifications; they also need to regularly upgrade their qualifications from time to time keeping in line with the international standards. More importantly, such trainers should have an international reputation and name in the field of gym and workouts.

### **Conclusion**

In the league of concluding the research paper, it could be inferred that body building not necessarily means staying healthy or likewise keeping yourself fit and structured. Rather there are the times when you begin to feel that too much of exercising activity leads to complete physical depreciation as well as reducing your mental health. It could be concluded herewith that individuals maintaining a strong exercising regimen may also get affected in terms of their body and health. But by overall means, exercising in gyms or at homes help in developing the personality of the individuals.

### **Acknowledgements**

The research probed into the assumptions as to why people like to visit the health centers and gymnasiums for the development of the body and muscle mass. The research paper makes substantial efforts to present a fair idea of various forms of exercises in our routine lives. I recognize the data and other pieces of knowledge offered to me in preparing the research paper were useful and effective in many ways. It helped me to know the significance of exercising as well as the body building measures.

**TRAINING AND DEVELOPMENT AND ITS IMPACT EMPLOYEE AND ORGANIZATIONAL PERFORMANCE: A REVIEW**

**\*Swati Bhatia, \*\* Dr.Richa Khugshal**

*\*Research Scholar, Lingaya's Vidyapeeth, Faridabad, Haryana, India.*

*\*\*Assistant Professor, Lingaya's Vidyapeeth, Faridabad, Haryana, India.*

There is no question that multinational organisations are aiming to attain excellence and outpower others in the same field. To achieve this, organisations must successfully acquire and use their human resources. Organizations must be more conscious of their human resources in a practical way. Training has a positive influence on employee work results. Training is a driving force that strengthen the workers' competence in their work and improve their capacity to achieve positive performance. Training is often seen as a valuable way for grappling with technical innovation-fostered changes; business competitiveness, corporate structure and, most significantly, employee success play a vital part. This paper analyses the relation amid the effect of training on employee efficiency and performance.

**Keywords:** Training, Development, Employee, Performance, Human Resource

**Introduction**

Organizations are experiencing intensified competitiveness due to globalisation, technical developments, political and economic conditions (Evans, Pucik & Barsoux 2002) so that they can train their workers to brace themselves to respond and develop their efficiency to the above rise. The recent proof of awareness development in the business environment over the last decade can not be overlooked. It is significant this development was brought on not only by technical changes or variations of output variables, but also growing attempts to enhance organisation's human capital.

Human resources in this era of globalisation have been a strategic weapon for sustainable competitive advantages. The distinction between a successful business versus a good organisation is human resources. The human resource is the foundation of any company, it is also the organisation's primary capital. The distinction between financial resources and a successful business is human capital. Training and development was an essential task for the administration of HRM and efficient utilisation of human resources. An investment in an organisation's human resources, both immediate and long-term profits, is successful training and development.

Training is a crucial factor in enhancing efficiency and can strengthen human and organisational abilities. Training is critical to open up the future prospects for growth and advancement and gain a competitive advantage. Training systems allow staff to understand more about modern technologies and acquire robust competencies and expertise such that recently designed technological equipment can perform the tasks and fundamentals. Training encourages capability upgrades and contributes to enhanced engagement, wellbeing and sense of membership, which directly strengthens the competitiveness of company.

Therefore, the obligation for enhancing employee efficiency of any company is definitely one of the key measures that most organisations ought to do. Training and development is definitely one of the main steps. As is clear, workers are a vital resource, the commitment of employees in order to sustain productive efficiency must be optimised. This also allows managers to have sufficient personnel who are physically and socially qualified and willing to establish their professional careers in divisions or managerial roles (Afshan, Sobia, Kamran & Nasir 2012, 646)

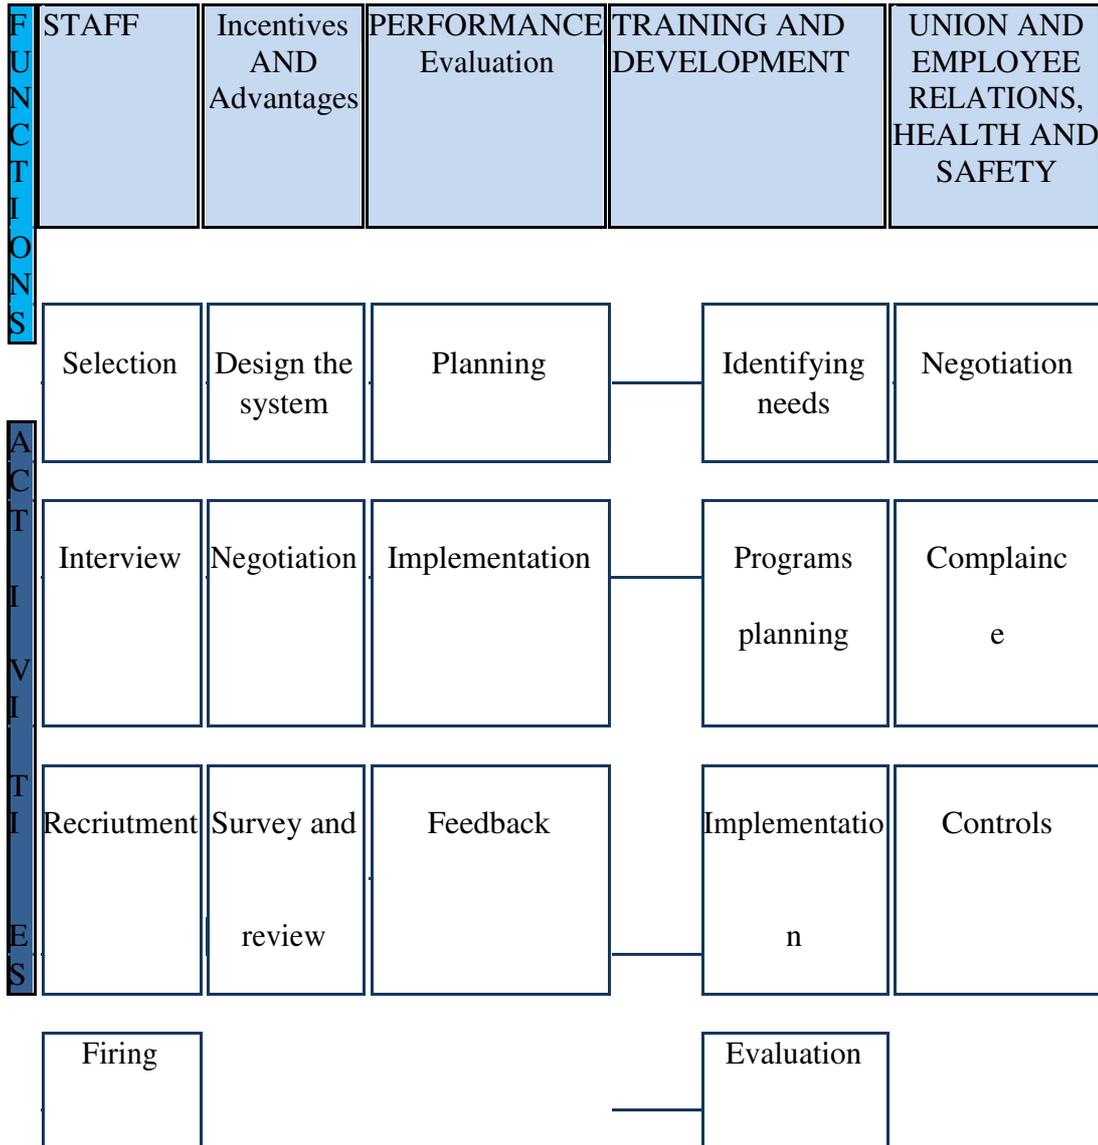

Training has the main function in enhancing workers' abilities to carry out existing and potential activities. Training allows you to alter things such as technologies and competitiveness. Training is, beyond a doubt, essential for an organisation in many things. Training is historically described as the mechanism by which persons adjust their abilities, expertise, attitudes and/or actions.

**Objective**

This study is intended to know the impact of training on employee performance on their jobs.

**Human Resource Management**

The management of human resources includes maintaining the human resources required by a company and ensuring that human resources are gained and retained in order to support the vision, policy and priorities of the organisation. In other terms, the emphasis of HRM is on the securing, management and use of an productive workforce, which companies demand for their short and long-term business survival. HRM main roles Briscoe (1995) are staff, training and development, performance evaluation, incentives and advantages and essentially the health and safety and employee relations.

**Training and Development**

Several variables included in these studies include: quality / quantity of jobs, preparation / organisation, effort / engagement, collaboration / co-operation and contact about the gaps in the employee output prior to and after training (Paat and Rumokoy, 2015). The findings of their analysis demonstrated the substantial gap in employee efficiency before and after training in quality / quantity

of jobs, plan / organisation, initiative / commitment, coordination and communication. One of the valuable systems for enhancing employee efficiency is the training programme. Management could also increase the quality of the training and expand the diversity of the training programme content and module (Paat & Rumokoy, 2015).

Falola 's (2014 ) explored the efficacy of training and development in Nigerian banking in terms of employee success and company competitive advantage. Descriptive study approaches were used by two hundred and twenty three accurate questionnaire, conducted using basic random sampling techniques by selected banks in the State of Lagos in the South-West of Nigeria. The collected data was evaluated in order to represent the raw data substantially using descriptive statistics. The findings revealed that there is a clear correlation between education and growth, success and competitive gain for employees. The results reveal that the tested dependent variable and independent construction have a close relationship.

Adeniji et al (2012) In the surveys of librarians in such Institutions, researchers showed that the quality or lack of a training programme depended strongly on the form of education offered by workers and the training they gained.

The effect of training on employee efficiency was evaluated in Bin Atan et al , ( 2015). The study was performed in a small and medium-sized (SME) Malaysian business. The research looked at the preparation element which had an effect on the success of company employees. The functional field of the organisation chosen for the research has also been analysed and involves preparation and staff success in the successful human resources management practises. A questionnaire was used to engage openly in the study by 85 workers of the respective development units of the company. Study results found that an essential association existed between productive training and the job performance of workers.

By an applied study model integrating the main factors which have been demonstrated in current literature with training transitions and also by evaluating the connexion between the transition of training and organisational results, the medium to long-term consequences of training programmes for companies were examined by Diamantidis and Chatzoglou (2014). The research involved the nature of preparation, self-sustainability and working conditions of trainees. Applying the Structural Equation Simulation method to data from 126 workers who have worked in a variety of Greek organisations, the test is accurate. The findings show the greatest influence on post-training work success and self-efficacy and after-training actions of trainees while the training curriculum is planned.

Al-Awawdeh (2011) carried out an analysis aiming primarily at statistically examining the connection between training policy and employee efficiency. The aim of this research was to evaluate the possible impact of staff performance found in the theoretical part of the study. Single regression method; SPSS were used to assess individual modules; training framework; training system, training and obstructions. Out of 651 staff members from the Al-Bayt University, a sample of 120 were selected. The findings revealed statistically significant impacts on output of all independent variables; the influence on morality was statistically significant. The transaction results of the two independent output variables were also positive. The research exposed the need for scientific approaches that will assess employees' training needs and that training systems are structured to concentrate on the practise and function to overcome challenges in the workplace. The Study guidelines included designing educational programmes in the face of global trends to give trainees training opportunities to deal with shifts in the environment which includes retraining from time to time.

### **Benefits of training**

Training strives primarily to develop awareness, expertise and behaviours in relation to job assignments and to enhance them. It is one of the most powerful motivators that can help both people and organisations on a temporary and long-term basis. With preparation, there are so many advantages. The following was summarised by Cole (2002):

1) Strong morals – trusted and inspired workers earned training;

- 2) Reduced manufacturing costs – training reduces the risks of efficient, more cost-effective usage of products and facilities in order to minimise and prevent waste;
- e3) Lesser turnover – preparation offers a feeling of protection at the office, minimising labour sales and avoiding absenteeism.
- 4) Change Management – preparation promotes change management by the staff awareness and interest in the change phase and also offers the knowledge and skills required for adjusting to different situations;
- 5) To include visibility, improved transparency and expanded compensation and advancement opportunities;
- 6) Support to maximise employee quality and availability.

### **Training and development methods**

Nadler (1984) stated that all practises relating to human resource growth are intended to enhance the individual's work efficiency, trainee new talents for new employment and new roles in the future and generally increase individuals and organisations in order to accomplish the present and future goals of the organisation. There are two ways in which organisations may opt to prepare and improve their staff's skills. This is on-the-job preparation given to corporate workers when doing their daily jobs at the same workplaces and off-work training allows employees to get away from their normal work atmosphere. Examples of work-related formation involve career rotations and transitions, coaching and/or mentoring, but are not constrained. Off-the-job preparation scenarios, on the other hand, include workshops, role playing, among several others, as detailed below.

Armstrong (1995) suggests that training on the job can be a teaching or coaching on the desk or at the table by more qualified persons or instructors. Various companies, for example, are encouraged to use various teaching strategies, (1) according to the policy, the objectives and the appropriate resources of the institution, (2) based on the requirements defined at the time and (3) according to the target population to be trained which may include, inter alia, particular staff, associations, teams, divisions or the whole organisation.

### **Effect of training on performance**

There are a lot of factors that influence organisation's success and development in the modern world. In view of present study, training for workers plays an important role in maximising efficiency and competitiveness in the growth of organisations. This ensures the companies are well positioned to compete and remain at the top. This also suggests that there is a substantial gap between the companies that train their workers and others that do not. Existing research indicates that there are clear impacts on job success in training and growth. In specific, several researchers have analysed employee efficiency (Purcell, Kinnie & Hutchinson 2003; Harrison 2000), while others have generalised to a general viewpoint on corporate performance (Swart et al. 2005). Both of these are associated in the way that the success of workers relies on organisational performance when employee performance affects overall organisational performance. Wright & Geroy (2001) states that the capabilities of workers change with successful training systems. In this sense. Therefore, it not only boosts employee's average efficiency in order to fulfil their existing roles successfully, it also raises workers' expertise and abilities, and thereby leads to greater corporate efficiencies.

Interesting results have been made on this partnership in the field of previous studies on training and employee performance. Training has shown a positive effect on success by improving awareness, talents, skills, abilities, maturity and actions for the employee and the business (Appiah, 2010; Harrison, 2000). (Appiano, 2014). Furthermore, other research by Swart et al. (2005) for example, analyse training to overcome ability deficiencies and competence gaps in order to enhance employee performance. The bridging of the performance gap is a relevant training technique for the acquisition of special abilities and skills of the workers and enhancement of their performance, according to Schwart et al., (2005). He expanded the idea further and claimed that creation allows organisations to understand that their employees do not perform well and therefore thus their expertise, abilities and

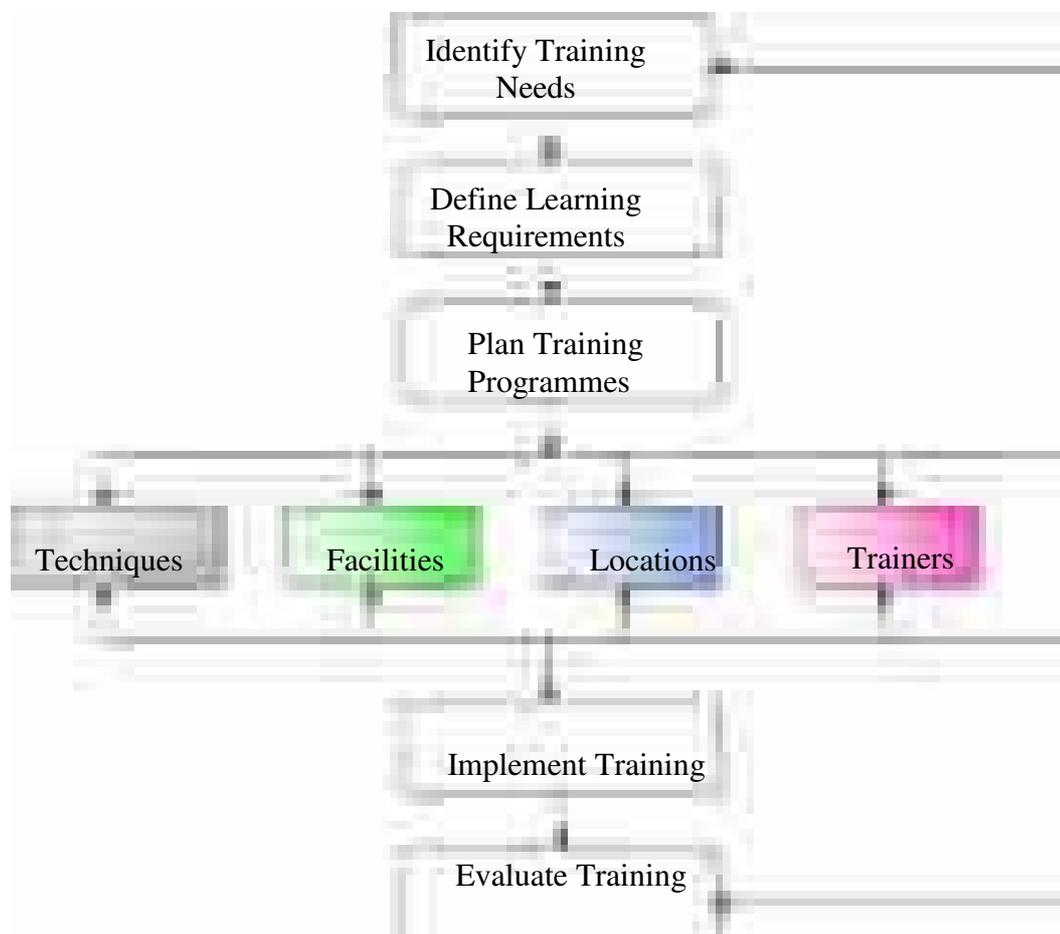

behaviours ought to be tailored to the firm's needs. It is often the case when workers have any information regarding multiple jobs. However this is not enough and workers need to respond regularly to new work performance criteria. In other terms, companies require quality preparation and staff engagement policies, and thus should not have to wait for qualifications and failures to arise.

The capabilities of workers change through successful training programmes, according to Wright & Geroy (2001). It not only boosts employees' cumulative efficiency to successfully fulfil the current work, but also enhances employees' expertise, abilities and mindset, thereby leading to higher organisation. Via training, employee skills are built and empowered to execute the role successfully and accomplish firm targets competitively. In addition, concerns of frustration, absentness and attrition may be significantly minimised where workers are so well trained that their success and expertise can be guided toward their innate strengths (Pigors & Myers 1989).

When training is scheduled, much of the gains from training will quickly be accomplished. So the company, trainers and trainees are trained well in advance for training. The proposed training is intentional action in order to obtain the requisite education to enhance jobs efficiency, according to Kenney & Reid (1986). The following phases are scheduled for training under Kenney and Reid:

- Identifying and defining needs for training
- Defines the training needed to recognise the expertise and abilities and the behaviours that need to be improved. Defining the training goals
- Planning training programmes, utilising the best blend of training methods and sites, to satisfy needs and goals. Choose who delivers the instruction
- Assess training.
- Amendment and expansion of training as needed.

Planned Training Process (Source: Armstrong Michael (1995).

### Conclusion

Training and development and its effect on results were outlined in the current study. In addition, the study indicates that organisational performance is substantially influenced by training provided to employees. A company's success depends on its dedication to workers, which in turn depends on its training and growth strategy for human resources. The analysis of the relationship between employees' training and success is relevant because the current market patterns need greater productivity, accuracy and efficiency in a lower period and expense and can only be accomplished by planning, improving and introducing excellent training programmes for employees. In order to acquire information about their employment, further educational programmes in the company allows workers to receive promotions between their colleagues. Given that training affects employee commitment and efficiency, it is essential that training is improved and implemented in order to meet organisational objectives.

# Women Entrepreneurs in India - Emerging Issues And Challenges

**Dr. Richa Khugshal**

**ABSTRACT** - Women need to struggle a lot to have equal rights and place like men have in Indian society. Regardless of all the social barriers, women have struggled with man effectively and improved their educational status, living conditions, made necessitate changes in their life style, managed to survive in the competitive environment with their hard work, attentiveness, determination, and perseverance. The present research endeavors to recognize the factors that motivate women to become an entrepreneur, assess the several problems and challenges faced by women entrepreneurs and highlight the various government schemes to promote women entrepreneurs. This study is descriptive in nature and secondary data is accumulated from published articles, books, thesis, websites, newspapers, journals, etc. on women entrepreneurs. This research showed that increased family support, education and qualification, success of friends and relatives, better future of their children, family occupation, need of extra income, government procedures and policies, liberty to take own decision, new challenges and opportunities for self accomplishment are some factors that motivate women to become an entrepreneur; women face various problems and challenges like family dispute, scarcity of finance, marketing problems, deficiency of entrepreneurial training, scarcity of raw materials, low risk taking ability, hard competition, inadequate managerial ability, absence of entrepreneurial aptitude, high cost of production, patriarchal society, legal formalities, travelling to become an entrepreneur; and government has various schemes like Swalamban (NORAD), Rashtriya Mahila Kosh, Support to Training and Employment Programme for women (STEP), Women Component Plan (WCP), Technology Development and Utilization Programme for Women (TDUPW), Women Enterprise Development Scheme(WEDS), Self Employed Women's Association (SEWA), The Stand up India scheme etc. to promote women entrepreneur in India.

**KEYWORDS:** Entrepreneurship, Women, Business, Government Schemes.

## I. INTRODUCTION

According to Indian government "women enterprise is an enterprise which is managed, controlled and owned by women, that means women are having minimum 51 per cent of the capital/ share and at least 51 per cent women are working in an enterprise". Educated women are not willing to limit their lives within the boundaries their house. They also want equal respect from their spouses. Though, Indian society has been a male dominated, so Indian women need to go a long way to attain equal rights and equal position in the society. In Indian culture, women are assumed as weaker than men and they are asked to execute the decisions taken by the men in their family. But now Indian society has been changed in terms of enhanced educational status of women, better living standards and life style. Women struggled and competed with men and successfully stood up with men and performed well. Women are self-confident, persuasive, enthusiastic, willing to take risk, and capable enough to manage to survive and excel in their work. Women with their ability to learn quickly, solving problem, willingness to take risk, to motivate people, and to know how to win are the strengths of the women

entrepreneurs in Indian. Women stand high in the society and are applauded for their accomplishments in their respective fields.

## II. WOMEN ENTREPRENEUR

Women entrepreneurs are those women who think about business enterprise, take initiative, organize and combine the all necessary factors of production, and by undertaking the risks run a business enterprise.

**Kamal Singh** has defined woman entrepreneur as "a creative, innovative and confident woman competent of attaining self-financial freedom independently or in partnership, creates employment opportunities for others people also by starting, establishing and running the business enterprise by keeping pace with her personal and social life."

**Indian Government (GOI2006)** has defined women entrepreneur as "an enterprise hold, owned and controlled by a women with a minimum monetary interest of 51 per cent of the capital and also providing employment opportunities to at least 51 per cent to the women."

## STATUS OF WOMEN ENTREPRENEURS IN INDIA

India is a country where there is a rich cultural heritage. But now social scenario in India is changing. Time has gone when women were not permitted to venture out of their homes, now women have enhanced their education standards and also participate in social, financial and political activities with equal zeal and enthusiasm like men. Traditionally, Indian women like Brahmi, Gargi, Laxmi Bai, Damyanti & Razia Sultana were strong and considerable decision makers. But, today the role and status of women has been drastically changed all over the world. In all over the world women are breaking their traditional and stereotypic roles.

Progressively with time, women entrepreneurs are being measured as essential for the economic development of the nation. Women help in generating employment opportunities and economic growth. Entrepreneurship facilitates women to become economically independent and also to develop and improve their social status in the society.

World Bank report showed that women entrepreneurs usually tend to recruit women. Perhaps because women entrepreneurs have started these enterprises. A considerable quantity of women entrepreneurs are micro-domestic based enterprises increasing their family income in India.

Ministry of Statistics and Programme in sixth economic census released that women comprise about 14% of the total entrepreneur base that means about 8.05 million out of the total 58.5 million entrepreneurs in India.

## NEED TO STUDY WOMEN ENTREPRENEURSHIP

In today's period of social change and advancement, it is significant to study about women entrepreneurship and also about how to promote and boosted women entrepreneurship. In many countries it has been observed that where there is gender impartiality and women play important roles in an organization, there is social development, greater wealth, and development of moral organizations. Women entrepreneurs are generally the owners of micro, small and medium enterprises that mean women play important role in the development of MSME. Thus, role of women as an entrepreneur and in modern organization is of great academic interest.

## III. LITERATURE REVIEW

**Terjesen, S., Elam, A. and Brush, C.G. (2011) De Bruin, Brush, Welter, 2006; Bullough, Moore, and Kalafatoglu, 2017<sup>[1]</sup>** in their study showed that women entrepreneurs play a vital role in generating new opportunities and also contribute towards the social and economic growth of their societies.

**Ramasetu (2015)<sup>[2]</sup>** in his study, focused on the issues and difficulties faced by urban working women in India and

found that women go through with physical and psychological pressure, poor work-life balance, inequitable management in the work place, stressed life and work place discrimination.

**Chanchan (2013)<sup>[3]</sup>** in his study, recognized and examined the pull and push factors related to the growth of women entrepreneurs and showed that irrespective of the education level and the income, the economic restrictions are the key reasons for women starting up entrepreneurship.

**Tuschano (2013)<sup>[4]</sup>** in his research, showed that women mainly belonging to lower or middle income group were found in the micro businesses in the unorganized sector. Women entrepreneurs faced immeasurable problems as these businesses run under condition of intense scarcity of all resources and also outside the range of social security. The amount of low investment limit their businesses to remain small sized. Thus, it enforced them to utilize traditional tools and economical raw material. Professionalism, lack of skills and low production level in business also affect their income but there was a immense chance of development in some businesses.

**Umamaheswari (2011)<sup>[5]</sup>** considered the development and the factors affecting the development of women enterprises in her research and showed that the factors such as nature of the organization, age of the enterprise, location of the organization, supply of labor, and professional management have control on the growth of women enterprises. Also other variable such as technically qualified entrepreneurs, past experience and the special skills of the entrepreneurs also have influence on the growth women enterprises.

**Mehta and Mehta (2011)<sup>[6]</sup>** in their research found that the major challenges and problems faced by women are work background and educational in rural area in business. The research indicated that various State Small Industries Development Corporations, NGOs and the nationalized banks are conducting several development programmes for women entrepreneurs.

**Thangaraju (2011)<sup>[7]</sup>** in his study considered the factors of entrepreneurial motivation, growth and problems faced by women entrepreneurs. The study found that the key problem was inavailability of money but reimbursement of it. The reimbursement is hard due to low paying ability, which is influenced by poor education and skills, and some issues related to marketing, viz., poor mobility, partial towards women and social group they belong and bad infrastructural facilities. Therefore, women need to be educated, skilled and trained to become successful entrepreneurs.

**Kulkarni (2010)<sup>[8]</sup>** in his study showed that the difficulties that women entrepreneurs faced micro issues related was financial problem caused by lack of money and modern technology. The second limitation that women entrepreneurs faced macro issues related was competition.

Women entrepreneurs need to be emotionally stronger to survive in the male dominated society. The third limitation that women entrepreneurs faced macro issues related to external environment was the geographic problems concerned with channels of distribution, distance, communication mode, etc.

**Ghosh and Cheruvalath (2007)<sup>[9]</sup>** in their study they discussed about various challenges faced by women entrepreneurs such as low education and socio-cultural constraints. The research also given some proposal to improve women entrepreneurship such as inculcating an entrepreneurial attitude, accurate training, understanding their entrepreneurial inspiration, attribution augmenting, and removal of discriminating social duties essential to them.

**Setty (2004)<sup>[10]</sup>** in his research focused on challenges and potential of women to become entrepreneurs. Women have been the economic associate of men in numerous fields when they become entrepreneurship, but men seem to rule the entrepreneurial world. Woman are equally endowed with the managerial abilities and psychological qualities that required in successful entrepreneurship. At times, the opportunities and environment are the same for both women and men. But the entrepreneurial activities in traditional societies have been restricted to men.

#### OBJECTIVES OF THE STUDY

1. To recognize the factors that inspires women to become an entrepreneur.
2. To study the several problems and challenges faced by women entrepreneurs.
3. To know about the various government schemes to promote women entrepreneurs.

#### IV. RESEARCH METHODOLOGY

Research methodology used in present study is as follows:-

**Research design:** Descriptive research was used in the present study.

**Research area:** Research area in present study was India.

**Data collection:** This study was based on secondary data. Secondary data was collected from published books, articles, thesis, websites, newspapers, magazines, public records, journals, and annual reports on women entrepreneurs. For the present study data about the women entrepreneurs in India was collected.

#### V. ANALYSIS

##### Objective 1

**1. To recognize the factors that inspires women to become an entrepreneur.**

In India, women entry into business is traced out as an expansion of their day to day primarily kitchen activities such as 3P's, Pappad and Pickle. But with the enhanced education and span of time women started shifting from 3P's to modern 3E's i.e., Energy, Engineering and Electronics. Skill, knowledge, compliance and adaptability in business are the key factors for women to emerge into business. Women entrepreneurs take such challenging role to congregate their personal needs and to become economically independent. Inbuilt quality of entrepreneurial and a strong aspiration to do something in their life make women capable to contribute values to both family as well as social life. Media makes women to know about their own personality, rights and the work conditions. Numerous women start a business because of some hurtful incidents such as divorce, the health of a family member, unfairness due to pregnancy, or economic reasons. But today a new flair pool of women entrepreneurs is forming, because many women leaving the corporate world and planning their own future. Women are booming as interior decorators, designers, publishers, exporters, garment manufacturers and still trying to search new opportunities for economic contribution.

There are various factors which inspire women to become entrepreneurs such as innovative thinking, new challenges and opportunities for self accomplishment, employment generation, freedom to take own decision, desire to become independent, favorable government policies and procedures, family occupation, requirement of additional income, better future of children, success stories of friends and relatives, role model to others, supportive family, education and qualification, self identity and social status.

##### Objectives 2

**To study the several problems and challenges faced by women entrepreneurs.**

In India, women faced several problems to get ahead in business in their life. Women entrepreneurs face various problems to develop their own enterprise. Women faced problems at various stages starting from their initial commencement of business and also in running their business. The major problems faced by women entrepreneurs in India are as follows:

**Shortage of Finance:** Women entrepreneurs endure from insufficient economic resources and working capital. Women have a very less assets and bank balance and family members show least interest in investing money in the business run by women because of lack of confidence in the ability of the women to run business successfully. It also very complicated to take loan and support from banks and manage the working capital for the women.

**Marketing problems:** Women entrepreneurs always face difficulties in marketing their products because they depend upon the middlemen for advertising their products who ask

for the high profit. The middlemen usually take advantage of the women entrepreneurs. It's very difficult for women entrepreneurs to capture the market and to make their products popular because of tough competition from male entrepreneurs.

**Shortage of raw materials:** Women entrepreneurs also find it difficult to acquire the essential raw materials and other inputs required for production because of high prices of raw materials.

**Stiff competition:** Male entrepreneurs and organized industries pose strict competition for women entrepreneurs.

**Limited managerial ability:** Women entrepreneurs may not be specialist in all functions of the business venture and they shall not be able to dedicate enough time for all kinds of activities of enterprise.

**High cost of production:** The development of women entrepreneurs is also restricted by the high cost of production. To reduce the cost of production it is required to increase competence and expand productive capacity. Reduction of cost of production is required to make their survival possible for longer tenure. Women entrepreneurs also face the problems of human resources, legal formalities, infrastructure, lack of family support, overload of work, etc.

**Absence of Entrepreneurial Aptitude:** The another problems of women is the lack of entrepreneurial aptitude such as innovation, risk bearing etc.

**Low risk taking ability:** Women entrepreneurs usually plan for a protected life so they have a problem of low risk taking ability as comparison to male entrepreneurs.

**Family Conflicts:** In India, women are also supposed to take care of the children and other family members. Married women entrepreneurs have to balance their household activities and business activities. Women spend long hours in business and thus they find it hard to fulfill the requirements of their family members and also sometimes become unable to do the domestic work, to have time for children's education, personal hobbies, and this lead to family conflicts.

**Patriarchal Society:** In India, women do not get equal treatment because of male-dominated society and men ego also places barriers in women progress.

**Lack of entrepreneurial training:** Many women usually do not have proper technical and professional training to start a new business enterprise.

**Legal Formalities:** Women entrepreneurs find it very hard to comply with several legal formalities to obtain license etc.

**Travelling:** Women entrepreneurs cannot travel from one location to another freely in comparison to men.

### Objective 3

**To know about the various government schemes to promote women entrepreneurs.**

Development of women has been a policy objective of the government since independence. Following are the government schemes to promote women entrepreneur.

#### **Trade Related Entrepreneurship Assistance and Development Scheme for women (TREAD)**

This scheme is for women involved in non-farm activities. The main components of this scheme are as follows:

- Grant by government to 30% of the total project expenditure to the NGOs for encouraging trade associated activities among women. The remaining 70% of the project expenditure is financed by the primary agency as loan for operating activities as laid down by the project.
- Government grants up to Rs 1 lakh per programme to the many training institutions and NGOs for organizing training programmes for the women who willing to start up their own business.
- The government also grants need based grants up to Rs 5 lakhs to national entrepreneurship development institutions and any other institution for conducting research, field surveys, and evaluation studies and hence making a blueprint for training modules.

#### **Credit Guarantee Fund Scheme**

Government grant loan up to 25 lakhs without third party guarantees to small scale industries. It is run by Credit Guarantee Fund Trust for Small Industries (CGTSI). This scheme covers up to 80% of the credit to enterprises run by women which embrace maximum guarantee limit of Rs 20 lakhs.

#### **Support for Entrepreneurial and Managerial Development**

Micro, Small and Medium Enterprises conducts entrepreneurship development programmes and charge fees for enrolling in such programmes. To promote more entrepreneurs from women, SC/ST, physically challenged groups, it is emphasized that such programmes will not ask for any fees instead these programmes will give stipend of Rs 500 per capita per month. 50,000 entrepreneurs will get trained in diverse industries like Fashion, IT, Agro, Catering, Pharmaceutical, Food Processing, etc. 20% of the programmes will be organized only for women.

#### **Exhibitions for women under promotional package for Micro and Small Enterprises approved by CCEA under marketing support**

To promote women entrepreneurs to take participation in International Exhibitions some provisions are implemented which are as follows-

- Free space in exhibitions is provided to women.
- Reimbursement of air fare of economy class for one women representative.
- Reimbursement of shipping cost up to 15000.

**Swalamban(NORAD)** This scheme is to offer training for skill development to women to facilitate them to get employment or self-employment. The focus of this scheme is the needy and poor women from backward and weaker section of the society. The Haryana State Women Development Corporation (WDC) is the nodal organization for execution of this scheme through voluntary organisation of the state.

**Rashtriya Mahila Kosh** A cluster is a assembly of venture producing similar products/services. In a cluster there can be 20 or more venture. This Cluster Development Program aims to improve technology, competitiveness, manufacturing practices, market the products competently, create employment, etc. The clusters encompasses women enterprises and they are assigned up to 90% support to organize diagnostic study, workshops and seminars, forming association, capacity building through training programmes, market development, etc.

#### **Support to Training and Employment Programme for women(STEP)**

Ministry of women and Child Development manages STEP scheme of training of women to develop their skill, to enhance employability and helps them to become entrepreneurs /self-employed. This scheme is for 16 years and above age group women.

#### **Swa Shakti project and Swamsiddha scheme**

This scheme grants financial aid to capacitate rural poor women through microfinance from international agencies.

#### **The Ministry of Small Scale Industries**

The ministry develops productivity, competitiveness, and capacity building of small women ventures in India.

#### **Women Component Plan (WCP)**

This plan gives prioritizing economic resources for schemes/programmes for women, mainly those which give power to women.

#### **Technology Development and Utilization Programme for Women (TDUPW)**

This programme encourages awareness regarding the new technology, acceptance of new technology by women, training programmes for women regarding technology issues, encourages technological upgradation of tiny, small and medium enterprises run by women entrepreneurs, also conducts demonstration programmes on design, technical procedures and growth of products for the benefit of women.

**Schemes of Consortium of Women Entrepreneurs of India (CWEI)** CWEI supports in attaining E-commerce (Electronic Commerce) through its global information transformation system and web portal. E-commerce is the online buying and selling of services and products.

#### **The Federation of Indian Women Entrepreneurs (FIWE)**

This federation is to conduct training programme in domestic marketing, export marketing and management, quality control, management of enterprises, procedures and systems, laws and regulations for running a small and medium scale enterprises in order to sustain their growth.

#### **Scheme of Assistance to Women Co-operatives (SAWP)**

This scheme commence several functional, structural, and institutional measures to empower women, development of their access to inputs and technology, capacity building, and other farming resources.

#### **Women Enterprise Development Scheme(WEDS)**

This scheme provides economic assistance to women for any feasible economic creating activities in liberal terms and conditions.

#### **Self Employed Women's Association (SEWA)**

SEWA is a trade union registered in 1972 and supports poor and self-employed women workers. SEWA supports women in establishing their own economic organization and capacity building. SEWA connects women workers to development programs, so that they can attain full employment and self-reliance.

#### **The Stand up India scheme**

This scheme helps the SC/ST and women entrepreneurs economically so that women have a equal chance to set up their own enterprises. This scheme helps by giving loans from Rs 10 lakh to Rs 1 crore to the weaker section of the population. The Start-Up India scheme was launched in January 2016 by Prime Minister Narendra Modi to assist new entrepreneurs to start up their own enterprise.

**The Ministry of Small Scale Industries** The Ministry enhances competitiveness, productivity and capacity building of small women ventures and their collectives in India.

## **VI. FINDINGS**

1. Increased education and qualification, support of family members, success stories of friends and relatives, better future of children, need for additional income, family occupation, government policies and procedures, freedom to take own decision and be independent, new challenges and opportunities for self fulfillment are some factors that inspire women to become an entrepreneur.

2. Women face several problems and challenges like scarcity of finance, marketing problems, scarcity of raw materials, hard competition, inadequate managerial ability, high production cost, lack of entrepreneurial aptitude, inability to risk, family disputes, inadequate entrepreneurial training, legal formalities, travelling to become an entrepreneur.
3. Government has various schemes like Trade Related Entrepreneurship Assistance and Development Scheme for women (TREAD), Credit Guarantee Fund Scheme, Support For Entrepreneurial and Managerial Development, Swalamban (NORAD), Technology Development and Utilization Programme for Women (TDUPW), Rashtriya Mahila Kosh, Support to Training and Employment Programme for women (STEP), Ministry of Small Scale Industries, Women Component Plan (WCP), Women Enterprise Development Scheme(WEDS), Self Employed Women's Association (SEWA), The Stand up India scheme to promote women entrepreneur in India.

## VII. CONCLUSION

Women have increased their education and qualification and they are motivated to become an entrepreneur. Today women have equal passion and enthusiasm like men. Enhanced education and qualification, supportive family, success stories of friends and relatives, better future of children, requirement of additional income, family occupation, government policies and procedures, freedom to take decisions, desire to become independent, new challenges and opportunities for self accomplishment are some factors that inspire women to become an entrepreneur. But to become an entrepreneur women face several problems and challenges like scarcity of finance, marketing problems, scarcity of raw materials, hard competition, inadequate managerial ability, high production cost, lack of entrepreneurial aptitude, inability to risk, family disputes, inadequate entrepreneurial training, legal formalities, travelling. Progressively with time, women entrepreneurs are being considered as crucial for the economic development of the country. Women contribute towards the employment creation and economic growth. In India, government has come up with several schemes to promote and support the women entrepreneur like Women's Association (SEWA), The Stand up India, Trade Related Entrepreneurship Assistance and Development Scheme for women (TREAD), Credit Guarantee Fund Scheme, Support For Entrepreneurial and Managerial Development, Swalamban (NORAD), Technology Development and Utilization Programme for Women (TDUPW), Rashtriya Mahila Kosh, Support to Training and Employment Programme for women (STEP), Ministry of Small Scale Industries, Women Component Plan (WCP), Women Enterprise Development Scheme(WEDS), Self Employed. These schemes facilitates women to become

financially independent and also to improve their social status in the society.

**A study of student's perception regarding E-learning during Lockdown.****Submitted By:****Dr Rachna Kalsan****Assistant Professor****Lingayas Vidyapeeth****Faridabad****8295472725****drrachnakalsan@gmail.com****Abstract:**

Corona virus pandemic era interrupt many things in the world. Where the GDP fall down, the education sector also faces several problems. Due to the lockdown all the colleges, universities, schools, institutes are interrupted. Due to these students faces many problems. This lockdown creates a major cause in student's learning. Due to this several health issues occurred among students. To limit/ minimize the loss of studies, Ministry of Human Resource Development & Regulators, Directorate of Higher Education in States motivated to educational institutions to shift to online modes of education. Due to this online teaching mode starts for higher education to reduce the loss of student's study. Online mode is a new challenge for both the students and teachers. This paper helps in knowing the current situation of online learning of students. For this study primary data was collected from 150 college students. The data was collected from Haryana rural areas with questionnaire method (in Google form) and mailed to students. This paper focus on the student's hurdles faced during lockdown basically in rural areas.

**Keywords:****Lockdown, MIHRD, Corona virus.****Introduction:**

The covid-19 pandemic era comes with several challenges for the whole world. The covid-19 spoils the whole world economy. All sectors were seriously harmed. In all sectors the education sector is also one of the major sectors faced various challenges. Education sector is also plays a very important role in Country's economy. In India both state and central government authorities faces various challenges and do preventive

measures to solve this problem. This pandemic situation disturbed the education sector, which effects the students future.

COVID-19 is an infectious disease caused by a newly discovered corona virus. Formerly, this disease was referred to as '2019 novel corona virus' or '2019 ncov'. COVID-19 was first identified in Wuhan, China in December 2019. This lockdown situation develops various health issues in students and teachers life.

E-learning tools are playing a crucial role during this pandemic, it aims to help instructors, schools, and universities facilitate student learning during periods of universities and schools' closure. Besides, most of these systems are free which can help ensure continuous learning during this Corona virus pandemic. The success of any information system depends on the usage of the system by users.

E-Learning is just like a web based training means to install a software through which both teachers and students communicate with each other. Everything change with the changing technology. Now the new tools of teaching and learning changes with the technology.

The deadly and infectious disease Corona Virus also known as Covid-19 has deeply affected the global economy. This tragedy has also shaken up the education sector, and this fear is likely to resonate across the education sector globally. The Covid-19 pandemic outbreak forced many schools and colleges to remain closed temporarily. Several areas are affected worldwide and there is a fear of losing this whole ongoing semester or even more in the coming future. Various schools, colleges, and universities have discontinued in-person teaching. As per the assessment of the researchers, it is uncertain to get back to normal teaching anytime soon. As social distancing is preeminent at this stage, this will have negative effects on learning opportunities. Educational units are struggling to find options to deal with this challenging situation. These circumstances make us realize that scenario planning is an urgent need for academic institutions. This is a situation that demands humanity and unity. There is an urgent need to protect and save our students, faculty, academic staff, communities, societies, and the nation as a whole.

E-learning tools are playing a crucial role during this pandemic, it aims to help instructors, schools, and universities facilitate student learning during periods of universities and schools' closure. Besides, most of these systems are free which can help ensure continuous learning during this Corona virus pandemic.

### **Literature Review:**

1. Dr Amita (2020) in his study analyse that faculty made appreciable efforts to compensate the loss of syllabus. According to them various online learning tools were used to deal with students. With the help of online teaching 60 to 80 percent syllabus were completed. The data is collected from 882 students of various higher education institutions through the questionnaire method.
2. Radha and her research coordinators conduct a research in 2020. According to them E-learning mode become the future trend of leaning. The study conducted on 175 students across the world using stratified sampling method. The findings are based on primary data of different students. According to them most of the students were interested in online learning but within their comfort. This mode become more effective and popular during the lockdown situation.
3. Accorging to Suraksha and their co-researchers findings in 2020 analyse that most of the respondents were suffered from disturbance during lockdown. The disturbance are in the form of internet connectivity problem, electricity problem, data packs facilities etc. Due to these hurdles online teaching mode makes difficult to understand the concepts. The data is collected from 13 different nursing colleges of Nepal. The primary data was collected with distributed the questionnaire to all the respondents through mail. This is a descriptive cross-sectional online survey on students. Both teachers and students faced the problem of internet connectivity, and others. If we have to reduce or minimize theses hurdles than it makes the online teaching and learning process more effective and efficient method.
4. According to the study motivation is most important element while using online classes. When the students are not motivated then they don't prefer to use this mode. According to their survey teachers use various strategies to motivate the students.
5. Raheem in his study concluded that learning and teaching from home with the help of online tools is a very efficient step to teach the students. It is beneficial for both the teachers as well as students. In today's life technology become the most

important part of our life. For E-Learning various applications like Zoom, Google meet, Google classroom, Youtube etc were used to help the teachers. So finally during the pandemic era E-Learning through various applications become the most effective tool. It is interesting to share something new.

6. M Samir, said that many educational institutions faced various obstacles during online classes. But the latest technology can help in overcome these problems with the help of different E- Learning platform like Zoom, Google Meet, Youtube, Google Classroom etc. Now these technologies were used in the universities to deliver lectures. This study is done in Egypt. Due to him E- Learning is a easy and effective way to motivate students for learning.
7. Mohammadi, in his study has showed the role of e-learning and its application in language learning process and compared it with traditional form of language learning. It also has provided advantages and disadvantages of e-learning in language learning. The researcher when referred to the above related studies was able to bring out this maiden thought into his research done on the role of e-learning in COVID19 crisis and to show the important of it in different fields. The present paper is going to show the role of e-learning in COVID -19 crisis.
8. Amidst this deadly virus spread such online platforms are needed where (a) video conferencing with at least 40 to 50 students is possible, (b) discussions with students can be done to keep classes organic, (c) internet connections are good, (d) lectures are accessible in mobile phones also and not just laptops, (e) possibility of watching already recorded lectures, and (f) instant feedback from students can be achieved and assignments can be taken in the study.
9. Kapasia in his study analyse the impact of lockdown on students both (graduate & undergraduate). This survey is basically conducted in West Bengal through questionnaire method. The survey conducted on 232 students. According to them 70% learners were involved in the online learning process. But during online classes students faced many obstacles like depression, poor internet connectivity, anxiety, unfavorable study environment at home etc. She suggests targeted interventions to create a positive space for study among students from the vulnerable section of society. Strategies are urgently needed to build a resilient education system in the state that will ensure to develop the skill for employability and the productivity of the young minds.
10. Pravat in his study highlights on major impacts of Covid-19 on HEIs in India. Some measures taken by HEIs and educational authorities of India to provide seamless educational services during the crisis are discussed. Due to Covid-19 pandemic, many new modes of learning, new perspectives, new trends are emerged and the same may continue as we go ahead to a new tomorrow. So,

some of the post Covid-19 trends which may allow imagining new ways of teaching learning of higher education in India are outlined. Some fruitful suggestions are also pointed to carry out educational activities during the pandemic situation

**Objectives:**

1. To know the status of e- learning during lockdown.
2. To study students behavior regarding e-learning.
3. To gather suggestions to make online teaching more effective.

**Research Methodology:****Population:**

All the college students of faridabad are the population of this study.

**Sample:**

This study is conducted on the Faridabad students. The study was done on college going students of different colleges of Faridabad. It mainly focuses on the private sector colleges students.

**Sample Size:**

In the study the sample of 150 students was taken to reach at the conclusion.

**Data Collection:**

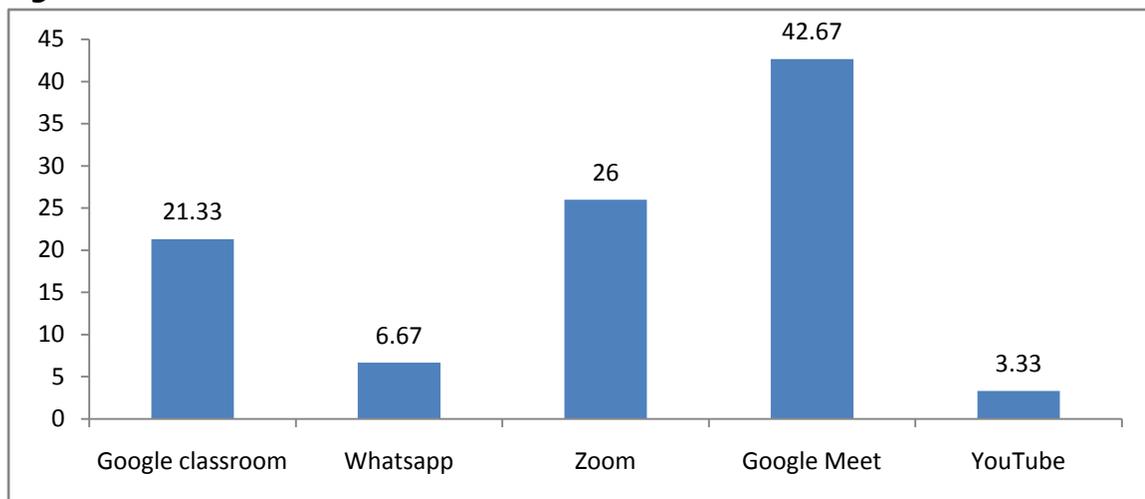

Primary as well as secondary both the sources of data were used in collecting the data. The primary data was collected through questionnaire method. The questionnaire was mailed to the respondents and collects the necessary information from them.

**Findings:**

1. Students preference on different types of application tools used for e-learning:

Table 1:

Classification	Respondents	Percentage
Google classroom	32	21.33
Whatsapp	10	6.67
Zoom	39	26
Google Meet	64	42.67
YouTube	5	3.33
Total	150	100

**Figure 1:**

2. Types of Device used for e-learning:

Table 2:

Classification	Respondents	Percentage
Laptop	42	28
Mobile	84	56
Desktop	24	16
Total	150	100

Figure 2:

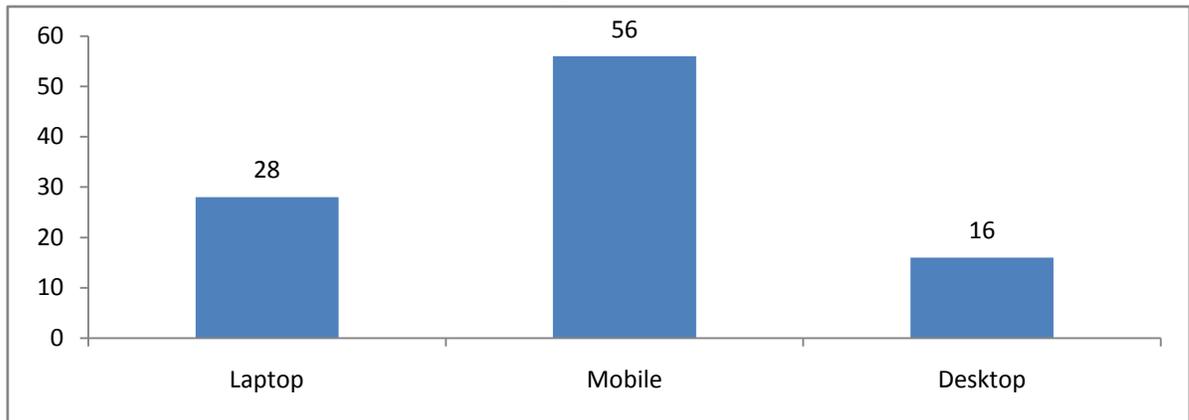

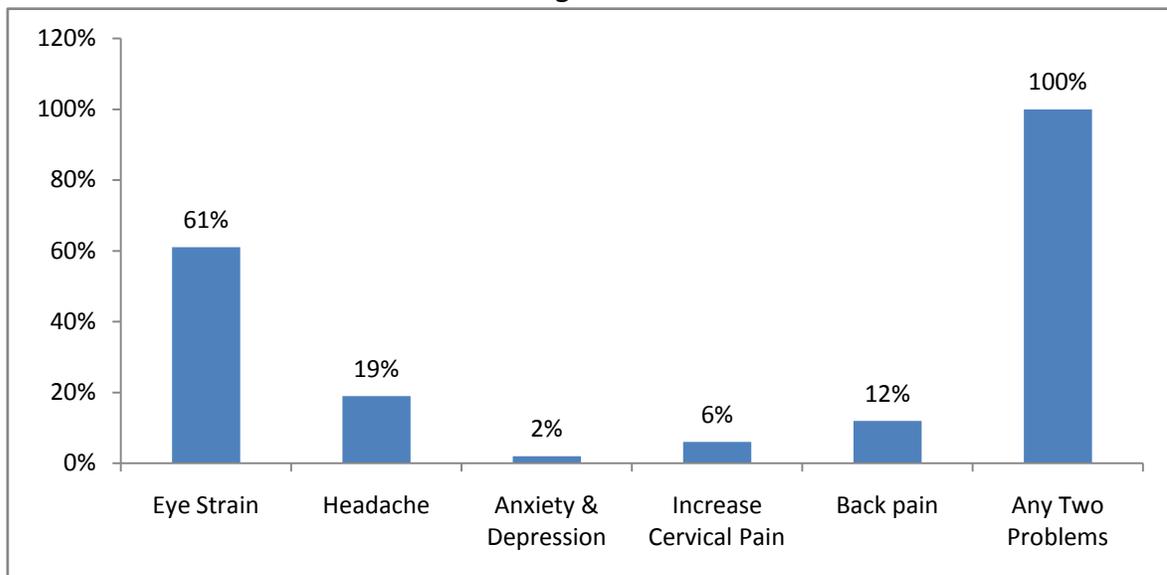

Table: 3

Students faced various health problems:

S.no	Health Problems	No. of Students	%
1	Eye Strain	92	61%
2	Headache	28	19%
3	Anxiety & Depression	3	2%
4	Increase Cervical Pain	9	6%
5	Back pain	18	12%
	Total	150	

Figure: 3

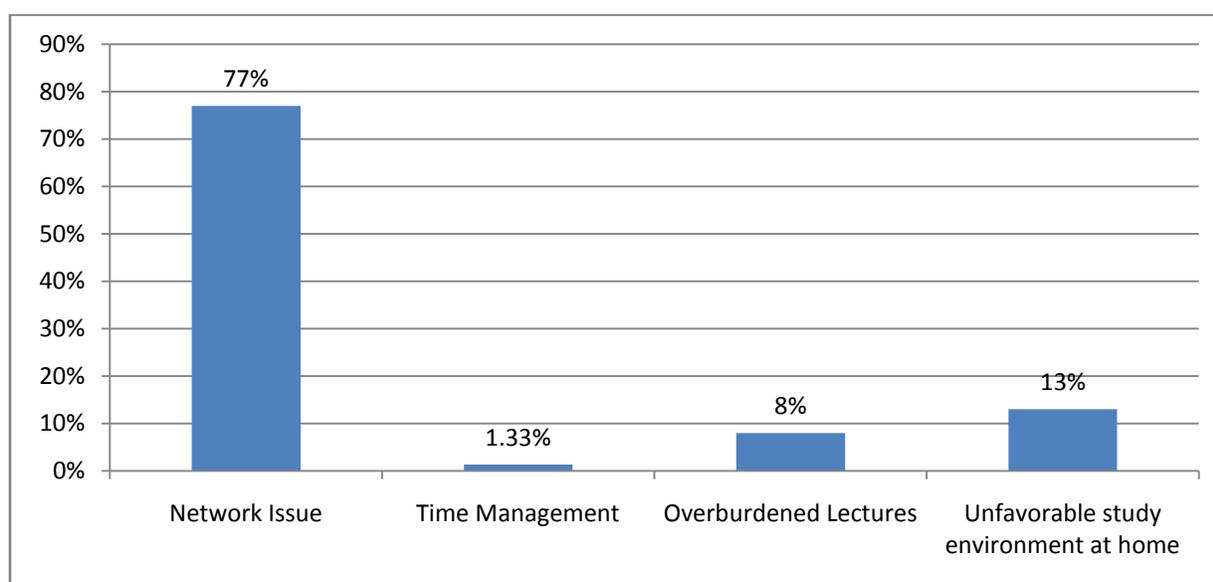

4. Different Problems faced by students during online classes:

Table: 4

S.no	Classification	No. of Students	%
1	Network Issue	116	77%
2	Time Management	2	1.33%
3	Overburdened Lectures	12	8%
4	Unfavorable study environment at home	20	13%
	Total	150	

Figure: 4

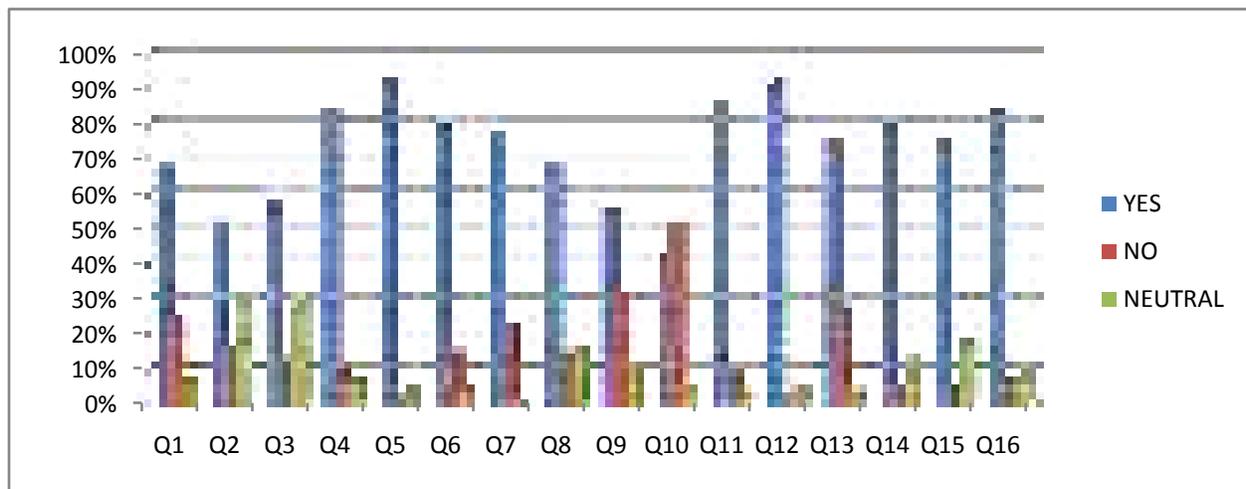

## 5. Attitude of students towards E-Learning:

Table: 5

Sno	Statement	Yes	No	Neutral
1	I enjoy taking online classes from home.	68%	25%	7%
2	Online classes are better than the offline classes.	52%	16%	32%
3	It can easily clarify the doubts and quarries.	58%	13%	29%
4	Online classes are suitable for Theoretical subjects.	84%	9%	7%
5	It can create health issues.	92%	2%	6%
6	Are you interested in e-learning?	80%	15%	5%
7	Does e-learning improve your study skill?	78%	23%	1%
8	Are you satisfied with Google Form mock test?	69%	15%	16%
9	Does e-learning make your quarantine time a useful one?	56%	32%	12%

10	Do you believe that improving knowledge through e-learning is better than traditional learning?	42%	52%	6%
11	Do you think Face to face learning is important for practical teaching?	87%	9%	4%
12	Did you face any issues during e-learning?	92%	2%	6%
13	Are you positive towards e-learning?	76%	28%	4%
14	Does e-learning make your knowledge wider?	81%	6%	13%
15	Do you think web-based teaching is important for a student?	76%	6%	18%
16	Can e-learning bring a social change in India?	84%	7%	9%

Figure: 5

**Conclusion:**

This pandemic era is very difficult for all human being. Due to this various sectors face obstacles and try to overcome the barriers. For students also this time is very difficult where they study from home using various applications and device to learn something new. This time period taught something new to students. They learn time management, give time to their parents, help in each and every activity. These all things are not done when they went to colleges. This covid-19 has positive and negative effects both. It can make students more efficient. More than 70% of students believe that online classes are effective to learn but there are several obstacles arise during E-Learning. If these

obstacles will remove then it makes learning more effective. But it can create health problems among students. Those who have cervical problem before lockdown, it may increase and also back pain increases due to over sitting for online classes. Eye problem also rises due to over usage of phones, laptops, Desktops and sit in front of camaras for a long time. Ministry of Education can control on make rules and guidelines for online classes for school students. According to their guidelines the time limit of each lecture is fixed of 30-40 minutes and 9 -12 pm is fixed to take classes. But for college students no guidelines were made. They take 6-7 lectures per day. Internet connectivity problem, electricity problem are the various obstacles during online classes. For remove these obstacles if we work on these things, then we make online classes more effective and attractive for the students.

The measures to be taken to remove the obstacles during E-Learning are:

1. Fix the time limit of online classes with limited Hours.
2. Fix the limit of no. of lectures per day with 3-4 lectures per day.
3. If the companies minimize the data rate, so that each and every student easily afford the network connection.
4. Make presentation more attractive for students.

## IMPACT OF ANNOUNCEMENT OF MERGERS AND ACQUISITION ON SHAREHOLDER'S WEALTH: A STUDY OF PNB AND IT'S ASSOCIATES.

Submitted by:

**Dr. Rachna Kalsan** (Assistant Professor), Email ID: [drrachnakalsan@gmail.com](mailto:drrachnakalsan@gmail.com)

**Yogesh Kumar** Ambawata (Research Scholar), Email ID: [ambawatayuvi@gmail.com](mailto:ambawatayuvi@gmail.com)

### Abstract

The aim of the study is to identify the impact of announcement of merger of Punjab National Bank with Oriental Bank of Commerce and United Bank by Minister of Finance of India Smt. Nirmala Sitharaman on wealth of its shareholders. Secondary data is collected from the website of BSE. In this study share price of the Punjab National bank is collected for one year before and one year after the merger to identify the impact of merger announcement on the share price of the bank. By analyzing the trend in the share price of Punjab National Bank for one-year pre-merger and one-year post-merger, this study finds that the share price of banks was increasing with slow rate before the announcement of merger but after the announcement this study finds that for first 3 months share price of the bank was increased after that there was a drastic decline in the share price of the Punjab National Bank. The share price of the bank was decreased in long term which also result as the decreased in the wealth of share holders of banks therefore this study concludes that the announcement of merger of Punjab National Bank is not in the favor of the shareholders of the bank.

**Keywords** Mergers, Announcement, Shareholders, Wealth.

### INTRODUCTION

We can define Banks as a financial institution whose main purpose is to deal in accepting and lending money by which it makes profit. Bank lend money on extra rate of interest rate as compare to the rate of interest it pays to its customer who deposit their money in the banks, this difference is known as interest spread and banks earn through this interest spread. Banks also issue their shares like all other publicly listed companies, by which people invest in Banks and own some ownership in the banks. Being traded as a public company is also in favor of all of both public and private sectors banks, as it generates crucial funds for banks to survive and thrive in the market and compete with other banks in the market, it also helps banks in further expansions development, however this is only one example of several various strategies taken by banks to expand in the market, one other example by which banks expand in the market is the strategy of merging together but in public sector banks the objective of merging of banks is not only expansion but to give a new life to the weaker banks in the market. Merger of banks is in practice in India for over 100 years, starting from the merger of Bank of Bengal, Banks of Madras and Bank of Bombay in 1921 to form the Imperial Bank of India which is now known as the State Bank of India at that time the reason of the merger was world war because of which there was shortage of sufficient fund to run three major banks in the country therefore in order to survive these banks were merged together. In 1969 14 banks were nationalized and in 1980 government nationalize 6 more banks in pre liberalization era. In 1993 New Bank of India was merged with Punjab National Bank as earlier was not in very good financial situation to survive. With time there were different committees were setup in country to improve the situation of banks in India such as Narsimham Committee in 1998. Recently SBI and its associates were merged together in 2017 also this time the objective of the merger was by give and take same to create a single strong machinery in

banking sector of national level rather than having several average banks. Strong banking system is a sign of strong economy.

In August 2019 Finance Minister of India Ms. Nirmala Sitharaman gave a statement that we need to have a strong banking machinery in our country, none of our banks came in the list of 50 largest banks in the World and she announced 4 new mergers of the PSBs, after the merger India will have total number 12 PSBs.

Mergers that were announced are:

1. Punjab National Bank + United Banks + Oriental Bank of commerce,
2. Canara Bank + Syndicate Bank +
3. Union Bank + Corporation Bank + Andhra Bank
4. Indian Bank. + Allahabad Bank.

When two or more banks merged together it brings a lot of change in the organization from the size of the organization to the technology of the banks, from the number of customers to the value of the share-holders of the banks. Changes may be different in different cases, as it also depends on the pre-merger situation of the Banks, for strong banks merging with weak banks may impact negatively whereas for weak banks merging with strong banks will impact positively. However, the end goal of merging of banks is to improve the condition of banking sector in the economy. Merger of banks result in the increase of the economy of scale which reduces the overall cost of operation of banks and increases revenue for the banks. Banks also takes benefits of each other resources such as infrastructure. technology etc which also result as the increased productivity of the banks. In case of shareholders of the banks there are several studies have been conducted which gave different results, the shareholders of the target banks get more benefits as they were having the share of weak banks, whereas the shareholder of the strong banks has least benefit. This study is focused on the objective of identifying the impact of announcement of merger of Punjab National Bank on the wealth of its shareholders.

## **Review of Literature**

- Dutta and Dawn (2012) considered the impact of mergers on profit, deposits, total assets, number of employees and revenue. They focused on the merger of firms four years prior and after the merger. They concluded that the year after the merger of banks were more successful and have a significant increase in deposits, profit, number of employees and total assets In the firms that acquired other firms in Indian banking sector.
- Sikarwar, Ekta (2012) did a study on the impact of announcement of mergers on the wealth of shareholders. They studied the merger of State Bank of Indore and State Bank of Saurashtra with State Bank of India by the method of event study and their study gave mixed results with respect to the changes in wealth of shareholders of these banks. State Bank of Saurashtra gave abnormal return significantly in comparison of merger of State Bank of India with State Bank of Indore. They said that the movement in the market is not caused only because of the announcement of merger but also because of the various information already available in the market.
- Saluja (2012), in used CAMEL-MODEL for 2 years before and after the acquisition to study the impact of acquisition of Centurion bank of Punjab by HDFC bank and found that the financial performance of HDFC bank after the acquisition was affected significantly and also shows improvement in market condition of HDFC banks. it's as a productive strategy in order to improve the financial performance

by HDFC bank. This study shows that even in private sector banks when two strong banks get merged together, they can compete with public sector banks in terms of size and strength.

- S, Devarajappa (2012) concluded that for further expansion and growth of banks merging of weaker banks with stronger banks is a useful strategy, he said that merger of banks is good for the survival of the weaker banks in the competitive environment of the market, he focused his study on the changes in financial aspect of banks like of Net profit margin, return on capital invested, gross profit of the banks, debt equity ratio, return on equity of banks and operating profit of the banks before and after the merger and his study shows the significant improvement in them after the merger.
- Soongswang, Amporn, (2011) in their study take account on the share prices of both the bidder bank as well as of target banks in the period of 12 months before and after the merger announcement of the banks. In their study they use three different tests: cross sectional test, residual test and t-test. In order to estimate abnormal return of bidder and target firms they used market adjustment models. They also used the method of BHAR and CAR to measure the return of bidder banks and target banks. They also found that the announcement of merger has more positive impact on the prices of target bank as compare to bidder banks which sometimes also gave negative return as well.
- Sophia, John.M and EbunoboweiAppah (2011) undertook the effect on efficiency by Mergers and Acquisition. They took the sample of 10 different banks for the study and did the comparison for three years before and after the announcement of mergers on the return on the equity. They used descriptive statistics to analysed the data. They used t-test to analyse the data and found that there was absence of any difference in the mean of equity return in post and pre-merger and suggested that market forces of Nigerian Banking are driving Merger and Acquisition in the country.
- Kemal, Muhammad Usman (2011) studied the changes in the profitability of Royal Bank of Scotland before and after the Mergers and Acquisition. They collect the financial statement of 4 years from 2006 to 2009 of 47 bank's annual reports and they used 20 different financial ratios in order to test the changes in the profitability of banks both before and after the mergers. Their study shows that only 6 ratios out of total 20 ratios were improved because of the merger. Banks were doing well before the merger as compare to their performance after the merger. Ratios that were satisfactory were liquidity, cash flow, leverage, assets management and profitability. They gave that the merger of the banks was not successful.
- Natarajan, P. and Kalaichelvan. K (2011) compared the operating performance for 5 years before and 5 years after the process of merger of banks. In their research they undertook the financial factors for study like operating performance, profitability and liquidity of banks after merger and gave that the banks were in better condition before the merger than after merger but this was not in the case of public sector banks which shows positive results. The liquidity position of private sector banks was negatively impacted and In case of public sector banks they show some negative impact with respect to the generated income in comparison of their investment in fixed assets but their net earnings was improved.
- Rhagendorff, Jens and Vallascas, Francesco (2011) conduct a research of Merger and Acquisition in terms of the risk related to merger of banks in cross border situation and merger of banks which are not cross border and concluded that Merger and Acquisition does not have any impact the risk-taking situation of acquiring banks if the merger is not cross border. They further gave that risk is always present when merger is between cross border firms, they said that it is doubtful to say that merger and

acquisition decreases the risk associated with the banks specially when merger is between cross border banks as it is not necessary that various gains from the mergers will improve the risk associated with the banks when they got merged together.

- Manoj and Jagandeep (2008) studied the impact on wealth of shareholders after the announcement of merger of five banks. Mergers studied by them were can be pointed out as the merger of Times Bank with HDFC Bank, the merger of ICICI Ltd with the ICICI Bank and Bank of Madurai, the merger of Global Trust Bank with Oriental Bank of commerce and merger of the Bank of Punjab with centurion Bank and gave that there is a positive impact of merger on equity of the all the merging banks.

### **Objective of the study.**

1. To study the impact of merger on the share prices of PNB.

### **Hypothesis of the study.**

1. There is no significance impact on share prices of PNB after merger.

### **Research Methodology**

#### **Sample Design:**

1. Punjab National Bank
2. Oriental Bank of Commerce
3. United Bank

#### **Data Collection:**

Secondary Data of share prices of banks for one year before and after the merger announcement is collected with reference to BSE.

#### **Analysis of the study.**

Share prices of Punjab National Bank, Oriental Bank of Commerce and United Bank of India are collected and observe by using line chart and trendline.

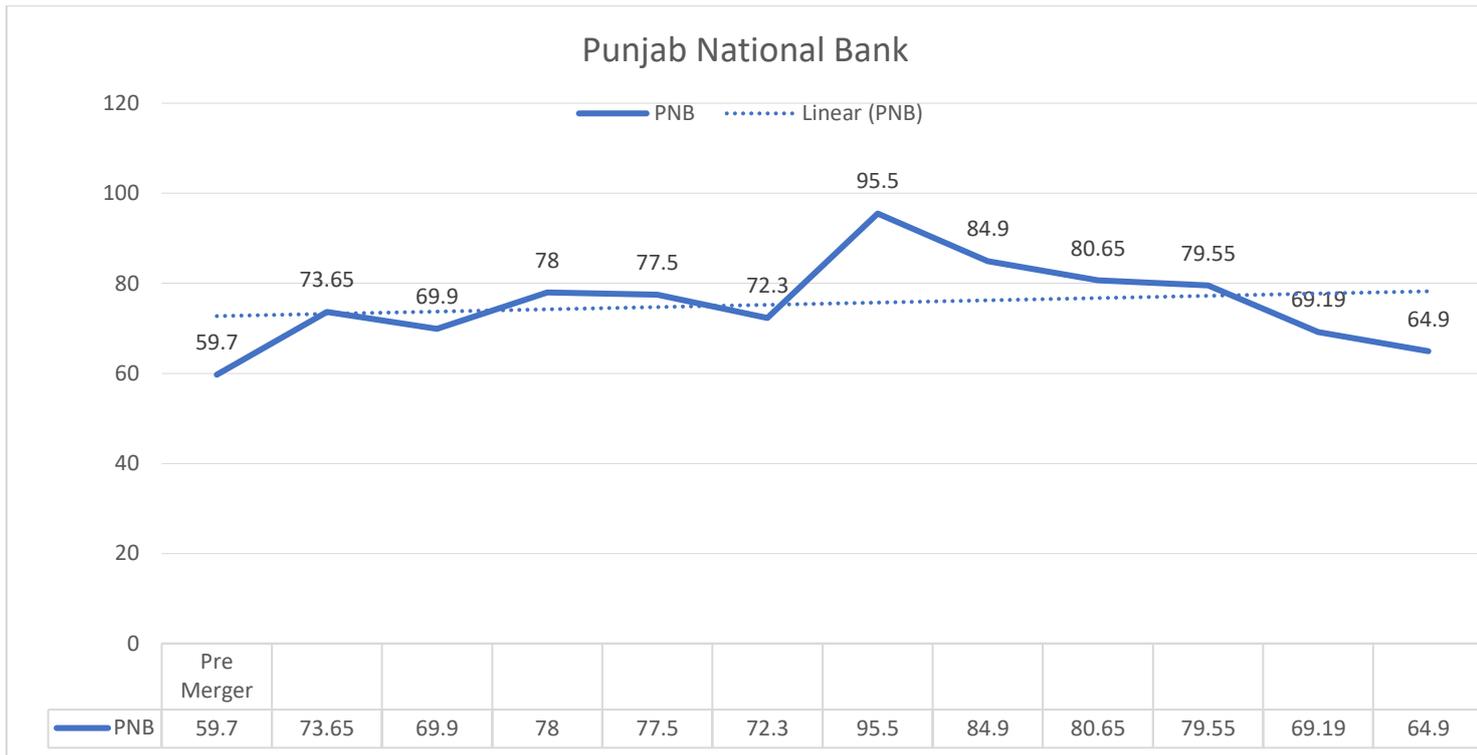

Figure 1.1

Above Figure 1.1 shows the performance of share prices of Punjab National Bank of 1 year before the announcement of merger, here trend line shows that the share price of the bank was increasing with very small growth rate as it increases from price of 59.7 to 64.9 in one year.

Figure 1.2

Figure 1.2 is of the share price of Oriental Bank of Commerce, here trend lines shows that the share price of this was decreasing rapidly one year before the announcement of merger, value of the share was declined from 91.5 to 43.25 in last one year.

