## **EDUCATION FOR LIFE, NOT JUST FOR A LIVING**

**Dr Poonam Gaur**

Associate Professor, School Of Education, Lingaya's Vidyapeeth, Faridabad

According to Allan— **“Education is a process which moves the person from darkness to light.”**

### **ABSTRACT**

NEP 2020 highlights the aim of education system to develop good human beings with integrity of thoughts and actions. Life oriented education will act as a tool to think independently. Here, writer expressed her feelings on the Role of Education for the society.

**KEY POINTS:** Integrity, thoughts, actions, life oriented

### **INTRODUCTION**

NEP 1986 also gives emphasis on the effective teaching and learning with the recommendation that “All the teachers will teach and all students study.”

According to NEP 2020-- the aim of education should be development of higher order skills among the students for better understanding of content and to adjust with the life.

In our present Education System, students learn the content without understanding, they just memorize for good academic record without proper knowledge of content. Therefore, role of teacher becomes very important as a facilitator to cultivate the tree of knowledge among the students through vibrant system of education.

### **SYSTEMATIC REVIEW**

- Education and life satisfaction: Perception or Reality, research done by Carolina and Di Maro, University college of London, 2008, and concluded that educational quality perceptions issue for the welfare of individuals.
- Education and Quality of life, research done by Robert and Jason, University of Manitoba, 2012 and concluded about positive effects of educational attainment on emotional wellbeing, physical health, personal safety.
- Importance of Education, article written by Al-Shuaibi, Salalah college of Technology, 2014 and described that Education develops personality and thoughts of the people and prepares them for life experiences.

**This article contributed towards the accountability of Education for people.**

# **EFFECTIVENESS OF ENVIRONMENTAL CONSERVATION ON HUMAN LIFE**

**Dr Poonam Gaur**

Associate Professor, Lingaya's  
Vidyapeeth

## EFFECTIVENESS OF ENVIRONMENTAL CONSERVATION ON HUMAN LIFE

Dr Poonam Gaur,  
Associate Professor, Lingaya's Vidyapeeth

### ABSTRACT

Environmental sustainability, or the long-term management and preservation of the planet's natural resources and ecosystems, is becoming more widely acknowledged as a societal concern influenced by human conduct at all spheres of social interaction, from communities to whole countries. A more nuanced understanding of the ways that both individual and group level processes can affect conservation efforts is now being incorporated into psychological perspectives on conservation, which traditionally focused on individual determinants of proenvironmental behavior (such as personal environmental concern). Research on social norms and identity-based influences, in particular, indicates that social perceptions, such as beliefs about what behaviors are typical and socially valued, can be stronger motivators of conservation behavior than financial incentives, pro-environmental appeals, or the simplicity of pro-environmental actions.

### 1. INTRODUCTION

#### 1.1 OVERVIEW

In many OECD nations, political attention has historically been placed on environmental concerns with a focus on health. Environmental risk factors have a very diverse and intricate effect on health, both in terms of their severity and clinical importance. For instance, the impacts of environmental deterioration on human health might vary from psychological issues brought on by noise to cancer deaths brought on by air pollution. The main effects of environmental deterioration on human health are described in this chapter, along with an estimate of the resulting health loss. Environmental policy may be more effectively designed if the economic consequences of health losses caused by the environment are better understood.

#### 1.1.1 Impacts of environmental degradation on human health

A population's health is influenced by a variety of elements, including its nutrition, cleanliness, socioeconomic standing, literacy, and way of life. In the OECD areas, life expectancy has increased dramatically as a consequence of these variables, which have altered significantly over the economic transformations that have defined modern civilization. Recent research indicates that improved working conditions, rising GDP, and higher health spending per capita were the main factors influencing life expectancy in OECD areas from 1970 to 1992. They do, however, also suggest that throughout the same time span, air pollution's detrimental effect on human health grew in OECD nations (Or, 2000). The numerous factors that have an impact

### **Effectiveness Of School Field Trip For Secondary School Students**

Mr. DEEPAK KUMAR,

Ph.D. Research scholar

Department of Education (CIE) University of Delhi

#### **Abstract**

School field trip are part of experiential learning and first-hand experience of the real world where students have own concepts about school field trip field trips are one of the most crucial things teachers can offer their pupils since they not only broaden their knowledge and experiences but also help them to better understand the environment in which they live. Although field trips that stress hands-on, real-world, and practical applications of learning have been proven to be effective by research, instructors still face a challenge in demonstrating student learning because the current trend in education tends to place a heavy emphasis on assessments. Students learn through experiential learning or hands-on learning. Students participate in this sort of learning with their own concepts, ideas, and knowledge. Through hands-on learning, students make various observations. In this study researcher will try to find out effectiveness of school field trip for secondary school.

**KEY WORDS:** Experiential learning, Field visit, First- hand experience, Real world, Practical application of learning.

**PILOT STUDY: MULTIDISCIPLINARY APPROACH ACT AS A BRIDGE BETWEEN  
DIFFERENT ACADEMIC SUBJECT**

Dr Poonam Gaur

Associate Professor

Ms. Minakshi Breja

Assistant Professor,

Lingaya's Vidyapeeth, Faridabad

**ABSTRACT**

Instruction is an interactive process between teachers and learners which requires advance preparation and efficient contribution of students. Encouraging approach of teachers towards teaching-learning process helps for maximum participation of students. Maximum participation is also possible when students are able to understand the content. Effective Pedagogy with Multidisciplinary approach will act as a meaningful tool for the teachers to deliver the content in the class. Multidisciplinary approach involves two or more academic areas to learn the particular content. Aim of Multidisciplinary Approach is to develop logical thinking, deeper understanding and knowledge of content among teachers and students both. Learning through multidisciplinary approach enables the students to apply their classroom learning in their daily lives through problem Solving Strategies. In this research paper, researchers will try to conclude the effectiveness of Multidisciplinary Approach as a bridge between different academic subjects for Pre-service trainees of B.Ed. from Lingaya's Vidyapeeth. This research study is qualitative and quantitative in nature. Opinionnaire will develop to know the effectiveness of MULTIDISCIPLINARY APPROACH from B.Ed. first year and second year trainees. Researchers will conclude the importance of multidisciplinary approach and encourage the trainees to consider this approach to connect with learners.

**KEY WORDS-** Instruction, multidisciplinary, logical, Problem solving

**INTRODUCTION**

Instruction is an interaction for sharing knowledge and talent between two or more persons. Positive attitude of the teacher towards teaching profession and teaching approach adopted by the teacher towards the subject information decided quality of learning. The main idea of learning is to communicate useful change in behavior of students to make information more significant and applicable.

In-service teachers and Pupil teachers (pre-service teachers) can involve in the progress of the social order by teaching children through Multidisciplinary Approach. In Multi-disciplinary approach similar theme is studied through integration of more than one discipline. This Approach can be used to teach ethics, beliefs, and skills to learners. Multi-disciplinary Approach can be used in instruction by pupil teachers to make teaching-learning process effective. This approach prepared the learners as well as pupil teachers for their future with inspired and reasonable thinking.

So, it is more important to understand the efficiency of Multi-disciplinary Approach to teach students by teacher trainees in teaching profession to make understanding more inspiring and pleasing for students.

### **Social Competencies among Tea-Garden Children in Assam**

Ms. Nirjmoni Bora

Research Scholar

Department of Education (CIE), University of Delhi, Delhi-110007

#### **Abstract**

This paper focuses on the social competencies of children living in tea gardens in Assam, India. The study aims to examine the social skills of these children and how their social competencies are influenced by their environment. The study is based on a qualitative research design, employing semi-structured interviews and observation methods. The findings suggest that the tea-garden children display a range of social competencies, including communication, empathy, cooperation, and conflict resolution. These competencies are influenced by factors such as family dynamics, education, and peer relationships. The study also highlights the challenges faced by these children, including poverty, lack of access to quality education, and exposure to harmful practices such as child labor. Overall, the study

## **1. INTRODUCTION**

Teaching is a process of sharing knowledge, understanding and skill between two or more persons. The excellence of education depends on the devotion of the teacher towards the subject information. The main purpose of education is to bring constructive transform in performance of students to make knowledge more meaningful.

A Teacher training institute helps in framing the outlook of student teachers towards teaching occupation. Pupil teachers can contribute to the development of the nation and the society by teaching children through innovative pedagogy/techniques. Storytelling is one of the effective pedagogies for sharing and expressing the experiences. It can be used as method to teach values, ethics, skills to learners. Storytelling can be used in teaching practice by pupil teachers to make teaching-learning process interactive. Storytelling pedagogy equipped the learners with creative and logical thinking in comfortable school atmosphere.

So, it is more important to understand the effectiveness of storytelling as an innovative pedagogy by teacher trainees in teaching profession to develop their educational toolbox to make knowledge more motivating and appealing for students.

The aim of this study is to examine efficiency of storytelling as an pioneering pedagogy for pre-service teachers of B.Ed. Such a study is essential to increase an understanding of how to use interactive strategies to bring positive outcomes rather than harmful.

## **2. REVIEW OF RELATED LITERATURE**

Several studies have been conducted to assess the influence of STORYTELLING in teaching profession as a strategy to create interactive atmosphere.

- ‘STORY AS A PEDAGOGYA: REFLECTIVE COMMENTARY’, research done by Glesne, Professor, University of Vermont, and Marleen, Professor, School of Education, University of Wisconsin, 2018 and concluded that teachers can use stories as a form of activism.
- ‘A PEDAGOGICAL POWER OF STORYTELLING’, research done by R. Eric, Boise State University and Karen, Spelman College, 2019 and emphasized to motivate the teachers to consider storytelling as one of their pedagogical tactics to connect with learners for positive learning outcome.

- ‘STORYTELLING---IMPACT OF TEACHING GRAMMER THROUGH ACTIVITIES TO IRAQI PUPILS AND ATTITUDE OF TEACHER TOWARDS ACTIVITIES’,research done by Bushra Saadoon,University of Baghdad,2020 and concluded that storytelling is an effective strategy for meaningful learning process.
- ‘TEACHING WITHIN A STORY:UNDERSTANDING STORIFICATION OF PEDAGOGY’,research completed by Aura,Hassan,Hamari,University of Tampere,Finland,2021 and findings suggested that storytelling equipped the students with moral values of story and enhanced their academic performance also.
- ‘HOW STORYTELLING CAN WORK AS A PEDAGOGY TO FACILITATE CHILDREN’S ENGLISH AS A FOREIGN LANGUAGE LEARNING’, research completed by Nguyen and Phillips,2022 and concluded that integration of storytelling in school curriculum has extensive benefit in language development. There is a need to examine STORYTELLING-AS A PEDAGOGICAL TOOL for pupil teachers in teaching profession because of qualitative improvement in TEACHING –LEARNING PROCESS as suggested by NEP2020 also regarding learner oriented strategies to develop higher order skills among learners.

#### **STATEMENT OF THE PROBLEM**

Using Stories by Pupil Teachers as a Pedagogical Tool in course enhance students learning.

#### **3. OBJECTIVES OF THE STUDY**

- To judge Storytelling as an influential pedagogy in classrooms.
- To assess the usefulness of Storytelling for pupil teachers in their teaching profession to enhance knowledge of learners.

#### **4. DELIMITATION OF THE STUDY**

- The study was delimited to Lingaya’s Vidyapeeth,Faridabad,only.
- The study was delimited only to B.Ed.trainees of first and second years of School of Education.

#### **5. METHODOLOGY**

- The research method is qualitative and quantitative 25in nature.

#### **5.1 POPULATION**

- 25 pupil teachers from B.Ed.first and second years of Lingaya’sVidyapeeth,Faridabad involved as population.

#### **5.2SAMPLE SIZE**

Purposive sampling was used with 25 B.Ed.trainees of first and second years. The sample size remains restricted to 25 B.Ed. trainees of Lingaya's Vidyapeeth.

### **5.3 TOOL USED**

In the present study, researchers developed questionnaire to assess the effectiveness of storytelling. Statements of the questionnaire were developed after discussions with experts of education from Educational Institutions and School of Education, Lingaya's Vidyapeeth. Based on the experts comment on the items 'content and face validity 15 statements were retained. Therefore, to assess the utility of storytelling for student teachers in teaching profession, questionnaire with five points marking developed by researchers was used as a tool and this scale was standardized after administration on B.Ed.trainees.

The Questionnaire contains five point Likert scale with 15 statements. All The statements were given options using five point (5) Likert scale type of responses, namely: Strongly Agree=5; Agree=4; Undecided=3; Disagree=2; Strongly disagree =1. The ten aspects/domains dealt in the questionnaire are---

- VOCABULARY INCREASE,
- PERSONALITY DEVELOPMENT ,
- EFFECTIVE AID,
- FEELING OF CONNECTION TO GOD AND CULTURAL UNDERSTANDING,
- COMMUNICATION AND SOCIAL SKILLS.

The pupil teacher responded by choosing the alternative against the serial number of the questionnaire statement in the sheet. Though no time limit was assigned for recording responses on the Performa, pupil teachers were asked to complete it as soon as possible.

### **5.4 Collection of Data**

For the collection of data, questionnaire was administered to the pupil-teachers through personal contact. General instructions about the scale were given to the pupil-teachers and the purpose was also explained to them. Responses of Pupil teachers were gathered on the spot for data analysis.

### **5.5 Statistical Technique Used**

The data was analyzed by using statistical techniques –percentage.

## **6. RESULTS AND DISCUSSION**

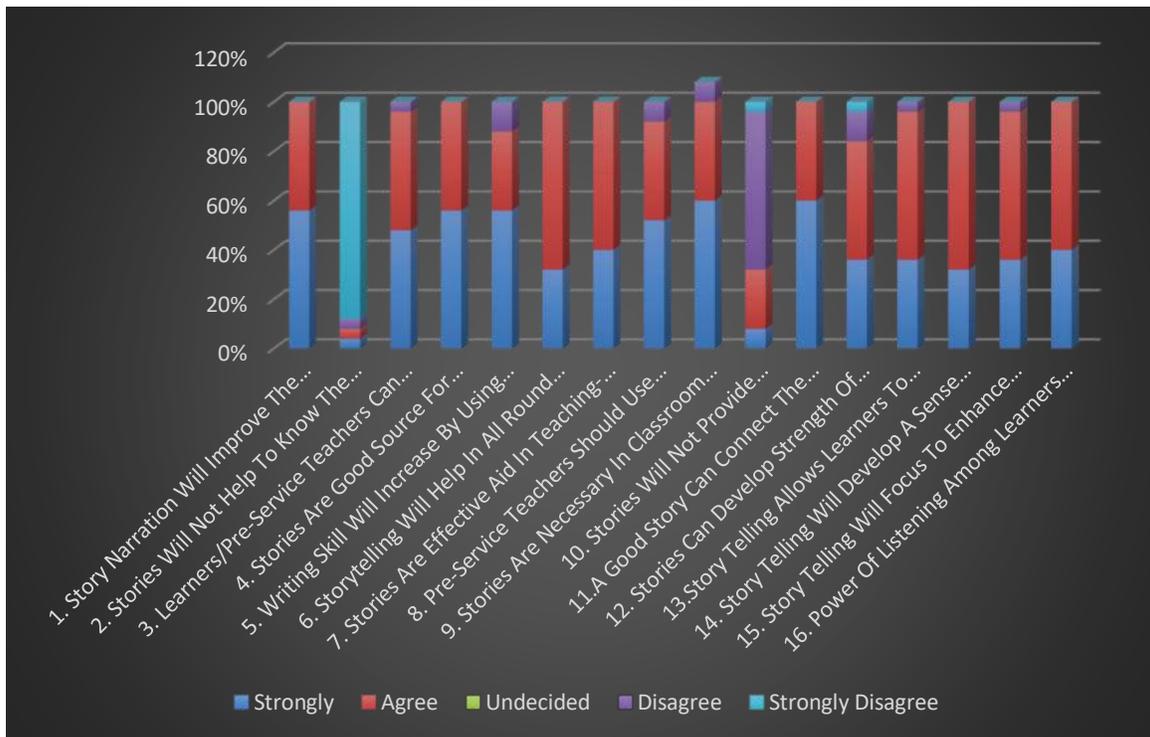

### **Analysis and Interpretation of Data**

## QUESTIONNAIRE

Domain	Statements	Sa Strongly Agree	A Agree	U Undecided	D Disagree	Sd Strongly Disagree
Vocabulary Increase	1. Story Narration Will Improve The Language.	56%	44%	---	---	----
	2. Stories Will Not Help To Know The Meaning Of New Words.	4%	4%	-----	4%	88%
	3. Learners/Pre-Service Teachers Can Use The Words Mentioned In The Story To Connect Them With Story.	48%	48%	---	4%	---
Personality Development	4. Stories Are Good Source For Imagination Of Ideas.	56%	44%	----	-----	-----
	5. Writing Skill Will Increase By Using Imaginative Ideas.	56%	32%	----	12%	----
	6. Storytelling Will Help In All Round Development Of Personality Of The Learners.	32%	68%	----	----	----
Effective Aid	7. Stories Are Effective Aid In Teaching-Learning Process To Increase Enthusiasm.	40%	60%	----	----	----
	8. Pre-Service Teachers Should Use Stories During The Lesson As A	52%	40%	----	8%	---

	Positive And Interactive Alternative Method Of Teaching And Knowledge Sharing.					
	9. Stories Are Necessary In Classroom For Learners To Improve The Right-Brain Imagination.	60%	40%	-----	---	---
	10. Stories Will Not Provide Opportunities To Students For Fun.	8%	24%	---	64%	4%
Feeling Of Connection To God And Cultural Understanding	10.A Good Story Can Connect The Learners With The Belief That God Is Always Around Them.	60%	40%	-----	-----	---
	11. Stories Can Develop Strength Of Unity Among The Learners In All Over The World Regardless Of Colour Or Religion.	36%	48%	---	12%	4%
	12.Story Telling Allows Learners To Understand And To Appreciate Different Traditions Of Countries And With In Country(India)	36%	60%	-----	4%	----
	13. Story Telling Will Develop A Sense Of Empathy Among Learners.	32%	68%	-----	---	---

Communication And Social Skills	14. Story Telling Will Focus To Enhance Communication Skills Through Expression Of Thoughts And Feelings.	36%	60%	----	4%	---
	15. Power Of Listening Among Learners Will Increase.	40%	60%	-----	-----	-----

From the table and pie chart, it can be observed that storytelling is an effective pedagogy for pre-service teachers of B.Ed----

- To IMPROVE THE LANGUAGE.
- To KNOW THE MEANING OF NEW WORDS.
- To USE THE WORDS MENTIONED IN THE STORY TO CONNECT THEMSELVES WITH STORY.

- As GOOD SOURCE FOR IMAGINATION OF IDEAS.
- To increase WRITING SKILL BY USING IMAGINATIVE IDEAS.
- To HELP IN ALL ROUND DEVELOPMENT OF PERSONALITY OF THE LEARNERS
- As EFFECTIVE AID IN TEACHING-LEARNING PROCESS TO INCREASE ENTHUSIASM
- AS A POSITIVE AND INTERACTIVE ALTERNATIVE METHOD OF TEACHING AND KNOWLEDGE SHARING.
- CLASSROOM FOR LEARNERS TO IMPROVE THE RIGHT-BRAIN IMAGINATION.
- To CAN CONNECT THE LEARNERS WITH THE BELIEF THAT GOD IS ALWAYS AROUND THEM.
- DEVELOP STRENGTH OF UNITY AMONG THE LEARNERS IN ALL OVER THE WORLD REGARDLESS OF COLOUR OR RELIGION
- WILL DEVELOP A SENSE OF EMPATHY AMONG LEARNERS.
- WILL DEVELOP A SENSE OF EMPATHY AMONG LEARNERS.
- TO ENHANCE COMMUNICATION SKILLS THROUGH EXPRESSION OF THOUGHTS AND FEELINGS.
- LISTENING AMONG LEARNERS WILL INCREASE.

## 7. SUGGESTIONS AND RECOMMENDATIONS

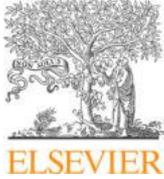

Similar study can be done for all the pupil teachers of B.Ed programs across Faridabad or even it can be undertaken in different states of India.

## 8. CONCLUSION

It was found that storytelling is an effective pedagogy for student teachers in their teacher training programme. As we all know NEP 2020 given emphasis on activity based learning at all the levels. Art Integrated learning approach helps to prove it. That is why ,we can say storytelling is one of the form of it.

Subgrade Soil

Coir Fiber

CBR Test

Geotechnical Properties

## ABSTRACT

This paper presents the study on the construction of pavement layers to be spread over subgrade soil starts with the calculation of the power of the subgrade and the traffic volume to be transported. The design of the different pavement layers depends very much on the strength of the sub-grade soil they are to be laid over. The power of a subgrade is expressed mainly in terms of CBR (California Bearing Ratio). Weaker sub-grade essentially needs thicker layers when stronger sub-grade works along with thinner layers of pavement. Normally CBR testing is a simple and well accepted process conducted on soil samples to determine subgrade intensity. For an engineer to understand the exact CBR strength of the sub-grade strength becomes absolutely essential. However, several other measurements are also taken into account for determining the power of the subgrade.

The use of waste material and natural fibers to boost soil quality is beneficial, because they are inexpensive, accessible locally and Ecological. The stabilizing effect of Natural Fiber (coconut coir) on soil properties was observed in this research. On the last the use of surplus material and fiber has seen a huge growth over the decade. Hence, an attempt has been made in this analysis to test the rise in subgrade intensity by supplying Coir Fiber in different layers. In this CBR study, different variations of parent sub-grade soil with Coir Fiber were performed. From the laboratory study it was observed that coir fiber's overall efficiency is higher. The CBR value of the parent subgrade soil was also found to increase as the number of coir fiber layers increased.

Selection and peer-review under responsibility of the scientific committee of the International Conference on Futuristic Research in Engineering Smart Materials.

## 1. Introduction

Soil is the vital component of this ecosystem and all the necessities of life such as milk, household and clothes are provided by the soil. Soil functions include biomass transformations (productivity), water partitioning and reservoirs [1]. Black Cotton soils have high swelling potential and are one of India's main soil deposits as a result of the increase in moisture content [2]. India's wide geographical area is (3,287,264 km<sup>2</sup>) and India's population is (138 million approx.) demanding the massive road system. Soil is inexpensive construction material and readily usable. Road building enforces heavy pressure on constrained capital such as suitable soil, stone aggregates, and binders, etc. Soil stabilization is the production that increases soil's physical properties, such as shear strength, bearing potential and can be achieved by using controlled compaction or deposition of suitable admixtures such as cement, lime, clay, fly ash or by providing geotextiles, geosynthetics etc.

[3] Soil stabilization is a common method used by engineers and designers to enhance the properties of soil with different stabilizers. Engineers are continually faced with sustaining and improving facilities for pavements with minimal financial capital. Outmoded concrete planning and maintenance methods allow high-quality material for building requirements to be self-actualized. Premium content is not usable in certain parts of the world or is short of quantity. Because of these constraints, engineers are often forced to seek alternative designs using deficient materials, commercial building aids and advanced design practices. Concrete or tarmac paving cannot be constructed on poor soil, since it can easily be broken on hard soil pavements. The layer should have an appropriate load-carrying capacity as underneath the sub-grade pavement. This will have to replace the whole pavement segment and to be correct, the condition of the embankment affected by lack of strength or uniformity. The embankment must be built as solid, durable, uniform and cost-efficient as possible. The most econom-

2214-7853/© 2021 Elsevier Ltd. All rights reserved.

Selection and peer-review under responsibility of the scientific committee of the International Conference on Futuristic Research in Engineering Smart Materials.

ical embankment is the one that maintains its life cycle by using modern technologies to help ensure sufficient strength, rigidity and uniformity.

Earlier fibers were used in soil strengthening process. Although the devices were not completely expected, roots of plants and straws were used to cob walls and render soil brick to improve the property. In the other hand, modern geotechnical engineering has mastered the use of strengthening the soil with isolated fibers which in geotechnical projects is still a comparatively recent technique.

Coir fiber is available at large scale in India which have very good property as pavement material having light weight, have ability to increase subgrade strength and can increase the life span of pavement compared to traditional method of pavement construction.

Coir fiber is part of a category of stable simple fibers [4]. It is a viable essential commodity obtained from coconut coating [5]. The coir fiber is stretchy enough to fold without breaking, and clenches a curl as though it were fluttering eternally. Soil coir fiber can be used as defective material in the stabilization cycle due to its spiral and long spike fibers [6]. The short cushion fibers were removed from the long fibers and later became waste in the coir fiber industry and this fiber waste is used in soil stabilization and can thus be disposed of efficiently. The application of fibers has had a major impact on soil and coir mixture development behavior. Reducing consolidation of clay soil settlement is caused by the addition of unsystematically distributed polypropylene fibers [7]. Because of the length of the fibers which imparts an insignificant effect on the soil characteristics, fiber content proved to be more influential and effective. Fiber inclusion results in plasticity decrease and hydraulic conductivity increase. This research has following objectives:

- To estimate the CBR strength of parent subgrade soil by placing one or more layers of coconut coir fiber at different depths.
- To understand the efficiency of coir fibre as pavement material.
- To obtain the most efficient depth for placement of coconut coir fiber.

## 2. Materials & methods

The entire research is performed in the Geotech Lab of the Lingaya's Vidyapeeth on subgrade soil, i.e. an analysis of the CBR content of subgrade soil by various layers of coconut coir fiber at different stages. Experiments have been performed to classify various soil properties, such as Index Properties i.e. Liquid Limit, Fluid Limit, Plasticity Index & specific Gravity [8]. Later on, heavy compaction experiments were accompanied to determine the optimum moisture level and the resulting overall dry pressure. The CBR experiments were then performed on a particular mixture of coconut coir fiber.

### 2.1. Material used

Subgrade Soil and coconut coir fiber are mainly used for experimental investigations [9]. Properties listed below:

#### A. Subgrade Soil

The subgrade soil used in the laboratory for analysis is obtained from the roadside of Lingaya's Vidyapeeth, Faridabad. The engineering properties of subgrade soil are going to be calculated in the laboratory in compliance with the Indian Standard Code IS 2720.

#### B. Coconut Coir Fiber (Fig. 1)

Fig. 1. Coconut Coir Fiber.

Coir is obtained from locally available coconut shells that are washed. Brown colored Coir fibers derived from coconut husks are seen in Fig. The fabrics are strong and durable. The fiber content used in this experiment is of 0%, 0.25%, 0.50%, 0.75% and 1% of 20 mm and added in discrete manner. Physical & Chemical properties of Coir Fiber is given in Table 1 & Table 2.

## 3. Experimental program

[11] CBR is the percentage of force per unit area needed to penetrate a soil mass with a standard 50 mm diameter circular plunger at a rate of 1.25 mm/min to that necessary for the equivalent penetration into a standard material. Typically, the ratio is calculated for the 2.5- and 5-mm penetration. If the ratio at 5 mm is consistently higher than at 2.5 mm, then the ratio at 5 mm is issued. The table below shows the standard loads adopted for the standard material with a C.B.R. value of 100% for different penetrations.

### 3.1. Preparation of test specimen

Remoulded specimen: The test sample should pass IS sieve of 19 mm and be held on IS sieve of 4.75 mm. For a remoulding the dry density shall be either the field density or the amount of the average dry density determined by the compaction test (Heavy Compaction Test as per IS 2720 (Part-8)-1983, for Railway Formation [12]). If the case might be, the water content used for compaction must be the optimal water quality or the field humidity. Complex compaction: A typical soil sample weighing around 4.5 kg or more for fine-grained soil and 5.5 kg or more for granular soil should be collected and thoroughly mixed with water. When the soil is to be compacted to the highest dry density at the optimum moisture content, the exact mass of the soil required shall be taken and the necessary quantity of water applied so that the soil sample water content is equal to the optimum moisture content calculated. The extension collar and base plate are attached to the mold. The spacer disk is placed over the base. Filter paper is placed on the spacer disk. Add Lubricating Oil to the mold inside. Through gentle compaction seal the soil mix in the mold. That is to say, compress the soil by 2.60 kg rammer in 3 layers of 55 blows to each layer. Then add the reinforcing material i.e. coconut coir fiber according to various variations in between different layers.

Table 1  
Chemical Properties of Coir Fiber [10].

Chemical Properties	Composition
Lignin	45.84%
Cellulose	43.44%
Hemi-cellulose	00.25%
Pectin's Related Compound	03.33%
Water Soluble	05.25%
Ash	02.22%

**Table 2**  
Physical Properties of Coir Fiber [10].

Physical Properties	Value
Length in inches	6–8
Density (g/cc)	1.40
Tenacity (g/Text)	10.0
Breaking Elongation %	30
Diameter in mm	0.1 to 1.5
The rigidity of Modulus (dyne/cm2)	1.8924
Swelling in Water (Diameter)	5%
Moisture at 65% RH	10.50

Remove the extension collar and carefully trim the compacted soil, using a straight edge, to the top of the mold. Any holes formed by removal of the coarse material on the surface of the compacted soil shall be filled with the substance of smaller size. Remove the perforated base plate, Spacer disk, and filter paper and record mold mass and compressed soil specimen. Place a filter paper into the mold over the specimen. Place annular weights at the nearest 5.0 kg to create a surcharge proportional to the base material weight and pavement.

3.2. Various combinations of subgrade soil with coir fiber

Table 3

4. Results and discussion

4.1. General

This study's key objective was to reduce the pavement thickness and increasing the efficiency of pavement systems by using coir fiber as reinforcement material. We are conducting a laboratory investigation on the parent subgrade soil to achieve this objective. In the initial stage of the laboratory analysis, we examine the index properties of parent subgrade soil (liquid limit, plastic limit, plasticity index, specific gravity, etc.). We measured the CBR value of parent subgrade soil without reinforcement after the initial analysis, and then analyzed the efficiency of parent subgrade soil by supplying coir fiber at various heights and combinations. The property of soil is given in Table 4 & the test result without reinforcement on parent soil is given in Table 5. The CBR method was used to compare the efficiency of soil strengthened with subgrade parent soil whose data is given in Table 6.

4.2. Properties of parent subgrade soil

**Table 3**  
Various combination of parent subgrade with coir fiber.

S. No.	Combination	No. of Layer	Fiber Content %
1.	CBR Test without Reinforcement	-	0
2.	Soil with coir fiber at a Depth of 42.43 mm (H/3) from Top.	01	0.25
3.	Soil with coir fiber in the Middle of mold specimen i.e., 63.65 mm (H/2) from Bottom.	01	0.50
4.	Soil with coir fiber at a Height of 42.43 mm (H/3) from Bottom.	01	0.75
5.	Soil with coir fiber at a Height of 42.43 mm (H/2) from Bottom & at a Depth 42.43 mm (h/2) from Top.	02	01

**Table 4**  
Index Property.

Index Property	Experimental Value
Liquid Limit	53.29%
Plastic Limit	34.01%
Plasticity Index	20.1%
Specific Gravity	2.6
Optimum Moisture Content	%

4.3. Result of CBR test

Test-01 CBR Test on parent soil, without reinforcement. The CBR test result is depicted in Table 5.

**Table 5**  
Test without Reinforcement on Parent soil.

Test Report			
CALIFORNIA BEARING RATIO (CBR) TEST (IS: 2720 PART 16/ASTM 1883-99)			
OMC	17.5%		
MOISTURE CONTENT		DRY DENSITY	
Container #	08	Wt. of the Mould (g)	3884
Wt. of Container (g)	25	Wt. of the Mould + Compacted Soil (g)	8352
Wt. of Container + Wet Soil (g)	85	Volume of Mould	2283.30
Wt. of Container + Dry Soil (g)	73	Bulk Unit Wt. (g/cc)	1.956
Moisture Content (%)	25	Dry Unit Wt. (g/cc)	1.621

4.4. Graphs of tests & results

- This test was performed on non-reinforced parent soil with 0% coir fibre and the CBR value at 2.50 mm was 13.026% and 18.267% at 5.00 mm (Fig. 2).
- This test was conducted on 0.25% "Coir fibre" parent subgrade soil in 01 layer at a depth of 42.43 mm (H/3) from the surface and 2.50 mm CBR value was 18.686% and 23.538% at 5.00 mm (Fig. 3).
- This test was conducted on 0.50% "Coir Fibre" parent subgrade soil in 01 layer supported in the centre (H/2) of the mould specimen, i.e. 63.65 mm from the bottom and 2.50 mm CBR was 10.690% and 14.074% at 5.00 mm (Fig. 4).
- This test was conducted on 0.75% "Coir Fibre" parent subgrade soil in 01 layer at a height of 42.43 mm (H/3) from the bottom and CBR at 2.50 mm was 8.534% and 11.379% at 5.00 mm (Fig. 5).
- This test was Conducted on parent subgrade soil with 1% "Coir Fibre" in 02 layer at a height of 42.43 mm (H/3) from the bottom and a depth of 42.43 mm (H/3) from the top and CBR at 2.50 mm was 16.171% and 20.034% at 5.00 mm (Fig. 6).

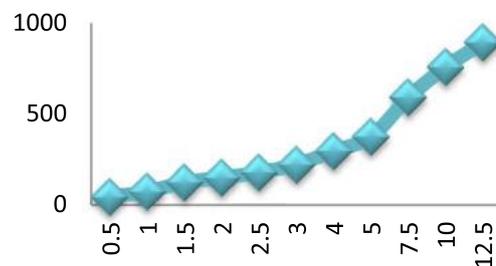

Fig. 2. CBR test without reinforcement.

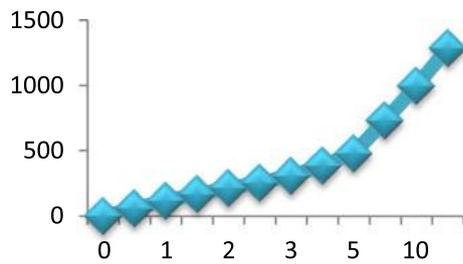

Fig. 3. Soil with 0.25% "Coir Fiber" in O1 Layer at a depth of 42.43 mm (H/3) from top.

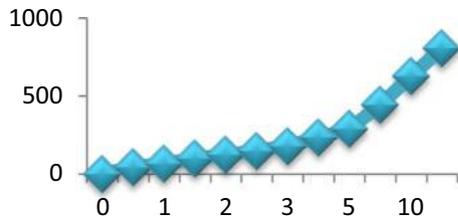

Fig. 4. Soil with 0.50% "Coir Fiber" in O1 layer provided in the middle (H/2) of mold specimen i.e., 63.65 mm from bottom.

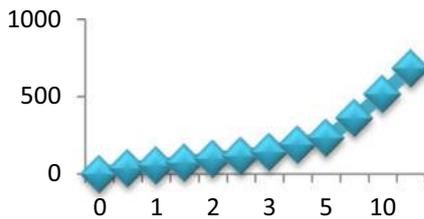

Fig. 5. Soil with 0.75% "Coir Fibre" in O1 layer at a height of 42.43 mm (H/3) from bottom.