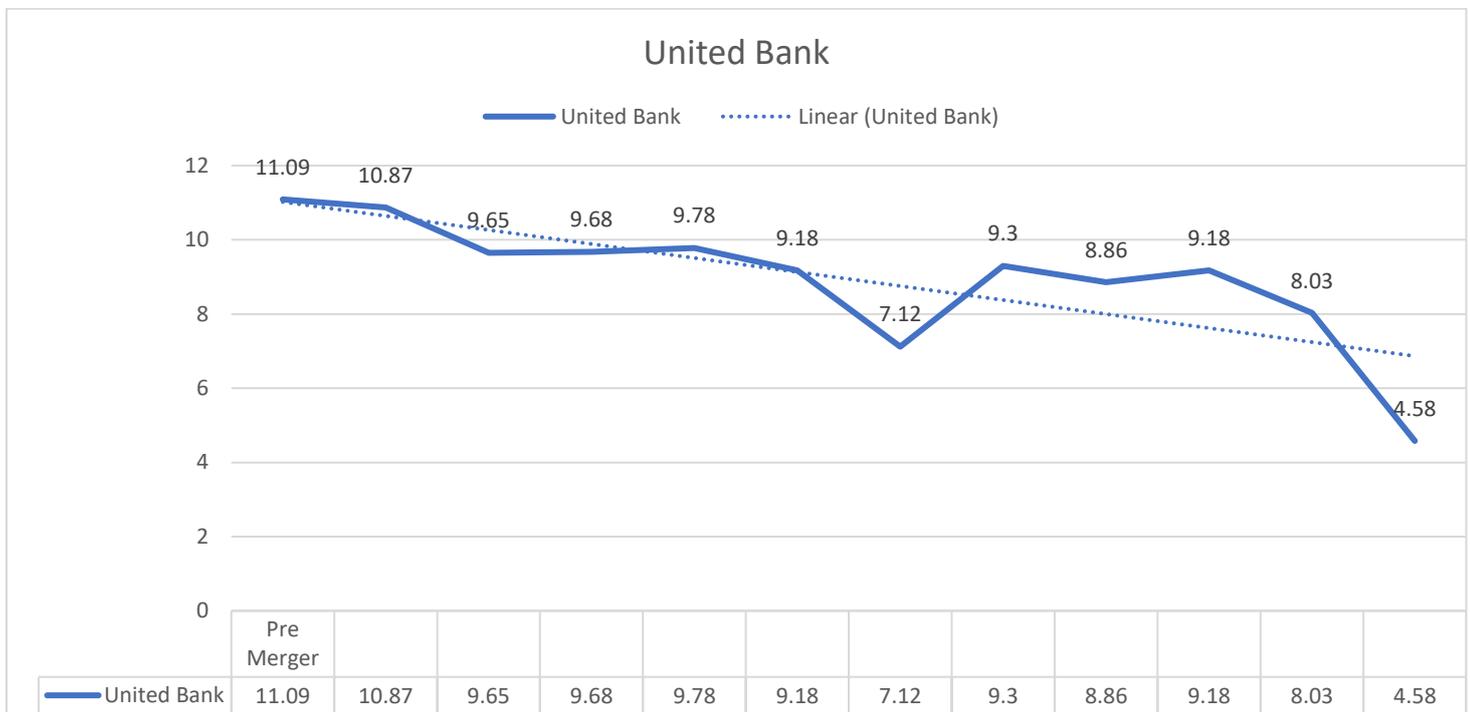

Figure 1.3

Figure 1.3 show the performance of share price of United Bank for last one year, here we can see that the value of share price of united bank was decreasing rapidly as, the value of the share price of the United Bank decreased from 11.09 to 4.58 in period of one year.

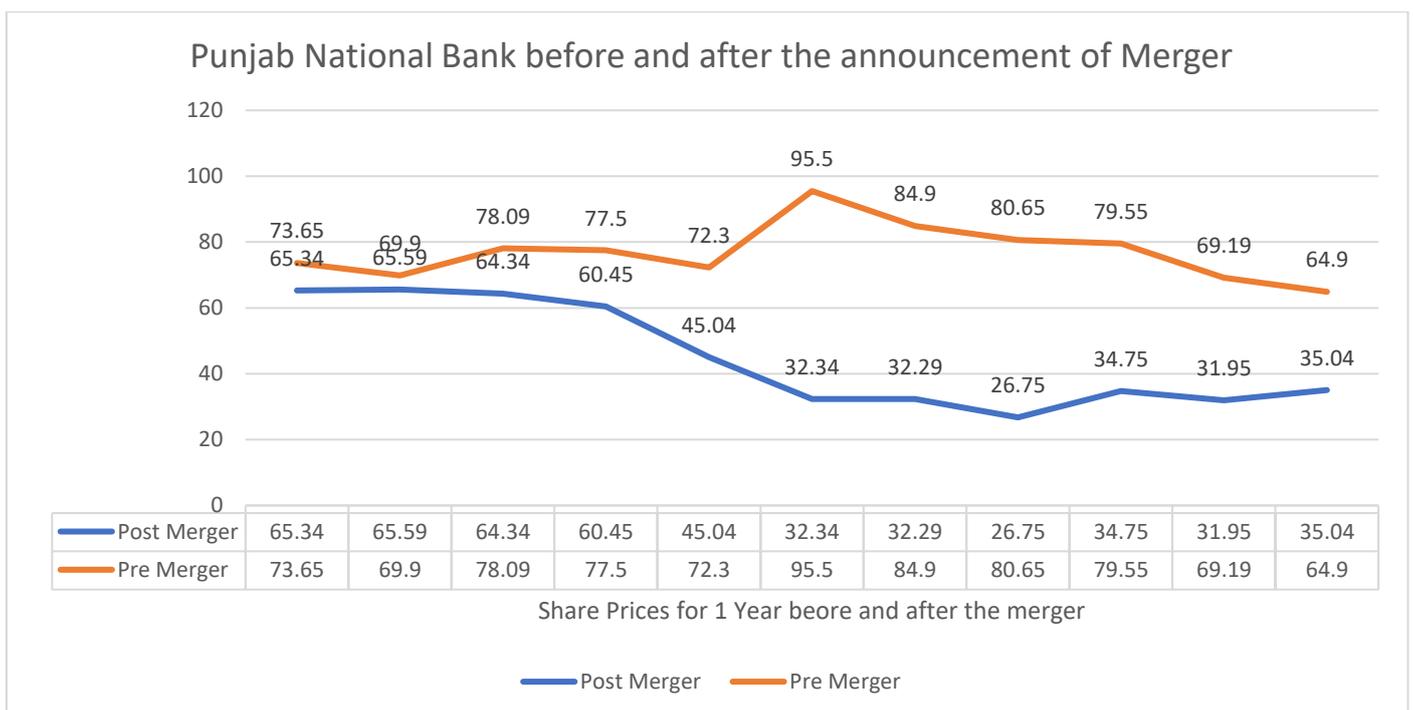

Figure 1.4

Above figure 1.4, compare the shows the value of share price of Punjab National Bank for one year before and one year after the announcement of the merger.

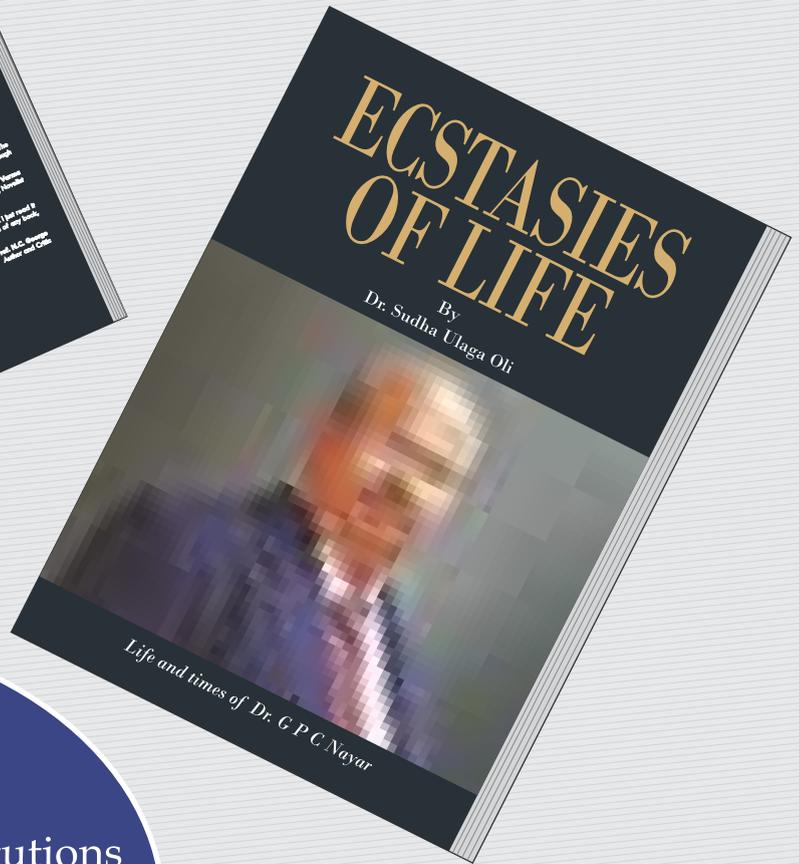

### **Findings and Conclusion of the study.**

This study was conducted to identify the impact of announcement of merger on the wealth of the share - holders of the bank in short term and long term. To identify the changes in the share prices of the bank a comparison has been done in the share prices of the Punjab National Bank for one year before and one year after the merger announcement of the banks. From the comparison of the share prices of Punjab National Bank in the period of one year before and after the announcement of the merger we observed from the line chart that the share prices of the Punjab National Bank were increased initially for next 3 months next after the merger announcement but after that the share prices of the banks drops drastically in period of one year as the share prices of the Punjab National Bank were dropped drastically from 65.34 to just 35.04 in one year only, there is a clear difference of 30.34 in the price of share of Punjab National Bank which is huge decline in the price of share. As the share prices of Punjab National Bank were initially increased with slow rate for 3 months after the announcement of merger it also increases the value of its shareholder's wealth so we can say that the announcement of merger is beneficial for the share-holders initially for the time of 3 months only but after 3 months share prices of the banks drops drastically, which result as the huge reduction in the wealth of the shareholders of the bank, therefore this study finally concludes that the announcement of merger Punjab National Bank increases the wealth of its share-holders therefore it has positively impacted the wealth of share-holders initially but as the share prices were reduced after 3 months drastically which result as the huge decline in the wealth of its shareholders it has an overall negative impact on the wealth of shareholders Punjab National Bank.

## Chairman's Overview

The divide between human and machine is narrowing with every major advance in technology. On one side is Elon Musk's Neuralink developing neural laces to provide a common interface between human brains and digital technology, while on the other side, technologies such as artificial neural networks try to mimic human brain functioning in machine learning. Our lead article, this time about the applications of Artificial Neural Networks in accounting and finance, offers a fascinating glimpse into the literature published in this area and points out possible directions for future research.

As the world economy grapples with the long term effects of the pandemic induced slowdown, the second article in the issue offers empirically backed insights into risk mitigation strategies for investors. The authors investigate long- term and short- term BRICS Bond Market Integration through a variety of analytical tools and come up with some interesting findings and recommendations.

E-HRM and the factors that affect its implementation in IT companies is another study that is especially relevant to these times of increasing work from home culture. This issue also features a good mix of articles on subjects ranging from working capital management in the healthcare industry to earnings management in the banking industry. We have interesting perspectives on how employee demographics influence employee engagement, how goal setting is perceived by employees and the outcomes of such goal- setting, as well as how reward systems in public sector companies influence employee commitment. A qualitative study that explores identity construction and its effect on the subjective wellbeing and quality of life of aged women, as well as a comprehensive study on stock market integration across 35 indices in 5 continents, rounds out the collection of scholarly literature offered for your perusal.

I am confident that this issue will be truly informative and educative to our readers.

### Transformation through Disruption

Three months into 2021, as the new financial year is being ushered in, with the positive notes of large scale development and distribution of effective vaccines, it is finally possible to hope that normality will return with time, though the definition of what is normal will be changed forever. It is up to each individual and business to take on the challenge of embracing the new normal and making it one that is better and more humane.

Grappling with the crisis brought in by the pandemic has given business schools across the world a never-before opportunity- that of using real-time, real-world experiences that each individual is experiencing, as case studies, for teaching students' crisis management principles. The world has, in effect, become a gigantic case study- one that is replete with takeaway lessons for anyone with a mind that is willing to think, question and learn from the life unfolding around them. Businesses are coming out of the worst of the pandemic with new lessons learnt and fresh insights on the possibilities of managing disruptions and emerging stronger.

In many ways, this change is for good. There has been an opportunity for introspection and for re-evaluating the accepted norms and procedures followed. Hybrid delivery of classes- with a combination of offline and online sessions, seems to be increasingly preferred. Students are encouraged to be increasingly self-reliant in their learning, and physical classes are used as a platform for discussing and putting into practice what they have learned. The shakedown should result in the academic world re-evaluating its course contents and assessing whether students are actually learning the skills that it takes to navigate a world of uncertainty. We are witnessing the birth of a new culture- one that is characterized by a questioning of how things have always been done, to one that is willing to embrace the 'ifs' and 'buts', and grow and become stronger with the challenges.

Artificial Neural Networks (ANNs) have emerged as a robust technique of forecasting and prediction in almost every part of the business. This study explores the development of ANNs over a period of time and provides an extensive and exhaustive literature review on the applications of ANN in various fields of accounting and finance, such as stock market prediction, bankruptcy, and many others. The findings of the study support the superiority of the ANN model over conventional statistical techniques in prediction, such as Linear Discriminant Analysis (LDA), Logit Model, etc. However, determining the optimal architecture of an ANN model is a time consuming and difficult process. The novelty of this study lies in the fact that there is a dearth of literature on applications of ANNs in some sub-areas of accounting and finance, namely time series forecasting, specifically in foreign exchange and commodity markets. Thus, ANN application can be explored in these sub-areas of accounting and finance.

**Keywords:** *Neural Networks (NNs), Artificial Neural Networks, Meta-Analysis, Bankruptcy, Stock Market Prediction.*

## 1. Introduction

“Artificial Neural Network is a system of hardware and software patterned after the operation of neurons in the human brain. It builds a relationship in the form of data through a process that mimics the way a human brain operates.” Artificial Neural Networks are dynamic in nature as they can adapt to changes in output so that they provide the best possible result without changing the input nodes. ANNs have shown huge potential in the field of finance where they are used for various purposes to enhance the productivity of the business in the global arena. ANN follows a series of algorithms that helps in finding the underlying relationship between the output and input variables. ANN consists of several neurons or nodes that are operated in parallel and arranged in layers or tiers. The layers are highly connected as each node from the tier N is connected to subsequent tiers N+1. The first layer receives raw input and transfers it to the preceding layer to generate the desired output, and the middle layer is called the hidden layer, which is responsible for connecting the first layer, i.e., the input layer and the last layer called the output layer. However, the number of nodes and layers depends on the desired accuracy to be achieved and also the complexity of the problem. Also, there can be a series of nodes in the output layer which forms an image in the readable format. In ANN, each node carries a weight that entirely depends on values that contribute to getting the correct answers. In other words, nodes that contribute to getting the desired results are awarded higher weights in comparison to nodes that don't. Initially, nodes are flooded with huge chunks of data and output is told to the network in advance. With advantages also come drawbacks and ANN is the one that is unaffected by this curse as the assumptions people make that causes bias during training has evolved as the biggest threat for the practitioners. If the data feeding is not neutral – the machine propagates bias.

Many scientists, practitioners and academicians have developed models based on ANNs in the past. The first computational model of Artificial Neural Networks, popularly called threshold logic which was based on mathematics and algorithms, was developed by Warren McCulloch and Walter Pitts in 1943. It splits the ANNs research into two approaches. The first approach was related to the biological process in the human brain, and the second approach was related to the application of ANNs. Later, Minsky and Papert (1969) discovered two critical issues with the Artificial Neural Network technique. The first one

was the ability of the machine to solve complex problems, and the second was the incapability of the computers to run large ANN models efficiently. This brought a slowdown in research on ANNs till the machines got fast processing circuit boards.

Due to its ability to learn and model non-linear relationships, its usage has gained popularity in different fields of business. They also allow users to build a strong and reliable model that can help in predicting future events. Nowadays, it is being used to check the reliability of a business plan, recognition of human faces, speech, characters and so on. Also, it is widely used in various areas of finance such as prediction of stocks, evaluation of loan application, analyzing the credit-worthiness of customers and many more. However, there is a dearth of review articles that combines the various applications of the ANN model in accounting and finance. Moreover, the authors believe that there is a great demand for comprehensive review articles that combine the various methods and current studies. Therefore, this study analyzes the various applications of the ANN model in different fields of accounting and finance.

This paper presents a review of articles comparing numerous models of ANN and conventional statistical techniques. Section 1 represents the introduction of the study, and section 2 consists of relevant literature in different areas of accounting and finance. The results of the study have been presented and summarized in section 3; section 4 deals with the future scope for research, and the last section deals with the conclusion part of the study discussing certain issues pertaining to ANN models.

## 2. A Review of Literature

Over the past few years, the usage of ANN has gained popularity due to its distinct ability to detect the underlying relationship between different sets of data. However, there are various factors that determine the accuracy of ANNs, which include the choice of input variables, architecture selected for a specified problem, training pattern of ANNs, etc. Thus, it becomes significantly important to study these factors before building an Artificial Neural Network. Also, various studies conclude that ANNs have provided a better statistical technique in forecasting when compared with other conventional prediction models. However, some studies also reveal that traditional statistical tools have outperformed ANNs in forecasting. Thus, it becomes important to identify the key areas where ANNs have shown good potential. This section provides a brief overview of applications of ANN in various areas of accounting and

finance, namely bankruptcy prediction, stock market prediction and other applications.

### **2.1. Bankruptcy Prediction**

Much of the research has been done on bankruptcy prediction as detection of accounting frauds, and bankruptcy is an important measure to evaluate a firm's performance. In the study of Odom et al. (1990), an analysis was performed on ratios using both discriminant and artificial neural network techniques. The authors have used the predictive abilities of both the models and the results show that neural networks might apply to this problem. Salchenberger et al. (1992) made a comparative analysis between a logit and ANN model, and to reduce the dimensionality of the model; the authors employed stepwise regression on twenty-nine variables resulting in five significant variables. The findings of the study reveal the ANN model has outperformed the logit model in terms of forecasting bankruptcy. Furthermore, the authors reported a reduction in type I and an increase in Type II error.

Tam and Kiang (1992) introduced a neural network approach to perform Linear Discriminant Analysis (LDA). They compared the performance of the ANN technique with linear classifier, logistic regression, k-Nearest Neighbour and ID3. The results show that ANN is a promising technique having the ability to outperform other traditional statistical models, especially in evaluating bank conditions. However, there are certain limitations too that includes limited interpretation ability of weights and computation time etc. The authors have also quoted that it is necessary to test the on-line capabilities before the full potential of ANNs is asserted.

One year later, Fletcher and Goss (1993) stated that ANN provides a better and accurate view of the given data. The author has used two methods to ascertain the firm's performance and stated that ANNs are more statistically accurate and viable than logit function as it has less variance and lowers forecasting risk as determined by the coefficient of variation. However, both methods failed to predict the performance of the firms implying the presence of missing explanatory variables in the model. After one year, Wilson and Sharda (1994) explained that the ANNs are better at forecasting the bankruptcy of firms in comparison to the traditional discriminant model. The author used five

variables and achieved 97% accuracy. The study argued that the number of variables has a direct relation with the accuracy of NNs, i.e. larger the number of variables higher will be the accuracy. However, NNs failed to predict correctly in the case of non-bankrupt firms due to limitations in the data set, methodology, and training. Still, when NNs were provided with balanced data sets, they outperformed discriminant analysis in forecasting non-bankrupt firms.

Later, in the same year, Fanning and Cogger (1994) determined two basic interpretations, ANNs should be viewed as a potential competitor, especially in the area of predicting financial distress of the firms and- ANNs can outperform other existing models that can be used in prediction. ANNs can be capitalized in the arena of forecasting as they are capable of exploring the underlying relationship between different data sets. The authors quoted that NNs have good potential that can be used in several other areas of business. Yang et al. (1999) examined four different methods to predict bankruptcy using financial ratios of the U.S. oil industry. Fisher Discriminant Analysis, back-propagation NN and probabilistic NN with and without patterns were used to determine the bankruptcy of firms, particularly in the oil industry, using deflated and non-deflated data. The authors quoted that the back-propagation NN model managed to achieve the highest accuracy using non-deflated data and the possible reason inferred was it predicted non-bankruptcy only. Another important finding of the study was that the discriminant analysis technique obtained the best results when using deflated data sets in both bankrupt and non-bankrupt firms.

Further, Zhang et al. (1999) explained that ANN techniques are superior to traditional statistical methods of prediction. In his study, the authors used the ANN technique to predict the bankruptcy of firms and also quoted that a better understanding of causes can substantially impact the financial and managerial decision-making process. The findings of the study reveal that ANN is the only known model that makes use of posterior probability to determine the underlying relationship of the unknown population. The study used a cross-validation technique to verify the robustness of neural classifiers, and the results reveal that ANNs are quite robust. The study also compared logistic regression with the ANN technique for classification purpose, and the results were very encouraging as ANNs were significantly superior to logistic regression in

determining the classification rate of the unknown population.

Charalambous et al. (2000) proved that ANNs show superior results in comparison to traditional methods of prediction in the current scenario. However, the author also argued that the reliability of the model majorly depends on the complexity of the problem and variables used, but researchers can apply the ANNs to their problems to find whether they indeed provide better results than commonly used statistical methods or not. Atiya (2001) explained that ANNs are better techniques, especially in predicting stock prices. However, the author also said that improvements must be made by way of better training methods, inputs, and architecture. The study showed this by improving the inputs resulting in improved performance of ANNs. Two years later, Lin et al. (2003) stated that Fuzzy Neural Networks (FNNs) outperformed other statistical models, and the performance of FNNs was compared with the logit model using fraudulent and non-fraudulent firm's data set. Both models have proved their potential in classifying non-fraud cases that will, in turn, enhance the validity and efficiency of the audit. However, the authors also quote that the Logit model was slightly better in forecasting non-fraud cases, and at the same time, FNN was substantially better than the Logit model in predicting fraud cases. Overall, when compared with other conventional statistical methods of forecasting, FNN was better in assessing the risk associated with the fraudulent firms. The study also recommends the auditors to implement these techniques as they offer the great potential that can enhance the effectiveness and efficiency of the audit.

West et al. (2005) explained ensemble ANNs are better predictors than "Single best" multilayer perceptron models, and this fact was supported by examples of three real-world financial data sets where generalization error was reduced by 3-4%, which is a significant reduction statistically. The author evaluated bagging and boosting strategies on the same data set and found bagging was more effective than boosting with the fewest number of variables and least noise. Later, Alfaro et al. (2008) compared two classification methods and showed improvement in accuracy that AdaBoost achieved against ANNs. The authors used these technologies to ascertain the corporate bankruptcy using financial ratios, and the results of the study indicate that the AdaBoost algorithm outperformed

the ANN technique both in the cross-validation and test set estimation in the classification error because AdaBoost makes use of a modified version of the training set to build consecutive classifiers. Also, the authors used accounting-based variables, the size of the firm, the industry and the organizational structure as inputs to evaluate the financial performance of the firm.

Celik and Karatape (2007) examined the performance of ANN in forecasting banking crises. The authors indicated by using a 25 input neurons ANN model that ANN is capable of forecasting banking crises, and ANN can be used for developing effective policies for the banking sector. Kim and Kang (2010) proposed an ensemble neural network for enhancing the performance of conventional ANN models for predicting bankruptcy. The results of the study indicate that the bagged and boosted ANN is a better predictor than traditional ANN models. Particularly, bagged ANN produced better accuracy than other classifiers. Also, the authors recommended more algorithms for future research. Rafiei et al. (2011) made the comparison of ANN, GA, and MDA for bankruptcy prediction. The results of the study indicate that the ANN is better than the other two models. However, the Genetic Algorithm has also evolved as a powerful technique of prediction. Olson et al. (2012) compared the forecasting ability of decision tree algorithms, artificial neural networks and support vector machines. The results of the study indicate that decision trees are more powerful predictors than ANN and SVM. Also, the authors indicate there were more rule modes than desired.

Lee and Choi (2013) analyzed the performance of ANN and MDA for a "multi-industry bankruptcy prediction model". The results indicate an ANN model outperformed the traditional MDA technique. Also, the authors quote the results will partially overcome the limitations of ANNs. Bredart (2014) developed a model to predict the bankruptcy of small and medium enterprises by using three financial ratios that are easily available and achieved 80 percent accuracy. Iturriaga and Sanz (2015) proposed a model based on ANNs to predict the bankruptcy of U.S. banks. The authors took into consideration some specific features of the financial crisis of 2014. Also, they combined multilayer perceptrons and self-organizing maps that can access the insolvency up to three years before bankruptcy occurs. The results reveal the proposed model to be more accurate due to the following reasons. First, the developed model has

outperformed other statistical tools. Second, it provides a better visualization of the complex structures. Third, it is simpler than other models proposed in the previous studies. However, the authors have also explained certain limitations that limit its usage.

Duan (2019) quoted that NNs can outperform traditional statistical tools. The author used Multi-Layer Perceptron (MLP) consisting of three hidden layers trained by the back-propagation algorithm to predict loan default. The study classifies the loan application into three categories: safe loan, risky loan and bad loan. The results of the study reveal that the accuracy level of MLP was much better than the conventional logistic model and the commonly used MLP with one hidden layer.

## **2.2. Stock Market Prediction**

During the past few decades, a precise prediction of the stock price has become a significant issue. Thus, ANN models are used extensively to predict stock price movement more precisely and accurately. Yoon et al. (1991) quoted that the precise forecasting of a stock price is a difficult and complex proposition. The findings revealed that artificial neural networks are capable of learning a function that maps input to output and encoding it in the magnitudes of the weights in the network's connection. The number of hidden layers employed in the model contributed to achieving a certain amount of viability. Also, the increase in the number of hidden units resulted in higher performance. However, additional hidden units beyond the point impaired the model's predictive performance. Furthermore, the results of the comparison reveal a superior performance of the ANN model than the MDA approach.

Chen et al. (2001) proposed that Probability Neural Networks (PNNs) have shown great potential in forecasting stock price movement as compared to the GMM-Kalman filter and the random walk model. The results of the study reveal that PNN guided trading strategies have obtained higher returns in comparison to strategies suggested by other models. The authors also recommend that Probability Neural Networks (PNNs) capability can be increased by including the threshold levels. Three years later, Cao et al. (2004) explained the superiority that ANNs have established over a period of time in predicting stock prices. ANNs indeed do provide an opportunity for the investors to

enhance their predictive ability that can, in turn, increase profitability. The findings of the study also suggest that the univariate model has shown more potential than multivariate models in predicting stock prices and also recommends using macroeconomic variables like volume; economic indicators can significantly enhance the accuracy estimates of NNs.

Kim and Lee (2004) proposed a genetically transformed ANN for stock market prediction. The results reveal that the proposed methodology is significantly better than the models considered for comparison in this study. Zhang and Wu (2009) proposed an integrated model consisting of IBCO and BPNN for the prediction of various stock indices. The authors used the IBCO algorithm to adjust the weights of the BPNN network and achieved better results than the traditional BPNN model. Further, Hadavandi et al. (2010) proposed a novel methodology based on the Genetic Fuzzy System and SOM Clustering for predicting stock price. In their study, the authors used the three-stage method to model the proposed structure. In the first stage, they used stepwise regression to choose significant variables, then in the second stage, they categorized the data into  $k$  clusters by SOM method, and in the last stage, they fed the clusters into a genetic fuzzy network to build the proposed model and validated the results using real-life datasets. In the end, the authors concluded that the proposed method outperforms all other models held for comparison. One year later, Guresen et al. (2011) compared simple MLP, DAN2 and Hybrid models that used GARCH to define input variables and reported that simple MLP outperforms the other two models in predicting NASDAQ stock exchange prices and recommended focusing on improving the architecture of DAN2 and hybrid models to improve accuracy measures.

Kara et al. (2011) analyzed the performances of ANN and Support Vector Machines (SVM) to predict the stock price movement. The results of the study clearly reveal the potential of the ANN model in determining the stock price movement in comparison to SVM with an average accuracy of 75.74%. Ticknor (2013) introduced a novel technique that combined the Bayesian regularization and ANN for predicting stock prices. The results of the study reveal the proposed methodology solves the problem of overfitting and local minima than commonly used ANNs. Later, Qiu et al. (2016) examined the NN approach to predict the return on

NIKKEI 225. The authors selected seventy-one variables with respect to the Stock Index of Japan, and then they made new combinations of eighteen input variables by fuzzy surfaces. The results showed that eighteen selected variables were capable of successfully predicting stock prices on NIKKEI 225. For selecting the best model, the authors conducted an experiment of nine hundred parameter combinations using the Back Propagation (BP) Algorithm. Also, the authors used a hybrid approach based on the Genetic Algorithm (GA) and Simulated Annealing (SA) that significantly enhanced the prediction ability of ANNs and outperformed the traditional BP algorithm.

Moghaddam et al. (2016) evaluated different architectures to predict the NASDAQ stock index. The results reveal that the network with 20-40-20 neurons has produced the highest level of accuracy. Inthachot et al. (2016) proposed a hybrid methodology for predicting the stock prices of Thailand's stock index. The results of the study indicate the proposed model is better than the previous model in terms of predicting stock prices. Ghasemieh et al. (2017) analyzed the performance of the ANN model using metaheuristic algorithms, and the results suggest that particle swarm optimization outperforms all other algorithms considered for a study that is cuckoo search, improved cuckoo search, improved cuckoo search genetic algorithm, and genetic algorithm.

Later, Alonso et al. (2018) explained the benefits of deep learning and the advantages that users can take while using it. The authors evaluated different ANN models to achieve the highest level of accuracy in time series and Long Short Term Model (LSTM) to be best suited because of the fact that autocorrelations, cycles, and non-linearity are present in time series. Furthermore, time-series data exhibits other challenging features such as estimations and non-stationarity. However, Eltman ANNs are also good candidates, but LSTMs have performed better in non-financial problems. Also, the authors have quoted it is not the performance of the LSTM, which is significant; the LSTMs have shown consistency in their predictions. In the end, the authors have concluded that LSTMs are powerful techniques in forecasting time series. Menon et al. (2018) stated that CNN outperformed all other models considered for the study. Furthermore, the author concluded that there exist underlying dynamics between the National Stock Exchange (NSE) and the New York Stock Exchange (NYSE).

### ***2.3 Other Applications in Accounting and Finance***

Other applications include time series forecasting, foreign exchange prediction, etc., which is a relatively new area of application for ANN as much of the research has focused on bankruptcy and stock market prediction. Jensen (1992) examined "the making and training of ANN to analyze the creditworthiness of the loan applicants is the practical and easy approach" The Author used 100 sample loan applications to train them and still achieved around 75-80% accuracy. The research has also highlighted the effectiveness of ANNs in forecasting. It is economically viable against other statistical methods of prediction. Later, Leung et al. (2000) examined the forecasting ability of a specific ANN architecture called the general regression neural network (GRNN) and compared its performance with numerous forecasting techniques, including a multi-layered feedforward network (MLFN), multivariate transfer function, and random walk models. The findings of the study reveal that GRNN achieved a higher degree of prediction accuracy but also performed significantly better than other models considered for the study. Later, West (2000) analyzed the prediction accuracy of ANN models for credit scoring applications by considering two real financial data sets. The results of the study suggest that ANN credit scoring models can enhance their accuracy level ranging from 0.5 to 3% by using advanced training methods and improved modelling skills. The author also suggests that radial basis ANNs and the mixture of experts are more accurate than other prevailing models in predicting the credit score of the applicant.

Further, Yao and Tan (2000) used the ANN technique to forecast the movement of exchange rates of the American dollar with respect to five major currencies "Japanese Yen, Deutsch Mark, British Pound, Swiss Franc, and Australian Dollar". The results are very encouraging for most currencies except Yen, and the reason could be the market of Japanese Yen is vaster and developed in comparison with other currencies selected for reference. The authors also recommend that ANNs can be best used when dealing with the real trading dataset. The findings of the study suggest using a more robust approach than Mean of Squared Errors (NMSE) for evaluating the performance of Neural Networks. However, sometimes it is important to have a small NMSE for testing and validation purpose. Later, Walczak (2001) analyzed that Neural Network incurs cost. It

can be in the form of money, time and effort. During his study, the author focused on training ANNs and argued that typically a Neural Network takes around 1 to 2 years to produce the best results through the back-propagation algorithm.

One year later, Nag and Mitra (2002) explained that ANNs had proved superiority over traditional statistical models in forecasting exchange rates in the past few decades. However, researchers argue that there is no theory available on the model building process as it depends on the decision of the model builder to choose an optimal number of hidden layers and a number of neurons in hidden and input layers to find the best solution. Therefore, the authors used a genetic algorithm optimization technique to overcome the shortcomings of traditional ANN models. The findings of the study revealed the potential of the proposed approach over conventional ANNs in forecasting foreign exchange rates. The researchers also quote that the proposed model is best suited to find the optimal topology of NNs, and further Malhotra and Malhotra (2003) compared the performance of Multiple Discriminant Analysis (MDA) and Artificial Neural Network in identifying potential loans. The findings of the study show that the ANN techniques consistently perform better than the MDA models in identifying potential loans and alleviating the problem of bias in the training set, and to examine the robustness of the model in identifying bad loans, the authors cross-validate the results through seven different samples of the data. In the same year, Zhang (2003) used a hybrid methodology consisting of ARIMA for linear modelling and ANN for non-linear modelling. The author concludes that the proposed hybrid methodology is significantly better than the traditional ANN model. Also, the authors validated the results by considering real-life data sets.

Later, Kumar and Bhattacharya (2006) stated ANNs outperformed Linear Discriminant Analysis (LDA) in both training and tests partition as they are capable of handling complex data sets and can be even employed to unseen data as it has the potential to determine the underlying relationship between the target and input variables. However, the author employed both techniques to check the credit score of companies by using financial statements and found NNs achieved a 79% accuracy level and the LDA technique achieved a 60% accuracy level which is very low

statistically. Also, the findings of the study suggest carefully choosing the variables after addressing the problem of multicollinearity in order to enhance the validity and reliability of the model. Weizhong (2012) proposed an automatic ANN modelling scheme that made use of a special type of network called GRNN. The author introduced several design parameters to automate the process of modelling ANN for time series forecasting. In the end, the results of the study conclude that GRNNs are robust and potentially good candidates for the automatic ANN modelling process.

Later, Wang et al. (2015) proposed the ADE-BPNN model to enhance the prediction accuracy of traditional BPNN. In their study, the authors concluded that ADE-BPNN outperforms conventional BPNN and statistical tools such as ARIMA in time series forecasting. Also, the authors validated the results by using two real-life cases. Khandelwal et al. (2015) proposed a novel methodology for time series forecasting that combines the unique features of Discrete Wavelet Transform (DWT), ARIMA and ANN. The results of the study were compared with Zhang's hybrid model and found to be significantly better. Parot et al. (2019) analyzed the performance of the hybrid model to forecast EUR/USD returns. The results of the model indicate that the proposed methodology is better than the traditional and classical forecasting models. Also, the authors recommend that post-processing is significant for increasing forecasting accuracy. Cao et al. (2019) introduced a novel methodology by combining the CEEDMAN and LSTM neural networks, and the results of the study indicate that the proposed method is better than other models used for comparison. Also, the authors say the proposed model can also be used for predicting other time series such as traffic and weather.

### 3. Findings

This paper presents a review of the application of ANN models in accounting and finance. The authors have reviewed 50 papers that have used ANN and other models to forecast in various areas of accounting and finance, namely bankruptcy prediction, stock market prediction and other applications such as time series forecasting, etc. An attempt is made to look at the literature more critically with respect to various criteria such as the number of variables, sample size chosen for the study, error measure, the model used in the study and the findings.

The articles discussed in the survey are summarized in tables 1-3. Each table provides a summary of each area in accounting and finance in order bankruptcy prediction, stock market prediction and other applications in accounting and finance. Each table consists of seven columns. Column 1 represents the year in which the study

was conducted, column 2 represents the names of the authors, column 3 illustrates the models used for the study, column 4 shows the number of variables, column 5 represents the sample size selected for the study, column 6 gives the error measure, and column 7 represents the findings of the respective studies.

**Table1: Applications of ANN in Bankruptcy Prediction**

Year	Author	RM	No. of Variables	Sample Size	Error Measure	Findings
1990	Odom and Sharda	NN and MDA	5	129	Confusion Matrix	NNs are better than MDA
1992	Salchenberger et al.	BPNN and LM	29	3479	Confusion Matrix	NNs outperformed Logit Model
1992	Tam and Kiang	NN, Linear Classifier, kNN, ID3 and LR	19, LR-14	236	Confusion Matrix	NN outperforms all three other statistical techniques
1993	Fletcher and Goss	BPNN and LM	3	36	Confusion Matrix, MSE	NN are better predictors than LM
1994	Wilson and Sharda	NN and MDA	5	129	Confusion Matrix	NN outperformed MDA
1994	Fanning and Cogger	GANNA, BPNN and LR	3	230	Confusion Matrix	GANNA outperformed the other two models
1999	Yang et al.	BPNN, PNN, FDA and MDA	5	122	Confusion Matrix	PNN is better than the other three models
1999	Zhang et al.	NN and LR	6	220	Confusion Matrix	NN outperforms LR
2000	Charamlambous et al.	LVQ, RBF and FFNN	7	139	Confusion Matrix	LVQ is better than the other two models
2001	Atiya	NN	5 and 6	911	Confusion Matrix	Proposed novel Indicators to improve performance of NNs
2003	Lin et al.	FNN and Logit	8	200	Confusion Matrix	Mixed Results
2005	West et al.	MLP, Cross-validation, Boosting, Bagging	24, 5	1000, 329	Confusion Matrix	Ensembles are better than single best MLP
2007	Celik and Karatape	ANN	25	350	RMS	ANN performs reasonably well.

2008	Alfaro et al.	AdaBoost and NNs	16	590	Confusion Matrix	AdaBoost outperforms NNs
2010	Kim and Kang	NN, Bagged NN, Boosted NN	32	1458	Type I and Type II	Bagged and Boosted NN is better than traditional NN.
2011	Rafiei et al.	ANN, GA and MDA	17	180	Confusion Matrix	ANN outperforms other models
2012	Olson et al.	Decision Tree, MLP, RBF, BPNN and SVM	18	1321	NA	Decision trees outperformed neural networks and SVM
2013	Lee and Choi	BPNN and MDA	46,40 and 58	6767	t-test	BPNN outperforms MDA
2014	Bredart	NN	3	3728	Confusion Matrix	NN achieves 80% accuracy
2015	Iturriaga and Sanz	MLP and SOM	32	386	ROC	The proposed model is better than other statistical techniques
2019	Duan	MLP and LM	28	887383	MSE, Confusion Matrix	MLP outperforms LM

Table 1 illustrates the application of ANN models in bankruptcy prediction. In most of the cases, the ANN model outperformed the other statistical models except for two. Olson et al. (2012) showed that decision tree algorithms are better predictors than ANN models and Alfaro et al. (2008)

showed the Adaboost algorithm is better than an artificial neural network. However, there are studies that compare the different kinds of ANN models. Also, it is clear from the table that the majority of the studies have used the confusion matrix as the most common error measure.

**Table 2: Applications of ANN in Stock Market Prediction**

Year	Author	RM	No. of Variables	Sample Size	Validation Method	Findings
1991	Yoon and Swales	NN and MDA	9	58	Confusion Matrix	NNs are better than MDA
2003	Chen et al.	PNN, RWM and GMM-kalman filter	4 and 6	128	Confusion Matrix	PNN outperformed the other two models
2004	Cao et al.	ANN and Fama and French's Model Fuzzy Transformation Model, Genetic	1 and 3	367	MAD, MAPE, SD, MSE	ANN is better than other statistical models
2004	Kim and Lee	Transformation Model, Linear Transformation Model	12	2348	Confusion Matrix	GTM outperform all other models
2009	Zhang and Wu	IBCO-BPNN and BPNN	1	2350	MSE	IBCO-BPNN outperformed BPNN

2010	Hadavandi et al.	Hybrid Model, ANN, ARIMA and CGFS	4	2047	MAPE	CGFS outperformed all other models
2011	Guresen et al.	MLP, DAN2, Hybrid models with GARCH	2	182	MSE and MAD	MLP outperform all other models
2011	Kara et al.	ANN and SVM	10	2733	RMS	ANN outperformed SVM
2013	Ticknor	Bayesian Regularized Artificial Neural Network (BRANN), ARIMA	6	734	MAPE	BRANN outperformed ARIMA
2016	Qiu et al.	BPNN and BPNN with GA and SA	18	180	MSE	The hybrid model outperformed traditional BPNN
2016	Moghaddam et al.	BPNN	5,10,20,40, 50,100,200	99	R-Square and MSE	Evaluated different architectures
2016	Inthachot et al.	ANN and GA	44	1464	MSE and MAPE	The hybrid Model outperformed the previous model.
2017	Ghasemieh et al.	ANN	28	1609	MSE	Particle Swarm Optimization Algorithm performs better than other algorithms
2018	Alonso et al.	NN and LSTM	50 and 53	560	MSE	LSTM is better than traditional NN
2018	Menon et al.	MLP, RNN, CNN, LSTM, ARIMA	NA	4861	MAPE	CNN outperform all other models

Table 2 illustrates the application of ANN in forecasting stock price. Over a period of time, different ANN models have been used for stock market prediction, and a comparative analysis is done with the other statistical

models and traditional ANN models. It is clear from the table that in recent times a hybrid model that combines two or more techniques has outperformed the traditional statistical techniques and conventional ANN models.

**Table 3: Other Applications of ANN**

Year	Author	RM	No. of Variables	Sample Size	Validation Method	Findings
1992	Jensen	NN	8	125	Confusion Matrix	NNs are quite practical and easy.
2000	Leung et al.	GRNN, MLFN, RWM	6	259	MAE and RMSE	GRNN outperformed all three models
2000	West	MOE, RBF, LVQ, FAR, MLP, kNN, LR, LDA, KD and CART	2 and 5	1000 and 690	Confusion Matrix	Mixed results

2000	Yao and Tan	NN and ARIMA	5 and 6	510	NMSE	NN outperformed ARIMA
2001	Wakczak	BPNN	2 and 3	125	Confusion Matrix	BPNN incurs cost
2002	Nag and Mitra	GANN, FGNN, ARCH, GARCH, EGARCH, AGARCH	NA	250	AAE, MAPE, Max AE, RSQ, MSE	GANN is better than other models
2003	Malhotra and Malhotra	MDA and NNs	6	1078	Confusion Matrix	NN outperformed MDA
2003	Zhang	NN and Hybrid Model	4	1133	MAD and MSE	Hybrid model outperformed NNs
2006	Kumar and Bhattacharya	LDA and ANN	25 and 8	129	Confusion Matrix	ANN is better than LDA
2012	Weizhong	GRNN	12	111	sMAPE	GRNNs performed well
2015	Wang et al.	BPNN and ADE-BPNN	12	168	RMSE, MAPE, MSE	ADE-BPNN outperforms BPNN
2015	Khandelwal et al.	DWT, ARIMA, ANN and Zhang's Hybrid Model	4	1133	MSE and MAPE	Proposed model outperformed all other techniques
2019	Parot et al.	ANN, VAR, VECM	20	4242	RMSE, MAE, MAPE	Proposed model is better than classical models
2019	Li et al.	CEEDMAN, LSTM, SVM and MLP	9951	128	MAE, RMSE and MAPE	The Proposed model is better than other models

Table 3 illustrates the application of ANN models in other areas of accounting and finance which includes time series forecasting and exchange rate prediction. Various models have been studied by the researchers and a comparison is made with other ANN models. The table shows a recent trend of using hybrid models instead of traditional ANN models.

**Table 4: Frequency of error measures used**

Error Measure	No. of Papers
Confusion Matrix	24
MSE/RMSE/NMSE	16
MAPE/MAE/MAPE/AAE	12
MAD	3
RMS	2
R square	2
ROC	1
Type I and Type II	1
t-test	1
SD	1
Max AE	1

Table 4 illustrates the error measures used in the studies to compare the performance of different techniques. Confusion matrix has been used most frequently, followed by MSE/RMSE/NMSE.

#### 4. Future Scope and Limitations

The present study has further scope for more comprehensive results. It can be explored in other areas of accounting and finance as there is a dearth of literature on applications of ANNs in other areas of accounting and finance such as time series forecasting, foreign exchange rate prediction and commodity market prediction. Furthermore, a comparative analysis can be done by comparing the forecasting accuracy of traditional ANN models and the hybrid models that combines two or more techniques. Also, the current study can be performed using different techniques such as the PRIMA method, bibliometric analysis, systematic analysis, etc.

Though ANN models find applications in a wide spectrum of areas like geo-engineering, marketing, operations etc., but the scope of this study is limited to applications of ANNs in the finance and accounting domain. Another limitation of this study is that it reviews research articles published over

the last three decades. Despite this limitation, the present study covers the entire gamut of applications of ANNs in accounting and finance.

#### 5. Conclusion

In this study, we have carried out a comprehensive literature review on the evolution of artificial neural networks over a period of time and the application of ANN models in various domains of accounting and finance. Since artificial neural networks have gained popularity over the last three decades due to which they have been applied to different domains. The review clearly points out the superiority of artificial neural networks over the conventional statistical models for classification and prediction problems. However, there have been studies where traditional statistical models outperformed the artificial neural network technique. One of the biggest advantages of this technique is it can model any non-linear function. This aspect is particularly useful where the relationship between the variables is unknown, as in the case of prediction of stock prices. However, the determination of various parameters like the number of hidden layers, number of nodes within the layers, the number of input variables is not straight forward and finding the optimal architecture is a time-consuming process.

Another disadvantage highlighted in most of the studies is the lack of interpretability of the weights obtained during the model building process. In this respect, the traditional statistical model stands out as they offer an interpretation of variables, and inferences can be drawn based on these variables. Further, most of the studies have compared the neural network with other statistical models such as logistic regression, linear discriminant analysis and artificial found neural networks to be more effective as they were capable of handling non-linear datasets and establish a relationship between them more precisely. This is particularly so because the performance of these conventional statistical models depends on the validity of the assumptions, which is not considered in the majority of the studies. Also, in most of the articles, the architecture of artificial neural networks is selected by trying out various models on the training data set, which is not done in the case of traditional statistical techniques. Furthermore, various studies have combined the artificial neural network technique with other statistical models and algorithms to enhance the predictive and classification ability of artificial neural networks, and results are very encouraging as they help in lowering down the error

rate by 3 to 5%, which is significant statistically. Therefore, the authors conclude that ANN has shown potential in the field of prediction, specifically in accounting and finance and outperforms the traditional statistical techniques. However, the predictability or accuracy level depends on the understanding of the problem statement. Thus, utmost care should be taken while designing the ANN model for a given problem.

## Appendix

**The abbreviations used in tables 1 - 4 are described below:**

---

Notation	Meaning
LR	Logistic Regression
MDA	Multivariate Discriminant Analysis
k-NN	k-Nearest Neighbour
NN	Neural Network
ANN	Artificial Neural Network
LM	Logit Model
BPNN	Back Propagation Neural Network
GANNA	Generalized Adaptive Neural Network Architectures
PNN	Probability Neural Networks
FDA	Fisher Discriminant Analysis
LVQ	Learning Vector Quantization
FFNN	Feed Forward Neural Network
FNN	Fuzzy Neural Network
RBF	Radial Basis Function
GA	Genetic Algorithm
MLP	Multilayer Perceptron
SVM	Support Vector Machine
SOM	Self-Organizing Maps
BRANN	Bayesian Regularized Artificial Neural Network
LSTM	Long Short Term Memory
CNN	Convolutional Neural Network
ARIMA	Auto Regressive Integrated Moving Average
GARCH	Generalized AutoRegressive Conditional Heteroskedasticity
RNN	Recurrent Neural Network
GFS	Genetic Fuzzy Systems
RWM	Random Walk Model
GMM	Generalized Methods of Moments
IBCO	Improved Bacterial Chemotaxis Optimization
DAN2	Dynamic Artificial Neural Network
GRNN	General Regression Neural Network
MLFN	Multi Layered Feed forward Network
MOE	Mixture of Experts
FAR	Fuzzy Adaptive Resonance

---

---

KD	Kernel Density estimation
GANN	Genetic Algorithm Neural Networks
FGNN	Fixed Geometry Neural Networks
EGARCH	Exponential Generalized AutoRegressive Conditional Heteroskedasticity
AGARCH	Asymmetric Generalized AutoRegressive Conditional Heteroskedasticity
VECM	Vector Error Correction Model
CEEDMAN	Complete Ensemble Empirical Mode Decomposition with Adaptive Noise
ADE	Adaptive Differential Evolution
VAR	Vector AutoRegression
DWT	Discrete Wavelet Transformation
LDA	Linear Discriminant Analysis
MSE	Mean Squared Error
RMSE	Root Mean Squared Error
NMSE	Normalized Mean Squared Error
MAPE	Mean Absolute Percentage Error
MAE	Mean Absolute Error
ROC	Receiver Operating Characteristic Curve
SD	Standard Deviation
Max AE	Maximum Absolute Error
MAD	Mean Absolute Deviation
AAE	Average Absolute Error
sMAPE	Symmetric Mean Absolute Percentage Error

## A b s t r a c t

This paper aims to understand the financial linkages and interdependence of BRICS (Brazil, Russia, India, China and South Africa) nations through the Government security market considering the 10-year bond yield. Long-run and short-run linkages among the 10-year bond yield of these countries are investigated using Johansen and Juselius' co-integration method. Interdependence and Causal relationship are further explored using correlation, cross-correlation, Granger causality test and Wald test. The coefficients of correlation recorded very small values, yet positive, for the bond markets of BRICS economies except for Russia with Brazil and India. The results of cross-correlation, Granger causality tests and Wald tests suggested several statistically significant unidirectional linkages. The results of Johansen co-integration identified a single balanced relationship in the long run among BRICS countries. The paper suggests and supports the adoption of diversification through investments in these emerging market economies, especially in the long-term government security market, as few countries have revealed negative correlation which would induce in lessening the risk during financial distress.

**Keywords:** BRICS, government security market, financial linkages, Johansen and Juselius' co-integration, Granger causality test

## 1. Introduction

Brazil, Russia, India, China and South Africa, collectively known as BRICS economies, are a small group of countries that have acquired lots of consideration from researchers and investors during the past decade. The reasons are diverse, but the essential perception being these emerging economies of relatively large size could potentially deliver the anticipated push to augment the economic growth of the world. As a consequence of the Global Financial Crisis of 2007-2008, the yearly growth rate of per capita GNP at an international level has plunged to an average of 1.7% (measured in 2005 \$PPPs during 2008 to 2017). On the other hand, BRICS economies have been the major contributors to the growth of per capita GNP globally, at an average of 5.4% and are considered to outlast the key drivers of growth of the world by 2030. These economies are currently accounting for 30.4% of total world GNP.<sup>1</sup> Since 2015, these five countries have been sharing a GDP of \$ 16.6 trillion, which is equivalent to roughly about 22 percent of the gross world GDP. The estimated expansion in the growth rate of BRICS is 5.3% in 2019.<sup>2</sup>

This turn of the century has observed one of the most complex and major financial crisis so far. The crisis has escalated rapidly from the U.S. housing market to its own financial market and to the whole world financial market. The proliferating growth of the BRICS market has made them significantly financially dependent on other markets of the world. BRICS economies today are more matured, and thus their markets are exhibiting a higher level of financial integration and linkages with other developed markets of the world. BRICS stock market exhibit linkages with global stock market (S&P index), commodity markets (oil and gold) and U.S. stock market uncertainty (Mensi, Hammoudeh, Reboredo, & Nguyen, 2014). Furthermore, bilateral relations among BRICS nations are mainly based on equality, non-interference and mutual benefit (Lopes Jr, 2015). These five BRICS countries differ in their structural characteristics, economic policies and

geopolitical importance. Brazil and Russia are primarily natural resource-based economies, well-known for the export of commodities and are more open in terms of foreign trade. Their capital markets witness liberal regulation with limited control by the state as compared to the markets of India, China and South Africa. These three countries are relatively closed and highly populated amongst the five BRICS economies, where the majority of the population is living in the rural areas having a state-controlled capital market.

The remarkable fall in the equity market wealth resulting from the deteriorating consumption patterns worldwide could pose grave implications on the health of the economy as well as on its financial institutions (Dynam & Maki, 2001). The correlations between major asset classes (particularly stock markets and bond markets) are of major concern for financial regulators and monetary authorities alike. An enriching number of researches in this domain have analysed the characteristics of these linkages and their essence through which information flows between markets. The past literature has been focusing on studying the interaction among the BRICS economies and how / what they contribute to the global markets. The domestic asset prices shocks pose a substantial impact on assets prices; however, the international spillover, both within and across various asset classes, is more considerable (Ehrmann, Fratzscher & Rigobon, 2011). International bond markets hence play a very crucial role in determining asset prices for the developed markets of the world. Financial authorities can influence the term structure minimally. Fundamentally, the expected future inflation and the short term real interest rates determine the long term bond rates. The increased co-variation amongst the bond rates of different economies restricts the influence of higher monetary authorities towards the term structure.

The correlation between bond markets of different countries may crop up through various channels. It can be done by framing an internationally diversified portfolio or determination of real rates by global factors. Risks in the worldwide prices or 'flight to quality' in terms of financial stress may also cause this correlation. The indefinite measure of correlations amongst the key international bond markets indicated an increased association between these markets since the 1960s; however, the results of

<sup>1</sup> Mckinley, T. (2018, Apr 20). Brics to play a leading role in driving future global economic growth (Blog post). Retrieved from <https://www.ineteconomics.org/perspectives/blog/brics-to-play-a-leading-role-in-driving-future-global-economic-growth>

<sup>2</sup> Global Economic Prospects: Divergences and Risks, A World Bank Group Flagship Report, 2016

correlations were neutral in displaying any trend (Solnik, Boucrelle & Le Fur, 1996; Christiansen & Pigott, 1997). In spite of the fact that the absolute prices and measures of the international bond market correlations are not in a situation of increasing trends, the measures taken by the monetary authorities in balancing the yield curve by changing the short-term rates still prevails.

A generous number of studies have examined the linkages, co-movements and correlations amongst the stock markets of BRICS nations (Sharma, Singh, & Litt, 2011; Xu & Hamori, 2012; Chkili & Nguyen, 2014; Bekiros, 2014; Mensi et al., 2014). Many of them have also tried to find the integration of one of the BRICS nations with U. S. bond markets, but the present study is differentiated from the other research by studying the integration within the BRICS nations through the government security market. In the same direction, the impact of the bond price movement on the rest of the BRICS countries has also never been examined. Thus, the study is novel in its type and explores the same concepts with the new dimensions.

The present study attempts to investigate the relationship between the 10-year bond yields of BRICS economies. The empirical analysis uses monthly data from January 2008 to December 2017. At the first stage, the presence of unit root and order of integration of all five series was examined. Secondly, the test of correlation, cross-correlation and Granger causality were adopted to identify short-run linkages and Johansen and Juselius (1994) co-integration framework was used to examine the long term relationships among BRICS countries. Finally, the short-run relationship was verified and confirmed using the Wald test. The paper is further structured as follows: Section 2 provides the synopsis of previous studies. The methodology and description of data are presented in section 3. Estimated results and their rationales are enumerated in section 4, followed by a conclusion and final summary in section 5.

## 2. Literature Review

The crash of stock markets in October 1987 was one of the key stimulants to study the financial market associations. Koutmos and Booth (1995) find that the major stock markets of New York, London and Tokyo witnessed higher interdependencies after the crash of 1987. The 1997 financial crisis played an influential role in bringing the

integration of ASEAN stock markets with other economies (Janor, Ali, & Shaharudin, 2007). The globalisation of economies had driven this obvious increase in the linkages between the domestic equity markets, which in turn have increased the presence of international investors worldwide. The early studies of international financial integration and linkages were triggered by the motive of having an internationally diversified portfolio (Grubel, 1968; Hilliard, 1979; Becker, Finnerty, & Gupta, 1990; Hamao, Masulis, & Ng, 1990). The increased number of foreign investors and strong international market interrelations are motivated by the relaxed restrictions of the capital markets (Phylaktis & Ravazzolo, 2005). The contagion financial crisis of the developed countries along with their portfolio diversification has attracted researchers to investigate the topics of financial integration. The correlation between the BRICS and the USA is increasing since early 2009 after the global financial crisis (Dimitriou, Kenourgios & Simos, 2013). Tornell and Westermann (2002) show that many countries that liberalised their financial markets experienced the development of lending that sometimes resulted in twin crises. King and Wadhvani (1990) anticipated volatility transmission as a result of contagion effect because intermediaries do not measure the economic inference of news from the foreign market; rather, they are merely responding by reacting first and thinking (Shiller, Kon-Ya & Tsutsui, 1991; Taylor & Sarno, 1997; Calvo, 1998). Dhingra, Gandhi, & Bulsara (2016) also argued that the foreign portfolio investors are purely the feedback traders and hence, they increase the financial market volatility. Pereira (2018) investigated the contagion effect in the BRICS economies with special reference to the collapse of Lehman Brothers and the European Sovereign Debt Crisis. The relationship and co-movements between the BRICS markets are analysed using the co-integration, causality and VECM methodology. The results verified and confirmed the long run and short-run relationship between the BRICS nations; however, the same has significantly changed during the crisis period.

Some of the empirical papers have also studied the relationship between stock and bond markets. A VAR approach of Campbell and Shiller (1987) has been used by the studies of Shiller and Beltratti (1990) and Campbell and Ammer (1993) to decompose asset returns. The results

of this study recorded an unexplained change in excess returns, and hence these returns can be explained by future events which are predominantly driven by the future expected inflation rates. Norden and Weber (2009) studied inter temporal co-movement among stock return, Credit Default Swap (CDS) and bond market, where they clearly showed stock returns lead CDS and bond spread changes. A negative relationship is found between the uncertainty measures and the future correlation of stock and bond returns (Connolly, Stivers & Sun, 2005). The returns on the bond market are likely to be higher compared to returns on the stock market, particularly on those days when the volatility in the stock market increases significantly, and the turnover is unusually low or high.

Barr and Priestley (2004) study the integration of the selected world markets by applying the factors of returns on government bonds and expected risks. Their study applies a conditional asset pricing model, which allows changes in the price and risk exposure. The results of the conditional asset pricing model reveal a partial integration of national markets with the world markets. Nasir and Fan Fah (2012) investigate the dynamic relationship of bond yields using the government bond returns and yield curves of India, Japan, Malaysia, Singapore and Thailand. With the results of VECM (Vector Error Correction Model), they indicate a presence of co-integration among all considered nations except Japan. Lapodis (2010), using GARCH (Generalised Autoregressive Conditional Heteroskedasticity) and VAR (Vector Autoregression), identify the existence of short-run relationships for the sovereign bond market of four major economies; Germany, Japan, the U.S. and the U.K. He confirms that the U.S bond market volatility also affects the other countries bond yield. Chaieb, Errunza and Brandon (2020) studied the dynamics of bond market integration for 21 developed and 18 emerging markets of the world. Results revealed a higher degree of integration for factors like political stability, credit quality, lower level of inflation and lower illiquidity. The level of integration and its impact on borrowing cost is measured using an asset pricing model in this study.

To our knowledge, few studies like Yu, Fung and Tam (2007), Barr and Priestley (2004) and Clare, Maras, and Thomas (1995) investigated the relationships between international bond markets. Ahmad, Mishra and Daly (2018)

analysed the financial connectedness with the help of returns and volatility spillovers of BRICS with three global indices. DY model, correlation analysis and VAR were applied to investigate the volatility spillover. Russia and South Africa are found to be the net transmitters of shocks and may have an adverse impact on other BRICS nations. Conversely, China and India revealed weak connectedness. Mohammad and Palaniappan (2017) investigated the integration of stock markets of BRICS nations. Johansen Co-integration Test (1994) and Pairwise Granger Causality test were applied to measure the interdependency and dynamic linkages among these markets. The results supported the absence of a long-run relationship between these markets. The literature studying the relationship amongst the bond yield of BRICS nations are scant in number. The present paper aims to coincide with the existing literature on financial market linkages by analysing the links between government security markets.

### **3. Data and Methodology**

#### **3.1 Data**

To render a comprehensive account of interrelationships, integration, interdependencies and dynamic linkages of the BRICS economies through the government security market, monthly data of 10-year bond prices have been extracted and further considered for detailed analysis. The data set comprises 120 observations ranging from January, 2008 to December, 2017 (i.e. last ten years) for five series or variables (representing BRICS economies) viz. Brazil, Russia, India, China and South Africa.

#### **3.2 Preliminary Analysis**

The co-integration test in the time series analysis requires fulfilling the assumption of time series being integrated of the same order to make the regression equation balanced. Augmented Dickey-Fuller and Phillips-Perron unit root tests have been performed for checking the stationarity of individual series. Results of stationarity tests reveal that all the series are stationary at the first difference, that is, individually, they are  $I(1)$ . To verify autocorrelation among the residuals Ljung-Box  $Q$ -statistic is used, which suggests the absence of significant autocorrelations among the residuals. Akaike Information Criterion (AIC) and Schwarz Bayesian Criterion (BIC) are used to determine the optimal lag length.

### 3.3 Correlation Analysis

Correlation analysis is performed for getting the initial sign of dynamic linkages and integration among these EMEs through the government security market. The correlation test measures the direction and strength of the association between the considered series. However, Leong and Felmingham (2003) criticised the reliability of the correlation test since the coefficients of correlation tend to be more upward biased in nature if the series is suspect to heteroskedasticity.

### 3.4. Contemporaneous Cross-correlation Analysis

To measure the strength of linear dependence between any two series under consideration, the cross-correlation coefficients are calculated (Haugh, 1976). The cross correlation between  $X_t$  and  $Y_{t-m}$  is defined as

$$r_{XY}(m) = \frac{\sum_{t=m+1}^n (X_t - \bar{X})(Y_{t-m} - \bar{Y})}{\sqrt{\sum_{t=1}^n (X_t - \bar{X})^2 \sum_{t=1}^n (Y_{t-m} - \bar{Y})^2}} \quad \text{Equation 1}$$

Where  $\sigma_X$  and  $\sigma_Y$  are the standard deviation of  $X_t$  and  $Y_{t-m}$ , respectively and are assumed to be time-independent.

Non-zero value of  $r_{XY}(m)$  (where  $m > 0$ ) indicates that the series  $X_t$  leads the series  $Y_{t-m}$  at lag  $m$ , whereas the non-zero value of  $r_{XY}(m)$  (where  $m < 0$ ) implies that the series  $Y_{t-m}$  lags the series  $X_t$  at lag  $|m|$ .

### 3.5 Granger Causality Test

To eliminate the possible simultaneity bias, the Granger causality test (Granger, 1988) is performed, which uses standard  $F$ -test:

$$F = \frac{RSS_1 - RSS_2}{RSS_2} \cdot \frac{n-k-1}{k} \quad \text{Equation 2}$$

$\beta_j$  represents the coefficients between values of variable  $X_t$  at time  $t$  and variable  $Y_{t-k}$  at time  $t-k$ . The null hypothesis being variable  $j$  does not Granger cause variable  $i$  if all other coefficients of the polynomial  $\beta_j$  are set to zero.

The Granger Causality test involves estimating the following pair of equations:

$$X_t = \alpha + \beta_1 X_{t-1} + \beta_2 X_{t-2} + \dots + \beta_m X_{t-m} + \gamma_1 Y_{t-1} + \gamma_2 Y_{t-2} + \dots + \gamma_n Y_{t-n} + \epsilon_t \quad \text{Equation 3}$$

$$Y_t = \alpha + \beta_1 Y_{t-1} + \beta_2 Y_{t-2} + \dots + \beta_m Y_{t-m} + \gamma_1 X_{t-1} + \gamma_2 X_{t-2} + \dots + \gamma_n X_{t-n} + \delta_t \quad \text{Equation 4}$$

Where  $\epsilon_t$  and  $\delta_t$  are white noise processes;  $m$  is a suitably chosen lag length;  $t$  is the trend variable;  $\alpha$ ,  $\beta_j$ ,  $\gamma_i$  and  $\delta_j$  are the slope parameters. One pair of equations is estimated for each series of bond prices with the other four series of bond prices. While estimating this pair of equations, all the series are  $I(1)$ .  $\beta_j$  denotes the linear dependence of  $X_t$  on  $X_{t-j}$  in the presence of  $Y_{t-k}$ . Similarly,  $\gamma_i$  denotes the linear dependence of  $Y_t$  on  $Y_{t-i}$  in the presence of  $X_{t-k}$ .

### 3.6 Cointegration Test

To examine the presence of a long-run relationship among BRICS' bond markets, the VAR based co-integration approach has been adopted, which is given by Johansen and Juselius (1994). The pre-requisite for the application of this approach confirms the considered variables to be non-stationary at level and having the same order of integration. This method finds the co-integrating relationship between non-stationary variables using maximum likelihood estimation. To carry out the test, the first VAR of variables  $p$  and order  $k$  is formulated using equation 5.

$$Z_t = \alpha + \beta_1 Z_{t-1} + \beta_2 Z_{t-2} + \dots + \beta_k Z_{t-k} + \epsilon_t \quad \text{Equation 5}$$

Where,  $Z_t$  is the  $p$  vector containing the  $p$  variables ( $\alpha$ ,  $\beta_1, \beta_2, \dots, \beta_k$  are the matrix of parameters and  $\epsilon_t$  is an independently and identically distributed  $n$ -dimensional vector with zero mean and constant variance.

The reparameterisation of equation 5 would yield equation 6.

$$Z_t = \alpha + \beta_1 Z_{t-1} + \beta_2 Z_{t-2} + \dots + \beta_k Z_{t-k} + \epsilon_t \quad \text{Equation 6}$$

$r$ , in equation 6 is the rank of the matrix. It represents the number of co-integrating vectors. If rank  $r < p$ , the ma-

trix is null. In such a condition, equation 6 becomes the ordinary VAR with the first difference signifying that variables in  $X_t$  are not co-integrated. Value of the rank  $r$  indicates the presence of only co-integrating vector and  $\epsilon_t$  denotes the error term.  $\alpha$  suggests the existence of multiple co-integrating vectors.

One can obtain the existence of a number of co-integrating vectors by assessing the significance of characteristic roots of  $\alpha$  and  $\beta$  statistics can be used to check the number of characteristic roots that are significantly different from one.

The statistic given by equation 7 involves assessing the null hypothesis that the number of distinct co-integrating vectors is less than or equal to  $r$  against the alternative.

$$\lambda = \frac{1}{n} \sum_{i=1}^n \lambda_i \quad \text{Equation 7}$$

The second test  $\lambda$  represented by equation 8 assesses the null that the number of co-integrating vectors is  $r$  against the alternative  $r+1$  co-integrating vectors.

$$\lambda = \frac{1}{n} \sum_{i=1}^n \lambda_i \quad \text{Equation 8}$$

In equation 7 and 8,  $\lambda_i$  and  $\lambda_j$  are the estimated values of the characteristic roots, which are obtained from the estimated  $\alpha$  matrix, also known as eigen values, and  $n$  is the number of usable observations.

### 3.7 Wald Test

Toda and Yamamoto (1995) proposed the Granger Causality technique to determine the causal relationship between two variables. The technique became very popular among researchers due to its simple application, which does not involve pre-testing of the same level of integration and co-integrating properties of the considered variables. Toda and Yamamoto (1995) gave an augmented VAR( $p+d$ ) model estimated through equation 9, which is used to test the causality between integrated variables.

$$X_t = \alpha + \beta X_{t-1} + \epsilon_t \quad \text{Equation 9}$$

Where variables with circumflex represent the OLS estimates,  $p$  and  $d$  represent the order of the process and

the order of integration respectively of the considered variables.  $k^{th}$  element of  $X_t$  non-granger cause the  $j^{th}$  element of  $X_t$  becomes the null hypothesis. The test for causality between two variables in  $X_t$  can be written as equation 10, which is popularly known as Modified Wald (MWALD) test. The full set of coefficients in the model may be arrayed in a single coefficient vector,  $\gamma$ . Assume  $\hat{\gamma}$  to be the sample estimator of  $\gamma$  and  $V$  the estimated asymptotic covariance matrix. The Wald statistic for the null hypothesis  $H_0: \gamma = 0$  is.

$$W = \hat{\gamma}' V^{-1} \hat{\gamma} \quad \text{Equation 10}$$

The null hypothesis for the Granger causality test will be a certain sub-vector of  $\gamma$ , say  $\gamma_0$  equals zero, where the test statistic will be equation 11.

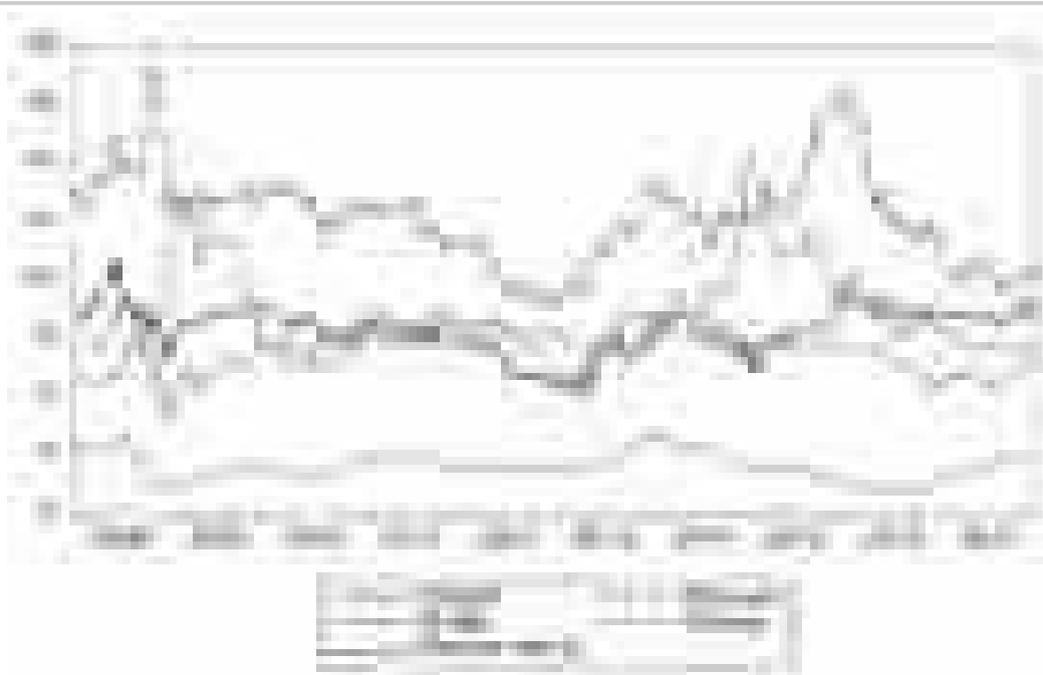

$$W = \hat{\gamma}_0' V_0^{-1} \hat{\gamma}_0 \quad \text{Equation 11}$$

Where  $V_0$  is the corresponding sub-matrix of  $V$ . The adequacy of the models is tested by serial correlation test and the test of heteroskedasticity. The null hypothesis for serial correlation is that residuals are not serially autocorrelated. For the heteroskedasticity test, the null hypothesis is that the residuals are homoskedastic. The proficiency of both the tests is measured by its  $p$  values. The value of the coefficient of determination that is  $R$ -square from the regression is an indication of the extent to which the conditional variance is explained. It helps to evaluate the adequacy of the models. The model having a high  $R$ -square suggests the good-fit.

## 4. Empirical Analysis and Discussion

### 4.1 Preliminary Analysis

The daily bond prices of BRICS (Brazil, Russia, India, China, and South Africa) economies are illustrated using a graph for the considered period of study in Figure 1. This plot hints at the likely nature of the time series. Figure 1 exhibits an upward and downward trend in the prices of bonds for BRICS economies, suggesting the changes in the mean values of different series and the series are confirmed to be of non-stationary nature.

Source: Author's analysis

**Figure 1: Daily bond prices of BRICS economies**

To achieve the objective of the study that is identifying long-run and short-run linkages among BRICS economies, Johansen co-integration test has been performed. This test pre-conditions that the variables under consideration should be in the same order of integration. Augmented Dickey-Fuller(ADF) Test and a Phillips-Perron (PP) Test are used

to examine the non-stationarity of the series. The results of both the tests of unit root in Table 1 confirm the presence of non-stationarity at level and stationarity at the first difference for all the series. All the series, therefore, are integrated at order one, that is  $I(1)$ .

**Table 1: Unit Root Test**

Variable	Level	First Difference	Level	First Difference
India	0.1234	-1.2345	0.0123	-1.9876
China	0.2345	-1.3456	0.0234	-2.0987
USA	0.3456	-1.4567	0.0345	-2.2098
UK	0.4567	-1.5678	0.0456	-2.3209
Japan	0.5678	-1.6789	0.0567	-2.4320

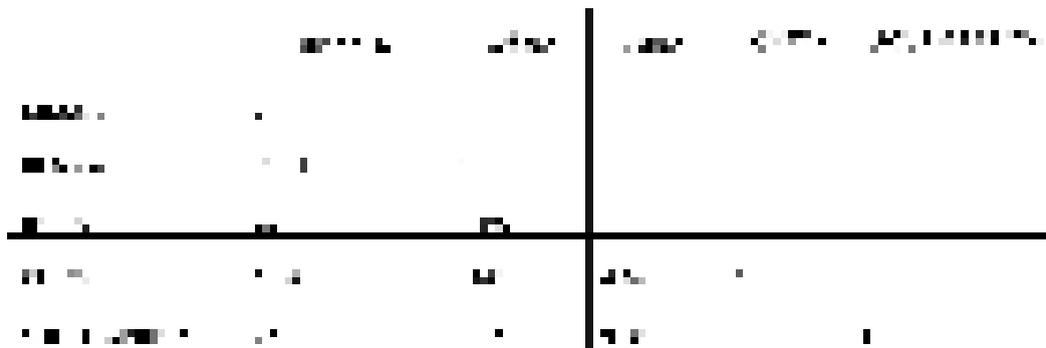

Note: Estimation procedure follows Ordinary Least Square (OLS) method. The null hypotheses are series contain unit root. '\*\*' denotes values significant at 1% level.

### 4.2 Correlation Analysis

The correlation analysis enumerated in Table 2 reveals that all bond price series are positively related to each other except the relationship of Russia with Brazil and India. All these coefficients do not support the strong association as these values are ranging between 0-0.3 except for the

correlation coefficient between Brazil and South Africa. The reason being that all the bond investments are related directly to policy rates, and they tend to be related for the long term. Investors cannot further exploit arbitrage opportunity in these markets due to the presence of interest rate parity.

**Table 2: Correlation Analysis**

Source: Author's analysis

### 4.3 Contemporaneous Cross-correlation Analysis

Table 3 shows the estimated cross-correlation coefficients of the first variable  $X(\pm i)$  up to 5 leads and lags. The “leads” and “lags” of the first variable are given in the first column as positive and negative integers. Lead coefficient suggests the influence of the first series that is the bond price of one country at time  $(t+1)$  on the other country bond price at time  $t$ . Similarly, the lag coefficient suggests the influence of the second series at time  $(t-1)$  on the bond price of the first series. Brazil bond price influences the bond prices of China and South Africa as the lead

coefficients of Brazil are statistically significant, whereas lag coefficients with Russia, India and South Africa are statistically significant. These suggest the bidirectional cause and effect relationship between Brazil and South Africa. Russia and India have a causal relationship flowing from each other. In the rest of the relationships between Russia - China, Russia - South Africa, India - China, India - South Africa and China - South Africa, the former causes change in the latter variable. A significant coefficient at lag 0 implies a contemporaneous two-way relationship for the selected variables.

**Table 3: Contemporaneous Cross-correlation Analysis**

Country 1	Country 2	Lag	Coefficient	Significance
Brazil	China	0	0.15	0.001
Brazil	India	0	0.22	0.001
Brazil	South Africa	0	0.35	0.001
Brazil	Russia	0	0.18	0.001
China	India	0	0.12	0.001
China	South Africa	0	0.10	0.001
China	Russia	0	0.08	0.001
India	South Africa	0	0.09	0.001
India	Russia	0	0.07	0.001
South Africa	Russia	0	0.06	0.001

	China	India	Russia	South Africa
China	0.0000	0.0000	0.0000	0.0000
India	0.0000	0.0000	0.0000	0.0000
Russia	0.0000	0.0000	0.0000	0.0000
South Africa	0.0000	0.0000	0.0000	0.0000
Asymptotic Standard Error	±0.1789	±0.1789	±0.1789	±0.1789

Note: Asymptotic standard error for the cross-correlation coefficients is  $\pm 0.1789$ . First column of the table denoted as “k” represents the leads/lags of first variable  $X(\pm i)$ . Here correlation is between  and other series and is denoted as . “\*” represents significant cross correlation coefficient which fall outside the asymptotic bounds.

#### 4.4 Granger Causality Test

Short-run causality among considered Emerging Markets has been analysed using an alternative approach. This approach involves estimating Granger causality statistics by applying the Toda–Yamamoto (1995) approach, which has its roots in the VAR model. Table 4 provides bivariate VAR framework-based results of the Granger causality test. The presence of unidirectional causality from Brazil to the other four countries has been confirmed from the results. Russia granger causes China at lag 2. However, the causality

in the case of India is flowing only towards Russia. The null hypotheses, “China does not Granger cause Brazil/India”, are rejected. The result further suggests that the China bond market contains useful information for Brazil and India. Similarly, South Africa contains useful information for Russia and India. These results are consistent with the results of the cross-correlation of Brazil and India.

**Table 4: Granger Causality Test**

The Granger Causality Test matrix shows the following significant relationships (shaded cells):

- Variable 1 causes Variable 2 (arrow from 1 to 2)
- Variable 2 causes Variable 1 (arrow from 2 to 1)
- Variable 2 causes Variable 3 (arrow from 2 to 3)
- Variable 3 causes Variable 2 (arrow from 3 to 2)
- Variable 3 causes Variable 4 (arrow from 3 to 4)
- Variable 4 causes Variable 3 (arrow from 4 to 3)

Note: Arrow “↘” shows unidirectional causality running from column variable to row variable. “-” indicates the absence of causal relationship at particular lag. Arrows represent significant *F*-statistics at 5% level. Number of lags have been determined using BIC criterion.

**4.5 Lag selection Criteria**

The first and foremost step to analyse either long-run or short-run relationship among considered series is to select a proper lag length for further analysis. To decide the lags to be included for estimating the Johansen – Juselius co-integration test (for long-run relationship) and the Wald

test (for short-run relationship), unrestricted Vector Auto Regression (VAR) has been estimated. The test statistics for lag selection criteria are shown in Table 5. FPE, AIC, SC and HQ unanimously select lag 2. Thus, the inclusion of variable up to two lags would make the model parsimonious and restrict us from over-parameterisation.

**Table 5: Lag selection criteria**

	1	2	3	4
LogL	1.23	1.23	1.23	1.23
LR	1.23	1.23	1.23	1.23
FPE	1.23	1.23	1.23	1.23
AIC	1.23	1.23	1.23	1.23
SC	1.23	1.23	1.23	1.23
HQ	1.23	1.23	1.23	1.23

Note: \* indicates selected lag order by the criterion at 5% significant level. LogL, LR, FPE, AIC, SC and HQ stands for Log Likelihood ratio, sequential modified LR test statistics, Final prediction error, Akaike information criterion, Schwarz information criterion and Hannan-Quinn information criterion, respectively.

#### 4.6 Cointegration Test

To ascertain whether the non-stationary bond price series share a long-run stochastic trend, Johansen – Juselius co-integration test is employed, and the results are shown in Table 6. The calculated values of  $\lambda_{max}$  and  $\lambda_{min}$  are reported in the second and fourth column. The considered series for all five variables are  $I(1)$ . From both the test statistics,

it is likely to accept the alternative hypothesis of the presence of one or more co-integrating vectors by rejecting the null hypothesis of no co-integrating vector, as the test statistics exceed the 5 per cent critical value. The values of the  $\lambda_{max}$  and  $\lambda_{min}$  statistics are such that the null hypothesis of no co-integration (i.e.,  $r=0$ ) is soundly rejected. As such, it is evident that there is only one co-integrating vector among the five BRICS variables.

**Table 6: Johansen Cointegration Test**

Note: “\*” denotes rejection of the hypothesis at the 0.05 level and “\*\*\*” MacKinnon-Haug-Michelis (1999) p-values

#### 4.7 Wald Test

To test the joint hypotheses of two or more coefficients, instead of using the classical  $F$ -test, the Wald test is used, which is a large sample test. The Wald statistics follow the  $Chi-square$  statistic with degrees of freedom equal to the number of regressors estimated. The null hypothesis, as in the usual  $F$ -test, is that all the regressor coefficients are zero simultaneously; that is, collectively, none of the regressors have any bearing on the endogenous variable. In our case, the  $Chi-square$  statistics are significant for Brazil, India, China and South Africa. Collectively, out of all the regressors India and China have an important impact

on the monthly bond prices of Brazil. For India, short-run causality is running from all other countries except Russia. China and South Africa are in a short-run equilibrium relationship with South Africa and Brazil, respectively. Although the co-integration test confirms the long-run relationship among the bond markets of all five countries, they also possess a short-term causal relationship with some of the countries under consideration. The findings of the Wald test are perfectly matching with the findings of the Granger causality test for Brazil, India and South Africa. It is interesting to note that the findings of the Wald test for Russia is quite different from the findings of the Granger causality test (Please refer Table 7).

**Table 7: Wald Test**

Country	Model	Wald Test			p-value		
		F-Statistic	D.F.	Asymptotic Significance	Asymptotic Significance	Asymptotic Significance	Asymptotic Significance
India	Model 1	1.234	3	0.75	0.92	0.88	0.95
	Model 2	1.567	3	0.68	0.85	0.82	0.90
	Model 3	1.890	3	0.60	0.78	0.75	0.85
China	Model 1	2.123	3	0.55	0.70	0.68	0.78
	Model 2	2.456	3	0.48	0.65	0.62	0.72
	Model 3	2.789	3	0.40	0.60	0.58	0.68
USA	Model 1	3.012	3	0.30	0.50	0.48	0.58
	Model 2	3.345	3	0.23	0.45	0.42	0.52
	Model 3	3.678	3	0.15	0.40	0.38	0.48
South Africa	Model 1	4.567	3	0.05	0.30	0.28	0.38
	Model 2	4.900	3	0.02	0.25	0.22	0.32
	Model 3	5.233	3	0.01	0.20	0.18	0.28

**4.8 Breusch-Godfrey Serial Correlation Test and Breusch-Pagan-Godfrey Heteroskedasticity Test**

The last step to validate the findings is checking the model fit by analysing the residuals for serial correlation and the presence of heteroskedasticity. Table 8 shows the results for the Breusch-Godfrey Serial Correlation Test and Breusch-Pagan-Godfrey Heteroskedasticity Test. The observed F-statistics for serial correlation fails to reject the null hypothesis that there is no serial correlation in the generated residuals series of the regression model. This

validates the results of Johansen – Juselius co-integration test and Wald test for the long run along with short-run linkages as the residuals are not victimised by autocorrelation throughout the series. The p-values for corresponding F-statistics in Breusch-Pagan-Godfrey Heteroskedasticity Test fails to reject the null hypothesis of the presence of Heteroskedasticity for all considered models except for South Africa. Thus one can conclude that the residuals are homoskedastic in nature.

**Table 8: Breusch-Godfrey Serial Correlation Test and Breusch-Pagan-Godfrey Heteroskedasticity Test**

Country	Model	Breusch-Godfrey Serial Correlation Test		Breusch-Pagan-Godfrey Heteroskedasticity Test	
		F-Statistic	p-value	F-Statistic	p-value
India	Model 1	1.234	0.75	1.567	0.68
	Model 2	1.567	0.68	1.890	0.60
	Model 3	1.890	0.60	2.123	0.55
China	Model 1	2.123	0.55	2.456	0.48
	Model 2	2.456	0.48	2.789	0.40
	Model 3	2.789	0.40	3.012	0.30

	Model 3	5.233	0.01		

## 5. Summary and Conclusion

The study of linkages and interdependencies between financial markets has been a highly researched topic in the field of finance. Several studies tried to find the linkages between the stock markets, money markets and bond markets of different countries. The BRICS nations in the past decade have already gone through noteworthy changes in their processes, international trade opportunities and financial integration (Pereira, 2018). The absence of linkages between markets results in an advantage for investors and leads to the creation of portfolio diversification in the global market. On the contrary, some studies revealed a negative performance in the portfolio returns due to the occurrence of extreme events such as financial crises and stock market catastrophes. In such cases, foreign investors should be allowed greater flexibility to switch between equity and debt assets which will make their investments more elastic. Such type of balance strategies may help to stabilise the movements of foreign investors in and out of any country. This kind of prudent measure would be an indirect effort to prevent asset price bubbles in the financial markets. This may result in imposing the ban on certain financial activities for a short time span by governments, as is deemed fit (Bulsara, Dhingra, & Gandhi, 2015; Dhingra et al., 2016).

The existing research is an empirical assessment of short-term and long-term integration among the bond values of BRICS (Brazil, Russia, India, China and South Africa) economies. In order to determine the co-integrating relationships for the bond markets of the five economies of BRICS, the co-integration approach given by Johansen was performed on these variable series. The data is ranging from January, 2008 to December, 2017. The results of the test strongly support the presence of a co-integrating relationship among the bond markets of these emerging economies. These results are consistent with the findings of Bianconi, Yoshino and De Sousa, 2013. This will benefit international investors by diversifying their portfolio internationally in the long run.

In order to assess the presence of co-variation and short-term co-movements contemporary correlation coefficients were calculated. The coefficients of

correlation recorded very small values, yet positive, among these countries' bond markets except Russia with Brazil and India. This result provides international investors with a chance to exploit the opportunity of possible diversification in the international bond market. The results of Granger causality tests and Wald tests confirm quite a few numbers of statistically significant unidirectional links. In the short run, Brazil is dependent on India and China, India is dependent on China and South Africa and South Africa is dependent on Brazil. These short-run relationships are not so strong for Russia and China if both the tests (Granger causality tests and Wald tests) are considered.

The Johansen co-integration test revealed the existence of a single balance long-run relationship among the BRICS countries. This co-movement may emerge due to the existence of some of the common factors, which restricts the independent movement of the bond prices of these countries and leaves scope for prediction. The certification of such relationships, in turn, facilitates the investment opportunities in international portfolio diversification. The results advocate the possibility for international investors in the long run to espouse the investment strategies which combine assets from the countries that do not show association in the long run, particularly in the government security market where inflow and outflow are not much frequent. The existence of these long-run and short-run relationships questions the legitimacy of the efficient market hypothesis. The prediction of the price movement of one series can be improved if the movements of the rest of the variable series in the model are known.

## A b s t r a c t

In a digital economy, the use of online systems is pertinent for all organisations. The online systems have provided better connectivity and save a lot of time due to reduced paperwork. One such system is e-HRM which helps in smoothening the operations of the HR department. Since e-HRM helps in faster decision-making and better communication, therefore, it was found to be an important area for research. Thus, the present study was undertaken to find out the various factors that influence the implementation of e-HRM system. This forms the primary objective of this research. For this, data was collected from employees of IT organisations located in the National Capital Region, India. The sample size for the study was 320 employees using convenience sampling. The data was analysed using SPSS version 23. It was found that there are eight factors that influence the e-HRM system in IT organisations. These factors include ease of use of technology, experience of information technology, secure systems, technology usefulness, communication tools, risk perception, usage intention and organisational support. All these factors play an important role in the effective implementation of e-HRM. The study has several implications, important among which is that organisational support should be taken care of as the adoption of e-HRM requires that the employees should have the required support.

**Keywords:** *e-HRM, IT organisations, factors of E-HRM implementation, organisational support, usage intention*

## 1. Introduction

Over recent years, the majority of organisations have integrated their HR departments with IT using e-HRM systems to improve their performance. This shift has not been sudden, but the changes were gradual as the requirement for automated systems became a necessity. According to Strohmeier (2007), “e-HRM is the planning, implementation and application of information technology for both networking and supporting at least two individual or collective actors in their shared performing of HR activities.” However, moving from pen and paper to online systems has not been an easy task.

In developed countries, e-HRM is already being used on a large scale. However, its implementation in Indian organisations has taken place mostly in the past few years. In the present scenario, there is a need for revision in the HR department because now internet technology has been associated profoundly with HRM. The term e-HRM came into existence in the early 1990s. Now the trend is new innovative technological developments, which realised the concept of paperless work at the touch of a finger. In fact, e-HRM has transformed traditional HR into a more realistic, informative and interactive format. Everything, including our way of thinking, living, communicating, culture, economics, demographics and even society, has been affected by these technological changes.

The organisations were influenced by several factors in the implementation of these systems. The internal environment and several external variables included technology available, sense of security, ease of use, use of technology and many more. The e-HRM implementation has been the fastest in the IT industry in comparison to others as the employees of this industry are tech-savvy when compared to those in other industries. Therefore, the present study dealt with the various factors affecting the implementation of e-HRM in the IT industry.

## 2. Review of Literature

### 2.1 Implementation of e-HRM

Panayotopoulou et al. (2010) conducted a study in 13 European countries. They explored the impact of the background of the nation on e-HRM implementation. They

stressed the existence of front end and back end systems. The study outcomes revealed that there were three clusters, namely Northern, Central and South-Eastern, on the basis of diffusion of e-HRM. In another study, Stone and Dulebohn (2013) presented advanced theory and research on HRMS (Human Resource Management System) and e-HRM. They also enhanced the effectiveness of these systems in organisations. This article reviewed the evolution of HRMS and e-HRM and provided an overview of the existing literature. The authors examined how HR scholars may perceive HRMS and e-HRM. A conceptual study was conducted for the research. HRMS and e-HRM provided internal support for HR professionals, e-HRM applications provided access to all internal and external stakeholders. The study also found that strategic considerations influenced decision-making on e-HRM applications. Ruel and Kaap (2012) aimed to clarify the relationship between e-HRM usage and HR value creation by considering contextual factors. A sample of 450 was collected from three different large international organisations of the Netherlands through e-mail and an online questionnaire. This study clearly indicated that contextual factors moderates the relationship between e-HRM usage and HR value creation- as HRM facilitation increases, the relationship between usage and HRM value creation becomes weaker.

Pant et al. (2012), in their conceptual study, provided a framework for e-HRM implementation. The exceptional success of e-commerce systems motivated organisations to make use of e-HRM systems. These systems have created dramatic changes in the HR department along with improvement in performance. Through this study, the authors have tried to assess the benefits of implementing e-HRM systems. They have also tried to find the factors that influence the relationship of e-HRM implementation with its benefits. More recently, Subhashree and Vasantha (2020), in their study, reviewed previous literature related to the adoption of e-HRM. The study discussed the importance of automation of tasks which reduces the burden on HR and saves time. The study also found that the most important factors influencing e-HRM adoption were the implementation of IT infrastructure and the expertise of employees in the field of IT. Earlier, Al-kasasbeh et al. (2016) focused on a review of the literature regarding

electronic human resource management and proposed a model to integrate variables of e-HRM, workforce agility and organisational performance. This was a conceptual study. The result of the review was employed to develop the study's theoretical framework. The framework of the study comprised of integrating literature and models of electronic human resource management, e-HRM implementation at the firm level, organisational performance and workforce agility. Guenter et al. (2014) aimed to provide a conceptual framework for understanding how delays in information exchange negatively impacted employee outcomes. This was a conceptual study. It was found that managers and co-workers should focus on restoring control in employees in order to prevent delays and deterioration of workplace relationship. Delay in information exchange and its impact on co-worker relationship was important for researchers who studied temporal events at work as well as managers structuring workplace interactions. Similarly, Findikli and Bayarcelik (2015) focused on the perspectives for choosing the applications and perspectives about e-HRM for the system. A descriptive study was conducted for the research. A qualitative method with an open-ended questionnaire and semi-structured interviews was used. A limited number of respondents in the company were chosen from only the HR department without involving any level of management hierarchy or other departments. The study found that the primary motivators for e-HRM applications were time management, ease of acquiring, access to personal data and reduced administration cost. Nagendra and Deshpande (2014) found that to increase the effectiveness of HR planning, HRIS (Human Resource Information System) needs to offer more intelligent capabilities. The authors tried to investigate the contribution of HRIS subsystem, to the training recruiting subsystem, to the workforce planning of an organisation, and to the development of the workforce of an organisation through HRIS. Primary data was collected from a sample that included 50 senior and junior HR managers/ executives in three organisations in Pune. The findings of the paper clearly showed that senior HR executives were well aware that they can increase the efficiency of HR planning through HRIS.

## 2.2 Factors influencing e-HRM implementation

Sindu (2018) tried to find how various factors influence organisational culture in the adoption of e-HRM systems. The study made use of previous literature and models in order to find the impact of these factors. These included the Yale model of communication and persuasion, Theory of Planned Behaviour and Technology Acceptance Model. On the basis of previous literature, it was found that actorial, external and organisational factors influence e-HRM implementation. Heikkila (2013) studied the application of e-HRM and strategic IS (Information System). They also focused on how normative, cognitive and regulative institutional dimensions in MNC (Multi-National Companies) subsidiaries in China affect western-based e-HRM practices. Interview data from Beijing and Shanghai related to key informants in 10 MNC subsidiaries was collected. The study found that institutional pressures created both negative dysfunctional and positive transformational consequences for subsidiaries. They also found that the ability of the information system to achieve its strategic potential was based on subsidiary responses to these substantial pressures. Al-Dmour et al. (2013) used content analysis to collect data regarding the adoption and implementation of HRIS (Human Resource Information System). The authors found that many researchers had tried to find the factors affecting HRIS implementation. The authors categorised them as internal and external factors of the environment. However, it was found that many of the studies had conflicting results. Later, Azhar Naima (2019) conducted a study in Iraq to find the factors that influence the acceptance of e-HRM. The data was collected using a two-part questionnaire from a sample of 332 respondents. Random sampling was used for data collection. On applying regression analysis, the results of the study revealed that industry support, management support, IT expertise, compatibility, complexity and employee attributes influence the adoption of e-HRM. Earlier, Masum (2015) identified the factors influencing the adoption of e-HRM in Bangladeshi Banks. A sample of 265 bank employees was taken using stratified random sampling. A pre-tested questionnaire was used to collect

the data. The results of the study showed that industry pressure, IT infrastructure, management support and compatibility, and individual attributes had an influence on the adoption of e-HRM in banks of Bangladesh. Ibrahim and Yusoff (2015) investigated the antecedent factors of technostress towards e-HRM in government agencies of Malaysia. Semi-structured interviews were conducted with seven HRMIS (Human Resource Management Information System) experts in three state governments agencies of Malaysia. The findings of the paper focused on the implementation of HRMIS in Malaysian government agencies and solving the problem of training and development program. The HRMIS experts were of the opinion that three characteristics (attitude, technology readiness and readiness for change) were all related to components of technostress. Later, Rahman et al. (2018) researched on the Bangladeshi government organisations regarding e-HRM implementation. They tried to find the influence of various factors like social, legal, economic, political, organisational, environmental and technological. The study used a case study method as a part of qualitative research. Two government organisations were used as part of the study. The study busted certain myths surrounding the slow implementation of e-HRM in government agencies. It also provided empirical data for further research.

### **2.3. Research Gap**

The above literature review on e-HRM shows that there is a gap in the understanding of the e-HRM practices in the IT organisation. There is a need to explore the e-HRM practices used in IT organisation and the factors which affect the e-HRM. e-HRM practices focus on how the organisation can facilitate the employer-employee relationship by using information technology. E-HRM and its implementation have been studied in various sectors like manufacturing/mining, banking, hotels etc. There is a need to study the e-HRM and the factors affecting it in IT organisations as well.

### **2.4. Objective of the Study**

To find the factors influencing the effective implementation of e-HRM in IT organisations.

## **3. Research Methodology**

### **3.1 Sample size and population**

The study used a descriptive research design. The data was collected from IT companies located in the National Capital Region, India. A sample of 320 IT employees was taken using a non-probability sampling technique. A sample of above 300 was taken as it is considered to be a good sample size (Comrey & Lee, 1992). The mail-ids of employees were obtained for mailing the questionnaire.

### **3.2 Data collection**

Primary data was collected using a structured questionnaire using online Google forms. Secondary data was collected from research papers, books, magazines using keywords such as “e-HRM”, “factors affecting e-HRM”, “implementation of e-HRM”. The data was collected from May 2020 to August 2020.

### **3.3. Measures**

The questionnaire consisted of two sections the first section included statements related to factors influencing the effective implementation of e-HRM in IT organisations. In the second section demographic information of the respondents was recorded. The statements were developed by researchers using previous literature and expert opinion. Initially, a total of 40 statements were developed, but only 31 statements were used in the final questionnaire. The items were measured on a 5-point Likert scale ranging from 1 “strongly disagree” to 5 “strongly agree”.

4. Results

Table 1: Demographic Profile of IT employees

Demographic Variable	Category	Frequency	Percentage
Gender	Male	100	100%
	Female	0	0%
Age	18-25	10	10%
	26-35	40	40%
	36-45	30	30%
	46-55	20	20%
Education	Graduate	100	100%
	Post Graduate	0	0%
Experience	0-5	10	10%
	6-10	30	30%
	11-15	40	40%
	16-20	20	20%
Employment Status	Full Time	100	100%
	Part Time	0	0%
Job Role	Software Engineer	100	100%
	Other	0	0%

Source: Survey by author

4.1. Factor Analysis

Table 2: KMO and Bartlett's Test

Statistical Test	Value	Significance Level
KMO	.766	> .05
Bartlett's Test	10.234	< .001

Source: Survey by authors

Before applying factor analysis, the values of KMO and Bartlett's test of sphericity were checked. As seen from the table, the value of KMO was .766 and the significance

value ( $p < .001$ ) of Bartlett's test of sphericity was less than .05. As both the values were within range (Nunnally, 1978) factor analysis could be applied.

**Table 3: Total Variance Explained**

Extraction Method: Principal Component Analysis.  
Source: Survey by authors

On applying factor analysis, eight factors were generated. The total variance explained for the eight factors was 66.46 per cent. Further on applying varimax rotation the factor

loadings were above .5 for all the items. Since the factor loadings of all items were above the recommended values, all eight factors were retained

**Table 4: Rotated Component Matrix<sup>a</sup>**

will increase staff administration to use it, perceived usefulness of e-HRM increase the interest to use it, staff acceptance of e-HRM is proof that system is easy to use” (Voermans & Veldhoven, 2007).

#### **FACTOR 2: EIT (EXPERIENCE OF INFORMATION TECHNOLOGY)**

Experience of information technology was the second factor. The alpha value of the four statements of this factor was 0.836. The total percentage of variance explained by this was 8.82 and the eigen value was 3.8. Here also, the value of AVE and CR was above the recommended value of .5 and .8 respectively. This factor also included the four statements as: “ICT device which are available in the organisation enough to use e-HRM, the employee has the ability and skills to use e-HRM system, Employee must be trained continuously to reduce perceived risk of e-HRM system, the availability of computers and modern communications tools can reduce the risk of e-HRM” (Pant et al., 2012).

#### **FACTOR 3: SS (SECURE SYSTEMS)**

Secure system was analysed as the third factor through the factor analysis. The Cronbach’s alpha of system security was .806. The total variance explained and the eigen value was the second-highest for this factor. The eigen value was 2.7 and the total variance explained was 8.71. The value of AVE and CR was .58 and .84 respectively. This factor included four statements. The statements were: “High level of system security reduces the risk of e-HRM, I need more training on the e-HRM system to reduce mistakes and increase my knowledge of the tools available in it, e-HRM system should not take time to perform tasks through it to increase system efficiency, less time needed to use e-HRM increase system usefulness” (Rahman et al., 2018).

#### **FACTOR 4: TU (TECHNOLOGY USEFULNESS)**

Technology usefulness was the fourth important factor in the analysis. The value of Cronbach’s alpha for this factor was .814. The eigen value and total variance explained was 2.4 and 8.35 respectively. The value of AVE and CR was .81 and .93 respectively. The technology usefulness factor included four statements. The statements were: “The concept of e-HRM is clear, perceived usefulness of e-

HRM increase staff attitude to use it, perceived usefulness of e-HRM increase staff behaviour intention to use it, using e-HRM reduce employee mistakes in the work” (Voermans & Veldhoven, 2007).

#### **FACTOR 5: CT (COMMUNICATION TOOLS)**

Communication tools was the fifth factor. The Cronbach’s alpha value of this factor was .798, which was above the cutoff of .7. The total variance explained and the eigen value was 8.34 and 2.15. Here also, the value of AVE and CR was above the recommended value of .5 and .8 respectively. This factor included the four statements and these statements were as: “The lack in using communication tools reduces employee’s intention towards e-HRM, the lack in using communication tools increase e-HRM perceived risks, Employee must be trained continuously to reduce perceived risk of e-HRM system, the availability of computers and modern communications tools can reduce the risk of e-HRM” (Pant et al., 2012; Azhar Naima, 2019).

#### **FACTOR 6: RP (RISK PERCEPTION)**

Risk perception was the sixth factor generated through factor analysis. The value of Cronbach’s alpha for perceived risk was .798. The value of AVE and CR was .56 and .83 respectively. In this factor four statements were included. These statements were: “e-HRM must be difficult and complex to reduce perceived risk, my attitude decline if e-HRM system is not secured, perceived usefulness of e-HRM increase when perceived risk is decreased, e-HRM system within an organisation is clear and highly secure”. The eigen value of this factor was 1.55 and the total variance explained was 8.09 (Voermans & Veldhoven, 2007).

#### **FACTOR 7: UI (USAGE INTENTION)**

Usage intention was the seventh important factor of the analysis. The Cronbach’s alpha value of this factor was .747. The total variance explained by this factor was 7.25 and the eigen value was 1.4. Here also, the value of AVE and CR was above the recommended value of .5 and .8 respectively. The usage intention factor included the following three statements: “Perceived usefulness of e-HRM increase my desire to use it, I intend to use or continue to use e-HRM system, Employee adoption of e-HRM increase colleagues’ intention to use” (Rahman et al., 2018).

## **FACTOR 8: OS (ORGANIZATIONAL SUPPORT)**

Organisational support was the eighth and the last factor of the analysis. The alpha value of this factor was .735. The total variance explained was 6.08 and the eigen value was 1.3. Here also, the value of AVE and CR was above the recommended value of .5 and .8 respectively. This factor included the three statements and these statements were: “The organisation support to use e-HRM system increase employees’ intention to use it, the organisation decisions adoption of e-HRM reinforce employees’ attitude to use it, the organisation depends on the e-career system to attract the employees” (Azhar Naima, 2019).

## **5. Discussion**

In the context of the current study, it was found that e-HRM includes eight factors that were found to have a significant impact on its effective implementation. These factors included ease of use of technology, experience of information technology, secure systems, technology usefulness, communication tools, risk perception, usage intention and organisational support. These factors were critical to the implementation of e-HRM. Numerous researchers revealed that there were similar factors that affected e-HRM implementation (Voermans & Veldhoven, 2007; Pant et al., 2012; Rahman et al., 2018; Azhar Naima, 2019). The researchers had worked on different factors included ease of use of technology, technology usefulness, risk perception (Voermans & Veldhoven, 2007), experience of information technology, communication tools (Pant et al., 2012), secure systems, usage intention (Rahman et al., 2018), communication tools and organisational support (Azhar Naima, 2019). Among these, the most important factor was the ease of use of technology which was found to be having the highest value of explained variance that was more than 10 per cent. Employees of organisations, especially IT organisations in this case, find it suitable to use e-HRM as it is an easy-to-use technology. It makes their work simpler and convenient. No previous study had found all these factors contributing together to the effective implementation of e-HRM. Thus, the study made a significant contribution to the field of e-HRM by exploring the major factors affecting e-HRM.

## **6. Conclusion**

The implementation of e-HRM has been influenced by a number of factors. Previous authors have given factors like

security, the expertise of employees, infrastructure etc., as the main factors. In this study, the authors also tried to study factors affecting e-HRM implementation from the perspective of IT employees. The study revealed that there were primarily eight factors that were influential in e-HRM implementation. These factors included ease of use of technology, experience of information technology, secure systems, technology usefulness, communication tools, risk perception, usage intention and organisational support. The organisations should take care of these aspects when implementing e-HRM so that the process can be smoothened.

## **7. Implications**

The present study provided some useful implications for organisations and HR managers. The successful e-HRM implementation requires that the employees should have secure systems and communication tools. Next, organisational support was another important aspect that should be taken care of as the adoption of e-HRM requires that the employees should have the required support. Further, organisations should try to involve people with experience in information technology to initiate successful e-HRM implementation. The HR managers should also take an assessment of the risks involved when implementing e-HRM. These risks may be related to lack of technological support, lack of coordination between departments, shortage of skilled staff and training facilities. Organisations should try to overcome these risks for the smooth implementation of e-HRM.

## **8. Limitations**

The study was conducted only in the IT organisations of India and cannot be generalised to other industries. The study was conducted through questionnaires and thus was subject to respondent bias.

## **9. Future Research**

The present study focused only on the IT sector. But e-HRM is used in many other sectors also like banking, hospital, education, manufacturing, hotels, forecasting and many others which can also be studied in future. The majority of the respondents in the present study belonged to the younger age-group. There is a scope in future to study the adoption of technology among the senior employees working in an organisation.

The present study analyses the influence of working capital management on the financial performance of Indian healthcare companies. Considering a sample of 211 listed companies over a reference period of 10 years (2010 – 2019), the study examines the effect of inventory holding period and net receivable period on accounting (measured by return on assets – ROA) as well as stock market (measured by Tobin's Q ratio) based measures. Findings, based on panel data regression along with fixed and random effects estimation, have presented dynamic effects of working capital management and firm performance. The inventory holding period has reported a significant negative impact on ROA, whereas it has a strong positive effect on Tobin's Q ratio. On the contrary, the net receivable period has a negative effect on both measures but lacks statistical significance. The outcome of the current research will assist managers to understand the relevance of liquidity management, and it also bridges the gap in the existing literature by contributing to the pool of knowledge.

**Keywords:** Working Capital, Return on Assets, Tobin's Q, Healthcare, Panel data regression

## 1. Introduction

Functions of corporate finance are categorised into four major groups, i.e. investment, financing, working capital and dividend decision. Investment and financing are associated with a long-term horizon and are non-recurring functional areas. On the other hand, working capital management (WCM) is more concerned with the operating activities of business and is more episodic than other aspects. The quest for working capital starts with the procurement of raw material, transforming them into finished goods to cash collection from debtors (Soukhakian & Khodakarami, 2019). The importance of WCM has been recognised in financial literature and is evidenced by ample contribution by past researchers (Deloof, 2003; Lazaridis & Tryfonidis, 2006; Garcia-Teruel & Martinez-Solano, 2007; Muhammad, Jan, & Ullah, 2008; Aggarwal & Chaudhary, 2015; Afrifa & Tingbani, 2018). In practice, WCM is a process of striving for a balance between liquidity and profitability. Lowering investments in current assets such as stock and receivables can reduce cost and improve profitability (Afrifa & Tingbani, 2018), whereas disproportionate investment in current assets yields suboptimal returns (Raheman & Nasr, 2007). Efficient management of WCM can assist in maximisation of firms' value (Deloof, 2003) and have a critical impact on profitability and risk of the firm (Garcia-Teruel & Martinez-Solano, 2007).

Conventionally, the influence of WCM on profitability has been analysed using operating profit and return on assets (ROA) as a measure (Raheman & Nasr, 2007; Rahman, 2011; Vijayakumaran & Atchyuthan, 2017) which further extended to market-based measures like Tobin's Q ratio (Abuzayed, 2012; Afrifa & Tingbani, 2018). The present research work is aimed at assessing the effect of WCM on the financial performance of the Indian healthcare industry. The current study differs from existing work in two ways. Firstly, it adopts 'net receivables period' as a novel measure of WCM, as firms always attempt to balance between accounts receivable and payable period to reduce the need for excessive working capital financing; hence, the net period should be used due to offsetting effects. Secondly, the study examines the effect of WCM on accounting as well as market-based financial performance in the context of the Indian healthcare industry. Besides, past studies have revealed contradictory results, such as the research findings

of Ganesan (2007), Ramachandran and Janakiraman (2009), Aggarwal and Chaudhary (2015) and Vartak and Hotchandani (2019) have concluded that WCM has a negative effect on profitability whereas Muhammad et al., (2008), Sharma and Kumar (2011) and Makori and Jagongo (2013) have reported a positive impact. Such differing results create a need for further probing in this area.

The present article has been organised as follows. The first section highlights the theoretical foundation of WCM and its importance in research as well as corporate practice. The second section briefly describes the Indian healthcare industry, along with its position in the Indian economy. A review of past literature has been summarised in the third section, followed by the research methodology adopted for conducting research. Further, data analysis, scope of future research and concluding comments are included at the end.

### 1.1 Indian Healthcare Industry

Healthcare has become one of the largest sectors in India in terms of revenue as well as employment. The industry stood as the fourth largest employer in India in 2017 by employing more than 0.3 million people. The Indian healthcare sector is expected to grow at a CAGR of 22% by the fiscal year 2022 and will reach a size of USD 372 billion. Besides, the medical equipment and hospital industry will record a CAGR of 16% and will cross USD 143.82 billion by FY2022. Favourable demographic conditions such as increasing income, improving health attentiveness, lifestyle diseases and access to health insurance facilities are major growth drivers of this industry in India. The healthcare industry contributes nearly 14% to the nations' GDP, which is expected to increase to 19.7% by 2027.

Government and regulatory support is also acting as a major determinant of growth in the healthcare industry. Public expenditure on the health industry has grown at 1.4% of GDP in FY 2018, which will reach 2.5% by 2025. Policies such as allowing FDI, tax advantages on life-saving equipment, healthcare education and training, National Nutrition Mission and such other initiatives have witnessed encouraging steps of regulators. High potential and favourable government schemes attract competitors, and that leads to increasing mergers and acquisitions (M&A)

deals. In FY2019, the total value of M&A in the healthcare sector has recorded a 155% increment and crossed USD 1 billion. Cost-effective medical services have attracted medical tourism and the establishment of international R&D centres. Growing demand, coupled with a favourable regulatory environment, are major success drivers of the health care industry.

## 2. Review of Literature

WCM practices and their impact on financial performance has been studied extensively by researchers using different approaches. The majority of research work has focused on assessing the effect of WCM on accounting-based performance indicators such as gross operating profit, net operating profit, ROA and return on equity (ROE). Further, several researchers have concentrated on WCM and market-based performance measures like Tobin's Q ratio. Besides, few research articles have moderated the influence of WCM on firm performance by macro-economic variables such as GDP growth and inflation. The present section summarises the findings of past research work by classifying them into three broad categories as discussed.

### 2.1 WCM and Accounting based Financial Performance

Financial performance of business, as indicated by measures like gross profit margin, net operating profit, ROA, ROE, and earnings per share, is based on information recorded in the books of accounts. Deloof (2003) has considered gross operating income as a measure of firms' performance. He has concluded that profitability can be improved significantly by reducing receivable days and inventory conversion period. Hindered collections result in a cash deficit which further leads to delay in payments to creditors. Lazaridis and Tryfonidis (2006) have supported the findings of Deloof (2003) and proved the adverse effect of a longer cash conversion cycle (CCC) on profitability. The extension of credit to the customer may lead to collection delinquencies and bad debts. To incorporate this adverse effect, gross profitability should be replaced by net profitability, i.e. net operating profit. Raheman and Nasr (2007) and Ramachandran and Janakiraman (2009) have considered net operating profit as a measure of financial performance. They have shown the strong negative effect of various components of

working capital management on operating profit, indicating that longer conversion cycles adversely affect financial performance. Firms with lower profitability are persuaded to reduce the credit period allowed to customers to bridge the gap between cash requirement and its availability (Ramachandran & Janakiraman, 2009).

Profitability, when expressed as a percentage of assets or investments, enables peer comparison and assists in decision making. ROA has been one of the most widely used measures of accounting-based financial performance (Chowdhury & Amin, 2007; Rahman, 2011; Makori & Jagongo, 2013; Gaur & Kaur, 2017). However, Deloof (2003) advocated for the use of operating income ratio to measure financial performance. But, ROA incorporates the operating profits of the company as well as utilisation of available assets in generating such profits (Makori & Jagongo, 2013) and hence can be viewed as a comprehensive measure of profitability (Padachi, 2006). Following the past studies from Senanayake, Dayaratna, and Semasinghe (2017) and Vartak and Hotchandani (2019), the study adopts ROA as the accounting-based measure of financial performance. Liberal credit policy can increase sales which further boosts profitability, but it also extends the CCC, which is used as a wide-ranging measure of WCM of the firm. Hence, companies have to trade-off between profitability and liquidity. Higher cash holding enables companies to avoid high-cost financing and also provides autonomy in decision making (Vijayakumaran & Atchyuthan, 2017). Sharma and Kumar (2011) have concluded a similar positive relationship for Indian corporates by considering a large data set of 263 listed companies. The direct relationship between profitability and CCC is quite uncommon in empirical research and has been contradicted by the findings of Rahman (2011), Goel and Jain (2017) and Vartak and Hotchandani (2019). A longer conversion cycle may be the result of inefficiency in the production process and delay in receiving payments. CCC as a composite measure cannot assist in decision making directly because of its inclusiveness, and therefore, it has to be broken down into sub-parts, namely stock conversion period (SCP), receivable payment period (RPP) and creditor disbursement period (CDP). Research studies from Ganesan (2007), Muhammad et al. (2008) and Aggarwal and Chaudhary (2015) have augmented the single

measure of WCM, i.e. CCC, by incorporating activity-wise conversion time to assist managerial decision making. Holding inventory for a longer span of time is an indicator of poor financial performance as firms with deteriorating profits find their stock level intensifying (Deloof, 2003; Garcia-Teruel & Martinez-Solano, 2007; Sharma & Kumar, 2011). The delay in payments adversely affects the profitability and credit worthiness of an organisation, and hence profitable firms prefer to discharge their obligations on time (Vartak & Hotchandani, 2019). On the contrary, loss-making firms struggle to pay their dues and hence longer CDP adversely affects profitability (Ganesan, 2007; Muhammad et al., 2008; Seyoum, Tesfay, & Kassahun, 2016). In addition to the phases of operating cycle and time period involved, the working capital policy can be analysed using an activity ratio expressed as a frequency rather than number of days. Rehman and Anjum (2013) and Gaur and Kaur (2017) have considered current ratio, acid-test ratio, current assets to total assets and current assets to sales ratio as exploratory variables and assessed their impact on financial performance. Both research studies have confirmed a positive relationship between working capital management and the profitability of firms. Collectively, this section highlights the significant impact of WCM on firms' performance; however, it also reveals that the research findings are not consistent.

## **2.2 WCM and Tobin's Q Ratio**

Maximisation of shareholders' wealth is the central area of all financial decision making. The wealth of shareholders is expressed by the market value of the firm derived from the price of its equity shares listed on the capital market. Accounting measures cannot express the response of investors on firms' business practices, and hence it is inevitable to study the effects of financial practices such as capital budgeting, capital structure, dividend and working capital management on the market value of the firm. Further, the profitability of the firm is an outcome of historical revenue, whereas firm value is an estimation based on expected future revenue. Hence, the linkage between firm value and WCM may differ from that of profitability and WCM (Abuzayed, 2012). Firm value can be measured by market-based performance indicators as P/E ratio, market-to-book value ratio, and Tobin's Q ratio. Out of these, Tobin's Q ratio has been the most commonly

used measure in past studies (Nazir & Afza, 2009; Abuzayed, 2012; Altaf & Ahmed, 2019). Q ratio captures the reputational value effects of firms WCM capabilities on the performance (Afrifa & Tingbani, 2018), and it has more desirable distribution properties than other measures (McGahan, 1999). Therefore, following the extant literature, the study considers the Q ratio as a measure of market-based financial performance. Investors assess the efficiency of senior management in handling working capital issues, and the same has been reflected in the market price of shares. The findings of Abuzayed (2012) and Afrifa and Tingbani (2018) reveal that stockholders attach negative value to longer CCC as an investment in working capital needs external funds, which leads to borrowing cost. Nazir and Afza (2009) have examined the effect of working capital investment (measured by current assets) and working capital financing (measured by current liabilities) on shareholders' value creation and proved the significant positive effect of aggressive financing policy on the Q ratio. On the other hand, Altaf and Ahmed (2019) have found an inverted U-shaped relationship between Tobin's Q ratio and working capital financing. They have concluded that a low (high) level of working capital finance through short-term borrowings improves (deteriorates) financial performance. The above discussion implies that shareholders consider WCM as value-relevant while evaluating a company's performance. But, this area has been less explored, especially in emerging economies like India.

## **2.3 WCM and Financial Performance moderated by Macro-Economic variables**

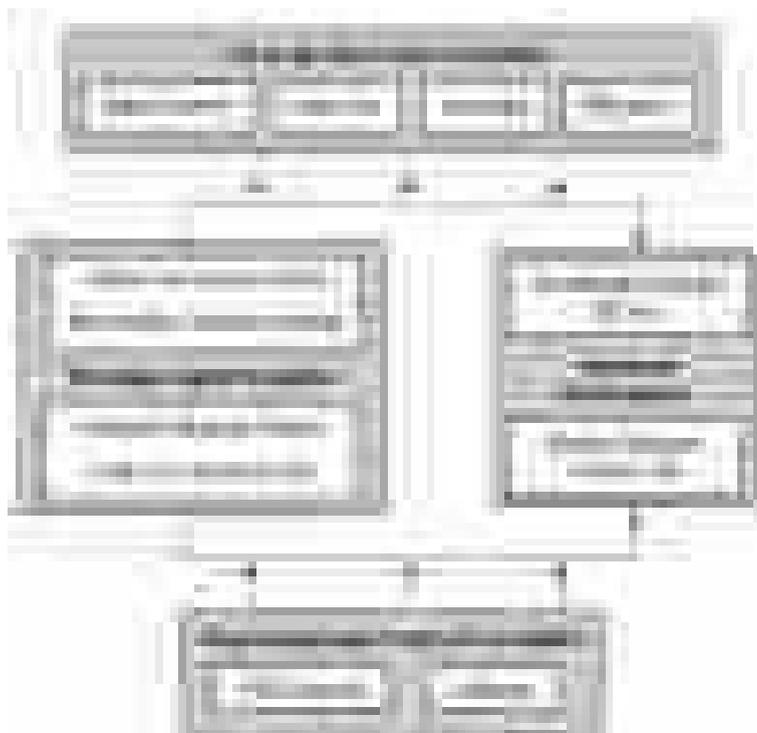

Macroeconomic conditions affect the financial performance of companies operating in a particular country. Favourable conditions such as increasing GDP, moderate inflation, virtuous balance of payments and exchange rates affect the profitability and investment activities in a progressive manner. One of the most commonly used proxies for macroeconomic conditions is the annual growth rate in GDP (Garcia-Teruel & Martinez-Solano, 2007; Nazir & Afza, 2009; Abuzayed, 2012; Soukhakian & Khodakarami, 2019). Garcia-Teruel and Martinez-Solano (2007) have concluded the positive and significant impact of GDP growth on ROA. The confidence of investors gets reinforced with the positive growth in GDP, which is reflected in the market value of

the firm (Nazir & Afza, 2009; Abuzayed, 2012). Soukhakian and Khodakarami (2019) have considered GDP growth and inflation rate as economic indicators and have concluded the direct and significant effect of these variables on financial performance. However, they lack evidence to support the moderating effect of economic factors on firm performance and WCM and have explained that the firm's WCM policy depends on company-specific factors. Lastly, the section concludes that the moderating effect of economic variables needs to be tested through further research.

#### 2.4 Research Gap and Conceptual Model

Though substantial literature focusing on working capital and firm performance is available, very limited research

work has concentrated on the linkage between WCM and shareholders' wealth as well as the market value of the firm. Besides, empirical studies focusing on this point are not carried out in the Indian context, especially in the healthcare sector. Moreover, past research work shows inconsistent results so far as WCM and financial performance are concerned. Hence, the current research will bridge the gap in the existing research by assessing the effect of WCM market based financial measures along with accounting measures. Figure – 1 presents the conceptual model highlighting the working capital, financial performance along with firm-specific and macroeconomic control variables identified from the review of literature.

(Source: Developed by Author)

**Figure 1. Conceptual Model**

### 3. Research Methodology

#### 3.1 Purpose, Variables of Study and Hypothesis

The present research aims to analyse the effect of working capital management on accounting and market based

financial performance of selected healthcare sector companies in India. The current study extends the research work of Nazir and Afza (2009) and Abuzayed (2012) in the Indian context. Based on the existing literature, the variables of the study are divided into three categories, i.e. (i)

financial performance, (ii) working capital, and (iii) control variables.

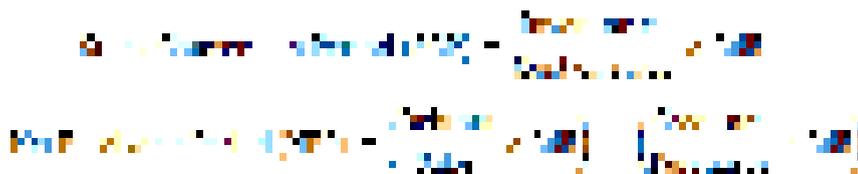

*Financial performance* has been considered as the dependent variable. Accounting and market performance

has been measured by return on asset (ROA), and Tobin's Q (TQ) ratio, respectively and are computed as mentioned below.

WCM, treated as the independent variable, has been measured using the stock conversion period (SCP) and net receivable period (NRP). As against past research work, CCC has been dropped as conclusions derived from it need

to be re-examined activity-wise for decision making. NRP is a novel measure calculated as the difference between the receivables collection period and creditors disbursement period.

*Controls*, as the financial performance is affected by several firm-specific factors other than WCM; hence, revenue growth (RG), size (SZ), leverage (LV) and efficiency measured by asset turnover ratio (AR) are considered as control variables. The annual percentage change in sales has been proxied for growth (Gaur & Kaur, 2017), whereas the size is measured by the natural log value of total assets (Vijayakumaran & Atchyuthan, 2017). Leverage is computed as the ratio of debt to assets (Makori & Jagongo, 2013), and the asset turnover ratio is measured as sales to total assets ratio. The present study adopts a descriptive methodology of research and analyses the effect of WCM on financial performance. Following hypothesis are formed and eventually tested using empirical results.

- H<sub>01</sub>: SCP does not have a significant impact on ROA
- H<sub>02</sub>: NRP does not have a significant impact on ROA
- H<sub>03</sub>: SCP does not have a significant impact on Tobin's Q Ratio
- H<sub>04</sub>: NRP does not have a significant impact on Tobin's Q Ratio

### 3.2 Sampling Plan and Data Collection

The present study focuses on the Indian healthcare industry; hence all listed companies are considered for inclusion in

the sample. The empirical results are based on the secondary data collected from the Centre for Monitoring Indian Economy (CMIE), Prowess and Ace Equity database. According to the CMIE database, 230 healthcare companies are listed on the Indian stock exchanges. To create a balanced panel dataset for the study period of 10 years (2010 – 2019), companies are selected using a multistage sampling technique. Continuous listing and availability of data for selected variables throughout the study period are the primary filters of sample selection. Finally, 211 companies are selected based on the requirement, which creates an ultimate dataset of 2110 firm-year observations.

### 3.3 Techniques of Data Analysis

Financial data collected from secondary sources have been analysed using descriptive analysis, correlation and multiple regression analysis. The data has been validated for assumptions like autocorrelation and multicollinearity using the Durbin-Watson (DW) test and Variance Inflation Factor (VIF), respectively. Panel data methodology has been adopted as it incorporates the potential endogeneity of variables arising from unobserved firm heterogeneity, which is ignored in the ordinary least square method (Vijayakumaran & Atchyuthan, 2017). Fixed effects model

assess the firm-wise variation in intercept assuming same slope, constant variations, and time-invariant individual effects whereas random-effects model treats individual intercept as a random variable with mean value  $\alpha$  and express intercept of each company as  $\alpha_i = \alpha + \varepsilon_i$  where  $\varepsilon_i$  is a random

error with zero mean (Gujarati, 2003). The suitability of fixed and random effects has been examined by a Hausman test with the null hypothesis that a random-effects model is a better estimate than fixed effects. Following regression models are formulated considering financial performance as the dependent variable and WCM as the independent variable.

*Fixed Effects Model*

$$ROA_{it} = \alpha_i + \beta_1 SCP_{it} + \beta_2 NRP_{it} + \beta_3 RG_{it} + \beta_4 SZ_{it} + \beta_5 LV_{it} + \beta_6 AR_{it} + u_{it}$$

$$TQ_{it} = \alpha_i + \beta_1 SCP_{it} + \beta_2 NRP_{it} + \beta_3 RG_{it} + \beta_4 SZ_{it} + \beta_5 LV_{it} + \beta_6 AR_{it} + u_{it}$$

*Random Effects Model*

$$ROA_{it} = \alpha + \beta_1 SCP_{it} + \beta_2 NRP_{it} + \beta_3 RG_{it} + \beta_4 SZ_{it} + \beta_5 LV_{it} + \beta_6 AR_{it} + \varepsilon_i + u_{it}$$

$$TQ_{it} = \alpha + \beta_1 SCP_{it} + \beta_2 NRP_{it} + \beta_3 RG_{it} + \beta_4 SZ_{it} + \beta_5 LV_{it} + \beta_6 AR_{it} + \varepsilon_i + u_{it}$$

Where,

$\alpha$  = Intercept

$\beta_1$  to  $\beta_6$  = Regression coefficients

$u_{it}$  = stochastic error of firm i and year t

i = Number of Firms

t = Time period from 2010 – 2019

**4. Data Analysis And Interpretation**

**4.1 Descriptive Results**

Descriptive statistics that assist in analysing the data and its variability have been summarised in Table 1. Indian healthcare companies generate an average ROA of 12.88% with a standard deviation of 7.88%, which indicates moderate volatility in returns. The mean and standard deviation values of the Q ratio are 1.1014 and 0.6930, respectively, indicating quite satisfactory results. The

average stock holding period of selected companies is approximately 67 days indicating a huge piling of inventory in the industry. The average net receivable period is close to 10 days, and its standard deviation is 38 days portraying firm-wise differences in collection and payment policies. The Healthcare industry has reported an average revenue growth of 15.71%, whereas its average debt ratio is only 0.2805, from which it can be inferred that healthcare companies rely more on owners' funds compared to borrowings.

**Table 1. Descriptive Statistics**

ROA	Mean	12.88%	Standard Deviation	7.88%	Q1	6.50%	Q3	19.26%
TQ	Mean	1.1014	Standard Deviation	0.6930	Q1	0.7000	Q3	1.5000
Inventory	Mean	67 days	Standard Deviation	38 days	Q1	30 days	Q3	104 days
Net Receivable	Mean	10 days	Standard Deviation	38 days	Q1	0 days	Q3	86 days
Revenue Growth	Mean	15.71%	Standard Deviation	10.50%	Q1	5.00%	Q3	26.42%
Debt Ratio	Mean	0.2805	Standard Deviation	0.1500	Q1	0.1500	Q3	0.4305

### 4.2 Correlation Matrix

Results of Pearson correlation have been abridged in Table 2, indicating linear relationships among the selected variables. A significant negative correlation has been observed between ROA and both WCM indicators. The results indicate that a higher length of operating cycle will adversely affect the financial performance of selected companies. Reducing the storage period of inventory and minimising the gap between collection and payment days can significantly improve the profitability of firms. Past research from Deloof (2003), Lazaridis and Tryfonidis (2006) and Sharma and Kumar (2011) has also supported the inverse relationship. Analysing the result for Tobin's Q ratio, NRP has an indirect relation, but it is not significant, and only inventory holding has a significant positive relation which is contradicting previous studies. An explanation for such results can be given as the current market value of a firm is an indicator of future returns, and investors analyse inventory holding jointly with revenue growth. Increasing inventories are associated with higher sales which can further improve operating profitability (Abuzayed, 2012) and gives a positive signal towards future profitability. Further, among control variables, sales growth, asset turnover, and leverage have significant relation with ROA, whereas Q ratio is significantly related with only leverage and turnover ratio.

**Table 2. Correlation Matrix**

Source: Compiled from SPSS Output

### 4.3 Result of Econometric Models

To strengthen the conclusion on the effect of WCM on financial performance, multiple regression analysis has

been applied. Table 3 and Table 4 summarises the regression output of Model 1 and Model 2, respectively. The robustness of results has been analysed by estimating both equations using fixed-effects as well as random effects methods, and the Hausman test has been applied to check their suitability. The results support (Significance value < 0.05) rejection of the null hypothesis and confirms the applicability of fixed-effects for both econometric models. Further, DW statistic and VIF values are also within the acceptable range (DW = 1.5 to 2.5; VIF < 10), indicating that any problem of autocorrelation and multicollinearity has been controlled (Gujarati, 2003). The fit of regression models has been tested using F-statistics, and its probability value (<0.01) shows that both models are significant.

The output of regression Model 1 (see Table 3) portrays the negative impact of WCM variables on the profitability of selected companies. SCP has a significant adverse effect on ROA, whereas the impact of NRP has not been supported by statistical significance. Holding inventory for a longer span of time will increase the carrying cost that adversely affects the profitability of the firm. Likewise, increasing the gap between collection and payments creates a liquidity crunch and forces companies to resort to external financing that leads to interest and procurement cost. Critical values of regression coefficients of SCP and NRP concludes **rejection of H<sub>01</sub>** hypothesis whereas **failed to reject H<sub>02</sub>** hypothesis. The findings of the present research coincide with the conclusions drawn from the research work of Raheman and Nasr (2007), Ramachandran and Janakiraman (2009), Aggarwal and Chaudhary (2015) and Goel and Jain (2017). Makori and Jagongo (2013) have reported contradictory results and concluded the positive effect of stock holding on profitability as higher inventory reduces the possibility of production interruption and loss of sales. Among the control variables, only leverage and asset turnover ratio are found to be significant, and leverage reported negative impact, whereas turnover ratio improves profitability. Further, the fixed effects model can explain 56.30% variations in ROA, which is more than random effects validating the results of the Hausman test.

**Table 3. Regression Output of Model – 1 (ROA)**

Model	Variable	Coef.	Std. Error	t-Statistic	Prob. >  t
Model 1	Constant	0.0000	0.0000	0.0000	0.0000
	ROA	0.0000	0.0000	0.0000	0.0000
	Inventory	0.0000	0.0000	0.0000	0.0000
	Asset Turnover	0.0000	0.0000	0.0000	0.0000
	Other variables	0.0000	0.0000	0.0000	0.0000

Source: Compiled from E-views Output

The effect of WCM on the market value of firm measured by Tobin’s Q ratio has been highlighted in Table 4. As against ROA, SCP has a significant positive impact on the Q ratio, demonstrating that investors attach favourable signal to increasing inventory. Higher inventory reduces the procurement and operating risk and ensures undisturbed production. Further, as explained by Abuzayed (2012), the growing inventory level is linked with increasing sales which improves the profitability of the firm. This will further strengthen the expectations of future returns resulting in a positive effect on market value. Though this is in contrast with conventional understanding, the extant literature has not explored the relationship between the inventory holding period and Tobin’s Q ratio adequately.

Thus, these findings need further validation through future inquiries in this direction. On the contrary, increasing NRP reduces the cash reserve of companies which could have been utilised for profitable investment opportunities and thereby maximising shareholders’ returns. Hence, NRP has a negative impact on market performance, but the results are significant at a 10% level (Prob. value = 0.065). Hypothesis testing for Model 2 reveals a similar result as Model 1 and supports the **rejection of the H<sub>03</sub>** hypothesis, and **fails to reject the H<sub>04</sub>** hypothesis. The Asset Turnover Ratio has a positive and significant effect on Tobin’s Q ratio as it indicates efficient utilisation of fixed assets. Other control variables are found to be insignificant.

**Table 4. Regression Output of Model – 2 (Tobin’s Q)**

Model	Variable	Coef.	Std. Error	t-Statistic	Prob. >  t
Model 2	Constant	0.0000	0.0000	0.0000	0.0000
	Tobin's Q	0.0000	0.0000	0.0000	0.0000
	Inventory	0.0000	0.0000	0.0000	0.0000
	Asset Turnover	0.0000	0.0000	0.0000	0.0000
	Other variables	0.0000	0.0000	0.0000	0.0000

## 5. Conclusion And Research Extentions

Working capital management is an indispensable part of the decision making under corporate finance. The efficient management of current assets and current liabilities play a vital role in determining the profitability and value of a firm. The present research article examines the impact of working capital management on the financial performance of 211 healthcare companies in India by taking balanced panel data for ten years (2010 – 2019). Using panel data regression methodology, the study concludes the negative and significant effect of working capital measured by the inventory holding period on the accounting performance measures, whereas market measures have been favourably affected by the same. The net receivable periods has a negative influence on profitability and market value, but the relationship is significant at the 10% level. Hence, the findings conclude that firms can maximise their profitability and value by managing their working capital optimally. The outcome of research work will help practitioners to devise a suitable strategy for managing working capital, and it also bridges the gap in the existing literature by contributing to the pool of knowledge.

Though the present research attempts to provide a comprehensive view of WCM and financial performance, few areas still require further examination. The current research does not include macroeconomic variables, which can be explored for future research. The conceptual model developed from the literature review can be empirically tested with different industry datasets. Further, similar studies can be conducted by concentrating on small and medium enterprises (SMEs) as they are equally exposed to the problems of profitability and liquidity.

## A b s t r a c t

In order to survive and gain a competitive advantage in today's fast-changing organisational environment, competitive pressures, and stakeholder demands, organisations attribute more importance to their workforce. The recent buzz among the industry, consulting firms and academia, still with vast scope for research, is the concept of employee engagement. There is an increasing awareness that employee engagement is pivotal to the success of the organisation. That is the reason that the world today is paying increased attention to Employee Engagement. The objective of the study is to ascertain how Employee Engagement and its facets like Growth, Teamwork, Management Support and Basic Needs, differ with workers demographic factors, including gender, age, and experience. Data was collected through self-administered questionnaires from 223 working adults in the IT companies of Pune, Maharashtra. Findings were made with the help of standard statistical software such as SPSS, and complete model testing was done with the help of AMOS. One-way ANOVA, Post Hoc test and T-tests are also used.

The current study discovered that overall male employees have elevated engagement level than females. Female employees outscore men employees in the dimension of Basic Need of Employee Engagement, thus concluding that females are greatly engaged at the entry-level. Findings reveal that employees between 31-40 years, and employees with more experience are highly engaged. The study has practical implications as now the employers are aware that employee engagement in males on two dimensions, namely Growth and Management support, is more than as compared to females in the IT organisations.

This study gives a clear understanding of how demographic factors influences employee work engagement that supports human capital management strategy within organisations. It is suggested that HR professionals can deploy targeted employee engagement programs and strategies to engage employees with their work and with the organisation.

**Keywords:** Employee Engagement, Gender, IT, Experience, Age

## 1. Introduction

In today's high-velocity environment, competition is the order of the day. In this cut-throat scenario, it's important that both businesses and individuals strive hard to keep their competitive edge intact. In this dynamic and increasing hyper-competition, managers will have to focus on employees physical and mental wellbeing. According to The Harvard Business Review (2013), 71 per cent of respondents concur with the thought that (employee engagement is a substantial predictor for the economic success of the organisation). Gallup (2006) defines Employee Engagement as "engaged employees are more likely to view the organisation and job as a healthy environment and therefore more likely to support the organisation." Hence, employee engagement is a strong tool that can be beneficial in these tough times. Employee engagement will be considered as a strategic technique for the service organisations to survive and to sustain in the prevailing extreme competitive environment (Amabile et al., 2011). Because engaged employees have a huge amount of energy which is obtained from the emotions which they experience in their workplace, and these engaged employees are fervent about their employment (John & Raj, 2020).

The engaged employees are the ones who go beyond that extra mile – who invest that discretionary effort for the success of the organisation (Leary Joyce, 2004). Employee engagement is a factor related to many organisational issues and individual outcomes such as work performance (Laschinger et al. 2006; Paul & Anantharaman, 2004) or turnover intentions (Agarwal et al., 2012; Bailey et al., 2015; Soane et al., 2012), and more productivity (Gallup, 2013)

Employee Engagement trait is used to denote the emotional and cognitive factors of organisational loyalty, which is desired to be in tandem with the missions and goals of the organisation (Ehambaranathan, et al., 2014). Engagement and immersing one's self into the job completely brings out a happy and good performer who will be more creative, motivated, authentic, non-retaliatory and overall, a more passionate employee about the work. Gallup, in their most recent "State of the Global Workplace Report" (2017), says that 85 per cent of the workforce is not engaged at

the workplace. Hence explaining it further, Gallup declares that 18 per cent are actively disengaged, while 67 per cent show all the characteristics of not being engaged at the workplace at all. The above-mentioned employees may not be the most awful performers, but these employees have a couldn't care less attitude with respect to their employment. This explains that employees do give their organisations the time, but they are not involved in their work in totality. Hence, their findings revealed that due to disengaged employees, the businesses suffered a major financial loss of \$7 trillion (Gallup, 2017.) Therefore, the organisation should develop strategies that serve to enhance engagement.

The exponential advancement of the IT sector has created incredible work prospects for a large section of educated women. Singhal (1995) is of the opinion that "Participation of women in the workforce is essential for economic development and population planning." According to the Ministry of Electronics & Information Technology, there are 34 per cent female employees, out of a total of 39.68 lakhs employees in Information Technology and web-enabled services combined. This is a fairly sudden increase from 21 per cent of women workers in 2001 (NASSCOM, 2001) and 30 per cent in 2012 (NASSCOM, 2013), cited in Gupta (2015).

In our patriarchal society, where a female is generally a homemaker or a caregiver, striking the right amount of balance amidst job and family can be quite a daunting task. Balancing work and family was one of the frequently quoted challenges in a study on women in Information Technology (Adya, 2008). The Information Technology sector is making all the endeavours to improve the work engagement of their employees as engagement makes the employee perform better, which in turn increases the productivity of the organisation.

Different employees will have different expectations, requirements, wants, desires, anticipations, etc., from the employers because they all are from varied social-demographic backgrounds. Hence, the management should, therefore, try to understand the employees at an individual level. Balain and Sparrow (2009) opined that when the attitudes of the employees have to be assessed, the employee demography should be taken into consideration.

Owing to its significance, employee engagement is now a matter of contention and is on the rise quite steadfastly up the agenda of Human Resource professionals. The literature revealed that employee engagement (EE) is diminishing and that an increasing disengagement currently exists in the workforce (Kular et al., 2008). Therefore, the engagement of the employee factor is keeping the HR folks and the employers on their toes since leveraging this key business driver is significantly critical for achieving competitive advantage. (Soldati, 2007; HR Focus, 2006) and now, the concept of work engagement is being researched comprehensively. This paper, therefore, is an effort to fill the gap in the literature and provide a different perception to the outcomes of earlier studies about the role of various demographics like age, experience and gender in employee engagement in the organisations under study.

## 2. Literature Review

### 2.1 Employee Engagement

Employee engagement, of late, has surfaced as an important part of business success in today's competitive arena (Saks, 2006; Bakker & Schaufeli, 2008). Sadique (2014) considered engagement as an emotional connect to the workplace because he opined that employees who are enthusiastic and passionate about their work are dedicated and are empowered. Albrecht (2011) added that engagement takes a particularly important role in all organisations. It makes an employee give his best performance in terms of work activities, and thereby allow them to understand the corporate culture. The investment in employees will help the organisation improve leadership and the creation of technological innovation that will result in elevated financial gain. Organisations that execute employee engagement strategies, implies that their employees have full faith in the company that they will be unbiased in all respects. Work engagement is also defined as the involvement and contributions that employees put into their work (Kuok & Taormina, 2017).

When business leaders implement the policies or strategies on employee engagement, it elevates customer satisfaction, increases production and profit (Bowen, 2016), and reduces turnover intentions (Memon et al., 2016). Consequently, employees with heightened employee engagement work more efficiently and effectively because

they work with a lot of involvement in their work, along with emotional connect.

Kahn (1990) recommended that engaged employees are ones who put a lot of effort into their work beyond the minimum requirement for the work to be completed by giving extra time, passion, and intellect. Chartered Institute of Personnel and Development (2013), in their report, describes employee engagement as "being positively present during the performance of work by willingly contributing intellectual effort, experiencing positive emotions and meaningful connections to others."

Recent research has identified engagement as more of an emotional feeling towards their work (Baumruk, 2004; Richman, 2006). In short, there is a psychic income or non-pecuniary income at work which is respect, appreciation, admiration, self-actualisation needs getting fulfilled, etc., and that makes employees committed and socially acceptable (Camerer & Malmendier, 2007).

In the opinion of many researchers, employee engagement is substantially related to the feeling that the employees are "glued" to their work (Harter et al., 2002; Schaufeli & Bakker, 2004). Engaged employees have an emotional attachment with the organisation, which results in higher productivity, return on investment, retention, loyalty and lower absenteeism (Shukla et al., 2015).

Consequently, these engaged employees are better suited to cope up with the uncertain demands of their work. These engaged employees will seldom have an intent to exit from the organisation, which is evident from the study of Schaufeli et al. (2001), who investigated that workforce who are engaged with full involvement in their job are more content with it and enjoy their work.

### 2.2 Demographic Variables

#### 2.2.1 Gender

Men are from Mars and Women are from Venus and which means that women can be just as unique professionally and personally. Though they are walking tall with men in the workplace, they have not become replicas of men. Both male and females exhibit different behaviours in the workplace.

Kelkar and Nathan (2002) stated in their study that the development of information technology (IT) in Asia has had a significant impact on women. Clark and Sekher (2007) assert in their study that IT employment to women has enhanced their socio-economic status. This has been reinforced by the findings of Shanker (2008), who also observed that Information Technology employment has contributed to the upliftment of the women employees pertaining to economic capital, social capital and symbolic capital.

Eagly's (1987) gender socialisation and social role theory stated that women are more focused on emotional relation investment by which they complete a task by emotionally connecting with the team, whereas men are supposed to be "agentic" and move directly to the project goal. Females believe in building relationships with people while on the task or job (Donelson, 2010; Eagly, 1987; Gilligan, 1982; Farrell & Finkelstein, 2007; and Knowles and Moore, 1970). This nature of females can be because they are highly compassionate and emotional and have great team-building skills. Ramamurthy and Flood (2004) reported in their study that women in general reported higher emotional attachment than men. The outcomes of many studies also indicate that the disparity in employee engagement between the genders is prevalent (Kong, 2009; Mauno et al., 2005; Rothbard, 2001).

Maitland (2001) suggested that in this dynamic environment, the women workforce will fill the gap of competent and well-trained talent in the workplace internationally. However, IT employers are facing a challenge when it comes to hiring and retaining skilled female employees. In spite of women-friendly retention policies, this is proving to be a substantial challenge in the Information Technology sector (Pfleeger & Mertz, 1995).

Shuttleworth (1992) found out that females in the IT companies are majorly participating in routine kinds of jobs, whereas men are involved in decision making and executive jobs. Many have advocated that enhancing the representation of females to decision-making levels and policy implementations will definitely make the workplace more conducive for women to work. On the contrary, many past studies have reinforced the fact that womenfolk in the IT field are at the lower and middle levels, and very few of them reach the top of the pyramid in the organisational

hierarchy (Myers, 1990; Benditt, 1992) Based on the research of Reid et al. (2010) and Trauth et al. (2012), the "equality argument" criticises existing world power structures, where men occupy most of the top positions in the IT field and elsewhere. Raghuram et al. (2017), in their research, found that 51 per cent of entry-level hires represent women; a little over 25 per cent of women reach the managerial level, but <1 per cent are at the senior executive level. Marcus and Gopinath (2017) signify in their study of professionals that gender as a demographic variable has no influence on employee engagement, i.e., no significant difference between male and female respondents with respect to the drivers of employee engagement in IT companies. Hence we propose:

H01: There is no significant difference in engagement levels of male and female employees.

### 2.2.2 *Experience of employees*

Robinson, Perryman and Hayday (2004) carried out a survey of around ten thousand employees in fourteen organisations and discovered that employee engagement decreased when the age and tenure in the organisation increased. Mahboubi et al. (2015) identified a significant association between work engagement and length of employee work experience. Employees who have spent more time with the employer are more likely to reach a level where there is no advancement in career (Allen, Poteet, & Russell, 1998) and thus feel low engagement level as compared to those who spend less time in the organisation. Jaupi and Llaci (2015) observed changes in the engagement levels of employees due to the longevity of experience with the organisation. Some studies conducted suggested that the engagement of the employee is not affected by the demographic factors such as gender, age, position, and income of the respondents (Madan & Srivastava, 2015; Sarath & Manikandan, 2014). Hence it is imperative to propose:

H02: There is no significant difference in engagement levels of employees with different years of experience.

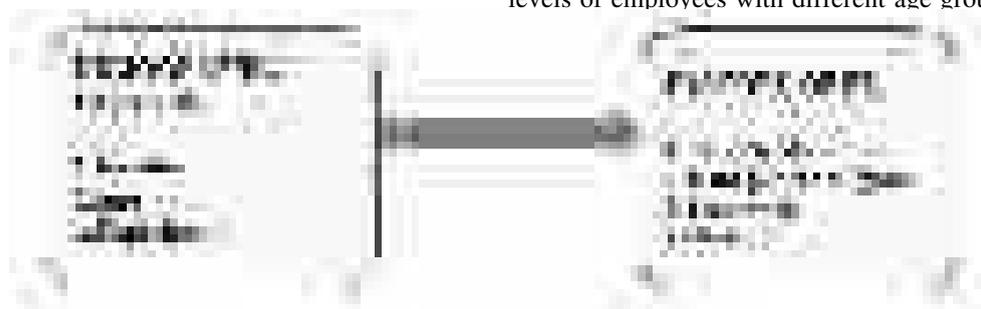

### 2.2.3 *Age of Employees*

Not many researches have been conducted for examining the linkage between the age of an employee and employee engagement. Whatever researches have been conducted on

this critical area has given us quite contradictory outcomes. Age has been identified as a predictor of work engagement (Kim & Kang, 2017). Bezuidenhout and Cilliers (2011) and Douglas and Roberts (2020) stated that there exists a positive association between age and work engagement of employee, which suggests that employee engagement increases with age. Vijay et al. (2016) posited that employee engagement does not vary with the demographic factors, namely gender, age, position and income of the respondents. Pitt-Catsoupes and Matz-Costa (2008) did the analysis from data which was obtained from 20 organisations and highlighted the importance of job flexibility and reported that flexibility in the job was more important to older employees in comparison to young employees, and this could be the driver for employee engagement. Similarly, their work was substantiated by Brough, O'Driscoll and Kalliath 2005 and De Cieri et al.

2005, who examined the effects of flexibility at work on employee engagement, and their outcomes of the study revealed that more the flexibility more the employee engagement. George & Ben (2017) posited that age and gender have a statistically significant effect on the engagement level of employees. It was found those workers whose age was more than 45 years was more engaged. In research conducted by Wolfe (2004), it is indicated that the highest level of employee engagement is felt when the employees are in the first year of the job, and then it subsequently comes to stagnation and then again falling in the 5–10-year bracket. The age of an employee and the amount of work experience an employee has should increase the likelihood of engagement. Therefore, we propose

H03: There is no significant difference in the engagement levels of employees with different age groups.

**Figure 1: Conceptual framework**

### **2.3 The Information Technology (IT) Industry of India**

India has evolved as one of the primary IT service breadwinners in the World since it has a skilled and intellectual knowledge base. IT Services is the segment that is growing by leaps and bounds. According to the latest report by NASSCOM, 2018, the Information Technology sector is projected to make exports revenues of the order of US\$ 69.3 billion in the year 2017-18 as compared to US\$ 66.0 billion in the year 2016-17.

Quick advancement in technologies along with multi-dimensional projects or flexi-timings and multi-linguistic, multicultural employees stationed all across boundaries, in different time zones (Sharma, 2014). With the amalgamation of these factors, the IT industry is dynamic and unique at the same time. The advent of globalisation and huge development and advancement in Information Technology saw greater career opportunities.

Subsequently, Information Technology's dynamism and its technological advancement have increased the attentiveness of the academic attention of scholars in the recent past. Yet, very few studies have been carried out with respect to employee engagement in the Indian IT industry. Computer-aided disciplines are known to be project-based and normally operate with multi-dimensional tasks catering to customers who have varied demands, hence the demand for such personnel who can contribute emotionally to their job has risen. The IT industry has ever been trying to mitigate the challenge of lack of skilled manpower and the burning problem of retention of employees. (Pereira V & Budhwar P, 2015). The subtle nature of abilities of employees due to steadfast progressing hi-tech expertise, mergers, support and use of talent has become of significant value, and this empirical research attempts to study the effect of demographic variables on employee engagement of the employees across the IT companies of the city of Pune, Maharashtra.

## 2.4 The Current Study

This study explores the relationships of demographic attributes with employee engagement. We broaden the information in this realm by organising research and learning how employee engagement differs with the change in demographic factors, including age, gender, and experience.

## 3. Research Method

### 3.1 Research Setting

The research design is a quantitative research design that was deemed appropriate for this study. This study was conducted at the IT companies in Pune. The selection of samples was made by the judgement of the researcher. A total of 250 questionnaire surveys were administered to the prospective respondents from ten IT companies, out of which 223 usable responses were received, so the response rate was 89 percent. Participant ages ranged from < 30 years to > 50 years of age. There were 91 males and 132 females with less than 5 years of experience to more than 15 years of experience.

### 3.2 Description of the instrument

In this study, the information was collected through self-administered questionnaires distributed personally to the subjects by the researcher. The 12 items encompassing the Gallup Q12 (also known as the “Gallup Workplace Audit”) were used to review employee opinions of engagement. This scale is a four-factor scale consisting of 12 items intending to assess the four representing factors of employee engagement, i.e., Basic Needs, Management Support, Teamwork, and Growth. All items are scored on a seven-point Likert scale ranging from 1 (Strongly Agree) to 7 (Strongly Disagree).