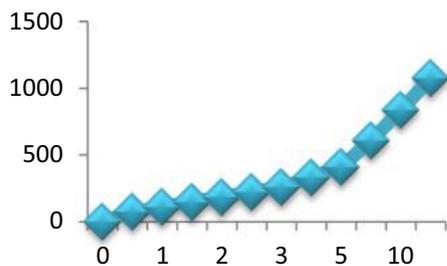

Fig. 6. Soil with 1% "Coir Fibre" in O2 layers at a height of 42.43 mm (H/3) from bottom & at a depth of 42.43 mm (H/3) from top.

Result indicates Coir Fibre's average efficiency was higher. Reinforcement at depth (H/3) from top and (H/2) from top with coir fibre gives better output. Further it was found that the Coir Fibre efficiency improves as we increase the number of layers of reinforcement, because the more layer of reinforcement, there is better binding with subgrade which helps subgrade to gain better strength.

Table 6  
CBR Test Data.

CBR TEST DATA			
CBR TEST NUMBER	01	FIBER CONTENT (%)	0%
TYPE OF CBR TEST	CBR test without reinforcement	PENETRATION RATE	1.25 mm/min

CBR OF SPECIMEN AT 5.00 mm (STANDER 2055 KG) BY GRAPH			

### 5. Conclusions

After the results, this research was concluded as followed with justifying the objective achievements:

- When Coir Fiber's number of layers increased, it was found that the parent subgrade soil's CBR value was increased which is our first objective.
- Coir fiber is a surplus material that can be used for lightweight and solid pavements in a sub-base.
- Coir Fiber is used to increase the subgrade Strength and therefore enhances the life of the pavement, which is our second objective.
- It has been observed that better performance is given when we provide Coir Fiber at height (H/3) from the bottom, which is our third objective.

<sup>3</sup> Associate Professor, Civil Engg. Deptt., Jabalpur Engineering College, Jabalpur, India

**Abstract--** Expansive soil are those soil, which have high swelling and shrinkage characteristics and CBR value and shear strength. Hence, there is need for improvement of these properties. At present construction is managed by using granular or lime stabilized soils. The concept of reinforcing soil masses with natural fibres like coir fibre, banana fibre, sisal fibre etc. is a relatively new development to improve the properties of soil. The use of natural and artificial fibres is a suitable method for homogeneous soil reinforcing. The present study attempts to investigate the effect of Jute fibres on engineering and strength properties of lime treated black cotton soil. The properties of stabilized soil such as shrinkage limit, unconfined compressive strength and California bearing ratio were evaluated and their variations with content of jute fibres are evaluated. Soil samples containing 0%, 1%, 2% to 5% of jute fibre were prepared and index properties were evaluated as per relevant IS code of practise. The test results showed significant decrease in the expansive behaviour of the black cotton soil. The shrinkage limit increases from 13.75% to 28.68% if black cotton soil is mixed with 5% lime and jute fibres from 0% to 5% by weight of black cotton soil. There is significant increase in California bearing ratio and unconfined compressive strength.

**Keywords:** black cotton soil, stabilization, jute fibres, index properties.

## I. INTRODUCTION

Innovative methods of soil stabilization are in great demand all over the world. The term soil stabilisation is used for the techniques which improve the index properties and other engineering characteristic of expansive soils. In India expansive soil cover about  $0.8 \times 10^6$  km<sup>2</sup> area which is approximately one-fifth of its surface area. This soils cover about 51.8 million hectares of the land area. They are predominant in the states of Andhra Pradesh, Gujarat, Karnataka, Madhya Pradesh, Maharashtra and in parts of Tamil Nadu and Uttar Pradesh. These soils contain montmorillonite mineral; due to this they swell and shrink excessively when they are wet and dry state. Such tendency of soil is due to the presence of fine clay particles which swell, when they come in contact with water, resulting in alternate swelling and shrinking of soil due to which differential settlement of structure takes place. Expansive soils can be stabilised by the addition of a small percentage, by weight, of lime, that is, it enhances many of the engineering properties of the soil. This produces an

improved construction material and so the technique has been used for many construction purposes, notably in highway, railroad and airport construction to improve subgrades and sub-bases.

## II. EXPERIMENTAL PROGRAMME

The black cotton soil used in the present investigation was collected from Bilheri area of Jabalpur.

The properties of Black Cotton Soil are as under

Fines ( $-75\mu$ ) = 88.73%

Specific Gravity = 2.6

Liquid limit = 51.75%

Plastic Limit = 24.85

Plasticity Index = 16.9%

Shrinkage Limit = 8.66

Differential Free Swell = 66.04%

Optimum water Content = 22.1%

Maximum Dry Density = 1.61 g/cc

California Bearing Ratio = 1.8

In the present study jute thread is collected from grain market Jabalpur. The length of the jute thread is 5cms uniformly selected.

The black cotton soil was mixed with 5% lime and soaked for a period of 4 days. After oven drying the lime and soil mixture was again mixed with different percentage of jute thread. The mix specifications are as under

(a) CL0F0 - Clay with 0% lime and 0% jute fibres.

(a) CL5F0 - Clay with 5% lime and 0% jute fibres.

(b) CL5F1 - Clay with 5% lime and 1% jute fibres.

(c) CL5F2 - Clay with 5% lime and 2% jute fibres.

(d) CL5F3 - Clay with 5% lime and 3% jute fibres

(e) CL5F4 - Clay with 5% lime and 4% jute fibres

(f) CL5F5 - Clay with 5% lime and 5% jute fibres

The consistency limits (liquid limit and plastic limit) tests were conducted as per IS: 2720 the differential free swell tests were also conducted as per IS 2720 (Part XL) 1977.

Test Performed	CL 5F0	CL5 F1	CL 5F2	CL 5F3	CL 5F4	CL5 F5
1..Liquid Limit(%)	40.05					
2. Plastic limit(%)	22.95					
3. Shrinkage limit(%)	13.75	16.34	19.63	23.08	26.44	28.68
4. Plasticity Index(%)	17.395					
5. Differential free swell(%)	10.86					
6. Modified procter test						
(a)OMC(%)	16.20	16.9	17.5	18.2	18.8	19.6
(b)MDD(g/cc)	1.68	1.67	1.65	1.63	1.61	1.58
7.C.B.R.(%)	3.10	3.27	3.72	4.18	4.60	4.95
8.Unconfined compression test(Kg/cm <sup>2</sup> )	1.18	1.24	1.29	1.38	1.46	1.54

### III. RESULTS AND DISCUSSION

The test results are summarized in Table 1.

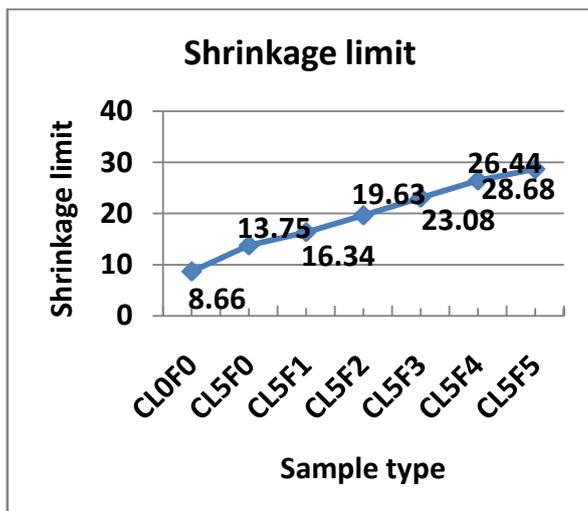

Fig 1 – Variation of shrinkage limit

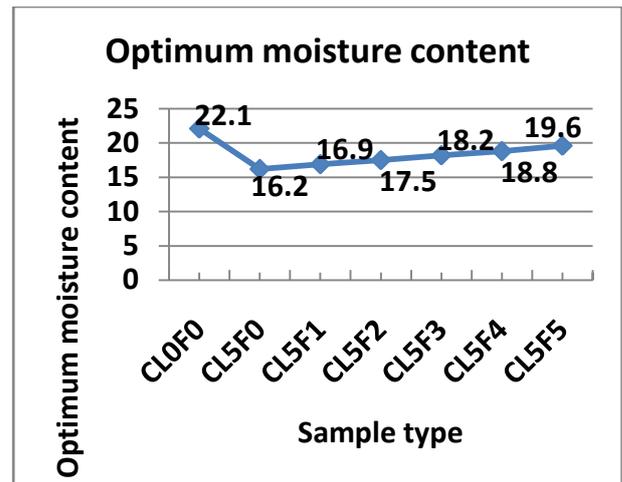

Fig. 2 –Variation in optimum moisture content

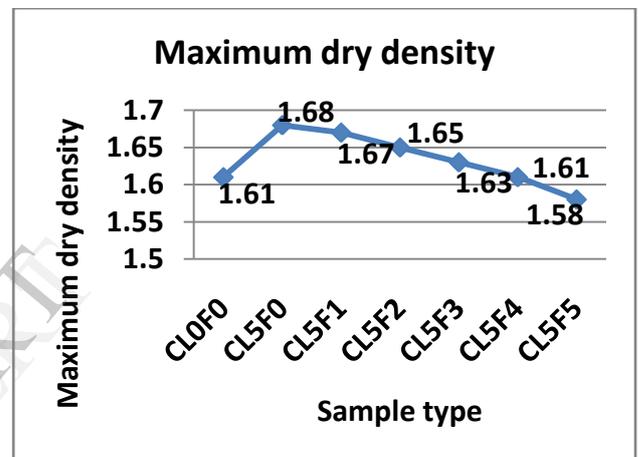

Fig. 3 – Variation in maximum dry density

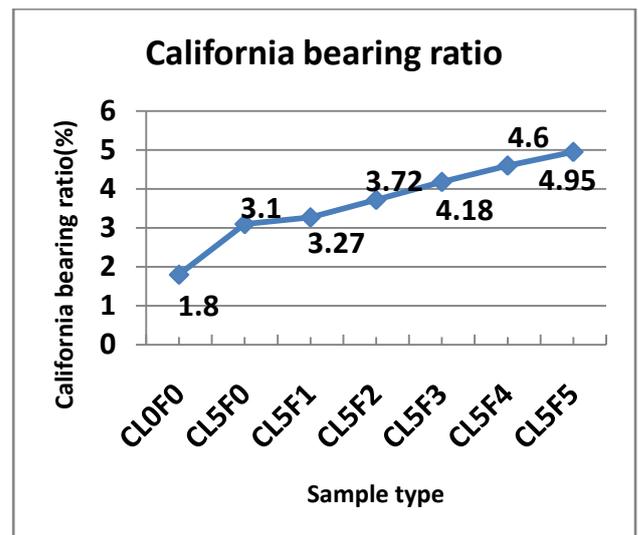

Fig. 4 – Variation in C.B.R. value

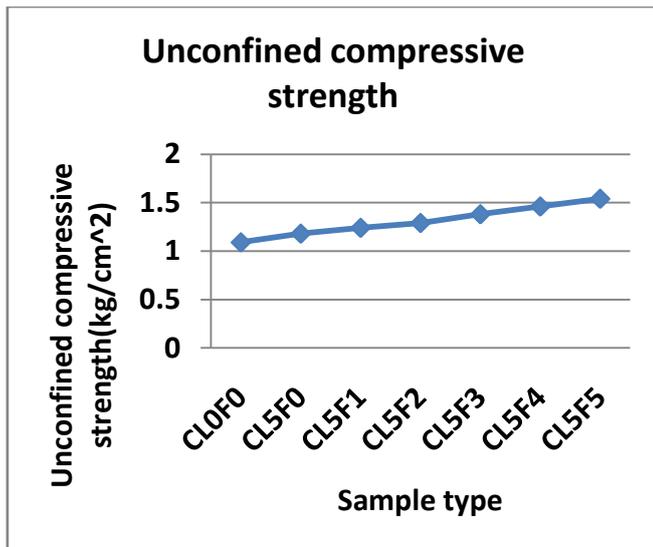

Fig. 5 – Variation of Unconfined compressive strength

#### IV. CONCLUSIONS

From the series of tests conducted on black cotton soil mixed with lime and jute fibres, the following conclusions are drawn :

1. The shrinkage limit values increases from 13.75% to 28.68% with increase in the jute fibres percentage (fig.1).
2. The Optimum moisture content values increases from 16.20 to 19.60. The Maximum dry density are also decreased from 1.68 to 1.58 (fig.2 & fig.3).
3. There is significant increase in California bearing ratio and unconfined compressive strength values. The C.B.R. increases from 3.10% to 4.95% and unconfined compressive strength from 1.09 kg/cm<sup>2</sup> to 1.35 kg/cm<sup>2</sup>. The variation is presented in figure 4 and 5.
4. From the test results it can be concluded that the addition of jute fibres to lime stabilized BC soil decreases its swelling behaviour and increase the C.B.R. and unconfined compressive strength properties.

## Abstract

In the previous years, Wireless Sensor Networks (WSNs) have increased expanding consideration from both the clients and scientists. It is utilized as a part of different fields which incorporate ecological, social insurance, military and other business applications. Sensor hubs are battery fueled so vitality imperatives on hubs are extremely strict. At the point when battery gets released, sensor hub will get detached from remaining system. This outcomes in connection disappointment and information misfortune. In a few applications battery substitution is likewise impractical. Consequently, vitality proficient strategies ought to be outlined which will upgrade lifetime of system and precise information exchange. In this paper, diverse wellsprings of vitality dissemination are recorded trailed by vitality effective systems to improve lifetime of the system.

### Keywords:

*Remote sensor systems, vitality productive strategies, lifetime of system.*

## 1. Introduction

The Advancement in remote correspondence prompts create remote sensor systems (WSN). It comprises of little gadgets. These gadgets gather data by organizing with one another. These modest gadgets are called as sensor hub which comprises of CPU (for information handling), memory (for information stockpiling), battery (for vitality) and handset (for accepting and sending signs or information starting with one hub then onto the next).

The span of every sensor hub fluctuates with application prerequisite. For instance, sensor hubs are infinitesimally little in military applications. The expense relies on parameters such as memory size, handling rate

and battery [1]. Remote sensor systems are utilized as a part of business and mechanical zones like living space observing, ecological checking, human services, reconnaissance and procedure checking. We can likewise utilize it to screen an action, for example, physical and ecological conditions, for example, temperature, weight, sound and pass their information to the sink which is the base station (called sink). A sensor hub incorporates three fundamental segments which are as per the following:

- a) A detecting subsystem for information securing from the physical encompassing environment.
- b) A preparing subsystem for nearby information handling and capacity.
- c) A remote correspondence subsystem for information transmission.

The battery source supplies vitality required by the gadget to perform assignments. Be that as it may, it comprises of restricted vitality asset. It turns out to be extremely hard to revive the battery, since hubs might be set in unfriendly or unconventional environment. Among the arrangement of potential situations, applications with observing errand advantage from this innovation as WSNs permit an information obtaining at scales and resolutions that are hard to accomplish with past methods.

Lifetime of a sensor system ought to be sufficiently long to satisfy application necessity. Outside force supply demonstrates a non-consistent conduct so

vitality cradle is required. In this way, vitality protection assumes key part in configuration of frameworks taking into account remote sensor systems.

A WSN comprises of various sensor hubs spread over a little or substantial land region. Every sensor hub has remote correspondence ability and noteworthy insight for sign handling and systems administration of the information. AWSN can be set in remote geological areas [2]. It requires least measure of setup and organization costs. In WSNs the hubs demonstration both as hosts and as switches.

They work in a self-sorting out and adjusting way. Commonplace WSNs correspond specifically with a brought together controller or a satellite, in this manner correspondence between the sensor and controllers depends on a solitary jump. In future, a WSN could be an accumulation of independent hubs that correspond with one another by shaping a multi-bounce system. The utilization of WSN is expanding step by step and in the meantime confronting issue of vitality imperatives as far as short battery lifetime.

Each hub relies on upon the battery hotspot for different exercises; this has turning into a noteworthy issue in remote sensor systems. On the off chance that anybody hub among every one of the hubs gets fizzled, the whole framework gets intruded. Each sensor hub can be in dynamic, rest and sit still modes. In dynamic state, accepting and transmission of information is done. Out of gear mode, the hubs expend same measure of vitality as in dynamic mode. While in rest mode, hubs make radio to shutdown to spare the vitality. The accompanying steps can be thought about to spare vitality created by correspondence in WSNs [3].

- a) Schedule the different conditions of hubs (i.e., transmitting, accepting, sit or rest).
- b) Change in transmission range between the detecting hubs.
- c) Use of effective steering and information gathering systems.
- d) Avoid the treatment of undesirable information as in catching procedure.

By and large, (e.g., Observation applications), it is impractical to supplant the battery source which is depleted of vitality. Numerous analysts are attempting to discover force mindful conventions for remote sensor systems with a specific end goal to overcome vitality effectiveness issues. Conventions ought to give ongoing backing as they are connected in regions where information is detected, handled and transmitted. On the off chance that a convention has a quick and solid in responses to changes in system, it is said to have constant backing. The postponement in transmission of information from sensor hubs to sink ought to be less, which transforms into quick reaction.

## 2. CHALLENGES IN THE NETWORK DESIGN AND ROUTING ISSUES

A few elements ought to be thought about while outlining a system and directing conventions. A few confinements of system assets influence WSNs, for instance, vitality, focal handling unit, data transmission and capacity [4][5]. The difficulties in outline of sensor systems include taking after fundamental aspects[4][5][6]:

### 2.1 Sensor Deployment

While planning of directing conventions, one needs to deal with the areas of the sensors. A large portion of the conventions accept that the sensors are in worked of GPS recipients or utilize some limitation strategies to think about sensor positions.

### 2.2 Limited Energy Capacity

Since batteries are utilized as a force source as a part of sensor hubs, they have constrained vitality limit. In front line, as it is unrealistic to revive batteries and access the sensors, vitality requirements on sensors are tight. At the point when vitality of the sensor achieves characterized limit, it won't ready to work appropriately. Thus, drawn out system lifetime can be accomplished by planning vitality proficient steering conventions for sensors.

### 2.2 Data Aggregation

Enhanced information exchange and in addition vitality effectiveness can be accomplished by utilizing information conglomeration method. The retransmissions of comparable bundles will be altogether

diminished which helps in minimizing the repetitive information.

#### 2.4 Various Sensing Application Requirements

There are various applications in which sensor systems are utilized. A solitary system convention can't fulfill the prerequisites of all applications. Subsequently directing conventions ought to have the capacity to in precise information conveyance and sink can accumulate all data about physical wonder on time.

#### 2.5 Scalability

In WSN, systems might be of various sizes and such systems might contain sensors with various limits and deviated joins between them. In such cases steering conventions ought to scale with these parts of system.

#### 2.6 Vitality

Vitality preservation can be accomplished at

- a) **Device level:** By proper determination and design of equipment.
- b) **Network level:** By selecting specialized routines and conventions.

The sensor hub comprises of handling unit, detecting unit, handset unit and force unit [7]. Preparing unit can read information of sensor furthermore perform a few counts and make a parcel prepared to move in the channel. Sensor changes over vitality starting with one frame then onto the next structure. Fundamentally it goes about as a transducer which changes over vitality into simple or computerized signal. Sensors can be prominent in view of sort of vitality they distinguish or exchange to the framework. Common sensor hub can be worked with various sorts of sensors. Some of them need a lot of vitality than others.

### 3. REASONS OF ENERGY WASTAGE

In WSNs, vitality is scattered by sensors while detecting, preparing, transmitting or accepting information to satisfy the mission required by the application. Information sensing so as to obtain is finished subsystem. The vitality can be spared if information from transducer can be minimized. Correspondence framework is an insatiable wellspring of vitality scattering. Extraordinary measure of vitality is squandered in states that are futile from the application perspective[8].

#### 3.1 Collision

At the point when a hub gets more than one parcel in the meantime, impact will happens between these bundles. All bundles that cause the crash ought to be tossed. Also, retransmission of these bundles is required.

#### 3.2 Overhearing

At the point when a sender transmits a bundle, every neighboring hub in its transmission range get the parcel regardless of the possibility that it is not bound for them. In this way the vitality is squandered when a hub gets parcels which are not proposed to be gotten.

#### 3.3 Idle Listening

It is one of the significant wellsprings of vitality wastage. Vitality scattering happens when a hub is listening to an unmoving direct keeping in mind the end goal to get conceivable movement.

#### 3.4 Interference

The hubs situated between transmission extent and obstruction range gets a bundle however can't decipher it. A forementioned reasons give us general thought regarding vitality scattering sources. As system lifetime gets to be essential variable for assessing WSN, vitality protection methods ought to be intended to upgrade the system lifetime.

### 4. ORDER OF ENERGY EFFICIENT TECHNIQUES

Vitality effective strategies can be characterized in five principle classes specifically, information diminishment, convention overhead decrease, vitality productive directing, obligation cycling and topology control.

#### 4.1 Data Reduction

It primarily concentrates on diminishing the measure of information delivered, prepared and transmitted. Information pressure and information collection utilizes information diminishment method.

#### 4.2 Protocol Overhead Reduction

This method is utilized to expand convention proficiency by diminishing the overhead. Streamlined flooding is likewise used to decrease the overhead.

Transmission times of messages are chosen relying on the dependability of the system, or on the separation to the wellspring of the transmitted data.

### 4.3 Energy Efficient Routing

Directing conventions ought to be planned in a manner that system lifetime ought to be expanded and vitality devoured by end-to-end transmission ought to be minimized. Hubs with low lingering vitality ought to be kept away from. A few conventions use land directions of hubs to construct a course toward the destination. Others construct an order of hubs to improve directing and decrease overhead. Information driven conventions send information to just hubs which are intrigued to keep away from pointless transmissions.

### 4.4 Topology Control

It alters transmission control and keeps up system network. It will diminish vitality utilization.

## 5 GENERAL APPROACHES FOR ENERGY SAVING

Diverse routines can be utilized to diminish vitality utilization in remote sensor systems (WSN, for example,

### 5.1 System Partitioning

Sensor hubs in WSN have constrained measure of vitality as they are battery fueled. The sensor hubs might be conveyed in unforgiving natural conditions relying on the application prerequisite. Hub disappointment is tranquil normal in barrier applications where issue of vindictive treating; ecological corruption can influence execution of hubs.

Because of which system topology might get to be disengaged. Because of disappointment of set of hubs, a subset of hubs that have not fizzled likewise gets to be isolated from rest of the system. This is called as "cut" in a system which brings about loss of bundle information. The method is utilized which separates the sensor hubs into N sets to accomplish the maximal lifetime change. Framework apportioning can be utilized to diminish vitality utilization in the system.

### 5.2 Dynamic Voltage Scaling

To add to a vitality productive framework is one of the difficulties in remote sensor systems. It is a method to

decrease vitality utilization by differing the CPU recurrence. Changing the CPU recurrence can influence time keeping usefulness of sensor stages. In [9], creator expressed diminishment of vitality utilization in remote sensor systems by means of element voltage scaling while lessening effect of CPU recurrence exchanging on time synchronization. Dynamic voltage scaling (DVS) and element voltage and recurrence scaling (DVFS) strategies have been broadly used to diminish vitality dispersal continuously and occasion driven frame works.

### 5.3 Energy Efficient MAC Protocols

Remote sensor system is an appealing decision for different applications as no wired system is included. Different remote systems are not as vitality compelled as remote sensor systems. As different systems can be connected to mains supply or furnished with batteries that are rechargeable and replaceable. One of the prime wellsprings of vitality exhaustion in WSN can be controlled by medium access control (MAC) protocols[10]. MAC conventions can be named controlled access(CA), random access(RA), slotted access(SA), hybrid protocols(HP).

### 5.4 Energy Aware Routing

Vitality mindful information driven directing convention (EAD) [11] is circulated steering convention, which frames a virtual spine involved dynamic sensors that are in charge of in-system information handling and activity handing-off. EAD methodology is vitality mindful and valuable expanding system lifetime.

### 5.5 Duty Cycling

The best vitality saving operation is to put the radio handset in low power mode i.e. rest mode at whatever point correspondence between hubs is a bit much. The radio ought to be exchanged off when there is no information to exchange or to get and ought to be made dynamic when an information parcel gets to be prepared [12]. The exchanging in the middle of dynamic and rest mode can spare vitality usage. Along these lines, hubs substitute in the middle of dynamic and rest periods.

### 5.6 Network Coding

System coding is utilized to upgrade a system's throughput, productivity and versatility [13].This procedure enhances the limit of a system with better utilization of data transmission. The hubs of the remote

system take a few parcels and send them together for transmission to achieve greatest conceivable data stream. Middle hubs encode information bundles got from neighboring hubs. Fundamentally this system is utilized to lessen movement in bottleneck zone or territory close to the sink. The hubs in bottleneck zone are inclined to drain their energies immediately called as vitality entire issue in WSN.

At whatever point a hub goes into the bottleneck zone, system coding layer keeps up got line and a detected line. At whatever point it gets a parcel a hub put the bundle in got line. Encoded (XOR) parcel is produced by bundles from detected line and got line. On the off chance that got bundle is as of now handled then it is disposed of by the hub. In the event that the hub is not an encoder hub, it goes about as hand-off hub and transmit parcel to the sink. Obligation cycle and system coding method can be consolidated to utilize the system assets viably.

## 6. CONCLUSION

Vitality sparing in remote sensor systems have pulled in a considerable measure of consideration in the late years. It is one of the basic viewpoints for WSNs. The overview is done about vital ways to deal with vitality protection in remote sensor systems. Vitality monitoring system correspondence methods turn out to be more vital. This paper is review about what are the systems that are utilized as a part of the remote sensor systems for upgrading the life time of systems. It set forward both development methods and some of past strategies .Important procedures are condensed yet at the same time a few improvements are required.

**Abstract**—A remote sensor system (WSN) is a remote system comprising of spatially dispersed self-sufficient gadgets utilizing sensors to screen physical or natural conditions. A WSN framework consolidates a portal that gives remote network back to the wired world and dispersed hubs. Vitality utilization and constrained battery life is the primary issue in remote correspondence particularly in remote sensor system. In this manner as of late vitality productivity is getting more consideration in remote sensor system. To enhance the battery life of sensor hubs we permit the sink to move in sensor system. For better sink versatility, the development example of the sink ought to be chosen, with the goal that sink can take after the way and accumulate the information all the more effectively additionally in less time. Sink Trail and Sink Trails, two vitality proficient proactive information reporting conventions are utilized to choose the most brief way for sink portability.

**Index Terms**— Sinks, Sink Trail, Sink Trails, Data get-together, and Sensor Nodes.

## I. INTRODUCTION

A remote sensor system (WSN) is a remote system comprising of spatially conveyed self-governing gadgets utilizing sensors to screen physical or ecological conditions. A WSN framework joins a door that gives remote network back to the wired world and dispersed hubs. Engineers have made WSN applications for zones including social insurance, utilities, and remote checking. In social insurance, remote gadgets make less obtrusive patient checking and medicinal services conceivable. For utilities, for example, the power network, streetlights, and water municipals, remote sensors offer a lower-cost technique for gathering framework wellbeing information to lessen vitality use and better oversee assets. Remote checking covers an extensive variety of utilizations where remote frameworks can supplement wired frameworks by diminishing wiring costs and permitting new sorts of estimation applications. Remote checking applications include:

- Environmental observing of air, water, and soil
- Structural observing for structures and extensions

- Industrial machine observing
- Process observing
- Asset following

Remote sensor systems comprise of individual hubs that can collaborate with the earth by detecting or controlling physical parameters. These hubs need to work together to satisfy their undertakings. The hubs are interlinked together and by utilizing remote connections every hub can impart and team up with each other. The sensor field constitutes sensor hubs.

Normally, a sensor hub can perform undertakings like calculation of information, stockpiling of information, correspondence of information and detecting/incitation of information. A fundamental sensor hub commonly includes five primary segments and they are to be specific controller, memory, sensors and actuators, specialized gadget and force supply. A controller is to process all the applicable information, fit for executing self-assertive code. Memory is utilized to store projects and middle information. Sensors and actuators are the real interface to the physical world. These gadgets watch or control physical parameters of nature. The specialized gadget sends and gets data over a remote channel. Lastly, the force supply is important to give vitality.

In remote sensor systems, power utilization proficiency is a standout amongst the most imperative configuration contemplations. In this manner, these interlaced parts need to work and adjust the exchange offs between as little vitality utilization as could be expected under the circumstances furthermore the need to satisfy their assignments. On the off chance that the sensor hubs and sink both are static then more vitality is required by the sensor hubs to pass on the vitality towards the sink hubs. Along these lines to diminish the force utilization of sensor hubs scientists incorporates the idea of sink portability. Sinks are permitted to move in the system and assemble the data from the sensor hub and procedure over it. Accordingly, Sensor hubs does not require to cost vitality to exchange the information toward sink hubs.

At the point when the idea of portable sink is presenting, the sink can be a robot, vehicle or creatures which are furnished with radio gadgets are utilized which are send into the system and straightforwardly speak with the sensor hubs which results in streamlined information transmission way and lessens the vitality utilization. Sink versatility decreases the vitality utilization; it presents new difficulties in sensor system applications. At the point when the sink is permitted to move in the system, way ought to be trailed by the sink with the goal that it can work all the more viably. For the better development of the sink in the system, course should be found, on which sink can move productively and accumulate the information in least time.

A few calculations have been proposed to discover the upgraded course, for example, on-interest directing, separation vector steering, land steering and so on when geological directing is utilized the drawback as a part of that is, it accepts that the topographical area of the considerable number of hubs are known. Numerous specialists concentrate on arranging a portable sink's moving direction ahead of time to advance the system execution. Be that as it may, in numerous applications predefined direction is not pertinent. So, without predefining the direction we permit the moveable sink to habitually declare the area data all through the system.

Sink Trail, a proactive information reporting convention is utilized as a part of sensor system where the sink moves consistently in the system, in moderately low speed and accumulate the information. At specific separation after same time of interim sink hubs telecast the control knead in much lower recurrence than it customarily required in existing information gathering convention. The position where the message is telecast is called as "impressions".

This impression is considered as virtual point of interest. Utilizing this virtual historic point sensor hub can without much of a stretch recognize its jump tally separation from the milestone. These jump check separations consolidated speak to the sensor hub's direction in the coherent direction space built by the portable sink. By utilizing the destination directions and its own directions, every sensor hub chooses the following jump with the improved separation.

Hence the convention finds the streamlined way without utilization of GPS or any predefined milestone. This convention decreases the unpredictability of the directing calculation and additionally builds the battery life time of the sensor hubs.

## II. RELATED WORK

Wired system concentrates on amplifying the end-to-end throughput and minimizing the deferral. In any case, vitality utilization and constrained battery life is the fundamental issue in remote correspondence particularly in remote sensor system. In this manner as of late vitality productivity is getting more consideration in remote

sensor system. In view of the versatility example of the portable hub's information gathering plan is separated into two classifications.

*A. Wild Mobility*

In Uncontrollable Mobility, the versatile authority moves haphazardly. In proposed to utilize an exceptional kind of portable hubs as sending specialists is utilized to encourage network among static sensors and transport information with irregular portability. In portable hubs are not permitted to choose straight course to accumulate the data in the system. Batalin et al. set proposed a framework NIMs, where portable authorities can just move along altered links amongst trees and guarantee that they can be energized at whatever time amid the development. A known component of these methodologies is high security and dependability, and the framework upkeep is basic. In any case, they normally do not have the deftness and can't be versatile to the sensor dispersion and natural flow.

*B. Controlled portability*

Controlled versatility is the second classification in which the portable gatherers move anyplace in the system uninhibitedly and its direction will be plan to move proficiently in the system. To expand the battery life of the sensor hubs, visit arranging calculations is utilized for accomplishing a short information gathering visit and to transfer every one of the information inside a solitary bounce. While these methodologies minimize the vitality utilization by totally evading multi jump transfers, they may bring about long information gathering inactivity particularly in an extensive scale sensor system. Information gathering plan is proposed in that mutually considers the full use of simultaneous information transferring and visit length minimization. In the plan, various sensors can at the same time transfer information bundles to the versatile gatherer in a solitary jump, which effectively abbreviates information transferring time. Effective information gathering turning into a more imperative as of late, for which numerous plans are proposed by specialists. These plans are classified in three sections, productive hand-off steering , various leveled base, and portable information gathering.

*C. Examination of information social event plans*

In surveying-based methodology portability of sink is controllable where the way of movement is not choosing. In single-bounce information gathering (SHDG), a portable authority stops at some chose sensor hubs to gather information such that solitary jump information transferring from every sensor to the versatile gatherer can be ensured. In controlled portable component plan (CME), a versatile authority crosses the predefined track and gathers information from the sensors close-by with multihop transfers.

TABLE I: EXAMINATION OF INFORMATION SOCIAL EVENT PLANS

	<b>Polling Based Approach</b>	<b>Single Hop Data Gathering</b>	<b>Controlled Element Data Gathering Scheme</b>
<b>Pattern of motion</b>	Can move anywhere, Controllable	Can move anywhere, Controllable	Path is decided, uncontrollable
<b>Locations for data gathering</b>	Movable sink stops at selected sensor nodes and gather data	Movable sink stops at subset of sensor nodes and gather the data in single hop	Pausing locations are not predefined
<b>Moving path</b>	Starts from sink visit each node at least once	Starts from the sink cover all the locations in transmission range	Moves on predefined path

*D. Various leveled Infrastructure*

In progressive base WSN is gathered into bunches, where in every group one group head is pick which is in charge of the information exchange from on one sink to another. Be that as it may, in progressive foundation

bunch head expends more vitality than other sensor hubs. Since every sensor hub perhaps get to be group head every hub ought to be capable for approaching and active movement. It expands the general expense of the system. It might build overhead because of incessant data trade among sensors.

#### *E. Portable Data Gathering*

When static various leveled system is utilized numerous issues are happened amid information gathering. To conquer this issue versatile information gathering plan has been proposed. In this plan portable gatherers are utilized which interfaces the static sensors. The portable authorities, called information donkeys, are proposed in, which accumulate the information from close-by sensors store its and last process it. Despite the fact that it decreases the vitality utilization of the sensor hubs, its moving direction is not controllable and parcel deferral is not unsurprising. In a vitality proficient item following plan is proposed in which the quantity of following sensors is minimized through direction expectation. Here the portable operators are stay in contact of sensor hubs constantly which are closer to the article which we need to track. As the portability of the haphazardly moving item is not unsurprising and not controllable, most extreme bundle postponement are not garneted. In this manner for the sensor hubs conveyed in the urban ranges, transports or prepares go about as versatile base stations.

Presently the moving way and time is unsurprising. In spite of the fact that the portable information gathering plan diminishes the vitality utilization in remote sensor system, information gathering inactivity is expansions. The plan essentially centered around minimizing the moving direction however did not consider the information transferring time. These perceptions propose to outline a plan which minimize the aggregate information gathering time which incorporates moving time of the information authorities and additionally information transferring time of sensor system. Along these lines the joint methodology of versatility and space- division numerous entrance (SDMA) system is proposed in.

#### *F. Versatility and Space-division Multiple Access (SDMA) Technique*

In this method portable gatherers go about as versatile base station and surveys every sensor while navigating its transmission range. Every sensor hub specifically sends data towards portable gatherers with no transfer so that the lifetime of sensors can be drawn out. SDMA procedure is additionally connected to information gathering by outfitting the versatile authority with two receiving wires. With SDMA, two unmistakable good sensors may effectively make simultaneous information transferring to the versatile gatherers. At the point when the idea of sink versatility is presented it additionally presented new difficulties. Numerous methodologies and conventions are proposed by the specialists to diminish the control overhead in the system presented by sink versatility.

### III. PROPOSED WORK

#### *A. Sink Trail Protocol*

Consider a huge scale, consistently dispersed sensor system sent in an outside region where the hubs in the system speak with each other utilizing radio connections. All hubs in sensor system are associated with each other. We accept that when the procedure information accumulation begins sensor hubs will wake up means they are in alert state. To accumulate the information from the system versatile sinks are utilized which are occasionally send as a part of system. As vitality supply of versatile sinks can be supplanted or energized effortlessly, they are accepted to have boundless force. At the point when versatile sink enters in the system it ends just when enough information is accumulated or there is no information to assemble.

The Sink Trail convention is proposed for sensor hubs to proactively report their information back to one of the portable sinks. In Sink Trail Protocol amid the information gathering sink moves in the given system in low speed and focus on the reporting information bundle. Portable sink stops at some spots for brief length of time, show the message to entire system and begins advancing. The focuses where the sink stops are called as trail focuses and the telecast message are called as trail messages. There is no any predefined example is trailed by this trail focuses. Trail messages created by the sink contain the arrangement number and the bounce check of sink. The time interims between two Trail focuses are known as "move".

#### *B. Calculation for portable sink technique*

1. Initialization
2.  $Msgseq \leftarrow 0$
3.  $msghop \leftarrow 0$
4. step size parameter K

5. moving techniques
6. while not get enough information do
7. go to next trail point
8. msgseq←msgseq+1
9. stops eventually and show message
10. same time listen for information parcel
11. end while
12. stop

In sink Trail convention predefined points of interest are not utilized as a part of spot of predefined milestones coherent directions are utilized. To speak to the legitimate direction, sink references are utilized.

Every hubs keep up the trail reference and utilized amid the information sending. Two stages are utilized as a part of Sink Trail Protocol. Coherent direction space development is the primary stage. In this stage as indicated by versatile sink's trail messages sensor hubs redesign their trail references. Destination Identification is the second period of Sink Trail. Rather than planning a portable sink's development, it permits a versatile sink to suddenly stop at advantageous areas as per current field circumstances or fancied moving ways. These trail focuses in Sink Trail, are impressions of a versatile sink, and they give significant data to following the present area of a portable sink.

#### *C. Effect of number of portable sinks in system*

In sensor system number of versatile sinks influences the general framework execution. At the point when different portable sinks are utilized as a part of system, a few consistent direction spaces are built simultaneously and information bundles are sent to the destination reference utilizing the briefest way as a part of any direction space. As the quantity of portable sinks expands it diminishes the normal course length furthermore decreases the aggregate vitality utilization. In any case, more portable sinks likewise present heavier weights for trail message television and steering data support. Far and away more terrible, various number of versatile sinks in a system bother control activity clog and correspondence delays, which will thus bring about higher parcel misfortune and retransmission rate.

#### IV. CONCLUSION

In this paper different part of information social affairs plans, for example, uncontrolled portability, controlled versatility, proficient transfer steering, various leveled framework is talked about, besides concise idea of Sink Trail convention is portrayed for vitality productive information gathering where effect of numerous sinks in system is depicted .

Sink Trail utilizes sensible directions to choose separates, and sets up information reporting way by eagerly selecting the briefest way to the destination reference. It likewise comprises wanted elements of topographical directing without requiring GPS gadgets or additional historic points introduced.

# Requirement Gathering and Classification: An Engineering Perspective

Thakur Ritesh Bankat Singh, S.V.A.V. Prasad, Malla Reddy Jogannagari, Tapsi Nagpal

**Abstract:** *Gathering the requirement is the vital steps for every successful quality software. Requirement Engineering is the key role for gathering the requirement. The good quality software development require useful data requirement. In recent Software Engineering achieve the data centric with the involvement of big data, artificial intelligence (AI) and machine learning. The most of data gathered from different sources with the evolution of technology, social media and other sources. There are many factors while gathering the requirement to produce the product with good quality. This Paper highlights and extends the research scope of existing requirement engineering to meet the new challenges of requirement clusterization and increase the productivity of product in regards to customer requirement. There is need of applying classification and clustering technique to form requirement clusterization.*

**Keywords:** *Requirement Analysis, Classification, Clustering, Requirement Engineering, Requirement Elicitation.*

## I. INTRODUCTION

Requirement Engineering is a important phase of software development life cycle. The purpose of requirement engineering is deal between the client and developer. The collection of full and consonant requirements can lead the quality of software product and can fulfill the user requirements. The requirement engineering is a tough exercise that considers the product requirement demands from the number of viewpoints, roles and responsibilities [2]. The proper execution of requirement engineering will have direct effect on the product quality of the software.. In this paper, we highlight the role of requirement engineering and its activities in the development of quality software product. Requirement engineering is the incremental process.

It is the systematic technique for requirement elicitation, requirement analysis, requirement specification, requirement management .Traditionally, the requirement engineering is performed in the first phase of the software development life cycle [1]. The requirement engineering has dominant impact on the software product. The irrelevant or noise requirement present in a initial stage will be continued to the next stages of product implementation. Identification and modification of error at initial stage is more easier than the later stage in terms of time and cost.

Because of this requirement engineering is the important phase to reduce the errors at the initial stage of the good quality software development. There are many factors while gathering the requirement to produce the Software with good quality. There is a need of applying classification and clustering technique to segregate the requirements of same type. This Paper extends the research scope of existing requirement engineering to meet the new challenges of requirement clusterization and increase the productivity of product in regards to customer requirement. In this we form the cluster of same requirements based on number of requirements' received from the different users.

During the software development the quality of software project is decided in terms of requirement elicitation and requirement managing process.

Research paper provides comprehensive view of the role of requirement gathering in the requirement Engineering. The different sections in the paper are as follows. The Section II focused on the literature review of requirement engineering. Section III describes the taxonomy of requirement engineering. section IV describes various challenges & issues. Section V contains conclusion.

## II. LITERATURE REVIEW

In the field of requirement engineering number of researches share their knowledge as follows J Malla Reddy, et al [1], discussed about the requirement engineering concept Huma Hayat Khan, et al [2], discussed the factor generating the risk in the mean time of requirement engineering process in paradigm of Global software development. The work is useful for the people with less experience working in the global software development. Dr. Rajinder Singh [3]. conducted the survey on different software development organizations. He analyzed with evidence how quality of software product co-related with the reengineering process Swarnalatha. K.S, et al [4] proposed the dynamic framework for requirements engineering process model to produce better requirements for any software. The successful implementation of proposed requirement engineering process can have a good impact on the production of quality and quantitative software product.

## Requirement Gathering and Classification: An Engineering Perspective

Dr. Rajinder Singh [5] reviewed crucial processes used in requirement engineering role is the software development with practical survey conducted on Indian companies and evaluated results for better software product.

Haron, et al [6] described the role of people, process and technology during software project requirement. He conducted survey on IT Industry of Malaysia and find out 79.7% of IT Managers are in the requirement engineering process performing the roles of Project leaders and project managers. Dharendra Pandey, et al [7], presented the paper on requirement engineering and its influence on quality software development. In this I studied different classification methods for requirement engineering.

Abhijit Chakraborty et al [8], Implementing an effective method on requirement engineering the example of health care system. Saima Amber, et al [9], presented research paper on determination of risks in the requirement analysis process with framework model. In this comparison of model is shown on the basis of risk identification techniques. Dharendra Pandey, et al [10], described the basic fundamentals and dimensions of requirement engineering process and provide the idea on software requirement specification.

### III. ISSUES AND SOLUTION FOR REQUIREMENT GATHERING

Requirement gathering is a crucial part of any project. It will become a challenging attempt to achieve it. Knowledge expert role is to gathering the requirement. There are some common problems while gathering requirements. Every problem will have some solution in same way there are some suggestion to overcome from the problem while gathering the requirement. The good requirement always makes the software project successful.

#### A. Undocumented Processes

There is poor documentation or no documentation in many organizations about the existing processes. Here requirement gathering become a two step process. Firstly area of information of existing process and then identifying area for improvement and enhance optimization.

To confirm requirements are full and correct, its important to identify main stakeholders and subject knowledge experts and contact with them directly.

#### B. Conflicting Requirements

The business analyst will play the crucial role in document all the requirements. The ideas of the entire stakeholder will never be same and it leads to conflicting requirements. Business analyst identifies inconsistent requests and let stakeholders decide on priorities.

Business analyst has to listen stake holder's opinion and have some recommendations about what should be prioritized. The opinion of stakeholder will be crucial while gathering the requirement.

#### C. Lack of Access to End Users

Sometimes end users were too busy in their daily routine task and unable to participate in requirement gathering process. Absence of end users may lead to a few reasons and requires appropriate resolution.

Business analyst will play the crucial role. Defining groups and finding the most suitable end users in each group. Doing as much research as possible prior to the engagement

will help to make conversation more structured and insightful.

#### D. Validating And Tracing Requirement

Requirement gathered are listed should be cross checked before starting the implementation. It avoids the irrelevant requirement. Tracing the requirement will play the vital role. There should be forward as well as backward traceability.

#### E. Stakeholder Design

Stakeholders or end user have the need to utter how the system should work rather than providing details about what the system should do.

Hearing to stakeholders about possible solution can be perceptive but may also redirect actual problems and better solution designs.

#### F. Communication Issues

This includes language difference, unclear assumptions, and wrong vocabulary that lead to misunderstand between stakeholders and a business analyst.

The best solution to overcome from this is to establish two way communications.

### IV. REQUIREMENT ENGINEERING PROCESS

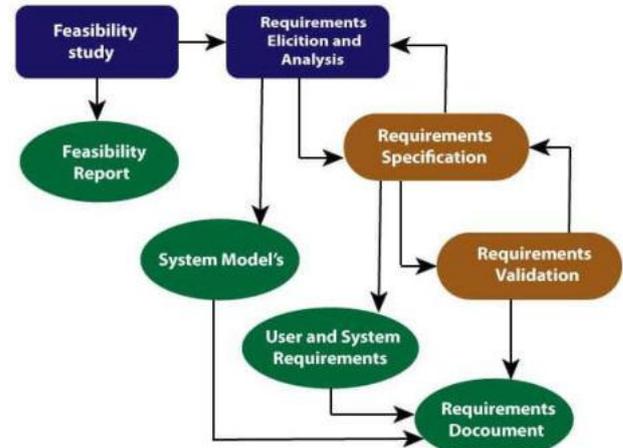

Requirement engineering process consist of four steps they are

Feasibility Study

Requirement Elicitation and analysis

Software requirement specification

Software requirement validation

Requirement Engineering Process

#### A. Feasibility Study

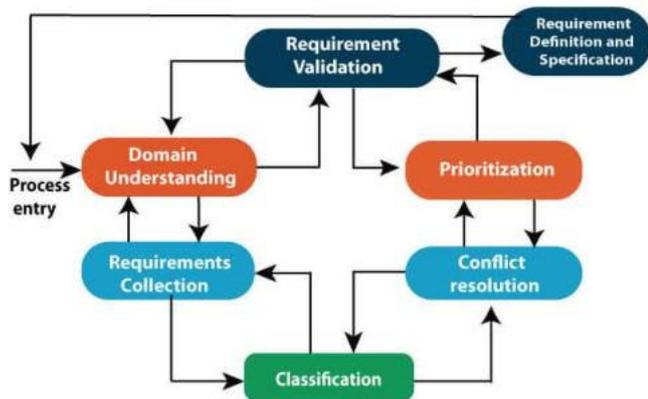

The feasibility study is used make the reasons for creating the software that satisfy the user requirement. It should be flexible to change and consistent to established the standards. There are three types of feasibility study. They are Technical Feasibility, Operational Feasibility, Economic Feasibility, Technical Feasibility determines the latest technologies which are required to gather the customer requirement within the time and budget.

Operational feasibility examines the range in which the required software performs a series of level to solve business problems and customer requirements. Economic feasibility deals with the financial analysis of the organization. It decides whether the necessary software can generate financial profits for companies.

**B. Requirement Elicitation and Analysis**

In this requirement are recognized with the help of stakeholder, customers and existing system. In this gathering of requirement is done. Analysis of requirement begins with requirement elicitation. The requirements are analyzed to find the missing, incomplete, inconsistencies. Problems of Elicitation and Analysis Only right people must involve gathering all requirements. Sometime stakeholders don't know what they required. Knowledge experts can involve gathering the requirements. Sometimes requirement is not specified in the detailed manner. Conflict requirements arise due to different opinion. During analysis process requirement can change.

**Elicitation and Analysis Process**

**C. Software requirement specification:**

Requirements are collected from the different sources. A document is prepared by the software analyst after the requirements collected is known as software requirement specification. The requirements received from the stakeholder are in natural language. It is the job of the analyst to translate the requirement in the technical language. It will help to the development team to understand technical language very easily. ER diagrams, data flow diagrams, data dictionaries will be used. E-R diagram is a detailed logical representation of the data for the organization. It mainly consists of data entities, relationship and their associate attributes. Data flow diagrams represent the flow of data through a system. DFD'S are mostly used for modeling the requirements. Data Dictionaries are repositories to store information about all data items defined in DFDs. It should ensure that the stakeholder and developers uses the same definition and methods at the requirement stage.

**D. Software Requirement Validation**

It is the process of checking that requirements defined for development, define the system that the customer really needs. Requirement validation performs to check issues related to requirements. Some of the requirement validation techniques are Automated consistency analysis Prototyping Test Case generation Requirement inspection A complete Software Requirement Specification should be:

-Clear

- Consistent
- Correct
- Modifiable
- Verifiable
- Traceable

**V. CONCLUSION**

From above study, it is concluded that requirement gathering is the crucial steps in software project. The Various factors that contribute to the requirement engineering process based on the knowledge of requirement engineer and commitment of stakeholder. Requirement gathering can be used for software development process to produce a quality product.

**AUTHORS PROFILE**

**Mr. Thakur Ritesh Bankat Singh**, B.Tech(CSE), M.Tech (CSE) ,Ph.D(CSE) \* Pursuing Ph.D from Lingaya university. Currently working as Associate Professor at Indur Institute of Engineering and Technology, in Computer Science and Engineering Department ,Siddipet , Telengana. Having more than 20 years of teaching experience .Guided nearly 100 project batches at UG and PG

level. I published more than 40 papers in reputed National and international journal and conference.. I update my knowledge and enhance my skills with the reserch quality education and use my skills in the best possible way to meet the industry requirement. Organized many workshops and technical event at work place .

## Requirement Gathering and Classification: An Engineering Perspective

**Dr. S.V.A.V. Prasad**, did his M.Tech and Ph.D (Satellite Communications). Presently working as professor, Dean ( CA) and Director Lingaya's Vidyapeeth, Faridabad, Haryana. Dr. Prasad has developed various products like 100 MHz dual Oscilloscope, High Voltage Tester, VHF Wattmeter, Standard Signal Generator with AM/ FM Modulator, Wireless Beacon, High power audio Amplifier,

Wireless microphone and many more in the span of 25 years( 1981-2007). Dr. Prasad has been awarded for excellence in R& D in the years 1999, 2004 and National Quality Award during the Years 1999, 2000, 2004 2006. He has over 40 years of active professional, Research and Administrative experience both in Industrial and Academics in senior positions. Dr. Prasad has guided 28 research scholars and they were awarded Ph.D degree. Presently guiding eight Ph. D Scholars in the Research Areas of Communication Engineering, thermal image processing for early diagnose of breast cancer, medical facilities for remote areas using m-health solutions , thought processing gadgets adoptive for broad band wireless communication and Semantic Web, Information Retrieval and so on. Dr. Prasad has published 168 research papers in various National and International, referred journals such as SCL, IEEE, Springer, ACM etc and also published text volumes. Dr. Prasad's research area includes Satellite Communication, Acoustics, Neural Networks, Artificial Intelligence and m health.

**Dr. J.Malla Reddy Jogannagari Malla Reddy**, obtained M.Tech(CSE) from JNTU, Hyderabad. and awarded Doctor of Philosophy in Computer Science & Engineering from Lingaya's University, Faridabad. At present working as Professor in Computer Science & Engineering Department, Mahaveer Institute of Science & Technology, Hyderabad, Telangana. He

also designated as OSD. Having 26 years of industry and teaching experience. His area of specialization in Software Engineering, Object Oriented Analysis Design, Data Base Management Systems and Management Information Systems. He published various research papers in reputed National and International Journals & Conferences. His strength is to adopt the new challenges technologies and make it available to the students.

**Dr. Tapsi Nagpal**, B.Tech, M.Tech ,Ph.D from Thapar Institute of Engineering and technology , Patiala.. Her area of specialization is artificial intelligence. Currently working as Associate Professor at Lingaya's Vidyapeeth, Faridabad, in Computer Science and Engineering Department. She is also designated as Ph.D research coordinator. Having more

than 11 years of teaching and industry experience. Guided more than 20 project batches at UG and PG level. Currently guiding many students in their Ph.D work. Published more than 12 papers in reputed National and international journal and conference. Organized various technical event at Lingaya's Vidyapeeth. Her strength is to expose towards the recent research technologies and build the practical knowledge.

## **Analysis of the Genome Sequence for the Purpose of Understanding the Causes and Treatments of Bipolar Disorder and Related Disorders**

**Kavita Agarwal, Dr. Tapsi Nagal**

Department of Computer Science and Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana, India.

**Email:** goel.kavita15@gmail.com, dr.tapsi@lingayasvidyapeeth.edu.in

**Abstract:** In cases of bipolar disorder (BD), genetic factors have only been shown to contribute to a minor portion of the condition's heritability. Because of this, people have been looking into sub-phenotypes of BD, such as treatment response, in an effort to narrow the heterogeneity of BD. Using a variety of methods, the researchers in this study conducted a series of experiments with the goal of identifying molecular signatures that are related to bipolar disorder (BD), the response to lithium medication, and other subclinical traits in a cohort of individuals who have BD. First, we investigated the connection between lithium response and essential candidate genes already known to influence lithium response in other populations. In the second step of the process, a global and CpG island DNA methylation profiling was carried out with the goal of locating genomic loci that had distinct methylation patterns in lithium responders as opposed to non-responders. Third, a genome-wide copy number variation (CNV) study was done to find and describe CNVs that are linked to BD symptoms and how well lithium works. Finally, the results of an untargeted plasma metabolomic profiling showed that patients with bipolar disorder, both those who responded to lithium treatment and those who did not, had different amounts of a number of different metabolite species. The study's results support the idea that BD is most likely caused by the dynamic dysregulation of a large number of gene regulatory networks, proteins, and metabolic pathways, which is a sign of complex problems in the system.

### **1. Introduction:**

Formerly called manic-depressive disease, bipolar affective disorder is a neuropsychiatric condition currently categorized as a mood disorder. Patterns of aberrant and extreme mood swings, from periods of depression to heightened mood, which is called mania, characterize this medical disease for which this diagnostic word is used. There is a wide variety of manifestations of bipolar disorder (BD) [1]. Treatment success is condition-specific and can occur in tandem with other psychiatric disorders. Without treatment, BD can have devastating effects on not just the quality of life of those who suffer from it but also their loved ones and the larger community [2]. Psychosis, both manic and

depressive, can occur in the most severe forms of BD, which is coupled with cognitive and behavioral issues. The disease is extremely problematic from a public health perspective because it leads to increased suicide mortality and requires recurrent hospitalization [3].

**1.1. Nosology, Symptoms, and Clinical Course of BD:**

Psychiatric conditions that fall under the umbrella of "bipolar disorder" are quite varied. Clinical studies that tracked patients over time in the late 20th century revealed a striking diversity of phenotypes among the affected group. Mania without depression, dysthymia, cyclothymia, and mania type I and II are all part of the bipolar spectrum. Figure 1 depicts some of the most common types of mood disorders and the symptoms associated with them [4]. BD is a chronic condition that can progress in a variety of ways throughout the course of a person's lifetime. The initial manifestation of BD might manifest as either manic or hypomanic symptoms, depressive ones, or a combination of the three. The initial episode of bipolar disorder is typically manic for men, while the first episode of depression is equally common in both sexes [5]. More than ten affective episodes may occur in a patient's lifetime if BD is left untreated. Most people with bipolar disorder have typical 'euthymic' intervals between manic and depressive episodes, during which they revert to a more or less normal mental state. In people with bipolar disorder, the duration of both manic and depressive episodes, as well as periods of remission (euthymia), varies widely. Manic episodes tend to be shorter in duration than those of depression or mania [6].

**Figure 1: Characteristics of mood states in different types of mood disorders.**

It has been estimated that the average duration of a manic episode is six weeks. It takes eleven weeks on average for a major depressive episode and seventeen weeks for a mixed episode. The time between episodes is shorter in later

seasons compared to the first three. After the first three episodes, both the number of episodes and their length begin to reduce and increase gradually [7]. Rapid cycling describes patients who have more than four episodes of disturbed mood per year. Females with BD are more likely to experience rapid cycling, which affects 5-20% of adult females. Some people with BD have a regular, predictable pattern of episode recurrence, with shifts from depression to mania or mania to depression, whereas others have no such pattern [8]. The long-term effects of BD-I in a South Indian community were assessed in a recent survey. Mania is the most common and often the initial manifestation of bipolar disorder (85% of cases) [9].

Affective episodes, most frequently mania, accounted for 11% of patient lifetimes on average. The average length of a depressive or manic episode was two months, and the average length of time until a relapse was 21 months [10-11]. Similarly, a cohort from north-east India and research conducted in a rural Indian community both found that BD often manifested itself through episodes of recurring mania.

## **1.2 The Diagnostic Procedure**

The diagnosis of BD, like that of other psychiatric diseases, is based on a thorough evaluation of the patient's psychological and behavioural health due to the lack of appropriate clinical laboratory tests. When diagnosing a patient with a mental disorder, psychiatrists follow established diagnostic interview methods that take into account the patient's history, personality, social and functional limitations, and other factors [12]. To rule out physical causes of psychiatric symptoms, it is occasionally necessary to perform a physical examination and review the patient's medical history. All diagnosable mental and behavioural illnesses are listed in chapter V of the tenth revision of the ICD (International Classification of Diseases). Diagnostic criteria for BD and related symptoms are detailed in the International Classification of Diseases, 10th Revision (ICD-10) (<http://apps.who.int/classifications/icd/>). The American Psychiatric Association's (APA) Diagnostic and Statistical Manual of Mental Disorders (DSM) is the gold standard for psychiatric diagnosis. Every few years, the International Classification of Diseases (ICD) and the Diagnostic and Statistical Manual of Mental Disorders (DSM) are updated or altered to reflect the latest research findings in the field of psychiatry. The following sections outline the key criteria used in the DSM-IV-TR to diagnose BD in clinical practice [12]

## **1.3. Genetics:**

Many different clinical observations have been made in BD, but the most consistent one is that BD is passed down via families. This is why a large portion of current studies aim to identify risk factors for the condition, such as specific genes or chromosomal locations [13]. Genetic research in the 21st century has made great progress in understanding the biology of BD, even though the specific genes or chromosomal locations causing this condition are still obscure. Multiple physiological mechanisms and alterations in CNS structure and function have been related to genetic predispositions to BD. Additional features of BD that are compatible with epigenetic dysregulation include discordance in monozygotic twins, parent-of-origin effects (POEs), late age of onset, and a varied illness course [14]. Epigenetic processes have been the focus of recent research into BD. The literature review in this thesis provides additional information on the genetics and epigenetics of BD [15].

## **2. Related work:**

Research conducted on families, twins, and adoptees over the past several decades has been crucial in elucidating the heritable nature of BD. It has been calculated via studies of families that the relative risk of BD among first-degree relatives is approximately 10%, or ten times that of the general population [16]. There is a 2-fold increase in the incidence of unipolar depression in first-degree relatives. In families with a history of bipolar disorder, unipolar depression is more prevalent due to its high population incidence. Moreover, schizoaffective disorder and schizophrenia were also found to occur at elevated rates in bipolar families. Diverse families have different histories, making it difficult to generalize about the transmission of BD. The true nature of heredity is further muddled by the existence of other psychiatric diseases in families where BD is present [17].

If one twin has BD, there is a 70-85% chance that the other does as well; for dizygotic twins, the risk is 15-25%. Taking into account these variations, BD has one of the highest estimated heritabilities among all psychiatric diseases, at 70–85 percent. As a result, environmental impacts, such as psychological factors, account for some of the risk (15-20%), meaning that it is not entirely genetic [18]. Research on adopted people with BD has found that their adoptive families tend to have fewer members with the disorder than their biological families. These findings provide more proof that BD is a genetically predisposed psychiatric disorder.

Candidate genes for neuropsychiatric diseases are those that code for critical enzymes in neurotransmitter metabolism [19]. The enzyme catechol-O-methyltransferase (COMT) is involved in the breakdown of the neurotransmitter catecholamines. The amino acid valine 158 is replaced by methionine as a result of the single-nucleotide polymorphism (SNP) rs4680 (A/G), also called Val158Met, in the COMT gene [20-22]. It has been found that the Val allele variant catabolizes dopamine at a rate roughly four times faster than its Met equivalent. Dopaminergic neuronal activity and synaptic dopamine levels are both raised when the Met allele slows down the pace at which dopamine is broken down. Both schizophrenia and BD, in which there is an excess of dopamine in the brain, have been linked to the Met allele. Several other COMT polymorphisms, including Val158Met, have been associated with pharmacological response, especially to second-generation antipsychotics that target the dopaminergic system [23]. Serotonin and other serotonin-related neurotransmitters are synthesized in part by the enzymes tyrosine hydroxylase (TH) and tryptophan hydroxylase (TPH1 and TPH2). Multiple studies have linked genetic variations in these genes to BD and schizophrenia. Evidence for BD has also been found in the genes D-amino acid oxidase (DAO), D-amino acid oxidase activator (DAOA), and monoamine oxidase A (MAOA). The vast majority of antipsychotic medicines work by blocking the effects of certain neurotransmitters at their receptors. Multiple studies have looked into the possible significance of neurotransmitter receptor genes in BD's genesis and therapeutic response. Multiple studies corroborated the findings in favor of the dopamine DRD3 and DRD4 receptors and the serotonin HTR2A and HTR2C receptors [24-27]. Furthermore, recent research has indicated a substantial relationship between BD and genetic variations in NMDA glutamate receptors and numerous types of GABA receptors. One of lithium's best-studied targets is glycogen synthase kinase 3 (GSK3). Although early reports suggested a positive relationship between SNPs in this gene and BD, several contradictory studies have since been published [28].

### **2.1. Psychotic Symptoms:**

Some people with BD also have psychotic symptoms of schizophrenia, such as delusions and hallucinations. The psychotic episode may accompany mania or depression. Throughout the course of their illness, more than half of BD patients will have a psychotic episode at some point. The most typical sign of psychosis is grandiose delusions, but others include hallucinations, inconsistent moods, and cognitive instability [29]. Patients with BD who also exhibit psychotic symptoms may constitute a distinct subtype of the condition, one that shares common etiological roots and genetic vulnerability with schizophrenia. The genetic analysis of psychotic BD is gaining attention as multiple studies demonstrate that psychotic characteristics tend to cluster in BD families [30]. Several chromosomal areas have been linked to potential psychotic BD susceptibility genes by linkage studies. COMT has been linked to this condition in candidate gene association studies.

### **2.2. Family History:**

One of the most reliable predictors of increased risk for BD is a family history of mood disorders. Family studies of BD have shown that a child with even one parent who also suffers from a mood illness has a 10-25% chance of developing the same condition. It nearly doubles if both parents are affected. Children are more likely to contract an illness if they have a large number of affected relatives [31-33]. First-degree relatives, as opposed to more distant relatives, carry a higher risk. Patients with BD who have a high prevalence of psychiatric illness in their families likely have a heavier burden from one or more causative genetic variations. Patients with BD, whether they have a family history or not, are just at the start of a comprehensive genetic analysis.

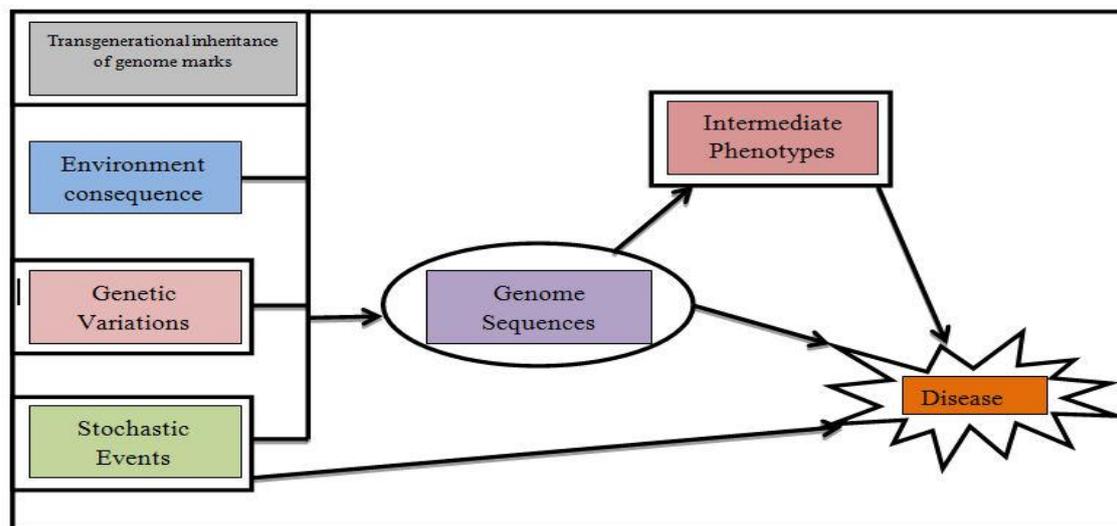

### **2.3. Genomic Structural Variations:**

Population and medical geneticists have focused extensively over the past few decades on identifying and mapping variants in the human genome. Short genetic variants and structural variants make up the bulk of human genomic variability [34]. Common polymorphisms and point mutations are examples of the short-range genetic variants that make up the vast majority of the human genome. This category also contains repeat polymorphisms with a length of less than one kilobase (STRs, short tandem repeats), as well as shorter insertions and deletions.

VNTRs (variable-length polymorphic tRNA-derived nucleotide repeats; di, tri, tetra, etc. Genomic variants that affect regions of DNA larger than one kilobase (kb) are classified as structural variations (SVs). SVs can range in size from very small to microscopic and encompass a wide variety of alterations, including copy [35]. Changes in copy number, including additions, deletions, switches, and transpositions.

Copy number variation refers to the quantitative difference between the copy number of DNA at a given genomic region of size greater than 1 kb and a reference genome of choice and can take the form of gain (insertion, duplication/amplification), loss (deletion), or null genotype (CNV). A common nuclear variation in copy number, polymorphisms are mutations that occur at a rate of more than 1% in any given population (CNP) [36]. Segmental duplications are regions of DNA larger than 1 kb that is repeated several times in the genome with higher than 90% sequence identity. Approximately, duplications the extent of segmental duplications varies from 1 to 14 percent across the 24 chromosomes, making up 4 percent of the human genome. CNVs can come in many forms, from simple

duplications and deletions to more complicated inversions and translocations, depending on the method by which they were created [37]. Changes in copy number can influence gene expression in ways apart from gene dosage and long-term effects on global gene expression, including reshaping chromatin structure and affecting the function of gene regulatory and enhancer elements.

**Figure 2: Inter-relationships among the epigenetic modification and other causal factors in complex psychiatric disorders.**

DNA obtained from peripheral leukocytes or post-mortem brain tissue was employed for the majority of the earliest epigenetic investigations in neuropsychiatric illnesses, which mostly focused on the examination of epigenetic marks in specific candidate genes. DNA methylation variations in catechol-O-methyltransferase (COMT) and reelin (RELN) have been linked to BD and schizophrenia in studies using methylation-specific polymerase chain reactions [38]. These results were not confirmed, however, by subsequent research utilizing more sensitive quantitative approaches such as bisulfite pyro-sequencing. An increased concentration of SAM and increased levels of DNMT1 gene expression were found in the brains of people with schizophrenia and BD. They also discovered that reelin and GAD67 gene mRNAs were down-regulated in cortical GABAergic neurons due to elevated promoter methylation. Down-regulation of DNMT1 and DNMT3A mRNA was later shown to be upregulated in peripheral blood cells [39-40]. No major alterations in global methylation were found in brain samples or peripheral leukocytes, despite the finding of DNMT up-regulation in psychosis.

### **3. The objective of this research:**

This research was set up so that scientists could get a good grasp on how numerous genetic events contribute to the phenotype of lithium receptivity in people with BD. This was done on the premise that evidence for the additional study could be found in the integration of many genetic abnormalities, as is possible in complex illnesses like BD. Because of this, the following are our detailed goals.

Genome-wide aCGH strategy to identify and validate genomic regions/genes with copy number variation (CNVs) in individuals with BD, and to correlate such CNVs with the lithium response phenotype and clinical subtypes of BD. Analysis of plasma metabolites in a group of bipolar disorder patients defined by their level of responsiveness to lithium.