It is important to note that each of the Q12 items relates to four psychological conditions promoting engagement: Basic Needs, Management Support, Teamwork, and Growth. For example, Items 1 and 2 relate to workers’ resources, i.e., possessing resources may be construed as being valued in the workplace, which is supposed to be a factor of Basic Needs. Items 3, 4, 5, and 6 describes the style, procedure, and method that the management uses to complete a certain task which is a part of psychological

Management Support. Item 7,8,9, and 10 refers to relations amongst the team members and managers, which is a component of Teamwork. Items 11 and 12 refer to progress in work or success in the competition of the task, which is a part of growth.

### 3.3 Data Analysis Technique

This is an applied research-based study. For analysis of multiple-choice questions, a computer program called Statistical Package for Social Sciences -SPSS 23 and AMOS was used. At first descriptive statistics (results have been shown in table 1 and 2) was used to study the characteristic of the statistical sample. One-Way Analysis of variance (ANOVA) and T-test is used to analyse how the mean of a variable is affected by different combinations of factors. In the study, the relationship of demographic variable, namely - age designations and gender and each of the factors of engagement, are analysed. The subsequent sections throw light on the relevance of the factors of employee engagement based on the age of the respondents using ANOVA, t-test, Fisher’s Least Significant Difference (LSD) is used to identify the pairs of means that are different.

### 3.4 Reliability

Cronbach’s alpha ( $\alpha$ ) values were applied to test the reliability of all the four factors of Employee Engagement so as to achieve a reliable result of “internal consistency” of the instrument which is measuring the variable. The outcomes of the reliability test show that for all four factors, alpha ( $\alpha$ ) values are more than .7 (Nunnally, 1994), which is a threshold value. This suggests a good “internal consistency” of all the items.

### 3.5 Validity

The validity refers to how well an instrument measures what it is supposed to measure. Content validity is called as logical or curricular validity. The scale used to measure Employee Engagement was adopted from the existing literature. To test the validity of the scale, specialists of the IT industry, academicians and IT employees were given the questionnaire, and every item in the questionnaire was assessed by the panel, and hence the validation of the scale was completed for further study. Confirmatory Factor Analysis was used to examine the construct and

Management Support dimension. Female employees gain more scores than males on the dimension of Basic Needs. The studies show that women are less engaged in the growth dimension. According to the NASSCOM-Mencher report (2009), the senior management women represent only five percent, the rationales ascribed to the above statement are: (1) ‘stereotyped female professionals’, (2) ‘personal sense of mid-career guilt’, and (3) ‘glass ceiling effect’.

Female employees are thus clustered at the lower level of the career climbing ladder; hence it leads to a certain feminisation of jobs. The percentage of female workers reaching the top level is exceptionally low (Kelkar et al. 2002; Upadhya, 2006). Shanker (2008) reiterated the similar outcomes in Bangalore that female employees’ show less level of engagement at the senior level but are highly engaged at the entry-level, as most of the times, they fail to upgrade their technical proficiencies; they refrain from job-hopping and remain loyal to one company for a pretty long time (Shanker, 2008). Their family responsibilities forbid them to put up late hours in their work to establish networking (Upadhya, 2006). Their

choice of career is governed by distance from home, family obligations, the security of the work and other social reasons that make the women less engaged when they climb up the ladder.

Our findings reveal that overall, the males have higher employee engagement as compared to females. This finding was in line with the study of Kong (2009). At the same time, female employees showed higher scores on the dimensions of the basic needs of employee engagement than their male counterparts. However, Madan and Srivastava (2015) reported that demographic variables such as age, gender and marital status do not have a significant impact on employee engagement. However, we conclude that there is a significant difference between male and female respondents with respect to the drivers of employee engagement in IT companies in Pune. Therefore, we reject the null hypothesis(H03). The only factor which was insignificant between the gender of the respondents was Teamwork.

**Table 2: Comparisons of dimensions of Employee Engagement between Females and Males (T-Test)**

4.2.2 Experience

In table three, Fisher’s LSD post hoc test was applied to compare the four factors of work engagement among three groups, namely D1, D2 and D3, it comprised of employees who have less than 5 years experience, 5-15 years experience and employees who have more than 15 years of experience respectively. There was a significant difference which was found in employee engagement, Growth, Teamwork, Management Support and Basic Needs between D1/D2, D1/D3, and D2/D3. Employees of the D2 group showed higher employee engagement and Teamwork (M= 4.59, SD= .888) than employees of group D1 (M=

3.6, SD= .85881, F= 66.699). Workers comprising of group D3 exhibited elevated employee engagement and Teamwork (M= 6.2940, SD= .601) as compared to those who were in group D1 (M= 3.61, SD= .85881, F= 66.699). Employees who were a part of the D3 group showed higher employee engagement and Teamwork (M= 6.290, SD= .601) than employees in the D2 group (M= 3.61, SD= .85881; F= 66.699).

Hence, workers with different tenure in the organisation differ substantially in the study as regards their engagement levels. Employees having more experience will be more

engaged than employees having fewer years of employee experience in the organisation. Similarly, Sibiya et al. (2014) too opined that years of service were positively related to employee engagement, implying that longer-tenured employees were more engaged. Having said that, more experienced workers go the extra mile, exercise more discretionary effort, and are likely to keep customers satisfied and generate more revenue for the Organisations. This may be because, with the increase in the length of service, the match between individuals' values and the organisational values gradually increases as individuals get edified (Yang, 2010). Besides, while their work experience gradually accumulates, and they have better work proficiency, they gradually enjoy higher positions and salaries. Thus, the sense of achievement and recognition coming from work gradually increases, which is reflected as increased job engagement and a sense of responsibility (Xudong et al., 2016).

In the survey done by Business World (2008), it was indicated that senior professionals with respect to

experience are highly engaged. Sharma et al. (2017) identified a statistically significant difference in the work engagement level of employees based on different years of experience. Employees who have more experience and have spent more time in the organisation are not mere employees in the organisation; they are the institution in themselves. They have remained with a company through all the challenges and been a witness to the strategies, policies, changes in personnel, mergers and acquisitions and redefining of competitive landscapes. The research conducted by Chaudhary and Rangnekar (2017) was in the same continuation with our findings where junior, middle, and senior employees with respect to work experience show different levels of engagement (Mathieu & Zajac, 1990).

Based on our above findings, we reject the null hypothesis ( $H_0$ ) that there is no significant difference in engagement levels of employees with different years of experience. Instead, there is a significant difference in the engagement levels of employees with different years of experience.

**Table 3: Comparisons of Dimensions of Work Engagement among Three Experience Groups**

Dimensions	Less than 10 years			10-20 years			20-30 years			F-Value	Sig.
	Mean	SD	N	Mean	SD	N	Mean	SD	N		
Basic Needs	3.21	0.85	100	3.45	0.78	100	3.68	0.72	100	12.34	.000
Management Support	3.15	0.92	100	3.38	0.85	100	3.52	0.78	100	10.12	.001
Teamwork	3.28	0.88	100	3.51	0.81	100	3.74	0.75	100	11.56	.000
Growth	3.18	0.95	100	3.42	0.88	100	3.65	0.82	100	9.87	.002

**4.2.3 Age**

In table four, Fisher's LSD post hoc test was performed to compare the four factors of employee engagement among four age groups. A1, A2 and A3, A4 comprised of age less

than 30, 31-40 years and 41-50 years and above 50 years, respectively. Significant difference was found in employee engagement and Growth, Teamwork, Management Support and Basic Needs between A1/A2, A1/A3 and A2/A4.

Employees who were in group A2 showed higher employee engagement and Teamwork ( $M= 4.36$ ,  $SD= 1.00$ ,  $F=8.065$ ) as compared to those who were present in group A1 ( $M= 3.41$ ,  $SD= 1.10$ ;  $F= 8.065$ ). Employees who were in group A3 showed higher employee engagement and Teamwork ( $M= 3.922$ ,  $SD= 1.025$ ) than employees in group A1 ( $M= 3.41$   $SD= 1.10$ ;  $F= 8.065$ ). Employees who were in group A2 showed higher employee engagement and Teamwork ( $M= 4.36$ ,  $SD= 1.00$ ) than employees who were a part of group A4 ( $M= 3.995$ ,  $SD= 1.0588$ ,  $F= 8.065$ ).

Thus, we can say that the respondents who were in the 31-40 years bracket showed the highest level of employee engagement. This group of respondents are the ones who are looking at this particular work or job with their whole career in front of them. They show more engagement towards their work because they have their future professional life at stake more than the employees who are older in age as compared to them. These employees are possibly a little more stable, experienced and matured in comparison to employees who are less in age and who are inexperienced. This group between 31-40 years may be less demanding or have limited wants and desires and are less materialistic about the trivial needs that can detract them or irritate them about the working culture of the organisation. Hence these employees exhibit high levels of engagement at this juncture as they are more focused on their careers and their professional life.

Employees who are old or aged show low levels of accommodation with the circumstances and situations, are less ebullient, slow in their work, take extra sick days, etc., and hence appears to be having low levels of engagement. The real issue of older workers is absenteeism. It is known to be an ageing workforce tendency. There can be many reasons for their absence from work; either it is their health, or they are disengaged, that is, they are not motivated enough to work. The reason can be any, that does not matter; what matters is that the company has to incur that cost. Older employees seem to be less engaged.

As per the findings, employees under the age of 30 were least engaged when compared to other employees.

According to “The Qualtrics 2020 Employee Experience Trends” report, the employees under the age of 30 were found to be most at risk of attrition, with many of them looking to switch jobs within twelve months and the rest of them look for jobs within two years.

The teamwork dimension scored the highest amongst all the other factors of Employee Engagement, indicating that Worker engagement increases markedly when employees are able to work together in teams and show a team spirit. Employee engagement is enhanced tremendously when workers work in effective collaborations and together. The mantra for Google’s success and its efficient and effective team performance is attributed to the combined independence to take risky decisions, which paves the way for creativity and innovation. Hence when workers think they can voice their ideas, they have this feeling of sharing; those employees are engaged emotionally and connected to the work.

A global study of engagement was carried out by ADP Research Institute (2020), and the outcomes stated that when employees feel that they belong to a team, it elevates their engagement towards the work. A similar trend was found in a study by Mckinsey (2020), where it was found out that employees working in teams exhibit a great amount of engagement because the team leaders develop trust in the employees. Trusting one’s team members and regarding him to be as helpful is viewed as a significant job- resource that helps in the achievement of personal as well as organisational goals associating substantially with employee engagement (Schaufeli & Bakker, 2004). May et al. (2004) were of the opinion that amicable and cordial relations with one’s team members could establish emotional safety in the organisation, leading to better job performance, thus being more engaged. On the contrary, employees who do not have good relations with other employees gives rise to mistrust resulting in disconnection in the workplace, contributing to disengaged employees. Ducharme and Martin’s (2000) results advocate those employees who have sound interpersonal relations exhibit heightened job satisfaction that will yield more employee engagement (Harrison et al., 2006).

**Table 4: Comparisons of dimensions of Work Engagement among four age group**

## 5. Discussion and Conclusion

The study was conducted on Indian IT employees. We found that there is a difference in the employee engagement among IT workers of different genders, which is consistent with the results of some earlier studies (Li, 2011; Zhu et al., 2015). Our findings reveal that the employee engagement of women in this study is generally lower than that of men (Schaufeli, Martínez, Marques Pinto, Salanova, & Bakker, 2002; Zhou, 2013; Pang, 2014).

Domestic responsibilities may make women less likely to pursue an avenue for upward mobility (Britton, 2003; Rothbard, 2001). This implies that men in general (relative to women) have better status and influences in their positions, and thereafter are more likely to experience psychological meaningfulness and employee engagement. Of course, we have examples of career successes and upward mobility of several women moving into higher ranks of organisations. This may suggest that at least some organisations may have paid attention to improving the work engagement of female employees. It also suggests that successful women may also have invested an extra amount of hard work and resources in overcoming gender-discriminatory structures and cultures.

Employees in the age group of 31-40 years and employees who have more years of experience have a significant part to play in keeping the employees engaged by building trust in them, putting forth the goals and values of the company

and communicating what is expected of the employees by the management. They are an especially important and critical resource for the organisation, and that is why they can be termed as the ‘central nervous system’ of the organisation as they are highly engaged employees. Highly engaged employees bring spirit and energy to the workplace. Their motivation and drive to succeed don’t take long to spread to others. Such employees motivate others to achieve their tasks. Such employees are a lot more active to take up tasks and participate in activities. They facilitate in executing and implementing the plans and changes formed by the management in day-to-day activities because they naturally become company advocates. They feel a sense of pride to be a part of the organisation. These employees play a key role in setting a clear vision for what can be achieved through the implementation of senior management decisions (Parker & Williams, 2001).

All highly engaged employees put in the extra effort in terms of time, energy and passion in their work. The clients are satisfied with them, and they contribute more towards the organisational level outcomes of growth and productivity (Bulińska-Stangrecka & Iddagoda, 2020).

### 5.1 Implications

Engagement is a psychological state. Researchers call engagement “an amalgamation of commitment, loyalty, productivity and ownership” (Wellins & Concelman, 2005). It is much more than making employees feel happiness and paying them a hefty paycheck.

The current research will add to researchers endeavours in comprehending the relationship between employee engagement and demographic factors in the Information Technology sector. This research provides new findings to the management of the organisations by leading a discussion as it shows how employee engagement varies with diverse demographic attributes.

Male employees in the organisations were found to be more engaged in their jobs as compared to their female counterparts in the dimensions of Growth and Management Support. It was found that females are more engaged at the entry-level than their male counterparts. When they first enter the organisation, they are of the belief about the equal opportunities to achieve their potential as men, and subsequently, this enthusiasm and passion diminishes over time because what females observe and experience has an adverse effect on their belief system about the gender disparity. This was the most significant finding of this research.

It was also found that employees' having high experience were more engaged than employees' having less experience. Another outcome of this research was that the results pointed towards employees between the range of 31-40 years as the most engaged amongst all the employees. However, the Teamwork dimension of Employee Engagement was found to be of insignificant value in male and female employees of the IT workforce.

The findings of this study will help management and HR professionals to design strategies so that employee engagement can be enhanced to a great extent. Consequently, the employers need to understand that having an engaged workforce in the organisations will lead to enhanced productivity, happy, satisfied employees and fewer turnover intentions.

The organisations also need to develop strategies to engage the female workforce during the whole life cycle of their career. Due to family, travelling concerns, and in an effort to strike a balance in work and family life, the women employees are forced to remain in the organisation, at times which may not be conducive for them to stay, due to which

they become disengaged. This could lead to untoward consequences both for the employees and employer. So, engaging the women workforce by analysing the female-oriented issues should be a primary concern for the organisations. Organisations ought to give equal prospects to the female folk because a feeling of getting ignored or neglected conveys a malevolent shade on employee engagement levels. An engagement programme exclusively for women employees will build a better organisational culture where there is no scope for gender discrimination or biases against women.

Difference due to age can prove to be detrimental for employee interpersonal relationships, which can turn out to be a challenge for the engagement of employees in their employment. Hence the companies should involve staff members of diverse attitude, skills and age in team outings, outdoor activities and also execute programs like 'reverse mentoring.' Such activities will foster comradeship among the employees, and in general, the silo mentality can be broken.

The study also value adds to the sparse literature on employee engagement especially related to Information Technology that is undergoing huge turmoil and vagaries of business in the form of retentions, hiring skilled manpower, acquisitions, mergers, leaning the manpower and suffering from business closures.

### **5.2 Limitations of the Study**

This paper has its own limitations. The study is based on a cross-sectional design, which is one limitation. Secondly, the sample size is less, due to which the outcomes are limited in generalisability.

### **5.3 Directions for future Research**

The present results add to our knowledge in comprehending that employee engagement varies with demographic features, and it acquires a larger sample from many more Information Technology Companies. In future, more studies can be carried out while considering the seniority level/ hierarchy level of employees in the organisation to investigate their employee engagement level. It would also be interesting to know employee engagement differences across generations.

## A b s t r a c t

The research investigated the individual perception of goal setting and its relationship with employee outcome. Using the 10-factor model of Goal Setting, 640 executives of Central Public Sector Enterprises (CPSEs) judged the quality of the goal-setting program in their respective organisations. The study also tried to establish the relationship between goal-setting factors and employee outcome. The results provided empirical evidence of a moderate implementation of the goal-setting program in the CPSEs. The correlation analysis further established the relationship between goal setting and employee outcome. The present study helped to figure out a more comprehensive picture of the influence of a goal-setting program on employee outcome, thereby providing important insights into the individual differences regarding the implementation of a goal-setting program.

**Key Words:** *Goals, 10-factor model, Public Sector, Job performance, Job Satisfaction, Employee Engagement, Motivation*

## 1. Introduction

Present-day organisations aim at maximising employee performance and achieving the highest level of quality output. In order to achieve these, the organisations need to translate their organisational objectives into individual and group level objectives. Performance Management System serves as a critical tool for achieving these objectives. The organisation that prioritises effective goal setting will succeed in its performance management, in developing its employees' skills and confidence, and in its business in general. One of the key components of performance planning is the setting of individual goals and objectives. It primarily refers to the process of setting the work-related activities in the form of job objectives that are integrated with the department or unit goals which are further tied to corporate goals and strategies. The goal-setting process needs to be properly planned and administered in order to achieve a desired level of performance. This study aims at investigating the perceptions of executives regarding the goal-setting process and analysing the possible relationship between goal setting with employee outcome.

## 2. Literature review

The modern understanding of goal setting and motivation was pioneered by Locke in 1968, where he highlighted that employees work more productively when guided by clear and achievable goals, given the appropriate feedback (Locke, E.A., 1968, 1982). His findings were validated by Latham and Baldes (1975) by stating that the performance increases immediately after assigning specific and hard goals. Kim and Hamner (1976) further found that goal setting without formal feedback can enhance performance, but when supervisory feedback and praise was added to a formal goal-setting program, performance was enhanced even more. Latham, Mithchell and Dossett (1978) found that employee participation in goal- setting led to higher goals being set than in a case when the supervisor assigns goals to the employee. In 1984, a 53-item questionnaire was developed by Locke and Latham that attempted to measure the core goal attributes of "specificity and difficulty" in addition to other attributes of the goal-setting process such as perceptions regarding participation in goal setting, supervisor support, conflict and stress. In 1990, however, a more comprehensive Goal Setting theory of motivation was presented by Edwin A. Locke and Gary P.

Latham on the basis of nearly 400 empirical studies conducted nearly over a 25-year period. These studies were conducted in Asia, Australia, Europe and North America, at individual, group and organisation levels, in both laboratory and field settings involving more than 40000 subjects, 88 different tasks, in different time spans and taking different performance criteria. The two core findings of these studies were; first, there is a linear relationship between goal difficulty and performance. Second, specific and difficult goals lead to higher performance than vague or abstract goals. (Locke & Latham, 1990, 2002, 2013). Over the years, the studies relating to goal setting was expanded across many domains. Lee et al. (1991) carried out a principal component analysis of the goal-setting questionnaire developed by Locke and Latham (1984) and extracted 10 meaningful factors consisting of both positive and negative factors. The positive factors were found to be positively associated with job performance and job satisfaction, whereas negative factors were found to be negatively associated for the same. Orpen (1995) found that the impact of goal setting was stronger among poor performers than among good performers and that this relationship was moderated by superior relations with the employees. Medlin and Green Jr (2009) investigated the relationships between goal setting, employee engagement, workplace optimism and individual performance and found that goal setting leads to engaged employees, which in turn leads to higher levels of workplace optimism that improves the individual performance of employees. Mahbod (2007) in their study, provided an integrated approach that prioritised organisational key performance indicators (KPIs) in terms of the criteria of SMART (Specific, Measurable, Attainable, Realistic, Time-sensitive) goals. Bipp and Kleingeld (2011) found that employee perception of a goal-setting system is related to both job satisfaction and goal commitment. Devrajan et al. (2018) studied the role of goal setting in the creation of work meaningfulness and found a positive association between goal rationale and work meaningfulness. Hoek et al. (2018) studied the extent and utility of goal setting at the team level within the public sector and its effect on their performance. From the individual and group level, the research on goal setting has been further extended to a more macro-level where the organisation as a whole is being studied. Goal-setting was proven in the literature to have increased the performance

among individuals, teams, and the organisation in Germany (Asmus, Karl, Mohnen & Reinhart, 2015; Bipp & Kleingeld, 2011), Spain (Morelli & Braganza, 2012), Taiwan (Chiu, Chen, Lu, & Lee, 2006), Sweden (Thorgren & Wincent, 2013) and India (Bhattacharya & Neogi, 2006; Mishra & Srivastava, 2008).

### 3. Conceptual Framework

Goal Setting is an open theory, and there is no limit to the discoveries that can be made between the goal-setting theory and other theories (Locke & Latham, 2006). Longitudinal studies are needed to gain insight into the perceptions of a goal-setting program and its effect on performance-related variables (Bipp & Kleingeld, 2011).

According to Latham et al. (2008), goal setting has a role to play in public sector management, and it being combined with self-management techniques can prove equally important in the Public Sector. The past literature found limited studies considering all the relevant variables of the goal-setting scale developed by Locke and Latham in 1984 (Lee et al., 1991; Bipp & Kleingeld, 2011). However, most of these studies did not consider the overall employee outcome as one of its variables. Therefore, the present study mainly focuses on the relationship of the 10-factor model developed by Lee et al. (1991) with Employee Outcome. Therefore, a structural model is being theorised, incorporating Goal Setting as an antecedent to Employee Outcome, which is shown in Fig.1.1.

**Fig. 1.1: Hypothesised structural model.**

Source: From author's study

#### 3.1 Goal Setting variables

*Goal clarity* describes the clarity and specificity of goals and the prioritisation of those goals. *Goal rationale* is concerned with the clarity of performance-goal relationships and the reason behind those goals. *Goal efficacy* relates to the existence of proper action plans, job training and feedback and one's happiness on achieving

the goals. *Supervisor Support* relates to the supervisor's supportiveness and willingness to let subordinates participate in setting goals and strategies. *Use of goal setting in performance appraisal* describes the use of goal setting in the performance appraisal and review process. *Rewards* represent the probability that goal achievement will lead to security, pay raise and opportunity for promotions etc. *Organisational facilitation* for goal achievement relates to teamwork, company resources and

policies that facilitate goal achievement. *Goal stress* relates to the difficulty and stressfulness of goals and employee's failure to attain them. *Dysfunctional effects of goal* deals with punitive measures such as a non-supportive supervisor or top management, using goals as a mode of punishment rather than to facilitate performance. And *Goal Conflict* describes different types of goal induced conflicts such as inter-role conflicts, too many goals and personal value related conflicts (Lee et al., 1991).

### 3.2 Employee Outcome variables

Job performance refers to "employee behaviours that are consistent with the expectations and that contribute to organisational effectiveness (Judge & Mueller, 2012). Harter et al. (2002) defines the term employee engagement as "an individual's involvement and satisfaction with as well as enthusiasm for work". According to Locke (1976), job satisfaction is a pleasurable or positive emotional state resulting from the appraisal of one's job or job experiences. Motivation is defined by Pinder (1998) as "a set of energetic forces that originates both within as well as beyond an individual's being, to initiate work-related behaviour, and to determine its form, direction, intensity and duration" (cited in Tremblay et al., 2009).

## 4. Research Methodology

Based on the conceptual framework, a research design has been laid down to follow the study in a systematic way. Goal Setting is considered to be the primary independent variable and Employee Outcome is considered to be the key dependent variable for the present study.

The study is focused on the CPSEs present in Assam. The study has been conducted with respect to the presence of MoU based Goal Setting process in CPSEs. Only those Executives/Officers who are assigned with individual Key Result Areas (KRAs)/ Key Performance Areas (KPA) are taken into consideration for the study. Four behavioural attributes were taken into consideration while measuring the employee outcome.

### 4.1 Objectives

The study aims to fulfil the following objectives;

i) To measure employee perception regarding the quality of Goal Setting in Central Public Sector Enterprises in Assam.

ii) To examine the relationship between Goal Setting and Employee Outcome.

### 4.2 Sampling design

The data was collected from 640 participants from six profit-making CPSEs present in Assam, Oil and Natural Gas Corporation Ltd (ONGC), Indian Oil Corporation Ltd. (IOCL), Power Grid Corporation of India Ltd (PGCL), Oil India Ltd. (OIL), Airport Authority of India (AAI), North Eastern Electric Power Corporation Ltd. (NEEPCO). Judgement sampling was used to identify the top profit-making CPSEs from each category present in Assam (PE survey report, 2014-15). Non-probability purposive sampling method was used to select the sample for the present study. Purposive sampling, also known as judgment sampling basically involves selecting a sample that is believed to be representing the population (Gay & Diehl, 1992). Moreover, for the purpose of our research, the selection of cases was based on the following criteria;

- a. The respondent should be of Executive Level.
- b. The respondent should be assigned with goals and should be involved in the goal-setting process.

All the items in the questionnaire were measured in 5-point Likert Scale ranging from "Strongly Agree" to "Strongly Disagree".

### 4.3 Research tools

In order to measure the perception of goal setting, the 10-factor model developed by Lee et al. (1991) is being used. These 10 factors are a reduced version of the goal-setting questionnaire developed by Locke and Latham in 1984.

In order to measure Employee Outcome, four behavioural outcomes were selected, viz., Job Performance, Motivation, Employee Engagement and Job Satisfaction. It should be noted that the items that are related to individual job and job-related goals are included in the questionnaire. As such, the Job Performance scale by Koopmans et al. (2013), Work Motivation scale by Shouksmith (1989) and Tremblay et al. (2009), Employee Engagement scale by Harter, Schmidt & Hayes (2002), and the Job Satisfaction Scale by Macdonald and Macintyre (1997) and SHRM Report (2014), were taken into consideration for measuring these outcome variables.

#### 4.4 Hypotheses

The hypotheses for the present study were set in the following manner;

H1: Goal Setting is positively related to Employee Outcome.

H2: The positive aspects of Goal Setting are positively related to Employee Outcome variables.

H3: The negative aspects of Goal Setting are negatively related to Employee Outcome variables

#### 5. Analysis

The responses (n=640) are subjected to analysis using the SPSS 20 version. The reliability test revealed the Cronbach's Alpha for Goal Setting to be .89 and for Employee Outcome to be .92. These values fall under the acceptable range of 0.70 to 0.95 (Tavakol & Dennick,

2011). Descriptive analysis is carried out in order to find the mean scores for analysis of the first objective, and Correlational Analysis is done for the analysis of the second objective.

#### 5.1 Perception of Goal setting

The mean scores obtained from descriptive analysis were interpreted based on the criteria given by Kraetschmer et al. (2004) and Francois (2014), where mean scores less than 3 was termed as 'low level', 3 to 3.99 as 'moderate level' and 4 to 5 as 'high level' perception. The data on perception of executives of CPSEs regarding Goal Setting and its factors are displayed in the following manner, as shown in Table 1.1.

The mean scores (Table 1.1) indicated that the Goal Setting score (3.81) in CPSEs was 'Moderate'. This implied that the quality of Goal Setting process was perceived by the executives to be moderate in the CPSEs.

**Table 1.1 : Mean Scores of Goal Setting variables.**

Source: Primary data

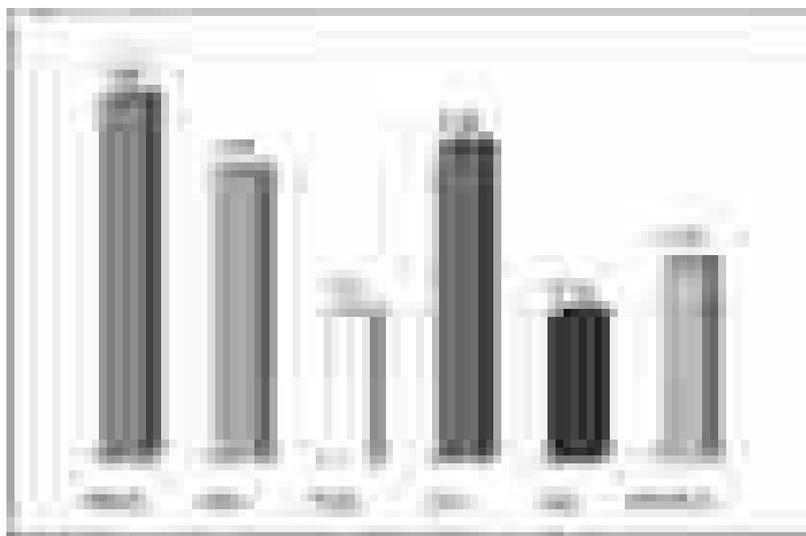

If the individual factors were analysed, the mean score of Goal Clarity (4.43), Goal Efficacy (4.14) and Supervisor Support (4.03) was found to be 'High' for the CPSEs. This implied that the executives of CPSEs have specific and clear goals set for the executives with proper prioritisation. They have all the skills and capabilities to achieve their goals. They are properly trained for the particular job assignments. There existed a participative relationship between the Supervisor and the Subordinate regarding Goal setting. The supervisors were found to be highly supportive

and helpful towards the executives in achieving their goals. It was also found that the other positive aspects, i.e., Goal Rationale (3.95), Use of Goals in Performance Appraisal (3.85), Rewards (3.34) and Organizational Facilitation (3.97), have scored 'Moderate'. This implied that the executives had moderate knowledge about their assigned goals and the use of those goals in their appraisal process. They perceived that they have a moderate level of goal-related rewards and that achievement of their goals is not directly linked to rewards like PRP, Promotion etc. It

should be noted that the executive's rewards are based on other factors as well, such as the Profit of CPSE, Executive's Grade, MoU rating, Performance review rating and the recommendations by the Remuneration Committee (DPE OMs dated 26.11.08 & 09.02.09). The negative aspects, viz., Goal Stress (3.44), Dysfunctional Effects (3.50) and Goal Conflict (3.46) of Goal setting were also found to be present at a 'Moderate' level in the CPSEs. This implied that executives experience a moderate level of difficulty and stressfulness in relation to their goals.

They have a moderate level of managerial dysfunctions and conflicts arising during their goal-setting process.

The mean scores of goal setting across CPSEs were analysed and are displayed in Fig.1.2. The total Goal Setting score was 'Moderate' for all the CPSEs indicating that all the CPSEs had a moderate level of Goal Setting Process. The opinions of executives were subjected to one-way ANOVA in order to find out the significant difference of opinion regarding Goal Setting across CPSEs.

Source: Primary Data

**Fig.1.2: Goal setting scores across CPSEs**

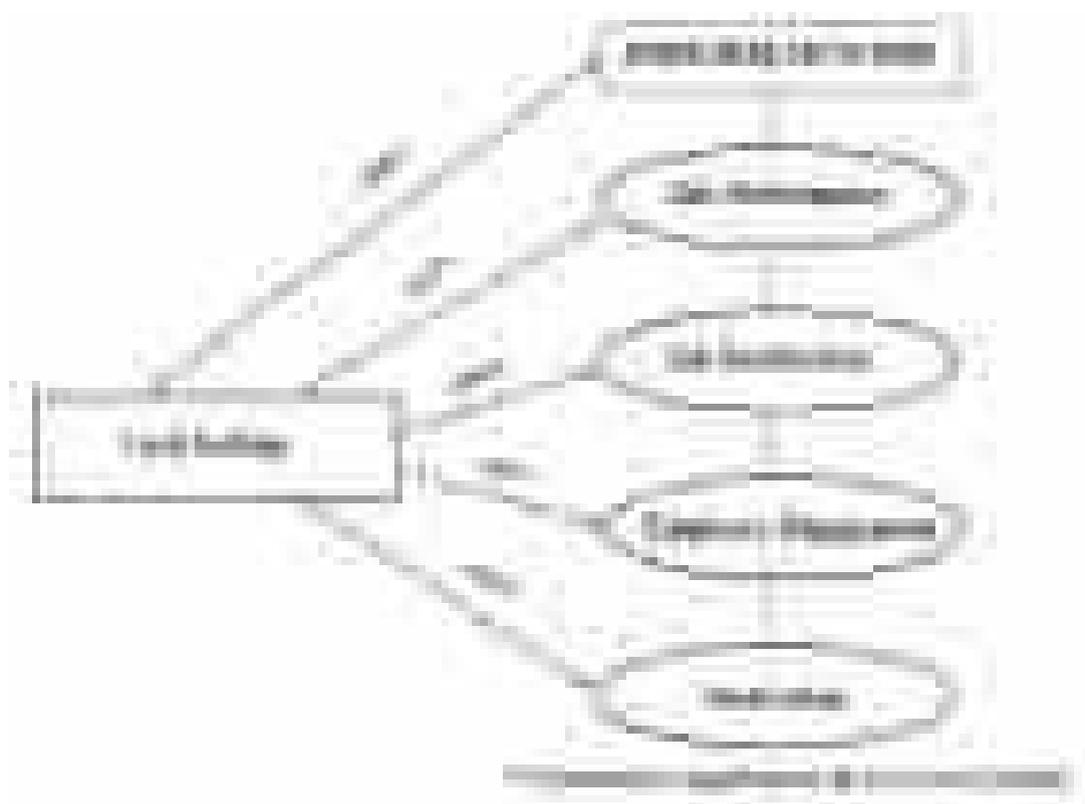

The result revealed a significant difference of means regarding goal setting ( $p=.033$ ,  $p<.05$ ) across CPSEs, implying that the executives differ in their opinion regarding goal setting across the six CPSEs.

### **5.2 The relationship between Goal Setting and Employee Outcome**

Correlation analysis was used in order to find out any significant relationship between Goal Setting and Employee Outcome. The effect sizes for the coefficients were assumed as .10 to be Small/Weak, .30 to be Medium, .50 to be Strong/High and .70 and above as Very Strong correlation (Kotrlík & Williams, 2003).

Figure 1.3 below shows a 'Strong' positive correlation between Goal Setting and Employee Outcome ( $p=.680$ ,

$p<.001$ ). This indicated Goal Setting to be strongly associated with the Employee Outcome in CPSEs. Similarly, Goal Setting was found to have a significant positive correlation with the sub-variables of Employee Outcome. All the sub-variables showed a strong correlation except for only Job Performance that was found to have scored a moderately significant correlation with Goal Setting. This implied that when the quality of Goal Setting is increased, the sub-variables, viz., Job Satisfaction, Motivation and Employee Engagement increases at a higher rate and Job Performance increases in a moderate manner. Therefore, supporting H1, it can be said that at the .01 level of significance, Goal Setting was positively related to Employee Outcome.

*Source: Author's analysis*

**Fig. 1.3. Figure showing Correlation coefficients between Goal Setting and Employee Outcome.**

Again, correlation analysis between Goal Setting variables with sub-variables of Employee Outcome was carried out in order to find out any significant relationships. The results are shown in Table. 1.2.

In the case of Goal Setting variables and Employee Outcome, it can be seen that all the variables have a p-value less than .01, which indicate a significant correlation between Goal setting and Employee Outcome. Goal Clarity, Goal Rationale, Goal Efficacy, Supervisor Support,

Goal Setting in PA and Organizational Facilitation were found to have a strong positive relationship with Employee Outcome. This meant that the higher the level of these variables, the higher is the Employee Outcome. Rewards are found to have a moderate positive relationship with Employee Outcome. And the negative factors such as Goal Stress, Dysfunctional Effects of Goal and Goal Conflict is found to have a 'Weak' negative relationship indicating that the increase in these variables decreases Employee Outcome in a similar manner (Refer to Table 1.2)

**Table. 1.2. Table showing Correlation coefficients between Goal Setting Variables and Employee Outcome variables**

	Goal Setting	Employee Outcome	Goal Setting	Employee Outcome	Goal Setting	Employee Outcome
Goal Setting	1	0.463	Goal Setting	1	Goal Setting	1
Employee Outcome	0.463	1	Employee Outcome	1	Employee Outcome	1
Goal Stress	-0.15	-0.12	Goal Satisfaction	0.18	0.15	0.18
Goal Clarity	0.22	0.18	Goal Commitment	0.25	0.22	0.25
Goal Motivation	0.18	0.15	Goal Persistence	0.20	0.18	0.20
Goal Self-efficacy	0.15	0.12	Goal Resilience	0.18	0.15	0.18
Goal Flexibility	0.12	0.10	Goal Adaptability	0.15	0.12	0.15
Goal Innovation	0.10	0.08	Goal Creativity	0.12	0.10	0.12
Goal Risk-taking	0.08	0.06	Goal Proactivity	0.10	0.08	0.10
Goal Autonomy	0.06	0.04	Goal Responsibility	0.08	0.06	0.08
Goal Accountability	0.04	0.02	Goal Integrity	0.06	0.04	0.06
Goal Transparency	0.02	0.01	Goal Honesty	0.04	0.02	0.04
Goal Openness	0.01	0.00	Goal Trustworthiness	0.02	0.01	0.02

\* Correlation is significant at the 0.01 level (2-tailed).

Source: Primary Data

When the relationship between the Goal Setting variables and the sub-variables of Employee Outcome are analysed, it can be seen that all the positive aspects of Goal setting have a significant positive correlation. The strength of the co-efficient ranged from strong to weak (refer to Table 1.2). This implied that when the positive aspects of Goal setting increased, the sub-variables of Employee Outcome also increased in the given manner. Therefore, supporting H2, it can be said that .01 level of significance, the positive aspects of Goal setting are positively related to Employee Outcome variables.

When the negative aspects of Goal setting and Employee outcome variables are analysed, it can be seen that except for Goal Stress and Job Satisfaction, all the other variables are found to have a significant weak negative correlation with the Employee Outcome and its sub-variables. This implied that when these negative variables have increased, the Employee Outcome is decreased. Therefore, with the

exception mentioned above and supporting H3, it can be said that at the .01 level of significance, the negative aspects of goal setting are negatively related to Employee Outcome variables.

### 5.3 Impact of Goal Setting on Employee Outcome

The correlation analysis only helped in determining the degree of the relationship, and it was not sufficient to prove causality. As such, a regression analysis was used to measure the impact of goal setting on employee outcome. The value of R<sup>2</sup> for Employee Outcome was found to be .463, indicating that the model explains 46.3% variance in the Total Employee Outcome; the estimated regression parameters were found to be β<sub>0</sub> = 1.571(intercept) and β<sub>1</sub> = .684 (slope), indicating a positive linear relationship. This regression line can be interpreted as, when X= 0, the value of Y is 1.571.

**i.e., Employee Outcome = 1.571 + .684 × Goal Setting**

This implies that goal setting has a positive impact on Employee Outcome and that Employee Outcome increases with a better goal-setting process.

Again, Multiple Regression analysis is carried out to find out the major predictors of Goal Setting that affects Employee Outcome. With an R<sup>2</sup> value of .576, the regression coefficients are shown in Table 1.3.

**Table. 1.3. Table showing regression coefficients.**

Goal Setting Factor	Regression Coefficient (β)	p-value	Significance
Goal Clarity	.182	p=.000<.01	Significant
Goal Efficacy	.161	p=.000<.01	Significant
Supervisor Support	.105	p=.000<.01	Significant
Organizational Facilitation	.173	p=.000<.01	Significant
Goal Stress	-.073	p=.000<.01	Significant
Goal Conflict	-.064	p=.001<.01	Significant

\* Significant at .01 level.

Source: Primary Data

The regression coefficients Table 1.3 reveals that Goal Clarity (β=.182, p=.000<.01), Goal Efficacy (β=.161, p=.000<.01), Supervisor Support (β=.105, p=.000<.01), Organizational Facilitation (β=.173, p=.000<.01), and Goal Stress (β= -.073, p=.000<.01), and Goal Conflict (β= -.064, p=.001<.01) significantly predicts Employee Outcome. The positive aspects of Goal setting such as, Goal Clarity, Goal Efficacy, Supervisor Support and Organisational facilitation were found to have a positive impact on Employee Outcome and the negative aspects such as Goal Stress and Goal Conflict were found to have a negative impact on employee outcome. This can be summarised in quadratic form as shown below;

$$i.e., \text{Employee Outcome} = 1.337 + .182 \times \text{Goal Clarity} + .161 \times \text{Goal Efficacy} + .105 \times \text{Supervisor Support} + .173 \times \text{Organisational Facilitation} - .073 \times \text{Goal Stress} - 0.064 \times \text{Goal Conflict}$$

Thus, the results from regression analysis suggest that Goal Setting significantly predicts Employee outcome and six out of the ten Goal Setting factors (i.e., Goal Clarity, Goal Efficacy, Supervisor Support, Organizational Facilitation, Goal Stress and Goal Conflict) were found to have the significant power to predict Employee Outcome.

### 6. Conclusion

Organisations nowadays rely highly on effective performance management and goal setting interventions. This study contributes to the practical and theoretical knowledge of Goal Setting and its relationship with different behavioural outcomes. The study provided information on how the employees perceived their goal-setting process and how this can be used as a tool for further policymaking. The study brought upon some interesting facts about the relationship between Goal Setting in Central

Public Sector Enterprises (CPSEs) and Employee Outcome. Firstly, the results supported the notion that executives scoring high on goal setting variables have a better understanding of the goal-setting process. Secondly, the Goal Setting process is found to be of moderate level in the CPSEs present in Assam. This raised an important question regarding the credibility of the individual goal of the executives of these profit-making CPSEs. It is argued that the targets set in CPSEs are much lower than actual achievements (Sharma, 2013; Althaf & Ramesh, 2013; Shirley, 1998; Yadav & Dabhade, 2013). Therefore, the CPSEs should attempt to re-evaluate the goal-setting process and focus on all the other factors that make the goal-setting process more effective. Thirdly, the study of possible relationships between Goal Setting and Employee Outcome leads the researcher to conclude that positive perception of Goal Setting increases Employee Outcome and all the 10-factors are significantly associated with Employee Outcome. Lastly, the significant relationships between Goal Setting and Employee Outcome found from Regression analysis revealed Goal Setting to be a significant predictor of Employee Outcome and six factors, viz., Goal Clarity, Goal Efficacy, Supervisor Support, Organizational Facilitation, Goal Stress and Goal Conflict were found to significantly predict Employee Outcome. Therefore, the CPSEs should focus more on increasing the positive aspects and reducing the effects of the negative aspects. Further, the organisations can provide the employees with high goal-specific support so that they can obtain realistic expectations with respect to goals. Thus, the conclusion suggests that Employee Outcome can be enhanced through proper goal setting and those goal-setting variables have a direct impact on Employee Outcome.

### 6.1. Limitations

The present study is limited to only six CPSEs and their executives present in Assam. As such, the data is limited to a specific sample, given that the data was collected only from the units of the organisation present in Assam. As such, the small size effects, especially in correlation analysis, was difficult to detect. Since the measurement of items is subjective, it needs to be interpreted with caution. For example, differing interpretation of items by subjects may lead to socially desirable answers, which may, in turn, lead to bias. The employee outcome is limited to behavioural aspects only.

### 6.2 Scope for future research

Future research can be done for the development and refinement of the goal-setting questionnaire. Studies can be done either in the qualitative or quantitative areas of goal setting and its relationships with other outcome variables. Given that the study conducted is limited to CPSEs only, it would be interesting to look at differences in opinions among two or more organisations, preferably between public and private organisations.

Scams in the banking sector have diverted stakeholders' attention towards manipulated financial figures that reduce the authenticity of accounting numbers. There is an urgent need to investigate and plug the loopholes. The objective of the present paper is to review the literature on earnings management (EM) in the banking industry and to develop a conceptual framework. The review is based on 129 selected papers published between 1988 to 2019 in peer-reviewed journals. The literature is mapped on the basis of databases, publication year, country of study, number of citations, and approaches used to measure EM. The proposed conceptual framework of EM in the banking industry comprises of its determinants, approaches, consequences and mitigators.

**Keywords:** *Earnings Management, Banking Industry, Scams, Systematic Literature Review, Conceptual Framework, Loan Loss Provision*

## 1. Introduction

Collapse of banks and financial institutions have always landed the economies around the globe into trouble with a number of shocks to the stakeholders. The story starts with the collapse of the Medici Bank, founded by Giovanni di Bicci in the year 1397, in Florence in Italy. History witnessed another collapse of the Overend Gurney & Co. bank of the United Kingdom in the year 1866. During the twentieth century, banks such as the Danat-bank (1931, Germany), the Herstatt Bank (1974, Germany), the Lincoln Saving and Loan Association (1989, California), the Bank of Credit and Commerce International (1991, Pakistan), the Nordbanken (1991, Sweden) and the Barings Bank (1995, Britain) became bankrupt. The advent of the twenty-first century has made the situation worse. In the year 2008, seven prominent banks became bankrupt such as Bear Stearns (USA), Northern Rock (Britain), Lehman Brothers (USA), Washington Mutual (USA), Royal Bank of Scotland Group (Britain), ABN-Amro (The Netherlands) and Bankwest (Australia) (“List of corporate collapses and scandals,” 2019).

Banks in developing countries are not far behind in this race. The recent Indian examples include the Punjab National Bank (2018) and the Punjab Maharashtra Co-operative Bank (2019). “In the last 11 fiscal years, a total of 53,334 cases of fraud were reported by banks involving a massive amount of ₹ 2.05 trillion, the RBI data said” (Press Trust of India, 2019). This has resulted in a significant increase in the percentage of bad loans (non-performing assets) from below 3% in 2006-2008 to 11.5% by 2018 (Mistry, 2019), pressurising banks to manipulate earnings. The most common element in all these scams was misreporting of financial numbers. In the case of Lehman Brothers, “A March 2010 report by the court-appointed examiner indicated that Lehman executives regularly used cosmetic accounting gimmicks at the end of each quarter to make its finances appear less shaky than they really were” (“Lehman Brothers,” 2019). In another example of Punjab and Maharashtra Cooperative (PMC) Bank, “The bank misled auditors of the Reserve Bank of India (RBI) by replacing legacy accounts of the company with dummy accounts, dating back to 2008, to show a healthy balance sheet” (Roy & Panda, 2019). These collapses did not happen overnight, but were hidden initially

in the guise of window dressed financial statements. The primary reasons responsible for the collapse of banks are irregularities in financial statements, inadequate provisioning, non-recognition of NPAs, bad governance practices, etc. Earnings Management (EM) can be described as the manipulation of earnings in a desired direction by managers within the flexibility provided by accounting standards and laws to fulfil their personal motives. Though it does not violate any standard or law, it deviates from the spirit of the standard or law. This has not only downgraded banks’ image but has also shattered the investors’ and depositors’ confidence in banking systems in general. So, it has become essential to curb the malpractice of EM.

The concept of EM has evolved over a period of time. Schipper (1989) defines EM as, “disclosure management in the sense of a purposeful intervention in the external financial reporting process with the intent of obtaining some private gain.” According to Healy and Wahlen (1999), “EM occurs when managers use judgement in financial reporting and in structuring transaction to alter financial reports to either mislead some stakeholders about the underlying economic performance of the company or to influence contractual outcomes that depend on reported accounting numbers.” Managers are supposed to apply professional judgement and ethics in accounting as the situation demands so that the financial statements report true and fair information. However, the accounting professional’s judgement gets biased by personal motives, hidden corporate agendas and the flexibility provided by the regulatory environment. Magrath and Weld (2002) view EM as a value-maximising function as it helps in meeting the regulatory requirements, avoiding violation of debt covenants and achieving the analyst’s expectation regarding stock prices. Dutta and Gigler (2002) found that shareholders do not find it appropriate to restrict EM as it helps in reducing the cost of low-earnings prediction by managers. Discussing the divergent views of practitioners, regulators and accounting academics, Dechow and Skinner (2000) opine that regulators and practitioners see EM as a troublesome practice that needs immediate corrective actions, while accounting academicians believe that EM does not have any significant effect on financial statements, and for small effects, investor’s attention is not necessary. So, it is a matter of conflict whether EM is good or bad, and till now, there are no conclusive answers to this.

## Classification of Literature

Further, classification of the selected articles (129) is done on the basis of databases, year of publication, the approaches used to detect EM, country of study and the number of citations. The articles published between 1988 to 2019 were classified according to the database (Figure 1). The richest sources of selected articles were Google Scholar and Elsevier's Science Direct, which contributed 80 articles. Emerald (27), JSTOR (13), Taylor & Francis (5) and SAGE (4) contribute 21%, 10%, 4% and 3% of the total selected articles respectively. The higher percentage of articles from Google Scholar is due to its free availability. It has articles from many databases such as Wiley, Kulwer, American Accounting Association, etc.

**Figure 1: Article Classification by Database**

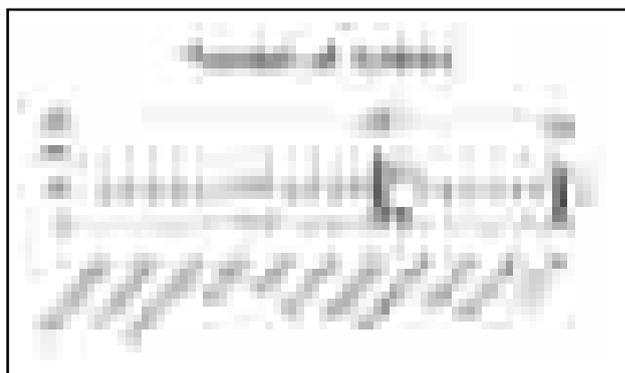

The articles are arranged on the basis of the year of publication (1988 to 2019) to pinpoint the trend of publication and development of research on EM in the banking industry (Figure 2). Only a few studies got published during the period of 1988-2010, and after 2010 the number of published research papers has increased tremendously, exhibiting that in the past decade, researchers in the area of finance and accounting have shown keen interest in explaining EM practices in the banking industry. Post 2010, banks across the globe were at the centre of controversies due to underperformance, stressed assets and governance issues. The subprime crisis further posed a question mark on the credibility of major

banks. These circumstances motivated the researchers to re-examine the issues at the heart of the problem fuelling research in the area of EM.

**Figure 2: Classification of Articles by Publication Year**

The articles are distributed on the basis of countries in which the study is conducted or from where data is collected. The country-wise classification (Figure 3) shows that the research on EM practices in the banking sector is primarily confined to 21 countries. The majority of the studies focus on a single-country approach, whereas 40 empirical papers use a multi-country approach. The multi-country studies are helpful in making cross-country comparisons of the EM behaviour of banks. Of the single-country studies, the majority (around twenty-eight percent) are conducted in the USA. There is a dearth of studies in European countries and other parts of the world, including from emerging markets.

**Figure 3: Classification of Articles by Country**

The literature is also categorised on the basis of the approaches used to detect EM (Figure 4). Specific Accrual,

Total Accrual and Real Activities are the alternative approaches used. The analysis reveals that 68.21% of articles use the Specific Accrual model due to its popularity in the banking industry. This helps in identifying the important factors that have a potential impact on accruals.

Total Accrual, Real Activities and Specific Accrual approaches are also used. The ‘Distribution Approach’ is not popular in the banking industry because it is a relatively new approach and is primarily helpful in detecting the benchmark-beating behaviour of bank managers.

**Figure 4: Classification of Articles by Approaches of EM**

Citation of research papers denotes scholarly or intellectual use of one’s research by another scholar in the same or related area. Citation analysis helps to locate the most critical and influential papers/ researchers in a specific field. The information about citations was gathered from Google Scholar in February 2020. Out of 129

selected papers, 104 have been cited. Table 3 includes papers that have more than 100 citations. Ahmed et al. (1999) is the most cited (1067 citations) article, followed by Beatty et al. (2002), Beatty et al. (1995), Laeven and Majnoni (2003), and so on.

**Table 3: List of Articles According to Citations**

company and to overcome this behaviour, compensation of managers' is attached to the firm's performance (Jensen & Meckling, 1976). This results in upward manipulation of earnings to increase current managerial remuneration and downward manipulation to increase future remuneration. Cornett et al. (2009) found that CEO pay-for-performance has a positive relation with EM. When a bank's capital adequacy ratio is close to the minimum regulatory requirement, an increase in the level of equity incentives leads to an increase in the level of EM (Cheng et al., 2011). Uygur (2013) concludes that EM is positively affected by bank executive's incentives.

Watts and Zimmerman (1986) hold *debt covenants* responsible for manipulation in accounting numbers. Debt covenants are the agreement between a company and creditors stating certain limits regarding earnings or financial ratios that a company should not breach. To avoid the violation of these agreements, managers tend to manage earnings. Kanagaretnam et al. (2003) and Kanagaretnam et al. (2004) found that debt to loan ratio is positively associated with income smoothing, and banks indulge in income smoothing through discretionary LLP to reduce the cost of external financing. In accordance with the literature, income smoothing and EM can be used interchangeably (Uygur 2013). Othman and Mersni (2014) also found a positive relation between loan to deposit ratio and discretionary LLP. Moghaddam and Abbaspour (2017) discussed a positive and significant effect of financial leverage on EM.

**Threshold Management** theory describes that managers use discretion to manipulate earnings in order to achieve a target 'threshold'. Burgstahler and Dichev (1997) suggest two thresholds: 'zero threshold' or loss avoidance and 'nil variation threshold' or avoiding the negative changes in earnings. A new variant, 'analyst expectation threshold', has been added by Degeorge et al. (1999). These thresholds create incentives for managers to manipulate earnings. Robb (1998) states that when market analysts are unanimous about the earnings forecast of the bank, the bank managers get highly motivated to manage earnings. Beatty et al. (2002) claim that public banks, when compared with private counterparts, are more actively engaged in EM by announcing more consecutive strings of increase in earnings and circumventing small earnings reduction. Shen and Chih (2005) found that banks use EM to eliminate negative variation in earnings and earnings losses.

A **bank** may face different types of *risks* like credit risk, liquidity risk, operational risk and market risk. In high-risk situations, bank managers resort to EM to hide their inefficiency or financial difficulties. Operational risk has a positive association with discretionary accruals, indicating the use of EM by managers to hide their operational deficiencies, whereas systematic risk has no significant relation with discretionary accruals, implying that general risk faced by all the sectors of an economy does not motivate banks to manage their earnings (Mohammad et al. 2011; Abaoub et al. 2013), firm-specific risk is negatively associated with EM (Mohammad et al. 2011), and total risk has no significant impact (Abaoub et al. 2013) on EM. Cohen et al. (2014) conclude that EM can successfully predict a bank's tail risk. Ozili (2017a) found that non-performing loans and loans outstanding have a positive impact on discretionary LLPs.

"The **ownership structure** is defined by the distribution of equity with regard to vote and capital, but also by the identity of equity owner" (Wahl, 2006). Different ownership structures affect EM differently. If majority shares are held by a few investors the ownership is concentrated. It is found that concentration of ownership has a positive impact on EM (Bouvatier et al., 2014; Lassoued et al., 2017; Lassoued et al., 2018), suggesting that the few controlling shareholders encourage managers to manage earnings to maximise their personal benefits. State and institutional ownership have a positive impact on EM (Lassoued et al., 2017; Lassoued et al., 2018), indicating that these investors are interested in current earnings. Family ownership has a negative impact on EM (Lassoued et al., 2017).

Rules and regulation that are specifically meant for a particular industry are referred to as **Industry-specific Regulations**. In the banking industry, various regulatory authorities, primarily the central bank, impose capital adequacy requirements to curtail the risk exposure of banks. It is found that banks use discretionary LLP to meet their minimum capital ratio requirement in order to avoid the cost associated with violating the norms (Moyer, 1990; Lobo & Yang, 2001). Ahmed et al. (1999) reported that before changes in capital regulation of banks in the USA in the year 1990, LLP had a negative association with capital ratio and subsequent to the changes, the coefficient exhibited a positive association with LLP, indicating a

declining trend of managing capital via LLP because of stricter regulations. Chipalkatti and Rishi (2007) investigated Indian banks and found that after 1999 banking reforms, the banks which are less profitable and poorly capitalised understate their non-performing assets and LLP. Another study by Ghosh (2007) on Indian banks marks that LLP is used by managers to manage capital ratio. On the contrary, Anandarajan et al. (2003) found that in the new capital ratio regulatory environment, banks do not engage in managing capital via LLP. Further, Kanagaretnam et al. (2003) noted that managers of well-capitalised banks have a higher propensity to indulge in income smoothing than managers of weakly-capitalised banks, as the well-capitalised banks are less prone to regulatory scepticism. Few studies, such as Kanagaretnam et al., 2004; Chang et al., 2008 and Pérez et al., 2008, exhibit that capital ratio does not incentivise managers to use discretionary LLP in Spanish banks.

**Auditor's independence** implies that the external auditor does not have any relation with the parties that have a financial interest in the company. Lack of auditor independence provides an opportunity for managers to manipulate earnings. Kanagaretnam et al. (2010a) found that in the case of large banks, abnormal audit fees are not linked with EM as Federal Deposit Insurance Corporation Improvement Act, 1991 holds auditors of large banks responsible for ensuring the effectiveness of internal control system. On the other hand, small banks are exempt

from these requirements resulting in strong negative relation of abnormal non-audit fees and abnormal total fees of audit paid to auditor with discretionary LLP. Jayeola et al. (2017) and Akintayo and Salman (2018) reinforce that audit independence has a positive association with EM.

**CEO Turnover** is the replacement of an existing CEO with a new one. Bornemann et al. (2015) testified that the incoming CEO reports more discretionary expenses in the turnover year irrespective of low credit risk, to blame his predecessor for poor performance. The results are stronger when the incoming CEO is an outsider as the new internally promoted CEO cannot blame his predecessor, unlike an incoming outsider CEO, because of his previous position in the company.

Different phases of growth in an economy are termed as **Business Cycle**. Many studies endorse negative relation between GDP growth and LLP (Laeven & Majnoni, 2003; Bikker & Metzmakers, 2005; Ozili, 2017a; Ozili, 2017c; Ozili & Outa, 2018) indicating that banks do not make adequate provision for bad loans in a boom period and during a recession in the economy they increase such provisions to cope with increased credit risk. Liu and Ryan (2006) reported that in a pre-boom period bank managers increase their earnings via reducing LLP and during the boom period they decrease earnings via increasing provision for loan losses. Abu-Serdaneh (2018) found no evidence of procyclicality in Jordanian banks.

**Table 4: Determinants of EM**

#### 4.2 Approaches for Detecting Earnings Management

The application of managerial discretion is the genesis of EM. Researchers have developed different approaches to detect EM. Sun and Rath (2010) have discussed critically the approaches used to detect EM, i.e. real activities, specific accrual, earnings distribution approach, total accruals and changing accounting choices. The present paper elaborates on the EM methods used in the banking industry (Table 5).

In the **Total Accruals Approach**, Healy (1985) used the discretionary accruals model to detect EM for the first time, but he assumed the non-discretionary portion of total accrual as a constant, which led to the detection of EM with error. To overcome this limitation, Jones (1991) introduced another model which controlled the change in the non-discretionary portion of total accruals. Dechow et al. (1995) presented a new model, called the Modified Jones model, after making some modifications in the Jones model whose power to test for EM was low. Earnings have two parts; one is accruals, and the other is cash flow. Total accruals are the adjustment in cash flows as per the judgement and estimates of management and can be segregated into non-discretionary and discretionary accruals. Non-discretionary accruals refer to those adjustments in cash flows that are dictated by accounting regulations, whereas discretionary accruals refer to the adjustment in cash flow at the will of the managers but within the flexibility provided by accounting regulations (Sun & Rath, 2010). Thus, discretionary accruals are used as a measure to detect EM.

The **Specific Accrual Approach** is widely used in the banking industry. In the specific accrual model, a single accrual is used to calculate EM. In the banking industry, LLP forms a major part of total accruals and has been extensively used by researchers. "An LLP is an expense set aside as an allowance for uncollected loans and loan payments. This provision is used to cover a number of factors associated with potential loan losses, including bad loans, customer defaults, and renegotiated terms of a loan that incur lower than previously estimated payments" (Kagan, 2019). The discretionary part of LLP is used to detect EM and has a negative relation with EM. When managers want to manage earnings upward, they decrease LLP and vice-versa. Nevertheless, some studies like Beaver

and Engel (1996) use loan loss reserve to detect EM. More than 50% of studies have used this approach, thereby exhibiting its popularity in the banking industry, where single accrual (LLP) forms a major part of the total accruals portfolio.

Schipper (1989) recognised that the **Real Activities Approach** can be used to detect EM. Gunny (2010) (as cited in Ruiz 2016, p. 6) explains that real activity manipulation refers to actions of managers that cause a change in financial or investment transaction or restructuring operations with the purpose of reaching a desired level of earnings. Real EM can be done in many ways, such as (i) increasing sales through lenient credit terms, (ii) overproduction to reduce fixed cost per unit, (iii) deliberately cutting research and development expenses or advertisement expenses, (iv) selling or purchasing of securities, etc. In the banking industry, realised securities gains and losses (RSGL) is used as a measure to manipulate earnings; however, some studies exhibit that commission and fee income (CF) are also used. Greater information asymmetry in public banks gives them an incentive to indulge in EM more than private banks by manipulating securities gains and losses (Beatty & Harris, 1998). Ozili (2017b) concludes that banks manage earnings through commission and fee income.

In the **Specific Accrual and Real Activities Approach**, a combination of two approaches is used to evaluate EM. Beatty et al. (2002) developed this approach in which discretionary LLP is calculated by applying the model developed by Beatty et al. (1995), and discretionary realised securities gains and losses are calculated by applying the model developed by Beatty and Harris (1998). EM is the difference between discretionary realised securities gains and losses and discretionary LLP.

The **Earnings Distribution Approach** is a relatively new, innovative and less explored approach in the literature. Burgstahler and Dichev (1997) developed this approach. This approach is mostly used in those cases where the achievement of earnings benchmark provides greater incentives to managers. Burgstahler and Dichev (1997) and DeGeorge et al. (1999) recognise three benchmarks, which are loss avoidance, positive change in earnings and analysts' consensus forecast.

The selection of the right kind of approach is a tough task for detecting EM accurately. So, one should take into consideration the pros and cons of every approach before making a final selection. McNichols (2000) concludes that in the specific accrual approach, a direct relation can be estimated between the specific accrual and explanatory factors, and it helps researchers in developing an instinct for the important factors that have a potential impact on accruals, but it can be applied to only those industries where a single accrual forms a major portion of total accruals. The total accrual approach can be applied to all industries

which is the main reason for its wider acceptability. Sun and Rath (2010) explained that managers favour the accrual approach to manipulate earnings rather than resorting to manipulation through real activities. On the other hand, the use of managerial discretion in altering real activities needs to be disclosed and hence is easily detectable. Within accruals, the total accrual approach is good as it measures the effect of various accruals in aggregate, unlike in the case of specific accrual, but in the banking industry, specific accruals approach is more useful.

**Table 5: Constructs Used as Approaches in Detecting EM**

Construct	Definition	Measurement	References
Specific Accrual	Change in the value of specific accruals	Change in the value of specific accruals	McNichols (2000)

Managerial Discretion	Change in the value of managerial discretion	Change in the value of managerial discretion	Sun and Rath (2010)
Banking Industry	Change in the value of banking industry	Change in the value of banking industry	Sun and Rath (2010)

### 4.3 Consequences of Earnings Management

Researchers have investigated the consequences of EM on banks' performance and banks' responsibility towards stakeholders in the form of Corporate Social Responsibility (CSR) (Table 6). **Bank Performance** can be estimated through various measures such as Return on Equity, Return on Assets, Earning Per Share, etc. The financial performance of banks has a negative and significant relationship with LLP (Wu et al., 2016; Ujah et al., 2017; Ashfaq & Saeed, 2017), implying that with the increase in EM, the performance of bank decreases. Alhadab and Al-Own (2017) found that in European banks, a high level of EM results in inferior performance measured through return on asset and return on equity. Umoren et al. (2018) revealed that return on assets has a negative relation with EM. On the other hand, Saidu et al. (2017) did not

find any relationship between EM and bank performance. On the contrary, Abbas (2018) marked that both income-increasing and income-decreasing EM behaviour have a positive impact on bank value. A bank uses different resources of society to run its operations smoothly; therefore, it also has a responsibility towards society in terms of providing employment and providing services or goods at reasonable rates termed as **Corporate Social Responsibility (CSR)**. Grougiou et al. (2014) found that EM and CSR are positively and significantly associated with each other, indicating that the banks that are practising EM are also actively engaged in CSR activities. Bank managers view CSR as a pre-emptive approach to build a positive image and to avert the attention of outsiders from EM activities. Pertiwi and Violita (2017) found that the quality of the CSR report of Islamic banks is not affected by the presence of EM.

**Table 6: Constructs used as consequences of EM**

Construct	Measurement
Bank Performance	Return on Equity, Return on Assets, Earning Per Share, etc.
Corporate Social Responsibility (CSR)	Quality of CSR report, engagement in CSR activities

### 4.4 Mitigators of Earnings Management

EM has both good and bad sides to it. Few managers use EM to further the interests of other parties instead of their own, thereby creating wealth for the stakeholders. On the contrary, bad EM practices lead to fraud (Yaping, 2005). Schipper (1989) opined that it is not advisable to eliminate EM completely. He further clarifies that if compensation contracts are removed, it would result in the lower performance of managers. Dechow and Skinner (2000) also opined that complete elimination of EM is not an adequate solution because earnings that are influenced by managerial predictions and judgement about the future are a better measure of the economic performance of a company than cash flows. Table 7 provides a list of articles that have examined the variables that help to mitigate EM.

**Corporate Governance** is a system of monitoring and controlling the actions, policies, procedures and decisions of corporations. Zhou and Chen (2004) opined that good governance experts in the audit committee, active audit committee and board of directors play a significant role in

restraining EM. Board independence is negatively associated with EM (Cornett et al., 2009; Akintayo & Salman, 2018; Oladipupo & Ademola A, 2018), though board size has no impact on EM (Akintayo & Salman, 2018; Oladipupo & Ademola A, 2018). It is seen that corporate governance has a negative association with EM (Leventis et al., 2012; Jallow et al., 2012). The presence of foreign investors can help in reducing EM. Wu et al. (2012) observed that foreign strategic investors' presence in Chinese banks reduces loss avoidance EM. Ugbede et al. (2013) while investigating Malaysian and Nigerian banks, found that Nigerian banks resort to a higher level of EM compared to Malaysian banks. Mersni and Ben Othman (2016) found that large board size, presence of audit committee and small size of Shariah Supervisory Board (SSB) play a significant role in constraining the use of discretionary LLP to manipulate earnings. Kumari and Pattanayak (2017) revealed that in public banks, the size of the board and the number of audit meetings have a negative association with EM. On the other hand, in private

banks, independence of the board and the number of committees in the board play a significant role in mitigating EM. The reasons attributed to these differences are dissimilarity of ownership structure, regulatory requirements and other environmental variables. García-Sánchez et al. (2017) found that gender diversity and the presence of financial experts on board positively influence earnings quality.

**Auditors** are the persons who examine the company's financial records and assess the integrity and reliability of financial statements. It is evident that the specialisation of the auditor in the banking industry restrains the income-increasing EM (Kanagaretnam et al., 2010b; Deboskey & Jiang, 2012) and the type of auditor moderates bank's behaviour of avoiding losses and meeting or beating previous year earnings (Kanagaretnam et al., 2010b). Further, high quality of audit is also helping in mitigating EM behaviour of bank managers (Bouvatier et al., 2014; Nawaiseh, 2016). Jayeola et al. (2017) remarked that joint audit and audit specialisation negatively influence EM. **Adoption of IFRS** by banks helps in controlling EM. Onalo et al. (2014) opined that the adoption of IFRS significantly reduces EM behaviour in Malaysian and Nigerian banks. Hassan (2015) revealed that different attributes, i.e., size, growth, profitability, liquidity and leverage of a bank have no relation with earnings quality in the pre-IFRS period, but subsequent to the adoption of IFRS, all the attributes get positively related with earnings quality except leverage. Adzis et al. (2016) marked that adoption of IAS 39 (International Accounting Standards) has led to the reduction of income smoothing behaviour in Hong-Kong banks. Ozili and Outa (2018) explained that the

implementation of IFRS creates an opportunity for managers to indulge in income smoothing practices instead of curbing them.

In banks, **sturdy regulations** regarding investor protection, effective supervision, accounting disclosure, accounting enforcement, etc., would prove helpful in reducing EM. It is found that stricter requirements related to accounting disclosure (Shen & Chih, 2005; Fonseca & Gonzalez, 2008; Uwuigbe et al., 2017), stringent supervisory regulations (Bouvatier et al., 2014), restrictions on activities of banks, effective private and official monitoring, and greater protection to investors (Fonseca & Gonzalez, 2008) play a significant role in controlling EM. In the case of Euro-countries that have adopted higher protection for creditors and sound banking regulation (Curcio & Hasan, 2015), and in the case of tighter legal protection to shareholders in the Middle East and North African (MENA) countries (Bourkhis & Najar, 2017), it has resulted in acting as a constraint to manipulating earnings. Di Martino et al. (2017) found that new banking regulations have a negative association with LLP. Dal Maso et al. (2018) found that accounting enforcement is directly related to earnings quality, as the rise in accounting enforcement results in a decline in the loss avoidance and the use of discretionary LLP to manage earnings behaviour of banks. **Religiosity** shows that someone holds strong religious beliefs. The organisational structure of banks also differs across countries due to **religiosity and cultures**. Kanagaretnam et al. (2015) discerned that countries where people are highly religious are less prone to EM. Religiosity decreases the benchmark-beating EM behaviour.

#### 4.5. Research Gap and Area for Future Research

Research on EM in the banking industry is still evolving. The review helped to identify research gaps or the areas related to EM that need to be explored in the banking industry. There is a dearth of research on EM by banks in developing countries like India. The results drawn from the studies in developed countries are not applicable at par to the banking system of developing countries due to differences in regulatory mechanisms and banking structures. Financial markets have globalised. Bank manager's motivations to indulge in EM and methods of manipulating earnings differ across countries. Thus, in future studies, samples can be drawn from different countries to make an international comparison of EM behaviour. The specific accrual model has been extensively used to calculate EM, whereas few studies have used a combination of models simultaneously. Researchers can use more than one approach to measure EM to assess which approach better explains EM behaviour.

#### 5. Conclusion

Manipulation of earnings in banks can badly hit the growth of an economy. When managers indulge in EM, the financial statements fail to convey accurate information about the bank's value and its risk level, and it may also not be able to provide early warning signals which may lead to bankruptcy at later stages. This paper examined EM in the banking industry through a systematic literature review. In this review paper, articles are classified on the basis of publication year, country of study, journal of publication, citation analysis etc., to give a comprehensive idea of all the articles. A conceptual framework of EM is also developed. It is concluded that bank managers take undue advantage of discretion in accounting choices to hide their inefficiencies, to increase their compensation, to avoid debt covenant violation, to signal private information to stakeholders, and there may be many other factors such as threshold achievement, bank risk, capital adequacy regulations etc. that motivate managers to indulge in EM practices. Though EM may be measured through various approaches, the most popular approach in the banking industry is the specific accrual approach in which LLP is widely taken as a proxy for EM. Further, the paper discloses that EM influences banks' profitability and reduces the reliability of the CSR report. Thus, there is a need to control and mitigate EM practices through effective corporate governance, implementation of IFRS in the true spirit, enhanced audit quality, sturdy regulations and

propagation of ethical business practices in the bank. Only good quality financial reports can help in gaining the confidence of the public and providing valuable and relevant information to the stakeholders.

## A b s t r a c t

Rewards are very critical to attracting, motivating, and retaining talents. Reward satisfaction plays a determinant role in shaping employee attitudes, those reflected in their performance. This study is intended to assess the impact of extrinsic and intrinsic rewards on employee commitment among the public sector employees in India. The sample subjects are chosen from ten public sector companies using the method of stratified random sampling and the data is analysed through Structural Equation Modelling (SEM). The results reiterated the impact of extrinsic and intrinsic rewards on employee commitment and the importance of intrinsic rewards over extrinsic rewards. The findings are beneficial to the practicing managers in formulating typical reward packages based on employee preferences by mixing extrinsic and intrinsic rewards in varying proportions.

**Keywords:** *Reward management, Total rewards, Extrinsic rewards, Intrinsic Rewards, Employee Commitment*

## 1. Introduction

The employee expectations and perceptions are rapidly changing due to the fast changes taking place in the organisational context (Stairs, 2005). A shift of employee interest from physical requirements to psychological needs is evident in the present-day literature as part of these contextual changes. Employee responses towards these changes is an area of attention of employers, and this has resulted in finding out new approaches to manage employee rewards, both extrinsically and intrinsically, so as to satisfy both physical and psychological requirements (Harter et al., 2002; Luthans, 2002; Linley et al., 2005). This realisation about the change in employee expectations, on another side, led the management to study and research the effect of employee perceptions in determining the financial performance of the organisations and the impact of people management strategies and policies on shaping employee behaviours. Employee commitment has a determinant role in ensuring customer commitment towards the organisation. It is necessary for every organisation to maintain committed employees for organisational success and wellbeing (Fischer, 2003). Rucci et al. (1998) clearly identified a strong bond between employee commitment and customer commitment within the organisation. As per their study, a five percent increase in employee commitment may cause a three percent change in customer commitment.

Traditionally reward management is supposed to attract, retain, and motivate employees in a desirable manner so as to get optimum employee performance. This connection of rewards with performance is the reason for developing the 'pay for performance strategy'. Over the last decade, employers are practising reward strategy by aligning employee performance with the organisation's strategic goals (Higgs, 2004; Brown, 2006; Gerhart, Rynes, & Fulmer, 2009). This concept is the core of strategic human resource management, where the HRM strategies are aligned with business strategies for leveraging the value of human capital for improved organisational performance (Gratton & Truss, 2003; Christainsen & Higgs, 2006). Many studies reported that performance pay is not the solution for organisational performance (Kohn, 1993; Pink, 2009; Ledford, Gerhart & Fang, 2013). According to Kohn (1993), extrinsic rewards are less effective than intrinsic rewards, and on many occasions, it seems to reduce intrinsic motivation. This finding led the researchers

to develop a comprehensive reward strategy that encompasses all the tangible and intangible rewards within a single package. This movement has resulted in developing a comprehensive rewarding system known as the Total Reward Strategy (TRS). Many professional reward management organisations such as WorldatWork (2006 and 2015); SHRM (2007); Hay Group (2008); Aon Hewit (2012); Towers Watson (2012), and many more developed their own distinct TRS models with different components and elements representing extrinsic and intrinsic forms of rewards. Herzberg's (1966) two-factor theory illustrates the dichotomous nature of rewards and their employee values. The hygiene factors of rewards consisting of the major elements of extrinsic rewards such as basic pay and benefits, by themselves, are not sufficient to motivate employees at their workplaces. Even though these factors significantly contribute to demotivation, the real motivators are the intrinsic form of rewards such as work by its content and context, career development, authority and responsibility.

This study is an attempt to examine the influence of extrinsic and intrinsic rewards in shaping employee commitment among the public sector manufacturing employees in India. This study is also intended to examine the relative importance of each category of rewards and its components. This information can be used by the management while formulating a rewarding mix that is capable of satisfying the employees optimally.

## 2. Literature Review

### 2.1 Extrinsic and Intrinsic Rewards

Rewards are very important to employees. Rewards comprise everything offered to the employees by the employer as a return to their services towards the organisation. The study of Sarvar and Abugre (2013) revealed that higher rewards and satisfied employees contribute more to organisational performance and profit. All the goals of the organisation can be achieved by offering a good rewarding system that can motivate employee (Lawler, 1993), and a well-defined rewarding system can attract, retain and motivate employees (Mc Cormic, 2015). Rewarding an employee is not merely paying salary and benefits, but it is equally concerned about non-financial rewards such as recognition, increased job responsibility, and learning and development opportunities (Armstrong, 2010).