#### **4. Proposed Algorithm:**

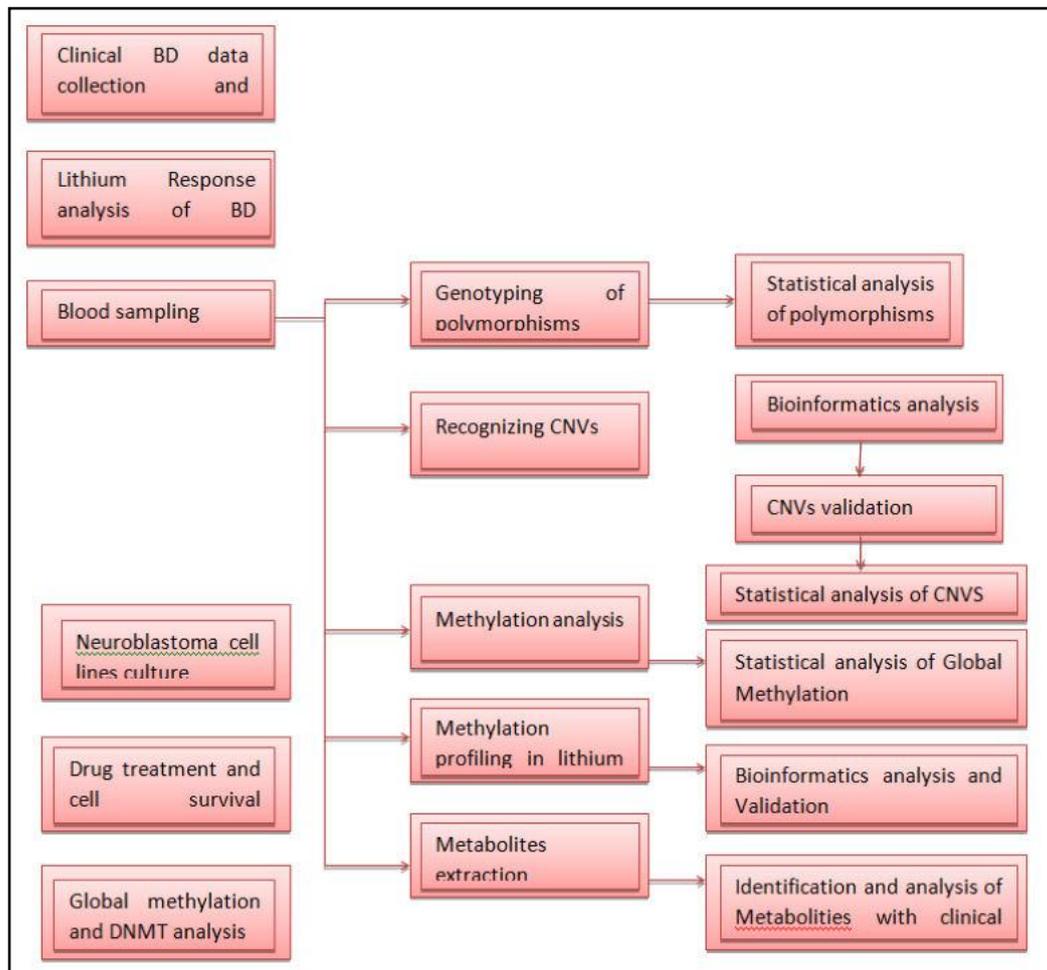

The proposed flow diagram is shown below in figure 3.

##### **4.1. Bipolar Disorder cases:**

After a thorough mental health evaluation, review of case records from hospital outpatient departments, and in-person interview, a diagnosis of BD was made using the DSM IV-TR criteria (boxes 1, 2, 3, and 4). The psychiatrists evaluated and diagnosed all of the patients. Specifically, a young psychiatrist first assessed the patients and meticulously recorded their mental and clinical histories. A prominent psychiatrist oversaw the final assessment and treatment plan. Individuals were selected on the basis that they had BD as their primary illness, the one that caused the most substantial discomfort or dysfunction, and so led them to seek therapy. The vast majority of BD patients (98.5%) were classified as having type I BD. Head trauma, major physical or neurological illness, substance use disorders, and mental retardation were also ruled out because of their correlation to neuropsychological impairment but were not included. We excluded patients who had been diagnosed with multiple Axis-I diseases.

##### **4.2. Lithium Response Analysis:**

Psychiatrists looked back at their patients' clinical symptoms while they were on long-term lithium medication to determine how well it was working. Throughout the acute stages of their illness, patients were seen once every week and once every three months during remission. Patients who experienced a recurrence of major depression or mania following a euthymic period of at least six months were diagnosed with a new episode and given additional care (hospitalization, medication change if necessary) and treatment based on the clinician's assessment of the situation. Minor depressive episodes and other subclinical presentations were not considered new recurrences. Our routine clinical treatment intervention and monitoring of the patient's illness progression was provided to all patients. There was no use of ECT or other psychiatric treatments. Following the best guess approach, we interviewed patients, family members, and previous health professionals and obtained records to learn as much as we could about their sickness before they contacted our center. For the therapeutic benefit of lithium medication to be evaluated, a minimum follow-up period of two years was recommended. Calculating plasma lithium levels in the clinical biochemistry lab was used to evaluate KH patients' adherence to lithium therapy. Levels of lithium in the plasma were monitored at least once every three months, and values between 0.6 and 1.2 mmol/L were regarded as having therapeutic value.

**Figure 3: The proposed flow- diagram.**

### 4.3. Genotyping of polymorphisms:

The samples were genotyped for the single-nucleotide polymorphism (SNP) rs25531 within the 5-HTTLPR, which is a 44-bp insertion-deletion polymorphism. We employed a PCR test to analyze rs25531 for both ins/del polymorphism and genotype. A pair of primers (forward: 5'-GCCAGCACCTAACCCCTAAT-3'; reverse: 5'-AGGGGATCCTGGGAGAG3') were chosen to amplify a 249 bp area surrounding the insertion, as was previously described. In a 25 ul reaction containing 1X PCR buffer, 100 ng of each primer, 1 unit of Taq DNA polymerase, and 100 M of each dNTP, the target sequence was amplified from 100 ng of genomic DNA. Initial denaturation at 95 degrees Celsius for 5 minutes was followed by 35 cycles at 95 degrees Celsius for 30 seconds, 60 degrees Celsius for 45 seconds, and 72 degrees Celsius for 1 minute. Electrophoresis on a 1.5% agarose gel stained with ethidium bromide and having a DNA ladder of 100 bp allowed for the separation of the amplification products. Two types of alleles, S (206 base pairs) and L, were identified (249 bp). The MspI restriction endonuclease (CCGG) uses the SNP as part of a recognition site, cutting the site when the G nucleotide is present but leaving it uncut when the A nucleotide is present. Overnight MspI digestion of PCR results provides a 249 bp fragment (uncut LA allele), two pieces of 148 bp and 101

bp (cut LG allele), or a 206 bp fragment (S allele). Protein fragments were isolated on ethidium bromide-stained 2% agarose gels. Sanger sequencing was used to confirm the rs25531 genotypes of a subset of samples.

#### **4.4. Identification of CNVs by array CGH analysis:**

Agilent feature extraction software was used to examine microarray pictures (protocol CGH-v4 91). Based on the array format, a microarray image-aligned grid template was chosen. The interactive adjust-corners algorithm uses an array of dark spots to optimize grid alignment. Cookie-cutter algorithm is used to detect spots and calculate local background intensities surrounding each spot for background removal. Outlier pixels were separated from designated pixel populations. Featured pixels were saturated. Each spot's pixel intensities' mean, median, and standard deviation were calculated. The error was calculated for each characteristic using a universal model. Multiplicative detrending removes non-systematic array intensity distribution. A dye normalization curve fit determined differences in red and green channel intensities induced by labelling and/or fluorescence emission. The log<sub>2</sub> ratio of red and green intensities was then calculated. Detecting genomic copy number abnormalities requires measuring array log ratio noise. Calculating the robust standard deviation of log ratio differences between consecutive probes (dLRsd) along all chromosomes gives a reasonable assessment of noise. Signal intensities, background noise, and the signal-to-noise ratio were used to determine the best hybridization and washing settings.

The feature extraction data file was imported into Agilent's CGH module. CNV increases and losses were discovered using the conventional ADM-2 technique. This technique detects all anomalous intervals in a given sample with consistently high or low log ratios. Log<sub>2</sub> ratios in at least two consecutive array probe signals were used to identify CNVs. Aberration zones are represented as a sample-colored bar graph. The ADM-2 algorithm with 6 thresholds discovered aberrant areas. Centralization method set at 6.0 and 10 bins. The minimum average log ratio for a region is 0.25, and the minimum number of probes in an aberrant interval is 3. CNV areas were visualized in genomic and chromosomal views along with log ratios.

#### **4.5. Bioinformatic Analysis:**

From the Genomic software workbench, we exported a list of CNV regions and associated metadata. Galaxy genome browser capabilities allowed for a combined study of CNV regions found in both responders and non-responders.

The CNV areas shared by responders and non-responders were divided into those that overlapped and those that did not, creating two distinct groups. Each group's shared and distinct areas were compared to the CNVs found in the general population and stored in the DGV database. The overlapped and separate CNV regions were shown in Venn diagrams. In addition, the coding genes (RefSeq), segmental duplications, repetitive elements, and CpG islands in the hg19 assembly were all mapped to CNVs. DAVID bioinformatics resources were used for the gene ontology analysis. Data from the Genetic Association Database (GAD), the CNVD database, Decipher, and BDgene were used to look for evidence of illness association in gene mapping inside the discovered CNV areas.

#### **4.6. CNVs validation and statistical analysis:**

The real-time polymerase chain reaction has surpassed other methods for detecting and quantifying DNA and RNA in recent years. One common technique for identifying CNVs is real-time quantitative polymerase chain reaction (RT-

qPCR). At the end of each PCR cycle, the amount of DNA is quantified using fluorescent dyes that produce a rising fluorescent signal in direct proportion to the number of PCR amplicons created. While in the exponential phase, enough amplified DNA product builds up to provide a fluorescent signal. The CT represents the critical cycle in which this occurs. CT values are inversely proportional to the initial amount (in copies) of template present in a reaction because they are measured during the exponential phase when the reaction components are not constrained. By comparing the CT value of the unknown sample to that of a reference sample with a known copy number, it is possible to get an estimate of the copy number of the unknown sample.

#### **4.7. Methylation statistical analysis:**

Agilent's e-array database was queried for the probe sequence descriptions. The DMRs' whole sequences were mapped and annotated in the galactic genome browser. Promoters, CGIs, genes, coding and non-coding sections, distance from the transcription start site (TSS), untranslated regions (UTRs), and other genomic components were mapped to the DMRs. EpiExplorer was used to compare data from the ENCODE research on different human tissues and cell types with the DMRs.

The extent of methylation variation at individual gene promoters was determined by downloading promoter sequences from the DBTSS and mapping them to the DMRs. The methylation difference in a given genomic region was visualized using UCSC genome graphs. Genes serving as DMRs were subjected to functional analyses with KEGG and DAVID bioinformatics tools, including gene ontology, pathway enrichment, and disease connection. Tissue-specific gene expression data from the GEO library was then compared to the DMR-related genes. Based on their levels of expression in the body's blood tissue, hypermethylated and hypomethylated genes were separated.

#### **5. Result and Discussion:**

Based on the response criteria, 63 of the 203 BD patients enrolled in the current trial were designated, lithium responders. Clinical subjects were gathered from a single large mental healthcare center to ensure homogeneity in diagnostic procedures and lithium response evaluation. Thirty-one patients did not fulfill all inclusion criteria and, as a result, could not be assigned to a separate response group. Major factors contributing to excluding such patients for the assessment of lithium response included discontinuation of lithium before two years due to poor tolerance, side effects, intervening contraindications, poor therapeutic adherence to lithium, and inadequate information regarding the treatment outcome.

We compared demographic and clinical variables between the two groups to assess how they might have affected the subjects' lithium response outcomes in BD. Clinical and demographic data of bipolar disorder patients, lithium responders, non-responders, and controls were described using frequencies and percentages. In order to determine if there was a statistically significant relationship between the categorical variables, a Fisher's exact test was performed, whereas t test was used for the continuous data. Patients had been suffering from the disease for a mean of 14 years and had suffered through a total of three abnormal mood episodes. Among these patients, manic episodes were the most common and contributed to the vast majority of hospital hospitalizations. Both the frequency of episodes and the prevalence of psychotic characteristics were greater in lithium non-responders than in responders (mean difference =

0.12, 95% CI 0.09 to 0.33). No statistically significant variations in allele or genotype frequencies were found when comparing STin2 VNTR and 5-HTTLPR for all the clinical variables (table 1).

The  $X^2$  and P-values are calculated by following formula.

$$X^2 = \frac{1}{m} (A_{i,k} - \bar{A}_k)^2 \quad (1)$$

Where,  $A_{i,k}$  is data and  $\bar{A}_k$  bar is centre value of data.

$$P - value = 10. \log_{10} \frac{Max_i}{\sqrt{MSE}} \quad (2)$$

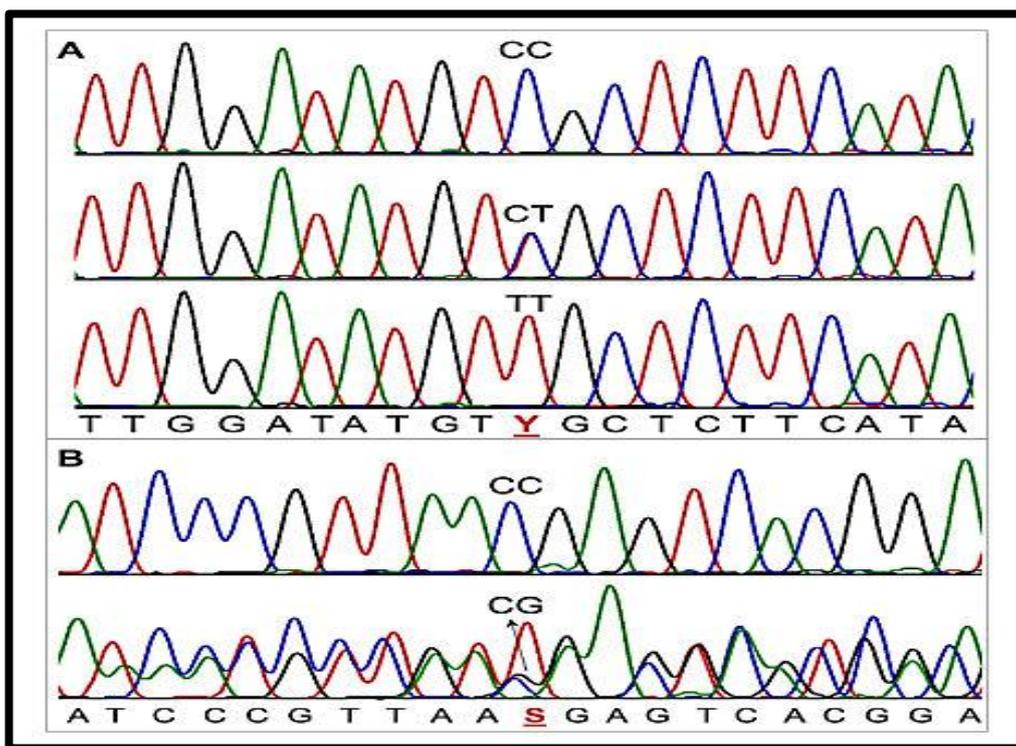

**Table 1: Comparison of STin2 VNTR and 5-HTTLPR for different clinical variables.**

Clinical Covariate	Clusters	HTTLPR Alleles			VNTR alleles	X <sup>2</sup> Value	P-Value
		S	L <sub>A</sub>	L <sub>G</sub>

Genetic association studies on SLC6A4 polymorphisms and lithium responsiveness have been published, albeit with mixed results. These studies are predicated on the idea that the total activity and integrity of the serotonergic system are crucial for the action of lithium. S/S genotype has been linked to poor response to lithium in bipolar disorder and unipolar depression; however, the research is limited. Lithium prophylaxis has been demonstrated to be more effective in patients with the S/S genotype than in those with other genotypes, according to other research. An SNP (rs25531

A/G) within the 5-HTTLPR insertion has recently been found to be functionally triallelic, resulting in two variants of the L allele, LG and LA. Other results imply that rs25531 is located upstream of the 5-HTTLPR gene, but its precise mapping is still up for debate.

We have looked into the GADL1 SNPs rs17026688 and rs17026651 for any potential relationship with lithium responsiveness in BD. In our lab, a tetra-ARMS-based assay was used to identify the variant alleles. Allele-representative samples were Sanger sequence-verified, and those samples were used as positive controls in future PCR runs. Finally, the tetra-ARMS-determined genotypes were shown to be consistent with the genotypes of many randomly selected samples after validation through Sanger sequencing.

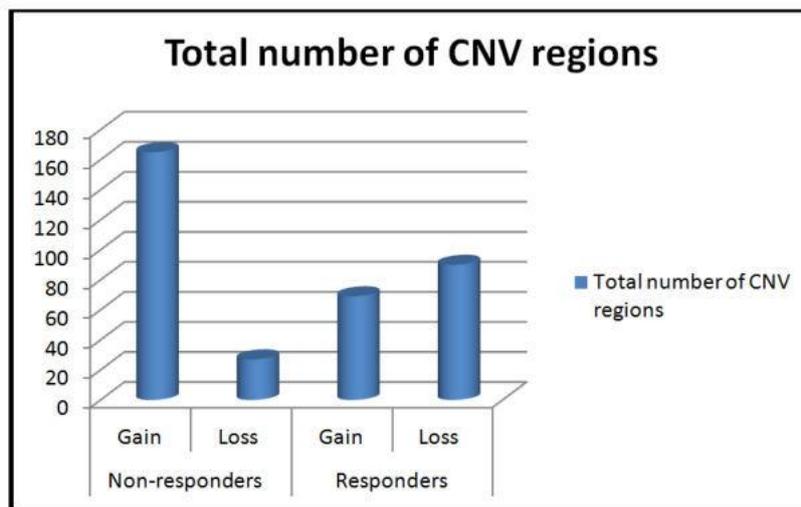

**Figure 4: Sanger sequencing electropherograms of samples representing different genotypes.**

CNV Identification: Agilent 244k (two-color) microarray aCGH analysis was used to determine genomic copy number gains and losses in BD lithium responders and non-responders. Two pools of samples, one from respondents and one from non-respondents, were hybridized into an array, and the third pool of DNA from a shared control group was used as a reference (R vs. C and NR vs. C). The Agilent 244k aCGH platform has 8.9 kb of total median probe spacing, 7.4 kb in coding areas, and 236,381 unique human genomic sequences annotated against NCBI Build 36 (UCSC hg18).

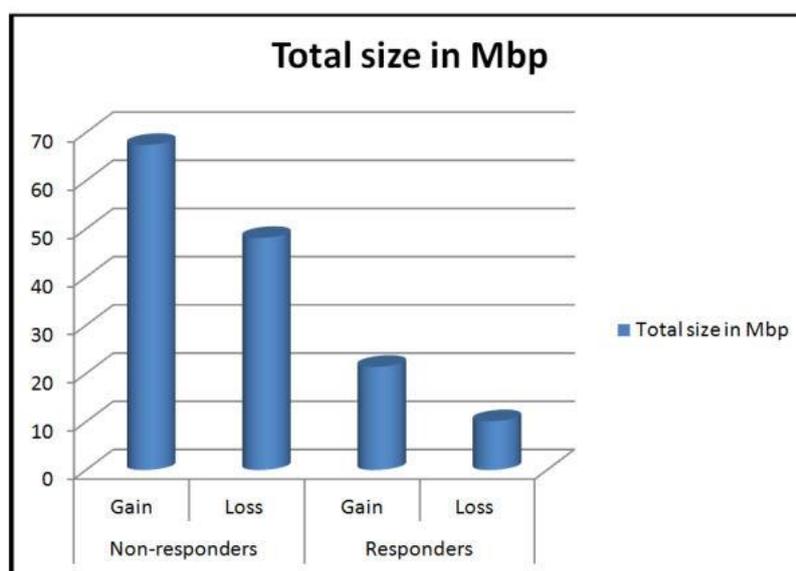

**Table 2: CNVRs Count identified in the aCGH analysis**

Group	CNV Types	Total number of CNV regions	Total size in Mbp

Non-responders	Gain	165	67.43
	Loss	27	48.15
Responders	Gain	69	21.392
	Loss	90	10.12

**Figure 5: Total number of CNV regions for Responder and Non-responder type CNVs.**

**Figure 6: Total size in Mbp for Responder and Non-responder type CNVs.**

We analysed the genomic intervals of CNVs in responders and non-responders to identify the distinct regions affected in each group. Results showed that both responders and non-responders shared 34 CNV areas (31 gains and 3 losses). It's possible that the areas related to BD, rather than the lithium response, are represented by these frequent CNVs. We

also tested the opposite, with CNV losses in non-responders vs growth in responders. We did not, however, uncover any CNVs of this common but opposite type.

## **6. Conclusion and Future Scope:**

### **6.1. Conclusion:**

Dynamic dysregulation of numerous gene regulatory pathways, proteins, and metabolic networks, reflecting complex perturbations of the system, is likely to result in neuropsychiatric illnesses like BD. Multiple methods were employed in this study to discover molecular markers linked with bipolar disorder, lithium responsiveness, and other subclinical traits in a group of BD patients from India. Patients diagnosed with primary BD had their responses to lithium medication retrospectively classified, yielding 103 non-responders and 62 responders.

Subjects with BD were classified according to a set of subclinical symptoms, including the presence of psychosis, a familial history of psychiatric disorders, suicidal behavior, etc. When comparing clinical features, the rate of suicidal behavior was much higher in lithium non-responders than in responders. Multiple studies have pointed to the widespread presence of CNVs in the human genome, raising the possibility that they play a significant role in neuropsychiatric illness susceptibility. Most genome-wide CNV investigations in BD have found no evidence of a greater CNV burden in BD patients than in healthy controls. Concurrent nucleotide variants (CNVs) may represent a unique genetic determinant for susceptibility to illnesses with a more prominent neurodevelopmental component than BD. It was found in our study that the frequency of CNVs larger than 1 Mb was substantially higher in non-responders than in responders. Our examination of CNV distribution and average size suggests that lithium non-responders have a higher CNV burden than responders. This study lends credence to the theory that individuals who do not respond to lithium have a more severe type of BD with deeper neurological and/or neurodevelopmental roots.

### **6.2. Future Scope:**

The results provided in this paper represent one of the first attempts to throw light on the potential involvement of CNVs and epigenetic variables in BD, its subclinical manifestations, and the lithium response, although more research is needed to identify the actual function of the molecular markers revealed. Because of our limited knowledge of the inheritance process at work in complex illnesses and the nature of biological variation that might lead to disease, studying the aetiology of psychiatric disorders remains a difficult research subject. The ever-improving state of the art in high-throughput DNA sequencing technologies holds great hope for the discovery of new genetic variations linked to psychiatric disorders. The discovery of the genetic basis of psychiatric diseases is hoped to benefit greatly from large-scale whole-genome sequencing.

## PREVENTING MEASURES IN BIPOLAR DISORDER VIA MACHINE LEARNING

**Kavita Agarwal & Dr. Tapsi Nagal**

Department of Computer Science and Engineering, Lingaya's Vidyapeeth, Faridabad, Haryana, India, [goel.kavita15@gmail.com](mailto:goel.kavita15@gmail.com)[dr.tapsi@lingayasvidyapeeth.edu.in](mailto:dr.tapsi@lingayasvidyapeeth.edu.in)

**Abstract:** The technical advancement in recent days has made a drastic increase in the amount of data generated from the physical, cyber, and human world. The collection of data at a huge scale makes sense only if the data is actionable and can also be used for making decisions. Data mining provides needed assistance at this stage by inspecting the relationship in the data and offers needed insights to the data owners. Moreover, the significant insights obtained are shared with third parties for further analysis. In this situation, numerous varieties of information is processed and the integration of machine learning with big data technology has made prominent aspect in the identification of bipolar disorder. It is a complex genetic disorder characterized by episodes of mania and depression. It affects 1% of the population worldwide. It is a major under-addressed public health problem which causes a significant burden on caregivers. High heritability and familial relative risk indicate the role of genetics in the etiology of the disorder. In this research, data is handled using an improved auto encoder and deep neural network. The feature selection is accomplished using ISAE and classification is accomplished using DNN. The proposed approach outperforms the existing state of art techniques.

**Keywords:** Bipolar disorder, big data, EMR, Registries, Claims, Patient Monitoring

### 1. Introduction

Bipolar disorder is a severe mood disorder with a lifetime prevalence of 1% in both males and females [1, 2]. It is characterised by recurrent episodes of dysregulated moods and is associated with high morbidity and suicide risk. Life time risk of an unrelated member of general population is 0.5 to 1.5%, that in first degree relative of bipolar disorder (BD) is 5-10% and that in monozygotic co-twin is 40-70% [3, 4]. It is a leading cause of global disability and its treatment is unsatisfactory. Family, twin, and adoption studies have provided strong evidence for the significant involvement of genes in predisposition to BD [5].

Estimates of heritability is as high as 89% and 93% in twin studies from hospital register in the UK and population register in Finland respectively [6]. However, the genetic basis for the disorder remains obscure [7-11]. It has been suggested that environmental stressors may trigger mood episodes [12] though they are more likely to be involved in the precipitation of the first episodes, but less with subsequent episodes [13].

Antioxidants suppress the process of oxidation that eventually led to the formation of free radicals. These free radicals are generated through lipid peroxidation. At higher concentration, free radicals from oxygen (reactive oxygen species - ROS) can damage the integrity of various biomolecules including DNA [14] and promote the activation of autophagy, apoptosis, and necrosis [15]. Oxidative stress has been implicated in the pathogenesis of neuropsychiatric diseases [16] as the brain has

greater vulnerability to oxidative damage.

Big Data offers a huge value and has recognized as being impelling force behind the innovation of technology and economic progression. Emerging approaches likely smart grid, e-health system, social network etc, provides exceptional utilities by examining the data for obtaining better understanding and services. An issue related to privacy is faced during the communication, transmission, mining and aggregation process. The sophisticated mining approaches may increasingly efficient and can expose the underlying data. The privacy related issues had established viable elucidations to fulfil the necessities of privacy.

The intent is to construct trade-off among utility and privacy which means effective use of these services while averting exposure or inference of private information during data analytic process. In the past few years, researchers have retorted to the issues and projected various approaches [17]. While the privacy related research is still quickly establishing, it is significant to discuss the privacy related aspects to preserve the privacy of the data in the era of big data. This informative chapter offers a various facet of privacy in big data analytical process [18].

Big Data is a ubiquitous technology with the emergence of social network, outsourced cloud computing, Internet of Things (IoT) and data transmission generated huge data that witnessed the enormous growth in the data. The data generation is observed in name of huge volume, elevated velocity and diversified data variety [19]. The exceptional usage of networking among smart objects and the intelligent computational platform accords the Big Data but pretences towards privacy where the location of privacy, transaction and behaviour are recorded digitally [20, 21]. Nowadays, Hospitals maintaining patient medical records digitally and it contains personal medical data that increases the privacy concerns [22]. Most of the developed companies are utilizing Big Data to observe the workforce by tracking the performance and the productivity of the employees [23]. The issues faced in hospital and companies revealed the gap among the regulatory policies (convention), Big Data and the necessities of new policies to address the complete concerns of privacy [24, 25-33].

Evaluating the term of big data conceptually from privacy perspective is inadequate to understand privacy comprehensively in big data domain. Hence, if 7 V's of big data can be evaluated from privacy perspective, a better understanding of big data can be presented. As presented in Figure 1, Volume, Velocity, Variety, Veracity, Value, Variability and Vulnerability are considered and evaluated from privacy perspective in Table 1.

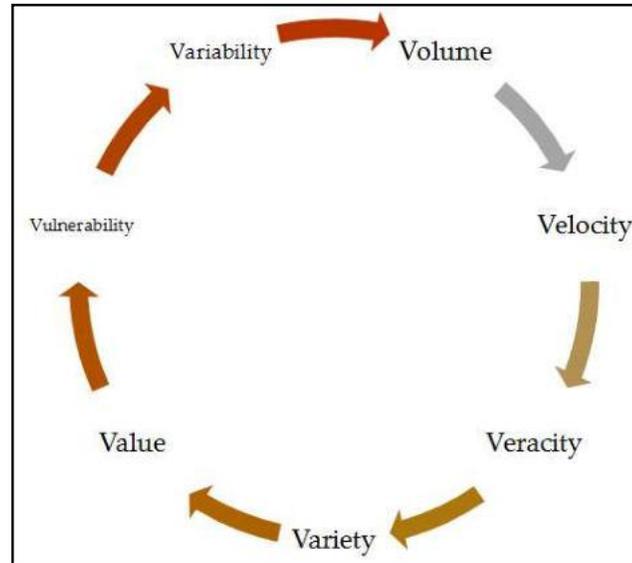

Figure 4. 7V's of Big Data

Table 2 Privacy Perspective of 7V's of Big Data

V's of Big Data	View of Privacy Insights
Volume	The raise in the count of the data records is directly proportional to the raise of the volume of data. The increase of data volume results in the decreasing of privacy threats and increases the utility data.
Velocity	The lifetime of data utility is more effective and the process of stream, batch as well as real time is accompanied in terms of high utility.
Variety	The combined form of diversified data is utilized to enhance the processing of big data analytics and processing. Thereby, the privacy issues are decreased with the data utility rate.
Veracity	The more reliable and accurate data available with high level of utility rate. The integrity of the data is devastated by the entrusted data source. Accurate data offers meaningful and high rate of utility.
Value	High utility value achieves best potential rate whereas data value plays significant role in preserving the privacy.
Variability	Most of the inconsistencies of the data namely extreme values, outlier and negative accurate analysis were rectified. Variability is one of the important concerns in the privacy domain.

Vulnerability	Big data is holds several personal information and it needs privacy preserving approaches in order to prevent the data from exposure to the unknown or any third parties.

## 2. Classification of Bipolar Disorder

This section discusses about the classification of bipolar disorder using improved stacked auto encoder and deep neural network. The overall proposed methodology is illustrated in Figure 1.

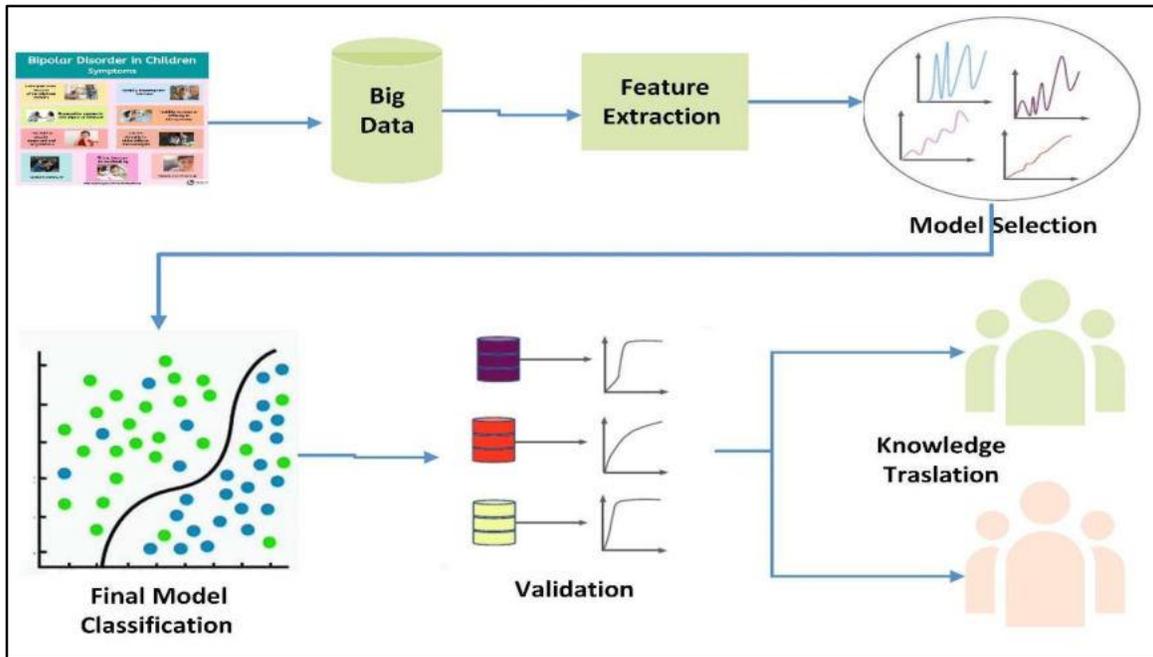

Figure 1. Overall Proposed Methodology

Auto encoders are used to build improved stacked autoencoders (SAE). In a neural network, the hidden layer of every auto-encoder is linked to the hidden layer of the following auto-encoder. The hidden layer of the first auto-encoder should be the input to the second one during the training phase. The improved stacked encoder is given in Figure 2.

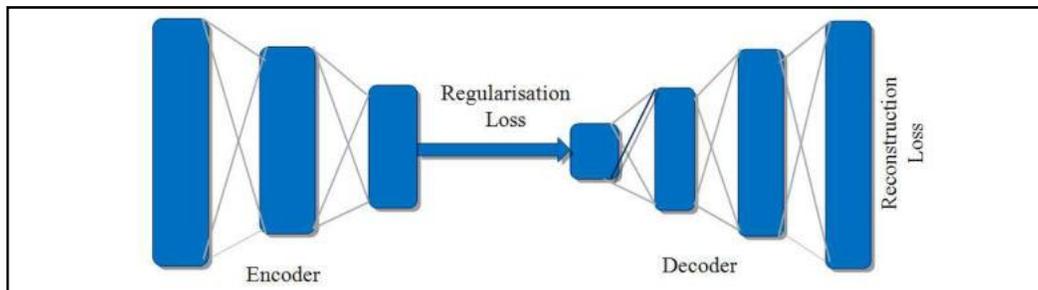

Figure 2. Improved Stacked Auto Encoder

New representations utilizing the improved SAE is constructed by piling them on upper edge of older ones. The high-level properties of the datadata are included in the eventual hidden layer output after

rebuilding. The qualities of an item in the object field determine how conductivity is distributed. To calculate the conductance distribution, the layer of logistic regression is employed. Figure 2 indicates the structure of improved stacked auto encoder.

The DNN receives the normalised data choices as input. The symbol for selected data is denoted by  $S = \{SG(1), SG(2), \dots, SG(A)\}$ , where A stands for the amount of training sets and  $SG(l) \in [0,1]^a$  is the count of normalised data. In a set of randomly selected data sequences, the letter a denotes the presence of an undetermined count of data values. Distribution sample for internal connectivity is  $(S = \{\sigma(1), \sigma(2), \dots, \sigma(a)\})$ , where  $\sigma(l) \in [0,1]^n$  and n indicate the possibility of every class. The bias matrices, vectors, and weight are seeded via unsupervised layer-by-layer training. The DNN is assigned with the responsibility of processing the data with the rate  $S = \{SG(1), SG(2), \dots, SG(A)\}$ .

The whole method is elucidated below: It's crucial to learn the initial hidden layer by utilising the outcomes of the preceding one. Until all hidden levels are revealed, the similar process is repeated. After the process of feature selection using ISAE, classification is done using Deep Neural Network. During the supervised fine-tuning step, the pre-trained model parameters from a DNN's last hidden layer are input into a model of logistic regression to activate the whole DNN. An authentic representative group of the conductivity distribution serves as the inspiration for the network's name. The back-propagation algorithm used in the top-down method of optimising network parameters is based on the principle of gradient improvement. Dropout may be used to improve a model by lowering overfitting and making it more generalizable. Through every training program, 0.5% of the network's hidden units are arbitrarily removed from the network.

Neuronal coadaptation can be made easier, leading to the development of a more robust network. When trained on big datasets, the dropout layer works superbly. Equations (2) and (3) are affected by dropout, as can be observed in a standard auto-encoder.

$$y_i = f(\sum_{j=1}^a w_{ij} \text{Bernoulli}(p) \times x_j + b_i) \text{-----}(2)$$

$$z_i = f(\sum_{j=1}^a w_{ij}^T \text{Bernoulli}(p) \times x_j + b'_i) \text{-----}(3)$$

A randomized vector either of zero or one with a frequency of p equivalent to 0.5 is produced by the Bernoulli() operator.

During the process of training weights are updated in every iteration that improve the features of the encoder output. The proposed framework is trained for limiting both the reconstruction and regularisation loss that is given in equation 4.

$$\min_{\theta, \emptyset} \beta F_{rec} = \min \frac{1}{2} \sum_{i=1}^n \|x_i - g_{\emptyset}(f_{\theta}(x_i))\|^2 \text{-----}(4)$$

where the encoder and decoder parameters are indicated by  $\theta$  and  $\emptyset$ , respectively. The hyper parameter  $\beta$  stabilises significance of losses to the reconstruction of data. Equation (4) established

the term Frec, which is then minimised to maximise the resemblance among the input and output data and enhance the latent space description.

SVM employs kernel trick to identify new features for conversion from low dimensional feature space to higher dimensional feature space. In the application of SVM classifier, the parameters should be tuned to reduce the tuning time and to overcome the over-fitting problem. SVM builds a model using a set of labelled training samples and classifies the new samples on the basis of distance to the hyper plane. Training of the samples is performed by minimizing the error function EF as presented in Equation 1

$$EF = \frac{1}{2}w^T w + c \sum_{i=1}^N \varepsilon_i \text{ -----(5)}$$

with the constraints  $y_i(w^T \phi(x_i) + b) \geq 1 - \varepsilon_i$  and  $\varepsilon_i \geq 0, i = 1,2,3,4, \dots \dots N$

C and b are constants; w is the vector of coefficients and  $\varepsilon_i$  denotes the factor for managing the non-separable input data. Index i is used to label the N training cases. Proper choice of C will avoid over-fitting problems.

The categorization between malignant and non-cancerous samples will become poorer if  $\beta$  is high and the data reconstruction term dominates. However, if this term is set too low, the hidden space's features won't be properly optimised and the reconstructive losses will be minimal. As a result, the latent characteristics will be drastically varied from the input data, which lowering the generalization ability as well as accuracy. Consequently, the hyperparameter  $\beta$  have to be adjusted properly.

### 3. Result and Discussion

This section illustrates the numerical outcomes of the existing and proposed methodology. The existing approaches namely SVM, and CNN are compared with the proposed ISAE. These approaches are investigated using the classification accuracy.

Accuracy: Accuracy refers to how close the determined value from the classified occurrences is to the true value. The representation of quantitative bias and persistent flaws is known as accuracy. It is also the recognition (both TP and TN values) amongst number of the assessed classes, as well as the estimation's similarity to the true value. Variation between the outcome and genuine resulting values occurs when the lowest accuracy occurs. It's the proportion of successful fall detection to the number of information examined. The rate of accuracy is given n Figure 3 and Table 2. It's calculated as follows:

$$\text{Accuracy} = \frac{TP+TN}{TP+TN+FP+FN} \text{ -----(6)}$$

**Table 1. Comparison of Accuracy**

Iteration Count	SVM	CNN	ISAE
50	83	87	93

100	86	89	95
150	88	90	96
200	89	91	97

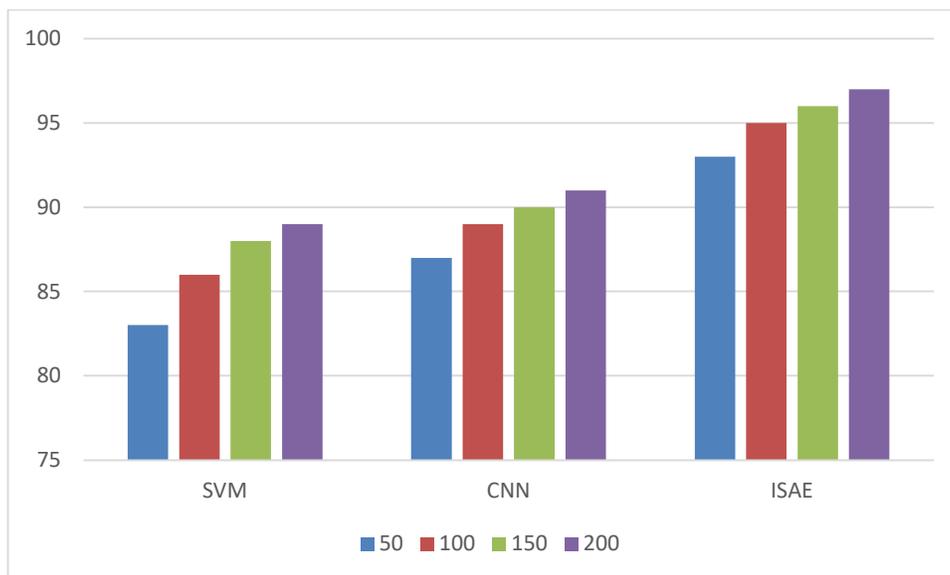

Figure 3. Comparison of Accuracy

#### 4. Conclusions

By examining the relationships in the data and giving the data owners the necessary insights, data mining delivers the necessary support at this point. Also shared with outside parties for additional investigation are the major discoveries that were discovered. Numerous different types of information are processed in this condition, and the integration of big data and machine learning technology has become a crucial factor in the recognition of bipolar illness. It is a complicated hereditary condition that is characterised by manic and depressive periods. 1% of the world's population is impacted by it. It is a serious under-resolved public health issue that places a heavy strain on caretakers. High heritability and familial relative risk show that genetics play a part in the disorder's genesis. In this study, a deep neural network and an enhanced auto encoder are used to manage data. DNN and ISAE are used for feature selection and classification, respectively. The suggested method performs better than current state-of-the-art methods. The proposed approach attains 97% accuracy and outperforms SVM and CNN. In future, the approach can be extended with artificial intelligence based algorithms for attaining effective accuracy.

**Received:** 08 March 2023

**Accepted:** 28 April 2023

**Published:** 01 June 2023

**Abstract:** *An issue of classification may arise when learning classifiers use skewed or imbalanced datasets. In case of an imbalanced dataset, the majority of examples are with one class whereas the other class which is normally considered as the most important class, is however signified by a minor share of instances. By using this type of data, the outcome of machine-learning models would be ineffective. There is a term (High training reliability) used to define preconceptions in between one instance against all other illustrations of the class. In this paper, most important methods used to solve the class imbalance problem i.e. data-level, algorithm-level, hybrid, cost-sensitive learning, deep learning etc. including their advantages and limitations are discussed in detail. Performance and efficiency of classifiers are evaluated using a numerous evaluation metrics such as Accuracy, Precision, Recall, F-Measure.*

**Keywords:** *Cost Sensitive Learning, Evaluation Metrics, Imbalanced Classification, Machine Learning, Predictive Model, Resampling.*

## 1. INTRODUCTION

Imbalanced classification is an important problem in the domain of data mining and machine learning. Since the last few years, researchers are giving more attention towards the imbalanced data and its classification. Traditional classification techniques are used to perform a balanced sample distribution approach across classes due to which, the majority of the classes perform unfavourably. Generally, the overall classification error can be reduced by the use of classifiers but in case of an imbalanced dataset these classifiers would reveal more classification errors with respect to the examples of minority classes (Barua & Murase, n.d.). In the era of big data, the nature of imbalance learning can be better understood by using machine learning and data

mining [1]. It has been observed that finding rare events in Machine learning and data mining groups is a prediction task. As rare events are scant in nature, therefore the prediction task suffers due to the absence of balanced data [2]. The structure of larger datasets (big data) is complex and distinctive. As a result, the disparity of the lower classes is a big problem. Spam detection, software defect prediction and fraud detection are very common examples of unbalanced datasets in the real-world [3].

In an online transaction, electronic fraud detection is a significantly challenging problem due to the imbalancing of classes. Fraudsters have done so many attemptations for closely cloning a legitimate transaction to avoid scrutiny. In this era of big data, differentiation of legitimate and illegal transactions is very difficult due to the overlapping of huge amounts of data. Overlapping problems in machine learning-based fraud transaction detection methods have less attention than the imbalanced classification problems [4]. The philosophy behind it is that the imbalanced data is skewed in favour of the instances of majority class with high training accuracy. The solution to this issue is data creation from the minority class that has the best chance of success [5].

### **1.1 Class Imbalance Problem**

In classification, learning classifiers from skewed or unbalanced datasets leads to a serious problem. In this case, the majority of instances belong to one class. It is due to the other class (minor class) which encompasses the more significant characteristics has a lower number of instances. It is observed from the previous research that traditional classifiers generally categorize all data into the majority class and leave the class with the lowest importance which is unsuited to handle imbalanced learning tasks [6].

When some classes are splendidly belittled, statistical and machine learning techniques are inclined to encounter issues. In spite of being learned, cases of the rare classes are lost amongst the others. As a result, unknown rare cases are misclassified by the resulting classifiers and data could be misrepresented by descriptive models. The learning task becomes significantly more difficult if a small class is hardy to identify due to its other features. Other classes may be significantly overlapped by a small class.

In this paper, various techniques are discussed used to handle the imbalanced data sets used in binary as well as in multi classification problems and also anticipate a relative study of the nearly all accepted methods with their advantages and shortcomings. The remaining portions of the paper are as follows: A few important methods of class-imbalance learning (Literature Review) is discussed in section 2. Existing methods are elucidated in section 3. Essential evaluation metrics are explained in section 4. Finally, the conclusion is given in section 5

## **2. Literature Review**

Contemporary research challenges associated with imbalanced data learning that have roots in application areas of the real-world and also investigate various facets of imbalanced learning, like streaming of mining of data, classification, regression, clustering and big data analytics

has been discussed by the author in this paper. By doing this, an error-free overview of new challenges in the above-mentioned fields can be estimated [7].

An open-source toolbox of python which is known as imbalanced-learn proposes a large variety of solutions to handle the issues related to imbalanced dataset that usually emerges in machine learning and pattern recognition [8]. To balance the imbalance dataset in an artificial manner, sampling techniques like the synthetic minority oversampling technique (SMOTE) have been used so that this training dataset can be used by classifiers to build the model.

To reconcile the restraints of SMOTE's for nonlinear problems, a weighted kernel-based SMOTE (WK-SMOTE) model that oversamples the feature space of the support vector machine (SVM) classifier is implemented [9]. On the basis of chromosomal theory of inheritance, the MAHAKIL synthetic oversampling method is introduced for imbalanced software defect datasets [10].

To address the class-imbalance issue in the identification of breast cancer, on the basis of sample selection an algorithm named RK-SVM algorithm was proposed Noise and borderline issues are brought on by SMOTE's blind oversampling. Hussein et al., 2019 proposed the A-SMOTE or advanced SMOTE which works on the basis of distance between original minority class samples and the newly introduced minority class examples.

There was no sufficient solution by a high-class imbalance, random under sampling using conventional binary classifiers for the fraud detection problem. A plan was developed for early prediction of turnover intention of new college graduates by the establishment of a predictive model using public data and machine learning [11]. Data of minority class data can be remodelled into a realistic data distribution if it is sparse for **Generative Adversarial Network (GAN)** (Sharma et al., 2022). An effectual model using ensemble classification (Logit Boost + Random Forest) was built to predict academic performance of students at lower secondary level [12].

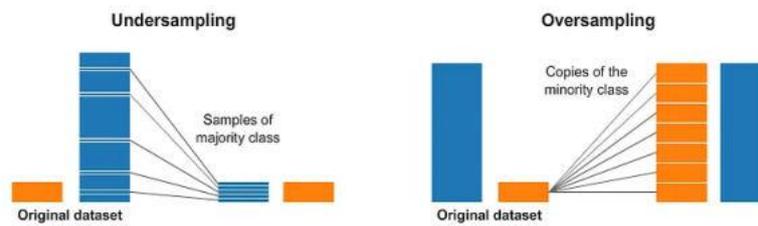

### **3. Approaches to Handle Imbalanced Dataset**

To handle an imbalanced dataset, techniques can be classified into three categories:

- i) Data level Approach
- ii) Algorithm level Approach
- iii) Hybrid (Ensemble) Approach

#### **3.1 Data Level Approach**

This approach/technique is also known as the resampling method. To make the changes in the training set's distribution, this approach is very useful as it keeps the algorithm's overall structure, including the loss function and optimizer, uninterrupted. This approach is also useful to alter the dataset in order to make popular learning algorithms [13]. Instances of minority and majority classes could be balanced using this method. Two most popular methods of data level approach are under sampling and oversampling techniques of resampling methods. Diagrammatic representation of the resampling method is given in the figure 1.

a) Under sampling Technique

b) Oversampling Technique

Fig.1 Resampling Methods

To equalize the count of the majority and minority occurrences, a portion of majority class instances is deleted from the training dataset using under sampling methods. For this, instances of the majority class are removed one by one until the size of the two classes is nearly equal as shown in Fig. 1 (a).

An oversampling method/technique increases the number of instances of minority class until the size of both classes becomes almost equal as shown in Fig. 1(b).

The problem of class imbalance can be reduced up to some extent with the help of some existing approaches like under sampling and oversampling, but each one has its own considerable restraints. Under sampling leads to loss of instances/samples of majority class having meaningful/valuable data while a considerable amount of computational time is entailed by an oversampling method. In a fraud detection model, it is difficult to apply the fusion of these two methods.

Under sampling and Oversampling techniques-based algorithms have their own advantages and disadvantages. So, it is always suggested to use an ensemble/hybrid resampling algorithm which integrates both oversampling and under sampling. It gives you truly accurate results in data processing. There must be a large minimization of imbalancing the samples while diminishing the proportion of majority samples and uprising the number of minority samples,

To make predictions about students at secondary level, an integrated ensemble model comprising features like students' demographic, family, social and academic attributes is developed in this paper. To assess a student at an initial stage, this model is highly beneficial. Out of various models i.e., single, ensemble, and fusion based ensemble classifiers developed in this paper, a model built up with LogitBoost and Random Forest (RF) proves the best model to predict students. [13].

### 3.2 Algorithm-level Approach

To handle the imbalance classification, a new method is used in this study which utilizes a single-class classifier technique to apprehend the properties of the minority class. An innovative hybrid sampling/boosting method i.e. (RUSBoost algorithm) described by (Seiffert et al., 2010) is used in place of SMOTE Boost for learning from skewed training data. To classify noisy label-imbalanced data, a new technique on the basis of bagging of Xgboost

classifiers is proposed by [14]. To combine weighted ensemble classification with a method to handle the issue of class imbalance, Weighted Ensemble with One-Class Classification along with Oversampling and Instance Selection (WECOI) was proposed by [15].

### 3.3 Hybrid (Ensemble Approach)

Combination of resampling and ensemble learning techniques are used by hybrid ensemble methods. For this, a comprehensive review of ensemble learning methods was used for imbalanced classification. In ensemble learning, multiple classifiers are integrated to enhance the performance of the model. Since blending is a complex process which takes more time to train the model. Cost-sensitive learning confirms accurate classification of the minority class by various algorithms and also does not affect its computation time and complexity.

The main aim of cost-sensitive learning is to minimize the total cost by computing misclassification cost. Cost-insensitive learning is different from cost-sensitive learning because the former type of learning handles misclassifications uniquely, i.e., the classification cost to predict a sick patient vs healthy is disparate from the classification cost of predicting a healthy patient vs. sick. Thus, the error rate could be minimized and numerous misclassification errors could be neglected by using cost-insensitive learning. Moreover, it is also assumed by cost-insensitive classifiers that all misclassification costs are equal.

### 4. Evaluation Metrics

Confusion Matrix is an important parameter to check the performance of a model built for the solution of binary classification as given in Table 4. A negative label ( $y_i=0$ ) is used to mark the majority class while a positive label ( $y_i=1$ ) is used to mark the minority class.

Table 4. Confusion Matrix for binary classification

		Actual	
		Positive	Negative
Predicted	Positive	True Positive	False Positive
	Negative	False Negative	True Negative

We used False Positives (FP), False Negatives (FN), Precision (P), Recall (R), Accuracy and F1 Score as base metrics for the purpose of evaluation.

$$\text{Precision} = \text{True Positive} / \text{Total Positives} = \text{TP} / (\text{TP} + \text{FP}) \tag{1}$$

$$\text{Recall} = \text{True Positive} / (\text{True Positive} + \text{False Negative}) = \text{TP} / (\text{TP} + \text{FN}) \tag{2}$$

$$\text{F1 Score} = 2 * \text{Precision} * \text{Recall} / (\text{Precision} + \text{Recall}) \tag{3}$$

$$\text{Accuracy} = (\text{True Positive} + \text{True Negative}) / \text{Total Values} = \text{TP} + \text{TN} / (\text{TP} + \text{FP} + \text{TN} + \text{FN}) \quad (4)$$

Area under the Precision-Recall Curve is a single statistic that encapsulates the precision recall (PR) curve. It is a useful metric for the prediction's success when the classes are imbalanced. Precision Recall (PR) curves are used as a replacement for receiver operating characteristic (ROC) as it presents the veracious image of performance of an imbalanced dataset.

To make a comparative analysis of various studies, area under the curve (AUC) is used. To get the high score in prediction, each of the four confusion matrix categories (true positive, true negative, false positive, false negative) must be predicted accurately and the same is dependent upon the size of positive and negative values in the dataset.

A special metric Matthews correlation coefficient (MCC) is a statistical statistic used to check the performance of the model. If the value of coefficient is +1, model is in perfect state whereas coefficient=-1 shows that the model is not valid or it is completely failed.

A detailed meaning of all metrics for model evaluation is given in Table 2.

Table 2: Evaluation Metrics and their description

<b>Metric</b>	<b>Description</b>
Precision	It determines how good the classifier is in detecting fraudulent cases.
Recall	It evaluates the quality of a qualifier.
Accuracy	It measures the efficiency of the algorithm.
F-Measure	It qualifies the quality of a classifier for the rare classes
AUC	It represents the area that exists under a ROC curve
ROC	It is used for evaluating the trade-offs between true positive and false positive error rates in the case of classification algorithms

## 5. CONCLUSION & FUTURE SCOPE

Most pioneered approaches used to solve the problem of imbalance classification are discussed and evaluated in this paper. Every technique/approach has its own benefits as well as limitations. There are numerous methods such as data level, algorithm-level, hybrid learning, context sensitive learning, deep learning etc. Out of all these methods, data-level methods such as oversampling, under sampling, and hybrids are used on a training set of data. By using under sampling techniques, there is a problem of underfitting as this technique incurs the loss of information whereas there is an issue of model overfitting by using an oversampling approach.

Although hybrid approaches are more effective than resampling, their computation cost is very high and they are also complex in nature. Apart from these, one-class learning and ensemble learning can be used at the classifier level (Bagging and Boosting algorithms).

In the future, advanced techniques such as deep learning and cost-sensitive learning techniques can be used to handle issues of class imbalances in more complex and big datasets. To measure the accuracy and performance of the model, numerous evaluation metrics could be used.

**Abstract:** Properties such as superior specific strength, being imponderous, and the ability to reprocess are the key features that have drawn attention to magnesium. In the last few years, applications such as automotive, aerospace, and medical applications have been seeking light-weight equipment, and light-weight materials are required for making them. These demands were matched by developing metal matrix composites with magnesium as a base and reinforced with carbon nanotubes (CNTs), grapheme nanoplatelets (GNPs), or ceramic nanoparticles. CNTs have been adopted for developing high-strength metal matrix composites (MMCs) because of their delicately superior thermal conductivity, surface-to-volume ratio, and tensile strength, but lower density. In developing high-performance light-weight magnesium-based MMCs, a small number of CNTs result in refined properties. However, making Mg-based MMCs has specific challenges, such as achieving uniform reinforcement distribution, which directly relates to the processing parameters. The composition of CNT, CNT sizes, their uniform distribution, Mg-CNT interfacial bonding, and their in-between alignment are the characteristic deciding factors of Mg-CNT MMCs. The current review article studies the modern methods to develop Mg-CNT MMCs, specifications of the developed MMCs, and their vital applications in various fields. This review focuses on sifting and summarizing the most relevant studies carried out on the methods to develop Mg-CNT metal matrix composites. The article consists of the approach to subdue the tangled situations in highlighting the Mg-CNT composites as imminent fabrication material that is applicable in aerospace, medical, and automotive fields.

## 1. Introduction

In the current scenario, light in weight and high strength are the prime features of the materials used in aerospace, medical, and automotive applications. The property of magnesium that enables it to be used in vital applications is its density of 1.738 g/cm<sup>3</sup>, which is nearly two-thirds of aluminum, making it the lightest structural material. In addition, some other properties, such as the ability to reprocess, its appreciable damping character, treatable machinability, good electromagnetic shielding, and plenteousness, make Mg an adequate selection among all other materials [1–3]. Due to these properties, the abovementioned applications have adopted magnesium as a prime material [4–6]. However, corrosion resistant strength and mechanical strength are the properties in which magnesium is inferior to aluminum. Mg alloys consists hexagonally closed packed crystal structure (HCP) and atomic packing in HCP does not allow slipping to occur easily, due to this Mg

alloys offers restrictions in deformation at normal temperature conditions. The strength of Mg alloys can be further increased by reinforcing them with metallic particulates, ceramic particulates, and carbon fiber reinforcing agents [7–9]. Recently, as Mg-based composites have attracted attention, their mechanical and electric properties are being enhanced to a higher level by incorporating reinforcing agents, such as carbon nanotubes (CNTs) and graphene nanoplatelets (GNPs). This has evolved into a wide research area [10–12]. The exclusive optical, electrical, thermal and mechanical characteristics and the enhanced surface area and aspect ratio make CNTs a superior candidate for vital application areas [13, 14]. Studies have revealed that CNTs contain diamond and graphite characteristics. It has been said that due to their possession of high conductivity with regard to thermal as well as electric behavior, they are as formable as graphite and hard as diamond [15]. Studies have confirmed that the CNT-reinforced composites have significantly improved characteristics due to their high modulus and strength of CNTs. Photovoltaic cells, fuel cells [16], energy depository products [17], physical properties detectors and responding devices, amplification devices, electron escape process guns, energy source inverters [17, 18], medicine distribution systems [19], and biological sensors [20] are the various other fields of applications of CNTs. Conclusively, a new research area in the field of material science has been explored by incorporating nanotechnology in developing metal matrix nanocomposites (MMNCs).

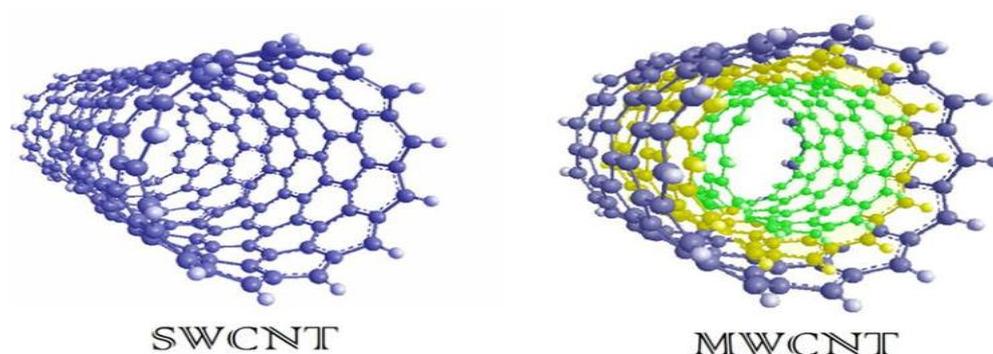

Recently, many studies have been carried out on developing metal matrix composites (MMCs) reinforced with CNTs, especially aluminum and copper particulates [20–22]. In addition, in depth work has already been carried out on CNTs reinforced with polymer matrix nanocomposites (PMNCs), and various advantageous outcomes have already been drawn [23–25]. The application of carbon nanoparticles in the metal matrix is still a hot cake in research due to the challenges in its homogeneous distribution [23,26,27] and inferior wettability. This poor wettability in CNT arises due to its considerable surface tension difference from metals. This difference is responsible for the development of weak interfacial bonding between the metal matrix and the CNT. Studies have shown that in polymer matrix nanocomposites, the constituents interact at the molecular level and highly refine the composite's properties. However, this phenomenon has not yet been studied in the metal matrix composites composed of CNTs. Several investigations have been carried out using various fabrication processes to conquer the issue of uniform distribution of carbon constituents in the metal matrix [28–33].

Hence, the generation of lumps of nano-reinforcement and permeability in the synthesis and fabrication process are the areas that need to be resolved for CNTs to be considered as a prime choice for developing MMCs. The earlier gravity casting method was found unsatisfactory due to the low yield point of the developed nanocomposites. This low yield point is caused by its high permeability. However, these permeability levels can be reduced by techniques such as squeeze casting. The distribution of reinforcing particles and reduction in the formation of lumps are factors of the development techniques that are adopted to develop the metal matrix nanocomposites (MMNCs) [34]. These development techniques can be categorized generally as liquid state and solid-state techniques. Casting under the liquid state category and powder metallurgy under solid state are two techniques that are utilized in developing particle-reinforced magnesium-based composites. Several investigations have been performed to develop magnesium-based composites and to study their characteristic behavior using the powder metallurgy route [14,30–36]. The powder metallurgy process is a chain of various processes, creating the uniform mixture of fine powders of constituents, compacting the uniform constituent's mixture, and finally sintering the compacted shape. The steps mentioned above are executed to enhance the density of the composites by minimizing the porosity level. The properties of the composites, such as poor ability to machine, appreciably low fracture toughness, and inferior tendency to deform easily, can be overcome easily by reducing the size of the reinforcement from the particle to nano level and as a result, the characteristics are refined. These appreciable enhancements in mechanical characteristics are due to grain refinement and

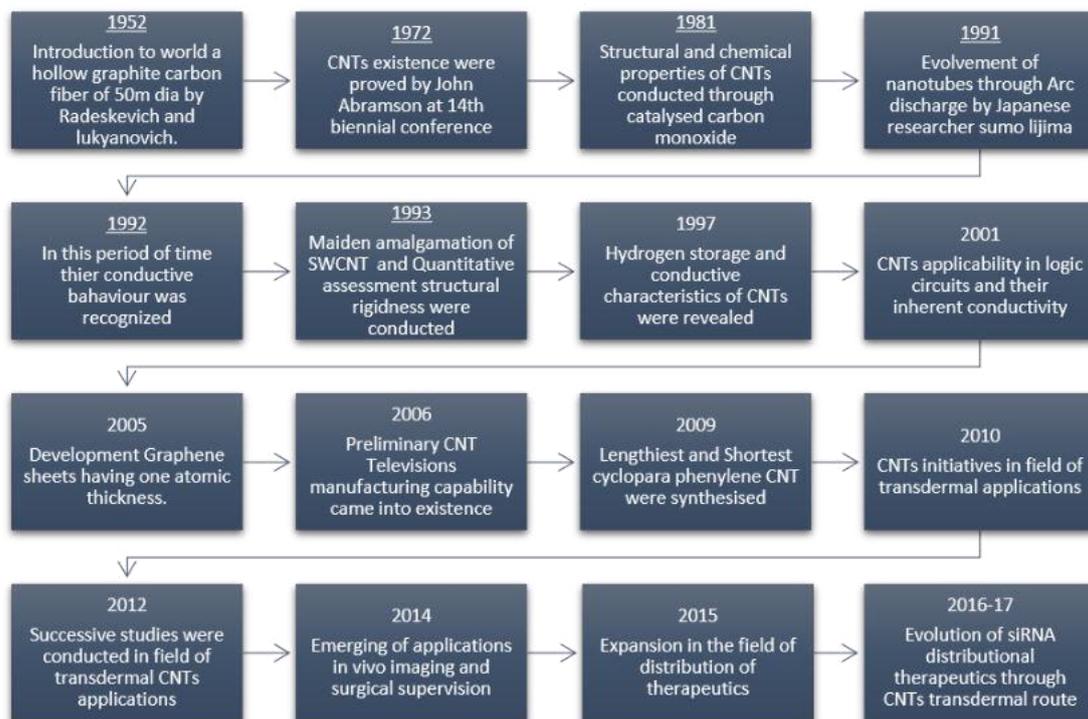

Orowan strengthening. The attention-catching factor of metal matrix nanocomposites (MMNCs) is their creep resistive property even at high temperature conditions, and this property becomes more anticipatory in the magnesium-based MMNCs. Several studies have been carried out on strengthening Mg/CNT composites to refine their mechanical characteristics [33,37,38]. Emerging of various innovative fields of application of nanotechnology in recent time, have contributed to a significantly reasonable decrease in the cost of CNTs [39]. As a result, CNT nano particles are currently available as chief reinforcing agents for developing Mg-based nanocomposites at reasonable prices. The current review article is a summary of the studies that have been conducted about the objectives of refining the mechanical, corrosion, and tribological characteristics. This article also involves the development-related suggestions/findings of authors in their respective research towards the development of Mg/CNT composite materials.

## 2. Carbon Nanotubes (CNTs)

At the beginning of the 1990s, during the study of spherical carbon molecules in electric arc equipment, Japanese scientist Sumino Iijima unintentionally found the existence of coaxial nanotubes of carbon molecules [40]. The mentioned carbon atom layer, graphene, was loped in a cylindrical shape for developing CNTs. These coaxial tubes were called multi-walled carbon nanotubes (MWCNTs) [41]. Later, Iijima and Ichihashi and their teammates, based on the above findings, further investigated and successfully found refined single-walled carbon nanotubes (SWCNTs) [42]. The configurations of carbon atoms in SWCNTs and MWCNTs are depicted in Figure 1. The techniques adopted by Iijima et al. for developing MWCNTs, consisting of diameters up to 100 nm, were further utilized with minor adjustments to develop the SWCNTs. The SWCNTs were designed by transforming the single graphene sheet to a cylinder-shaped tube (0.4 to 2.5 nm diameter) by rolling and they were extensively adopted due to their outstanding electrical, optical, physical and chemical characteristics. The property of SWCNTs that empowers them to carry numerous molecules in  $\pi$ - $\pi$  piling connections is due to their well-defined walls, possessing extremely high surface areas [43]. Rather than being straight, these nanotubes curled and coiled towards inside, having the diameter of about 1 nm [43,44]. CNTs has evolved into the most widely explored nanostructured materials, due to the availability of their extremely unique characteristics, such as high flexibility, enhanced strength, sp<sup>2</sup> hybridized carbons, and the capability to align those atoms in rope-like structures [45–49]. Figure 2 shows the historical evolvement of CNTs, which involves the wide developments that were achieved during its journey. Since 2010, some extraordinary notable applications of CNTs have evolved [20].

**Figure 1.** Structural morphology of CNT [50].

**Figure 2.** Evolution of CNTs at various stages and their major developments in several applications with respect to period of time.

The axial dimensions of CNT are in microns and in radial direction they are in nano size. As a one-dimensional nanomaterial, their surface area ranges from 50 to 1315 m<sup>2</sup>/g. The property that makes CNT a low weight nanomaterial is its lower density of about 1.3 g/cm<sup>3</sup>. The aspect ratio of CNT is much more refined compared to conventional fiber materials, ranging from 100 to 1000. The most stable carbon–carbon covalent bonds can assume the strength of CNT in their carbon loops, which possess heat conductivity of nearly 3000 W/mK. This much high thermal conductivity of CNT is analogous to the thermal conductivity of diamond. CNT holds some unique mechanical, thermal and electrical characteristics, along with a lower density, which plays a role in the development of strengthened MMNC. Studies has been executed to find the rigidity, strength and density of the CNT relative to the values of steel. It has already been stated by some researchers in their respective investigations that the density of CNT is extremely low. In a relative study of CNT with steel, the density was approximately one-sixth of that of steel, the strength was found to be approximately 100 times higher and Young’s modulus was approximately 1 TPa. This Young’s modulus is analogous to diamond and is the maximum value among all the carbon allotropes [51]. These unique characteristics of CNT have evolved due to the carbon–carbon (C-C) bond that they possess with a sp<sup>2</sup> hybridized nature [15,17,18]. By containing higher stiffness as compared to diamond, CNTs also have appreciable formability because of their locked and muffled configurations [52]. As a result, the CNTs can deform their structure to a small angle ring shape when subjected to external stresses and can regain their previous shape after the removal of stresses. Stone–Wales defects are a kind of defect studied in CNTs, which has become advantageous for them with regard to deformation beyond the elastic range. Due to this defect, CNTs have developed the capability to bear 40% of the applied tensile strain without undergoing brittle failure [53]. Electrolysis, chemical vapor deposition, arc evaporation, laser ablation, and flame synthesis are the various CNT development techniques. The techniques that are adopted the most for the production of CNTs are the vacuum depositing method, metal depositing through dispersal of arc and photoablation [54]. The above-mentioned unique characteristics of CNTs make them suitable for use in various fields of applications.

### 3. Carbon Nanotube-Reinforced Mg Composites

In recent times, it has been observed that rigorous and vital investigations have been conducted to decrease the weight of the materials used in various applications without compromising their strength. These investigations are specially carried out for the materials used in automobile and aerospace applications [55]. The density of magnesium has been found to be even lower than aluminum and titanium. The characteristics of magnesium that restrict its use in industrial applications are its inferior ductility and lower strength. These inferior characteristics of Mg are due to its hexagonally closely packed (HCP) crystal structure [54,55]. Because of the mentioned restrictions with magnesium, it is required to improve the characteristics of magnesium to enhance its use in various applications by adding reinforcing agents through different process routes. For increasing the strength and other characteristics of pure magnesium, involvement of nanoscale reinforcing agents, such as GNPs, Al<sub>2</sub>O<sub>3</sub>, SiC, and CNTs, in Mg matrices have been performed [28,56,57]. The low density and attractive strength of CNT make them an attractive selection among other reinforcing agents reinforced in the Mg matrix [5,6]. Highly stiff and strengthened MMCs may develop through the addition of CNTs in Mg matrices. The characteristics such as high ultimate strength (approximately 30 GPa) and great Young's modulus, of developed MMCs enhances by these CNTs addition [11,14,58–60].