Extrinsic rewards are the tangible and visible form of rewards offered to the individual or employee for his/her contribution to achieving something. The monetary part of rewards such as salary, incentives, bonus, etc. and benefits such as medical care, various kind of allowances, fringe benefits those have some financial content indirectly are considered as extrinsic rewards (Mottaz, 1985; Mahaney & Lederer, 2006). Extrinsic rewards are important for employees because it is instrumental to their personal, family, and social existence. Most of the employees' physical needs are satisfied with this form of rewards, and therefore it is the basic requirement for their existence. Literature shows that while employees at the lower levels of hierarchy are more concerned about extrinsic rewards, the employees at higher levels prefer intrinsic rewards (Stumpf, Tymon Jr, Favorito & Smith, 2013)

Intrinsic rewards differ from extrinsic rewards which are in tangible form. Intrinsic rewards are generally qualitative (intangible) in form and critical in motivating employees. This non-physical form of rewards which is emotionally connected to the employees comprises challenging jobs, sense of achievement, recognition, work freedom, participation in decision making, the content of authority, attracting positions in the hierarchy, etc. (Mottaz, 1985; Mahaney & Lederer, 2006). The degree of influence of these elements may differ from individual to individual. This represents the portion of rewards that satisfy an individual's psychological needs. Wherever a job is intrinsically rewarding, the individual involves with more enthusiasm and accomplishes the task more effectively (Mahaney & Lederer, 2006). Intrinsic rewards are the positive feelings an employee experiences at the workplace that energises him to do the task in a personally fulfilling manner (Deci & Ryan, 1987; Thomas & Tymon, 1997; Thomas, 2009). Thomas, Jansen & Tymon (1997) reported that when individuals get opportunities to do meaningful work with a sufficient level of freedom and choice, they feel intrinsically motivated. Tymon Jr, Stumpf and Doh (2010) argued that intrinsic rewards can improve organisational satisfaction even in low extrinsic rewards. It is possible to provide many non-financial or less financial benefits, which can bring satisfaction to the employees and better performance (Mohamood, Ramzan & Akbar, 2012). A higher level of hygiene factors (extrinsic rewards) can make good results

only with an adequate level of intrinsic rewards (Tremblay, Sire & Balkin, 2000). The study conducted by Tymon Jr., Stumpf and Doh (2010) rejects the argument of Deci and Ryan (1987) that extrinsic rewards have a tendency to reduce intrinsic motivation.

## 2.2 Employee Commitment and Reward

Employee commitment is the reflection of a psychological attachment of the employee towards his organisation that reflects in higher employee performance, increased citizenship behaviour and reduced turnover (O'Reilly & Chatman, 1986; Williams & Anderson, 1991). When employees perceive a caring approach from the side of the employer, they demonstrate committed behaviours to achieve organisational goals (Ajmal, Bashir, Abrar & Khan, 2015). Committed employees always show a willingness to accept company values and targets as their own and do whatever possible to achieve the goals (Porter, Steers, Mowday & Boulian, 1974). Allen and Meyer (1985, 1990) proposed three dimensions for employee commitment. These three dimensions of commitment refer to the relationship with an organisation that reflects on the desire of the employee to remain with the organisation and contribute more for the benefit of the organisation (Wo<sup>3</sup>owska, 2014). The first dimension of affective commitment refers to the willingness and likeness of the employee to remain with the organisation due to psychological attachment towards the organisation and the need to be known as part of the organisation. Continuous commitment refers to the awareness of the individual about the cost of leaving the job for another one, and so he wants to stay with the organisation anyhow (Allen & Meyer, 1985). Normative commitment reflects in employees' determination to remain with the organisation even at bad times and it shows a moral obligation. Mehtha, Singh, and Bhasker (2010) observed employee commitment as a component of the emotional dimension of employee loyalty.

Work rewards refer to the benefits that an employee receives as part of the employment relationship from the employer and is considered as the determinant of employee commitment (Malhotra et al., 2007). Employee perceptions of reward fairness significantly influence employee attitudes, behaviours and performance (Scott, Mac Mullen, & Royal, 2011; Munir, 2016; Hareendrakumar,

2020). Turkyilmaz, Ali., Akman, Gulsen., Ozkan, Coskum., and Pastuszak (2011), and Ajmal et al. (2015) reported that both extrinsic and intrinsic rewards play a significant role in determining employee loyalty and commitment through the mediating variable of job satisfaction. The study conducted by Kokubun (2017) among the employees of Japanese companies in Thailand revealed a strong relationship between extrinsic and intrinsic rewards with employee commitment.

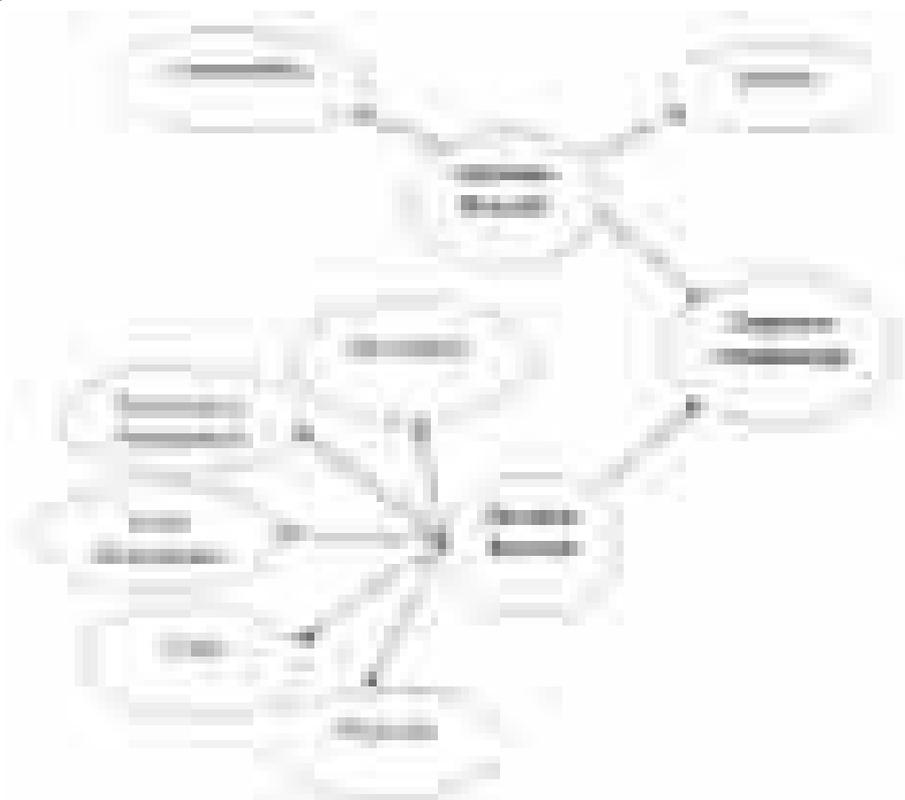

Milcovitch and Newman (2008) commented that the way in which employees are paid affects their behaviours, and a good compensation system would help the organisation to achieve its goals effectively. Mishandling of compensation issues is likely to affect employee and organisational performance due to a lack of employee loyalty (Gomez, Balkin, and Cardy, 2005). Schultz (2005) opined that rewards can induce changes in the observed behaviour of individuals and can act as a reinforcement for the behaviour that creates better rewards. Obicci (2015) observed a strong bond between extrinsic and intrinsic

rewards and employee engagement, which is a demonstration of employee commitment itself. The study of Allen and Grisaffe (2001) also supported the relation of extrinsic and intrinsic rewards with employee behaviours.

### 3. Methodology

#### 3.1 Model development

The total reward is a newer concept of rewarding employees by incorporating all the intrinsic and extrinsic elements of rewards, those that are valued by the employees, in unique proportions. To develop a conceptual model, this study adapted the Total Reward model consisting of seven dimensions developed by Hareendrakumar et al. (2020). In this model, extrinsic reward satisfaction is measured by two dimensions (Compensation and Benefits), and intrinsic reward satisfaction is measured through five dimensions (Recognition, Performance Management, Talent Development, Work, and Work-life) as shown in the

Source: prepared by the author

**Figure 1: Conceptual diagram**

conceptual model. While the two extrinsic dimensions are focused on the financial content of rewards, which are necessary to satisfy the basic needs of employees, the five intrinsic dimensions are concerned about the non-financial form of rewards, which are necessary to satisfy the psychological needs of individuals. The model hypothesises that extrinsic and intrinsic rewards positively influence employee commitment.

### 3.2 Scale development

All the scales to measure the dimensions of extrinsic and intrinsic rewards are adapted from the literature (Hareendrakumar, 2020). The scale to measure employee commitment is adapted from Meyer and Allen (1990). Thus a comprehensive instrument containing 46 items (Compensation-7, Benefits-6, Recognition-5, Performance Management-5, Talent Development-5, Work-5, Work Life-5, and Commitment- 8) have been developed to measure all the eight latent variables under study. The pilot study is conducted among the employees of a large scale public sector company at Thiruvananthapuram and found that all the constructs have reliability (Cronbach alpha) greater than 0.7.

### 3.3 Hypotheses of the study

The following two hypotheses are set to test the significance of multiple relationships between the latent variables.

**H 1:** Intrinsic Rewards significantly influences Employee Commitment in the public sector companies in India

**H 2:** Extrinsic Rewards significantly influences Employee Commitment in the public sector companies in India

### 3.4 Population and sample

The population of interest comprises all the employees working in the public sector manufacturing companies in India. The public sector manufacturing companies are grouped under various sectors such as electrical, electronics, engineering, chemical, textile, traditional, etc. The sample size is fixed at 400. The sample units are selected by following the method of stratified random sampling.

### 3.5 Research design

Even though the topic of study is qualitative in nature, a mixed approach is followed, and the data is collected in a quantitative manner. Structured questionnaires, the instrument for data collection, are served to the respondents and requested to mark their degree of agreement/disagreement in a five-point Likert scale, using numeric values ranging from 1 (strong disagreement) to 5 (strong agreement). This quantitative data collected in the form of numbers is used for statistical analysis and to test the significance of relationships between the variables.

### 3.6 Data collection

The sample data is collected from 418 employees chosen from ten public sector companies in South India. Out of 418 instruments collected, after eliminating 14 instruments with extreme values/ missing responses, 404 instruments are taken for final statistical analysis.

## 4. Analysis and Discussion

### 4.1 Demography and Descriptive Statistics

More than forty percent of the sample subjects have service of more than twenty years and are of age above forty. Hence the responses can be considered as highly reliable in revealing the realistic character of the attributes through the employee lens. As shown in Table 1, the sample comprises candidates from all levels of the hierarchy, starting from unskilled labour to senior managers and qualification ranging from matriculation to post-graduation. Most of the participants are from the non-executive category (74.6 %). Only one third belongs to the executive category. Among the total, around 25 percent are from technical backgrounds and seventy-five percent are from non-technical backgrounds.

Table 2 shows the descriptive statistics of the sample. The mean for the eight latent variables ranges from 2.6 to 3.5, and the standard deviation ranges from 0.709 to 0.986. The correlation coefficients range from 0.202 to 0.609. All the dimensions of independent variables show a good correlation with the dependent variable. The descriptive statistic shows that work and work-life are the most correlated one, among the seven dimensions, to employee commitment.

**Table 1: Demography of the sample**

Demographic Variable	Category	N	%	Mean	SD	Min	Max	
Gender	Male	211	86	3.21	0.45	1	4

**4.2 Structural Equation Modeling (SEM)**

To assess the causal relationships between variables and to test the hypotheses, the method of Structural Equation Modeling (SEM) is employed using IBM SPSS Amos 22. SEM analysis comprises a two-step assessment (i) measurement model assessment and (2) structural model assessment.

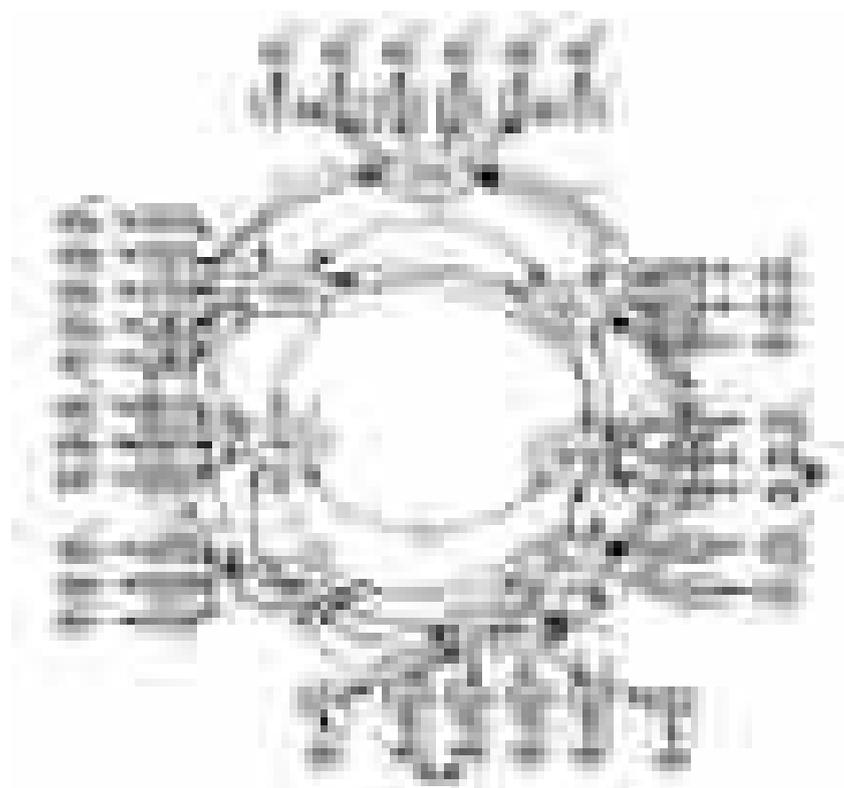

**4.2.1 Measurement model assessment**

In this first step, also known as the confirmatory analysis, the researcher develops a measurement model with all the variables under study and test for the reliability and validity of the scales used. In this study, the measurement model

has been developed with all the first-order variables and correlated, as shown in Figure 2. Prior to CFA, it is necessary to ensure the fitness of the model with the data, and this is done by comparing the fit indices with the recommended threshold values. At this stage, fifteen items (Compensation-1, Benefit-1, Recognition-2, Performance Management-2, Talent Development-2, Work-2, Work-life-3 and Commitment-2) are eliminated to achieve a sufficient level of fitness as per the recommendations. Thus the final model has only thirty-one items under the eight latent variables. The values in Table 3 show that the model is adequately fit with the data as per the recommended fit measures and good for further statistical analysis.

**Table 3: Fit indices of measurement model**

Fit Index	Value	Recommended Value
Chi-Square	123.45	< 200
Df	120	> 100
P-Value	0.000	> 0.05
RMSEA	0.08	< 0.10
GFI	0.95	> 0.90
NFI	0.98	> 0.95
TLI	0.99	> 0.95
CFI	0.99	> 0.95

Note: COM- Compensation, BEN-Benefit, REC- Recognition, PRM- Performance management, TD-Talent development, WOR- Work, WL-Work life, COMM- Commitment

**Figure 2: Measurement model**

4.22 Reliability of indicators and constructs

After ensuring the fitness of the data, the next step is to assess the reliability of the indicators and the constructs in measuring the attributes which are intended to measure. In this part, the researcher ensures whether the items and the set of items under different constructs are unidimensional in measuring the construct and whether the scale items are consistent with different time of measurement. For this purpose, the usual practice is to evaluate the factor loadings of each indicator variable to assess the indicator reliability and Cronbach Alpha and Composite Reliability (CR) to assess the reliability and internal consistency of various constructs. Factor loading above 0.5 is considered as a good measure for indicator liability (Hair, Black, Babin, &

Anderson, 2010; Kline, 2010; Mishra. 2016). Cronbach's Alpha and Composite Reliability greater than 0.7 indicates adequate reliability of constructs (Gefen, Straub & Boudreau, 2000). In this study, all the indicator variables have loadings greater than 0.5, and all the constructs have alpha and CR greater than 0.7 (Table 4). Hence it is assumed that the indicators and constructs have sufficient internal consistency and reliability in measuring the related attributes.

4.2.3 Validity assessment

To assess the validity of the scale, the researcher has to examine both content and construct validities simultaneously. Content validity examines whether the scale items are capable of measuring the characteristic which the researcher intended to measure (Lawshe, 1975).

**Table 4: Reliability, Internal Consistency and Convergent Validity**

Construct	Indicator	Factor Loading	Cronbach's Alpha	Composite Reliability	Construct Validity
C1	IT1	0.72	0.85	0.88	0.85
	IT2	0.68			
	IT3	0.75			
C2	IT4	0.71	0.82	0.85	0.82
	IT5	0.69			
	IT6	0.73			
C3	IT7	0.70	0.80	0.83	0.80
	IT8	0.67			
	IT9	0.74			
C4	IT10	0.73	0.84	0.87	0.84
	IT11	0.69			
	IT12	0.76			
C5	IT13	0.71	0.81	0.84	0.81
	IT14	0.68			
	IT15	0.74			

In this study, the content validity is ensured with the help of the literature and collecting opinions from the practitioners of various public sector companies in Kerala. Construct validity of the scale is generally evaluated by assessing two subsets of validity measures, namely convergent validity and discriminant validity. The criterion that is generally followed to assess convergent validity is to ensure the Average Variance Extracted (AVE) as recommended for the purpose. AVE refers to the extent of variance explained by

the set of variables under a construct. AVE greater than 0.5 is regarded as a good indication of sufficient convergent validity (Fornell & Larcker, 1981; Bagozzi & Yi, 1988; Chin, 1998). To assess discriminant validity, the method is to compare the squared root of AVE of a construct with the intercorrelations of that construct with other constructs. A higher squared root of AVE than the intercorrelations ensure the discriminant validity of the construct (Fornell & Larcker, 1981).

**Table 5: Fornell-Larcker criteria for Discriminant validity**

	1	2	3	4	5	6	7	8
1	<b>0.527</b>							
2	0.12	<b>0.68</b>						
3	0.15	0.18	<b>0.57</b>					
4	0.18	0.22	0.25	<b>0.62</b>				
5	0.21	0.25	0.28	0.31	<b>0.58</b>			
6	0.24	0.28	0.31	0.34	0.37	<b>0.55</b>		
7	0.27	0.31	0.34	0.37	0.40	0.43	<b>0.53</b>	
8	0.30	0.34	0.37	0.40	0.43	0.46	0.49	<b>0.51</b>

Note: Bold diagonal value represents square root of AVE

In this study, all the AVE measures are > 0.5 ranging from 0.527 to 0.715 (Table 4), and the squared root of the AVE of each construct is greater than the intercorrelations of the construct with other constructs (Table 5). The compliance of these two criteria ensures adequate convergent and discriminant validity of the constructs. From Table 4, it is evident that all the indicator variables have factor loadings above 0.5, Cronbach Alpha and CR greater than 0.7 and AVE

greater than 0.5. The squared root of AVE for every construct, given as diagonal values in Table 5, is greater than the intercorrelations of that construct with other constructs. The correlation between variables shows the presence of sufficient nomological validity for the latent variables (Table 2). Figure 3 shows that there is a moderate correlation between the second-order constructs of extrinsic and intrinsic rewards ( $r = 0.68$ ).

4.2.4 Assessment of Structural Model

Source: Prepared by the author  
 Note: COM- Compensation, BEN-Benefit, REC- Recognition, PRM- Performance management, TD-Talent development, WOR- Work, WL-Work life, COMM- Commitment

**Figure 3: Structural Equation Model for hypotheses test (with standardized regression coefficients)**

The structural model is the inner part of the Structural Equation Model that represents the multiple relationships between variables. The structural model assessment enables the researcher to interpret the causal relationships between variables and to test the hypotheses. In this multi-factor

second-order structural equation modelling, there are two exogenous variables, namely extrinsic and intrinsic rewards, and one endogenous variable, employee commitment. The various fit measures for the structural model are given in Table 6.

**Table 6: Fit measures of the Structural model**

Fit Measure	Value	Interpretation
Chi-square	123.45	Significant
Df	100	
p-value	0.000	Significant
RMSEA	0.08	Acceptable
GFI	0.92	Good
NFI	0.95	Good
TLI	0.97	Good
CFI	0.98	Good

Source: Calculated by the author

Most of the fit indices are as per the recommendations, and the others are very close to the recommended values, which indicate a satisfactory or moderate fit of the data with the proposed model. The correlated exogenous variables-extrinsic and intrinsic rewards - could explain 83 percent of the variation of the dependent variable, employee commitment.

The two dimensions of extrinsic rewards showed good R<sup>2</sup> values ranging from 0.63 to 0.95. The R<sup>2</sup> values for the five intrinsic dimensions range from 0.38 to 0.60 (Table 7). All these measures are found significant at the level p < 0.001. The regression coefficients (standardised beta coefficients) between the first and second-order constructs are found significant at the level p < 0.001 (Table 8).

**Table 7: R-square values for the first order constructs**

Construct	R-squared		F	Sig.	R-squared	F	Sig.
	Model	Change					
Employee Commitment	0.83	0.83	100.00	0.000	0.83	100.00	0.000
Extrinsic Rewards	0.63	0.63	100.00	0.000	0.63	100.00	0.000
Intrinsic Rewards	0.38	0.38	100.00	0.000	0.38	100.00	0.000

Table 8 shows the comparative contribution of each reward component under the extrinsic and intrinsic rewards. Among the extrinsic rewards, employee benefit is found more significant with a beta value of 0.972. As such, all the five

dimensions of intrinsic rewards are also found significant at the level p < 0.001. Recognition, Talent Development and Work are found more influential in determining employee commitment with beta values 0.80, 0.77 and 0.76, respectively.

**Table 8: Unstandardized and Standardized beta values with level of Significance**

Predictor	Extrinsic Rewards		Intrinsic Rewards		Sig.
	B	β	B	β	
Employee Commitment	0.972	0.972	0.80	0.80	0.000
Recognition	0.77	0.77	0.76	0.76	0.000
Talent Development	0.76	0.76	0.77	0.77	0.000
Work	0.76	0.76	0.76	0.76	0.000
Employee Benefit	0.972	0.972	0.76	0.76	0.000

Source: Prepared by the author, \*\*\*, P < 0.001 level (2-tailed).

The beta coefficients in Table 9 show that extrinsic and intrinsic rewards have a significant impact on employee commitment and hence the statistical conclusion is to reject the null hypotheses of no impact for the exogenous variables on the endogenous variable. This finding supports the study conducted by Obicci (2015), Ajmal et al. (2015), and Turkyilmaz et al. (2011). As far as employee commitment is concerned, the intrinsic reward is found highly influential in

comparison with extrinsic rewards with a standardised beta coefficient of 0.759 (p < 0.001), which is two times higher than the extrinsic rewards (beta coefficient = 0.20, p < 0.001). The regression values indicate that unit change in the intrinsic rewards would cause for 0.759 unit change in employee commitment while the same change in extrinsic rewards would cause for 0.203 unit change in employee commitment.

**Table 9: Hypotheses test results**

\*\*\*significant at the level  $p < 0.001$  (2-tailed).

## 5. Managerial Implication

The findings of this research are highly beneficial to the HR managers who are responsible for formulating and implementing tailor-made rewarding systems for their employees. From the results, it is clear that employee attitudes are determined mainly by non-financial rewards. It highlights the possibility of influencing employee attitudes without spending additional money. This greater importance of intrinsic rewards due to employee preference helps the managers to make good reward packages by blending more non-financial rewards with the extrinsic rewards in unique proportions. All the intrinsic rewards are highly influential on employee commitment. Hence management of public sector companies in India must give more attention to offer intrinsic motivators to attract, motivate, and retain talents with their organisation. The results of this study revealed the relative importance of each reward component to the employees, and it can be taken as a base for formulating or modifying the prevailing rewarding systems in the public sector companies in India.

## 6. Conclusion

This study once again established the strong bond between rewards and employee commitment. The management can never undermine the importance of either extrinsic or intrinsic rewards. Among the two dimensions of extrinsic rewards, employee benefits showed high significance with employee commitment (0.972,  $p < 0.001$ ). In this era, the new generation of employees is more concerned about the indirect financial rewards that provide more work comfort and security feeling to them. The results show that the employees in public sector manufacturing companies are highly concerned with their intrinsic rewards. The difference in regression coefficients between these two

predictor variables gives a vital message of employee preference towards the intrinsic rewards over the extrinsic rewards. In determining employee commitment, intrinsic rewards are three times more powerful than extrinsic rewards. This reveals the potential power of intrinsic motivation over extrinsic motivation in shaping employee attitudes at the workplace. This expectation of employees towards the intrinsic form of rewards may be the result of their higher level of satisfaction with extrinsic rewards. The regression values show that among the intrinsic rewards, performance recognition, talent development and challenging work are the highest influencers. Performance management comparatively showed a less value (0.62;  $p < 0.001$ ). This may be due to the lack of proper performance management schemes in the public sector industries.

## 7. Limitation and Scope for Further Research

This study has been conducted among the public sector employees in south India. It would be better to conduct a wide study by including more samples from North Indian states also. As the working conditions and pay patterns are different across the states, such a study will yield better results that are more reliable in a Nationwide context.

## 8. Funding

The authors received no financial support for the research, authorship, and/or publication of this article.

## **A b s t r a c t**

Self-identities and social identities on ageing are constructed on the basis of ‘conditions’ and ‘experiences’ in the life of the aged. Using Bourdieu’s Theory of Habitus, the study tried to understand the dialectics of self and social identity constructions on subjective well being and quality of life of aged women. Qualitative analysis using narratives and photo-elicitation method was used. The study consisted of 14 elderly women aged 70 years and above living in Kerala. Results showed that perceptions about age identity have both direct and indirect impact on subjective well being. Corresponding to the nature of self-identity, both positive and negative influences are observed. Disengagements from active roles and power positions, attitude towards old age as a definite period of dependency, belief in the inevitability of ill health, pessimism about cure for health problems, fear and anxiety about miseries and unpredictability in life were the leading self-identity statements. Identity constructions, when used deliberately as a tool of oppression, results in Reverse Metamorphosis. Unlike biological metamorphosis– where the process brings life to an active, vibrant, beautiful stage till the end of life, in Reverse Metamorphosis, aged women enter into cocoons of identities and images that label their life as passive, inactive, shadeless and unattractive. Gender and widowhood add to the process by setting limits to the conditions of life. Reverse metamorphosis is reinforced through marginalisation, isolation, neglect and abuse leading to depression, poor subjective well being and reduced quality of life. Suggestions are made to use Social, Cultural, Economic and Symbolic Capitals envisaged by Bourdieu to influence the identity constructions, explore designs for Inclusive Social Spaces and gender sensitisation to reduce ageism.

**Keywords :** *Quality of life, Habitus, Reverse Metamorphosis, Ageism, Inclusive Social Spaces*

## 1. Introduction

World Health Organization explains ageism as the stereotyping, prejudice, and discrimination against people on the basis of their age. Ageism is a widespread and insidious practice that has harmful effects on the health of older adults. For older people, ageism is an everyday challenge. Overlooked for employment, restricted from social services and stereotyped in the media, ageism marginalises and excludes older people in their communities.

Ageism is everywhere, yet it is the most socially “normalised” of any prejudice and is not widely countered – like racism or sexism. These attitudes lead to the marginalisation of older people within our communities and have negative impacts on their health and well-being. In low-and middle-income countries, older people face daily discrimination and are largely invisible. Ageism leaves people excluded, considered different, restricted in what they can do or simply treated like they don’t exist. It means older people are often at risk of violence, are excluded from health services and face disproportionate levels of poverty.

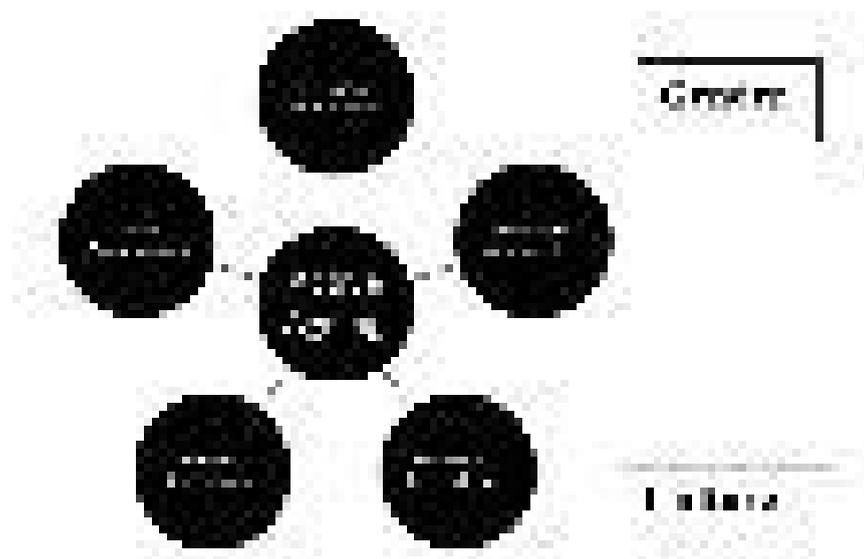

Gender is the major intersecting factor that explains discrimination, exploitation and marginalisation. Women outlive men in nearly all countries in the world. Currently, in the developed world, differences in mortality favour women at all ages and especially so at the oldest ages. In developing countries, seventy percent of females have a life expectancy at birth of more than 80 years, compared to 52 percent in developed countries, while no males have a life expectancy over 80 (Help Age International, 1996).

Gender is a powerful determinant of mental health that interacts with such other factors as age, culture, social support, biology, and violence. For example, studies have shown that the elevated risk for depression in women is at least partly accounted for by negative attitudes towards them, lack of acknowledgement for their work, fewer opportunities in education and employment, and greater risk of domestic violence. The risk of mental illness is

also associated with indicators of poverty, including low levels of education and, in some studies, with poor housing and low-income (Patel & Kleinman, 2003). Gender shapes older women’s experience of ageing, health, and ill health. Previous researches identify that ageing, gender, and health are intrinsically linked and collectively shape older women’s experience.

Elderly women, especially in Third World countries like India, face several threats. They are likely to be illiterate or poorly educated, unlikely to be employed, most likely to be widowed and dependent on others, and they suffer from malnutrition and disabling symptoms as well as report higher psychological distress. The vulnerability of the ageing women, special types of problems they are likely to encounter over the life span, and factors that marginalise them need to be better understood. There is no clear awareness as yet, of the potential contribution of ageing women to the development process as ageing women are stereotypically perceived as burdens on the national economy (Prakash, 1997). This again gives strength to the fact that ageism manifests in various forms in the life of aged women, making them vulnerable.

Humphries (1991) links women’s health status to their access to control of production. In societies where women are viewed as an economic burden, not only is their status lower, but this in turn adversely affects their access to education, food and health. The dependence of women within the family, coupled with cultural norms, promotes discrimination at a number of levels. For example, food allocation in many households often leaves women and female children undernourished. The intra- household allocation of food and its impact upon women have received little attention from gerontologists and remains a significant factor in determining the quality of later life. Long term malnourishment has severe implications for women who survive into older ages, and these are particularly significant for the contemporary developing world. The following chart shows how gender and culture are determining the concept of active ageing in the world.

**Figure 1 – Gender and Culture Determinants of Active Ageing**

*Source: Active Ageing: A Policy Framework, WHO, 2002*

International efforts span back to the Vienna Action Plan on Ageing (1982) to address the developmental potential and dependency needs of older persons, World Summit for Social Development in Copenhagen (1995) that aimed to integrate “age” into a “Society for all”, the Madrid Plan of Action on Ageing (2002) that focused on “Building a Society for all Ages”. All of these efforts were for materialising certain key areas like older persons and their development, advancing health and well being into old age, ensuring and enabling supportive environments, etc. Recently, the Sustainable Development Goals also put forward inclusive growth, good health and well being of the people, reducing gender inequalities etc., into the forefront of the global action plans. However, ageism continues to be a threat in achieving the target of active, healthy and successful ageing and the motto of adding life to years and not just years to lives.

### **The Study**

In determining the health and well being of a population, the physical and social environments play a major role along with our biological and genetic factors. Especially the socio-cultural environments hold a vital role in designing the physical and mental capacity across a person’s life

course. The accommodation and realisations of one’s own condition in old age determine the whole process by which she adapts to her environment, manipulates her conditions and overcomes the challenges. Aged people are always heterogeneous based on the conditions they are exposed to and the variation of experiences they have. Both older people and their environments will always be diverse, dynamic and changing. The interaction between both the conditions and experiences during the life course have enormous potential to decide whether or not the aged women will be successful in leading a healthy, successful, active aged life that is devoid of ageism.

In this background, the study tries to explain three major objectives. What are the conditions and experiences of the aged women that design or help to design the identities in which they live? Images of ageing exist at two levels; personal or self-identity and societal or social identity. To understand ageing holistically, it is imperative to understand how self-identity is influenced by the process of ageing and what is the mutual interaction between the two identities in the life of the aged women? This interaction related to the production and reinforcement of ageism became the third major objective of the study.

dimension. Ageist connotations can be identified as the major factors. Willingly or unwillingly, aged women step into the socially constructed threshold and are forced to follow the norms of society that depicts certain things as normal or ideal for those who are aged- women, widowed, and financially dependent.

Here, influenced by the conditions and experiences in their lives, identity constructions can be observed as existing in

two ways - positive and negative. When the constructions are positive, it becomes a refuge or support for the women to age successfully. On the contrary, negative self and social identity creations prove to be a risk. Compared to positive identity constructions, what we see in a patriarchal, highly stratified society is the construction and deep-rooted existence of negative age identities.

**Table 2 – Positive and negative self-identities developed by the respondents.**

Positive self-identities		Negative self-identities	
1. I am a strong woman.	2. I am a confident woman.	1. I am a weak woman.	2. I am a dependent woman.
3. I am a capable woman.	4. I am a resilient woman.	3. I am a fragile woman.	4. I am a vulnerable woman.
5. I am a self-reliant woman.	6. I am a determined woman.	5. I am a helpless woman.	6. I am a timid woman.
7. I am a hardworking woman.	8. I am a goal-oriented woman.	7. I am a lazy woman.	8. I am a pessimistic woman.
9. I am a responsible woman.	10. I am a proactive woman.	9. I am a negligent woman.	10. I am a passive woman.

**Table 3 – Positive and negative social-identities developed by the respondents.**

Positive social-identities		Negative social-identities	
1. I am a respected woman.	2. I am a valued woman.	1. I am a disrespected woman.	2. I am a devalued woman.
3. I am a dignified woman.	4. I am a dignified woman.	3. I am a dishonored woman.	4. I am a dishonored woman.
5. I am a well-regarded woman.	6. I am a well-regarded woman.	5. I am a poorly regarded woman.	6. I am a poorly regarded woman.
7. I am a socially accepted woman.	8. I am a socially accepted woman.	7. I am a socially rejected woman.	8. I am a socially rejected woman.
9. I am a socially integrated woman.	10. I am a socially integrated woman.	9. I am a socially isolated woman.	10. I am a socially isolated woman.

Narratives also showed that positive self and social identity constructions are mutually nurturing. It gives the capacity for the aged women to have high self-esteem, assertiveness

in their behaviour, feeling of fulfilment and freedom, self-sufficient and happy to gracefully embrace the changes related to ageing.

**Table 4 – Narratives and corresponding constructs by the respondents showing positive self and social identities.**

<p>“I understand that I am getting old. But that does not mean that I am unhealthy. I do all my household works. I leave the rest to god.”</p> <p>“What else is there for me to worry about? I have fulfilled all my duties. Now I have to obey my son and demand only genuine needs”.</p> <p>Constructs – Aged women can experience inner peace and fulfilment when they can understand their own limitations and come into terms with the process of aging.</p>
<p>“I do not have much demands. I have secured enough for my old age. Now until death comes, I have to live calmly”.</p> <p>Constructs – Aged women should feel satisfied with the conditions of life and stay calm. In doing so, they can find dignity and meaning in the later years when physical and biological senescence progresses.</p>
<p>“I was an atheist. But after 65, when I felt alone after my husband’s death and daughter’s marriage, I found GOD as a companion to share everything. I talk with the GOD. He is like a friend to me. I feel he is with me when I talk. After that I feel lightened”.</p> <p>Constructs – More dependent on ‘God’, but not necessarily on religion.</p>
<p>“Even when there is financial crisis, my daughter and son take care of me very well. We - my husband and me - do not have any savings. Whatever we have earned were spend for the children. We didn’t have any worries. Life will go like that.”</p> <p>Constructs – Even in low socio-economic conditions they feel supported and cared by the significant others. “I have to live without my husband since my younger ages. Had faced everything till now. I do not easily get worried by crisis. I have lived all my years through crisis. I have made them (children) realise the struggles I have been through. So expect that they will stand by me”</p> <p>Constructs – They can retrospect, face challenges in later life with optimism.</p>
<p>“I know what I want. I am still independent. I will hire according to my demands and never bother my children. But I will inform them. Because nowadays there is lot of insecurity around.”</p> <p>Constructs – Observed sense of freedom – physical, mental and economical.</p>
<p>“I have changed a lot. Earlier I used to worry a lot. Was angry almost all the time. But now there is a sense of detachment from everything. But I enjoy the solace in life.”</p> <p>Constructs – Detaching from worldly pleasures and practicing asceticism are identified as self-realisation in old age.</p>

### The Dialectics

When the identities are constructed negatively, they become risks for the survival, happiness, and well being of the aged women. These negative identities function as tools of oppression perpetuating ageism in society. Knowingly or unknowingly, standards are being set, and images are being projected in such a way that self and social identities are built at the expense of each other. At various junctures, social identity can be seen as dominating self-identity. Through this domination, social identities control the self-identity constructions in aged women. Self-identities constructed by the aged women always tend to be in

confirmation with the one projected by social identities. When this process continues for a longer period of time, it automatically reaffirms the existing ageist social identities into concrete social identities through actions and interactions. It gets normalised in society as a synonym for old age and aged women. Gender, widowhood and negative social identities perpetuate ageism through processes of discrimination, exploitation and marginalisation. In this sense, there is a vicious cycle of the structuring of ageist negative identities and processes of ageism. The processes may take the following forms:

**Table 5 – Synthesis of ageism**

<p>Biological metamorphosis refers to the change in anatomical and physiological form through a series of life stages. Complete adult stage is the epitome of beauty, vibrant life and happiness. What we always propagate through the concept of healthy, active, successful ageing is comparable to the life stages of a butterfly/ metamorphosis whereby life is added to ages. However, in reality, ageism is the stumbling block for the aged, especially aged women, to achieve this target. The researcher uses the concept of Reverse Metamorphosis for explaining the process due to the negative identity constructions. It is a two-way process that influences the self and social identities and the processes of ageism. Unlike simple disengagement from the active life entirely due to physiological or functional limitations resulting from the biological processes of ageing, there is a deliberate oppression of self-identities in ageism. Reverse metamorphosis starts with the self-identity pronouncing sacrifice, renunciation, passive, withdrawal from the social world. With added vulnerabilities like gender, widowhood and asset-lessness, social identity constructions project</p>	<p>aged women as weak, inefficient, less adaptive, burdening the young productive population, and easy prey for exploitation. The stereotyping progress into labelling and limiting conditions for the aged women within the mind, family and society. They set boundaries around themselves, indirectly leading to reaffirming the negative images. Internalised self-identities become social identity and vice versa, creating cocoons of identities that confine oneself within the barriers in an effort to confirm with the norms of social identity. Mostly this results in low quality of life and low subjective well-being.</p>	<p>The dominance of social identity over self-identity, when remained unchecked, leads to designing the future of identity creations. This becomes a cyclical process whereby constantly reaffirmed self-identities develop constantly oppressive social identities and vice versa. Gradually, it becomes a process of social construction that inherently bear the capacity to reduce the freedom, liberty and equality of elderly women. It emerges as an anti-democratic process that continues to oppress the already vulnerable, marginalised section of elderly women in our society.</p>
---	---	---

**Negative identity constructions and Reverse Metamorphosis**

Biological metamorphosis refers to the change in anatomical and physiological form through a series of life stages. Complete adult stage is the epitome of beauty, vibrant life and happiness. What we always propagate through the concept of healthy, active, successful ageing is comparable to the life stages of a butterfly/ metamorphosis whereby life is added to ages. However, in reality, ageism is the stumbling block for the aged, especially aged women, to achieve this target. The researcher uses the concept of Reverse Metamorphosis for explaining the process due to the negative identity constructions. It is a two-way process that influences the self and social identities and the processes of ageism. Unlike simple disengagement from the active life entirely due to physiological or functional limitations resulting from the biological processes of ageing, there is a deliberate oppression of self-identities in ageism. Reverse metamorphosis starts with the self-identity pronouncing sacrifice, renunciation, passive, withdrawal from the social world. With added vulnerabilities like gender, widowhood and asset-lessness, social identity constructions project

aged women as weak, inefficient, less adaptive, burdening the young productive population, and easy prey for exploitation. The stereotyping progress into labelling and limiting conditions for the aged women within the mind, family and society. They set boundaries around themselves, indirectly leading to reaffirming the negative images. Internalised self-identities become social identity and vice versa, creating cocoons of identities that confine oneself within the barriers in an effort to confirm with the norms of social identity. Mostly this results in low quality of life and low subjective well-being.

The dominance of social identity over self-identity, when remained unchecked, leads to designing the future of identity creations. This becomes a cyclical process whereby constantly reaffirmed self-identities develop constantly oppressive social identities and vice versa. Gradually, it becomes a process of social construction that inherently bear the capacity to reduce the freedom, liberty and equality of elderly women. It emerges as an anti-democratic process that continues to oppress the already vulnerable, marginalised section of elderly women in our society.

**Table 6 – Conversations, conditions and experiences of ageism faced by aged women**

Conditions	Experiences
<p>‘Give away the charge of kitchen’, ‘give room for active and smart family members’, ‘don’t waste time’, ‘give way, you can’t move fast’, ‘try to understand’</p> <p>Self and social restrictions to withdraw from active roles</p>	<p>Live a passive life.</p> <p>Considered as burden to family and society</p>

Conditions	Experiences
‘It’s time for prayers’, ‘request god not to make you suffer’, ‘you are aged’, ‘it’s not suitable for the aged women’, ‘you are an aged widow’, ‘obey your son/daughter’ Imposes to take shelters in “age molds or labels.”	Socially isolated and experience loneliness
‘Vegetarianism, bhajans, temples, prayers, soft colour traditional wears, television series of bhakthi/god/devotion’ Change in tastes- dress, food, entertainments, frequency of travels.	Cocoons of age is developed. Spiritually modified space and materials Market value as ‘spiritual consumers’
‘You can wait’ Less prioritised	Neglect in resource allocation and prioritisation
‘It’s enough,’ ‘what else do you want?’ Spared with less resources	Marginalisation
‘You have lived your life, now let us live ours’, ‘we have to build our career and home’, ‘we are busy, try to understand’, ‘ you always have lot of complaints’, ‘ you are hard to manage.’ Lack of social support and care	Alienation

### Ageism explained by Habitus

Habitus emerges over time and acts like a durable ‘structuring structure’. It comes from practice, and it shapes practice. It predisposes people to think and act in patterned ways. In this sense, habitus can be used to explicate what are the socio-cultural underpinnings of ageism in a multicultural society like India- a risk leading to reverse metamorphosis in later life. Stereotyped age identities are so ingrained that people often mistook the feel of being marginalised as a natural process associated with ageing instead of identifying it as culturally developed. This often leads to justifying social inequality because it is mistakenly believed that some sections of the population are disposed to the finer things in life while others are not. Aged women, as a group with multiple vulnerabilities like widowhood, lack of personal financial assets, cognitive as well as physical limitations that increases with age, social and cultural constructions of subordinate power possessions, set the foundation for limiting their social world. Self-identity created on this basis becomes the foundation for constructing social identity about the aged women. Bourdieu’s concept of habitus as “a structuring

structure, which organises practices and the perception of practices” fittingly explains this situation.

### Managing Ageism and the Action Plan

Examining the WHO Strategy on a global action plan on ageing and health, we can see that the plan focuses on five strategic objectives:

- Commitment to action on Healthy Ageing in every country;
- Developing age-friendly environments;
- Aligning health systems to the needs of older populations;
- Developing sustainable and equitable systems for providing long-term care (home, communities, institutions); and
- Improving measurement, monitoring and research on Healthy Ageing.

### Application of theory

A key point within Bourdieu’s theory is that habitus constrains but does not determine thought and action. If

an individual is both reflective and aware of their own habitus, they possess the potential to observe social fields with relative objectivity. Bourdieu outlines four species of capital that are linked with habitus. Species capital is located as part of the structuring process of habitus. This can be used by individuals within the relative field as a tool for gaining dominance and power. Bourdieu breaks species capital down into:

1. **Social capital** which can be defined as the circles of friends, groups, memberships and social networks (also virtual within online communities).
2. **Cultural capital** which is an individual's knowledge, experience and connections. (Academic background, credentials and work-life).
3. **Economic capital** is the economic assets held (property owned, earning ability).
4. **Symbolic capital** is the honour, prestige and recognition relative to the individual (a veteran in a certain field, an aged person, a respectful person).

Older women can age gracefully depending on their effective utilisation of all the four capitals. They should learn new ways to build community, find spiritual and cultural interests and continue to render services even it is limited. Habitus has the potential to influence our actions and to construct our social world as well as being influenced by the external. By modifying their identity constructions, they can mould their identities to support successful, positive ageing. Society is the essential counterpart for attaining the purpose. Support for the efforts of aged women in this direction can be pragmatically achieved by restructuring age identities through inclusive age-friendly - gender-friendly initiatives done by governmental, non - governmental and community level programs.

### Conclusion

Around the globe, the fastest-growing population group is the group of people over 60 years of age. It is estimated that by 2050, one in six people will be over the age of 65. This demands the need that ageism is to be urgently tackled at every level possible, whether it is at the global, national or community level.

Describing the need for a global strategy and action plan on ageing and health, WHO recognises that it is the need of the hour. We cannot move blindfolded towards the future in an ageing population. With some of the rapidly ageing low- and middle-income countries, promoting healthy ageing and building systems to meet the needs of

older adults will be sound investments in a future where older people have the freedom to be and do what they value. (WHO, May 2016)

Creating environments that are truly age-friendly requires action in many sectors: health, long-term care, transport, housing, labour, social protection, information and communication, and by many actors – government, service providers, civil society, and older people and their organisations, families and friends. The study suggests that combating ageism, enabling autonomy, supporting healthy ageing and age-inclusive policies at all levels are certain key approaches that are relevant to all stakeholders.

This paper analyses the nature and level of interdependence of various stock markets of the world. The study explores stock market interdependencies and dynamic interactions among selected global indices. The paper also ascertains the degree of association between developed and emerging markets. The findings show that a considerable amount of interdependency exists among the Indian stock market and other global stock markets. Findings suggest that there is an association between developed and emerging markets. These results are recommended to policymakers, regulators and researchers on the one hand and firms' managers as well as investors. These results provide insights to investors for portfolio diversification.

**Keywords:** *co-integration, cross-correlation, stock markets, market efficiency, interdependence, causality, international financial markets,*

## 1. Introduction

Global capital market integration over the last thirty years has been noticed through major strategic deviations under which international investment limits were reduced, exchange control was almost eliminated, free movement of capital, humans and technology was promoted, and the fundamental structures of most worldwide markets were transformed. Such progress in markets can change the relationship among different markets across the globe. Market integration has been promoted through liberalisation, which has critical implications on investment decisions and policies.

The stock market is connected with a sharp increase in uncertainty both in developed and emerging markets. Stock market behaviour analysis offers information about the future evolution of the stock market.

The dynamics of the progress of economy is inevitable. Nowadays, there is great attention towards the analysis of linkages among global stock markets. Through financial integration, native country can be linked with international capital markets. Increasing regional integration of financial markets helps to diversify the risk. The cost of financial contagion and crisis can be avoided by global financial openness (Cyn & Jong, 2011).

Integration can be deliberated from different standpoints: first is the general integration process at the global level, and the second is the economic integration process. The general integration process explores the level of global financial integration and its impact on economic growth. Previous studies by Lane and Milesi-Ferretti (2003), Arestis and Basu (2003) and Edison et al. (2002) concluded that the impact of financial integration on economic growth is dependent on various factors such as financial growth, economic development, legal progress etc. The economic integration is more critical as it focuses on the relationship between the financial markets as part of economic integration. Such integration can change the relationship among stock prices in various countries. Such market integration leads to international diversification, which results in better benefits to investors. Integrated markets are likely to have a higher transmission of market turbulence among different countries. Few previous studies like Errunza and Losq (1985) and Jorion and Schwartz (1986)

concluded that global capital markets were moderately integrated.

The probable reason behind co-integration comes from the efficient market hypothesis (EMH). According to EMH, asset/stock prices reflect the new information arrival in the market. The change in stock prices of one market due to change in other stock indices is not constant. Hence, it is important to analyse the change in the stock price in one market due to changes in different variables in different markets. The cause of co-integration among various stock indices is due to increased global market capitalisation based on the factors like development in MNCs, advances in technology, deregulation of financial systems, increase in capital flows due to relaxed foreign exchange policies etc. Such movement of stock prices across the markets leads to superior profits and better diversification which will lead to co-integration of stock markets globally.

According to Jorion and Schwartz (1986), lower co-integration of stock prices propels the investors to take advantage of diversification by investing across various stock markets globally. Mukherjee (2007) found that the Indian stock market had very high co-integration with stock markets of the USA, Russia, Korea, Japan and Hong Kong due to the ADRs and GDRs listed by the Indian companies in these markets.

Co-integration among the stock markets can be studied to understand if there are any mutual factors that determine the returns of stocks or indices or if an individual market or stock is driven by its own fundamentals. If mutual factors are found across markets, they are perfectly correlated with each other over a long period of time and are found to be more prone to contagion and ripple effects. The study of co-integration and causality among the markets can help to reduce such risks.

Khan (2011) explained two major reasons for co-integration in his study, namely global liberalisation of capital flows and a better network of communication which made it easier for investors to invest in global markets. He also concluded that co-integration has also happened due to a financially and economically integrated world which would result in an efficient international financial scope, and various markets would not be able to show independent behaviour of prices. Other studies by Domowitz (1995),

Lee (1998), Domowitz and Steil (1999), Cybo-Ottone et al. (2000), Shy and Tarkka (2001), Hasan and Schmiedel (2004), Armanious (2007) and Nicolini (2010) confirmed that mergers, acquisitions, strategic alliances, cross-listing and other forms of restructuring and co-operative movements between various stock markets as well as derivatives indices could lead to co-integration to increase the value of stock exchanges across the world. According to Dorodnykh (2014), “co-integration is a complex process, and it depends on various macroeconomic, structural, cultural-geographical and operative forces, where different stakeholders can also affect the integration decision.”

In order to obtain the variations in the degree of integration among markets, correlations can be used as a technique to observe the discrepancies in the stock values over the years. A higher correlation can be implied as an increase in the degree of integration and can have a much significant tendency that impacts in one country can be spread to others. As such, this methodology is not found to be much informative as the correlations can be found as a result of short and long-term relationships.

Co-integration is the study of a long-term relationship or co-movements between two variables in an equilibrium setup. The co-integration relationship in stock markets indicates the presence of a common trend that connects the stock markets. The presence of co-integration between stock markets reduces the portfolio risk diversification opportunities since the co-integrated stock markets share similar investment risks. The implications of no integration between international stock markets increase the benefits of investing in different stock markets. Therefore, the International investors looking out for global investment opportunities can formulate portfolios that include securities of either single asset class or multiple classes but spread in different countries' stock markets that are not co-integrated. Further, the non-integrated stock markets have fewer implications of global news affecting their domestic stock markets. The research in stock market co-integration helps international investors, mutual fund houses and hedge funds to look for investment opportunities across international stock markets.

The studies on the co-integration between the stock markets have been a vital topic in the financial literature ever since the works of Granger (1983) formalised the concept of

co-integration. Later studies of Granger and Weiss (1983); Engle and Granger (1987) evolved into a model to test the linear relationships among the financial markets. The unfavourable events in one market cause fluctuations in stock prices. Due to the interlinkages with other markets, the fluctuations are spread as a Contagion to the interlinked markets.

The co-integrated and interlinked stock markets can lead to a worldwide crash to begin with a particular news event in one country (Roll, 1989). The studies of Arshanapalli and Doukas (1993), Masih and Masih (1997), and Kizys and Pierdzioch (2011), among others, have reported the interlinkages among developed markets of USA, Japan and Europe. The interlinkages between the US, Japan and Asian markets were evidenced by Arshanapalli et al. (1995), Anoruo et al. (2003), Asgharian et al. (2013), among others. Further, these studies attributed the decline in the stock indices after the United States stock market crash of October 1987, the Asian Financial Crisis of 1997 and the Global Financial Crisis of 2008 to co-integration and interlinkages of stock markets.

Normally, the long-term equilibrium relationship is specified by a bivariate co-integration relationship. In such a relationship, the deviation from the equilibrium relationship is found to be stationary with a mean value of zero. It can be interpreted into an application that can be assessed as a combination of two non-stationary series, which itself is stationary. According to Engle and Granger (1987), such bivariate series is considered to be co-integrated.

Such bivariate relationships can be expanded to a multivariate relationship. In such relationships, a deviation in the price factors from the long-term relationship can be created from a grouping of all the time series. Though it looks like a complicated structure, the concept remains the same. Multivariate co-integration is a long-term relationship among the non-stationary time series, and there is a combination of non-stationary time series, which is stationary. In such a situation, a bivariate relationship can lead to inappropriate results and inference.

It has been observed that co-integration is expected to be found more in larger systems than smaller ones, which can be explained as representing the broader association among

international stock markets, and these markets are integrated to a greater extent. A change in the degree of co-integration among the factors/variables can explain the long-term relationship among global stock markets. This can be achieved through the comparison of the co-integration relationship over various sub-sample periods. In this study, the multivariate approach of co-integration is adopted to investigate the co-integration of multiple countries.

## 2. Literature Review

There had been a number of studies done by various researchers over the years emphasising different parameters of co-integration such as risk, return, volatility, prices etc.

Corchy Rad and Urbain (1995) studied the relationship among various stock markets by applying the Granger causality test for the period of 1981 to 1991 and found that there was no co-integration among these stock markets. Darrat, Elkhail and Hakim (2000) studied about the integration of emerging stock markets in the Middle East. Modelling techniques such as co-integration and error correction were associated with the international stock markets, and the stock prices in each country have been equalised by the arbitrage force. They found many differences between the trading patterns, which have especially been marked in regard to the market integration at a national level. Macroeconomic shocks throughout the economy have affected the capital markets at the international level. Free-flowing information and capital across international borders are some of the levels which have characterised the foreign market integration effectively.

Schleicher (2001) observed co-integration between the Eastern European Market and the Western European Market. The study had used a VAR model with multivariate GARCH and concluded that Eastern markets were more influenced by the Western markets.

According to Brooks and Negro (2002), the international equity market has a low degree of correlation returns across the stock markets at a national level. Emerging stock markets have constituted only the data with a small fraction. They pointed out that the stock market has been considered as the benchmark portfolio in most of the cases. They emphasised on the regional perspectives of international stock markets and market integration.

Click and Plummer (2003), Majid et al. (2009) and Phuan et al. (2009) studied about the stock market integration in ASEAN after the financial catastrophe and found that the co-integration of five ASEAN markets have not been completed in an economic sense. Serwa and Subramanian (2008) studied the relationship among five stock exchanges in East Asia. He used co-integration test and Granger causality test to study the relationship and concluded that these stock exchanges were co-integrated and diversification across various markets can be beneficial in the short-term but not in the long-term.

Mukherjee and Mishra (2005) observed long-term co-integration among the Indian stock market and other Asian stock markets.

A study done by Guidi (2010) has shown contradictory results that there was no co-integration found in the Indian stock market and Asian stock markets. The study revealed that the long-term benefits of investing in India are very limited. Another study done by Chittedi (2010) observed the relationship between developed countries stock markets and the Indian stock market and found that these markets were not co-integrated. He used the Granger causality test and found a uni-directional relationship between the Indian stock market, US market and Japan, whereas the UK and Australia were found to have no causality. Nath and Verma (2003) found that there is no co-integration among three South Asian stock markets, i.e. India, Taiwan and Singapore.

Thalassinos and Thalassinos (2006) studied the integration analysis of the stock market and analysed that there were significant changes in the market integration degree among various stock markets using different econometric techniques. The EMU establishment has affected the European stock market integration highly when compared to others. They also concluded that there has been a significant relationship between the dependence of bilateral import and the degree of stock market integration.

Alagidede (2008) studied the African stock market integration with implications for portfolio diversification and international risk sharing. Integration of stock markets has tended to be more efficient when compared to the segmented markets. Co-integrating vector numbers have revealed the integration extent across stock markets. Geographical proximity has not clearly dealt with the

African stock markets. Further, they suggested that the efforts at integrating African stock markets have remained futile to date.

Tirkkonen (2008) studied the stock and bond market integration with evidence from Russian financial markets. Long-run relationships testing with the autoregressive model (VAR) has played an important role in the Russian stock market integration.

Wang and Moore (2008) studied the stock market integration for the transition economies by using time-varying conditional correlation. They found a very high level of correlation after entering to the European Union. Financial market integration has seemed to be a largely self-fuelling process, and it also has a dependence on the development of the financial sector at the existing levels.

Chen and Shen (2009) studied the co-integration among stock markets of U.K., U.S.A., Japan and Germany Markets by using Granger causality and co-integration test and found the integration among markets. Chancharat (2009) studied stock market integration by using econometric techniques such as the Co-integration test, factor analysis and GARCH models, which are found to be useful to investigate the relationship among the economic variables and the stock market integration. These techniques also have the tendency to examine whether the international stock markets have the capability to move together in the context of the stock market integration.

Erdogen (2009) concluded that co-integrated stock markets have created greater chances for global investors by discarding country-specific risks. It was found that co-integrated markets reduce the capital cost, which helps the growth of an economy. Co-integrated markets have the capability to intensify the sector effects and nullify country effects. Co-integration among developing stock markets in Asia was studied by Raju and Khanapuri (2009), and they found the existence of a high degree of co-integration among the markets used in the sample.

Baumöhl and VÝrost (2010) analysed co-integration using the Granger causality test with respect to non-synchronous trading effects. They used classical mean-variance methodology and concluded that there was no significant lead-lag relationship of stock market integration in the pre

and post-crisis period. Karagöz and Ergun (2010) observed market co-integration among Balkan countries and found that economic and financial integration has helped to reduce the political risk and to promote the stability of the economy and local markets size. Yeoh et al. (2010) studied co-integration between Malaysia and Singapore stock markets. They concluded that the Malaysian stock market was having a higher degree of co-integration.

Babecký et al. (2012) studied co-integration between Chinese and Russian stock markets by using beta-convergence and sigma-convergence approaches. Bhunia and Das (2012) studied about the financial market integration from India and selected south Asian countries. The global crisis of finance has focused more attention on the linkages among the Asian countries stock market. Authors have predicted that the stock index of the Indian stock market has not co-integrated with the developed markets. Indian stock market has integrated with the mature markets effectively.

Birau and Trivedi (2013) studied stock market co-integration and contagion of emerging markets with respect to the global financial crisis. The financial system turbulence resulted in the heavy reduction on the stock market around the world. Joshi (2013) examined the co-integration among BRIC's stock indices and concluded that India had a long-term equilibrium relationship with Russia and China but not with Brazil.

Park (2013) studied co-integration among Asian stock markets and found that there was an increased correlation between the movement of assets prices, and the degree of stock market co-integration was enhanced over time from one market to another. Mohamed (2014) investigated the existence of co-integration among GCC stock markets. Most of the GCC stock markets are relatively small, closed to foreign investors, which also have led to the blocking of inflows of foreign portfolio investment effectively.

Patel (2014) proposed a study regarding the co-integration of Indian and selected Asian stock markets. This study examined the Indian stock market independence with other equity markets of Asia like Sri Lanka, Pakistan, Korea, Japan, Malaysia, China, Singapore and Taiwan. The study concluded that all Asian stock indices are first difference stationary, and there is an existence of long-term

equilibrium relationship among Asian markets. It found that the stock market of India is influenced by stock indices of China, Sri Lanka, Singapore and Japan. The major suggestion derived is that the government of India must supervise the Asian equity markets movements very closely because a crisis in any country of Asia may influence the Indian stock market performance.

Seth and Sharma (2015) studied the co-integration among the Asian and US markets by applying the Granger causality test, Johansen co-integration test and found the existence of short term and long term co-integration among the market. Mitra and Bhattacharjee (2015) found a co-integration of BSE with other markets.

Bhattacharjee and Swaminathan (2016) studied the stock market integration of India and few selected countries and found that co-integration of the Indian market with other indices have improved over the years due to liberalisation, and during the recession, the Indian market was more responsive to Asian markets.

Everaert and Pozzi (2016) studied co-integration among 19 European stock markets for a period from 1970 to 2015 by using a panel of monthly stock market returns. They developed a model of dynamic factor, which decomposes equity risk premium into a country risk factor of Europe with stochastic volatilities and time-varying factor loadings. This model was evaluated using Bayesian MCMC (Markov Chain Monte Carlo) methods. The study concluded that there was an existence of co-integration in few developed European countries from the late 1980s to early 1990s, but also neither euro area membership nor European Union has developed the integration of the stock market. Shahzad, Kanwal, Ahmed and Rehman, (2016) studied co-integration among the stock markets applying ARDL and found the existence of co-integration among the markets.

Patel (2017) explored the co-integration among 14 stock markets. The correlation analysis showed that BSE remained somewhat positively correlated. Results of the Johansen co-integration test concluded that there was a long-run relationship among selected stock markets.

Kiviet and Chen (2018) reviewed the literature on the analysis of co-integration between the price indices of

stocks or their realised returns at various markets and registered frequently recurring methodological deficiencies such as omitted regressor problems, neglecting to verify agreement of estimation outcomes with adopted model assumptions, employing particular statistical tests in inappropriate situations and, occasionally and lack of identification.

Nautiyal and Kavidayal (2018) examined cross-country returns and co-integration of 11 stock indices of developed and developing countries by using VECM and found that there was a slow but significant price adjustment and stock market co-integration was found.

### 3. Data and Methodology

#### 3.1 Data Sources

This study included closing values of daily prices of various indices from January 2005 to December 2018, which were collected from the respective websites of the stock exchanges. The stock market behaviour and the extent of co-integration were investigated among 35 stock indices from 5 continents (Africa, America, Asia, Europe and Australia) in the world. The major stock indices of the Asian markets (SENSEX, HSI, JAKARTA, KLSE, KOSPI, NIKKEI 225, NZSE50, SHANGHAI, STRAITS, TAIWAN and NIFTY), stock indices of European markets (AEX, ATX, BEL20, BIST100, CAC40, DAX, FTSE100, IBEX, OMX, OSE ALL SHARE, RTSI, SMI and STOXX50), index AORD from the Australian market and stock indices of the American market (DJIA, GSPC, IBOVESPA, IPC, Merval, NASDAQ, NYSE and S&P TSX) were selected for this study.

#### 3.2 Methodology and Hypothesis

This study involved a two-stage methodology. In the first part, normality, stationarity and causality of the time series were tested using statistical techniques like Jarque-Bera Statistic, ADF Test and Granger Causality Test, respectively. The hypothesis statements were developed for each test as follows.

$H_0^1$ : Stock indices prices are normally distributed.

$H_0^2$ : A Unit Root is present in the stock indices prices. (Dickey & Fuller, (1979 & 1981))

The descriptive statistics show that mean returns of most of the indices in the sample were positive though it was found that the mean daily return of the JALSH index was highest (0.2) among all the indices followed by the Merval index, whereas the average daily return of OSE index was lowest (-0.02) among all. The fact that the emerging markets are more volatile is evident from statistics on the standard deviation of daily returns in these markets. In general, the developed market returns are less volatile with a standard deviation lesser than the emerging markets. The South African market, though, provides the highest magnitude of maximum daily returns, along with a maximum standard deviation of 5.5, followed by Russia (2.25) and India (1.52). The Developed markets exhibit high volatility in US DJIA (4.71), and the least volatility in the developed market sample is exhibited by the Australian Market (1.08).

Skewness values of emerging markets like Russia and China exhibit an asymmetrical distribution with a long tail to the left, while India situation is near to zero exhibiting only asymmetrical distribution. In developed markets, the US stock market exhibits symmetric distribution around the average value. While other developed markets like the UK, Japan and Singapore exhibits left-skewed distribution. All the Kurtosis values of the stock markets investigated in this study display a value of more than three, showing a leptokurtic curve, which demonstrates that the distribution of stock returns in these countries contain extreme values. The values of Kurtosis accompanied by those of Jarque-Berra statistic clearly indicate that the returns of developing markets are not normally distributed. These findings are consistent with Harvey (1995) and Bekaert et al. (1998). Under large departure from normality, the mean-variance criterion given by Markowitz (1952) can lead to the application of wrong portfolio weights (Jondeau and Rockinger, 2005). For risk-averse investors, the use of sub-optimal mean-variance criterion in portfolio construction can result in substantial opportunity cost. The non-normality of returns in emerging markets, therefore, compels the international investors to use distinct and typical models for determining expected returns of portfolios comprising emerging-market assets.

#### 4.2 Examining Stationary of Variables

In order to check the co-integration, a requirement is to check that all factors are non-stationary. The ADF test was used to determine that the variables are stationary or not. AIC was used to find out that the optimal lag structure for conducting the test.

The ADF test was performed for each of the indices in the sample included. The findings of the ADF test are shown in Table 1. As can be seen from Table 1, that the p-value is less than 1% for all the variables at the 1<sup>st</sup> difference level. It was found that all the stock indices prices are non-stationary at the original level, and they are stationary at the 1<sup>st</sup> difference.

#### 4.3 Test for Causality

Granger causality test was performed to examine the causal relationship among these markets. Since co-integration—at any level—exists, the Granger causality testing is appropriate for bilateral pairs of markets. As Granger (1988) pointed out, if two variables are co-integrated, causality must exist at least uni-directional.

The Granger causality test was conducted by dividing the data into three sub-periods (Period 1: 2005 – 2009; Period 2: 2010 – 2014; Period 3: 2015 – 2018). For most of the indices, the causality remained the same during all sub-periods. But in the case of some indices, the causality was found during one sub-period (either bi-directional or uni-directional) with an index but was not found in another sub-period. In a couple of cases, it also happened that for one sub-period, causality between two indices was uni-directional, for another sub-period, it was bi-directional, and for the third sub-period, there was no causality between those two indices. This led to a very interesting change of trends during short-term Granger causality results. These results for each of the sub-period are shown in the table below. In the last column of the table, the results show bi-directional or uni-directional causality of an index with other indices for the long-term, i.e. for the entire duration of the study. These long-term results are the combination of all short-term results, which include the bi-directional and uni-directional causality of an index with other indices, which were found in all three sub-periods as mentioned below. For instance, for bi-directional causality, the ATX index causes 12 indices during 2005-2009, 13 indices during 2010-2014 and 11 indices during 2015-2018. Out of these indices, ATX causes 11 indices during all three sub-periods, which is cited as long-term causality.

From the causality analysis, it can be inferred that there is an existence of bi-directional causality. Among 35 indices, AEX index causes 14 indices, AORD causes 9 indices, ATX causes 11 indices, Bel20 causes 11 indices, CAC40 causes 11 indices, DAX causes 8 indices, DJIA causes 3 indices, FTSE100 causes 12 indices, GSPC S&P500 causes 14 indices, HIS causes 9 indices, IBEX causes 8 indices,

#### 4.4 Co-integration Test

The Johansen (1988, 1991, 1995) efficient maximum likelihood test was used to examine the existence of a long-term relationship among indices. A model of the Johansen procedure was used: the one with a linear trend in level and intercept in the co-integrating equations (CE). This version was found to be more appropriate to our data since we have trending series with stochastic trends. The test was performed using a formulation of a VAR model with lag length determined according to AIC and Akaike's Final Prediction Error (FPE). Determination of co-integration rank ( $r$ ) depends on the values of eigenvalue and trace statistics.

Maximum likelihood estimators of the co-integrating vectors for an autoregressive process were derived by Johansen (1988) and Johansen and Juselius (1990) by considering the following equation.

$$X_t = \alpha + \beta X_{t-1} + \epsilon_t \quad (1)$$

VAR model can be estimated at the first level difference, i.e.  $I(1)$ , a majority of time series variables are non-stationary at level  $I(0)$ . The above-mentioned equation (1) of Johansen and Juselius (1990) can be represented by introducing a first level difference operator as follows:

$$\Delta X_t = \alpha + \beta X_{t-1} + \epsilon_t \quad (2)$$

Matrix can be used to trace co-integration. The first level difference, i.e.  $I(1)$ , might be preferred when all  $X_t$  values are found to have unit roots which can be determined if  $p \times p$  matrix has rank 0.

The Johansen co-integration test was performed for the set of 35 stock exchanges to investigate the integration of these markets as a group. Analysis using the multiple

equations was based on a VAR model, which is required before constructing a related VECM system. The VAR model of order 2, which was chosen according to AIC, contains a  $5 \times 1$  vector that contains logarithms of the share price index of the five markets. The multivariate approach examined the existence of a co-integrating vector in the stochastic matrix and a sequence of hypotheses test using maximum likelihood methods, establishing the greatest possible number of vectors within the system. In this study, the null hypotheses assumed for each row of numbers: zero and at most one co-integrating equations. The alternative hypothesis states one, co-integrating equations, respectively, for each row. As long as trace statistics exceed critical values at 5 or 1 percent, the alternative hypothesis was accepted (the null hypothesis was rejected).

Table 3 shown co-integration between the SENSEX and other indices. At  $r=0$ , the trace statistic was higher than the critical value at 5 percent; therefore, the null hypothesis of no co-integration was rejected. The result implied that there was at most one co-integrating equation between the two variables. The findings of the co-integration test of BSE and WALSH were consistent with the finding of the correlation analysis, which determined that the relationship between movements in the two stock markets was strongly positive. Positive co-integration was compatible with the concept of stock market integration, which assumed a similarity in securities offerings and the ability of investors from each market to hold investments in all securities.

As illustrated in Table 3, trace statistics and Eigenvalue statistics indicated one co-integrating vector at the 5 percent significance level among the markets. Since the trace statistic exceeds the 5 percent critical value, it is possible to reject the null hypothesis of no co-integrating vectors, indicating that there are one or more co-integrating equations.

**Table 3: Results of Co-integration Test for All Indices**

Indices	Co-integration tests	No. of variables	Eigen values	Eigen			Maximum Eigen value	
				Eigen statistics	F value	Significance	10% Eigen statistics	F value

coefficients can be interpreted as those having significant linkages. On the other hand, low correlation reflects the separation property of stock markets and, therefore, the existence of an opportunity to diversify risk. Further, markets in the common region are more correlated because these markets are more prone to get influenced by their regional news and developments and also because of reasons such as trade and economic ties. The correlation structure of emerging and developed markets has been examined to detect preliminary evidence on potential diversification benefits in the region.

One of the procedural issues to be handled in the context of the log return correlation matrix in the table is the existence of timing difference or difference in trading hours between emerging stock markets and select developed stock markets, especially for the US stock market. Remaining all the markets taken in the sample interact within a single day of each other because all the emerging markets under study operate in the same time zone. On account of this, the contemporaneous correlation among the US market and the selected markets is not of much importance. Therefore, the correlation matrix is derived, taking into account the one day lagged returns for the US market. The same approach is followed for subsequent analysis of return data throughout the study.

The examination of the correlation structure of log returns from Table 4, 5 and 6 gives the following important findings:

The emerging markets exhibit mixed correlation coefficients with each other and also with select developed stock markets. At the same time, it can be observed that in general, however, the emerging equity markets share low correlation coefficients (less than 0.50) during the whole sample period. The Russian stock market exhibits high correlation coefficients with developed stock markets such as Japan as well as the UK and USA, positive correlations with both India and China, and having a negative correlation with Singapore. In an emerging market context, both India and China stock markets are having a relatively low degree of correlation coefficients with other counterparts.

The Indian stock market exhibits significant correlation coefficients with Singapore and with the Japanese stock markets. The lowest correlation coefficients with respect

to the Indian stock market is with Germany's (European) stock market, and India does not share a negative correlation with any index. Chinese stock market exhibit negative correlation coefficients with respect to US and European stock markets. This indicates that the Chinese market is by far the most isolated market in the region, which further is an indication of potential diversification benefits. The developed US stock market has a positive correlation coefficient with emerging market Russia followed by India and China.

Sensex and Nifty Index are positively correlated with all the indices. Sensex is highly correlated with other stock market indices, i.e. STRAITS (0.562) and HIS (0.536). It indicates that Sensex, BIST100, SMI and DAX indices following the same trend. There is a low positive correlation existing between Sensex and BIST100, SMI and DAX.

The below table is representing the test result of cross – Correlation between Developing Countries and Developed Countries. In this table, all the sample countries' stock returns are compared with the US stock return. In these cross-correlation tests, the results data is significant at 1% levels.

In the case of developed countries, Germany cross-correlation test results, most of the values of the lags are positive, which shows the positive association of Germany stock return with the USA stock return. It is clear that the Germany stock returns and the US stock returns move together. We can say that the Germany stock return is dependent on the US stock return. In the case of the UK, cross-correlation test results, 7 lags values are positive out of 11, which shows the positive association of the UK stock market with the USA stock market. It is clear that the UK stock market and US stock market move together. We can say that the UK stock market is dependent on the US stock market.

The cross-correlation results of Japan and Canada show that there are mostly negative lags values that show a negative association with the US stock return. We can say that Japan and Canada stock markets are not dependent on the US stock market. The cross-correlation results of France and Italy show that there are mostly positive lags values that show a positive correlation with US stock return. It is clear that France and Italy stock markets move with the US stock market.

In the case of developing countries, the cross-correlation results of India and Malaysia show that there are mostly positive lags values that show a positive correlation with US stock return. It is clear that the Bangladesh and Malaysia stock market is related to the US stock market. In the case of Turkey, the cross-correlation test clearly shows that the

Turkey stock market was not associated with the US stock market. The Egypt stock return, Pakistan stock return, and the Indonesia stock return show that there are many negative lags values that show a negative association with US stock return. The findings and inference of the cross-correlation are shown in the table below.