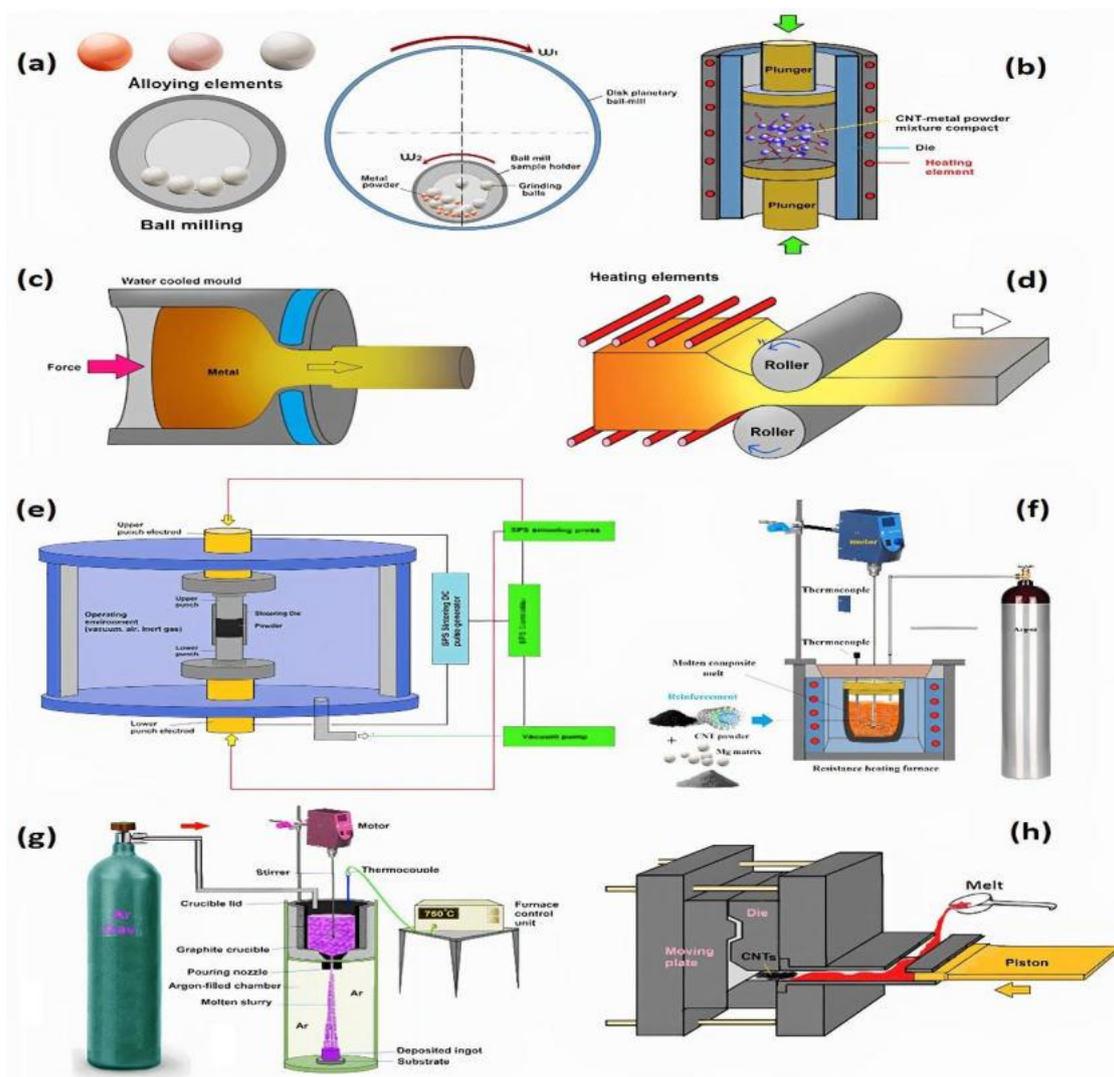

Furthermore, CNTs have also emerged as a reinforcing agent to improve the characteristics of Mg alloys, such as AZ81 [61] and AZ31 [59–62], monolithic Mg [11], and Mg-6AL [63]. However, MMCs developed through reinforcing CNTs do not possess mechanical properties that are as refined as when they are reinforced with nano-platelets (GNPs). This deficiency in the properties of MMCs developed with CNTs is due to the inferior reinforcement bonding with the Mg matrix material. This inferior bonding is due to CNT's inferior wettability in Mg matrix material. Utilization of Mg and its alloys in various fields of applications is poor due to the different inferior characteristics that they possess, such as poor anti-corrosive strength, less formability, and inferior mechanical characteristics. The poor anti-corrosive characteristic of Mg and its alloys is due to their lower standard electrode potential (−2.36 V), resulting in interaction with other elements, enhancing corrosion in Mg [59,60,62,63]. Hence, the frequency of corrosion deposition in monolithic Mg becomes unexpectedly unstable at the ppm level, due to the amalgamation of contaminations of Fe, Cu, or Ni [64]. CNTs have been introduced into the matrix of Mg material to enhance the characteristics of Mg and its alloys. However, the effect of this amalgamation of CNTs on the inferior anti-corrosive characteristic of Mg has not been thoroughly studied [65]. Possibly, attractive changes in the corrosive behavior of Mg material could emerge by reinforcing CNT particles because of its unique electrical characteristics relative to all its allotropes. The corrosive behavioral changes in the Mg alloy AZ31, when subjected to the CNT reinforcing agents, were studied by Fukuda et al. [66].

Furthermore, potential surface investigations, immersion, and polarization examinations of CNT-reinforced AZ31 were performed to obtain accurate results on the corrosion behavior changes [67,68]. The study mentioned the above-concluded remarkable changes in corrosion behavior of MMC due to the galvanic corrosion development in-between the Mg matrix and the CNTs. For further refinement of the characteristics of MMCs reinforced with CNTs, the uniform distribution of CNTs in the Mg matrix is needed. Numerous approaches have been implemented to achieve a more uniform distribution of CNTs.

### 4. Fabrication Routes to Fabricate Mg-CNTs Composites

Magnesium-based MMCs reinforced with CNT material have been developed by incorporating numerous development routes [31,35,36,53,55]. Among all the development routes of Mg/CNT MMC, the most acceptable method is powder metallurgy. Figure 3 depicts various development routes that have been incorporated to develop Mg/CNT MMCs [11,15]. Even in numerous routes, the uniform distribution of CNT particles in the Mg matrix is still a tedious job because of the clustering of CNT particles. This clustering is due to the poor wettability of CNT. The poor wettability of CNT is also responsible

for inferior bonding between CNTs and Mg matrix material. Inferior bonding alters the load transfer between CNTs and the Mg matrix [59,66]. Numerous process routes have been adopted to develop Mg/CNT MMCs to achieve uniform distributions; they can be categorized as follows: liquid distribution routes (ultrasonic curing and mechanical stirring, gemini dispersant), apparent physical reformation (ball milling (BM)), friction stir welding (FSW), applying glazing material (such as Si [69], Ni [70], and MgO [71]) to CNTs to enhance their wettability, doping of CNTs and hybridization of CNTs with other materials (such as hybrid Al-CNT reinforcement [72]). The investigations have concluded that CNTs' distribution in the Mg matrix with the stir casting process route is extremely non-homogeneous because of the lower wettability of CNT particles in a molten matrix of Mg [14,34]. However, outstanding distribution of CNTs has been observed in some development routes, such as ball milling. However, they harm the apparent physical structure of reinforced CNTs, resulting in lower strength of MMCs.

**Figure 3.** Various fabrication methods associated with powder metallurgical route: (a) powder metallurgy-ball milling [15,50], (b) direct current sintering [50], (c) extrusion based on hot working [50], (d) rolling based on hot working [50], (e) pulsed electric current sintering (PECS) [50], (f) stirring based casting (SC) [50], (g) deposition of disintegrated melt (DDM) [11,50], and (h) die casting featured with high pressure [15,50].

#### 4.1. Powder Metallurgy (PM)

Many investigations have been carried out to develop Mg/CNTs through the powder metallurgy route [30,57,71–73]. The general powder metallurgy route involves the following steps: obtaining a mixture of Mg and CNT particles by mechanical alloying or grinding, compression of the developed mixture through sintering. Some other processes for obtaining more refined characteristics are also performed with regard to further sintering, such as hot and cold pressing and spark plasma sintering. The investigations that have been carried out so far to develop the Mg/CNT MMCs majorly abide by specific post-processing of deformation, such as extrusion and rolling. These investigations were focused on obtaining a uniform distribution of CNT in the Mg matrix by developing good bonding between CNT and Mg, irrespective of the process route phases. These phases and their respective characteristic parameters are discussed in the following sections.

##### 4.1.1. Ball Milling (BM)

The process of producing powders of composite materials and blending them to obtain a uniform mixture is known as mechanical alloying [74,75]. For the development of Mg/CNT MMCs, researchers have performed numerous investigations with the adoption of significant modifications in their process routes to encounter the issues discussed in the above section. Zou et al. [74] have investigated the effects on MMC, developed with various compositions of CNT and varying porosities in the Mg matrix. The process route that they adopted for developing MMCs was powder metallurgy, which comprised processes of mixing, compressing, and sintering powder material. First, powdered Mg and CNTs were mixed to obtain a uniform mix; furthermore, this mix was compressed in a true shape die and lastly, the compressed and compacted shape of the powder mixture was sintered in a furnace to obtain the final strengthened product. Li et al. [76] also developed Mg/CNT MMCs with the same powder metallurgy route, but they followed certain specific process restrictions in the process. Thornby J. et al. [77] fabricated Mg-based composite material reinforced with 0, 0.25, 0.5, and 0.75 vol.% of CNTs through the PM route. The prime objective of the study was to analyze the creep-deformational analysis of the fabricated composites with nano-indentation. The matrix material was blended with reinforcing agents through a ball milling machine for 2 h at 200 rpm; the produced blend was compacted, followed by sintering in hybrid microwave at 640 °C for 15 min and left for 1 h for further soaking to 400 °C in a constant temperature-maintained oven. For producing the fabricated material in billet form, it was extruded at 350 °C with the extrusion ratio 20:25:1. For analyzing the creep deformation, a two-step test was adopted by incorporating a shielded environment of Ar gas. In the primary stage, any of the three 0.5, 5, or 50 /s loading rates at any of 298, 373, 473 and 573 K temperature were applied to each of the sample to a maximum loading of 50 MN. In the secondary stage, the duration for which the indentation load was consistently applied was 120 s, and then the deformational behavioral data were documented. Fewer micro-cracks and grain modifications were observed in the microstructural investigation relative to pure Mg, which promoted the improvement in material ductileness. It was observed that the dimensions of indentation at elevated temperature conditions did not deviated by much extent; this is due to the agglomeration of the large number of developed dislocations. The variation in the modulus of elasticity for different compositions was observed to be limited at 373 K, although it was found to be reductive until the vol.% of the CNTs was raised to 0.5 and abruptly increased at 0.75 vol.% of the CNTs. The creep deformation characteristics of the fabricated composites were observed as the only function of the testing temperature and were unaffected by the loading rate of the CNTs. Habibi et al. [72] have developed Mg-based MMC by using Al and CNT nanoparticle hybrid reinforcement. The process route that they adopted was PM and the Al content in the hybrid reinforcement that they used was approximately 1 wt.%. Their process was initiated with the mixing of Mg powder with hybrid reinforcing nanoparticles by adopting ball milling. This uniform mix was then compressed in die to create an initial bond between the discrete powder particles under a pressure of 97 bars.

These compressed and compacted geometries were heated/sintered in an advanced oven, which had a two-way sintering feature. For fusing the powders into one another, the molded shape of the powder was heated to their melting point temperatures, and finally, the sintered material was extruded. Their study found the satisfactory distribution of hybrid reinforcing agents up to 1 wt.% of Al and further increasing the composition of Al showed the agglomeration of the reinforcing agents. Goh et al. [31] also adopted the PM process route for developing Mg/CNT MMC. Their study found an appreciable adherence among the reinforcing agent CNT and the matrix material Mg. However, this adherence between the particles was completely mechanical, and no chemical binding was involved.

#### 4.1.2. Ball Milling (BM) Followed by Direct Current Sintering

Due to time, the powder metallurgy process route has evolved by adopting certain modifications in its processes, for example, the conventional sintering of PM was replaced by hot press sintering (HPS) [71,73]. The study followed the mentioned modification in PM and has shown remarkable improvement in the hardness, bending strength and compressive strength of the developed Mg/CNT MMC. The process of hot press sintering is basically the sintering of powder mix along with compression, which endorses the changes in their microstructure due the development of linkages in CNTs [71,78]. Endu et al. [79] proposed in their study that the anticorrosive nature of MMNC could be boosted by adding certain reinforcing agents in the Mg matrix. In their study, they developed composites by using AZ91 as the matrix material and MWCNTs as the reinforcing agent through the PM route. Their process of development of MMNCs began with grating the AZ91D alloy into a fine powder by processing the AZ91D alloy through a ball miller with argon shielding. Furthermore, this grated powder was mixed with the reinforcing agent MWCNT in the same ball miller. The uniform mixture of the matrix and reinforcing material then underwent hot pressure sintering (HPS). The hot sintered part was further extruded, and certain post processes, such as solution curing and aging, were performed. These post processes are performed for further enhancement of the anticorrosive nature of the MMNCs. Ding, Y. et al. [73] developed MMNCs by grating pure Mg by employing a high energy ball milling (HEBM) setup, which provided argon shielding. During this ball milling, a controlling agent (stearic acid) was added. These milled, pure Mg granulates were further mixed with CNTs of 1 vol.% through the previously used HEBM. This uniform mix of CNTs and Mg further underwent HPS to be sintered. Li, Q. et al. [78] introduced CNTs into Mg matrix material in an enhanced composition of 2 wt.%. The process of development of MMNC included the dry powder mixing of Mg and CNT. The mixtures produced were sintered in a vacuum environment using HPS; a compacting pressure of 50 MPa for 30 min was utilized, along with sintering at 600 °C. For the final touch to the samples, hot isostatic pressing (HIP) was performed at 600 °C for a duration of 60 min. The researchers concluded that the above-mentioned processes result in regular distribution of reinforcing agents in the Mg matrix.

#### 4.1.3. Pulsed Electric Current Sintering (PECS)

Researchers have further modified the PM process that was adopted to develop CNT-reinforced Mg composites, in which sintering was replaced by pulsed electric current sintering (PECS) [57,64,77]. The application of sparks in the PECS sintering process involves pressure, electric field diffusion, and heating. In PECS, the methodology adopted for rapid heating of the powder mix is carried out by passing the AC supply through the die containing the powder mixture of the matrix and reinforcing agent [78–81]. Due to this, the powder contained in the die has a high density and low porosity in the sintered part. The applicability of PECS was assumed by the fact that even in a short period of PECS sintering, the chances of agglomeration of CNT particles in Mg matrix were lowered significantly. Adopting the PECS technique reduces the chances of agglomeration and reduces the need for post-processing material formation [14].

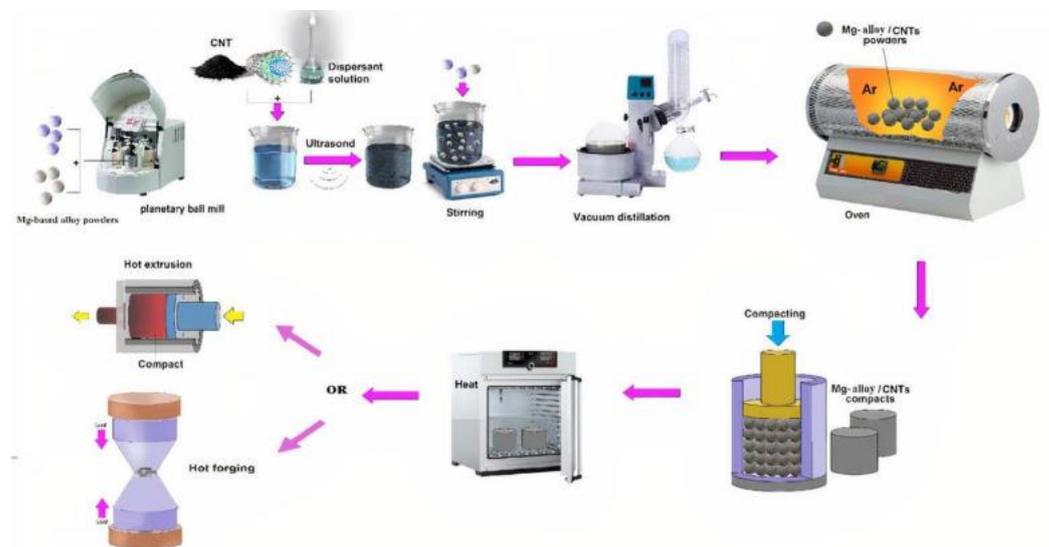

#### 4.2. Semi-Powder Metallurgy (SPM)

The research above has proven that grating the powder of Mg and producing a homogenous mix with CNTs using the ball mill is tedious. The tediousness of the ball milling process is because the process depends on various processing factors; also, the processing through cluster balls produces heat that may result in the fusion of Mg powder. Additionally, the ball milling process also ruptures the geometry and unique structure of the CNTs, which results in less strengthened composite development. To overcome these issues, semi powder metallurgy (SPM) came into existence to develop MMNCs. Here, in the SPM technique, a liquid solvent is utilized rather than planetary clustering in ball milling for developing the mix of the matrix material and reinforcing agent [28,79,80,82]. A study and its associated investigations revealed that an appreciable amount of local pressure of approximately 50 MPa was generated due to ultrasonic cavitation [83,84]. This noticeable amount of local pressure enhanced the mechanical properties of the developed composite by achieving refined distribution of CNTs in the Mg matrix. Abazari S. et al. [85] fabricated Mg-3Zn/CNTs composites through the semi powder metallurgy route. The process was initiated by developing the Mg-3Zn alloy through the ball milling process in a shielding environment of Ar gas. Before introducing the reinforcing CNTs to the matrix material, they were acidic and treated with sulfuric and nitric acids. To observe the effect of CNTs on the properties of the fabricated composites, samples were created with 0, 0.2, 0.4 and 0.8 wt.% of CNTs. The Mg-3Zn alloy was magnetically stirred with ethanol for 1 h at 600 rpm; simultaneously, MWCNTs associated with functional groups were separated in ethanol by ultrasonication for 1 h. A droplet of definite solution of CNTs was introduced to the powder suspension in ethanol at 600 rpm for 3 h. Furthermore, this mix was dehydrated in the vacuumed furnace at 344 K for 24 h. The dry mixture was compacted under a pressure of 650 MPa, sintered at 874 K for 2 h, and at the last extrusion based on hot working was performed. The researchers concluded that semi-powder metallurgy and extrusion were efficient process routes. The microstructures improved due to the presence of functional groups associated with CNTs, which raised the nucleation sites and enhanced the strengths of the load transfer mechanisms found to be responsible.

##### 4.2.1. Gemini Dispersant

The objective of loading the Mg matrix material with CNT reinforcing agents faces hurdles due to the clustering of the CNT particles in the Mg matrix in the process of developing the mix, which results in the degradation of unique features of CNTs, due to the generation of weak bonding between CNT and Mg particles [59,66]. The issue mentioned above can be overcome, and for obtaining the desired uniform distribution, the method of reform in covalent and non-covalent bonding is utilized and the process of doing so is termed as chemical reformation [82,83,86,87]. This chemical reformation method efficiently executes the uniform distribution of CNTs; however, this also alters the CNTs' internal structure by inducing a covalent bonding surface through chemical and physical oxidation [86]. In recent times, researchers have investigated the use of new dispersants named gemini in respective investigations and the results has shown appealing characteristics [84,85,88,89]. The gemini dispersant constitutes two identical amphiphiles. These amphiphiles are integrated with one another through a chemical bond. Aromatic rings, hydrophilic groups, and hydrophilic chains develop these amphiphiles. The even distributions of CNTs are possible with the gemini dispersant due to the phenomena of generation of  $\pi$ - $\pi$  assembling and also as a result of the tendency of gemini to be adsorbed on the CNTs' surfaces [64,80,86–89]. The gemini dispersant's hydrophobic and lipophilic nature also generates uniform distribution [90]. Hou et al. [91] developed Mg/CNT MMNCs by incorporating the gemini dispersant in the mix and the dispersants they utilized were of ionic characteristics. The researchers concluded in their study that, by using the mentioned dispersant, they achieved a more refined distribution of CNTs, even with CNT's untouched unique structure. From the purity of the developed MMNCs, these dispersants can be extracted through annealing. To obtain the desired dispersal of the CNT particles

throughout the matrix of Mg, the investigators dissolved MWCNTs in the die ionized water and ionic gemini dispersant. The authors observed in their study that the reason behind the refined distribution of the CNTs in the Mg matrix was due to the formation of negative charge in the MWCNTs developed by the DSDM route. The generated negative charge raises the intermediate particle repulsion in MWCNTs in DSDM water solution. Even more refined distribution and less agglomeration were observed in enhancing the surface potential of MWCNTs [91]. Furthermore, the powdered forms of Mg and Al were added to the MWCNT mix with a steady rate, along with moderate ethanol and to obtain a perfect mix, stirring was performed for 20 min. Vacuum distillations were performed for drying the stirred Mg-Al-MWCNT mixture. The removal of dispersant from the MWCNT mix was performed through the annealing process in an argon shielding environment. The annealed mix was placed under compression, heat-treatment, and extrusion, resulting in the development of MWCNT's outstanding characteristics [55]. Figure 4 depicts the characteristic defining steps in the development of Mg/CNT composites through the gemini dispersant.

**Figure 4.** Processes included in the gemini dispersant for fabricating Mg-CNT composites [50].

#### 4.2.2. Development of CNT's Surface Functional Groups

The development of the Mg/CNT composites is vulnerable to the agglomeration of CNTs and generation of their clusters, which occurs due to CNTs' possession of certain unique characteristics, such as their enhanced L/D ratio, extraordinary Van der Waals force, and immense specific surface area. This clustering of CNTs in the Mg matrix is responsible for the generation of porous composites [92]. For overcoming the disadvantages of CNTs, function groups such as hydroxyls ( $-OH$ ) and carboxyl ( $-COOH$ ) carbonyls ( $>C=O$ ) can be generated on their surfaces. The uniform distributions of CNTs were also achieved by applying sound energy to agitate the CNTs in an anhydrous ethanol solution. The process of doing so is called sonication of CNT particles, which also leads to eradicating the contamination from CNT's surfaces [70], [75]. Rashad et al. [82], in the attempt to develop a hybrid composite, produced a slurry of powders in an Mg-3Al-1Zn composition in ethanol. Furthermore, this slurry was added to 1.5 wt.% CNTs, which were layered with nickel. The additions were executed through mechanical stirring at 1500 rpm for a duration of 2 h. Finally, vacuum filtration was performed, and the composite powder was compressed in an SS die. Fatih Aydin et al. [93] developed MWCNT-reinforced Mg composites through a process route that started with preparing the material powder through SPM, extraction and sonication using ultrasonic waves in ethanol; for distribution of CNTs, mechanical stirring was used and lastly, extrusion through dies was performed.

#### 4.3. Extrusion Based on Hot Working

The deformation of material through cold working processes results in work-hardening of the materials. The Mg/CNT composites are deformed through hot extrusion to overcome this issue. However, the hot extrusion process is optimal only when the amount of composite material fabricated through the PM route is in a large quantity. During the development of Mg/CNT composites, the generation of carbides has been observed at the interface of the Mg matrix and CNTs when the working temperature rises above 500 °C; this leads to lower composite strength [94]. The hot extrusion step in the process route may overcome the issue mentioned above. Shimizu et al. [95] developed AZ91D alloy-based composites using MWCNT as a reinforcing agent in different wt.% compositions, ranging from 0.5 to 5 wt.%. The process route that they adopted involved ball milling, vacuum-operated HPS, and hot extrusion. In their observations, they stated that until the 1 wt.% was reached, they observed proper CNT distribution. Once it raised above 5 wt.%, they observed clusters of CNTs in the mix. In addition, they summarized that the strength of the fabricated composite was enhanced due to the lying of the shorter and in line CNTs on the outermost surface of the Mg particles, which offered restricted deformation; hence, the strength of the composite was raised. Harun Mindivana et al. [96] fabricated Mg-6Al/CNT composites and their observation was based on variations in the composition of CNTs, which were 0.5, 1, 2, and 4 wt.%. The fabrication process consisted of ball milling, cold compacting, and hot extrusion. The generated composites after hot extrusion underwent microstructural study. It was concluded that the CNTs were uniformly distributed over the Mg chips and added that this distribution of CNTs suffers from the increments in CNTs' wt.%. In their study, Han et al. [59] summarized that the CNTs in Mg matrix material enhance the development of twinning and also deteriorate the basal consistency in Mg-based nanocomposites processed through hot extrusion.

#### 4.4. Metal Fusion and Solidifying Technique

Plenteous attempts have been carried out to develop CNT-reinforced metal matrix composites through the melting and solidification technique. The melting and solidification route incorporates high-temperature conditions, which may affect the characteristics of CNTs and involve chemical reactions at CNT-matrix interfaces. It has been advised to include this process route in low-temperature working conditions. Furthermore, the uniform distribution of CNTs in the metal matrix through mechanical stirring is a tedious job; due to surface tension, CNTs are generally agglomerated with each other and develop in bunches. Mg's low melting point temperature enables the incorporation of the melting and solidification route for reinforcing the Mg matrix with CNTs [14,88,93].

##### 4.4.1. Stir Casting (SC)

The fabrication of Mg/CNT composites can also be performed through the stir casting route. However, the process of stir casting possesses certain restrictions, such as the clustering of CNT particles and oxidation of molten Mg. In addition to the issues mentioned above, the mechanical stirring in stir casting damages the unique crystallographic characteristics of CNTs, resulting in inferior mechanical characteristics of the Mg/CNT composites. The issue of clustering of CNTs in the stir casting route may be overcome by modulation and controlling the various parameters of the stir casting technique [97]. The oxidation of molten Mg can be prevented by maintaining the vacuum in the stirring container [91,94,98]. In recent times, numerous investigations have been carried out, intending to optimize the process parameters of the stir casting technique for obtaining the uniform distribution of CNT particles by overcoming the above-mentioned issues. Gupta M. et al. [99] experimented with fabricating the Mg matrix composite reinforced with different reinforcements, such as ceramic nanoparticles, metallic and CNTs. The objective of the experiment was to study the variance in mechanical characteristics of the fabricated composites [93–96,100]. The microstructural porosity in the Mg/CNT composites fabricated through the stir casting route was comparatively lower; this has been concluded by the study conducted by Tun, K.S. et al. [101]. Kumar et al. [102] fabricated AZ91D-based composite material by insertion

of MWCNTs. The process route that they adopted was stir casting. In the outcome of the study, they concluded that uniform distributions of CNTs in the AZ91D matrix were observed with well-fabricated microstructures. Selvamani et al. [103] employed the semi-automatic stir casting route in their AZ91D/MWCNT fabrication process. The amount of MWCNT reinforcement that they dispersed in the Mg alloy matrix was from 2 to 4 wt.%. As a result of the study, they found that CNT particles were dispersed in the eutectic matrix and the developed composite consisted of a dendritic structure of lower porous nature in comparison to the pure Mg alloy [103]. Abbas et al. [36] conducted an experiment to decrease the porous nature of the fabricated composites through the stir casting route by increasing the amount of CNTs dispensed in the Mg matrix. Different wt.% of MWCNTs were added in the AZ31 matrix in their composite fabrication process. This increment in mass density effectively enhanced the mobilization and compaction of metal atoms. The continuous stirring caused grains to be refined and shearing of the particles in the molten mix. Consequently, the porous nature of the composites was reduced. Additionally, they summarized the factors that influence the porous nature of the composites, which were reinforcement distribution, appreciable wettability, and effective linkages. Hong Yuan et al. [104] adopted a unique and innovative technique for developing ZM1 alloy-based CNT-reinforced MMCs. A ZM1 matrix material was prepared separately, with 3.50, 5.50, 0.50–1.00, 0.10 and 0.01 wt.% of Zn, Zr, Cu, Ni, Mg and impurities, respectively. Instead of feeding the reinforcing material in the matrix, primarily, they were pre-dispersed in Zn powder through liquid mixing and mechanical alloying. In liquid mixing, 1000 mL of ethanol was added with 10.0 g CNTs and ultrasonication was performed. Later, simultaneous sonication along with stirring were carried out after adding 3.0 g of powdered Zn to develop CNT-Zn heterogeneous solution. In the secondary stage of mechanical alloying, for obtaining the CNT-Zn mix, 10.0 g of CNTs, 3.0 g of Zn and 1.0 g of stearic acids were blended and then ball milled at 100 rpm for 4 h. For obtaining the solid pieces of CNT-Zn, the mixes obtained in both stages were further compressed through a hydraulic pressing machine. Finally, these solid CNT-Zn pieces were fed in (1.0 wt.%) as reinforcing agents in separately prepared 3.0 kg ZM1 Mg alloys through mechanical stirring. Sample testing revealed appreciable modifications in the dispersion of the reinforcing material, leading to enhanced mechanical characteristics, in addition to the fact that the fracture modes were also transformed from brittle to ductile.

#### 4.4.2. Deposition of Disintegrated Melt (DDM)

The DDM route of fabrication of composites has been adopted generally for those fabricated with reinforcing nano-sized particles. The method involves the heating of Mg above the superheated temperature of 750 °C, which contains the provision of argon shielding. A mechanical stirrer is provided to disperse the reinforcing agents uniformly throughout. The heating pot has a bottom nozzle for pouring out the molten material, which also has the provision of disintegration with argon jets. Lastly, the poured-out material is extruded. Chan et al. [11] employed an innovative electromagnetic concept to stir the Mg/CNT molten mix. The molten pot used in the fabrication had inducting coils at the outer surface; these coils induced the magnetic field that enabled the molten mix to be stirred. Furthermore, the molten mix was heated to 700 °C in an environmentally shielded manner. Lastly, the composite slurry was poured into the die for developing the composites. Paramsothy et al. [105] conducted their experiment of developing a composite through the dispersion of CNT particles into the ZK60A matrix. The process of development was carried out through deposition of the disintegrated melt route, trailed by hot extrusion. The vibrant accumulation of composite slurry on the substrate through hot extrusion, material shielding through argon gas, and least gravity-associated segregation, due to proper selection of the stirring factors, resulted in the uniform distribution of the CNT particles.

#### 4.5. Friction Stir Processing (FSP)

FSP is a solid phase processing approach that generates an adequate grained microstructure. Analogous to friction stir welding (FSW), a rotating tool, is adopted in the process to rotate at the substrate surface. This generates the required deformation resulting from the fine and uniaxial grains on the friction plastic deformation surface. This process of development of fine and uniaxial grains is termed as dynamic recrystallization. FSP is a productive technique that is generally employed to fabricate the composites. However, it has been employed for dynamic recrystallization of the substrate surface. The outcome found by researchers in the process of Mg/CNT composite fabrication through FSP involves the welding zones of CNT and matrix material [32,101,106]. Sharma et al. [107] fabricated composites by introducing nano-sized MWCNTs and graphene as the reinforcing material to the rolled matrix material plates of AZ31B through FSP. The process constraints were as follows: axial load of 5.4 kN, transitional velocity of tool of 40 mm/min, and 2° tool inclination. The composites were fabricated with 1000, 1200 and 1400 rpm rotational tool speeds. The characteristic investigations of the developed samples revealed that tensile and compressive strength of the fabricated composites increased by enhancing the reinforcing material distribution, which was achieved through enhancing the rotational tool speed. In addition, they observed a drop in the tensile strength in the case of the hybrid composite. They concluded that the mechanical characteristics of the fabricated composites were satisfactory at a toll rotational speed of 1400 rpm. Jamshidijam, M. [108] fabricated AZ31-based composite material reinforced with MWCNTs through FSP. The FSP process involved adequately grained rigid interfacial bonding between the matrix alloy AZ31 and reinforcing agents MWCNTs, resulting in hardened surface composites. Morisada et al. [33] employed the process of FSP to develop Mg/CNT composites. The method of composite development was initiated by creating an indent in a solid piece of the matrix material Mg alloy and that indent was filled by the reinforcing agent CNTs. Then, a revolving tool was projected in the groove for distribution and bonding of the CNTs with the Mg material. The revolving tools were employed to rotate at 1500 rpm, providing the desired frictional force to produce intermetallic bonding. They concluded from their findings that the size of grains was reduced by the process; however, the grains were refined and proper distribution of the CNTs was observed in the Mg matrix. Additionally, it was concluded that the distribution of CNTs was found to be more uniform with a lower rotational speed of the tool, but that resulted in increased process duration. Huang et al. [109] employed the stir casting route followed by FSP for fabrication of Mg-6Zn-based composites reinforced with CNTs. The researchers found in their investigations that the mechanical characteristics of the fabricated composites were enhanced due to the development of appreciable intermetallic bonding and refined grains.

#### 4.6. Spread Dispersion (SD)/Rolling Process

Spread dispersion/rolling process is an innovative route to fabricate Mg matrix composites by developing a layered micro-nano configuration. Xiang et al. [75] employed the SD/rolling process route to fabricate Mg/CNT-laminated composites. For obtaining the layered micro-nano configuration, they were the first to employ the method of electrophoretic deposition (EPD) for combining the CNTs with 50 µm Mg foils. The tests were oriented towards characteristic identification and revealed no clustering of the CNTs or proper dispersion of the CNT particles. They added that the characteristics of the layered configured composites can be customized by adopting variable thicknesses of Mg foils. Furthermore, the deposition time is the most important factor in deciding the thickness of the CNT layer. The process of fabrication ended with hot rolling of the stacked Mg foils, which resulted in the reduction in the total thickness by up to 60%. The researchers also investigated dislocation/slip vector movement in the fabricated composites; their observations and findings reported the presence of blockages in dislocation movement in the fabricated composite. The presence of these dislocation blockages resulted in a highly strengthened composite compared to the composites fabricated through conventional routes. Figure 5.

illustrates the process route of fabrication of Mg/CNTs through the layered micro-nano configuration [75].

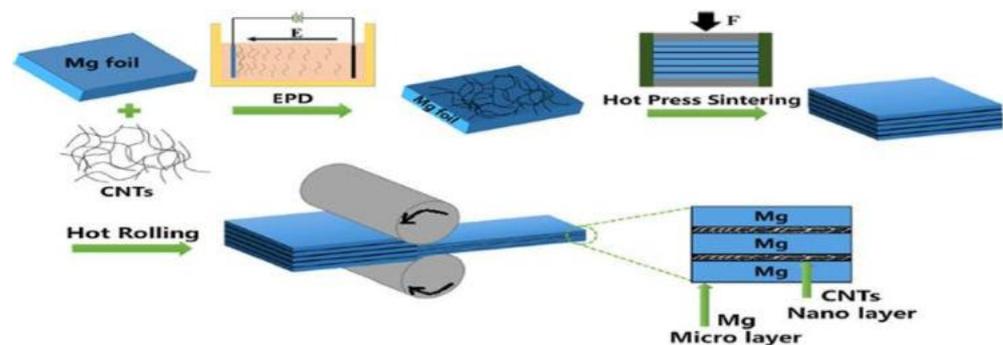

Figure 5. Fabrication of layered micro-nano configuration of CNT-reinforced composites [75].

## 5. Mechanisms Responsible for Strengthening of Nano-Composites

The fabrication of metal matrix nanocomposites (MMNCs) through any of the routes mentioned above is commonly employed to enhance their mechanical characteristics, such as strength and stiffness, relative to the pure matrix material. These composite characteristics are accomplished by effectively transferring the working stress from the matrix material to the reinforcing agents, i.e., CNTs. Interfacial bonding of the CNTs and matrix material, homogenous dispersion of the CNTs in the matrix material, and aspect ratio are the chief deciding factors of the characteristics of a fabricated composite [110]. It has been observed that the observation of a crack at interfacial bonding between the reinforcement and matrix materials affects the composite's toughness, and the ductility of the composite will be the factor of moderation of uttermost stresses near the interface [111]. Additionally, fabricated composites' characteristics are highly altered through the process route employed in fabrication [11]. Four mechanisms have been suggested for understanding and gauging the strengthening effect in the fabricated composites, which are discussed further.

### 5.1. Load Transfer

Nardon and Prewo [112] have stated that the load transfer is the most acceptable mechanism. Following this mechanism, the interfacial bonding created in the fabricated composite enables the matrix material to transfer the applied stresses from the matrix material to the reinforcing agent. This will enhance the composite strength to bear the stresses. Although, for transferring the stresses and strengthening the composite, there should be an appropriate aspect ratio associated with the nano reinforcing materials [107–109,113–115]. Consequently, employing a reinforcing agent of greater hardness will be more effective in stress transfer and may strengthen the composite. The shear model [116] is widely accepted for analyzing the concept of load transfer mechanism. The perception made in the shear lag model is that a 3-D fiber will be considered as a 1-D object during the analysis. The shear model is also employed for analyzing the consequences of the presence of broken fiber in a metal matrix with various complexities [117]. Li P. et al. [118] conducted a study for developing AZ91D-based composites by introducing CNT-Mg<sub>2</sub>Sip as the reinforcing material through the in-situ process route. At the initial stage, the CNTs were oxidized through magnetic stirring in a 1:3 acidic mixture of concentrated H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub>. The CNTs underwent acidic treatment with powdered AZ91D and were mechanically stirred in a C<sub>2</sub>H<sub>5</sub>OH solution for 2 h. The developed precipitated particles were dehydrated in a vacuum furnace at 60 °C for 10 h. These dehydrated particles and powdered Sip underwent ball milling in atmospheric shielding of Ar gas to develop 0.3 vol%CNTs-0.37 vol%Sip/AZ91D composite powders. This powdered CNT-Sip/Mg form was hot compacted at 200 °C in a vacuum environment. The compacted bar of the material was reheated in a capillary furnace at 585 °C for 60 min. Finally, the desired composite was developed by pouring the partial solid into a preheated mold under the pressure of 224 MPa. The same procedure was followed for the fabrication of

0.75 vol%CNTs-0.75 vol%Mg2Sip/AZ91D, 1.5 vol%CNTs/AZ91D, 1.5 vol%Mg2Sip/AZ91D and 3 vol%Mg2Sip/AZ91D. The results concluded that load transfer and thermal incongruity were the prime strengthening mechanisms in the developed composites. The most feasible mechanical characteristics among all the compositions fabricated were found for 0.3CNTs-1.2Mg2Sip/AZ91D.

### 5.2. Orowan Mechanism

Composite material undergoes plastic deformation beyond its yield limit. Plastic deformation of composites is due to crystallographic movement of dislocations; this plastic deformation consists of the Orowan mechanism [119]. The phenomenon of generation of residual dislocation loops near to the dispersed CNT particles in Mg matrix, occurs through the succeeding slip bends and sidestepping of the integrated agent's in compliance with the Orowan mechanism. Thus, the generation of the residual loops consecutively strengthened the work material; hence, the dispersion of reinforcing agents in the metal matrix occurs in the developed composite [34,36,55,70,73,74,103]. Earlier studies have summarized that in order to analyze the Orowan mechanism in a fabricated composite, it is required to have interparticle spaces among the reinforcing agents. Additionally, it was concluded that appreciably strengthened composites were developed when cylindrically shaped reinforcing agents were incorporated instead of spherical ones [120]. For the composites that are fabricated through reinforcing the particles of comparatively smaller and shorter shapes, the Orowan mechanism plays a major role [121].

### 5.3. Thermal Incongruity

The thermal incongruity mechanism emerges when the generation of the enhanced dense dislocation site emerges around the reinforcing agents. This emergence is due to the appreciable variation in the coefficient of thermal expansion (CTE) between the reinforcing agent and matrix material. The presence of variation in CTE between the reinforcing agent and matrix causes the composite to undergo thermal changes, resulting in the generation of thermal and internal stresses. Due to the developed thermal variation, the dislocations are generated around the reinforcing agents to lower the stored energy. The dislocation density present in a composite is related to the thermal strain present in composites. These developed dislocations are the measuring parameters for the level of strengthening produced in the fabricated composites. Strengthening of the composite is enhanced with the enhancement in the density of dislocations [115,116,122]. Multiple strengthening mechanisms [60] due to the dispersion of CNTs in the metal matrix may be characterized according to the following equation:

$$\sigma_c = \sigma_{mt} + \Delta\sigma_L + \Delta\sigma_T + \Delta\sigma_{Orowan} \quad (1)$$

In the above equation,  $\sigma_{cm}$  and  $\sigma_{mt}$  are the composite strength and matrix strengths, respectively,  $\Delta\sigma_L$ ,  $\Delta\sigma_T$ ,  $\Delta\sigma_{Orowan}$  are the quantum enhancement in strength due to the mechanisms related to the transfer of the load, thermal incongruity, and Orowan.

### 5.4. Grain-Boundary Strengthening

Grain-boundary strengthening is also a member of the group of mechanisms that plays a chief role in strengthening the fabricated metal-based CNT-reinforced composites. Unlike all the other mechanisms mentioned above, the grain-boundary strengthening mechanism deals with the compressive strength of the composite. The mechanism is initiated through the refining of grains and results in enriched compressive strength of the composite. It has been experimentally observed that the grain-boundary strengthening befall during the composite development process routes involves refining the grain sizes [53,66,69,103,117]. It has also been observed that different process routes adopted to fabricate the CNT-reinforced composites result in dissimilar grain-boundary strengthening coefficients [123–125]. During the fabrication process of the composites, the reinforcing mechanism based on particle size is expected to occur by simple reinforcing principles based on stress transmission,

such as “rule of mixture”. Compared to conventional reinforcing agents, such as SiC, the high aspect ratio property of CNTs enables the fabrication of the composite, which may contain minor voids to lock the dislocation movement, even with lower wt.% of the CNTs. The deformations through these composites are only possible if either the dislocation bypasses the hindrance created by the Orowan mechanism or with the shearing of CNTs. The characteristic feature of CNTs such as the smaller diameter and stress concentration at the head, contribute to the dislocation growth which results in the yielding.

Furthermore, a significant rise in resistance to creeping in the fabricated composite may be realized, as a result of the difficulty regarding the dislocation climb [126]. “Crack divergence”, “CNT’s linking” and “CNT’s bug-out” are the general Mg/CNT composite strengthening mechanisms. At the moment of failure in CNT-reinforced Mg-based composites, many CNTs pull out from the matrix. The pulling out of the CNTs lowers the crack propagation speed by overcoming the stresses at the crack tip. In addition, CNTs pulling out results in generated interfaces that require external work that must be carried out. Thus, crack propagation consumes surplus energy. When these bridged CNT composites are subjected to external stresses, the stresses generated on the crack surface are compressive. These compressive stresses develop near the crack surface, restricting further crack enhancement; consequently, the toughness of the composite rises. Xiang et al. [75] employed a layered micro-nano configuration to fabricate Mg/CNT composites. The study aimed to investigate the fractured format in fabricated Mg/CNT composites. Compared to pure Mg, in which a localized strain was observed, the fractured surface of the Mg/CNT composites was found to be smooth. The Mg/CNTs underwent advanced strain hardening and showed a substantial modification in even cleavage to a rough, jagged fractured surface. This progressive rate of strain hardening results in even more uniform deformation. CNT’s layers restrict the crack propagation; consequently, the CNT layers refine the toughness of the composite.

## 6. Mechanical Properties of Developed Composites Depending on the Production Process

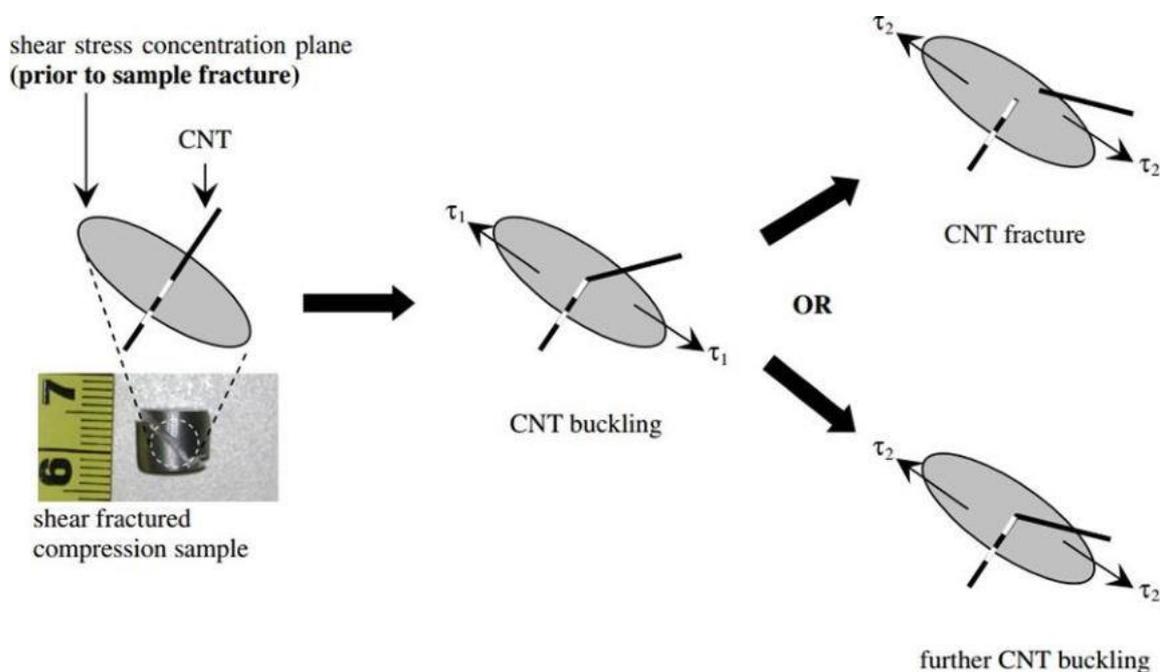

Various studies have been carried out to investigate the mechanical properties concerned with fabricated Mg/CNT composites. The investigated mechanical properties obtained in Mg/CNT composites fabricated through different process routes are summarized in Table 1. Ding et al. [73] conducted an experiment to evaluate the mechanical characteristics related to Mg-based, CNT-reinforced composites fabricated through the powder metallurgy route. The fabrication process illustrated that the refinement of Mg powder could be achieved by ball milling before the dispersion of CNTs, which enabled CNTs to be uniformly dispersed in the matrix material. Furthermore, the sintering of Mg/CNTs was executed. The grain sizes of the sintered composite observed through optical microscopy were found to be approximately 2–25  $\mu\text{m}$ . No considerable refinement in the grain size was observed in the sintered samples after ball milling (2–18  $\mu\text{m}$ ). The fabricated composite was further tested for the evaluation of mechanical properties. The results of these tests were concluded as follows: malleability of 11% was observed, compression strengths were found 504 MPa, and yield strengths were 454 MPa, respectively. Li et al. [35] developed Mg-MWCNT composites by employing a process route that consisted of two basic steps. The first step was executed for the pre-distribution of MWCNTs on matrix material Mg chips through a distributing block polymer. In a further step, the Mg chips containing the MWCNTs finely distributed on their surface were converted into molten form. This heating process of Mg chips was followed by stirring. Furthermore, this molten Mg alloy/MWCNT composite mix was solidified after it was poured into the mold. The sample analysis ensured that the addition of only 0.1 wt.% MWCNTs resulted in the outstanding rise of 36% in CYS and UCS. The investigators further concluded that the Mg matrix material’s deformability was enhanced due to thermal incongruity, load transfer, and Orowan strengthening mechanisms. In addition, they added that the CNT’s distribution in the base Mg matrix material effectively offered obstacles in crack propagation. Yuan et al. [71] initiated their study to evaluate the mechanical characteristics of the AZ91/CNT composites coated with

MgO. Their experimental outcomes highlighted the enriched mechanical characteristics. The researchers concluded that the causes of enrichment were the Orowan mechanism, thermal mismatch, grain size modifications, and stress transfer mechanism. Zeng et al. [127] employed a manual stirring process route of distribution of MWCNTs in the AZ31 matrix. The MWCNTs that they utilized as reinforcing agents had 30 nm diameters and lengths of 1–10  $\mu\text{m}$ . As an outcome of the experiment, they found extraordinary improvement in hardness, tensile strength, and Young's modulus when the AZ31 matrices were loaded with 1 wt.% MWCNTs. They concluded that when the loading of MWCNTs rises from 1 wt.%, this resulted in the alteration of the tensile characteristics due to the development of clusters of MWCNTs in the AZ31 matrix. Hou et al. [55] developed MWCNT-reinforced Mg-9Al-based composites. Their experiment revealed the alterations in length from micron to nano size of the  $\text{Mg}_{17}\text{Al}_{12}$  phase. During the study of Mg-9Al/MWCNT composites, it was found that the addition of 0.4 wt.% of MWCNTs resulted in a UTS value of 355 MPa and elongation of 15%, which represents 18% and 150% enhancement, respectively, compared to pure Mg. Proper dispersal of the nano-sized  $\text{Mg}_{17}\text{Al}_{12}$  phase and appreciable inter-metallic bonding between the matrix and reinforcement were the responsible phenomena for the enhancement in the characteristics, according to the researchers. Goh et al. [31] employed the powder metallurgy route to develop Mg/MWCNT composites. For the MWCNTs, they adopted a diameter of 20 nm, and these reinforcing agents were added in different compositions from 0.06 to 0.3 wt.%. The fabrication proceeded by blending the MWCNTs and Mg powder, followed by sintering and hot extrusion. Regarding the study outcomes, they concluded that the addition of maximum wt.% in the adopted range, i.e., 0.3 wt.%, generated clusters in the matrix material.

Furthermore, they added that by increasing the wt.% of the CNTs, the yield strength and deformability of the composites rises. However, negligible impact was found on the composite's UTS value by enhancing the wt.% of the CNTs. Shimizu et al. [95] carried out their study by fabricating AZ91D-based MWCNT-reinforced composites through the PM route. The route included ball mill, HPS, and extrusion processes. Their study was focused on refining the distribution of reinforcing MWCNT particles. They reported that the maximum yield strength (YS) and ultimate tensile strength (UTS) were observed with reinforcing 1 wt.% of the MWCNTs. They found proper distribution of the CNTs over the Mg matrix particles. Consequently, these generated restrictions in the deformations, and thus strengthened the composite material. Liu et al. [128] experimented with developing Mg-based composites reinforced with MWCNTs with a loading of 1.5 wt.%. The MWCNTs that they employed were 20–40 nm in diameter and 1–5  $\mu\text{m}$  in length. The process route that they followed was mechanical stirring, with the incorporation of the high-intensity ultrasonic process. They reported that yield strength (YS), ultimate tensile strength (UTS) and elongation of the Mg matrix material were enriched by the dispersion of 1.5 wt.% MWCNTs as a reinforcing agent.

Sun, F. et al. [129] employed the CVD method to develop MWCNT-reinforced Mg-based composites. The CVD technique was performed at 480 °C by incorporating a Co/Mg catalyst and acetylene gas. The process was initiated with argon-shielded ball milling of the matrix material dispersed with MWCNTs in the range of 1.8, 2.4, and 3 wt.%, for 400 rpm for 2 h. The ball milled mixture was further sintered at 580 °C for 2 h and lastly extruded in a heated form. During observations, it was reported that the tensile strength of the matrix Mg was enhanced to 285 MPa with increments in the reinforcing agent up to 2.4 wt.%. This increment in tensile strength was about 45% of the pure Mg Matrix, which was 220 MPa. Increasing the composition of MWCNTs further up to 3 wt.% resulted in the clustering of the reinforcements. The matrix material Mg possesses HCP crystal geometry, which was the hindrance that Mg provided in tensile deformation. With the dispersion of MWCNTs and further extrusion, the prismatic and cross-slip dislocations vectors activated in the Mg matrix enhanced the composite's deformability. Goh C.S. et al. [88,93] developed Mg/MWCNT composites by employing deposition of disintegrated melt and extrusion, incorporating variable wt.% reinforcing MWCNTs. In the study mentioned above, they

concluded that with MWCNT incorporation of 0.3 and 1.3 wt.%, the tensile elongation, UTS and YS of the matrix material improved. Upon further increment of the reinforcement to 1.6 and 2 wt.%, the clustering of the MWCNTs was observed in the Mg matrix, and consequently reduced the tensile strength, deformability, and YS. It has also been reported that the fabrication of Mg/MWCNTs with MWCNTs consisting of length less than 100  $\mu\text{m}$ , diameter of 20 nm and inferior loading lower than 1.3 wt.%, this resulted in the enhanced tensile deformability of the composites. The instigation of prismatic slipping and advancement in basal slipping resulted in this enhancement in deformability [97]. Figure 6 illustrates the CNTs that sheared and buckled under compressive loading. The shearing and buckling of the CNTs generated is due to the inhomogeneity of the tensile yield strength (TYS) or compressive yield strength CYS [105]. The buckling of CNTs occurs when these dispersed CNTs within the matrix material undergo fracture after experiencing compressive deformation.

**Figure 6.** Compressive shearing and buckling of CNTs in ZK60A-based nano-composite ( $\tau_2$ ,  $\tau_1$  are in-plane stresses of shear nature, where  $\tau_2 > \tau_1$ ) [105].

Paramsothy, M. et al. [105] fabricated ZK60A matrix-based composites reinforced with CNTs of 40–70 nm outer diameter and an aspect ratio of about 100. They stated through their study that the dispersion of 1 vol.% of CNTs in the ZK60A matrix resulted in an improvement in UCS by about 5% and decrement in CYS of about 14%, compared to unreinforced ZK60A. With the same dispersion value of CNTs, the compressive strength (CS) of the developed composites was found to be inferior at any given strain value, compared with unreinforced ZK60A. Figure 6 illustrates the causes of this decrement in CS, which could be because of the adverse effects of (i) inferior intermetallic phase dilution in the fabricated composite or (ii) the phenomena of the generation of buckling in reinforced CNTs in the ZK60A matrix. The researchers have further stated that fabrication of the ZK60A/CNT composites was performed by employing CNTs with an aspect ratio of about 100. When the fabricated composites were subjected to compressive deformation, buckling of the CNTs was reported and consequently, they fractured within the matrix material [123,124,130,131]. The above-mentioned buckling in CNTs can also be carried out even more smoothly by enhancing the width to height ratio of the CNTs being used, which as a result lowers the limits of the characteristics concerning to reinforcement [100,125].

**Table 1.** Summarized investigated mechanical properties obtained in Mg/CNT composites fabricated through different process routes.

Li et al. [68] employed CNTs with diameters of 40–60 nm and lengths of 2 µm to fabricate Mg/CNT composites. It was observed through the testing that the CNTs' distributions were dependent on the degree of solidification. Through the observations, they stated that with an inferior degree of solidification, CNTs were found to be projected out of the solidification front and clustered besides the grain boundaries. Furthermore, at a higher degree of solidification, appreciable CNT-matrix interface bonding was observed, resulted in improved UTS and YS of the fabricated composite. Park et al. [32] fabricated composites using AZ91 matrix material reinforced through Si-coated MWCNTs with diameters of 5–10 nm and lengths of 0.5–10 µm.

The microstructural study depicted the formation of a uniform structure and consequently, the mechanical characteristics of the fabricated AZ91-based composite reinforced with MWCNTs were improved. Nai et al. [110] employed Ni coating on reinforced CNTs with the diametric specification of 10–20 nm for fabricating composites in Mg matrices. The generation of Mg<sub>2</sub>Ni intermetallic phases in the fabricated composite was observed as the consequence of employing Ni coating on CNTs, which resulted in the improved distribution of CNTs (Ni coated) and strengthening of the linkages was observed between the CNTs and matrix. Conclusively, they stated that the mechanical characteristics, such as micro-hardness, universal tensile strength, and yield strength, of the fabricated composite were improved by 41%, 39%, and 64%, respectively, compared to the unreinforced Mg material. Corrosion resistivity in composite material is also a major issue, which has attracted the focus of various researchers to investigate that area of study. The studies discussed above did not focus on the resistance offered by the fabricated composites to corrosion. In a further section of this article, the consequences of the dispersion of CNTs on the corrosion behavior of Mg matrix material are discussed.

## 7. Corrosion Properties

Magnesium is a prime material used in automotive, aerospace, and medical lightweight applications. Nevertheless, the low corrosion resistivity of magnesium material provides hurdles regarding its adaptability in various other applications, and this also degrades the

life cycle of the servicing period. Several studies have been conducted so far regarding the enhancement of the mechanical characteristics of developed composites [88,91,93]. However, no such in-depth studies have been conducted yet for observing the corrosion characteristics. The tendency of Mg to become easily corrosive in various environments is due to the development of a substandard magnesium oxide or magnesium hydroxide layer of low ordinary electrode voltage ( $-2.36$  V) [130–132]. The MMCs fabricated by incorporating the particulate reinforcements of ceramics or carbon fibers are found to have low anti-corrosive properties, when subjected to environments containing chloride ions. These chloride ions affect the matrix and the reinforcing material interfaces, leading to fissure and pitting corrosion [133]. It has been also observed that the rate of corrosion on Mg-based MMCs was found to be enhanced due to the presence of Cu [134],  $\text{Al}_2\text{O}_3$  [135], Mo [130] and SiC [131] reinforcing materials. Corrosion behavior of MMCs composed of CNTs as reinforcing agents lies in their matrix material, along with the process route adopted for their fabrication. In the case of Mg as a matrix material, it has been observed that the presence of CNTs as reinforcing material enhances the corrosion behavior [63,130,131]. This enhancement in corrosion behavior is due to the formation of galvanic couples between the reinforcing material CNTs and the matrix material Mg, resulting from their large in-between variation in standard electrode potentials. Additionally, it has been observed that the presence of intermetallic phases, such as  $\beta\text{-Mg}_{17}\text{Al}_{12}$ , Al–Mn and Al–Mn–Fe in Mg alloys, behaves as cathode terminals to promote micro-galvanic corrosion at the anodic Mg-based matrix [88,132–139]. As CNTs possesses high electrode potential, their reinforcement in Mg to develop composites, also enhances the galvanic corrosion in developed MMCs.

The electrical characteristics of CNTs are diverse in comparison to other carbon allotropes. Because of this, the behavior of Mg matrix material could be divergent when reinforced with CNTs [11]. Endo et al. [79] proposed that the rate of corrosion could be reduced by separating the oxide layers from the Mg matrix by MWCNTs, which leads to decelerating the corrosive layer formation. The researchers examined a pure AZ91D Mg alloy, fabricated AZ91D/CNT composites in salt water, and observed the development of rigid oxide layers at the Mg-alloy matrix material grain boundaries. They concluded that surface protective layers were found to be reinforced through CNTs and possess water shielding characteristics. The researchers in their investigation did not report on the relevance of galvanic corrosion between Mg and CNTs; additionally, it was not clearly explained if development of the oxide layers could boost the overall anti-corrosive nature of the Mg matrix. The rate of corrosion of MMCs could be degraded by developing passive layers on the fabricated composite surfaces [11]. Furthermore, the study performed to fabricate Mg/CNT composites did not revealed the development of such passive behavior in inhibiting further corrosion [140–145]. The microstructural study of fabricated Mg/CNT composites revealed that a major percentage of CNTs were stacked near to primary particle boundary, the fabricated composite's surface was locally damaged and severe galvanic corrosion occurred in the CNT's vicinity [136,137]. Fukuda et al. [66] fabricated an AZ31B Mg alloy-based MMC, by incorporating the MWCNTs as the reinforcing agents through the PECS route. To study the corrosion characteristics of the fabricated composites, the researchers performed an immersion and polarization test by subjecting it to NaCl. Because of the appreciable amount of the potential difference between the matrix and reinforcing material in the NaCl solution, similar conditions to the galvanic cell were developed. Furthermore, the anticorrosive characteristics of AZ31B degraded due to the large number of corrosive byproducts stacked in the CNTs' vicinity. The pH value of the solution in which the fabricated composites were dipped was enhanced comparatively to the AZ31B pure alloy. Monolithic Mg underwent progressive chemical reactions with aqueous solutions and these are as follows [138–140,146,147]:

$\text{Mg}(\text{OH})_2$  was not developed adequately enough to restrict the further corrosion of the fabricated composites in a corrosive environment. According to the above-mentioned reactions, the magnesium fusion enhances the solution's pH value. Furthermore, the  $\text{Mg}(\text{OH})_2$  layer could be converted into  $\text{MgCl}_2$  salt due to the presence of  $\text{Cl}^{-}$  ions, resulting in an increment in Mg dissolution according to the following chemical reaction:

Aung et al. [65] developed Mg-based CNT-reinforced composites and subjected them to NaCl solution in order to observe the corrosive characteristics through the mass loss due to the immersion test, hydrogen evolution measurement, and polarization curves. It was reported that the corrosive characteristics of the fabricated composites were enhanced, as compared to unreinforced Mg. The reason for this enhancement is the development of intermediate corrosion, sandwiched between Mg and CNTs of galvanic nature. Saikrishna N. et al. [148] conducted experimental work to develop Mg/MWCNT composites through FSP. Unadulterated 10 mm thick Mg sheets of size  $100 \times 80 \times 10 \text{ mm}^3$  were prepared for the process. Before execution of the FSP process, dual zig-zag blind holes in multiple rows were developed on the Mg plates to fill with the MWCNTs. To prevent the reinforcing particles from ejecting out from the holes, a pin-less FSP tool with a revolving speed of 1400 rpm and a travel speed of 25 mm/min was adopted to execute the process. Sample investigations concluded that the presence of CNTs improved the micro-hardness of the fabricated composite relative to unadulterated Mg. However, the fabricated composites' corrosion behavior was sacrificed, leading to enhanced galvanic corrosion. Turhan et al. [137], Aung et al. [65], and Li et al. [138] also concluded in their studies that reinforcing the Mg matrix with CNTs results in lower anticorrosive strength of the fabricated composites, due to the generation of galvanic couples. Table 2 depicts the corrosion characteristics of the fabricated Mg/CNT composites. Funatsu et al. [149] attempted to examine the corrosion behavior of developed AZ61B-based CNT-reinforced composites through the PM route. In the experimentation, they employed thermal treatment of 823 K for the duration of 10 h while introducing Al atoms into the fabricated composites, resulting in an accumulation of Al atoms adjacent to the CNTs' surface. The presence of Al atoms in CNTs' vicinity was reported to lower the potential difference between the matrix and reinforced material. The researchers further performed an immersion test on the fabricated composite to examine the effect on the corrosion rate by immersion in NaCl solution and reported that the rate was lowered down to 30% of the composite in which Al atoms were not introduced. Say Y. et al. [150] fabricated AZ61 and AZ91 matrix material-based composites by introducing CVD's prepared CNTs as the reinforcing agent through the PM process route. For producing the CNTs through CVD, the substrate used was p-type Si wafer. Before preparing the substrate, the furnace capillary was washed 5 times in a vacuum of 10<sup>-3</sup> Torr and further heated along with Ar gas. The developed CNTs in 0.1, 0.2 and 0.5 wt.% were added with a predefined exact ratio of powdered matrix material and ethanol solution. This mix was further ball milled at 200 rpm for a duration of 90 min. The prepared ball milled mixture was compacted in die of 12 mm diameter at 500 MPa and sintered at 500 °C for 2 h. Characteristic identification concluded that the increments of wt.% of the CNTs sacrificed the strength of the fabricated composite in both matrix materials. The corrosion resistive capability of the fabricated composites with higher wt.% CNTs was also found to be degraded, as compared to 0.1 and 0.2 wt.%. For both matrix alloys, the highest corrosive currents were reported for the samples containing 0.5 wt.% of CNT. Aydin et al. [93] fabricated Mg/MWCNT composites through the PM route and performed plasma electrolytic oxidation (PEO) to develop the coating on the fabricated composites. Furthermore, they examined the fabricated composites through potential-dynamic corrosion tests. They reported that the corrosion rate of the coated material decreased by 1.6 times that of the uncoated composite. Davaari M. et al. [151]

studied the corrosion behavior of the fabricated AZ31B-H24 Mg alloy-based composite reinforced with PEO/PCL-coated MWCNTs. Initially, the specimens of the base material of 15 mm × 15 mm × 2.5 mm were prepared and microstructural study was performed after polishing and etching. A jacketed electrochemical cell with continuous electrolyte stirring adoption was adopted for the PEO coating for 10 min with enforced voltage amplitudes of + 405/ −25 V for 60 s and output current density restricted to 100 mA/cm<sup>2</sup>. Similarly, the PEO process was also performed for 5 g/L of MWCNTs containing electrolytes. The counter electrode employed for the process was a cylindrical mesh of SS 316. The coated specimens were cleaned with water and isopropanol and dehydrated in lukewarm airflow. For detecting the uncoated, PEO coated and PEO-MWCNTs, the employed acronyms were BM, PEO and PCT, respectively. PEO and PCT were sealed using either a thinner or dual PCL layer. Investigations concluded that thrusting pitting corrosion in the PEO samples was due to successively generated stress, agglomeration of the corrosive byproducts and undercoating corrosion. The PCT coating developed on the samples delayed the undercoating corrosion by 48 h. Sealing of the PCL layer resulted in appreciable enhancement of the corrosive resistive strength by 15%, in comparison to PCT.

**Table 2.** Examined corrosion characteristics of fabricated CNT-reinforced magnesium nanocomposites.

Samples	Reinforcement	Processing Route	Reinforcement Particle Size	Corrosion Medium	I <sub>corr.</sub> (μA·cm <sup>-2</sup> )	E <sub>corr.</sub> (V vs. SCE)	Corrosion Rate (mm/year)			R <sub>p</sub> (Ω·cm <sup>2</sup> )	Ref.

## 8. Wear and Friction Properties

Mg-based composites have been recognized as one of the prime selections among the lightweight materials, with applications in aerospace, automotive, and biomedical fields.

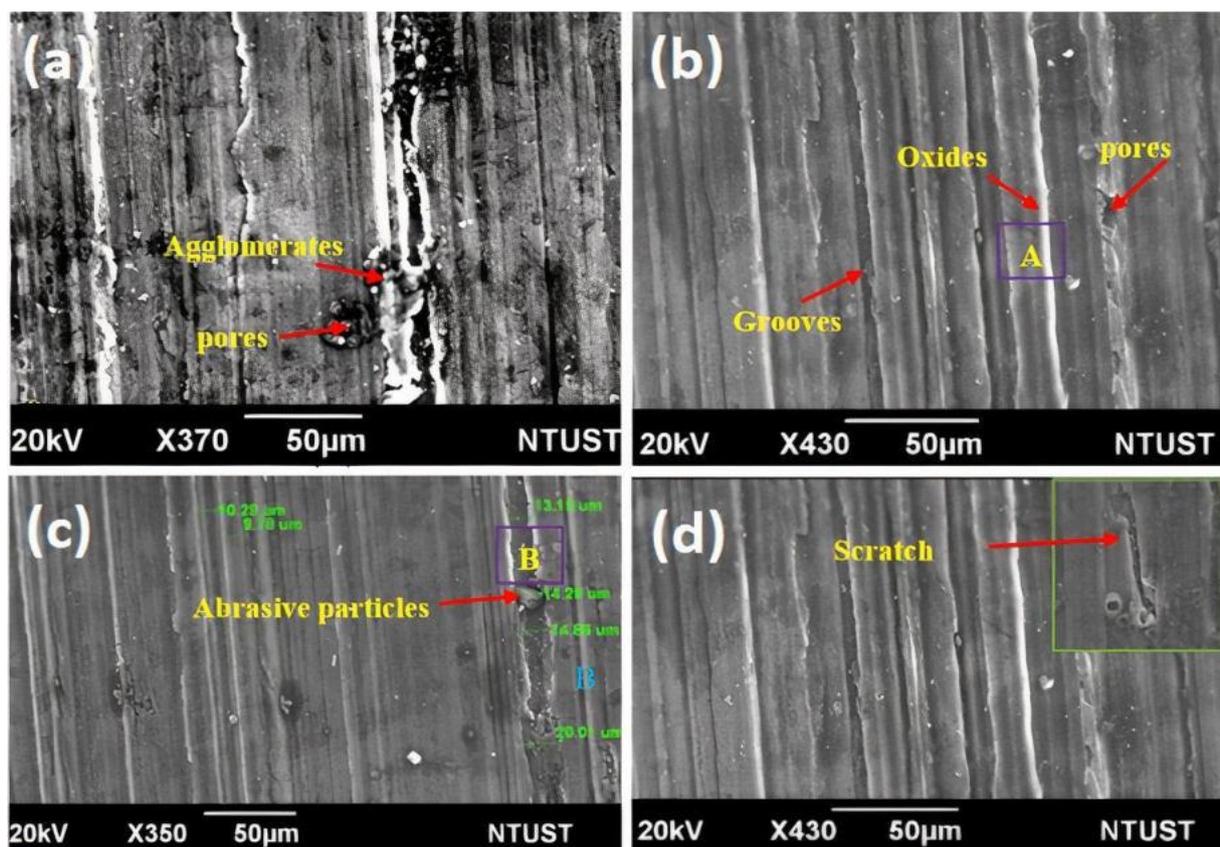

The superior properties of Mg, such as the ability to reprocess, appreciable damp character, treatable machinability, good electromagnetic shielding, and plenteousness, makes Mg an adequate selection among all the other materials. However, the specific properties of Mg that make it an inferior choice for tribological applications include remarkably low hardness and wear resistance. The hardness and wear resistivity of the Mg-based composites can be altered according to the fabrication route that is adopted for their fabrication, even though the coefficient of friction and wear resistivity of the fabricated composites may be enhanced by introducing ceramic as the reinforcing agent in the Mg matrix [11]. It has been reported that composites composed of Mg matrix and CNTs as reinforcing agents have commendable self-lubricating and mechanical characteristics, low coefficient of friction, and high wear resistance [11,143–145,154,155]. Recently, CNTs have emerged as an attractive reinforcing material that can be used for reinforcing Mg. Numerous investigations have been performed to examine the effect of CNTs on composites regarding their mechanical and corrosion properties. Additionally, some studies have been conducted to evaluate the wear characteristics of Mg-CNT nanocomposites.