**Table 4: Findings and Inference of High Correlation of Indices**

<b>Highly Correlated :&gt;0.50</b>	
Bel20	FTSE100
CAC40	FTSE100 and Bel20
IBEX	FTSE100, Bel20 and CAC40
S&P TSX	FTSE100
NASDAQ	FTSE100, Bel20, CAC40, IBEX and S&P TSX
OMX	FTSE100, BEL20, CAC40, IBEX
HIS	AORD and STRAITS
NIFTY50	STRAITS and HIS
IBOVESPA	FTSE100, Bel20, CAC40, S&P TSX, Nasdaq, NYSE and OMX
ATX	FTSE100, Bel20, CAC40, IBEX, NYSE and OMX
KOSPI	AORD, STRAITS and HIS
OSE	FTSE100, CAC40, OMX and ATX
Sensex	STRAITS, HIS and Nifty50
Nikkei225	AORD, STRAITS, HIS and KOSPI
GSPC S&P500	FTSE100, BEL20, CAC40, S&P500, NASDAQ, NYSE, OMX and IBOVESPA
IPC	FTSE100, BEL20, CAC40, S&P500, NASDAQ, NYSE, OMX, IBOVESPA and S&P500
AEX	FTSE100, BEL20, CAC40, IBEX, NASDAQ, NYSE, OMX, IBOVESPA, S&P500, ATX, OSE and IPC
RTSI Russia	FTSE100, BEL20, CAC40, OMX, ATX and AEX
Merval	Nasdaq, NYSE, IBOVESPA, S&P500 and IPC
JLSH	DJIA

TAIWAN	AORD, STRAITS, HIS, KOSPI and NIKKEI225
NZSE50	AORD

**Table 5: Findings and Inference for High Degree of Anti-correlation**

**Table 6: Findings and Inference for Low Degree of Anti-correlation**

To examine if there is a problem of serial correlation, the Durbin Watson statistics of the model is 2.141974, which infers that there is no problem of serial correlation. Regression is spurious if the residual of the regression is auto-correlated, i.e. they are not stationary at level. Autocorrelation among residuals is checked using a correlogram of residuals and unit root test; estimates of Q-statistics are statistically insignificant for all 36 lags. This means the null hypothesis of no autocorrelation cannot be rejected, i.e. confirming the non-spurious regression model.

Stationary estimates (using ADF-Test) of residual shows that the residuals of the estimated function are stationary at the I(0) order of integration. Thus if the variable is integrated of the same order and the linear combination among them is stationary, indicating the presence of co-

integration. This finding implies the existence of a long-run equilibrium relationship among the variables. In this case, OLS estimation is consistent, and there is no problem of spurious regression and t, as well as F statistics, are valid.

**4.6 Hurst Exponent Analysis**

There is a basic assumption in theories of quantitative finance that the changes in stock prices are independent. Such changes can be exhibited using Brownian motion. For this purpose, Hurst exponent analysis is used as a test for independence in time series data. Hurst exponent value of 0.5 explains that the time series is independent. But predetermined Brownian motion data will give a value of Hurst exponent, which can be higher or lower than 0.5. Such values can be wrongly inferred as evidence of long-term memory in the case of the absence of a proper test.

the diversification benefits from the markets that have a weak correlation. Therefore, the investors who diversify their portfolio across various countries can improve the portfolio's expected return without increasing the risk of the portfolio. FIIs and individual investors can use this study to understand the correlation structure and interdependence of the global stock indices for better and effective portfolio diversification.

Further, these results are recommended to policymakers, regulators and researchers on the one hand and firms' managers as well as investors on the other. FIIs, HNIs, individual, institutional, and public investors can make decisions regarding their investments based on co-integration among the markets, which may be of short as well as long-run. These results provide insights to the investors for portfolio diversification which can help reduce the systematic risk of the portfolio.

### 5.2 Limitations of the Study

This study is constructed on the secondary data of stock market indices which included daily closing prices. This study does not involve the weekly or monthly prices, which can be used for further analysis, such as seasonality in stock indices.

One of the procedural issues to be handled in the context of the log return correlation matrix is the existence of timing difference or difference in trading hours between emerging stock markets and select developed stock markets, especially for the US stock market. Another limitation of the study is that it does not cover event-specific co-integration.

### 5.3 Scope for Further Research

The study has further scope of research. The dependency of each market to other markets can be studied using the Regression analysis. The analysis of dependency can help in taking the investment in a better way. The effect of volatility among markets can also be analysed.

## SCMS JOURNAL OF INDIAN MANAGEMENT

SCMS New Campus, Prathap Nagar  
Muttom, Aluva-683 106, Kochi, Kerala, India  
Ph: 91-484-262 3803 / 262 3804 / 262 3885 / 262 3887 Fax: 91-484-262 3855  
E-mail: editor@scmsgroup.org  
Website: www.scms.edu.in/journal

### Aims and Scope

The *SCMS Journal of Indian Management* is a blind peer-reviewed Journal. The Journal deems it its mission to submit to the readers fresh fruit of management thoughts and rich cream of current innovative research. The format of the Journal is designed reader-friendly. The academia and the corporates have an easy access to the Journal.

The Journal looks for articles conceptually sound, at once methodologically rigorous. The Journal loves to deal knowledge in management theory and practice individually and in unison. We wish our effort would bear fruit. We hope the Journal will have a long life in the shelves catering to the needs of b-students and b-faculty.

- ◆ Proposals for articles that demonstrate clear and bold thinking, fresh and useful ideas, accessible and jargon-free expression, and unambiguous authority are invited. The following may be noted while articles are prepared.
- ◆ What is the central message of the article you propose to write? Moreover, what is new, useful, counterintuitive, or important about your idea?
- ◆ What are the real-world implications of the proposed article? Can the central message be applied in businesses today, and if so, how?
- ◆ Who is the audience for your article? Why should a busy manager stop and read it?
- ◆ What kind of research have you conducted to support the argument or logic in your article?
- ◆ What academic, professional, or personal experience will you draw on to make the argument convincing? In other words, what is the source of your authority?
- ◆ The manuscript of reasonable length shall be sent to the Editor—*SCMS Journal of India Management* (Both for postal and electronic submission details are given here under).

### The manuscript should accompany the following separately:

- ◆ An abstract (about 100 words), a brief biographical sketch of above 100 words for authors describing designation, affiliation, specialization, number of books and articles published in the referee journals, membership on editorial boards and companies etc.
- ◆ The declaration to the effect that the work is original and it has not been published earlier shall be sent.
- ◆ Tables, charts and graphs should be typed in separate sheets. They should be numbered as Table 1, Graph 1 etc.
- ◆ References used should be listed at the end of the text.
- ◆ Editors reserve the right to modify and improve the manuscripts to meet the Journal's standards of presentation and style.
- ◆ Editors have full right to accept or reject an article for publication. Editorial decisions will be communicated with in a period of four weeks of the receipt of the manuscripts.
- ◆ All footnotes will be appended at the end of the article as a separate page. The type script should use smaller size fonts.
- ◆ An Author/Co-author shall submit only one article at a time for consideration of publication in the Journal. The author/co-author can send another article only on hearing from the editor whether it is accepted / rejected.
- ◆ The author getting one article published in the Journal has to wait for two years to get another published

### Submit the manuscript to:

editor@scmsgroup.org

The submission must be in the form of an attachment with a covering letter to be sent as e-mail.

---

### Ethical Guidelines for Authors

The Author shall present an accurate and complete account of the research performed. The corresponding author must have obtained the approval of all other authors for each submission. Ghost authors are not permitted. The material in the submission shall be original. The material based on prior work, including that of the same author/s shall be properly attributed by proper citation. The author shall have the obligation to notify the editor immediately should any one of the statements in this list ceases to be true.

### Ethical Guidelines for Peer Reviewers

The Peer reviewer shall review manuscripts for which they have the subject expertise required to carry out a proper assessment. Peer reviewers shall respect the confidentiality of peer review and shall not reveal any details of the manuscript under review and of its review. Peer reviewers shall be objective and constructive in their reviews.

### Ethical Guidelines for the Editor

The Editor shall actively seek the views of authors, readers, reviewers, and editorial board members about ways of improving the journal's success. The Editor shall support initiatives designed to reduce academic misconduct. The Editor shall support initiatives to educate researchers about publication ethics. The Editor shall provide clear advice to reviewers. The Editor shall require reviewers to disclose any potential competing interests before agreeing to review a submission. The Editor shall encourage reviewers to comment on ethical questions and possible research misconduct raised by submissions.

The Journal abides by the The Best Practices Guidelines of COPE (COMMITTEE ON PUBLICATION ETHICS) for Editors, Authors, and Peer Reviewers.

# REVIEW ON ACTION RECOGNITION IN VIDEOS PROCESSING

<sup>1</sup>Diksha malik

<sup>2</sup>Anjali Sharma

<sup>1</sup>MTECH STUDENT CSE DEPARTMENT, LINGYAS VIDYAPEETH FARIDABAD

<sup>2</sup>ANJALI SHARMA ASSISTANT PROFESSOR CSE DEPARTMENT LINGYAS VIDYAPEETH FARIDABAD

**Abstract** - The introduction of actions in the video is currently in the focus of scientific research due to improvements carried out in automatic analysis of static images and greater availability of processing power. This paper provides a general description of the key model and method for the introduction of actions consisting of models and human methods based on shared track estimates, silhouettes and matching temporal local templates and descriptors. To handle compound actions and activities, the semantic action model is proposed with the help of expert knowledge. Because the task of recognizing actions depends on the domain, methods and models are built and tested on the domain specific database. This paper provides general reviews and descriptions of the latest video datasets made to develop the introduction method of action, with emphasis on datasets with additional modalities such as depth images or accelerometer data.

## I. INTRODUCTION

Automatic video analysis is currently focusing on research interest. This is caused by their independence in ordinary life and usability in many different fields such as security supervision, process automation based on visual reference, detection of all kinds of abnormalities, and anything connected with visual observations.

The important part of automatic video analysis is recognition of individual actions, such as falling down, or jumping. Recognized actions can be used per se, for example to interact with electronic devices, or can function as the starting point towards recognizing activities that require further interpretation, such as distinguishing between normal meetings or threatening approaches.

Over the years, many techniques have been proposed to complete the task of recognizing human actions in the video. Most of them use several types of supervised machine learning approaches, where the model of actions that must be recognized is built using training data consisting of features extracted from the appropriate video. Fig.

1. Shows a typical workflow from a supervised learning approach, where the prediction model is made at first workflow and then is used in the second workflow to make a prediction.

Figure 1. Traditional model of action recognition

In Another knowledge-based approach, the model of the action used for recognition is built mainly by encoding by providing expert knowledge using descriptive language operators and logic.

Lately, the new type of machine learning approach to the introduction of actions using neural networks has emerged. This approach has been used for automatic features that will be used for recognition of instead of handmade features in classical ml style, as well as an integrated feature extraction and classification framework where the two processes are handled completely in deep tissue.

The purpose of this paper is to provide an overview of the most widely used models and methods for the introduction of activities with their strengths and weaknesses. A list of datasets that are appropriate for this purpose will also be presented.

## II. MODELS AND METHODS

Raw Video sequences are not suitable for modeling and classification because of the very high dimensions (proportional to the dimensions of the image and time), where most dimensions do not really contain relevant information for the introduction of action. On the other hand, the machine classifies only based on primary elements such as pixels or features. That is why the first step after acquiring the video is usually an extraction of features. Simply put, features are an interesting part of the images that are changed in a way that can be used by the machine. Some common levels of low levels are edges (divided between lighter and darker parts of the image), the angle (point where the edge intersects), lumps (the image area is too subtle to detect advantages), etc.

In recognition of actions, its features can be roughly divided into those who encode or trajectories from different body parts, into those who aim to track all numbers and become local features operating on interesting points in videos without paying attention to someone or not. Features based on body parts and number-based features require additional video processing to detect, group and track people in the video, which is a non-trivial task. Local features, on the other hand, have an advantage because it does not require any people's pelocations, so they have recently become increasingly attractive to researchers in the field.

### A. Body Based Model

Representation of features for the introduction of actions based on the human body parts using 2D and 3D features such as stick numbers (Fig. 3), silhouette (Fig. 4) or volume (Fig. 5) to represent information about position and movement of different body parts[1].

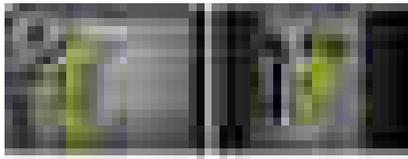

Figure 2. Stick figure from the Cornell Activity Datasets database [2]

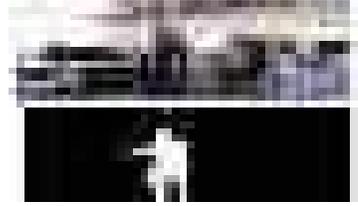

Figure 3. A video frame depicting a person walking (left) and the corresponding silhouette mask (right) [3]

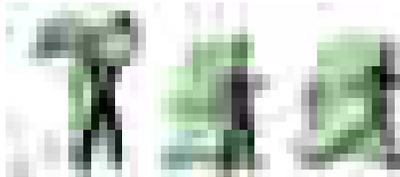

Figure 4. Volumes formed by stacking the silhouettes of persons while performing actions [4]

Most Approaches using the explicit model of the human body, such as a stick model, and strives to optimize the compatibility between model projections and image frames observed while simultaneously maintaining correspondence from the frame. The representation produced is a set of connections trajectories in 2D-time space or 3D-time space, as shown in Fig. 5.

Figure 5. Tracked trajectories of joints generated by performing different actions [4]

The drawback of 2D-time representations is that they are Depending on, meaning that features for the same actions will be very different depending on the relative orientation of the camera and the person taking action. On the other hand, estimates of 3D poses from a single display require a more complex model. If the Requirements for a single camera relax, the solution uses multiple cameras to reconstruct the depth information has been proposed, such as [4]. Lately, affordable depth cameras have emerged that capturing 3D depth information using infrared sensors along with RGB videos, which can be very helpful in the estimated combined position in 3D, but still limited to use because of the simple depth sensing range. Additional consideration is whether the camera display is stationary or cellphone [4], whether a single camera is used or there are several displays available [3] to reconstruct 3D representations the world or to mitigate the effect of occlusions and expand the field of view.

Precise The full poses reconstruction is a difficult task, and the results are unreliable because of noise and occlusion, but it is not necessary for the introduction of action. Thus, different research directions are focused on representation of actions using body silhouettes, without trying segments or matching individual body parts to the model. It has been used in the initial work [6] where the vector quantization scheme is used to change the order of silhouettes into a sequence of symbols. The sequence of symbols is used to train the Hidden Markov model (HMMS) actions, which are applied in the recognition phase to find the most suitable model with observed symbol sequences, thus combining flexibility in the duration of action.

In newer works [4], the action is represented as a template that is formed by the volume by stacking the silhouette of people who take action along the time axis (Fig. 4), and matching is done by matching templates. The disadvantage of the silhouette and based on the volume that representation is the fact that silhouette segmentation can be difficult in the noisy environment, and see dependence, which can be reduced by forming different models for different views.

#### A. Visual word model bag

Recognition of actions using local features and bags of visual words that have the advantage of the approach that rely on body model, because local features extraction does not require a type of human model or localization personalization. Local features are extracted by first using flower point detectors and then extracting the local descriptor from the flower point. Descriptors are grouped into visual words. Every picture later represented by a bag of visual words (BOW) which is then used for learning, Fig. 6.

Figure 6. Bag-of-features learning diagram

Following Division in [7], flower point detectors can be grouped into 3 groups - contour-based, based intensity and parametric based. Contour-based detectors extract contours to find the most interesting edges and angles. Intensity-based detector calculates interest points directly from gray value. Parametric-based identification angle in the image using the analytic estimate of the gray value structure [8]. Harris 3D Detector [9] Calculates spatio-temporal angles at each video point and determines the final location of the flower point of the space-time with a local maximum. Cube-shaped detector based on Gabor filter [10] detects regions with different distinguishing spatial characteristics that experience complex movements. Hessian [11] Detects spatio-temporal lumps and solid sampling [12] is extracting 3D patches at regular positions with variation in scale.

After Interest points or trajectory of information about the shape and movement in the surrounding area were successfully detected, they were presented using flower points descriptors. The feature trajectory is usually extracted using a cannade-lucas-tomasi tracker (KLT) or by matching the SIFT descriptor [14] between the frame.

The majority of descriptors are under the spectrum descriptor group based on the amount calculated such as the intensity of color and light, local area gradients, statistical features and moments, surface norms and sorted data such as 2D or 3D histograms of spectral types.

Descriptor 3D, 4D, volumetric and multimodal becomes more interesting because of the development of affordable 3D sensors and accelerometers built into cellular devices. Because of the 3D feature description fields earlier in development, which method will not be widely adopted. The most prominent at this time is 3D HOG [15], 3D SIFT [16] and Hon 4D [17] which is based on the familiar 2D method expanded to spatio-temporal 3D space.

The extracted features are then encoded using a fisherman's arc or vector approach [18].

General classification methods are used along with the above features for recognition of actions such as multi-layer perceptron (MLP) in [19], and supports vector machines (SVM) [10,9,20,21].

#### A. Deep learning approaches

Motivated With success that has been achieved by in-depth learning methods such as convolutional neural networks (CNNs) [22], used in the classification of images and videos [23], there is an increase in interest to apply the approach in the field of action recognition as well. CNN can learn to extract features automatically from a large number of images labeled and outperform classic ML approaches using handmade features for image classification tasks. In [24] the CNN method classification of images is expanded to handle temporal video dimensions. The proposed architecture uses several layers of 3D convolution ranging from cubes in the initial 7-frame, which generates many analog information channels with handmade features, and subsampling layers that reduce the vector dimensions of the feature. The classification itself is also carried out by the last layer of neural networks.

The architecture in which two parallel networks captures spatial and temporal information proposed in [25]. One network operates on individual video frames, introduces actions from photo images, and others operate on the optical flow explicitly describing the movement between frames and forming a temporal introduction flow. The output of these two networks is integrated into the final decision score using the SVM classifier. The results obtained with CNNs in the introduction of action show the similar performance as classical methods [24,25].

### III. ACTIVITY UNDERSTANDING

The previously mentioned methods, due to intensive research that has been done are very accurate in recognition of simple actions but they lack the ability to deal with more complex and hierarchically related actions and activities.

Therefore, More descriptive models and logical operators must be used to present such activities with the help of expert knowledge.

The author [26] provides an overview of the current research in the field of understanding of activities and the overall model of activities of understanding activities, consisting of abstraction and modeling action, image.7. Abstraction is related to the problem of translating motion image input into the form can be understood by the action model to determine whether interesting actions have occurred. The final output can be in the form of certain activities or summaries of action. ABSTRACT is done using pixel features, objects and properties or logical knowledge facts. Modeling action includes traditional classification methods for actions, state models for knowledge representation in the space-time domain and semantic model for reasons for sequential actions. State modeling formalism includes: Machine Speed State (FSM), Bayesian Network (BN), Hmm, etc. The semantic model uses an interesting subset of action determined by the semantic relationship between their sub-actions. The semantic model depends on expert domain knowledge to classify an activity. It is usually applied if there is more complex actions that vary in their appearance [27, 28, 29]. Semantic models including grammar, petri nets, constraint satisfaction, etc. The deterministic nature of the semantic model makes it sensitive to inaccuracies in the lower level recognition, therefore the mechanism of fuzzy reasoning to handle uncertainty in observation and interpretation is generally desirable [30]. Writer [31, 32] uses a fuzzy knowledge representation scheme that allows uncertain knowledge modeling about the relationship between entitiesthatcouldbeusedforindistinctinterpretationofborders between actions in motion image sequence.

Figure 7. Activity understanding model after [26]

### IV. DATASETS

To Start building models for activity introduction, it is important to obtain a good video sample dataset that reflects the desired activity. There are many datasets available to the public for scientific research including recent datasets with additional information obtained using RGB-D sensors, accelerometers and position markers placed directly on models being observed, some sources, etc. In this paper it will be heredatasets.

**Princeton Tracking Benchmark** [33] Introduced 2013 consists of 100 datass tracking RGB-D with tracking software and online shipping scripts. The dataset includes real world recordings of various actions made by humans, pets and objection objects in the form of RGB(8bitPNGformat)and

accompanying Depth picture (16 bit PNG) picture (GBR. 8). Annotation is per-frame in the form of the Bounding box only cover the target object. This dataset is more relevant to tracking than doing an action identification but can function as an initial point in segmentation scenery.

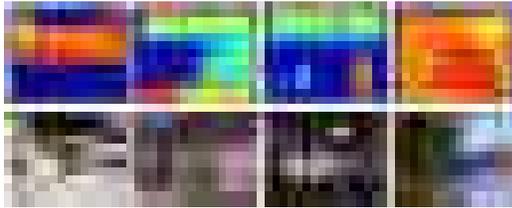

Figure 8. Princeton Tracking Benchmark [33]

**Cornell Activity DataSet: CAD-60 & CAD-120 [2].** CAD-60 comes with 60 RGB-D videos of 2 men and 2 women in the real world of closed environments: offices, kitchens, bedrooms, bathrooms, and living rooms that explain 12 activities: Mouth rinsing, brushing teeth, wearing contact lenses, talking phones, drinking water, opening pills containers, cooking (cut), cooking (stirring), talking on the couch, relaxing on the couch, writing on the board, working on a computer, Figure 9. CAD-120 consists of 120 videos RGB-D with the same number of people in the same environment. Activities are divided into 10 high-level activities (making cereals, taking medication, stacking objects, objects that are not stopped, micro food, objects, cleaning objects, take food, arrange food) and 10 sub-activity labels (reach, move, pour, Eat, drink, open, place, close, rub, null) with an object preaction label as you can reach, move, destite, closed. Position and orientation with a skeleton are labeled on each frame. RGBD data has a resolution of 240 times 320. RGB is saved as three-channel 8-bit PNG file and depth is saved as single-channel 16-bit PNGfile.

Figure 9. Cornell Activity Datasets: CAD-60 & CAD-120 [2]

**Northwestern-UCLA Multiview Action 3D Dataset [34]** contains RGB, depth and human skeleton data captured simultaneously by three Kinect cameras. This dataset include 10 action categories: pick up with one hand, pick up with two hands, drop trash, walk around, sit down, stand up, donning, doffing, throw, carry (Fig. 10). Each action is performed by 10 actors in a library from a variety of viewpoints.

Figure 10. Northwestern-UCLA Multiview Action 3D Dataset [34]

**RGB-D People Dataset [35]** collected by a three kinect sensor mounted vertically in the tower around

1.50 m high. It contains 3000+ RGB-D frames obtained in the University Hall and mostly contain people who stand upright and stand seen from different orientations and with various levels of occlusion, Figure 11. Annotation is made in a square box form. Deep images are stored as 16 bits, 1 PGM image channel - 640 by 480. They contain raw data content from the Kinect sensor. Namely, each pixel has a value between [0, 1084]. RGB images are stored as 8 bits, 3 channels of PPM - 640 by 480. Datasets do not provide activity annotations but offer material for art galleries research.

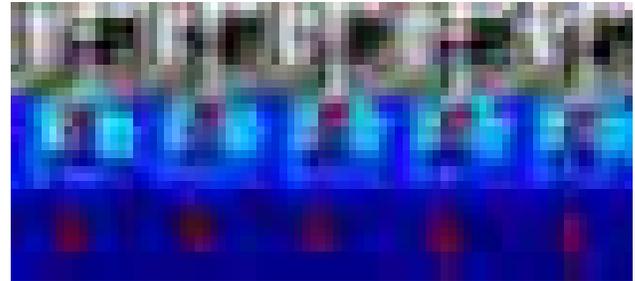

Figure 11. RGB-D People Dataset [35]

**UTD Multimodal Human Action Dataset (UTD-MHAD) [36] [36]** Collected using Kinect sensors and inertia sensors that can be used in the indoor environment. The dataset contains 27 actions taken by 8 subjects (4 women and 4 men). Each subject repeats every action 4 times. The dataset includes 861 data sequences. Four RGB video data modalities, deep videos, skeletal joints, and signal sensor inertia are recorded in three channels or utas (Fig. 12). One channel is used for simultaneous arrests of deep videos and the position of the skeleton, one channel for RGB videos, and one channel for signal sensor inertia (3-axis acceleration and 3-axis rotation signal). For data synchronization, the time stamp for each sample is recorded. Inertial sensors are charged on the right wrist subject or right thigh (see the picture below) depends on whether the action is mostly arm or a leg type of action.

Figure 12. UTD Multimodal Human Action Dataset (UTD-MHAD)

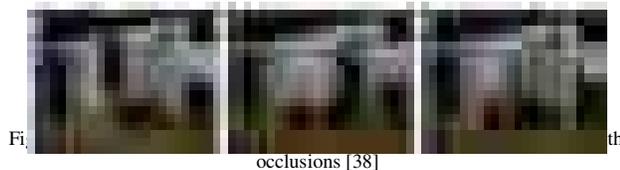

**Berkeley Multimodal Human Action Database (MHAD) [37]** contains 11 actions performed by 7 male and 5 female subjects in the range 23-30 years of age except for one elderly

subject. All subjects do 5 repetitions of each action, generate around 660 sequence of actions that match about 82 minutes from the total recording time. In addition, T poses for each subject are recorded that can be used for the extraction of a framework along with background data (with and without seats used in several activities). The specified set of actions consists of actions with movement on the upper and lower limb, actions with high dynamics on the upper extremities and actions with high dynamics in the lower limb. Each action simultaneously captured by five different systems: optical motion-taking system, four multi-view stereo vision camera arrays, two Microsoft Kinect cameras, six wireless accelerometers and four microphones. (Fig.13).

Figure 13. Berkeley Multimodal Human Action Database (MHAD) [37]

**Dataset of a human performing daily life activities in a scene with occlusions** [38] Consisting of 12 RGB-D video sequences someone who moves in front of Kinect in the scene with obstacles, Figure .. In addition to the image of depth and RGB, each sequence contains the synchronized basic truth data obtained from the Qualisys motion system with 8 infrared cameras. 3D representation of the human model is achieved using 15 position markers: one for head, neck and stem and 2for shoulders, elbows, wrists, hips andknees.

Fi. occlusions [38]

Recording Videos are another way to acquire datasets. Using a personal dataset allows adjustments to adopt the desired method, however, it takes time and requires significant resources to collect the desired record.

When building a personal dataset one of the things to consider is the approach of the camera number will be the most suitable. When one camera is used, the perception of lost depth and observed objects can be completely or partially hidden. Some cameras concentrate on observation objects from different positions providing more information. The camera position can be calculated as in [39] for optimal solutions. Some cameras can be set two ways. The camera field can overlap, which is more suitable for detailed action checks, or they can be placed side by side, called "Art Gallery". This method is used more in supervision [40]. Art gallery, too, allows greater submitted coverage with the same resource but sharing problem as one camera approach, only partial image is visible.

Overlapping The camera provides info about objects from different perspectives but there is an occlusion problem. This can be avoided using algorithms such as in [41] where inputs from different cameras are used sequentially which require a few samples and computing power.

Art galleries and one camera approach generally suffer from the absence of depth perceptions. Fortunately, the latest developments in the game industry carry affordable RGB-D sensors such as Microsoft Kinect and Asus Xtion which provide depth based on two cameras and wide use using the infrared spectrum. However, even though this sensor performs well, they are still inferior compared to marker-based systems [39].

## V. CONCLUSION

In This paper, the model overview, method for the introduction of actions is presented. Human models and methods based on trajectories, silhouettes and matching templates, spatio local descriptors and methods based on descriptors are presented along with their advantages and disadvantages. Recognition of actions that use local features has advantages compared to the classical approach, because local feature extraction does not require any type of human model or peer of people. There is an increase in interest in using convolutional neural networks that can automatically learn to extract features, and show sophisticated performance.

In terms of recognition of more complex actions and activities, the semantic model that uses expert knowledge is generally proposed.

In addition, paper gifts, in detail, the available image database is suitable for tasks in the introduction of actions with additional information obtained using RGB-D sensors, accelerometers and position markers.

### Abstract

In This paper, the introduction of human actions using hybrid neural networks is presented. This method consists of three stages: preprocessing, feature extraction, and pattern classification. For feature extraction, we propose a modified convolutional neural network (CNN) which has a three-dimensional receptive field. CNN produces a set of maps of features of the descriptor of actions that come from spatiotemporal volume. Weighted Fuzzy Min-Max (WFM) neural network is used for the pattern classification stage. We introduce the selection technique feature using the WFMM model to reduce the dimensions of the feature space. Two types of relevance factors between features and pattern classes are defined to analyze prominently features.

### I. INTRODUCTION

#### 1.1 Action Recognition

Recognition of human actions is very important for various practical applications such as intelligent autonomous systems, human-computer interactions, and visual supervision. However, one of the difficulties in developing action recognition systems is to complete the translation and distortion of features in different patterns included in the same class of action. Previous works about representation and recognition of actions have suggested several different approaches to overcome this obstacle. In [2], Davis and Bobick have developed a new view-based approach to representation and recognition of actions by building motion history images where pixel intensity represents the novelty of motion. Yamato et al. [3] Using the Hidden Markov model, which can be applied to analyze the time series with spatiotemporal variability, by transforming one set of Sequential images of time become sequences of symbols with vector quantization. Recently, Yilmaz and Shah proposed a new action

representative method called the action sketch resulting from the volume of view-invariant by accumulating only the object area of the input frame in a row [4]. Our work is motivated by the technique proposed Yilmaz and Shah for representation of combat templates.

In this paper, we propose a modified convolutional neural network model (CNN) that has a three-dimensional receptive field to extract the translation invariant feature of the volume of three-dimensional action. CNNs is a multilayered hierarchy nerve network inspired by BIO which reaches several degrees of change and invariant deformation using three ideas: local receptive fields, shared weight, and spatial subsamples [5, 6]. In our previous work [10], we proposed a weighted Fuzzy Min-Max (WFMM) neural network for pattern classification based on Simpson model [7]. The WFMM model is a hyperbox-based pattern classifier and provides a simple and powerful learning algorithm. This model has a gradual learning skills and can be used for feature selection techniques and reduce the dimensions of features. Two types of relevance factors between features and pattern classes are defined to analyze the similarity of features. The rest of this paper is compiled as follows. Part 2 provides a general description of the system recognition of the proposed action. In section 3, the feature extraction method uses the modified volume and CNN served. Part 4 Explain the technique of classification of action patterns using the WFMM model.

#### 1.2 Motivation

There Many bundles for the Ubiquity framework movement that combines video recovery, supervision, health care, human computer interactions and media outlets. Modern procedures of industrial systems that occur in risky conditions

for humans are usually directed with CCTV guidelines. There are many strategies in synthetic businesses, parts of the reactor or community for atomic fuel assembly. Unique cameras for several reasons incorporating a test camera test and thermographic camera which is a license administrator to the level of procedure. Traffic checks many cities and free systems have outstanding traffic after framework, utilizing a TV cap circuit to find clogs and watch accidents. Comparative framework is being developed as a way to recognize vehicles taken, criminals enter into the vehicle and so on. Observation camera also fill in as guests requirement cameras.

### 1.3 PROBLEM STATEMENT

There are various various human exercises. Depending on multifacetable properties, this is quite classified into 4 top notch levels 1. Signal, 2. Activities, 3. Connections, and 4. Collection activities.

1. The movement is the development of a casing, especially hands and heads that describe a large movement of an individual. Lifting hands, stretching arms is a very big motion. 2. Activities are the advantages of men or women who combine many signals. MIS: Walk, wave, run, bounce and so on

3. Connections include at least two people or objects acting on human exercises. Ex: hands vibrate between individuals, pick up items from other characters. four. Collection activities are developments wrapped in people or different contraptions. MIS: Fight, walk and so on. In this theory, we mainly consider developments to order to class. In this proposition the human movement recognition is carried out by the use of regulated learning. This procedure requires preparation and see the video dataset. At first the instrument was advanced to capture different developments. After Les Gadget, investigate the video treated with Classifier for classification. In this theory, we consider each the Simple single human activities and a few human developments. Area 1.5 portray about the various assortments of activities taken from the indistinguishable vintage database used to capture the moves utilizing this framework.

### 1.4 RESEARCH CHALLENGES

Human Action Recognition is a significant and testing research subject. The chief problem in development notoriety is that a similar activity can be cultivated in numerous methodologies by way of exceptional people and even by means of equivalent women and men as well. In this manner, to find a correct case of an activity is troublesome. The other trouble moving acknowledgment is because of impediment, see changes, demeanor, digicam, development, legacy mess, and variation in execution rate, anthropometry (logical see of the measurement and level of the human edge).

### 1.5 DATASETS

In this fragment the datasets utilized for the human movement acknowledgment are introduced. These datasets are utilized eminently in the examination field. These datasets contain the video recorded in a homogeneous memorable past. Weizmann developments The Weizmann activities dataset comprises of ten dioerent sorts of movement classes: bowing downwards, running, strolling, skipping, jumping jack, bouncing forward, hopping set up, dashing sideways, waving with two hands, and waving with one hand proven in

Figure.1.

**Figure 1 Weizmann actions dataset**

Each class actions performed by 9 subjects resulted in a total of 93 video sequences. Background in the video is homogenous and static. The nature of the video at the Weizmann dataset is the type: (. Avi) file VLC media Dimensions: 180 x144 Frame rate: 25 frames per second.

### 1.6KTH action

The Kth Dataset action is shown in Figure 4.2. Kth datasets consist of six human action classes dioerent: walk, jogging, running, boxing, waving and clapping. Every action class is done several times by 25 subjects. The sequence is recorded in

four scenarios different: outside the S1, outdoors with various scales of S2, S3 outerwear different, and in the S4A room illustrated below in Figure 2. The background is homogeneous and static in most of the sequence. In total, the data consists of 2391 sample video

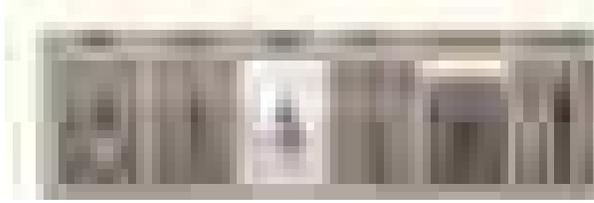

Figure 2 KTH dataset

### 1.7 Types of Activity Recognition

Premium principles stand out by combining spatial tracking systems increase with new data to prepare and study the technical framework for presenting various human practices (Tanzeem Choudhury et al.; Nishkam Ravi et al., 2005). For example, edge telephones) provide adequate data locators related to the capacity to replace the recognition of physical intrigues to be flexibly to estimate the revenue of vitality throughout the lifestyle. Leisure-based recreational activities are based on everywhere specialist agreeing with it with a guide to allow the current PC framework and sensor to take the best advertiser behavior (under Assent), the PC is better material to follow up for our benefit.

### 1.8 Project Aim

Perceiving Human interest in the video stream with a unique state has produced a significant subject in the PC vision bundle. Increased business objectives to recognize and describe human disorders from famous human articles in the video stream. The fundamental driver of this assignment is gracefully the advanced methodology that gets visual measurement of outline through video succession, and to represent this reality of definite utilization delineation. Moreover, a semantic depiction of this interest is produced. The reason for existing is to amplify the precision in both movement representation and notoriety. Basically the endeavor builds up a gadget dependent on speaking to and spotting human exercises: strolling and hand-forgoing.

Fig. 3. Overview of the proposed .

### . REVIEW OF LITERATURE

Recognition Human actions in videos are a challenging task that has received a large amount of attention to the research community. Compared to the classification of still images, temporal video components provide additional features for recognition, because a number of actions can be recognized more accurately based on the information of the human movement. In addition, videos provide natural data augmentation for single image classification. Video recognition research is mostly driven by progress in the image recognition method, which is often adapted and expanded to handle video data. But such methods involve the complexity of intensive computing which makes it not suitable for large datasets. Some methods have discussed the issue of estimating human poses using neural networks which are approaches that eliminate congestion joints when the computer vision approach is employed.

**Toshev et al. [5]** have estimated the human pose using a Deep Neural Network. The authors use a novel method using DNN's for visual classification and precise localization of articulated objects to the problem of human pose. Their method is able to capture the full context of each body joint and that a cascade of DNN- based pose predictors gives increased precision of joint locations. They are also able to achieve a running time of 0.1 seconds per image on a 12-core CPU. Despite the fast computation speed, their DNN-based regression method is still unable to give precise joint localization when the joints are occluded which was one of the problems of the earlier computer vision approach.

**Baccouche et al. [6]** developed a fully automated two-step neural-based deep model for human action

recognition without any prior knowledge. The first part extends the CNN to 3D case thereby learning spatio-temporal features. Then, using the learned features a recurrent neural network is used to classify the video. This automated steps removes the need for hand-crafted features for every specific task which can be highly problem dependent. They achieved an overall accuracy of 94.39% on the KTH dataset on cross validation with five runs. However, their method, since it involves a 3D Convolution has very high computation time which is a major drawback.

**Feichtenhofer et al. [7]** use a novel spatiotemporal architecture with a convolutional and temporal fusion layer to incorporate motion information for both appearance in still images and stacks of optical flow to mitigate the problem of occlusion of joints which occur frequently in real-life scenarios. They extend the work on the two-stream convolutional network for action recognition in videos by **Simoyan and Zisserman [14]** which had the problem of pixel-wise correspondences between spatial and temporal features. When the method is tested on the UCF-101 data, they report a 4.5% improvement in recognition when using a VGG-16 for both streams. However, these results can further be improved by combining Convolutional Network predictions with FV-encoded IDT features. Since all these approaches uses the spatio-temporal architecture, the computational time can become a big problem. The concept introduced by **Bilen et al. [8]** on the compact representation of videos which can be used in CNN's called dynamic images (RGB image which summarizes the whole video in a compressed format) would be good solution to the above problem. To achieve this, they build the dynamics of a video directly from the image pixels instead of an intermediate feature representation. This reduces the complexity, compression factor and the efficiency of the CNN whereas capturing the dynamic image. They report a 2- 3% accuracy improvements in the UCF-101 dataset and that dynamic images pooled on top of static RGB frames lead to better results. In order to improve the accuracy, the authors propose combining the dynamic images with sophisticated encodings.

**Hei Ng et al. [4]** propose two CNN architectures to process individual video frames, AlexNet and GoogLeNet. They investigate LSTM networks capable of learning from temporally ordered

sequences and various feature pooling architectures. GoogLeNet stacks Inception modules to form a network of 22 layers. It outperforms **Karpathy et al. [1]** by a margin of 4.3-5.6%.

Several methods exist to recognize actions by various methods.

**Sung et al. [9]** have devised a method to sub-sequences of the various activities using a two-layered maximum-entropy Markov model. They use a supervised learning method approach where the ground truth of the labeled data is given for training. They have reported an 84.3% accuracy for activity recognition on their dataset. The strength of their method is that it reports a neutral value most of the time which reduces the prediction error and also learn new actions. But, their method cannot be used when there is any occlusion and it cannot recognize actions where the human interacts with the environment. Meanwhile, Gupta et al. [10] in his work has shown that modelling of interaction between human poses and objects in a 2D video gives better performance for the tasks of object detection and activity recognition. But, it does not take into account the 3D relations between activity and the data and also the reduction in quality when using 2D data. Several approaches to the action recognition problem have used the human skeletal structure to predict actions. Although, these works have significant accuracy, their approaches are based on Recurrent Neural Network (RNN) and Hidden Markov Models (HMM) which don't use the inherent advantages of using a CNN which removes the problem of overfitting and has shown to significantly increase the accuracy of other image classification methods.

**Yong Du et al. [11]** divide the human skeleton into five parts according to the human physical structure and use five separate neural networks. They use a novel hierarchical bidirectional RNN to recognize the action of a human and compare it with four other architectures on the MSR Action 3D dataset. Their hierarchical RNN architecture outperforms all the other four architectures. But, one problem in their method arises from the overfitting and underfitting during training. Also, it becomes difficult to distinguish human actions only from the skeletal joints. Thus, the presence of more features in the recurrent neural network would improve the precision of human action recognition.

However, the use of RNN can lead to overfitting when the number of features is less when dealing with temporal data.

**Woo Young Kwon et al. [12]** developed an improved skeleton tracker and complexity based motion features by combining the joint positions from a Kinect sensor and a Kalman filter framework. They used a supervised learning with a deep recurrent neural network for this purpose. They use their own dataset which consists of 16 activity classes to test their method. They are able to achieve an accuracy of 70% which is around 11% greater than other baseline methods. But, their method is computationally complex since it involves computing the Kalman Filter at each time step of the video.

**Di Wu and Ling Shao [13]** use a hierarchical dynamic framework to extract the high level skeletal joint features and use deep neural networks to predict the probability distribution over the states of the Hidden Markov model. They choose a HMM due to the fact that an RNN tends to overemphasize the temporal information in the presence of insufficient data which can lead to overfitting. Their work is able to achieve better results on the MSRC 12 dataset when compared to Randomized Forest and Structured Streaming Skeletons with an F-score increase of around 0.01, but still cannot address the issue of overfitting which is present in RNN.

#### IV. CONCLUSIONS AND DISCUSSION

Conclusion And this paper outlook presented a new idea for the introduction of sensor-based activities. We introduce implementation of recognition of activities in the inner neural network model and visualization of data features in deep learning. Furthermore, most importantly that we visualize sensor-based activity data features extracted from CNN and data features are abstracts for a large number of researchers. This article is intended to provide a way of thinking for scholars, so we make an in-depth analysis of the map of visual features in one dataset mustp, which includes the visualization of the graph of activity data features extracted from layer layer and three. - CNN. After analysis, we manually extract important data characteristics for our model that has a greater impact on activities. We then verify the truth of the manual feature extraction of two aspects of theory and experiment. Classification accuracy increased to 96.1%. Experiments reveal that this paper can help solve problems in Chapter 2.1. Therefore, verified by experiments that our proposed idea promises, which laid the foundation for the next precision classification. Through in-depth analysis of features, we have identified relationships between activities, sensor data, and features. In addition, we analyze how in the neural network model in recognizing activities based on these features. The significant features mentioned in the experiment can be used not only in the paper method but also in other methods and ideas, which have a major significance of increased recognition of activities. Through visualization, we have a deeper understanding of mechanisms in neural networks. The ideas, findings and conclusions in the experiment are applicable not only to the field of activity recognition but also to other areas of deep

learning. However, in practice, the manual extraction of features is difficult to verify, particularly in the case of theoretical verification. It is necessary to know the location of sensor when each activity occurs. In future work, we will first present a method for extracting main features automatically. In addition, we ensure the accuracy of the enhancement by considering that we present a fusion model that combines the main features with the original features to enhance the data.

## Abstract

Spectrum sensing (SS) is a concept of cognitive radio systems at base transceiver stations that can find the white space i.e. licensed spectrum owned by primary users (PU), for transmission over a wireless network without any channel interference. The cognitive radio network is designed to overcome the problem of the limited radio frequency spectrum as most of the applications are dependent on wireless devices in 5G. The major concern that arises here is the detection of spectrum availability. The traditional approaches can solve this issue but consume a large amount of time and prior information about PU and spectrum. The objective of this paper is to give a solution to resolve such issues. In this paper, we have used the learning capabilities of deep learning algorithms such as Convolution neural network (CNN) and Recurrent neural network (RNN) for spectrum sensing without prior knowledge of PU. The proposed model is termed ensemble CNN and RNN (ECRNN) to learn the features of spectrum data and predict the spectrum availability at base transceiver stations in 5G. The simulation result of the ECRNN showed the improvement of accuracy of the system with a reduction in losses that occurred during the false alarm of prediction as well as an improvement in the probability of detection. ECRNN had analyzed PU statistics and result in better spectrum sensing. This paper also supported multiple SUs that would increase the speed of spectrum sensing and data transmission over the available limited spectrum at the same time.

**Keywords** Cognitive radio · 5G · Spectrum sensing · Deep learning · Probability of detection

## 1 Introduction

The advancement of 5G technologies and modern wireless communication systems had led to the scarcity of spectrum resources [1]. From different studies, it has been reported that

there is a variation of spectrum usage from 7% to 34%. So, to overcome the scarcity of the limited spectrum resources, Cognitive radio (CR) appeared as a potent approach that can balance the trade-off of demand and availability of spectrum resources [2, 3]. The main concept of CR is to reuse the

available unused frequency bands. These are also termed white spaces or spectrum holes. This method also ensures that there is no interference in the spectrum of licensed users [4]. The licensed user is technically termed a primary user (PU) whereas unlicensed users are termed as a secondary user (SU) (Fig. 1). The CR technology allows SU to access the available unused spectrum frequency bands in a non-interfering way to PU [5]. This makes spectrum sensing highly robust and efficient. An intelligent, multi-dimensional, adaptive, and wireless communication device that learns from its experience, plans, and determines future behavior to meet customer needs, can be described simply as a cognitive radio [6]. Cognitive radio has two major characteristics. One is the cognitive capacity that collects the information from its radio environment is the skill of cognitive radio technology. The second is reconfigurability that makes it possible to dynamically program the cognitive radio according to the radio environment necessary.

The four key functions of Cognitive Radio [7] are spectrum sensing, management, sharing, and mobility. Radio is continually looking for the unused bandwidth known as the void in the spectrum. This cognitive radio property is known as spectrum sensing. Once the spectrum holes are located, the available hole or channel is chosen by the cognitive antenna. This cognitive radio property is referred to as spectrum management. As long as the primary user does not require it, the property of cognitive radio to delegate the spectrum holes to secondary users is called spectrum sharing. It is the property where, when a licensed (primary) user is identified, the cognitive radio (CR) vacates the channel.

One of the aspects of 5G transmission is spectrum sensing for fast data transmission and utilization of limited spectrum

band. Empty spectrum was utilized for the elimination of congestion created due to traffic of a large amount of data. An efficient spectrum sensing algorithm is integrated with current 5G technologies. There is no way for disruption or delay of communication. Radio frequencies only can obtain spectrum sensing in cognitive radio [8]. To make the idea of cognitive radio performance, witnessing a licensed user's unused spectrum is important. Thus, the primary user is sensed to enable the mobility of the SU's channel in another part of the spectrum; if the primary user initiates the transmission. Efficient hardware is needed with minimal error. The detection threshold is the key. The intervention in the worst-case scenario should be considered. Future study of the spectrum and decisions rely on the right sensing of the primary consumer. This is known as the dynamic management of the spectrum.

Parametric and non-parametric schemes are two categories for spectrum sensing (SS). In the condition of parametric sensing, there is a need for prior PU activity information. Whereas in non-parametric schemes there is no need for any prior information. Therefore, non-parametric SS is preferred over parametric SS [9]. There are some conventional non-parametric (SS) techniques, for example, matched filter, cyclostationary, and energy detection are commonly used to their low computational complexity [10]. The matched-filter detection is used when the CR has previous information about PU. In this condition, a matched-filter can be considered to be the best detection technique. It's precise since the signal-to-noise ratio (SNR) is maximized. The matched filter coincides with the time version of the received signal. The primary user presence is calculated by a contrast between the final output of the corresponding filter and the specified threshold. Therefore, the matched filter will work weakly if this information is not correct. Similarly, a spectrum sensing technique that can distinguish the modulated signal from the additive noise is the implementation of a Cyclostationary function detector. Cyclostationary is a signal, provided it has a normal mean and autocorrelation. The identification of cyclostationary features will differentiate PU signal from noise and use the information present in the PU signal that is not present in the noise at a very low Signal to Noise Ratio (SNR). Due to its low computational and application complexity, energy detection is the most common means of spectrum sensing. No prior information about the primary users is required by the receivers. An energy detector (ED) essentially considers the primary signal as noise and, depending on the energy of the signal detected, determines the presence or absence of the primary signal. Even though these conventional SS methods have low computational complexity but these low detection rate with increasing communication advancements.

With the advancement of communication technologies from 5G to 6G, it is needed not only to adapt to the changing environment but also to adapt its hardware [11]. The current spectrum sensing techniques for cognitive radio network

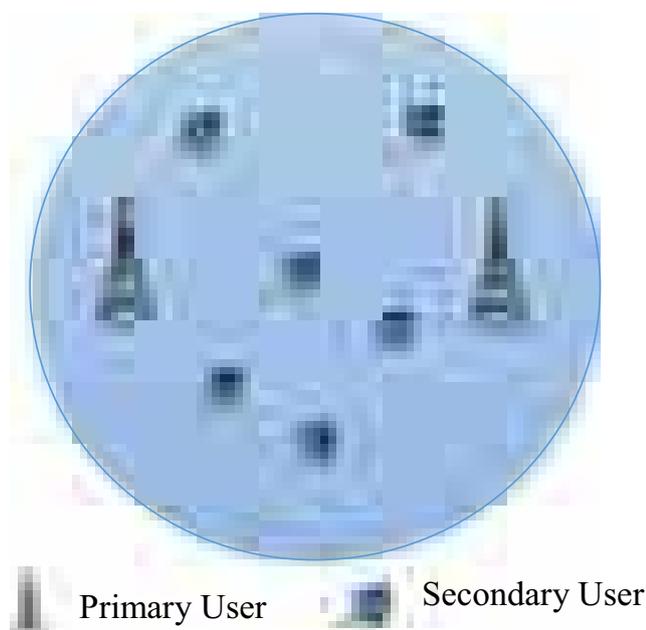

Fig. 1 An Example of Cognitive Radio Network

(CRN) requires the adoption of artificial intelligence or machine learning features. The journey of the communication system towards 6G needs deep learning trained transmission control because the traditional approaches consume a large amount of time and need prior information about PU and spectrum. So, to resolve issues of the traditional approach in CRN, this paper presented an application of computational intelligence algorithms (machine learning or deep learning) due to their learning ability so that they can learn the features of spectrum data and predict the spectrum availability at base transceiver stations in 5G.

### 1.1 Scope of the research

This paper is focused to design a blind spectrum sensing algorithm with the application of deep learning for cognitive radio (CR) system. The main scope of this paper is to mitigate the limitations of existing spectrum sensing algorithms for PU misdetection and to allow interference-free sensing of the spectrum. Based on the properties of the input data covariance matrix, this paper formulates the application of deep learning for spectrum sensing techniques. This paper employs the approach to detect PU activities in a blind state in which the sensing unit doesn't have prior knowledge about the PU activities or channel state. To overcome the limitations of practical spectrum sensing, aggregation of the most advanced method is expected. The data covariance matrix has different descriptive features such as energy, eigenvalues, etc.

It can be noted that the CNN model can learn the 2-D structured input data matrix. It has the powerful capability to extract correlation features from input covariance matrices. Whereas at the same time RNN can extract temporal features and can find time-shifted correlation features from the covariance matrix. In this paper, we propose the hybrid ensemble approach of CNN and RNN to extract energy correlation as well as temporal correlation to learn the PU's activities and pattern for spectrum sensing.

### 1.2 Key contributions of research

The key contributions of this paper are as follows:

In this paper, a state-of-the-art about spectrum sensing in cognitive radio is discussed along with detection techniques and associated challenges. Related works of researchers are also focused in this paper to explore their advantages and limitations for further improvement.

- We have proposed an ensemble deep learning model that supports a non-linear function termed ensemble CNN and RNN (ECRNN) to test the presence of PU in data samples.
- Further, we have also conducted simulation analysis under different test conditions to prove the efficiency of the proposed model concerning existing models.

### 1.3 Organization of Paper

The remaining section of this paper are illustrated to be as follows: Section 2 describes related works about spectrum sensing or detection in cognitive radio networks. In Section 3 paper illustrates the problem statement summarized from existing works. Section 4 gives a descriptive overview of the system model. Section 5 gives information about the performance parameters used. Finally, in Section 6 conclusion, limitations and future research scope are discussed.

## 2 Related work

In CRN, one of the major research topics for industrial application is spectrum sensing as the demand for high-speed data transmission is increasing day by day. The major function of spectrum sensing technologies is to sense the availability of spectrum. In the last few years, there is the development of different techniques for spectrum sensing for different scenarios such as blind, semi-blind, and non-blind. One of the approaches for the blind scenario was proposed by [9] termed as maximum to average eigenvalue ratio detector (MAER) and arithmetic to the geometric mean detector (AGM) [10] in which there is no need for known noise power. Similarly, in [12], a maximum eigenvalue detector (MED) and generalized likelihood ratio test-based signal subspace eigenvalues detector (GLRT-SSE) [13] was developed for the semi-blind scenario. This is termed semi-blind because there is a need for known noise power. Whereas in the condition of non-blind network scenario, sensing samples are needed for the detection process of PU. It has been reported in [14] that in non-blind conditions, there is the transition of PU from the silent state to transmission state and remains in the same period for the entire process. The Hidden Markov Model [15], had resolved the issues related to PU for such activities. In the current research area, machine learning or deep learning is also proposed for spectrum sensing. The local spectrum sensing quality can be improved by introducing the concept of cooperative spectrum sensing (CSS) whose function is to combine the local sensing information. In [16], the application of deep reinforcement learning (DRL) was adopted to classify the SU signals and resolved the CSS issues by reducing the signaling of SUs. Another deep learning approach such as long short-term memory (LSTM) [17] and convolutional neural networks (CNNs) [18] was proposed to detect available spectrum by learning the correlation between the energy of PU signals. In [19] hierarchical CNN model was proposed to learn co-relation between the energy of PU signals as well as the pattern of PU activities recorded from previous sensing data to enhance future sensing performance. It should be noted that CNN has shown up its capabilities to learn spatial features extracted from signals. At the same time, LSTM had shown up their capabilities for extraction of temporal features from energy correlation samples.

In [20] a combined CNN-LSTM detector was used. The energy correlation features are extracted from multiple sensing inputs and PU activity pattern was learned. The detection probability was increased by analyzing PU activities. The limitation of CNN-LSTM is that its computational complexity is somehow dependent on its input. In [21] spectrum sensing was proposed using LSTM which established the temporal correlation from spectrum data. The PU activity is also exploited to improve the performance of CR. The PU activities such as off period and the duty cycle is used as statistics to train the LSTM network. The detection process and classification accuracy were improved in terms of training time and execution time. The drawback of [21] was observed that it doesn't support multiple PU and SU scenarios which are considered to be a generic scenario. In [22] efficiency of DL is presented for spectrum sensing. But still in these DL algorithms learning process is generally based on a single feature that degrades performance in the noisy scenario. Furthermore, in [23] spectrum sensing is performed using two-autoencoder for OFDM scenario that gives better performance over traditional OFDM. In [24] CNN model is used for cooperative spectrum sensing (CSS) for multiple secondary users in a cognitive radio network (CRN) by using spectral and spatial correlation of each sense. In [25] deep reinforcement learning was used to explore the spectrum sensing issues in CRN. Even though these existing deep learning algorithms improve the detection performance that needs prior statistical knowledge. These methods are vulnerable to noise uncertainty.

### 3 Problem statement

The main working principle of spectrum sensing techniques to sense the available spectrum at base transceiver stations and to check whether the primary user is present or not. So, this arises an issue to track all channel statistics, spectrum characteristics to predict the available spectrum with high probability. During the last decade, there are much research presented, the most used statistic is the covariance matrix that contains different discriminative detection features. The key problem associated with spectrum sensing traditional techniques there is a requirement of prior knowledge about both PU signal and noise then only optimal performance is achieved. In traditional non-cooperative detection methods such as energy detection or cyclostationary detection algorithm there arise the problem of hidden terminal that generally occurs when cognitive radio is shadowed due to very low SNR values and detection methods cannot SNR sense the PU's presence. Designing an effective and robust spectrum sensing technique is a quite challenging task due to the level of complexity, accuracy, computational cost, error rate, etc. These performance parameters create a trade-off between the spectrum sensing technique and its requirements. Therefore, to resolve these issue

that arises a need for prior knowledge about primary users, computational intelligence algorithms showed up their efficiency. But still, there is a need to improvise their performance in terms of probability and accuracy of detection with reduced complexity. So, this paper had adopted a deep learning approach for detection and classification of statistics as PU and SU.

## 4 Methodology

### 4.1 System model

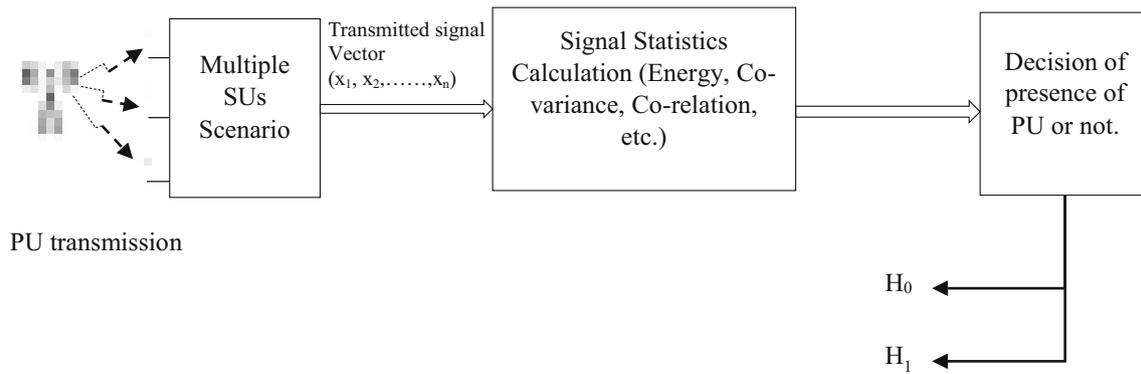

In this model, we have considered a multi-antenna scenario of cognitive radio, as shown in Fig. 2. This figure illustrates multi-antenna ( $A_m$ ) with observation vector ( $V_n$ ) for spectrum sensing. The spectrum sensing problem is formulated on the following hypothesis, Eqn (1):

$$\begin{aligned} H_0 : Y_n &= U_n \\ H_1 : Y_n &= h_n X_n + U_n \end{aligned} \quad (1)$$

Where,  $H_0$  represents the hypothesis of absence of PU i.e., PU is silent whereas  $H_1$  represents the hypothesis of the presence of PU i.e., PU is in an active state.  $X_n$  and  $Y_n$  represents the PU transmitted signal vector as well as the received signal vector.  $h_n \in C_m$ , that represents the channel index between PU and SU.  $U_n$  represents the received noise. In some scenarios, it may suffer some path loss or fading. As per the signal vector, we can design the decision statistics that detect PU state to be  $H_1$  in test statistics (T) based on decision threshold ( $D_s$ ). If the  $T > D_s$  then it will represent the presence of PUs otherwise, the PUs are absent. As illustrated in Fig. 2, the conventional framework for spectrum sensing in which transmitted signals are sampled together and the further test statistic is calculated for decision making. The CR will collect all signal vectors from multiple SUs system and further features associated with a signal vector such as energy, covariance matrix, co-relation, etc. to design the decision statistics methods such as ED [7, 26], MED [12], CM-CNN [18], CAV [26], etc. Based on a threshold value, test statistics will compare and finally decide the presence of PU. Hence, it can be stated that test statistics have importance for detection performance improvement. So, in this paper, we have focused on the deep learning model to design decision statistics to show its efficiency over existing techniques.

### 4.2 CNN-based framework for Spectrum sensing

We have adopted the deep learning approach and termed it as ensemble CNN and RNN (ECRNN). As compared to machine learning, deep learning showed up its proficiency of great learning capacity. Another issue with the machine learning problem is the overfitting problem that is resolved by deep learning.

**Fig. 2** Conventional framework for spectrum sensing

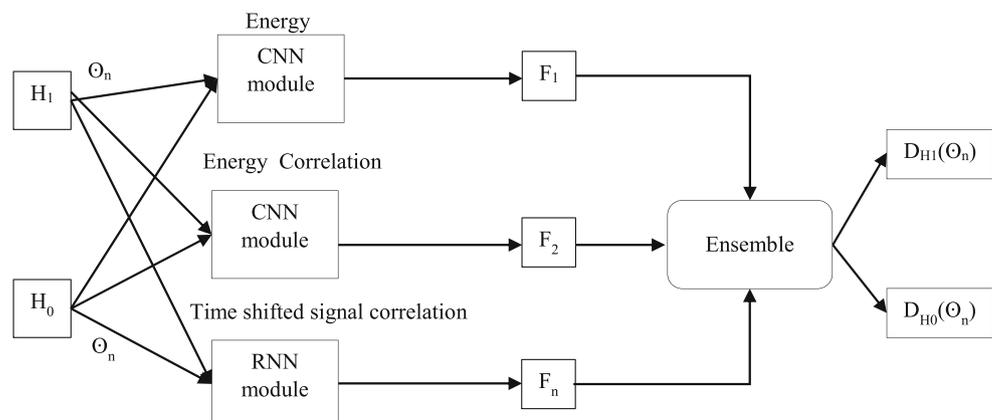

Therefore, we have adopted deep learning for PU presence from previous signal statistics. While training there is a requirement of labeled data, even for the deep learning (DL) approach. In this paper, we have taken  $Y = \{(x_1, l_1), (x_2, l_2), (x_3, l_3), \dots, (x_N, l_N)\}$  where  $Y$  is termed as a training set having training data of size 'N' with input data,  $x_N$  and  $l_N$  represents the labeled data. The PU presence is represented by  $Y$ . As it is observed that with the increased size of training input, the computational complexity increases. For PU sensing, sampling statistics may contain redundant data, because it may be from the same distribution source. Therefore, there is a requirement to pre-processing the input data before the start of the training process. The energy correlation and cyclostationary correlation are the two most important features that are applied in this paper.

In this paper, we have proposed an ensemble deep learning approach using CNN, as illustrated in Fig. 3. In this, two inputs, sample covariance matrix ( $\odot_n$ ) are fed into two CNN layers and one RNN layer respectively, as covariance matrix is considered to be the complex mathematical problem that contains real and imaginary parts. CNN and RNN layers are illustrated in Figs. 4 and 5 respectively. Here RNN is used for time-shifted correlation feature extraction because it can work effectively in time series data. In the case of the  $H_0$  hypothesis, the feature information such as energy is given in diagonal elements of the real part of the

matrix whereas, in the case of the  $H_1$  hypothesis, feature information is scattered. The difference between features of  $H_0$  and  $H_1$  is enough for the learning process of CNN. The training covariance matrices ( $\odot_n$ ) of both hypotheses are fed into three layers of CNN. Then each layer works on three different feature vectors out of the input covariance matrix. In this architecture, three features are considered, energy, correlation, and time-shift signal correlation, individually and lastly their decisions are ensemble together to make a final decision of either presence of PU,  $D_{H_1}(\odot_n)$  or absence of PU,  $D_{H_0}(\odot_n)$ , such that  $D_{H_0}(\odot_n) + D_{H_1}(\odot_n) = 1$  where  $D$  stands for decision parameters of CNN.

The convolution component in our spectrum sensing structure consists of three sub-blocks. Each sub-block also consists of a convolution layer a leaky rectified linear unit (LReLU) layer, which is also linked together in tandem. The retrieved spatial features of input data are fed into a 2D convolution layer. Each filter is set to  $3 \times 3$  in the convolution layer. The convolution layer depth for the basic  $i_{th}$  sub-block is set to  $C_i$ . To keep the result as same as that of the input set the stride to one and use the zero paddings. The LReLU layer activation layer complements non-linearity to the CNN. The convolution layer is linear that cannot classify non-linear data without the presence of LReLU. The fully connected layer classifies the function by obtaining the results of extraction of the function. At last, a fully connected (FC) layer is applied that performs classification process taking

**Fig. 3** The network structure of ensemble CNN

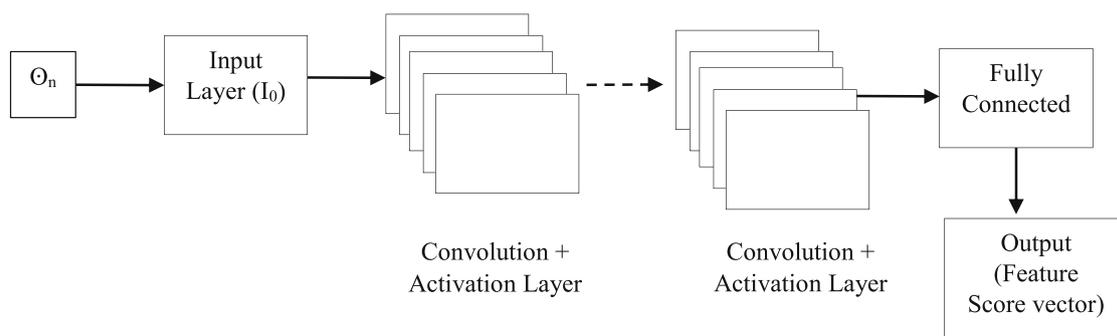

Fig. 4 CNN Architecture

input from the output of the previous convolution layer. The performance of the FC layers is then integrated into the ensemble classification system. By applying the ensembling approach final decision about the presence of PU or absence of PU is taken with the boosting function. Indexes 1 and 0 will present the presence and absence of PU respectively. The performance of CNN can be decreased there is no information about the presence of SU that makes the learning process difficult. Here, many CNN models with multiple SU permutations can be trained simultaneously that can achieve the highest accuracy. A permutation operation is performed for the correct order of the SU index that can be found in a data array to boost SS efficiency such that the sensing result of neighboring SU is located close to one another. The trained model can then be used to evaluate  $H_1$  state or  $H_0$  state based on different detecting outcomes. While preparation for the spectrum sensing process can lead to computational overhead, the conclusion of the final sensing result can, as shown later in the performance assessment, be carried out with relatively low overhead so that the operation of our proposed system in real-time is feasible.

### 4.3 Network training and complexity analysis

#### 4.3.1 Network training

When dealing with the offline based training modules the unlabelled samples are accumulated and constructed to bring about the formation of training data set,  $(X, L) = \{(x_1, l_1), (x_2, l_2), (x_3, l_3), \dots, (x_N, l_N)\}$ . The  $(X, l)$  is the training sample in the equation and the value of the example persisting in it. While taking into account only a single example in this set,  $(x, l)$  then they in it

is indicative of the input value provided to the neural network for the training purpose. The value  $y$  as an input can be a raw observation vector or can also be utilized in the form of the test statistic that has been derived from the observational vector. The  $X$  and  $L$  are indicative of the collections comprising the data associated with  $x$  and data associated with  $l$  respectively. The architectural design for the training has been done by utilizing the ensembling of CNN and RNN architecture to extract the features from the training set. The study concludes the ECRNN training requires to be dealing with the classification problems as the spectrum identification and sensing is a binary testing challenge. Therefore, the  $(x_N, l_N)$  being a single part of the set, the label for it can be encoded as one vector, Eqn (2):

$$l_N = \begin{Bmatrix} [1]^N, & H_1 \\ [0]^N, & H_0 \end{Bmatrix} \quad (2)$$

The Training process of ECRNN shall maximize the likelihood,  $L(\odot)$ , based on Eqn (3).

$$L(\odot) = P(L|X; \odot) = \prod_{k=1}^k \left( D(\odot)_{H_1}(x_N) \right)^{l_N} \left( D(\odot)_{H_0}(x_N) \right)^{1-l_N} \quad (3)$$

In terms of log-likelihood:

$$\begin{aligned} l(\odot) &= \log L(\odot) \\ &= \sum_{n=1}^N l_N \log D(\odot)(x_N) + (1-l_N) \log(1-D(\odot)(x_N)) \end{aligned} \quad (4)$$

This can be used for maximizing the cost function,  $C_f$ . The posterior probability enhancement  $P(L|X)$ , can only be achieved by the optimal  $\odot$  evaluation that forms the key objective for the proposed model training process.

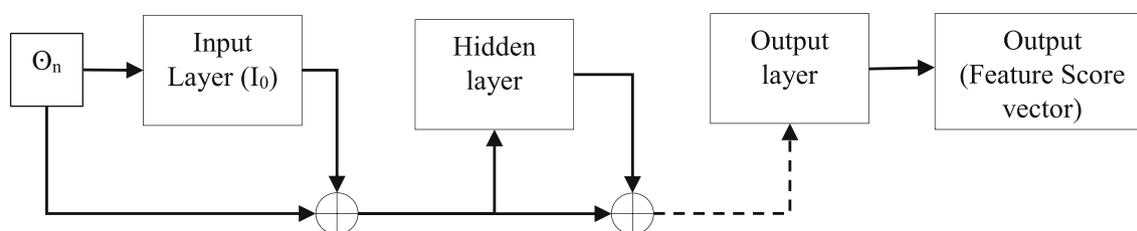

Fig. 5 RNN Architecture

$$C_f = \max(P(L|X), \odot) \quad (5)$$

The derivation of a well-trained ECRNN model is achieved by continuously updating the ECRNN network parameters via another backpropagation algorithm of calculation that is dependent on the cost function achieved the well-trained network is represented as Eqn (6):

$$D_{\odot}^*(x) = \begin{bmatrix} D(\odot)_{|H_1}^*(x) \\ D(\odot)_{|H_0}^*(x) \end{bmatrix} \quad (6)$$

The expression comprises of the well-trained CNN network having input as  $x$  which is indicated by  $D_{\odot}^*(x)$ . The expression  $D(\odot)_{|H_1}^*(x)$  depicts the class score for  $H_1$  or  $H_0$ . These can be used to derive the posterior probabilities associated with two hypotheses, Eqn (7):

$$\begin{aligned} H_1 : P(H_1|x) &= D(\odot)_{|H_1}^*(x) \\ H_0 : P(H_0|x) &= D(\odot)_{|H_0}^*(x) \end{aligned} \quad (7)$$

When the system is completely and efficiently trained with respective parameters, we can say that the training process is converged as well as “well trained”. On referring to the Bayes theorem Eqn (8) [28]:

$$\begin{aligned} P(x|H_1) &= \frac{P(H_1|x) \cdot P(x)}{P(H_1)} = \frac{D(\odot)_{|H_1}^*(x) \cdot P(x)}{P(H_1)} \\ P(x|H_0) &= \frac{P(H_0|x) \cdot P(x)}{P(H_0)} = \frac{D(\odot)_{|H_0}^*(x) \cdot P(x)}{P(H_0)} \end{aligned} \quad (8)$$

Where,  $P(x|H_i)$  = conditional probability,  $P(H_i)$  = prior probability of  $H_i$ , and  $P(x)$  = marginal probability.  $P(x|H_1)$  and  $P(x|H_0)$  are calculated and the conclusion is drawn that the NP is indicative of the optimum statistic for the test which is the likelihood ratio (LR).

### 4.3.2 Neyman Pearson detection

To maximize the probability of detection ( $P_d$ ) for a given PFA, we decide  $H_1$  if

$$P_d = \frac{P(x|H_1)}{P(x|H_0)} > D_s \quad (9)$$

The derivation of the ECRNN has been made as Eqn (10),  $x$  utilizing the above equations.

$$\begin{aligned} L_{ECRNN}(x) &= \frac{D(\odot)_{|H_1}^*(x)}{D(\odot)_{|H_0}^*(x)} \cdot \frac{P(H_0)}{P(H_1)} \\ &= \frac{D(\odot)_{|H_1}^*(x)}{D(\odot)_{|H_0}^*(x)} \geq D_s \end{aligned} \quad (10)$$

The  $D_s$  is the threshold value selected that is derived by the false alarm constraint and the  $L_{ECRNN}(x)$  is the test statistic framework indicating the ECRNN. The ECRNN testing framework helps in acquiring posterior probabilities for two distinct hypotheses by training the data set of  $(X,L)$ . However, it has been found that the training process generates posterior probabilities associated expressions that were not suitable for testing the samples that command the requirement of the conditional probability-based derivation of the ECRNN during the detection process. To achieve this  $P(x|H_1)$  and  $P(x|H_0)$  are being derived as the conditional probability that utilizes the Bayes' hypothesis for derivation. The process follows the attaining ECRNN that lays on the NP theorem. Further, the decision-making process shall inculcate comparison with a detection threshold ( $D_s$ ). The threshold value can even be determined with a method referred to as the Monte Carlo process that aids in achieving the  $P_d$  required. The training process is performed using Algorithm as shown below:

---

#### Algorithm 1 Training algorithm

---

- 1: Procedure Training parameter (Max\_epochs, Batch\_size, X, y,  $\alpha$ )
  - 2: for  $i = 1$ :Max\_epochs do
  - 3: Input[ $Y = \{(X_1, l_1), (X_2, l_2), (X_3, l_3), \dots, (X_N, l_N)\}$ ]
  - 4: Feature Vector( $F_v$ )  $\leftarrow$  extract(X)
  - 5: Train(DNN)  $\leftarrow$   $F_v$
  - 6: If likelihood ratio ( $L_r$ ) > threshold ( $\lambda$ ), {Maximize Probability of detection ( $P_d$ )}
  - 7: End if
  - 8: End for
- 

### 4.3.3 Testing process

The test data that is to be utilized during the detection based on the test framework is represented as  $\tilde{X}$  for a single as well as multi SU system that aims at achieving this data as a set of unlabelled samples. The ECRNN is trained for  $\tilde{X}$  samples of the collected data and further the ECRNN steps are processed for the test samples, this is denoted by the Eqn (11):

$$L_{ECRNN}(\tilde{X}) = \frac{D(\odot)_{|H_1}^*(x)}{D(\odot)_{|H_0}^*(x)} \geq D_s \quad (11)$$

The inherent comparison with the threshold value that has been preset previously, can bring about the decision-making process after achieving the test statistic. It has also been found that currently, an existing algorithm such as DL-based sensing of the spectrum has the capability of completely replacing the system with the neural network for end-to-end analysis and detection. The work in this process shall not comprise of the provision to define the threshold for attaining the  $P_d$ . The ECRNN based schemes for spectral identification hold within itself the framework for determining the current practical threshold value during the function other than other frameworks, whose objective of to

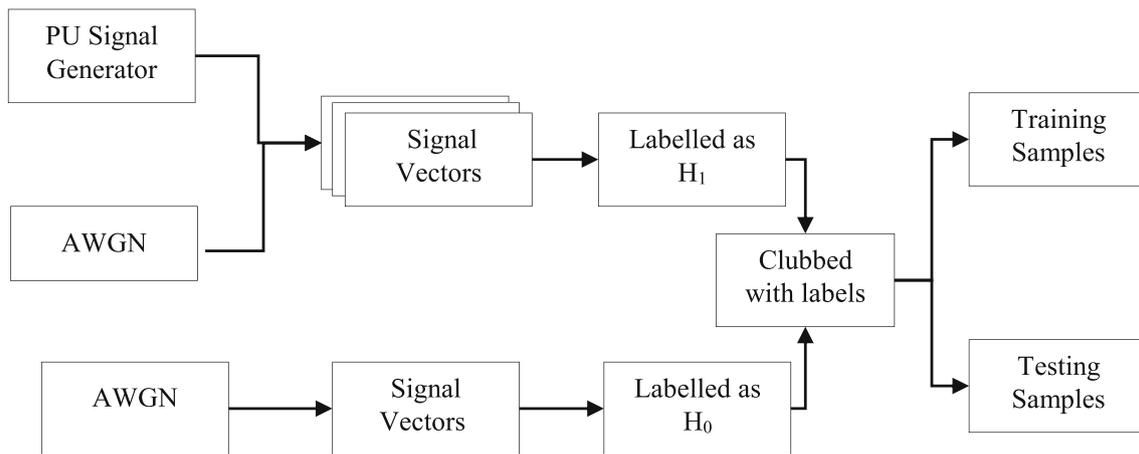

Fig. 6 Dataset Preparation for ECRNN

keep updating the threshold value to achieve the desired  $P_d$ . The complete algorithm of ECRNN (called Spectrum Sensing algorithm using ECRNN) is given below :

Algorithm 2 Spectrum Sensing using ECRNN

- 1: Initialization
- 2: Set epoch =1
- 3: Start Training (X,L)
- 4: Feature Vector( $F_v$ )  $\leftarrow$  extract(X)
- 5: Train(DNN)  $\leftarrow$   $F_v$
- 6: While epoch<max\_epochs
- 7: do
- 8: Update  $D_s$
- 9: epoch =epoch+1
- 10: End for
- 11: Set  $D_s$
- 12: Input Test ( $\tilde{X}$ )
- 13: Feature Vector ( $\tilde{F}_v$ )  $\leftarrow$  extract( $\tilde{X}$ )
- 14: Compare with  $D_s$
- 15: Identify PU activity
- 16: End

#### 4.3.4 Complexity analysis

While training any network, the complexity of CNN for processing one data sample is evaluated to be as in Eqn (12) [29]:

$$O\left(\sum_{p=1}^P N_{k,p-1} S_{k,p}^2 n_{c,p} O_{k,p}^2\right) \quad (12)$$

where  $P$  = Number of convolution layer with  $N_{k,p-1}$  to be the number of input channels. With  $N_{k,p}$  as number of convolutional kernels for  $p$ th kernel with the spatial size of  $S_{k,p}^2$  that generates  $O_{k,p}^2$  of the output feature map. We have designed the CNN layer of ECRNN with two convolution layers and taken the input of real and imaginary data of size  $(S \times S \times 1)$ . The CNN stride is set to 1 to reduce the computational complexity. While for the RNN network, the computational complexity is dependent on the number of neurons and internal parameters of the network. This can be illustrated in Eqn (13):

$$O(n_i) \quad (13)$$

Fig. 7  $P_d$  versus SNR

Fig. 8  $P_f$  versus  $P_d$

**Fig. 9**  $P_f$  versus  $P_m$

Where  $n_i$  is the number of neurons present in hidden layers. Therefore, the complexity of ECRNN for one data sample is represented as in Eqn (14):

$$O\left(\sum_{p=1}^P N_{k,p-1} S_{k,p}^2 n_{c,p} O_{k,p}^2 n_i\right) \quad (14)$$

#### 4.3.5 Dataset preparation

In this subsection, the dataset required for training the proposed ECRNN model is prepared. The spectrum data is used for training and test validation purposes. The data is captured through a simulation setup (Fig. 6). The clean PU signal is generated from the generator and its spectrum power is measured as  $\sigma_x^2$ .

The Additive white Gaussian noise (AWGN),  $n$ , is added to achieve a required signal-to-noise ratio (SNR). This noise is added to PU signal for timestamp  $t$ .

$$X = [x_1, x_2, \dots, x_t]^T \quad (15)$$

**Fig. 10** ROC Curve for single SU

For this study, approx. 5000 data samples are generated in the SNR range  $-15$  dB to  $+5$  dB having equal number of PU signal and AWGN signals. The generated dataset is divided into 2 sets 70% training and 30% testing samples.

## 5 Results and discussions

In this section, the simulation setup of ECRNN is presented. In our implementations, we have utilized the MATLAB platform for training and testing scenarios. The training is performed with different data samples having two classes i.e.  $H_1$  and  $H_0$ . The individual CNN or RNN are trained on different signal features and their results are ensembled together to generate the final result.

For training, the model simulation was performed with 10,000 data samples in which 7000 data samples are used for training and 3000 data samples are used for testing. The learning rate was set to be 0.0003 and 64 sample patches are used. The performance metrics are used to show the relationship between the probability of false alarm rate ( $P_f$ ), probability of detection ( $P_d$ ), and probability of misdetection ( $P_m$ ). The variation of  $P_d$  concerning  $P_f$  is also observed. The training process is performed using Algorithm 1. While Algorithm 2 is used to test the data samples for the presence of PU.

### 5.1 Relation between $P_f$ and $D_s$

**Theorem 1** In spectrum sensing, theoretically, the probability of false alarm ( $P_f$ ) is related to decision threshold ( $D_s$ ) value as following in Eqn (16):

$$P_f = (1 - D_s)^{M-1} \quad (16)$$

**Proof** When there is the presence of noise in the channel, the Cumulative Distribution Function (CDF) of  $D_s$  is evaluated as Eqn (17):

Fig. 11 ROC Curve varying SNR for single SU

$$F_d = 1 - (1-d)^{M-1}, 0 \leq d \leq 1 \quad (17)$$

Where  $P_f$  is represented as Eqn (18):

$$P_f = P_r[d \geq D_s | H_0] = 1 - F_d \quad (18)$$

Where  $H_0$  represents the absence of PU.

By substituting the value of  $F_d$  into Eqn (19), it has been proved the relationship between a false alarm and decision threshold. So, the threshold can be computed as:

$$D_s = P_f^{\frac{1}{M-1}} \quad (19)$$

## 5.2 Relation $P_m$ and $P_d$

**Theorem 2** For  $t$  cyclostationary detection, the Probability of misdetection ( $P_m$ ) is calculated as in Eqn (20):

$$P_m = 1 - P_d \quad (20)$$

Proof: Probability of detection ( $P_d$ ) is calculated as in Eqn (21):

$$P_d = P_r[d \geq D_s | H_1] \quad (21)$$

Where,

$Q(\cdot)$  = q-function.

$d$  = signal-to-noise ratio (SNR) at the receiver and  $H_1$  represents the presence of PU.

The probability of misdetection ( $P_m$ ) is calculated as in Eqn (22):

$$P_m = 1 - P_d \quad (22)$$

Figure 7 represents the graph of Probability of detection ( $P_d$ ) concerning SNR whereas Fig. 8 represents the graph of  $P_f$  concerning the probability of detection  $P_d$ . The figure shows that with an increasing number of samples (NoS) the  $P_d$  increases. Similarly, Fig. 9 represents the probability of misdetection ( $P_m$ ) with respect  $P_f$ . The figure concludes that with increasing samples the  $P_m$  decreases.

Fig. 12 ROC Curve varying NoS for single SU

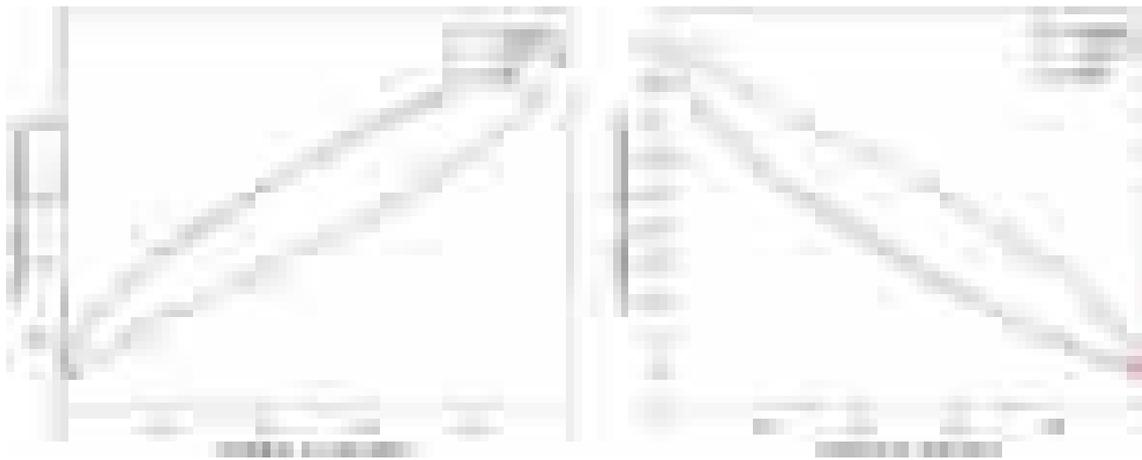

Fig. 13 ROC Curve for multiple SUs

### 5.3 Performance parameters

While simulating the proposed ECRNN model, the performance parameters used here are Receiver Operating Characteristics (ROC) for  $P_d$  against  $P_f$  for single and multiple PU. The ROC curve represents the area to show the relationship between  $P_d$  and  $P_f$ . The area increases with increased model performance. Three scenarios are created 1st is to observe at fixed SNR, the second with variable SNR, and the third is variable NoS. The performance of ECRNN is compared with CNN [19] and ED. Another parameter used to evaluate the performance of the proposed ECRNN are computational time and error rate. The time represents the total execution time for performing training as well as testing simulation. The error rate represents the mean square error (MSE) that occurred during training. This is evaluated by finding the mean of the squared difference between target and reconstructed value. MSE is calculated as in Eqn (23).

$$loss_{mse} = \frac{\sum_{i=1}^N (x_t - x_r)^2}{N} \quad (23)$$

Where,  $x_t$  = target value,  $x_r$  = reconstructed value,  $N$  = Number of samples.

### 5.4 Result analysis

Figure 10 illustrates the comparative ROC curve for different spectrum sensing methods. The figure is plotted for SNR = -15 dB. For comparison, the NoS taken is 20. In the comparison of ECRNN with other techniques such as ED [7] and CNN [30] the training data and scenario are kept the same. This simulation was performed for single PU and single SU and trained accordingly. As each module contains different features and input to CNN is single column so, we have taken a 1-D CNN network. The model was created, trained, and tested on the MATLAB platform using the deep learning library. We can analyze from the graph plot that ECRNN gives a better result as compared to other sensing techniques even at SNR of -15 dB. Due to the ensembled architecture of ECRNN, it gives better performance because it combines the combined results from different features while other existing

Fig. 14 ROC Curve varying SNR for multiple SUs

**Fig. 15** ROC Curve varying NoS for multiple SUs

techniques give results on a single feature such as energy correlation. Figure 9 represents the ROC for the probability of detection ( $P_d$ ) concerning false alarm ( $P_f$ ) as well as ROC for the probability of misdetection ( $P_m$ ) concerning  $P_f$ . Figure 11 represents the ROC curve for the  $P_d$  concerning  $P_f$  as well as the ROC curve of  $P_m$  concerning  $P_f$ . In this scenario, a comparison was performed with varying SNR values from 0 dB to -15db. The graph illustrates that with increasing SNR the  $P_d$  decreases and  $P_m$  increases. Figure 12 represents the ROC curve for the  $P_d$  concerning  $P_f$  as well as the ROC curve of  $P_m$  concerning  $P_f$ . In this scenario, the comparison was performed with varying data samples with -15 dB SNR. The graph illustrates that with an increasing sample the  $P_d$  increases and  $P_m$  decreases. Figure 13 illustrates the comparative receiver operating characteristics (ROC) curve for different spectrum sensing methods. The figure is plotted for SNR = -15 dB for multiple SUs scenarios and the NoS taken is 20. The graph represents the ROC for the probability of detection ( $P_d$ ) concerning false alarm ( $P_f$ ) as well as ROC for the probability of misdetection ( $P_m$ ) concerning  $P_f$ . Figure 14 represents the ROC curve for the  $P_d$  concerning  $P_f$  as well as the ROC curve of  $P_m$  concerning  $P_f$ . In this scenario, a comparison was performed with a varying number of SU, and the values of SNR are -15db. The graph illustrates that with an increasing number of SU the  $P_d$  decreases and  $P_m$  increases. Figure 15 represents the ROC curve for the  $P_d$  concerning

$P_f$  as well as the ROC curve of  $P_m$  concerning  $P_f$ . In this scenario, a comparison was performed with varying data samples with -15 dB SNR under multiple SUs scenario. The graph illustrates that with an increasing sample the  $P_d$  increases and  $P_m$  decreases.

Similarly, Table 1 represents the computational time evaluated in seconds for training and testing samples using the ECRNN algorithm. The algorithm is implemented in MATLAB and executed on a PC with an Intel Core i5 3.71GHz CPU and 2 GB Nvidia graphics with 8GB RAM. In summary of existing work, the proposed method achieves the optimal solution concerning detection. Even though the ECRNN had achieved optimal solution but still there is needed to reduce the computational complexities. If this model is parallelly executed on GPU, then it would be very much helpful to reduce computational complexity. Similarly, in Table 2 error rate is evaluated for the detection process and it can be inferred that ECRNN achieved less training error as compared to the CNN model.

## 6 Conclusion

This paper is dedicated to spectrum sensing problems using the application of CNN models. For this ensemble, CNN and RNN technique is developed and termed as ECRNN and presented over single and multiple user scenarios. In the first

**Table 1** Computational Time Analysis (in seconds)

Algorithms	ECRNN
For Single SU	85.97 s
For Multiple SUs	166.14 s
For Varying SNR	314.26 s
For Varying Samples	297.011 s

**Table 2** Error Evaluation

Algorithms	ECRNN	CNN [15]
For Single SU	0.0004320	0.0094
For Multiple SUs	0.000220	0.0125
For Varying SNR	0.000275	0.0115
For Varying Samples	0.0004378	0.0098

scenario, a single SU is considered under a varying NoS and varying SNR. Whereas in the second scenario, multiple SUs was considered with varying number of samples, SU and SNR. For training energy, correlation and time-shifted correlation was considered to be as a feature vector and individual DL model was trained and their results are ensembled together to give the final result. The detection of test data samples was performed using an ensemble approach which results in the optimal solution. The simulation results were performed and performance was evaluated by ROC curve analysis as well as time complexity and error rate. The result analysis showed better performance concerning the CNN model as well as the traditional ED model.

In this paper, we provide a theoretical analysis of the advantages of ECRNN over other methods. Then simulation experiments are performed for the probability of detection concerning variable SNR and showed up its robustness as well as scalability. The results have shown that the proposed CM-CNN method could achieve almost the same performance as that of the optimal E-C detector whether the PU signals are independent or correlated.

The limitation of this work is that with increasing SU there is a decrease in detection performance which needed to be optimized. These limitations can be improved in the future by deciding the optimal number of SU that can be handled. In the future, this work will also be enhanced with a path fading channel scenario along with noise.

## ABSTRACT

As of late, the idea of brilliant urban areas have picked up incredible fame. Steady actions are made in meadow of IoT to augment the competence and dependability of metropolitan framework concerns. The gridlock, restricted vehicle leaving offices and street well-being are being tended by IoT. In this paper, we present an IoT based cloud coordinated rich parking lot framework using IR sensor and ultrasonic sensor. The proposed parking scaffolds encompass of an IoT module that is exploited to VDT and signalize the circumstance of convenience of each sole parking dot. An OLED which consents an end patron to verify the openness of parking dot which is controlled by a Wi-Fi module. The paper additionally illustrates an elevated point perspective on the frame-work design.

## 1. Introduction

Smart parking system is a compelling apparatus for the board of parking space through better access control and parking income strategy in occupied territories in enormous urban areas, for example, shopping edifices, arenas and other famous spots, particularly during their pinnacle hour. Smart parking is smart parking system which helps in reducing and tackling the regular issue of distributing parking space [1-4]. Smart Parking System improves security, productivity and versatility, enhances the parking monetary execution and expands vehicle turn, and, likewise helps in keeping away from clog and henceforth lessens contamination. To oversee and check the parking openings, smart parking system is created, implemented and tried. There is a requirement for smart parking system since it is easier contrasted with other and establishment is simple. A smart parking system has been intended to encourage parking of vehicles. Probably the most goal of this exertion is to dissect how human direct could be diminished from finding the parking territory. The Proposed technique connected with is to persistently observing the accessible of void parking openings; this system is effective and smart approach to robotize the administra-

tion of the parking system that assigns a proficient parking space utilizing web of things innovation [5-7].

With developing prominence of tidy cities, up there is consistently an interest for smart answers for each area. The modern IoT has empowered the chance of elegant cities with it's above the web manage protocol. An individual can manage the gadgets introduced in home from anyplace on the planet by utilizing a medium electronic phone or any web associated gadgets [8,10]. There are different spaces in a stylish city and elegant parking is one of the famous areas in the elegant city. Today comparative methodology will be pursued and a stylish parking arrangement will be assembled which definitely utilize a ultrasonic sensor to identify automobile occurrence and trigger the door to release or close consequently with mystery solution for approval [9,11].

## 2. Related work

Rico et al. (2013) proposed a smart parking strategy for office territories. The entire territory of parking openings is separated into various zones. Every region has three least parking spaces. In a parking space the presence of vehicle is distinguished by sensor circuit. The sensor circuit comprises of two primary parts IR transmitter and IR beneficiary and comparator IC LM358. IR transmitter communicates the IR light, if vehicle is available, the infrared light is emanated back and gotten by IR collector [12]. These signs are

\* Corresponding author.

E-mail address: [bedipradeep1983@gmail.com](mailto:bedipradeep1983@gmail.com) (P. Bedi).

analyzed by operational speaker IC LM358 which will go about as comparator, if there is transmitted heartbeat got by IR beneficiary it produces high yield and in the event that there is no radiation, at that point it creates low yield beat. The comparator yield signal is given to 20 pin regulator IC 89C4051. The comparator yield are given to the port 3 of IC 89C4051. The LCD is interfaced with the regulator to speak to condition of parking openings in that specific zone [13-15]. The sensors data is then sent to dominate regulator's sequential transport UART 1. The sequential port of slave regulator and ace regulator UART 1 are interfaced. Presently Zigbee gadget is interfaced to UART 0 sequential transport of expert regulator (LPC2148). This Zig-bee gadget is utilized to communicate sensor information remote to another zig-bee gadget which is interfaced to worker through USB-TTL circuit. Crafted by this worker is to show sensor information data in Graphical User Interface (GUI).

Zheng et al. (2015) proposed parking system dependent on the bluetooth correspondence and client approval gadgets. The model ought to permit the client to enter/leave a parking part ceaselessly the vehicle. A comparable rule is additionally utilized for electronic cost assortment on motorways, despite the fact that with other identification methods [17]. The client begins a suitable application on their cell phone prior to arriving at the parking territory, for instance, prior to incoming of the vehicle. On beginning the submission, the client foliage the telephone where most appropriate situation. The client at that point budges the vehicle on the way to the parking sector [16,18]. The cell phone is continually through ultrasonic sensors. Subsequent to getting data from IR sensor, through servomotor entry doors are opened. At that point vehicle can move without much of a stretch left in a given opening. Checking the blue-tooth climate, the periods of automobile ingoing a parking parcel is introduced. The methodology of the vehicle, where the telephone isn't inside the scope of a bluetooth module

at the passageway. The cell phone starts sending orders and information to the manage element to approve the client on effective approval and is protected to bring down the boundary blast, forestalling the possible harm to the vehicle and to the obstruction itself.

Botta et al. (2014) proposed model for smart parking system has parking part comprises of a gathering of parking spaces. The condition of a parking part is the quantity of consumed spaces versus all out spaces. Each parking parcel approaches utilizing Internet to speak with the administration system and clients, and offer parking data with other parking parts. In each parking parcel, reservation authority is sent for confirming individual client's character and reservation demand [19]. In the engineering three parts in smart parking model, including parking zones, clients and the information base smart parking system. The administration system decides parking costs and broadcast lives parking accessible data to clients (likewise drivers). After accepting parking data, client chooses wanted parking parcel and holds a space. Primary System Architecture shows the Smart Parking System dependent on reservation. The applications are expand on Android Platform. Two distinctive applications are utilized in SPSSG. One is at the client end and another is administrator at the parking parcel. The Parking application in the client's telephone is utilized to save space in wanted parking parcel. Client needs to initially make a record to have the option to utilize administrations gave. When record is join, client can login with its portable number as username and secret key. Client would then be able to choose fitting parking parcel and check accessibility. In the event that free spaces are accessible, at that point client can continue with space reservation. One client is hold just one space. For booking, client needs to enter its vehicle's recognizable proof number with start time and end season of reservation. Client is furnished with a help that permits cli-

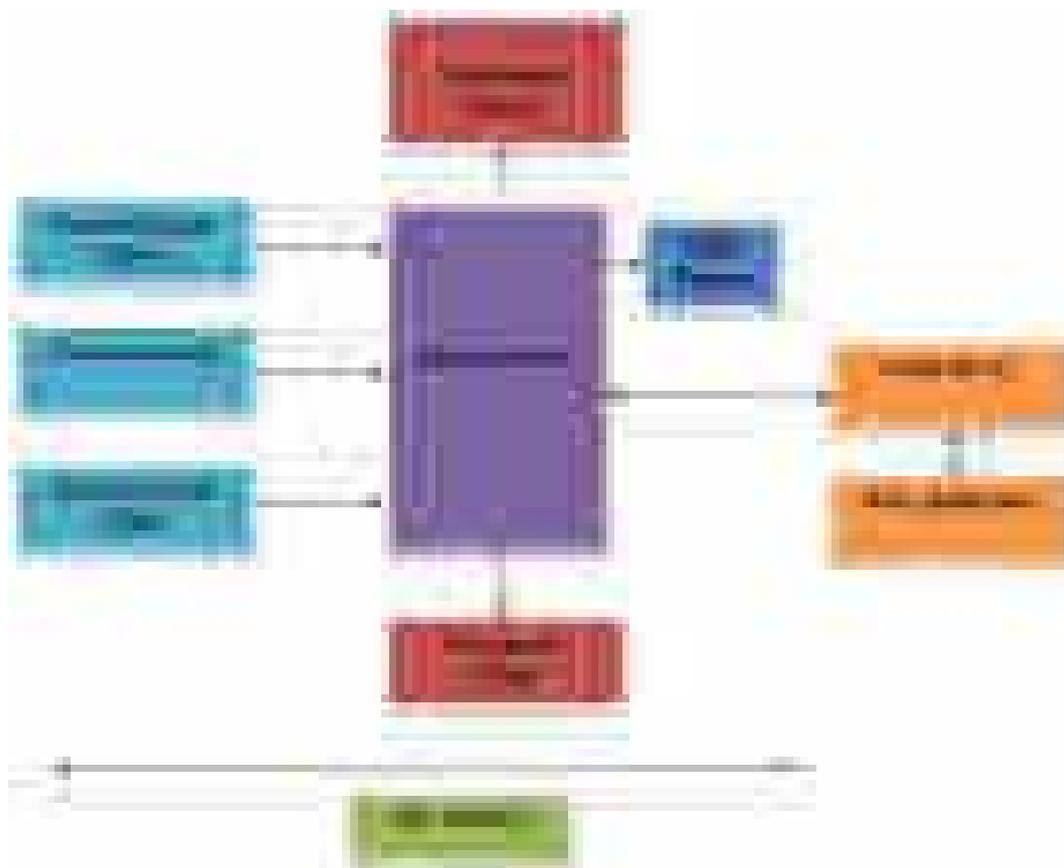

Fig. 1. Architecture of the proposed system.

ent to defer start time by 15 min. In the event that the client can't show up inside the all-encompassing time, at that point the booking is disposed of. Client is likewise allowed to defer finishing time. Administrator can see all parking opening subtleties. Parking spaces would be shown as graphical boxes hued as Red, Green and White. Each shading shows one of the imperatives. Green Indicates opening is held, White demonstrates the space free and Red shows terminated openings. Such terminated spaces have the choice of erase which would turn them in to free openings [20].

### 3. Proposed system

The smart parking system proposed in this paper comprising of the accompanying segments. They are IR sensor, ultrasonic sensor, Servo engine, hub MCU, OLED and Wi-Fi coordinated PC [21-28]. IR sensor used to recognize the presence of vehicle. The ESP8266 hub MCU will be utilized here as the fundamental regulator to control all the peripherals appended to it, as it has integral help for Wi-Fi to associate with web. The ultrasonic sensor sent inside each parking office and it is utilized to recognize the presence of vehicle with in the parking parcel and elicit the entryway to untie or close naturally. The distance between vehicles to ultrasonic sensor is least 20 cms, it will send the data to OLED for giving parking spaces accessibility and non-accessibility data all through the parking zone and it will show the passage of the door. Thus, we can leave the vehicles easily [22,23,25,29-33]. The proposed architecture is shown in Fig. 1.

An infrared sensor is an electronic gadget that discharges to distinguish few ingredients of the environmental factors. An IR sensor can estimate the warmth just as association [34-45]. These sorts of sensors calculate infrared emission, as opposed to discharging it that is known as a latent IR sensor. For the most part, the infrared assortment, articles derive several type of warm rays. These radiations are undetectable by eyes but identified by an IR sensor.

A servo engine is an electrical gadget which can push or turn an item with extraordinary accuracy. On the off chance that you need to turn and protest at some particular points or distance, at that point you utilize servo engine. Servo engine chips away at PWM

(Pulse width tweak) standard, implies its point of pivot is constrained by the length of applied heartbeat to its Control pin. Servo engine can be pivoted from 0 to 180 degree, yet it can go up to 210 degree, contingent upon the assembling [46-54,54]. This level of turn can be constrained by applying the Electrical Pulse of appropriate width, to its Control Pin. SSD1306 is a solitary chip CMOS OLED/PLED driver with regulator for natural/polymer light producing diode dab framework realistic presentation system. It comprises of 128 fragments and 64commons. This IC is intended for Common Cathode type OLED board (Figs. 2 and 3).

### 4. Results and discussions

The Circuit graph for IoT oriented motor vehicle parking structure is given beneath. It includes two hybrid IR sensor, two hybrid servo engines, one hybrid ultrasonic sensor and one bright combo16x2 LCD. Here the controller will organize the total cycle and furthermore hurl the parking accessibility data to Google database so it tends to be observed from anyplace on the planet over the web [55-60]. Two hybrid IR sensors are utilized at passage and leave door to recognize the occurrence of vehicle and consequently unfasten or close the entryway. IR hybrid sensor is utilized to dis-

Fig. 3. Hardware setup of the proposed system.

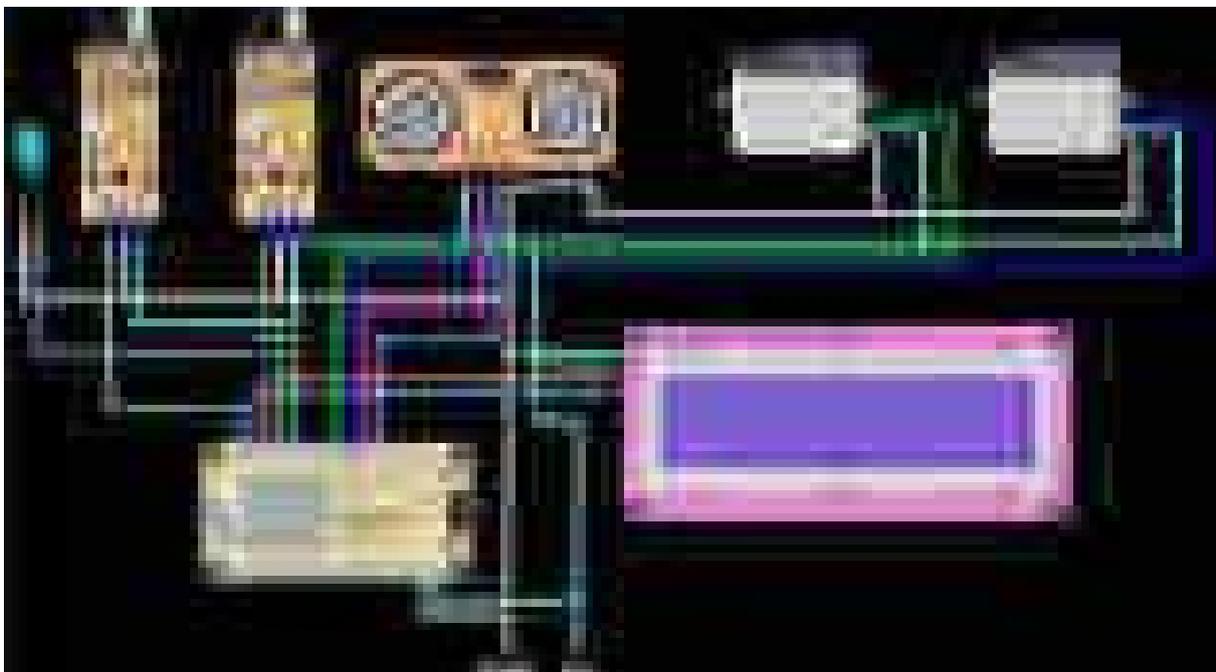

Fig. 2. Schematic of the proposed system.

**Table 1**  
Various sensor and servomotor action of proposed system.

S. No.	Parking Lot	IR sensor status	Ultrasonic sensor status	Servomotor Action and Display Message
1.	Parking Lot 1	Open [Status = 1]	Open [Status = 1]	Close
2.	Parking Lot 1	Close [Status = 0]	Close [Status = 0]	Open
3.	Parking Lot 2	Open [Status = 1]	Open [Status = 1]	Close
4.	Parking Lot 2	Close [Status = 0]	Close [Status = 0]	Open
5.	Parking Lot 3	Open [Status = 1]	Open [Status = 1]	Close
6.	Parking Lot 3	Close [Status = 0]	Close [Status = 0]	Open
7.	Parking Lot 4	Open [Status = 1]	Open [Status = 1]	Close
8.	Parking Lot 4	Close [Status = 0]	Close [Status = 0]	Open

tistinguish any item by transfer and accepting the IR beams. Two servos will go about as section and leave entryway and they pivot to open or close the door [61-64]. At last a Ultrasonic sensor is utilized to recognize if the parking gap is accessible or involved and fling the information to controller appropriately.

The smart parking system proposed in this paper comprising of the accompanying components. They are IR sensor, ultrasonic sensor, Servo engine, hub MCU, OLED and Wi-Fi coordinated laptop. IR sensor used to identify the presence of vehicle. The ESP8266 hub MCU will be utilized here as the main regulator to control all the peripherals joined to it, as it has inbuilt help for Wi-Fi to interface with web. There is a more prominent feeling that all is well with the world. Discharge are incredibly cut down and diminished. There is no requirement for driving while at the same time searching for an accessible space. There are less possibility of crushing. The significant function in establish better climate by decreasing the discharge of CO<sub>2</sub> and different poisons Smart parking empowers better and constant checking and overseeing of accessible parking space. Present-day, smart parking system is picking up ubiquity across the world and now it has become the world's quickest developing smart city arrangements. Air terminals, strip malls, city carports, colleges, private parking parcels and other business parking parts have started understanding the articulated points of interest of computerized parking innovation. As a matter of fact, it is the Internet of Things, capacity to associate dissect and computerize information accumulated from gadgets that make the smart parking conceivable.

Smart parking system includes usage of continuous information, applications and ease sensors that encourages clients to look and discover accessible spaces. A definitive objective is to computerize and restrain the time spent physically looking for the ideal parking parcels, space or floor. A few arrangements are expected to furnish total arrangements and in this way inserted with the total set-up of administrations including parking time warnings, online instalments and even vehicle scanning functionalities for an altogether enormous parking part. A smart parking system and arrangement gives advantages to both the client and the part proprietor. Vehicle expands traffic as they are cruising all over looking for parking space or parts. A very much oversaw parking system lets individuals discover the closest parts or space effectively and in this manner altogether turn down the traffic. The various sensor and servomotor action are tabulated in Table 1.

Clients proficiently locate the best spot accessible, saving time, exertion and assets. Parking parts can be productively occupied and space can be used at most extreme limit by business and corporate elements. Study uncovers that right around 1,000,000 barrels of oil are scorched every day by vehicles looking for parking parcels and space. So an ideal and very much oversaw parking system and arrangement will help in bringing down the driving time and along these lines bring down the everyday utilization of fuel and lessen the unsafe vehicle outflow that at last brings diminished worldwide natural impression. Smart parking innovation may bring different sorts of new incomes streams. For example, parking part proprietors can utilize layered installment choices according

to parking space area. In addition, reward projects can be utilized to energize the recurrent clients into existing models.

## 5. Conclusion

Every day clients can utilize account invoicing just as application installment from their smartphone rather than manual money installments. This would appear to be productive in support of client dedication and significant client input. Presently it turns out to be simple for all cycle including driver's installment, area search, spot distinguishing proof, time notice and a lot more and these are planned from the appearance to the objective consistently and in less time. The high level parking system saves a great deal on schedule, as vehicles can move quicker with the controlled recurrence too. Smart parking system and arrangement can give continuous information that includes connections and patterns of parcels and clients. These information will be important to parcel proprietors as it will help in fear as how to make changes and upgrades to drivers. In this manner the "Smart parking system for smart urban areas utilizing IBM Watson" is actualized and tried effectively. It has been improved by coordinated highlights of all the equipment segments utilized. The system has been tried to work consequently. The IR sensors distinguish the vehicle. On the off chance that the vehicle is run over the entryway, the IR sensor forward the sign to the Node MCU board which enacts the door to open and give the space number to individual vehicle. At the point when the specific vehicle came to, the system hangs all alone and the door is shut. Accordingly, the usefulness of the system has been tried altogether and it is said to work effectively.

## Declaration of Competing Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

## ABSTRACT

Now-a-days, due to mental stress a major section of society is affected by depression. There may be several reasons for depression especially in adults. As different person has different symptoms and its identification is a major challenge. Most of the people feel shy to accept that they are suffering from depression while some people are unaware of their depressed mental health. The objective of this paper is to design and develop an effective tool or model to diagnose depression. In this work, a hybrid system is designed and simulated for detecting depression using EEG features as well as facial features as biological feature gives accurate diagnosis. In this paper a deep learning approach termed as bidirectional long short-term memory (BiLSTM) is proposed with feature fusion from EEG data as well as facial data. The result analysis shows comparative analysis with other existing model and shows effectiveness of the proposed model.

## 1. Introduction

Depression is defined as the mental illness of a person that has influenced more than 350 million individuals all over the world till now. This illness is not only affecting one person but it also includes families of person suffering from depression. The World Health Organization (WHO) has declared that depression will be the second foremost reason of further disease by the year 2020. On the other hand, appraisal strategies for diagnosing depression were based on clinical and patient reports of relentlessness of a person. Apparent drawbacks associated with patient rejection, low sensitivity, subjective bias and inaccuracies were common to have in current diagnostic technique [1]. Finding a target, exact and useful strategy for recognizing depression stays a challenge. In introductory stages when depression is in its mild form, early discovery of depression in a person is helpful for both the individual as well as society [2]. This includes the following symptoms mentioned below [3]:

- Trouble in thinking, concentrating, making decisions and remembering things is also slowed by person dealing with depression.
- They feel tired all the time due to which small tasks took lot of time and effort.
- A person may feel tearful, sad, alone, and hopeless because of many scenarios running in his life.
- Some people feel anxious, agitated and restless all the time whereas some people feel worthless or guilty, fixating on past failures or self-blame.
- A person undergoing depression loses interest and pleasure in many normal activities like sex, sports, hobbies, family gatherings etc.
- In some cases, a person's appetite is reduced resulting in weight loss whereas in some cases a person's cravings for food increases resulting in excessive weight gain.
- A person gets very angry, irritable or frustrated even at very small issues.
- During the time when a person is depressed, it is difficult for them to take proper sleep. They also feel insomniac and sometimes they were taking too much sleep.
- Their thinking, speaking and body movements is slowed.

- Suicidal thoughts, suicide attempts and suicide were frequent during these periods.

Depression doesn't affect not only person's health but it also affects the family and relationships. According to World Health Organization it has been reported as one of the major health concerns by 2020. But the current assessment methods are dependent on patient report and clinical judgements. But these systems have some drawbacks due to denial of patient as well as subjective biases. All these drawbacks make the inaccurate diagnosis [4].

Preferably, machine learning tools for identifying depression ought to approach a similar information flow utilized by a doctor during diagnosis. As a result, the functionalities worn by these classifiers should symbolize any form of communication:

**Visual Indicators:** Visual indicators have been broadly studied for the analysis of depression, including body movements, gestures, subtle expressions and periodic muscle movements [5].

**Speech Indicators:** Ongoing research has revealed that the use of language as a diagnostic and monitoring tool for depression is promising. Vocal production system of an individual is extremely unpredictable, and hence small cognitive or physiological changes can cause changes in acoustic language. This thought drove researchers to utilize language as an objective indicator for depression. Depressive language has been efficiently connected with an assortment of prosodic, origin, training and spectral indicators.

**Textual Indicators:** In introductory stages when depression is in its mild form, early discovery of depression in a person is helpful for both the individual as well as society [6]. Numerous studies that center around discovery of the relationship between linguistic characteristics of a written text and the level of the emotional state of depression were also introduced. The attention is on non-content (non-semantic) computational linguistic markers of a written text [6].

**Biological Indicators:** In this type, EEG signals and eye movement tracking are considered as input signal to analyze the depression level [7–10].

Recently, machine learning has showed up their efficiency to analyze the biological signals such as facial expressions, audio, body movement, eye tracking, EEG, etc. for depression detection. However, still there are some research gaps that are focused in this paper.

## 2. Related work

Among all biological signals, EEG (Electroencephalogram) is most adaptive way that can reflect actual mental state. EEG signals are generated by nervous system when any external stimulus occurs which can be used to correctly diagnosis of mental health of an individual. Many existing researchers are exploring their knowledge to show the efficiency of EEG as a reliable mode for detecting depression. X. Li et al. [11] proposed GreedyStepwise (GSW) feature selection method based on Correlation Features Selection (CFS) and classified using KNN classifier and achieve 91% accuracy rate for mild depression detection. Mahato et al. [8] used alpha, betam delta and theta signals for depression diagnosis. MultiCluster feature selection was used with support vector machine (SVM) classifier and achieved accuracy of 88.33%. Mahato et al. [9] extended his work and by combining linear and non-linear EEG features and improved the accuracy rate upto 93.33%. Betul et al. [1] proposed deep learning approach such as convolutional neural network (CNN) and long-short term memory (LSTM) for classification of signal generated from left and right hemisphere of the brain and achieved accuracy rate of about 99.12% and 97.66%. Li et al. (2019) proposed convolutional neural network termed as ConvNet for depression detection and achieved 85.62% for

mild depression. G. Degottex [2] has developed a document on the freely accessible and programmed area or repository called COV-AREP that has the capability of processing the algorithms associated with the speech input. Karthika [5] focused on development of a Gabor wavelets based calculative algorithm for discriminatory feature extraction that has been made possible by performing a convolving a face picture with the coefficients of Gabor filter at different orientations and scaling. The classifier used is derived by utilizing SVM an acronym for support vector machines and the data set analyzed is ORL based that is available free of cost. The proposed algorithms has been tested and cross validated and the paper came up with results having a recognition rate of 94% which describes its authenticity in detection. Harati et al. [4], has mainly focused on the impacts of the treatment on the facial expressivity of the patients. The focused research area is to provide an examination of the methodologies for clinical depression recognition[7], [10].

## 3. Methodology

This section describes the proposed methodology in the field of depression detection from EEG signals and facial expressions. The proposed methodology flow chart is depicted in Fig. 1. The proposed model will deep biological feature fusion and classification using BiLSTM network to identify a person is depressed or not.

### 3.1. Signal acquisition

In this paper, for simulation of proposed methodology, dataset is taken from the BCI project for EEG signal and frontal facial data is taken.

### 3.2. EEG signal pre-processing

The procured information of the ECG is normally expected to be comprising of certain noise and therefore calls for procedure for noise extraction from them. The objective of filtration of the information was achieved by using a filter of 8 and 25 Hz which was a band pass filter utilizing Butterworth filter carrying out elimination of undesired artifacts. The band pass filtration is accomplished by association of a high pass filter along with the low pass filter that finally permits only foreordained frequency to pass along it. The cutoff points for the decisive cancellation of frequencies is calculated for both the higher frequencies and lower frequency referred to as  $f_H$  and  $f_L$  respectively. The clear and proper gap has to be defined between the two cutoff points that shall avoid

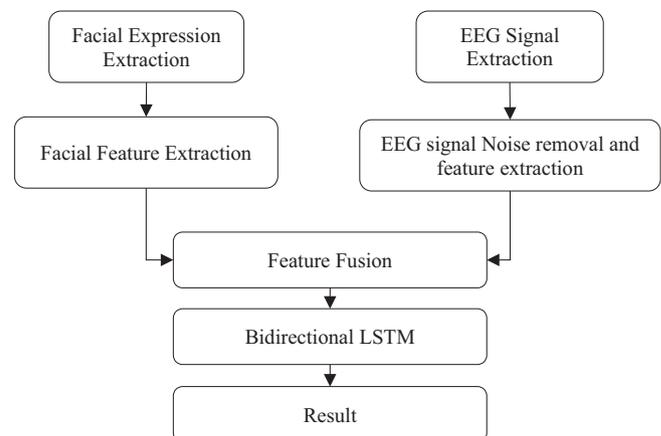

Fig. 1. Proposed Flow Diagram.

the intermixing of the frequencies. The overall voltage gain has been characterised by the amplifier along with the required necessary gap between the two stages.

### 3.3. Feature extraction

#### 3.3.1. Facial feature extraction

The process of depression identification in any individual is carried upon by keen observation of person's body movements that is inclusive of the eye ball rotation, mouth movement specifically of the corners, time and frequencies at which person's eyes blink along with the eyebrow's movement.

- Eyes: The eyes are studied for the pupil movement inside it and the responses with the distance between the left and right pupil.
- Eyebrows: The main feature points of study include the distances across the left and right eye brows.
- Corners of mouth: The feature extraction points include the points at the corners of mouth along with the tip of nose. The continuous analysis of the movement in these areas with their minimum and maximum deviation has been recorded for the feature study and analytical measurement of changes in the facial expression.

The features are extracted from the facial images such as eyebrows, eyes, nose, etc. For these features following parameters are evaluated:

- Standard deviation
- Mean
- Maximum
- Minimum
- Blink frequency of eyes

#### 3.3.2. EEG feature extraction

DWT features are being extricated from the ECG data set frequency band after their elimination of the noisy component in them. In the cases which administer huge data set collection those which are enormously huge to be processed comprising of little information about the data then it is being proposed to change the data set into more reliable set of features with reduced data that is often being portrayed as features vector. The alteration of the input data based on their feature to form a set of features classification is referred to as the process of feature extraction. The process has been found fruitful in bringing a reduction in the length of the data that has been selected for the processing by achieving extraction of key selective features from the set of information and conversion into feature vector by relevant information compression and redundancy avoidance. The feature extraction procedure is carried upon by the use of Discrete Wavelet transform technique from a set of available information that is followed upon after the filtration step via low and high pass stages. The wavelet coefficients are found to be the progressive continuation of the approximated along with the detail coefficients. The fundamental process of feature extraction is composed of the below procedures:

- The first step is to achieve the coefficients both approximated and detailed by allowing decomposition of the signal into N various level by making use of the DWT, filtration and decimation process.
- The second step is meant of finally extract the available features from the coefficients of the DWT.

Out of the extracted DWT features, some signal parameters are evaluated which are discussed as below:

Mean: Mean ( $\mu$ ) is termed as average value of data values. It is mathematically computed as in Eq. (1):

$$\text{Mean} = 1/N \sum_{i=1}^n x_i \quad (1)$$

Where,

$x_i$  = It represents data value

N = total data samples

Median: Median represents the mid value of some data values. It also represented as probability distribution of data values in upper and lower half of the data samples.

Variance: It represents the squared difference between mean value and data values. Mathematically it is represented as in Eq. (2):

$$\text{Variance} = \sum_{i=1}^n (x_i - \mu)^2 / (N - 1) \quad (2)$$

Standard deviation: It is evaluated as square root mean of data value from mean value. It is mathematically represented as Eq. (3):

$$\text{Standard Deviation} = \sqrt{\sum \frac{(x_i - \mu)^2}{N}} \quad (3)$$

Skewness: It represents the probability distribution of data values about the mean value. It is mathematically represented as in Eq. (4):

$$\text{skewness} = E[(X - \mu\sigma)^3] \quad (4)$$

Kurtosis: It represents the data distribution about the peak of the signal generated as compared to normal distribution. It is mathematically represented as in Eq. (5):

$$\text{kurtosis} = \mu_4 / \sigma^4 \quad (5)$$

Where,

$\mu_4$  = It represents the fourth moment about the mean

$\sigma$  = It represents the standard deviation

Complexity: It represents the frequency of the signal generated and mathematically represented as in Eq. (6):

$$\text{Complexity} = \text{Mobility} \left( \frac{dy(t)}{dt} \right) / \text{Mobility}(y(t)) \quad (6)$$

Where,

y = signal frequency

Mobility: It represents the standard deviation of the power spectrum of signal and mathematically, it is represented as in Eq. (7):

$$\text{Mobility} = \sqrt{\text{var} \left( \frac{dy(t)}{dt} \right) / \text{var}(y(t))} \quad (7)$$

### 3.4. Feature fusion

Both biological features extracted in above step are combined together and fed into bidirectional LSTM for classification.

### 3.5. Classification

Long short-term memory (LSTM) is one of the prominent recurrent neural networks (RNN). It is a neural network approach that involves in-depth analysis and consists of various neural network modules. The following units form the LSTM network (Fig. 2):

- Input unit
- Output unit
- Memory cell
- Forget unit

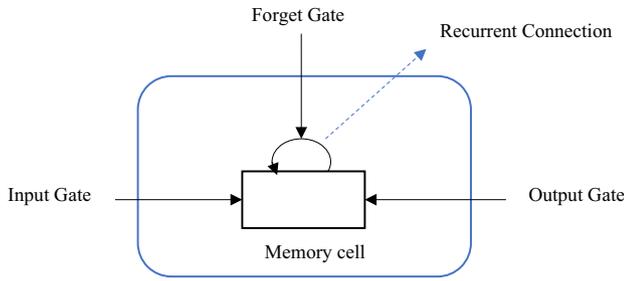

Fig. 2. Long Short-Term Memory (LSTM) Units.

The data values are stored in the memory unit for a very short interval of time and the evaluation of output value is done by regulating the flow of data values through the rest of the units. The bidirectional LSTM is represented by BiLSTM, which implies that the propagation of signal is in forward as well as backward direction.

A set of vectors is involved in each time step  $t$ , which include

- Forget gate  $f_t$
- Input gate  $i_t$
- Memory cell  $C_t$
- Output gate  $o_t$

The output pertaining to the hidden layer is evaluated by employing the above mentioned gates as follows:

$$f_t = \sigma(W_f * x_t + U_f * h_{t-1} + b_f) \quad (8)$$

$$i_t = \sigma(W_i * x_t + U_i * h_{t-1} + b_i) \quad (9)$$

$$\hat{C}_t = \tanh(W_c * x_t + U_c * h_{t-1} + b_c) \quad (10)$$

$$C_t = i_t * \hat{C}_t + f_t * C_{t-1} \quad (11)$$

$$o_t = \sigma(W_o * x_t + U_o * h_{t-1} + b_o) \quad (12)$$

$$h_t = o_t * \tanh(C_t) \quad (13)$$

$\sigma$  = sigmoidactivationfunction

$x_t$  = input at time  $t$

$\tanh$  = hyperbolic tangent function

To regulate the input, weight matrices such as  $W_i$ ,  $W_c$ ,  $W_f$ ,  $W_o$ ,  $U_i$ ,  $U_c$ ,  $U_f$ ,  $U_o$  are employed

Bias vectors =  $b_i, b_c, b_f, b_o$

The LSTM network involves the following steps:

Step 1:

The very first step involves the determination of information that should be wiped out from the cell state. This is represented by the forget gate values  $f_t$ . The output from the previous step  $h_{t-1}$  and input  $x_t$  are considered as input in this step. The output values between 0 and 1 are obtained through the sigmoid activation function. The value 1 represents “remembering everything” and a value 0 represents “let nothing through”.

Step 2:

This step involves the determination of values that should be added to the cell state. The input in this step are  $x_t$  and  $h_{t-1}$ . In order to determine the cell state parts that should be updated, a sigmoid layer is applied over the input by the input layer. The new candidate values  $C_t$  are created through a tanh layer. In order to get the cell state  $C_t$  updated, the two layers are combined in the upcoming step.

Step 3:

In this step, the memory flushes out the data from the memory cell that are of no use anymore and update the new data.

Step 4:

The final output is determined by the layer, i.e.  $h_t$ . The sigmoid function is applied to evaluate the output value from the previous output layer,  $h_{t-1}$  and input value  $x_t$ . The cell values are represented by 0 and 1. If BiLSTM is employed as a classifier, at the end softmax does the job of a classifier.

## 4. Result and discussions

This section describes the analytical and experimental description of proposed methodology for depression detection. The Simulation is performed using MATLAB platform to evaluate the performance. Section 4.1 states the performance measures used in this work.

### 4.1. Performance parameters

#### 4.1.1. Accuracy

It is the one of the most important parameter for determination of efficiency of the classifier. It represents the total correctly classified output either depressive or normal data. The mathematical representation of accuracy is represented as in Eq. (14):

$$Accuracy = \frac{(TP + TN)}{(TP + TN + FP + FN)} \quad (14)$$

Where,

TP = True Positive (This represents the total number of test samples that are predicted depressive and actual label of them are also depressive).

TN = True Negative (This represents the total number of test samples that are predicted normal and actual label of them are also normal).

FP = False Positive (This represents the total number of test samples that are predicted depressive and actual label of them as normal).

FN = False Negative (This represents the total number of test samples that are predicted normal and actual label of them as depressive).

#### 4.1.2. Precision

Similarly, another parameter for performance evaluation is precision that determines all correct depressive classification out of all predicted depressive samples. Mathematically, precision is represented as in Eq. (15):

$$Precision = \frac{TP}{(TP + FP)} \quad (15)$$

#### 4.1.3. Recall

Another parameter is recall that determines all the depressive prediction out of all actual depressive samples. Mathematically it is represented as in Eq. (16):

$$Recall = \frac{TP}{(TP + FN)} \quad (16)$$

#### 4.1.4. F\_Measure

The harmonic mean between recall and precision is termed as  $f\_measure$ . Mathematically it is represented as in Eq. (17):

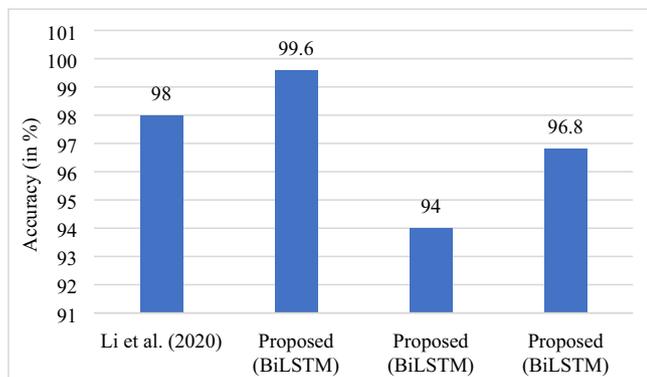

$$F_{measure} = \frac{2 * Recall * Precision}{(Recall + Precision)} \quad (17)$$

**Table 1**  
Performance Evaluation.

	Facial Features	EEG Features
Accuracy	94	99.66
Recall	98	99.34
Precision	96	100
F_Measure	97	99.67

**Table 2**  
Comparative Accuracy Evaluation.

Models	Feature	Accuracy
Li et al. [12]	EEG	98
Proposed (BiLSTM)	EEG	99.6
	Facial	94
	EEG + Facial	96.8

**Fig. 3.** Comparative Accuracy Evaluation.

#### 4.2. Result analysis

Performance evaluation of methodology proposed in this paper is represented in table 1. As depression detection in this paper is evaluated by using biological feature fusion such as EEG features as well as facial features and classified using BiLSTM. The performance is evaluated on the basis of accuracy, precision, recall and f\_measure. Different testsets are taken to illustrated the effectiveness of the model.

Table 2 and Fig. 3 represents the comparative performance evaluation with research work presented by Li et al. (2020).

#### 5. Conclusion

At current scenario, depression is considered to be one of the major issues of health. Depression causes as well as symptoms varies from person to person. So, it makes quite difficult to analyze manually. This paper is intended towards implementation of

robust, adaptable, reliable and accurate designing of model to achieve effective depression detection. Biological features such as Electroencephalogram (EEG) and facial features have been widely used for depression detection. As these features are easy to track and are non-invasive in nature. In this paper, two biological features are considered for effective diagnosis of depression. Many researchers focused towards unimodal diagnosis system, but in this paper hybrid model is designed to improve diagnosis accuracy. The result analysis of the proposed model has shown effective results as compared to other existing unimodal diagnosis system.

## **A Study on Role of Employee Engagement in Organizational Performance and Individual Well Being**

**Dr Savita Yadav**

Assistant Professor

School of Commerce and Management

Lingaya's Vidyapeeth, Faridabad

### **Abstract**

An engaged employee is one who is taking the interest in the organizational work and showing initiative in the benefit of organization. Employee Engagement has been a topic of study from many years. Many researchers in the past tried to associate it with many topics of organization and individual interest. This study is an attempt to find out the relationship of employee engagement with Organizational Performance and Individual Well-being on the basis of existing literature and research. Organizational Performance can be defined as the total of organizational outcomes while Individual Well-being is, doing the welfare of individual employee. The study is theoretical and concept based in nature. The study resulted into a significant relationship between Employee Engagement and Organizational Performance; Employee Engagement and Individual Well Being. The results were also supported with previous research findings.

Key Words: Individual well-being, Employees, Performance, Success

---

### **Introduction**

There is a paradigm shift in human resource and management practices from job satisfaction, job selection, selection and recruitment process, to employee engagement and employee involvement. Employee engagement is relatively new. In organizations every individual is accountable for his or her own engagement; anyone with direct reports must coach team members to higher levels of engagement and manage his or her own engagement; and executives

set the tone for high morale and motivation plus shoulder the responsibilities of individuals and managers.

Employee engagement is the level of commitment and involvement an employee has towards their organization and its values. Engagement at work was conceptualized by Kahn, (1990) as the ‘harnessing of organizational members’ selves to their work roles. In engagement, people employ and express themselves physically, cognitively, and emotionally during role performances.

There are various distinctive HR researches that are often repeated all through the research of HRM. However, what types of performance that these HR practices, or systems of them, are measured against varies. Financial/ market performance, operational performance and employee attitude & behavior. These are three categories of the performance which are frequently used in the research field. However, there is also a more subjective side to the financial and market performance data in the research field of HRM and performance – that is perceived organizational performance, which is often utilized in those instances when objective data is difficult obtain. Specific examples of financial and market performance are return on assets, return on equity, revenue, market share, and market value. In this study the main objective of this research is to examine how the employee engagement influences the performance of organization and individual well being.

## **OBJECTIVE OF THE STUDY**

1. To understand the concept of employee engagement, organizational performance and individual well-being.
2. To study the relationship between employee engagement, organizational performance and individual well-being.

## **Review of Literature**

Nidan (2016) conducted an exploratory study on employee engagement, employee productivity and motivational level in employee. This research was conducted in India and the retail outlets are the base of studies. Employee engagement was the independent variable and the dependent variables were employee productivity and motivational level. The sample size of the study was 500 but research was taken ahead with 380. The questionnaire was self-designed, the factors on the basis of which questionnaire was constructed were Motivation, performance and commitment. The major findings of the researcher were that there exists relationship between all the three as employee engagement increases all other also increases. Other than that it is also said that employee engagement also depends upon the working environment of the company if it is positive everything will be as per organizations choice.

Markos and Sridevi (2010) also developed a conceptual paper on employee engagement, job satisfaction, employee commitment and organizational citizenship behavior. Many scholars suggested that if any organization wants to develop itself i.e. its performance than it has to keep an eye over engagement of their employees. If the employees are more engaged with organization then they will be emotionally close to the organization and they will try to strive the goals of the organization. In the paper the scholars have suggested ten tablets i.e. ten points through which the organization may have engaged employees few are as follows: start it on the day one, start it from the top, enhance employee engagement through two way communication, give satisfactory opportunities for development and advancement, ensure employees have everything that they need to perform their job, give employees appropriate training and so on. Even though the literature of the paper suggests that the employee engagement and organizational performance outcome are closely linked with each other. If the employees are highly engaged then it will have low level of turnover and high level of performance.

Chandani et al. (2016) developed a conceptual paper on employee engagement. This paper has variables under study were engagement, retention, performance and organization. The authors suggested that if organization wants an engaged employees then they must use different strategies to make the employee engaged like for new employees' induction program, for old

employees training sessions. By creating meaning to the job the employee feels satisfied and becomes engaged in his work.

Devi (2017) in her study on evaluated the relationship between employee engagement and organizational performance. Questionnaire was filled by 150 employees of private bank at Jammu, India. In this paper scholar found that there is a significant relationship between both the variables and those employees were highly engaged, performed in the best way they can and in return organizational performance also improved. Due to high level of engagement the organizations were ahead of their competitors in profit. So the scholar draw a conclusion over there that if an employee is highly engaged than his/her productivity will increase, due to which the organization performance will also improve.

Kazimoto (2016), also conducted similar study on employee engagement and organizational performance in retail enterprises. In this paper the researcher want to study the factors of employee engagement and performance of organization and the relationship between employee engagement and organizational performance based on non-financial factor. This research was conducted at retailing enterprises in Wobulenzi- Luweero City, Uganda. Using purposive sampling technique 120 participants were selected from 20 retail outlets and convincing sampling technique was used to select 6 participants from each group. Karl Pearson's correlation method was used to ascertain the relationship between both the variables. The study reveals that there is a positive relationship found between job satisfaction and employee engagement.

Albrecht (2012), conducted a research on employee well-being, employee engagement, employee behavior and commitment. This research was conducted in Australia and Asia. The employees were from large mining industry where total respondents were 4,182 within which only 3,515 were usable questionnaires. Correlation and two tailed t-test was used to ascertain the relationship between employee engagement, commitment, well-being and behavior. The results stated that all are associated with each other positively. Each variable has its impact on another.

Bakker (2011) gave a work engagement model. Through this model the researcher wants to suggest that if the employees are physically, cognitively and emotionally attached with their work they won't quit rather they perform better than that of prior. Even if an individual is well engaged they will try to attain their goals and by which the performance of the organization all increases. So here the model of work engagement proves to be true if an employee is satisfied and do job crafting but always try to achieve the goal then the organization will productivity and performance will increase.

Taris and Schaufeli gave a theoretical and conceptual overview in their paper "Individual well-being and performance at work" according to their overview they are correlated with each other if well-being increases than the performance also increases. In their paper Grant et.al (2007) if the person wishes to increase both performance and well-being then they must check out all the long term consequences.

Shmailan(2016) worked on the relationship between job satisfaction, job performance and employee engagement: an explorative study. The objective was to find factor influencing employee satisfaction and performance and to define the correlation between job satisfaction and performance and employee engagement. The study is exploratory in nature and methodology used in this paper is based on review of literature. The researcher found out that employee satisfaction has a direct link to employee engagement and employee engagement can vary country to country. The author also added that poor employee engagement can cause problem to organization as lower down the profits, poor customer service.

Sibanda, muchen and ncube(2014) worked on employee engagement and organizational performance in a public sector organization in Zimbabwe. The objective was to find out how employee engagement may be used to unlock organizational performance. The public sector organization Zim-PSO was used for research. The sample of 50 was taken as 16 interviews were conducted for managerial employees and questionnaire was distributed to remaining 34 non-managerial employees. They found out that if employee engagement is influenced by the problems of an organization then it will ultimately affect their performance.

Simha and vardhan(2015) worked on enhancing “performance and retention” through employee engagement. The objective of the study was to know the relation between employee engagement and performance. The researchers found out that employee engagement drives performance by customer loyalty, productivity, safety and profitability. Further they added that engaged employees are not likely to quit their jobs and are more focused and care about the job.

Harter,et.al(2012) conducted a study on the relationship between engagement at work and organizational outcomes. The objective of the study was to check the relationship and the consistency of the employee engagement and performance. The data was collected through 263 research studies and 192 organizations in 49 industries and 34 countries. They applied hunter-schmidt meta-analysis method to estimate the true relationship between employee engagement and performance. They found out high consistency across the relationship between employee engagement and the performance at the business level.

Karina, Paauwe & Veldhoven (2011), suggested that employee well-being is connected with organizational performance. Objective of this study was to examine the role of employee well-being. They focused on the previous quantitative studies of employee well-being and related variables. Almost 36 studies were included in this research from 1995 to May 2010.

Employee engagement is critical issue, in today’s competitive business environment employee engagement is main focus of each organization to improve the performance and productivity. Andrew & Sofian (2012), tried to add in the existing concept of employee engagement. This study involved 104 HR officers of Malaysia. Statistics used by the researcher was t-test and multiple regression to find out the factors of employee engagement. After analyzing the data author finds that co-employees are major factor that influence employee engagement and performance.

Employee engagement in organization will be maximum on the point when employees and employers both have good working environment and they satisfied by the environment and organizations are providing the benefits to both. Suresh, Manivannan and Krishnaraj (2015),

assured that employees are emotionally attached to their work and job, which increases the employee engagement and improve the organizational performance. Authors gave their suggestion about employee engagement and performance on the basis of existing literature in the field of employee engagement.

Anitha (2013), focused on the concept of employee engagement and impact of employee engagement on the performances of employees. To understand the concept and to find out the impact researcher conducted causal study with the sample size of 700 in the area of Coimbatore and focused on the small industries. Data was analyzed through the regression and structural equation modelling was used to find out the relationship between employee engagement and employee performance. The main finding of study were employee engagement has impact on the performance of employees and this relationship was mediated by the work-environment, relationship with employers and co-workers.

Taris & Schreurs (2009), said that if employees are happy it will have positive impact on the productive work. This study represents a large-scale organizational level test for happy productive employee hypothesis, and assumes that if individual well-being is high then individual performance will also high, which improves the overall organizational performance. Data for the study was collected from the 66 Dutch home care organization, and regression analysis were used to examine the relationship. The results showed that improving well-being not only improves the performance of employees but it also have positive impact on organization and their stakeholders.

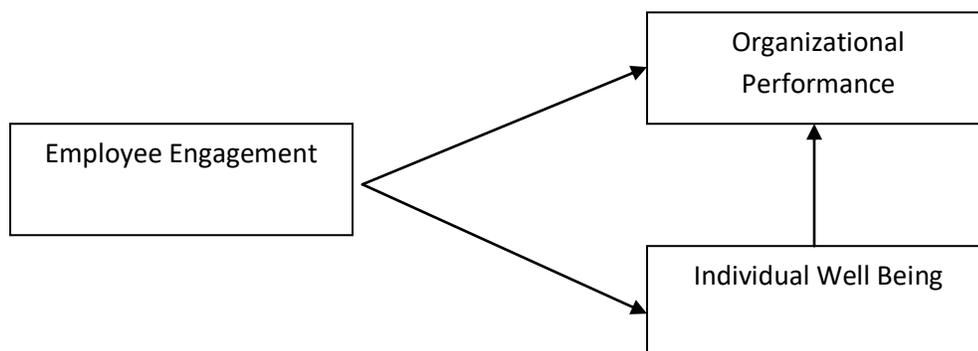

Bhuvanaiah & Raya (2014), their study aims to describe the concept of engagement, and to explain positive things related with engagement. The past literature on the employee engagement showed that employee engagement fulfills the requirement of organization on individual as well as organizational level. Employee will engage with the organization if work is meaningful and challenging for them, they have freedom to take their own decisions, opportunity for career advancement should be there, all of these will improve employee engagement and well-being of employees. To improve the employee engagement, management should take care of few things

like, work-environment, provide appropriate resources to the employees, continuous guiding should be there so that employees has clear idea about their work and role in the organization.

## FINDING

Employee engagement has play an important role in today's continuous changing business world. Employee engagement is used by organization to build their organization stronger and retain their talented employees. Employee engagement contributes towards better performance. On the basis of past research and literature, it is found that employee are key factor towards the growth of the organization. It is required for the organization to engage their employees in the organization by provide them challenging and innovative task and activities which increase the level of employee engagement. Employee engagement increase the motivation level of employee and they feel as a part of organization which automatically lead to higher organizational performance. Employee engagement also leads to individual well-being which initiate the good organizational performance. Employee engagement is an approach which make managers to capable from which they focus each and every employee separately which improve individual well-being and create a cordial relationship between the management and employee at individual, group as well as organizational level.

**Figure No. 1: Following is the proposed model**

Employee engagement leads to organizational performance as well as individual well-being, whereas individual well-being indirectly also relation to improved organizational performance.

## Conclusion

Employee engagement has been a much discussed concept but contributes towards better performance. Individuals well-being, though similar sounding concept yet it has a different perspective. The research indicates that employee engagement enhances organizational performance and well-being significantly. It was also found that Individual Well-being is significantly influencing the Organizational Performance. Though high level of engagement requires commitment that may result in to poor well-being but the sense of performing better improves well-beingsignificantly. Hence a balanced approach of managing both employee engagement and well-being may result in to better performances. Organization need to give emphasis on improving the employee engagement. More an employee is engaged, more he would focus on the organizational objectives. Organisation also has to focus on employee welfare and must provide all the benefits to the employee. These practices will definitely lead the organizational performance towards the higher degree.

## START-UP ECOSYSTEM IN INDIA: A STUDY WITH FOCUS ON ENTREPRENEURSHIP AND UNIVERSITY BUSINESS INCUBATORS

Alisha Kumar

Assistant Professor, School of Commerce & Management Lingaya's Vidyapeeth, Faridabad.

### ABSTRACT:

*On one side India is growing to be one of world's biggest markets after China. The incomes and consumption of not just the thriving middle class but even the rural economy is rapidly growing. On the other hand India has lot of really big problems to be solved - be it in education, infrastructure, agriculture, logistics, retail, healthcare etc. This combination is the most fertile ground for startups. The big businesses are comfortable making money off the shortcomings rather than solving them or changing their existing established business models. It's the startups that will come up with innovative disruptive business models to solve the challenges India faces. And this is the biggest impact startups will have on the Indian economy.*

*But entrepreneurship is not an easy path and the more you grow the more challenges you face. From awareness and sustainability of businesses to regulations associated with legality and enforceability, the list of challenges is long. Given these challenges, it can be hard to get started on your entrepreneurial journey without guidance and assistance. So how does one move forward and get ahead? Where do entrepreneurs get their dose of skill and know-how supplements to turn their startup ideas into reality? Incubators have an answer to the problem.*

*The present paper develops an in-depth understanding of the startup ecosystem in India. This paper discusses the role of Incubators in producing and nurturing successful business ventures. It also studies the government's policy measures in fostering entrepreneurship*

# Ablation of Hepatic Tumor Tissues with Active Elements and Cylindrical Phased Array Transducer

Sarita Zutshi Bhan, S. V. A. V. Prasad, and Dinesh Javalkar

## 1 Introduction

The high-intensity focused ultrasound (HIFU) treatment method for treating various tumors like prostate cancer [7], breast cancer [8], bone metastases [9] and malignant renal tumors [10] has proved one of the best ways of treating various solid tumors. The recent studies regarding HIFU treatment for treating liver tumor have depicted promising results out of this technology for this type of tumor which has always been a challenge for all researchers as well as surgeons because of continuous movement of liver tissues due to continuous breathing. This HIFU technique is an excellent alternative to conventional tumor treatment methods due to its non-invasive nature and fast recovery time [11]. The HIFU treatment can be delivered via one of the two mechanisms, i.e., via thermal effect or via mechanical effect [12] while thermal effect being the more dominant method due to its mechanism of creating extra damage of target tissue due to excessive heat generated there; however, few studies suggested to introduce exogenous synergists so as to exploit the pure mechanical effect of HIFU by adjusting the in sonication parameters which results in increase in treatment efficacy and is also responsible for prevention of unwanted heat-related side effects. In order to deliver such treatment method, the equipment required for this method needs to be designed with high level of accuracy. The major parts being the function generator for generating a high frequency, the power amplifier for providing high power to the high-frequency ultrasound waves and the transducer for focusing these

high-frequency high-power ultrasound waves at the target tissue site. The function generator and the power amplifier have been designed using state-of-the-art active elements, while the transducer has been simulated for more accurate center frequency, i.e., 1 MHz with reduced power of 60 watts as compared to the band of frequencies, i.e., 0.8–1.6 MHz with power output of 70 watts. The results were generated in Multisim Version 12.0 software for function generator and power amplifier while MATLAB software was used for generation of results for transducer.

## **2 Literature Survey**

### ***2.1 Liver Tumor and Available Treatments***

The various methods available for treatment of liver tumor are liver transplant, freezing cancer cells, injecting chemotherapy drugs, heating cancer cells, targeted drug therapy, injecting alcohol and high-intensity focused ultrasound (HIFU). Out of all these methods, the HIFU method is the most advanced method for treating liver tumor at various stages. In this method, the tumorous cell is ablated due to high-intensity ultrasound beams focused at it. It is the only non-invasive method that has more fast recovery time.

### ***2.2 Liver Tumor and High-Intensity Focused Ultrasound***

The authors in [13], Kim and et al., said that the treatment given to primary liver cancer patients with HIFU along with transarterial chemo embolization (TACE) depicts little damage of normal liver tissues along with higher overall remission rate as compared to treatment given with TACE alone.

In [14], the authors conducted the HIFU ablations on 15 patients in Phase I–IIa. 30 HIFU ablations were created by them very precisely with a precision of 1 to 2 mm within 40 s, and they observed that the ablation size is typically dependent upon the transducer characteristics; however, a typical size of lesion is generally found to be of 1.3 mm in transverse and 8 to 15 mm along the beam axis of the transducer.

In [15], the authors Ulrik Carling and et. al. conducted HIFU ablation of liver in six male land swine under general anesthesia. These ablations were made using a frequency of 1.2 MHz with a power of 200 W. The patients immunity for any treatment is a major concern before planning any treatment method for him. It was Baofengma and et.al in [16] who presented the clinical observations of a study carried out on 96 patients with primary liver cancer, out of which there were 66 males and 30 females. In their research work, they observed the patients for three months after giving the HIFU treatment and their observation concluded that the symptoms of Jaundice, the

pain in the abdomen, the anorexia and ascites were relieved as compared to their values observed before the treatment.

### **2.3 Active Elements**

The operational amplifiers had been versatile building blocks until their performance was found to be less as compared to the current driven latest state-of-the-art active elements [17]. The current conveyor introduced by Sedra and Smith in 1968 was the initial breakthrough for development of active elements that were found to be more expedient than operational amplifiers. It was in 1996 that first CMOS-based differential operational floating amplifier was introduced that was further used for implementing current mode filters [18]. Sooner more members for the family of active elements came into existence like current differencing buffered amplifier (CDBA), fully differential current conveyor (FDCCII), voltage current controlled conveyor transconductance amplifier, voltage differencing transconductance amplifier (VDTA), CMOS realization of voltage differencing buffered amplifier (VDBA), and many more [19–25].

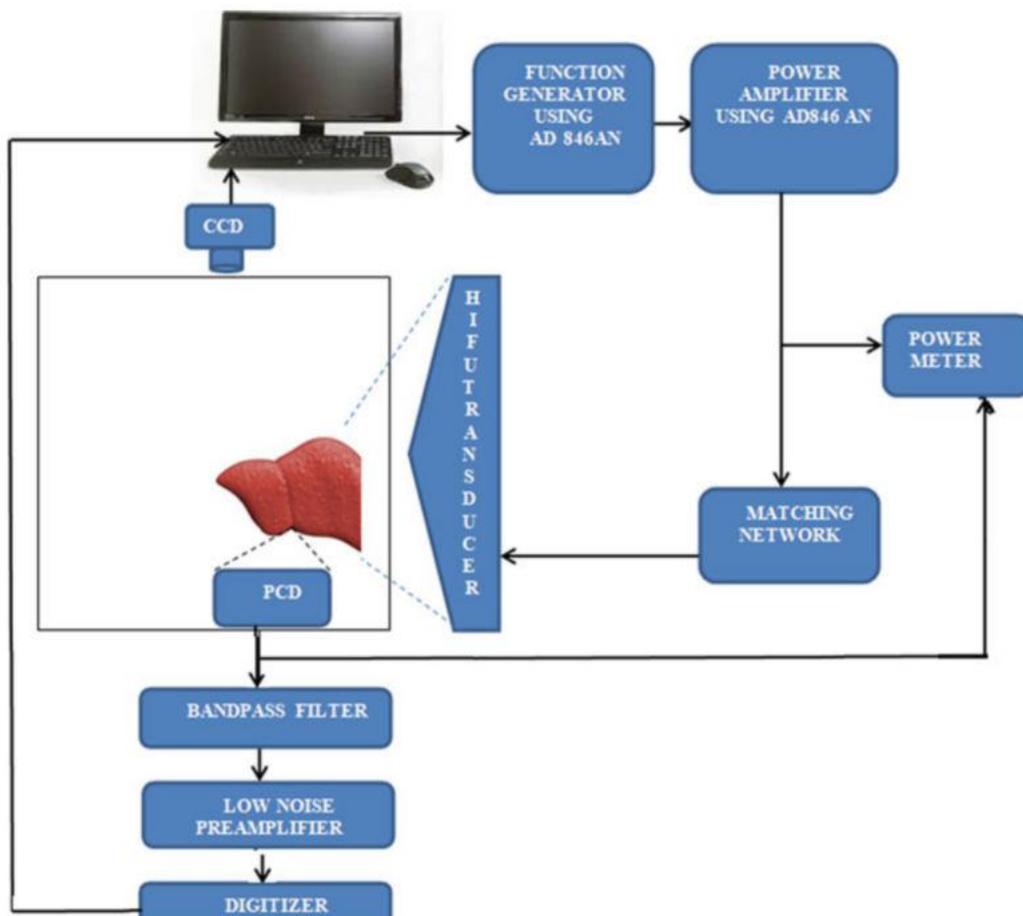

### **2.4 HIFU Transducers**

The authors Raffaula Righetti and et al. used a HIFU transducer that was air backed, single and spherical with center frequency at 1.5 MHz approximately, 80 mm radius of curvature and 100 mm diameter to generate the focused ultrasound field. This transducer maintained the RF power of 20 W and generated the lesions of liver tumor cells by exposing them to focal intensities ranging between 750 and 1565 W cm<sup>-2</sup>. The time for sonication was varied from 8 to 20 s [26]. Allain Sibbille and et. Al. performed several clinical experiments with extra corporeal HIFU on rabbit liver. They created a lesion of coagulation necrosis of tumorous liver tissue [27]. The authors Song Peng and et.al in [28] used the lower transducer out of lower and upper transducer of HIFU machine, i.e., FEP-BY02 made by China. They adjusted the treatment power as per the tumor dimensions and its location. The transducer used by them was a phased array transducer with 251 elements and was built using piezo lead zirconate (PZT) material. The HIFU transducers aperture was of 37 cm in diameter with 255 cm of focal length.

### 3 Experimental Configuration and Working Mechanism of HIFU Equipment

The experimental configuration used for HIFU equipment is depicted in Fig. 1. Its main blocks consist of a computer system, function generator, power amplifier, power meter, matching network, HIFU transducer, phantom (of Liver), phantom cavity detector (PCD), band pass filter, low noise preamplifier and digitizer.

The computer system with HIFU software loaded in it is used to send starting pulse to function generator to produce high-frequency pulses of 1 MHz. These high-frequency pulses are fed to high-frequency power amplifier to produce high frequency with 60 W power which is measured by the power meter continuously. These high-frequency pulses are then given to the matching network before feeding them to the HIFU transducer. The HIFU transducer focuses these high-frequency pulses at phantom at the focal length of 8.99 cm. The HIFU transducer is selected whose outer radius is 2.5 cm, inner radius is 1 cm, focusing depth is 10 cm, working frequency is 1 MHz, output power is 60 W.

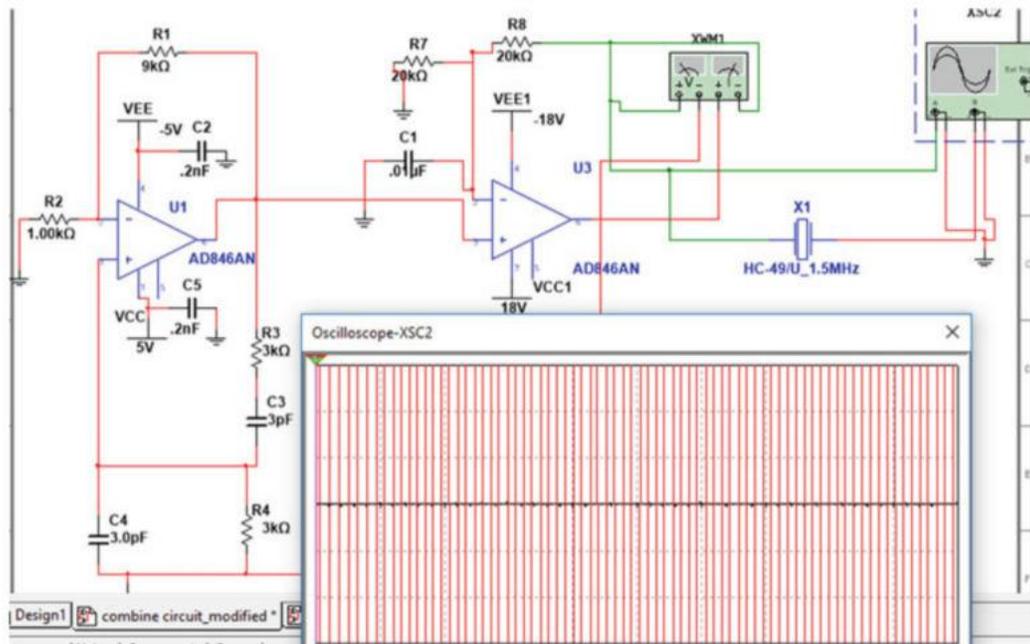

**Fig. 1** Experimental configuration of HIFU equipment

The high-frequency ultrasound waves are hit by the target which results into the generation of reflected echo signals that are captured by PCD, i.e., phantom cavity detector which is again a type of transducer that receives the echo signals from phantom. These signals are filtered by bandpass filter so as to eliminate the unwanted signals coming from the system. These filtered signals are further amplified using low noise preamplifier. In this block, the noise from received echo signals is minimized and the strength of such signals is raised. Since these signals need to be analyzed to take further decisions on creating lesions at target tissues in phantom, a digitizer is used for converting the echo signals into digital signals. These digital signals are then fed to the computer system where the preloaded software is capable to take further decisions on the basis of such received echo pulses.

### 3.1 Circuit Implementation Using Multisim Software

The HIFU equipment's main blocks excluding the transducer part were implemented using Multisim software. Fig. 2 depicts the implementation of oscillator (as the main part of function generator), power amplifier, power meter and matching network implemented using Multisim software. The oscillator and power amplifier have been implemented using the state-of-the-art active elements AD846AN [29, 30].

**Fig. 2** Implementation of proposed model using active element AD846AN

### 3.2 Circuit Implementation Using MATLAB Software

The transducer has been implemented using MATLAB software in which the different parameters of the transducer were fed in using HIFU Simulator toolbox. The equation coefficients for simulating the transducer using MATLAB are given below:

1. Peak Pressure at transducer face( $P_0$ )

$$= \sqrt{(2 * \rho * c * P / \Pi / ((a/100)^2 - (b/100)^2)}$$

where,

- $\rho$  Mass density of phantom in  $\text{kg/m}^3$
- $c$  Small-signal sound speed = 1482 m/s
- $P$  Output power of transducer = 60 W
- $a$  Outer radius of transducer = 2.5 cm
- $b$  Inner radius of transducer = 1 cm.

2. Nonlinear coefficient

$$= 2 * \Pi * P_0 * \beta * (d/100) * f / \rho / c^3$$

where,

- $P_0$  Peak pressure at transducer face in  $\text{kg/m}^3$
- $\beta$  Nonlinear parameter = 3.5
- $d$  Focusing depth of transducer = 8.99 cm
- $f$  Frequency of transducer = 1 MHz.

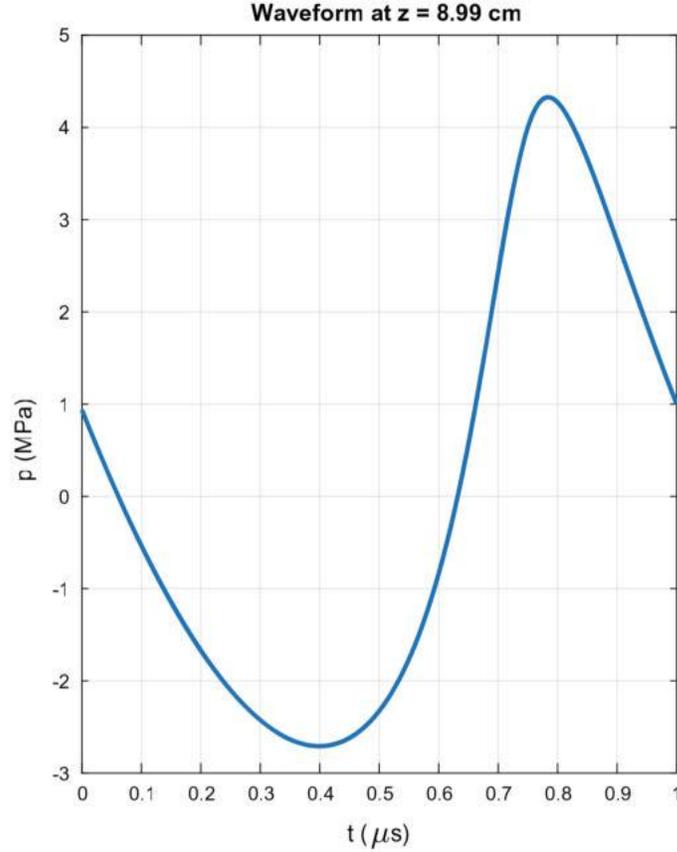

3. Linear Pressure Gain

$$= \Pi * (a/100)^2 * f / c / (d/100).$$

The various graphs obtained after simulating KZK equation in MATLAB are shown in Figs. 3, 4, 5, 6, 7, 8, 9 and 10.

In Fig. 5, it is observed that a peak pressure of 4 MPa is observed within short sonication period of 0.8  $\mu\text{s}$  while it is clear in Fig. 6 that this peak pressure is observed at an axial distance of around 9 cm. In Fig. 7, the focal intensity with transducer whose radius of curvature is 0.5 cm is observed to be of around 250  $\text{W/cm}^2$ , and Fig. 8 depicts that this intensity comes at a little less axial pressure of around 3.5 MPa. The radial heating rate is observed to be of more than 35  $\text{W/cm}^3$  at the focal depth which gives rise to axial heating rate of more than 50  $\text{W/cm}^3$  that gradually leads to focal intensity of around 350  $\text{W/cm}^2$ , and this heating rate becomes sufficient to create coagulative necrosis of phantom tissue immersed in degassed water tank as shown in Fig. 4. This irreversible cell death leads to lesion that removes the tumorous tissue permanently from the phantom.

**Fig. 3** Temporal waveform (on axis) at distance where peak pressure occurs

## 4 Result and Analysis

The circuit implementation of proposed model was done using Multisim 12.0 software and MATLAB software. The design and simulation of high-frequency oscillator and high-frequency and high-power amplifier has already been described in [29, 30]. The simulation results of HIFU transducer are mentioned below.

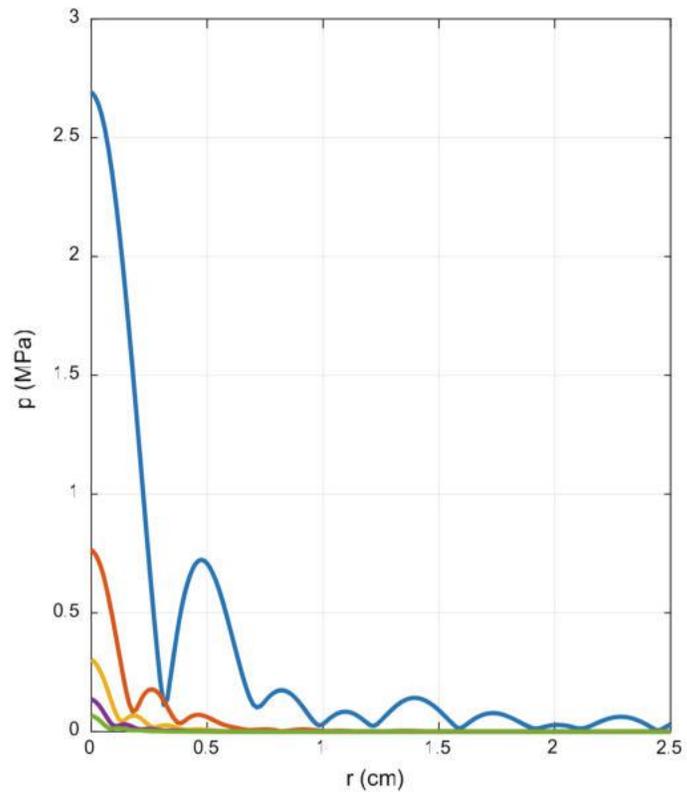

### 4.1 Simulation of High-Frequency Ultrasound Transducer

The HIFU transducer was simulated with the help of KZK equation given below:

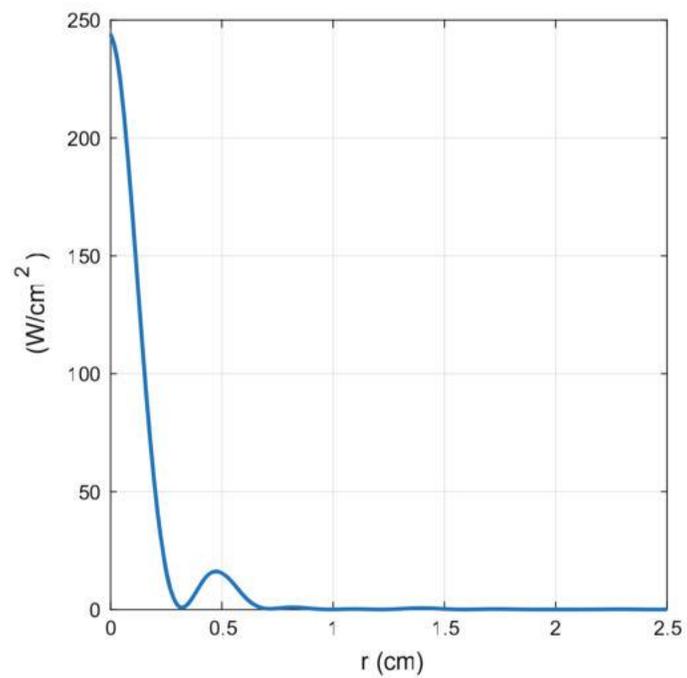

$$\frac{\partial}{\partial \tau} \left( \frac{\partial p'}{\partial x} - \frac{\varepsilon}{\rho_0 c_0^3} p' \frac{\partial p'}{\partial \tau} - \frac{b}{2\rho_0 c_0^3} \frac{\partial^2 p'}{\partial \tau^2} \right) = \frac{c_0}{2r} \frac{\partial}{\partial r} \left( r \frac{\partial p'}{\partial r} \right) \quad (1)$$

where,  $p'$  is acoustic pressure,  $\rho_0$  is medium density at rest,  $c_0$  is speed of sound,  $\varepsilon$  is nonlinearity parameter,  $b$  is dissipation coefficient of the medium,  $\tau = t - x/c_0$  is time in the coordinate system. The results obtained after simulating the KZK equation given in (1) are depicted in Table 1. The density of material used for simulation

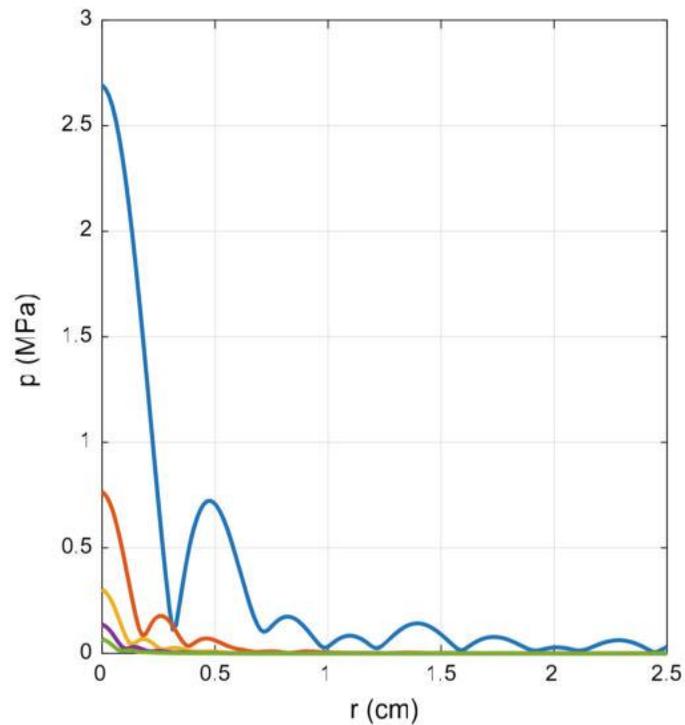

**Fig. 4** Axial pressure amplitude of the first five harmonics

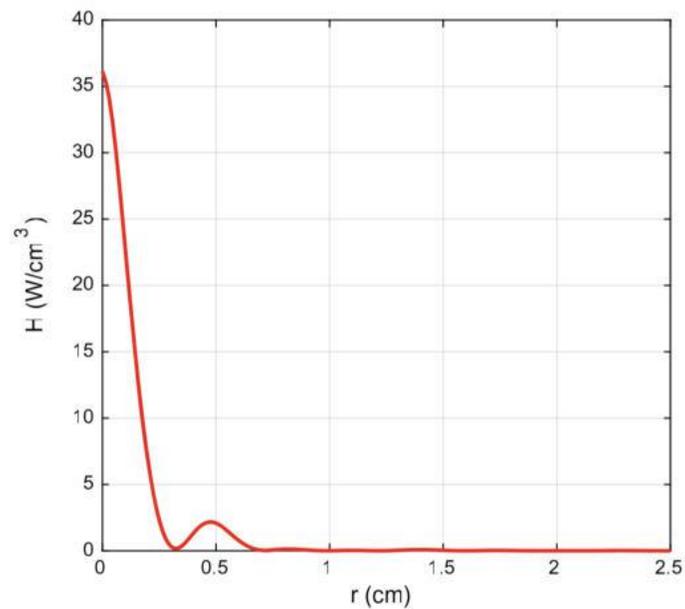

**Fig. 5** Radial intensity at focus

**Fig. 6** Radial pressure amplitude of the first five harmonics

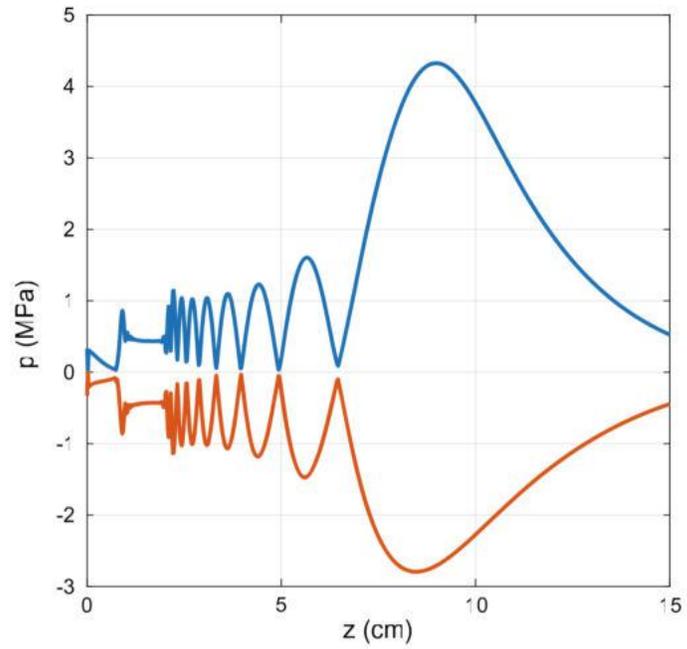

**Fig. 7** Radial heating rate at focus

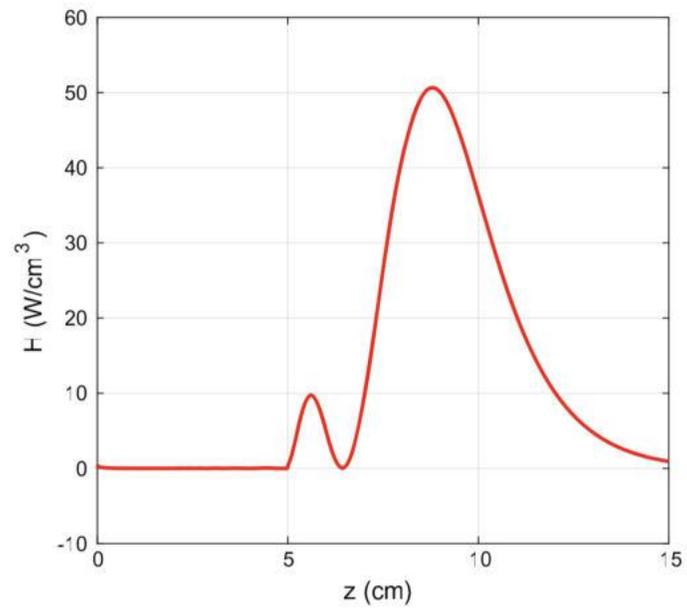

purpose is  $1000 \text{ kg/m}^3$  whose absorption at the frequency of  $1 \text{ MHz}$  is set around  $0.217 \text{ dB/m}$  maintaining the small-signal sound speed at  $1482 \text{ m/s}$  which is sufficient for the high-frequency ultrasound waves to reach at the target site. While the transition distance of material is fixed at  $5 \text{ cm}$ , the focusing depth is maintained at  $8 \text{ cm}$  and frequency of transducer is fixed at  $1 \text{ MHz}$  which is the improvement over past records

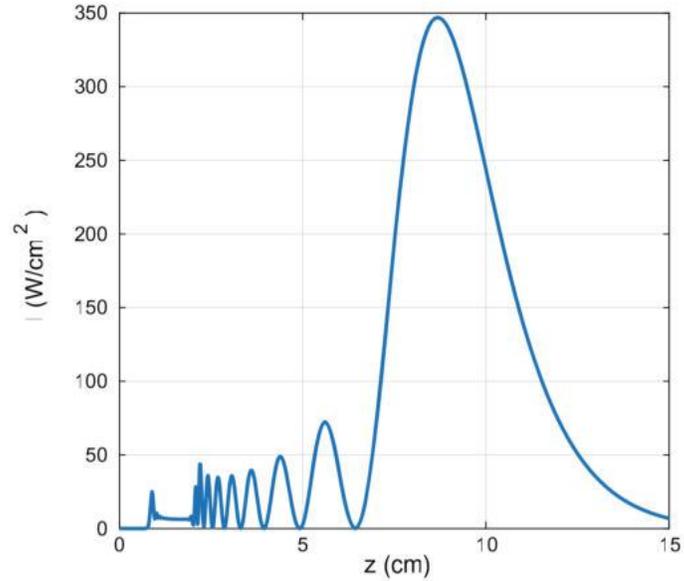

**Fig. 8** Axial peak positive and pressures

**Fig. 9** Axial heating rate

where the frequency is varied in the range of 0.8–1.6 MHz. With these settings, it is observed that the peak pressure is experienced after a time delay of just 0.8  $\mu$ s.

**Fig. 10** Axial intensity**Table 1** List of all HIFU transducer parameters (Calculated and observed ones)

Parameter	Symbol	Value	
Material related	Mass density	$\rho$	1000 kg/m <sup>3</sup>
	Absorption at 1 MHz	$\alpha$	0.217 dB/m
	Small-signal sound speed	$c$	1482 m/s
	Exponent of absorpition versus frequency curve	$\eta$	2
	Material transition distance	$z_0$	5 cm
	Nonlinear parameter	$\beta$	3.5
Transducer related	Outer radius	$a$	2.5 cm
	Inner radius	$b$	1 cm
	Frequency	$f$	1 MHz
	Focusing depth	$d$	8 cm
	Power	$p$	60 W
Computational domain	Max radius	$R$	a cm
	Max axial distance	$Z$	1.5 d cm
	Number of harmonics	$K$	128
Observations after simulation	Temporal waveform (on axis) at distance where peak pressure occurs	$\rho$ versus $t$	4 MPa < $\rho$ < 5 MPa at around 0.8 $\mu$ s
	Radial Intensity at focus	$I$ versus $r$	250 W/cm <sup>2</sup> at 0 cm
	Radial heating at focus	$H$ versus $r$	36 W/cm <sup>3</sup> at 0 cm
	Axial heating rate	$H$ versus $z$	50 W/cm <sup>3</sup> at < 10 cm
	Axial intensity	$I$ versus $z$	350 W/cm <sup>2</sup> at < 10 cm

## 5 Conclusion

The coagulative necrosis of liver tumorous tissue is possible in more effective way while maintaining the parameters of the required HIFU transducer at more comfortable and accurate ranges instead of a wide range that ultimately leads to increase in treatment time due to more adjustments in the transducer parameters even for the same patient. Also, the improvised HIFU equipment with the help of latest active elements will be a boon in improving the treatment time and thus reducing the anxiety of patients at the treatment table. This HIFU equipment gives high accuracy with repeatable results as is visible in result section.

## 6 Future Scope

The HIFU equipments are the need of future medical treatment techniques for various diseases. Diagnosing and planning treatment for patients with the help of previous case histories shall reduce the treatment time and can help radiologists to plan the treatment procedure more accurately when they shall be provided the database of such cases. Hence, with the introduction of artificial intelligence and smart database maintenance in future shall undoubtedly ensure its more effective utility in medical world.

# RAJIV GANDHI PROUDYOGIKI VISHWAVIDYALAYA, BHOPAL

Accredited with 'A' grade by NAAC

Rajiv Gandhi Proudhyogiki Vishwavidyalaya (RGPV), accredited with 'A' grade by NAAC, established in the year 1998 is truly a picture of modernization offering learner-centric programmes in Engineering, Pharmacy, Architecture & Management. University is sprawled over a vast campus of 241.4 acres, marching towards development into a center of excellence in the arena of Technical Education, Research and Innovations.

Under its umbrella there are 05 UTD's 188 affiliated Engineering Colleges, 69 Pharmacy Colleges, 25 MCA Colleges and 05 Architecture colleges imparting Graduate level instructions running 23 under graduate level courses & 84 post graduate level courses. Situated amidst an aesthetic and hilly surrounding the University is offering Ph.D. in eight faculties. RGPV has been selected by Ministry of Human Resource Development (MHRD) as one of the Affiliating Technical Universities (ATUs) among ten across the country for receiving TEQIP-III grant. The main objective of Faculty Development Programme (FDP) is to improve quality and equity in engineering teachers in order to up-grade the knowledge, enhancing research and teaching skills.

# JAWAHARLAL NEHRU TECHNOLOGICAL UNIVERSITY, HYDERABAD (TELANGANA)

Accredited with 'A' grade by NAAC

Jawaharlal Nehru Technological University, Hyderabad, was established on 2nd October 1972 by the Legislature of the State of Andhra Pradesh as the first Technological University in the country. After 36 years of existence it was restricted into 4 different Universities by the Government vide Government Ordinance No.30 dated September 2008 and this new University has been designated as Jawaharlal Nehru Technological University Hyderabad (JNTUH). It has been in the forefront for the past 44 years in providing quality technological education and situated in a sprawling 89-acre campus at Kukatpally,

Hyderabad. It has now Four Constituent Engineering Colleges and 15 other constituent units in Hyderabad campus.

JNTUH offers B.Tech. programmes in 21 disciplines and B.Pharm at UG level; Integrated 5-year dual degree Masters programme; M.Tech. Programmes in 68 disciplines, M.Pharm. in 11 disciplines; M.Sc. in 4 disciplines; MCA, MBA and Double Degree Programmes at P.G. level; in addition to M.S., M.Phil., Ph.D. Research Programmes in various disciplines of Engineering, Technology, Science, Management and Humanities. JNTUH has 300 affiliated colleges spread over the Telangana State. JNTUH has more than 3.50 lakhs students on rolls. The University has Memoranda of University with many National and International organizations. JNTUH is identified as TEQIP-III University under subcomponent 1.3ATU.

# LNCT GROUP OF COLLEGES

LNCT Group of Colleges is one of the oldest and largest educational group in central India. Founded in 1994 Lakshmi Narain College of Technology, Bhopal has the privilege of being the First Private (self financed) institute of M.P. , LNCT Group offers program from Diploma, Bachelor, Master's and Doctorate level programs. With campuses in five locations in Madhya Pradesh &

Chhattisgarh including the cities of Bhopal, Indore, Gwalior, Jabalpur and Bilaspur to meet the ever increasing demands of higher education in central India, LNCT Group is one of the largest Group central India to offer programs in field of study: Engineering, Management, Pharmacy, Medical, Homeopathy, Dental and professional studies. This includes the students a feeling of responsibility and concern and makes them comprehend the world a bit better. Each one is better endowed to face the world and the satisfaction of having fulfilled their social responsibility is an added bonus.

The L. N. Medical College & Research Centre located at Bhopal, MP. It is a part of LNCT Group of College, which are runs a hospital with 750 Beds and Medical courses affiliated with Barkatullah University, All group institutions have the finest relations among the industry and academics. Today, prospective students will find 58 undergraduate, graduate as well as post graduate programs. People who wish to pursue a career in Engineering, Management, Pharmacy, Medicine, Dentistry and Nursing.

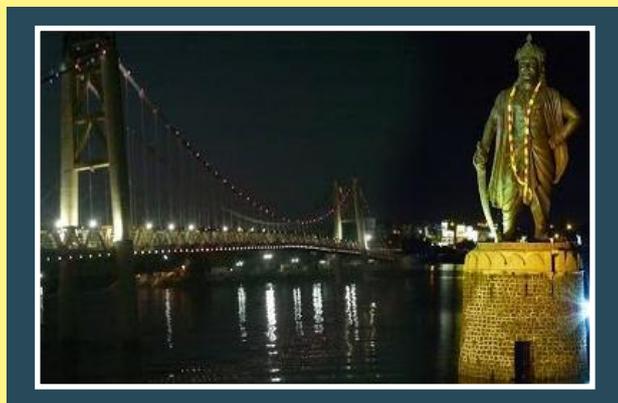

## **ABOUT ORGANIZING INSTITUTE & DEPARTMENT**

Lakshmi Narain College of Technology & Science, Bhopal is devoted to excellence in teaching, research and innovation and to develop leaders who will make a difference to the world. LNCT&S, which is based in Bhopal since 2006. The record breaking placement at LNCT&S is an apt testimony to its focus on upholding the highest academic standards right from selecting top faculty, introducing world class pedagogical practices to personality development to the students.

The department of Engineering Mathematics, one of the vibrant department of the institution, established in the year 2006. Department functions as a service agency providing support to UG inculcate analytical skills in mathematical sciences so as to enable the students to apply and formulate in solution making approaches of their technical subjects. Definitely the learning of mathematics will enhance and widen the mathematical aptitude, analytical skills, logical reasoning and systematic thinking of the students.

## **ABOUT BHOPAL**

Bhopal, capital city of Madhya Pradesh, is known as city of lakes. Founded by Raja Bhoj, the city has many natural and artificial lakes and it is one of the greenest cities in the country. The main cultural center of Bhopal is Bharat Bhavan. The State Museum has fossils, paintings and rare Jain sculptures. Taj-ul-Masjid is one of Asia's largest mosques, with white domes, and minarets. Van Vihar National Park, located in the middle of the city, has many species of animals living in their natural habitat. A large number of institutes of national importance have been

established in Bhopal. Climate of Bhopal is pleasant in the month of November.

## ABOUT INTERNATIONAL CONFERENCE

The purpose of this international conference is to discuss recent findings and new emerging trends in the field. It is intended to promote fruitful collaboration between various communities and institutes by bringing together a small number of scientists in inspiring surroundings. Some priority is given to young scientists to orally present and defend their own work. This will be a great opportunity for budding researchers particularly in the local region to explore the new aspects and global relations.

They would get ample scope to exchange views and thoughts besides presenting their research. The conference aims to provide a common platform to researchers working in various sub-disciplines of the theme.

## Course Objective

The course objective of this international conference is to bring together leading researchers and academics in the field of applied mathematics and engineers in order to debate current and interdisciplinary topics in mathematical modelling and high performance computing and their applications in science. The aim of this conference is to promote the interconnection of mathematical modeling, and High performance computing used in solving complex (real-world) problems. The lectures will be prepared with a broad multidisciplinary audience in mind, and ranging from modeling to scientific computing, will be covered. All submitted papers will be peer-reviewed by referees and accepted papers with great quality will be published in **International Journal of Scientific Research in Mathematical and Statistical Sciences (UGC Approved, Journal No. 63061)**.

**Main topics:** Mathematical modelling and High-Performance Computing in Science and Technology is a premier international conference on topics at the confluence of high performance and large scale computing systems, their use in modeling and simulation, their design, performance and use, and their impact, and related issues.

- ◆ Mathematical modeling the future Internet and developing future Internet security technology
- ◆ High Performance Computing (HPC)
- ◆ Mathematical Models and Information-Intelligent Systems on Transport
- ◆ Computational Methods for Linear and Nonlinear Optimization
- ◆ Numerical Methods for Solving Nonlinear Problems
- ◆ Bio-mathematics
- ◆ Mathematical Models for Computer Science
- ◆ Industrial Mathematics
- ◆ Mathematical Models for Computer Science
- ◆ Computational Modeling in Engineering and Science
- ◆ Mathematical modelling of Man-made Natural disasters: forest fire & environmental pollution
- ◆ Numerical Linear Algebra Methods for Large Scale Scientific Computing
- ◆ Machine Learning Techniques in Bioinformatics
- ◆ Processing, modelling, and describing time series

## MESSAGE

It gives me immense pleasure to know that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing **"International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)"** sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) and in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on February 12-13, 2020.

A galaxy of scientists and mathematicians, not only in India but across the globe, are coming to attend the International Conference.

I extend my best wishes to participants, members of managing committee and organizers of the International Conference (ICMMHPCST-2020) a grand success and also for the successful publication of the Souvenir and in all its future endeavors.

### MESSAGE

It gives me immense pleasure to learn that Department of Engineering Mathematics, **Laxmi Narayan College of Technology and Science, Bhopal** under the sponsorship of TEQIP-III, Rajiv Gandhi Prodyogiki Vishwavidyalaya, MP is organizing an International Conference on "**Mathematical Modeling and High Performance Computing in Science and Technology (ICMHPCST -2020)**" on February 12-13, 2020.

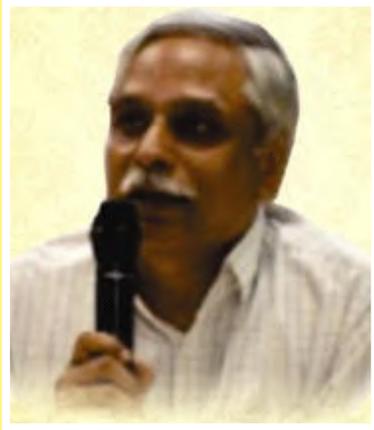

Mathematics is the backbone for the development of scientific and technical fields, scientific computing, the thrust area provides the basis for all round development of humanity and improvement of its well being.

I hope this Conference will provide a forum for interaction of researchers in the field of mathematical science, computer science and interdisciplinary researchers.

I am glad that **Laxmi Narayan College of Technology and Science, Bhopal** is providing the opportunity to large number of professional, academicians and researchers to generate high level of intellectual deliberations and would inspire younger scientists and faculty to go to greater heights.

My warm greetings to the organizers and wish the Conference all success to achieve its desired goals.

(Prof. Sunil Kumar)

**Dr. S.C Choube**

Coordinator TEQIP-III

Rajiv Gandhi Proudyogiki Vishwavidyalaya  
Bhopal (M.P.)

## MESSAGE

It's delightful to learn that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing “**International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)**” sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on February 12-13, 2020.

Mathematics is the backbone for the development of scientific and technical fields. Scientific computing, the thrust area provides the basis for all round development of humanity and improvement of its well being. This conference will provide a forum for interaction of Researchers in the field of mathematical science, computer science and Interdisciplinary Researchers.

I extend my best wishes to participants, members of managing committee and organizers of the **ICMMHPCST-2020** a grand success and also for the successful publication of the Souvenir and in all its future endeavors.

## MESSAGE

It's delightful to learn that the the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing “**International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)**” sponsored by TEQIP-III, Rajiv Gandhi Proudhyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on February 12-13, 2020.

“**ICMMHPCST-2020**” is successive efforts in the series of Mathematical Modeling and High Performance computing for the enhancement of knowledge and interest of one and all n research scholar and faculty members.

This conference is serving as an open platform for promoting and upbringing knowledge in the relevant area.

I heartily wish for the success of this conference and hope that all those are associated with this venture may achieve the most out of it.

(Jai Narayan Chouksey)

## Dr. Ashok Kumar Rai

Director, Administration, LNCT, Bhopal  
Conference Convener (ICMMHPCST-2020)

### MESSAGE

It is the matter of great pleasure and pride that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing “**International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)**” sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) and in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on **February 12-13, 2020**.

This conference brings together leading academicians, scientists & researchers to exchange and share their experiences and research results in all aspects of Mathematical Modeling and High Performance Computing. It also provides a premier interdisciplinary platform for researchers, practitioners and educators to present and discuss the most recent innovations, trends and concern as well as practical challenges encountered and solutions adopted in the field of mathematical modeling and High Performance Computing.

We are grateful to all the delegates participating around the globe, the sponsors of this conference to help us in making this Endeavour a great success. On behalf of LNCT family, I wish all of you pleasant stay and fruitful participation in the conference.

A handwritten signature in black ink, appearing to read 'Ashok Rai'.

## Dr. Sanjeet Kumar

Professor & Head

Department of Mathematics, LNCT&S, Bhopal  
Conference Coordinator (ICMMHPCST-2020)

## MESSAGE

I feel so enthusiastic to share that the Department of Engineering Mathematics, Lakshmi Narain College of Technology & Science, Bhopal, is Organizing “**International Conference on Mathematical Modeling and High Performance Computing in Science and Technology (ICMMHPCST-2020)**” sponsored by TEQIP-III, Rajiv Gandhi Proudyogiki Vishwavidyalaya, Bhopal (Madhya Pradesh) in association with Jawaharlal Nehru Technological University, Hyderabad (Telangana) on **February 12-13, 2020**.

The combination of mathematical modeling and high performance computing is very often ignored in the scientific community although only the combination of these two technologies allows us to get better simulation results for many pressing problems in science and engineering.

The presence of large number of professionals, academicians and researchers would be able to generate high level of intellectual deliberations and would inspire younger scientists and faculty to go to greater heights.

I am sure the delegates and speakers will enjoy the Sessions and will carry with them pleasant memories of the Conference and the College Campus. I hope the Conference will create a strong group of specialists in the area of High Performance Computing and its Applications.

A handwritten signature in black ink, appearing to read 'Sanjeet Kumar', with a large, stylized flourish extending from the end.

## Mathematical Modeling: An application to Corrosion in a Petroleum Industry

Arihant Jain

School of Studies in Mathematics, Vikram University, Ujjain (M.P.)-India

Email: arihant2412@gmail.com

**Abstract:** Mathematical modeling is richly endowed with many analytic computational techniques for analyzing real life situations. Recent reports have confirmed that several billion dollars were lost to corrosion, in addition to environmental pollution and economic wastage in cleaning up the environmental mess caused by corrosion. This paper considers application of mathematical modeling to corrosion problems. It uses the mathematical modeling techniques to forecast the life expectancy of industrial equipment in the refinery, petroleum reservoirs and gas pipelines' distribution. The models considered in this direction are the heat-mass transfer equation, Zhim-Hoffman's equation, equations arising from electrolysis and finally gas pipeline distribution.

**Keywords and Phrases:** Mathematical models, corrosion, phase transition, heat equation, galvanic corrosion.

**AMS Subject Classification :** 73V and 80A.

## Evaluation of some parameters of $Gd^{3+}$ activated $Sr_2ZnSi_2O_7$ host lattices synthesized by sol-gel procedure

Vijay Singh<sup>1</sup>, S.Kokate<sup>2</sup>, Manoj K. Tiwari<sup>3</sup>, N. Singh<sup>4</sup> and R. Kokate<sup>5</sup>

<sup>a</sup>Department of Chemical Engineering, Konkuk University, Seoul, 05029, Korea

Lakshmi Narain College of Technology, Bhopal (M.P.)-India

MIET, Shahapur, Bhandara, 441906, India

Email: vijayjiin2006@yahoo.com, vijayjiin@gmail.com

**Abstract:** In this study, a series of  $Sr_{2-x}ZnSi_2O_7 \cdot xGd$  (where  $x = 0.01$  to  $0.11$ ) samples were synthesized using the sol-gel procedure. X-Ray powder diffraction (XRD), scanning electron microscope (SEM), and photoluminescence (PL) spectroscopy were employed to analyze the crystal characteristics, surface morphologies, and spectral characteristics of these samples. The dominant emission peak due to  ${}^6P_{7/2} \rightarrow {}^8S_{7/2}$  transition of  $Gd^{3+}$  was obtained for the prepared samples. The electron spin resonance (ESR) and PL analyses of the samples confirmed the presence of the  $Gd^{3+}$  in the  $Sr_2ZnSi_2O_7$  lattice. ESR studies suggested that  $Gd^{3+}$  ions occupy distorted  $Sr^{2+}$  sites in the host lattice. Photon interaction parameters in the photon energy range 1 keV–100 GeV for mixture of  $Sr_2ZnSi_2O_7$  and gadolinium (mass attenuation coefficients and effective atomic numbers) for have been calculated. These photon interaction parameters are varying largely for the energy range 1 keV–100 MeV with the compositions with a maximum for the highest gadolinium.

**Keywords:** Ultraviolet radiation; Sol-gel; ESR;  $Gd^{3+}$ ;  $Sr_2ZnSi_2O_7$ ; Gamma-ray

## Face Recognition from Surveillance using Sequential CNN-Model

Ashwin Perti<sup>1</sup>, Mukul Pratap Singh<sup>2</sup>, Harsh Panwar<sup>3</sup> and Harsh Tyagi<sup>4</sup>

ABES Engineering College, Ghaziabad (U.P)-India

**Email:** ashwinperti@abes.ac.in, mukul.16bit1033@abes.ac.in, harsh.16bit1096@abes.ac.in,  
harsh.16bit1062@abes.ac.in

**Abstract:** Now-a-days there is lot of research going on face recognition and identification, with the increase in computational power working on images became easy and many complex and deep neural networks are implemented on images. There are many applications which updates automatic attendance and face recognition, we just wanted to extend to super market problem. This paper solves the problem of identification of customer and employees in super market. We have used deep convolution network and Siamese network to train images to classify in to customers, important customers and employees from cameras. This also compares the results from different models.

**Index Terms:** Neural network, Siamese network

## Some Elliptic-Type Integrals and Their Hypergeometric Forms

Sanjay Sharma<sup>1</sup>, Richa Gupta<sup>2</sup>, Bhupendra Tripathi<sup>3</sup>, Roshni Sharma<sup>4</sup>

<sup>1</sup>Department of School Education, Bhopal (M.P)-India

<sup>2</sup>SRK University Bhopal(M.P)-India

<sup>3</sup>Lakshmi Narain College of Technology, & Science, Bhopal (M.P)-India.

<sup>4</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India.

**Email:** sanjaysharma3240@gmail.com, richasharad.gupta@gmail.com, bhupendrat@lnct.ac.in,  
roshnis@lnct.ac.in

**Abstract:** In the paper, we established Hyper geometric forms of different elliptic – type integrals have been studied due to their importance and applications in certain problems involving computations of the radiation field off axis from a uniform circular disc radiating according to an arbitrary angular distribution law.

## Mathematical Modeling of Man- Made Natural Disasters: Forest Fire & Environmental Pollution

Kirti Verma

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: kirtiv@lnct.ac.in

**Abstract:** Mathematics is an extraordinary exercise of the human mind in abstracting the results of observation to find similarities and differences between phenomena. These relations between phenomena make it possible to organize the natural world into discrete sets of objects that can be studied using similar mathematical objects and methods. Natural disasters cannot be prevented; scientists can use Mathematical Modeling to help limit the damage. Mathematical models are used to summarize relationships between the characteristics of natural disasters. They are ultimately used to answer questions that humans have about natural disasters, and predict the results of events that have not occurred, but may be possible or even likely. In this paper, Mathematical models of some problems related to Natural disaster are discussed.

---

## An analysis of Operational Efficiency of Major Airports in India

Sapna<sup>1</sup> and Ruchi Gupta<sup>2</sup>

Manav Rachna University, Faridabad (U.P)- India.

Email : chauhansap11@gmail.com, ruchigupta@mru.edu.in

**Abstract:** This paper deals with major airport's data of India for the year 2017-2018 and analysis for their respective efficiencies. This empirical study evaluates the operational efficiencies of 30 major India airports using data envelopment analysis and some of its recent developments. Various airport characteristics are evaluated to determine their relationship to an airport's efficiency. In this model, we have taken number of runways, number of passenger terminals and total expenditure as input variables and ASQ rating, aircraft movements, number of passengers, freight and logistics and revenue generated, as output variables.

The model focused in this paper is DEA model (Data Envelopment Analysis) and calculation is done using MS Excel.

**Index Terms:** Airport Efficiency, ASQ, ATQ, DEA Model.

## Common Fixed Point Theorem for Weekly Compatible Self Mapping in Menger Space

Geetanjali Sharma<sup>1</sup>, Richa Gupta<sup>2</sup>, Pankaj Tiwari<sup>3</sup> and Rajesh Shrivastava<sup>4</sup>

<sup>1,2</sup>Sarvepalli Radhakrishnan University, Bhopal (M.P)-India

<sup>3</sup>Govt. Naveen College, Lidhoura, Tikamgarh (M.P)-India

<sup>4</sup>Govt. Dr. Shyama Prasad Mukharji Science & Comm. College, Bhopal (M.P)-India

E-Mail: [ajaygeet@gmail.com](mailto:ajaygeet@gmail.com), [richasharad.gupta@gmail.com](mailto:richasharad.gupta@gmail.com), [pankajvist@gmail.com](mailto:pankajvist@gmail.com)

**Abstract:** In this paper, we prove the nation of Menger space and prove a common fixed point theorem for pairs of weakly compatible self mapping. Which generalize the well known results.

**Keywords:** Common fixed points, Metric space, Menger space, t-norm and Weakly Compatible mappings.

**AMS Subject Classification (2000)** – 45H10, 54H25.

## Common Fixed Points for a Pair of Self Mapping in Generalized Menger Spaces with a Graph

N. S. Rajpoot<sup>1</sup>, Brajendra Tiwari<sup>2</sup>, Pankaj Tiwari<sup>3</sup> and Bhupendra Tripathi<sup>4</sup>

<sup>(1,2)</sup>RKDF University, Bhopal (M.P)-India

<sup>3</sup>(G.F.) Govt. Naveen College, Lidhoura Tikamgarh (M.P)-India

<sup>4</sup>Lakshmi Narain College of Technology & Science, Bhopal (M.P)-India

E-Mail: [narendrarajput912@gmail.com](mailto:narendrarajput912@gmail.com), [brajendra16.tiwari@gmail.com](mailto:brajendra16.tiwari@gmail.com),

[bttripathirewa@yahoo.co.in](mailto:bttripathirewa@yahoo.co.in)

**Abstract:** In this paper, we prove the existence and uniqueness of points of coincidence and common fixed points for a pair of self-mappings defined on generalized metric spaces with a graph. Our results improve and extend several recent results of metric fixed point theory.

**Keywords:** Coincidence and common fixed points, Metric space, Menger space, self-mappings.

## Some Fixed Point Theorem Satisfying General Contractive Condition of Integral Type

Himanshu Tiwari<sup>1</sup> and Subhashish Biswas<sup>2</sup>

Kalinga University, Raipur (C.G.)-India.

E-mail: [himanshu.tiwari.ht@gmail.com](mailto:himanshu.tiwari.ht@gmail.com) [deb12rishika@gmail.com](mailto:deb12rishika@gmail.com) [shubhb@yahoo.co.in](mailto:shubhb@yahoo.co.in)

**Abstract:** In this paper, we establish a fixed point theorem for a pair of self maps satisfying a general contractive condition of integral type. This theorem extends and generalizes some early results of Boikanyo [4] and Jaggi and Dass [12].

**Keywords:** Lebesgue- integrable map, Complete metric space, Common fixed point

**AMS Subject Classification (2000):** 54H25, 47H10.

## Integral Relation of I-Function

Aradhna Mishra<sup>1</sup>, Neelam Pandey<sup>2</sup> and Jyoti Mishra<sup>3</sup>

<sup>1,2</sup>APS University, Model Science college, Rewa (M.P)-India

<sup>3</sup>Gyan Ganga Institute of Technology and Sciences, Jabalpur (M.P)-India

**Email:** jyoti.mishra198109@gmail.com

**Abstract:** I- Function formulae play an important role in special function. In this paper we aim to establish some new integral relation of I- function of one variable. Some special cases also presented in this paper.

**Keywords:** I- Function, Multivariable polynomial.

---

## Analytic Study of Fixed Point Theorems in a Soft Metric Space with Integral Type Mapping

Abid Khan<sup>1</sup>, Ramakant Bhardwaj<sup>2</sup> and Deepti Shakti<sup>3</sup>

<sup>1,3</sup>Amity University, Madhya Pradesh, Gwalior (M.P)-India

<sup>2</sup>Amity University, Kolkata (WB) -India

**Email:** abid69304@gmail.com

**Abstract:** In the present paper we established fixed point and common fixed point theorems in soft metric space with integral type mappings. Analytic results of fixed points will be established.

**Key-words** - common fixed point; rational conditions; compact metric spaces;

**AMS Classification:** 47H10, 54H25, 55M20.

---

## Bianchi Type-I Bulk Viscous Cosmological Models with Decaying Cosmological Term

Abhay Singh<sup>1</sup>, Bhupendra Tripathi<sup>2</sup> and Roshni Sharma<sup>3</sup>

Technocrats Institute of Technology and Science, Bhopal (M.P)-India

Lakshmi Narain College of Technology, & Science, Bhopal (M.P)-India.

**Email:** abhaysingh5784@gmail.com, bhupendrat@lnct.ac.in, [roshnis@lnct.ac.in](mailto:roshnis@lnct.ac.in)

**Abstract:** Bianchi type I cosmological models with varying cosmological term  $\Lambda$  and bulk viscous fluid are investigated. Exact solutions of Einstein's field equations have been studied by assuming the law for variation of Hubble's parameter that yields a constant value of deceleration parameter. Physical and kinematical properties of the models are also discussed.

**Keywords:** Cosmological term  $\Lambda$ , Deceleration parameter  $q$ , Hubble parameter  $H$ , Scale factor  $S$ .

## Fixed Point Theorem for $(\beta\alpha)$ -Admissible Mappings in Metric-like space with respect to Simulation Function

Shiv Kant Tiwari<sup>1</sup> and Lakshmi Narayan Mishra<sup>2</sup>

Jai Prakash Mahila College Chapra (Bihar) 804103 India

**Email:** shivkantmath@gmail.com

**Abstract:** In this paper, we have introduced some new type simulation function of  $(a,b)$ -admissible mappings with respect to  $Z$ -contraction in the complete metric-like space and our results improved several recent results in the metric-like space. Also, we supported example for justification of theorem.

**Keywords:** Simulation function, Admissible mapping, Fixed point, Contraction mapping

## A Formal Solution of Certain Simultaneous Quadruple Integral Equations Involving I-Functions

R. K. Sakale

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** rajeshs@lnct.ac.in

**Abstract:** The problem discussed is to obtain the solution of simultaneous quadruple integral equations involving I-functions. The method followed is that of fractional integration. The given simultaneous quadruple integral equations have been transformed by the application of fractional Erdelyi-Kober operators to four others simultaneous integral equations with a common Kernel. Here for the sake of generality the I-function is assumed as unsymmetrical Fourier kernel. Here with the help of theorems of Mellin transform, the solution of simultaneous Quadruple Integral equations is obtained. Some interesting particular cases have been derived.

## Dynamics and stability analysis in the population dynamics by introducing a vaccination strategy and computational simulation

Rachna Soni

Millennium Institute of Technology, Bhopal (M.P)-India

**Email:** rachnasoni2005@gmail.com

**Abstract:** In this paper, we have studied the dynamical behavior of the population due to the presence of demographic changes such as; fertility changes, population growth rate, mortality rate, mortality etc. This complication arises due to the environmental changes which are affected by pollution and the unavailability of the healthy food resources. To overcome from these difficulties, we can introduce the vaccination strategy to increase the immunity system of the body. The main aim of this study deals with the changes arise in the Malthusian growth model by including the vaccination rate in the equation of this model and obtained the stability conditions of all the existing equilibrium state of the proposed model. Some computational simulations are also performed to justify the results obtained.

**Keywords:** Equilibrium state, Malthusian growth model, stability analysis, vaccination

## On Vehicle routing Problem using Mixed Integer Non-Linear Programming

Mamta Raipuriya<sup>1</sup>, Richa Gupta<sup>2</sup>, Vivek Prasad Patel<sup>3</sup> and Sushma Jat

<sup>(1,2)</sup> Sarvepalli Radhakrishnan University, Bhopal (M.P)-India

<sup>3</sup> Oriental Institute of Science & Technology, Bhopal (M.P)-India

<sup>4</sup> Lakshmi Narain College

of Technology & Science, Bhopal (M.P)-India

**Email:** mamtaraipuriya@gmail.com, sushmaj@lnct.ac.in

**Abstract:** The family of (VRPs) has received remarkable attention in the field of combinatorial optimization after its introduction in the paper of Dantzig and Ramser. VRPs determine a set of vehicle routes in order to accomplish transportation requests at minimum cost. In this paper we develop a mixed-integer non-linear programming model for vrp and apply it in electric vehicle charging.

**Keywords:** Vehicle Routing Problems, mixed-integer non-linear programming, electric vehicle charging.

## The Two Contiguous Hypergeometric Function of the Some Linear Combination

Aradhana Mishra & Poonam Mishra

APS University Rewa (M.P)-India

**Email:** aradhanamishra04@gmil.com

**Abstract:** The aims of this paper are to give using some contiguous relations. The asymptotic behaviour of some linear combination of two symmetric contiguous hypergeometric functions under some conditions of their parameters. The hypergeometric function belongs to an important class of special function they are very useful in many fields of physical and astronomical researches in mathematical analysis and its application they have significant properties identities of special values. And transformation formula. These properties have many interesting application in combinational analysis and arithmetic geometric. The first systematic and thorough study of hypergeometric series was carried out. An hypergeometric function is called contiguous to the other function if one. Two. Or three of the parameter are increased or diminished by an integer;

## Variational Inclusion Governed By $H(\cdot, \cdot) - \varphi - \eta$ -Mixed Accretive Mapping

Sanjeev Gupta

GLA University, Mathura, (U.P) 281406-India

Email: gupta.sanjeev@gla.ac.in

**Abstract:** In this paper, we look into a concept of accretive mappings called  $H(\cdot, \cdot)$ - $\varphi$ - $\eta$ -mixed accretive mappings in Banach spaces. We extend the concept of proximal-point mappings connected with generalized  $m$ -accretive mappings to the  $H(\cdot, \cdot)$ - $\varphi$ - $\eta$ -mixed accretive mappings and study its characteristics like single-valued property as well as Lipschitz continuity. Since proximal point mapping play an important role to solve variational inclusion problem. Therefore, we frame an iterative algorithm to solve variational inclusion problem as an application of introduced proximal point mapping and show its convergence with considerable assumptions.

**Keywords:**  $H(\cdot, \cdot)$ - $\varphi$ - $\eta$ -mixed accretive mapping, proximal point mapping, iterative algorithm, variational-like inclusion

## Solution for Congestion Control and Challenges of Mobile Ad Hoc Network

Harsh Pratap Singh<sup>1</sup>, Divakar Singh<sup>2</sup>, Rashmi Singh<sup>3</sup> and Narendra Sharma<sup>4</sup>

<sup>1</sup>Sri Satya Sai University of Technology and Medical Sciences,  
Sehore (M.P)-India

<sup>2</sup>Barkatullah University, Bhopal (M.P)-India

<sup>3</sup>Radharaman Institute of Technology and Science, Bhopal (M.P)-India

E-mail: singhharshpratap@gmail.com

**Abstract:** Congestion is a serious problem in mobile ad hoc network. In such network each and every node behaves as the router and has the capacity to convey the packet from correspondent to respondent. Because of the limited capacity of the bandwidth every node may transmit the packet at the same time due to this congestion arises which incur long delay and high packet loss which degrades the performance of the network. This network has dynamic topology and has shared behavior, it automatically forms the network temporarily which helps in transmission earl. To overcome these difficulties many approaches has been suggested earlier. This paper, presents the overview of the existing approaches and also discussing difference between these congestion control techniques.

**Keywords:** Congestion, Mobile ad hoc network, Bandwidth, Shared behavior, Dynamic topology

## The Direct Method for the Optimal Solution of a Transportation Problem

Priyanka Malviya<sup>1</sup>, Sushma Jain<sup>2</sup> and Rina agrawal<sup>3</sup>

Govt. M.V.M., Bhopal (M.P.), India

**Email:** deepriyanka\_13@yahoo.com, sushmajain22@gmail.com, drrinaagrawal@gmail.com

**Abstract:** In this paper, we discuss a new approach for solving both balanced and unbalanced transportation problem. Here we present a paper entitled “The direct method for finding the optimal solution of a transportation problem”, which is proposed to find an optimum solution. The algorithm for proposed method discussed in this paper gives an initial as well as either optimal solution or near to optimal solution. Some numerical examples has been given to show the efficiency of the proposed methodology. Also the results of new approach are compared with the MODI's method and we can see that the proposed method gives either same or less optimal cost as compare to MODI's method within shorter time period and also it is easy to use.

**Keywords:** Balanced and unbalanced Transportation Problem, Basic Feasible Solution, Optimal Solution, MODI method, Proposed method.

## Coincidence Points & Common Fixed Points of Expansive Mappings in *Ab*-Metric Space

Anil Bakhru<sup>1</sup>, Richa Gupta<sup>2</sup> and Manoj Ughade<sup>3</sup>

<sup>1</sup>S.V. Polytechnic College, Bhopal (M.P.), India

<sup>2</sup> Sarvepalli Radhakrishnan University, Bhopal (M.P.), India

<sup>3</sup>Government J.H. Post Graduate College, Betul (M.P) 460001 India

**Email:** anilbakhru@gmail.com

**Abstract:** In this paper, we prove some fixed point theorems for expansive mapping on *Ab*-metric spaces. Our results extend/generalize many pre-existing results in literature.

**Keywords:** *Ab*-metric space; expansive mapping; fixed point.

---

## Some Common Fixed Point Theorems in complete Fuzzy Metric Spaces

Ajay Soni<sup>1</sup> and Pooja Jain<sup>2</sup>

Lakshmi Narain College of Technology, Bhopal, India

**E-mail:** ajay.mvm01@yahoo.com

**Abstract:** In this paper we introduce the concept of common fixed point in the framework of L-fuzzy metric space and establish a fixed point theorem for self mappings. This result generalizes and extends the existing result et al. [3] on common fixed point on fuzzy metric space to L-fuzzy metric space using weak compatible mapping. In the support of our result.

## Projective Semi-Symmetric Connections on Almost Para-Contact Manifolds

S. K. Pal, M. K. Pandey and R. N. Singh

Govt., T.S.S. Naigarhi, Rewa (M.P.) India

Email: skpalmath85@gmail.com

**Abstract:** In this paper, we have extended the study of the projective semi-symmetric connections on almost Para-contact manifold. We have shown that the projective semi-symmetric connection on P-Sasakian manifold becomes a special projective semi-symmetric connection. We also prove that if curvature tensor of projective semi-symmetric connection vanishes, then SP-Sasakian manifold admits an  $\eta$ -parallel Ricci tensor.

**Keywords and phrases:** Projective semi-symmetric connection, curvature tensor, Para-cantact manifold.

**AMS Mathematics Subject Classification (2010):** 53C12.

## The Cosmic-ray Spectra at Spherical Termination Shocks

Brijesh Singh Chauhan

Govt. Arts and Commerce College Majhauri Sidhi (M.P.)-India

Email: s.brijesh3@gmail.com

**Abstract:** We discuss the nature of the steady-state spectra of particles accelerated at stationary spherical shocks, such as the solar wind termination shock. In addition to the two well-known spectral regions characterized by a power-law momentum dependence and a high-energy cut off, This consists of an enhancement of the cosmic-ray intensity just below the cut off similar features have been seen previously in multidimensional models and cosmic-ray modified shocks, where they were explained by acceleration and drift in the latitudinal direction along the shock face and decreasing effective shock compression ratio, respectively We show that a similar bump may be obtained in a purely spherically symmetric geometry with no drifts, and that this effect may also have contributed to the previous results. We attribute this effect to increased shock acceleration efficiency at certain energies. We also demonstrate that a one-dimensional planar shock with a reflecting wall upstream can give a similar effect. We conclude that care is necessary in interpreting observed bumps in any given situation.

## Computational Numerical Methods for Solving Nonlinear Problems

Gurusharan Kaur & Jyoti Gupta

Career College, Bhopal (M.P.)-India

Sri Sathya Sai College for Women, Bhopal (M.P.)-India

**Email:** kgurusharan@gmail.com, jyoti.gupta1709@gmail.com

**Abstract:** This paper will make it possible to tackle difficult non linear problems and deepen their understanding of problem solving using numerical methods. Multipoint methods are of great practical importance, as they determine sequences of successive approximations for evaluative purposes. The method involved here is beneficial to achieve the highest computational efficiency and accuracy of solution. It provides a deep understanding of the usefulness of each method which is supportive to a wide range of research areas along with many numerical examples. The rapid development of digital computers and advanced computer arithmetic have created a need for new methods useful for solving practical problems in a multitude of disciplines such as applied mathematics, computer science, engineering, physics, financial mathematics, and biology. In a clipped way, it enables to implement a wide range of useful and important numerical algorithms for solving research problems. It also illustrates how numerical methods can be used to study problems which have applications in engineering and sciences, including signal processing, control theory and financial computation. Further, it facilitates a deeper insight into the development of methods, numerical analysis of convergence rate and very detailed analysis of computational efficiency. It is a powerful means of learning by systematic experimentation with some of the many fascinating problems in science includes highly efficient algorithms convenient for the implementation into the most common computer algebra systems such as Mathematica, MatLab and Maple.

## A Review on Performance Analysis and Flow Features of Swirl Diffuser in a Floor Based Air Conditioning System

Deenoo Pawar<sup>1</sup>, Anil Chourasia<sup>2</sup>, Sandeep Mahore<sup>3</sup> and Sachin Kumar Nikam<sup>4</sup>

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** dinupawar2011@gmail.com, achourasia0112@gmail.com, sandeepm@lnct.ac.in, sachinn@lnct.ac.in

**Abstract:** An air diffuser is the mechanical device that is designed to control the characteristics of a fluid at the entrance to a thermodynamic open system. Diffusers are used to slow the fluid's velocity and to enhance its mixing into the surrounding fluid. Swirl diffusers can create better air mixing to enhance indoor air quality and help achieve compliance through air change effectiveness measure. Swirling vanes are used in air diffusers to create swirling outflow jet, so that more rapid mixing with ambient air can be achieved. The air change effectiveness calculation depends strongly on the flow characteristics produced by the diffuser outlet that vary considerably between different modelling set ups. Proper calibration and correct definition of performance related parameters are important to affect the radially diffusing flow pattern. This study demonstrates the common approaches, identifies the critical design parameters, analyses and discusses the differing outcomes in terms of flow pattern, air distribution.

**Keywords:** Air swirl, Diffuser, Effectiveness, Swirling Blades Angle, Air Flow

## Mathematical Modeling of Dilute Biphasic Fluid Flow in Industrial Aero-cyclone Dust Separators

A N Sinha<sup>1</sup>, V N Bartaria<sup>2</sup> and Rakesh Dwiwedi<sup>3</sup>

<sup>(1,2)</sup>Lakshmi Narain College of Technology, Bhopal (M.P)-India

<sup>3</sup>Chief Manager , CCL Headquarte ( Coal India Ltd.), Ranchi (Jharkhand)

**Email:** directoracademics@lnct.ac.in, vnbartaria@lnct.ac.in

**Abstract:** Cyclone is a device used for removal of dust in industrial complex having the biphasic fluid of air-dust mixture. A standard reverse flow cyclone with tangential inlet is the basic model based on empirical formulae derived by experiments which is exhaustively used in industry with comparatively less efficiency. Design analysis based on the governing equations of two phase dilute fluid flow will improve the efficiency of Cyclone. Though the operating principle of a cyclone is very simple, the turbulent flow-field in a cyclone is very complex due to presence of swirl and interaction between particles, fluid and walls. A tangential entry and cyclone geometry give rise to a strong swirling flow. The flow acquires a rotational movement along the cyclone wall (free or outer vortex) and it descends down to a certain axial location near the cyclone bottom where the axial velocity acquires a reverse flow (forced or inner vortex) towards the upward direction and finally exit through a central duct known as vortex finder. Particles entering the cyclone are rebound, re-circulated and re entrained all along the outer and inner vortex. Consequently, the variables controlling the centrifugal force become highly complex. The primary purpose of vortex finder (air outlet) is to guide the dust particles to a central point for easy handling and disposal.

The governing equation for the turbulent, steady, isothermal and incompressible fluid flow in a cyclone is given by the Navier Stokes equation. The integration of the force balance on the particle yields the trajectory of a particle and the same equates the particle inertia with the forces acting on the particle. Navier-Stokes equations for turbulence modeling of cyclone flow field uses Reynolds averaging ( time averaging) that yields the solution of exact Navier Stokes equations into the mean ( time averaging ) and fluctuating Components. , the discrete phase has been considered for modeling dilute phase industrial cyclone in this work.

The Finite volume technique is used in this work on the approach to satisfy the integral form of the Navier Stokes equations to suitable approximation for each of the many contiguous control volume which cover the solution domain. Based on FVM, CFD tool is used to understand the complex flow structures typical of cyclones for optimal design of it and make possible to exclude the need of experimental studies, a cumbersome ,inefficient, time consuming based on empirical formulae & thumb rules.

## Fuzzy EOQ Inventory Model Using Trapezoidal Fuzzy Number with Shortages

Sumit Pratap Singh

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: prof\_sps@yahoo.co.in

**Abstract:** In this paper, an EOQ inventory model with shortages has been considered by using Fuzzy. Our aim is to optimize the total cost and the order quantity for the proposed fuzzy EOQ inventory model. The Trapezoidal fuzzy numbers have been introduced in order to achieve this goal. The computation of economic order quantity (EOQ) is carried out through defuzzification process by using signed distance method. To illustrate the results of the proposed model, we have given examples and presented the computational results.

**Keywords:** EOQ, Fuzzy Inventory model, Trapezoidal Fuzzy number, Defuzzification, Shortages.

---

## Bayesian Approach for a Periodic Review Inventory Model with Emergency orders using Weibull Distribution for Demand Function

Sumit Pratap Singh

Lakshmi Narain College of Technology, Bhopal (M.P)-India

Email: prof\_sps@yahoo.co.in

**Abstract:** In this paper we consider a periodic review inventory model. we consider demand function as a random variable which follows weibull distribution with two parameters  $\lambda$  and  $\beta$ . There is provision for placing order only at discrete time points in periodic review inventory system. If the time between two consecutive review is large in the presence of random demands, there could be heavy shortages, and the profitability of the system could suffer more so when the shortage cost is high. However it may not be feasible/profitable to carry a high level of stoke in anticipation of the uncertain demand especially if the holding cost is significant to meet the excess demand in such situation, one or more emergency orders can be placed before the end of review period. Taking into account the nature of the demand and the supply source, the timing and size of the emergency order can be determine optimally. Therefore for the optimization of the model an accurate estimation of demand is important.

## Fractional Integral Operators Associated with certain Generalized Hypergeometric Function for Real Positive Definite Symmetric

Anamika Dubey

APS University Rewa (M.P)-486003 India

Email:

**Abstract:** In the present paper, fractional integral operators related with I-function for real positive symmetric definite matrix have been talked about .These operators have a wide scope of uses in the field of mathematical physics and linear differential equations .Various special cases of our operators have been referenced.

**Keywords:** Hypergeometric Function, I-function

## HR Management and Employee Performance Using Ethics: A Critical Analysis

Hema Rathore

Madhyanchal Professional University, Sehore (M.P)-India

Email: krati.h12300@gmail.com

**Abstract:** Recent corporate changing aspects have led to the developing attentiveness in business ethics, both in academia and in the professional practice. Nevertheless, ethical hiatuses endure to happen in human resource management activities, leading HR academics and professionals to reconsideration what to do to reinvent new strategies to successfully manage ethics in HRM functions. Performance is understood as achievement of the organization in relation with its set goals. It includes outcomes achieved, or accomplished through contribution of individuals or teams to the organization's strategic goals. The term performance encompasses economic as well as behavioural outcomes. The objective of this critical literature review therefore is to establish the role ethics can play in human resource management to improve organizational performance. The methodology used was critical review of relevant literature with the scope of the study encompassing qualitative research of theories and comparative nature of ethics in HRM.

**Keywords:** Employee Performance, Ethics, Human Resource Management, Ethical climate, HR academics.

**Email:** deepikabasedia@gmail.com, rajeshraju0101@rediffmail.com,

**Abstract:** Mathematical modeling is art of translating real world problems into mathematical problems, solving the mathematical problems and interpreting these solutions in the language of the real world. A mathematical model is a description of a system using mathematical concepts and language. Breast cancer is the second most commonly diagnosed cancer and leading cause of cancer death for women worldwide. Breast cancer (BC) is the main cause of cancer mortality in women. Breast cancer accounts for approximately 40% of all the cancer types in women. Computational and mathematical models are gradually being used to help us understand the breast cancer. The goal of this research is to improve the accuracy of predicting the breast cancer (BC) development and their accurate treatment using the ordinary differential equations, partial differential equation and interpolation formulas for mathematical model

**Keywords:** Mathematical modeling, Breast cancer, Carcinogenic agents, Cancer treatment

## A Mathematical Model for the Slip Condition of the Blood flow through a Stenosed artery using Casson-fluid flow

Ajay Kumar<sup>1</sup>, R.S. Chandel<sup>2</sup>, Rajesh Shrivastava<sup>3</sup>,

**Email:** ajaykumarrgv@gmail.com, rs\_chandel2009@yahoo.co.in,  
keertyshrivastava@yahoo.in, rajeshraju0101@rediffmail.com, sanjeet\_418@yahoo.com

**Abstract:** The mathematical model is developed by considering blood as Casson fluid through the asymmetric artery with the stenosis. The non-Newtonian fluid behaviour is characterized by using Casson-fluid flow model. The analytic expression for flow rate, resistance to flow and skin friction are derived by using this model. We observed that the flow rate decreases when the yield stress and viscosity coefficient increases, the skin-friction increases with the increase of yield stress in presence of slip velocity for velocity coefficient parameter. The results are derived in detail with the help of graphs for the variation of different flow parameter. Flow rate, resistance to flow, and skin-friction and impedance analysis of the casson fluid have been shown graphically by varying the yield stress.

**Keywords:** Stenosis; artery blood flow, flow rate, blood flow and Casson fluids model

**Mathematics Subject Classification [MSC] 2010 No.:** 76Z05, 92C35

## Some Important Results on Fixed Point Theorem using Generalized Metric Spaces

Rakesh Kumar Verma

Sagar Institute of Research & Technology Excellence-Bhopal (M.P)-India

Email: rakeshvr54@gmail.com

**Abstract:** In this paper we shall study the some important results on fixed point theorem using the generalized metric spaces. Some important generalization in previous paper of Kannan's fixed point theorem in the ordinary metric space and Das's fixed point theorem in generalized metric space. We will work the paper of Ali Fora, Azzeddine Bellour and Adnan Al-Bsoul regarding generalized metric space.

**Keywords:** Fixed point, Generalized metric space.

---

## The Involving in I-Function of Two Variables and General Class of Polynomials

Aradhana Mishra<sup>1</sup>, Neelam Pandey<sup>2</sup> and Poonam Mishra<sup>1</sup>

<sup>1</sup>APS University Rewa (M.P.)

<sup>2</sup>Govt. Model Science College Rewa (M.P.)

Email: rewapoonamm@gmail.com

**Abstract:** This paper presents in the some derivative formulas of I- Function of Two variables involving general class of polynomials. The well known H-function of one variable defined and proved the H-function as a symmetric. The H-function is often called fox's H-function. Later on many researchers studied and developed H-function. Introduced a new function in the literature namely the I-function which is useful in Mathematics. Physics and other branches of applied mathematics. In the present paper we establish derivative of I-function of two variables involving general class of polynomials. The generalized derivatives of product of general class of polynomials and I- function of two variables transformed as I-function of two variables but expression involving more terms. Also one can find same formulae involving general class of polynomial, I-function of r variables. The special case of our derivatives yields interesting result;

**Keywords:** I-function; Rathie Arjun A new generalization of generalized hypergeometric function.

## Classification of Large Data Set for Social Websites using Hadoop

Rajendra Gupta and Meenakshi Dayal

Rabindranath Tagore University Bhopal (M.P)-India

Email: rajendragupta1@yahoo.com, mons.dayal@gmail.com

**Abstract:** Large data set is a kind of collection of **data** in a **huge size**. Large data set is a term used to define a group of data that is large in size and yet growing mounting with time. This data is so large and also complex that none of the conventional data management tools are able to store it or process it efficiently. From blogger post, there data to Google using online search to predict incidence of the Twitter, YouTube, Instagram and Facebook are using troves of information. Online and offline actions are being chased, gathered, and analyzed at dizzying rates. Facebook or Google retrieve the data like what application user install they verify and access with user permission allow contact, photo, video and if user connect with and check the demand of the user and notify, using various applications on our computer, can be recorded and analyzed. We can find this analyze to splurge on weekdays. We can be more efficient at work by realizing we spend time more than we thought on Facebook. These are stored in Data warehousing and retrieve data through data mining are connected terms, as is NoSQL. With data firmly in hand and with the ability given by large data set using flume in hadoop Technologies to effectively store and analyze this data, we can find answers to these questions and work to enhance every aspect of our behavior. Twitter, Facebook, Instagram, Google can know every post and searching you ever viewed by analyzing large data gathered over the years. Facebook can analyze large data and tell you the birthdays of people that you did not know you knew. With the initiation of many digital modalities all this data has grown to large data and is still on the rise. In the end large Data technologies can exist to improve decision-making and to provide greater vision faster when needed but with the downside of loss of data secrecy.

**Keyword:** Large Data Set, Twitter, Facebook data set, flume in Hadoop, MapReduce

## Incomplete Mittag-Leffler Function

Dharmendra Kumar Singh and Saurabh Porwal

UIET, CSJMU, Kanpur (U.P)-India

**Abstract:** This paper devoted to the study of incomplete Mittag-Leffler function and some of its properties in terms of incomplete Wright function.

**Keyword:** Mittag-Leffler function

Mathematics Subject Classification (2000): 33E12, 33B15, 11S80.

## Extreme Values Analysis for Finding Outliers Detection Using Machine Learning to Detect Predicted Data Points

Ashish Jain

Lakshmi Narain College of Technology, Bhopal (M.P)-India

**Email:** ashishj@lnct.ac.in, jainashish1302@gmail.com

**Abstract:** An outlier is usually measured as an observation which is extensively found distant from the other well thought-out observations. In the era of ready-to-go analysis of n-dimensional datasets, data quality is essential for economists to guarantee robust results. Many machine learning algorithms are sensitive to the range and distribution of attribute values in the input data. Outliers in input data can skew and mislead the training process of machine learning algorithms resulting in longer training times, less accurate models and ultimately poorer results. Even before predictive models are prepared on training data, outliers can result in misleading representations and in turn misleading interpretations of collected data. Traditional techniques for outlier detection tend to exclude the tails of distributions and ignore the data generation processes of specific datasets. Various methods for detecting different kinds of outliers in high-dimensional data sets from two different perspectives, i.e. detecting the outlying aspects of a data object and detecting outlying data objects of a data set. N-dimensional data can be seen as part of the variety challenge of machine learning.

## Fuzzy EOQ Model for Deteriorating Items with Stock-Dependent Demand and Partial Backlogging

Yogendra Kumar Rajoria<sup>1</sup>, Anand Chauhan<sup>2</sup> and Preety Poswal<sup>3</sup>

KR Mangalam University, Gurugram, (Haryana)-India

Graphic Era University, Dehradun, (Uttarakhand)-India

**Email:** indiadrnanandchauhan81@gmail.com,  
yogendrarajo@gmail.com,preety2128@gmail.com

**Abstract:** In this paper, we have considered an economic order quantity inventory model with deteriorating items with stock-dependent demand and Partial Backlogging under fuzzy environments by employing trapezoidal fuzzy numbers. A fully-fuzzy inventory model is developed where the input parameters and decision variables are fuzzified. For this fuzzy model, an expected value method of defuzzification is employed to find the estimate of the profit function in the fuzzy sense. In addition, a rigorous methodology is constructed to examine for the optimal solution of fully-fuzzy inventory model. The optimal policy for the developed model is determined using the proposed algorithm after defuzzification of the profit function. Finally, a numerical illustration is provided in order to define the sensitiveness in the decision variables with respect to fuzziness in the components.

**Keywords:** Fuzzy, Deteriorating item, Partial Backlogging, EOQ

## Comparison of Wavelet and Fourier Transform-A Case Study

**Abstract:** The wavelet analysis is the advance based on Fourier transform and it is an innovation of the Fourier Analysis. Wavelet transforms are a mathematical means for performing signal analysis when signal frequency varies over time. Wavelet analysis is an exciting new method for solving difficult problems in mathematics, physics and engineering. Fourier transform is a powerful tool for analysing the components of a stationary signal. But it is failed for analysing the non-stationary signal whereas wavelet transform allows the components of a non-stationary signal to be analysed. Both the Fourier and wavelet transforms measure similarity between a signal and an analysing function. Both transforms use a mathematical tool called an inner product as this measure of similarity. A comparative study of Fourier and Wavelet transforms has been conducting in the present study and the main goal of this study is to find out the advantages of wavelet transform compared to Fourier transform.

**Keywords:** Fourier transform, wavelet transform, time-frequency, signal analysis, inner product.

## Customization of the WRF model over Gurgaon region by Sensitivity of PBL schemes for their application of Pollutant Dispersion