Jamshidijam et al. [108] developed metal matrix composites by adding the MWCNT reinforcement into AZ31 Mg matrix material through the FSP route. They conducted a relative study between reinforced and unreinforced MMCs on their respective wear resistive capabilities. As a result, they reported an outstanding improvement in mechanical characteristics in MMCs due to the presence of MWCNTs as a reinforcing agent. They argued that this improvement occurred due to the grain's structural improvement, appreciable interfacial bonding between AZ31 and MWCNTs, and uniform dispersion of the reinforcing particles in the matrix material. Selvamani et al. [103] employed a stir casting fabrication route to fabricate AZ91D-based composites reinforced with CNTs. The MMCs were reinforced by loading 2, 3, and 4 wt.% of CNTs in order to examine the changes in the mechanical properties of the developed composites. They reported that the MMC samples that contained 3 wt.% showed extraordinary wear resistive nature, compared to unreinforced AZ91D. In addition to the mentioned phenomena, they experienced enhancement in the tensile strength of the same 3 wt.% sample, which was verified by their ductile mode fracture. They reported extraordinary hardness values with further enhancement of the wt.% of the CNTs up to 4. Mindivan et al. [96] argued that uneven fragments and dragged out CNTs from fabricated Mg6Al-CNTs at the matrix–reinforcement interface could enhance the lubricating behavior. They also concluded that even high wt.% CNT loading may result in inferior wear resistive characteristics, if unsatisfactory interfacial linking is present among the chip layers.

Abbas et al. [36] fabricated AZ31-based composites reinforced with MWCNTs through the stir casting route, which was further processed through precipitation hardening for the duration of 10 h. The study was focused on examining the wear characteristics of the fabricated composites. The results of the respective study were graphically depicted in the form of bars, designated for the loss of mass and coefficient of friction, in contradiction to the increasing values of wt.% of the CNTs, as shown in Figure 7. Conclusively, the researchers argued that increments in the CNT wt.% decreased the wear-out weight loss of the composites. The researchers also stated that two factors were responsible for this decrement in weight loss. First, the increment in wt.% in CNTs enhanced the strength and hardness. Second, the self-lubricating characteristic of CNTs, which lowered the coefficient of friction, led to material loss. Abbas A. et al. [36] performed a study to reveal the wear characteristics of fabricated AZ31-CNT composites. In order to reveal the effects of CNTs on the fabricated composites and their wear behavior, CNTs were introduced in different wt.% in the AZ31 matrix. The manufactured composite part's worn-out surfaces were studied through scanning electron microscopy (SEM) to obtain knowledge related to their erosion, oxidation, abrasion and permanent deformation patterns. Figure 8. depicts the worn-out surfaces of the SEM micrographs in non-wet sliding conditions.

**Figure 7.** Plots pertaining to the variation in (a) mass loss due to wear, and (b) coefficient of friction in contradiction to CNTs' concentration in AZ31-based CNT-reinforced composites in dry friction situations [36].

**Figure 8.** Pictorial observations of external worn-out structure of AZ31-based CNT-reinforced composites through SEM composed with CNTs wt.% of (a) 1.0, (b) 0.5, (c) 0.1, and (d) 0, in dry circumstances [36].

Figure 8a depicts the SEM micrograph of the fabricated composites comprising 1 wt.% of CNTs. The micrograph clearly highlights the plenteous worn-out depression as well as the marks; most of them are tending towards the sliding direction. This abrasive nature of these wt.% CNTs raised due to clustering of the CNTs, which performed as plowing

agent in the fabricated composites for promoting abrasion. As a result, the clustered zone of CNTs promoted to occur the phenomenon of 3-body abrasion. According to the 3-body abrasion phenomenon, a hard element stuck between two surfaces could lead to abrasion of one or both surfaces [108]. The 3-body abrasion could happen along with the wear-out and abrasion phenomenon [156]. Figure 8b depicts the micrograph of the fabricated composites comprising CNTs of 0.5 wt.%. The wear-out characteristics pertaining to oxidation could be read using the micrograph. The wear-out characteristics of the composites are highly affected by the thickness of the oxidation layer that developed. It has been reported that the wear rate of the composites was lowered due to the presence of a thicker oxidation layer, which prevents the surfaces from sliding, and hence consecutively generated an inferior wear environment [157]. Figure 8c depicts the SEM micrograph of the fabricated composite containing 0.5 wt.% of CNTs. Generated networks of major voids that developed on the wear-out surface can be easily observed from the micrograph. These major voids are the leftovers of shearing of the surface through the propagation of cracks, generated by the application of dynamic forces. The wear characteristics were also revealed by the heating of the surfaces that they are in contact with. This heating could lead the asperities to become soft, restricting them from adhering to the counterpart surface. The repeated continuous sliding motion enabled the asperities to gather at the contact surface, which led to nucleation, resulting in the erosion of the contact surfaces in a layered form. This type of wear mechanism, which is initiated without the generation of wear cracks damages, the surfaces more severely and is known as plastic wear. Figure 8d. depicts the SEM micrograph of the unreinforced AZ31 matrix material. The significance of the plastic wear can be observed through the micrograph. At elevated loading conditions, these layered wear characteristics become responsible for permanent deformation of the surfaces [158]. The tendency of the wear-out mechanism is to support permanent deformation, enhanced in the conditions of high surface roughness [159]. This permanent deformation phenomenon was forced to occur through the heat generation between the counter steel plate and fabricated composite sample and consequently, the permanent distortion of the surface is enabled towards the direction of sliding [160]. It has been observed that large uneven irregularities separated from part were deformed severely and extruded towards the sliding direction [36]. The anti-wear characteristics and the coefficient of friction of the fabricated composites was drastically enhanced through the presence of CNTs in their vicinity. Most of the studies performed so far that concern the wear characteristics of the fabricated composites have revealed the behavioral effect on the composites through different compositions of CNTs, but one must obtain more knowledge in order to establish the association of wear behavior of fabricated composites to their respective CNT loading.

## 9. Conclusions

The current article highlights the reputations of the factors that influence the conventional routes for fabricating Mg-based composites reinforced with CNTs, their potential, challenges, and scope for future developments. Their exclusive optical, electrical, thermal, and mechanical characteristics, as well as their enhanced surface area and aspect ratio, make CNTs a superior candidate for reinforcing metal matrices as a way of enriching their properties, such as self-lubrication characteristics, overall lightweight nature, and superior strength. These enriched properties in the fabricated composites could be achieved if the fabrication process could allocate the reinforcing agent uniformly. Throughout the article, knowledge has been gathered on the significance of several factors that play a role in various Mg/CNTs fabrication routes, along with various strengthening mechanisms, corrosion behavior, and wear properties and the following conclusions are suggested:

1. Due to various obstacles in the fabrication route of CNT-reinforced metal matrix composites (MMCs), inadequate studies have been accomplished in the mentioned domain. Only the fabrication routes pertaining to PM and stirring casting have been comprehensively studied.

2. The mechanical characteristics of fabricated Mg/CNT-reinforced composites that have been debated and observed demonstrate that they are broadly altered through the process route adopted to fabricate the composites. Additionally, uniform allocation of CNTs, specifications concerned with CNTs, wt.% of CNTs in matrix material, CNTs' orientation with matrix material and their in-between interfacial bonding could be the responsible factors for enhancing the mechanical characteristics by an appreciable amount.
3. With regard to enhancing the strength of the composites to bear stresses, the load transfer mechanism is expected to happen at the interfaces of the Mg matrix and CNTs in fabricated composites. As a result, the composite will enable the transfer of the stresses to reinforce CNTs more adequately. The interfacial bonding is crucial due to poor wettability between CNTs and the Mg matrix, which arises due to their considerable surface tension difference. This difference in the surface tension prevents the Mg matrix material from being coated with CNTs. This interfacial bonding could be strengthened by enhancing the wettability by incorporating Cu, Ni, or Cr as the coating material for CNTs.
4. The mechanism through which the composites were reinforced with CNTs in the Mg matrix that undergoes corrosion is the micro-scale galvanic phenomenon in sodium chloride solution. The CNTs present in the Mg matrix behaved appreciably as cathodes; as a result, increasing the wt.% of CNTs in the Mg matrix could decrease the corrosion resistivity of the fabricated composite.
5. The coefficient of friction and wear resistivity of the fabricated composites could be altered according to the fabrication route adopted for fabricating them. Incorporating increased wt.% of CNTs in the Mg matrix could lead to enhanced self-lubrication characteristics, refined mechanical characteristics, low coefficient of friction, and high wear resistance.

**ABSTRACT-** It has been observed recently that sustainable development is the primary goal for any manufacturing industry globally. Green manufacturing is indeed needed because of its long term advantages such as low carbon emission or wastes by better production design and durability of the product. Green manufacturing not only provides unlimited opportunities for long term development but also eliminates the unpredicted risks involved at strategic level for manufacturing. The main objective of this study is to study the recent trends in green manufacturing. This article is emphasizes on the literature review related to green manufacturing and overall past research results and the identification of challenges in this methodology.

**Keyword:** Green manufacturing, sustainable, emissions, greenhouse gases.

### INTRODUCTION

There are two important challenges in the 21st century identified as deficiency of resources and environmental shift. It was also shown by Keeling curve that there is rapid increase of CO<sub>2</sub> as compared to previous limit of emission of the polluting gases which will eventually result in increases greenhouse phenomenon [1]. Secondly as per national geographic source, there is sea level withdrawal which poses a threat to high density regions such as New York, Miami and Shanghai [2]. Another change we are facing is the increase in world population up to 100 billion at the end of this century [3]. This problem will be further worsened by the upliftment of living

standards in the developing countries. Productivity is merely not the criteria for success rate of the country, as there will be more requirements of facilities such car and fuel which will result in more emissions. In today's era, the industrialized countries enjoy affluent products such as

energy, food and other daily requirements but there are no preparatory efforts in order to eliminate the adverse effects of the environment by the regulating bodies such as local governing bodies and international organizations.

Therefore there are chances that there will be disasters to the human lives in the upcoming decade [4]. Therefore sustainable manufacturing is gaining more and more grounds these days. If we look at the current consumption of the world in terms of energy then the major portion of the energy is consumed by the industry (33%), temperature control in the building results in consumption of 28% - 39%. Other adverse effect by the energy consumption results in production of waste/ toxic material which negatively impacts the environment. Several studies have also been conducted in green product innovation and low carbon matters [5-14].

## 2. Methodology of Green Evolution

There are different abstracts available for evaluation of recent technologies such as Hype cycle which was published by Gartner Group which has given an insight of the emerging technologies and additionally it also shows the development stages and its pace in the trend [8]. There various assumptions taken into consideration such as trigger of innovation, inflated expectation peak, trough of disillusionment, slope of enlightenment and finally the plateau of productivity as shown in Figure 1. In the plateau region, the innovative technology matures and its profitable margins are determined. For example if we consider rapid prototype as case study in field of additive manufacturing which came into existence in 1980's. The rapid prototyping (RP) was at the peak at 2013 and even the laymen knew the technology due to the popularity but later on due the adverse effects of RP, the expectations were not met but eventually RP will still be in demand. There several examples of technologies which did not reach the maturity phase due the various adverse effects.

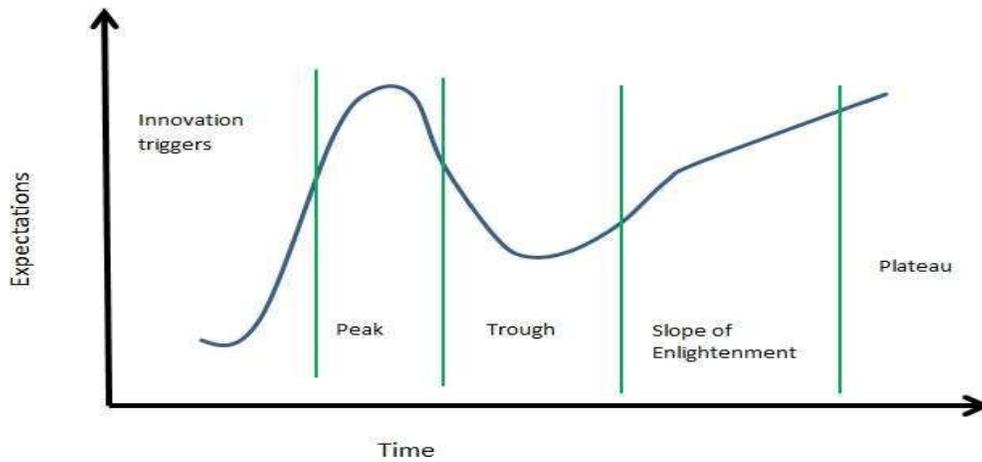

Figure 1. Hype Cycle

Recent study shows a comparison of average impact factors in engineering field related to environment and fuels technology and it has been observed that nowadays more journal papers related to greener technology is available as compared to research related to fields of manufacturing engineering and mechanical engineering as shown in Figure 2. The combination of manufacturing technologies and energy-environment technology provides adequate synergy effect for the green technology and also for the initiation of new engineering research journals covering those areas which are not yet discovered by the existing journals.

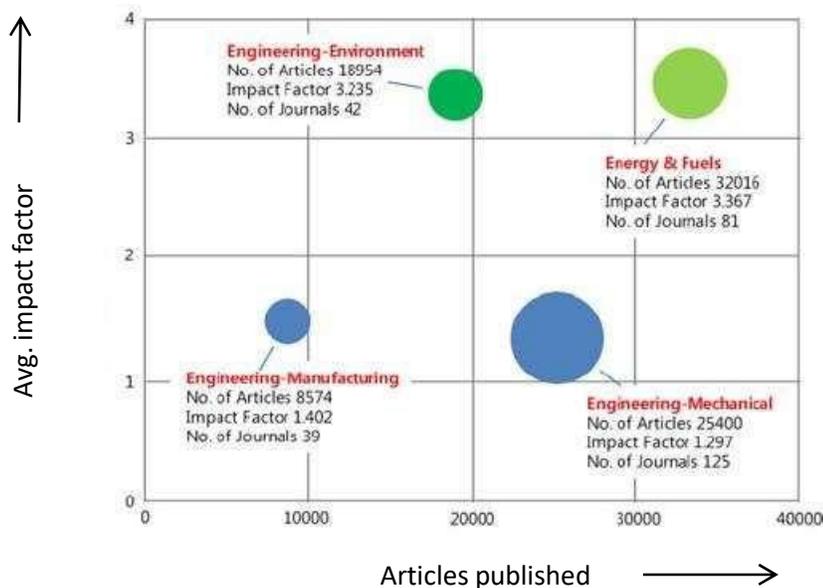

Figure 2. Comparative studies for different fields [15]

Establishment of sustainable methods as a key challenge when it comes to economic activity because it involves energy and climatic issues. Innovations in patterns of material flows for the least effect of ecological footprint of human economic activity are shown in Figure 3.

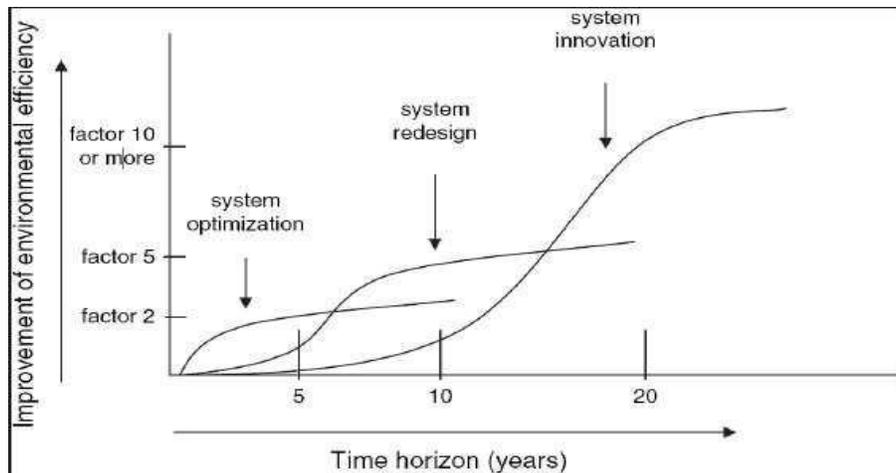

Figure 3. Innovations in patterns of material flows [16]

## 2.1 Energy-intensive industries for selective green technologies

### 2.1.1 Iron and steel industry

There are various steps in steel production process which can be categorized in different combination such as mixing of product, availability of raw material, and supply for energy and capital investment as shown in Figure 4. These characteristics can be mentioned in three routes:

- Blast furnace produces pig iron using iron ore and coke. Afterwards this can be converted into steel by using oxygen furnace. This is high energy intensive process as it involves sintering process by involvement of coke making.
- Scrap furnace uses scrap from iron input and this route uses considerably less energy intensive as compared to blast furnace due to coke omission.
- Finally there is process of direct reduced iron in which utilized scrap iron and this route is less energy intensive.

In recent years, increasing attention has also been paid to smelting reduction, which is emerging as a contender to the blast furnace process.

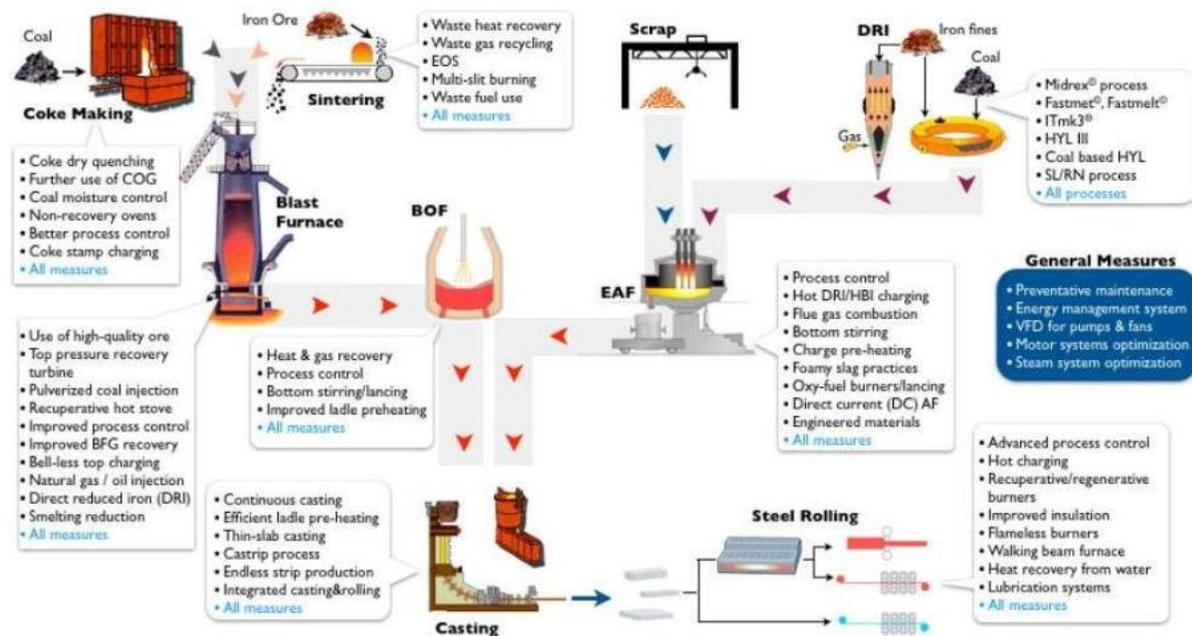

Figure 4. Source: Industrial Efficiency Technology Database, Institute for Industrial Productivity [17]

### 2.1.2 Cement production

The main four process routes utilized in cement production is dry process, semi- wet process, semi-dry and wet processes. Although dry processes are more energy efficient but availability of the raw resources also plays an important part in its production. On the other hand, the wet process is more energy intensive process therefore it is being ruled out in many countries such as Australia, New Zealand etc. There are several processes involved in cement production such as sintering limestone, grinding raw material which require high demand of fuel. Therefore nowadays alternate blends for fuels, energy efficient technologies and other options are also emerging in the form of alternative cementitious materials which reduces carbon emissions and consumption of fuel. Figure 5 shows the schematic diagram for use of alternate efficient technologies in cement industry.

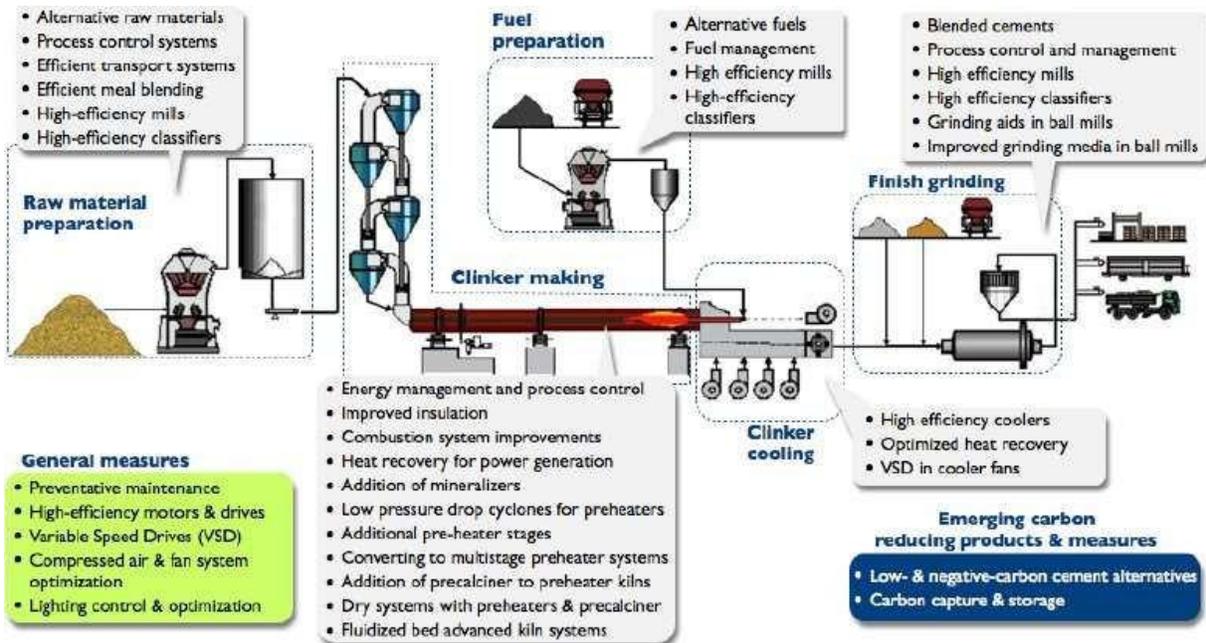

Figure 5. Cement production schematic, Institute for Industrial Productivity [17]

### 2.1.3. Paper production

Generally in paper production industry, pulp production and its conversion to dry paper are the main energy consuming processes which need to be reduced by better technologies. Therefore integrated mills are being encouraged these days for balancing the energy consumption as they are more energy efficient as shown in Figure 6. The major energy consumer in the industry is the process which involves production of pulp and its conversion to dry paper. Efficient Integrated mill have significantly have reduced the impact of pulp mills and other integrated mills. Kraft chemical is the most favourable material uses in pulp industry although it needs large amount of heat energy for its processing but it can be compensated by the by-products such as black liquor. Another chemical used is sulphite which also involves high energy consumption but large part of energy can be met by its by-products too. Although weaker fibres are produced by mechanical pulping but due to the high yield of the fibres, the energy demand is considerably lower. Innovative technologies such as thermal –mechanical process for pulping are being used because a large portion of heat is recovered at different grades.

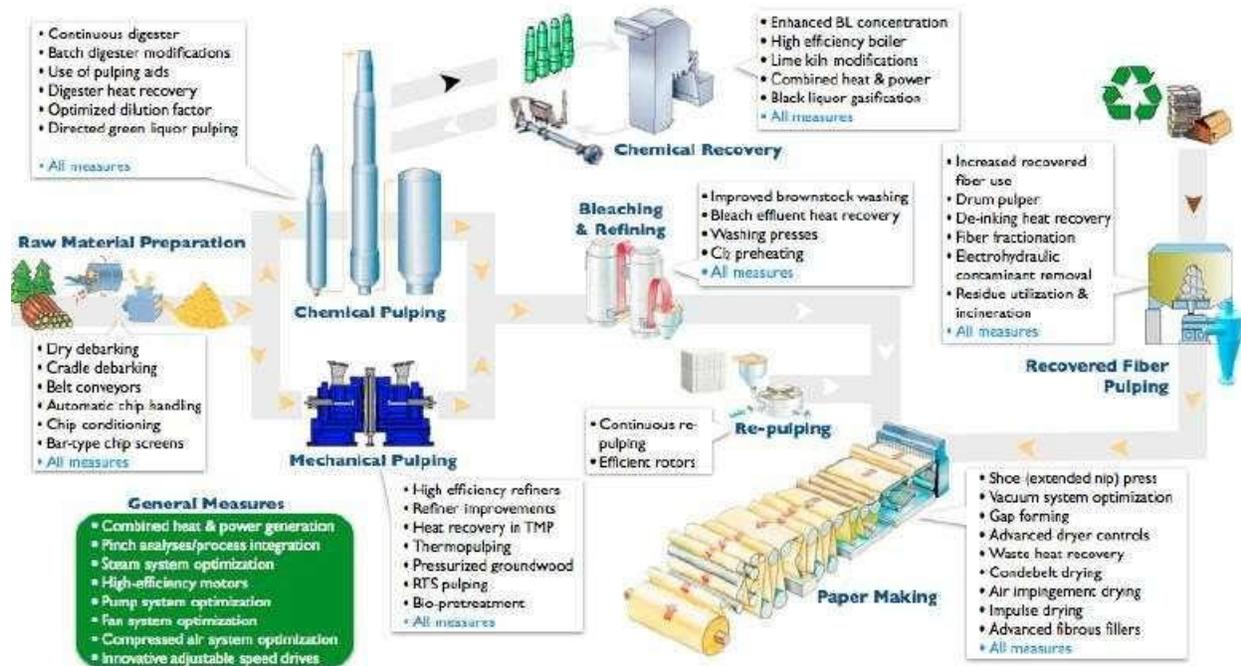

Figure 6. Paper production schematic, Institute for Industrial Productivity [17]

## 2.2. Less Energy Intensive Industries for Green Technologies

Electrical motors convert electrical energy into mechanical energy and are motor driven system. These motor driven systems find application in applications such as conveyor belts, fans, pumping, handling of mechanical equipment's and processing. As we know that most of the electricity is consumed by the motor parts but if we consider the overall efficiency then the overall electricity consumption is often limited. The main reason attributed to this fact is that the system components of motor driven system such as valve pipes, pumps, and ducts have affect on mechanical power of the entire system and all the other losses incurred during the delivery of the power have large impact on overall consumption of energy. Therefore it is much more important to adopt an optimized system in way to reduce the overall energy consumption. The advanced solution and technologies are very much responsible for improving the overall design of the system. In most cases, improving the efficiency of a motor-driven system involves the following parameters such as making use of energy efficient motors, selection of core components such as fans, compressors, speed drives with high efficiency as shown in Figure 7.

Figure 7. Equipment of motor systems, Institute for Industrial Productivity [17]

### 2.2.1 Renewables and Smart Grids

Renewable energy sources are considered as one of the possible solution for manufacturing industry but only for short duration of time because these renewable resources are not a mainstream for fields like industrial manufacturing and applications as these continuously demands innovation in technology. This renewable energy finds application in generation of electricity by utilizing wind energy or photo voltaic source. Similarly small batch of power units in an approximate power range of 20-30 KW can be utilized for medium heat generation for industrial purpose. In building, small units of solar panels can be utilized for temperature control in building and offices. Other source such as bio-waste and bio genetic material further can also be used for power generation and oil based chemistry respectively.

### 3. Conclusions

- Several developments have taken place in previous two decades related to green manufacturing. Different innovations role has been played at different strategies ash shown in Figure 8.

Figure 8. Various innovations in environmental technology [18]

- Initially end of pipe solutions were followed but these solutions do not provide any modification in the manufacturing process. This strategy was focussed on reducing pollutants.
- In other stage process integration came into existence which used policy of efficient energy and at the same time lower emissions. Quality production and economic productivity were of utter importance along with environmental benefits such as use of electrical efficient motors in steel making industry.
- Thirdly use on non-toxic material was encouraged for product design and development. Recycling of end products and life cycle assessment was focussed in this trend.
- In this study it was concluded that various efforts have been made in order to attain sustainability and there is complete transformation of industry in the global level. Secondly carbon free economy is the need of the hour without any further delay in the future.

## ABSTRACT

Many devices are using transparent heaters and they often face problems due to fogging or icing on the surface of the transparent heater (TH). The fogging or icing is mainly due to the droplet that gets deposited over the surface of the transparent heater. If the evaporation of these droplets from the surface of TH gets obstructed, then only the fogging or icing starts. To develop an effective defogging, we require the effective evaporation rate of the droplet. Many studies have already been done on the dependence of evaporation on the various factors of the substrate as well as the ambient conditions. In this paper, the evaporation droplet characteristics of the transparent heater are analysed. Theoretical and experimental investigations on droplet evaporation are reviewed. The dependence of droplet evaporation time and temperature distribution on transparent heater coating properties are studied. Finally, the role of material coating on defogging and defrosting properties of transparent heaters are investigated and discussed. Also, the dependence of surface wettability of transparent heaters on the droplet evaporation property has been investigated.

## 1. Introduction

The phenomenon of how liquid droplet is responsible for wetting the solid surface has already been studied since the 18<sup>th</sup> century. The control of wettability on the surface of heater and the characteristic of evaporation of a droplet is an important function for developing an effective photo electronic instrument with TH [1]. With the modification of the wettability of the substrate, the evaporation rate of the water droplet can be controlled which is a prime requirement for the defogging and deicing effectiveness devices with TH [2]. The angle of contact between the solid and liquid is an important factor for wetting the solid by liquid droplet. The role of Contact angle, wetting properties and the bonding of liquid and solid was investigated by Young and Pierre-Simon Laplace. In biomedical and normal life situations, it is very complicated to solve and predict the wetting and evaporation of droplets, though the geometry is simple for a sessile droplet [3]. Agrawal et al. [4] stated the optimal design parameters using Aluminium Alloy AA6063. Also, deformation analysis of Al Alloy AA2024 through Equal Channel Angular [5]. Further, experimental study

carried out on RMDTM welding parameters for ASTM A387 Grade 11 Steel and optimal solution were obtained [6], Beniwal et al. [7] conducted an extensive review on Pore and Porosity in Tissue Engineering. A simple droplet becomes a complicated one when the wetting together with evaporation is investigated, which is because of the factors of full coupling of the droplet with the substrate on which the drop is deposited, the nature of the fluid, the particles contained by the fluid and the mechanism of physics involved. In this review paper, the mechanism involved in the evaporation and wetting of droplets by considering the flow dynamics, surface tension, dynamics of evaporation, properties of wetting, and the behavior of vapor will be discussed. It is found that the droplet of different liquid when deposited on the same solid surface behaves differently. On the other hand, the same liquid also behaves differently when deposited on different solid surfaces. Various literature describes the thin film behavior [8–11]. It is not possible to produce a uniform layer of mercury over a glass surface because mercury will produce a drop with a spherical cap immediately as it falls over a glass surface. The contact angle of this spherical cap is more than 90° as depicted in Fig. 1. This case of formation of the mercury drop over a glass surface is a classic example of a non-wetting phenomenon. On the other hand, oil drop can easily spread over the same glass surface and is a classic example

\* Corresponding author.

E-mail address: [deb.rupak@gmail.com](mailto:deb.rupak@gmail.com) (R. Kumar Deb).

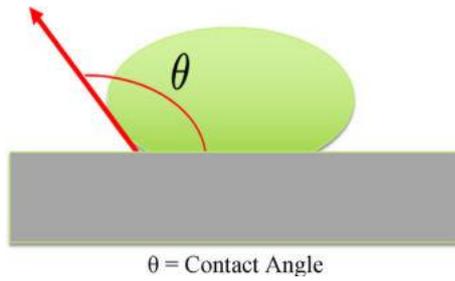

Fig. 1. Shape of the mercury droplet on a glass surface.

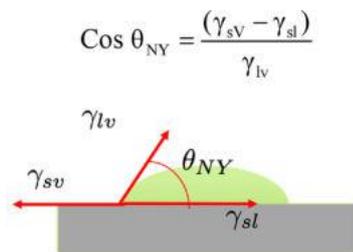

of wetting of the surface. The oil drop can be deposited over the surface of the glass and with time it will completely spread over the surface. The corresponding contact angle in this case will decrease to zero with respect to time. An ordinary droplet of water on the same surface of the glass will spread partially keeping the contact angle between zero to 90°.

Thus an aqueous drop of water behaves between the phenomena of mercury and oil with the same substrate glass. Like mercury on a glass surface, the water drop also shows the same behaviour on the Teflon surface. So it may be concluded that the same drop behaves differently with respect to different surfaces and the wetting, non-wetting or partially wetting behaviour is dependent on both the liquid and solid substrate. With respect to Fig. 2 the contact line of three phases may be considered to determine the meeting point of the three phases namely the liquid phase, solid phase, and vapor phase. The equivalent contact angle  $\theta_{NY}$  and the interfacial tensions between solid-liquid phase  $\gamma_{sl}$ , solid-vapor phase  $\gamma_{sv}$  and liquid-vapor interfacial tension  $\gamma_{lv}$  can be connected by Neumann-Young's rule as;

$$\cos \theta_{NY} = \frac{(\gamma_{sv} - \gamma_{sl})}{\gamma_{lv}} \quad (1)$$

- $\theta_{NY}$  = equivalent contact angle.
- $\gamma_{sl}$  = interfacial tensions between solid-liquid phase.
- $\gamma_{sv}$  = interfacial tensions between solid-vapor phase.
- $\gamma_{lv}$  = interfacial tensions between liquid-vapor phase.

Now if  $\gamma_{sv} > (\gamma_{sl} + \gamma_{lv})$  then no forces in the tangential direction will be compensated and the corresponding case will refer to the wetting surface condition. If  $0 < \cos \theta_{NY} < 1$  the corresponding case will be partial wetting and finally if  $-1 < \cos \theta_{NY} < 0$  then the case will be the non-wetting case. Thus we can conclude that Eq. (1) by Neumann-Young can be easily applied to find out the wetting, partial wetting, and non-wetting case provided we know the values of  $\gamma_{sv}$ ,  $\gamma_{sl}$  and  $\gamma_{lv}$ . But in reality, it is still impossible to directly

- $\theta_{NY}$  = equivalent contact angle
- $\gamma_{sl}$  = interfacial tensions between solid-liquid phase
- $\gamma_{sv}$  = interfacial tensions between solid-vapor phase
- $\gamma_{lv}$  = interfacial tensions between liquid-vapor phase

Fig. 2. Depiction of forces applied on droplet contact point with the solid and vapor phase.

measure the interfacial tensions  $\gamma_{sv}$  and  $\gamma_{sl}$ . Further Eq. (1) of Neumann-Young has also not shown any dependency of the contact angle of the droplet on the volume of the droplet and the excess pressure inside the droplet, which is denoted as  $P_e$ . The values of both volumes of the droplet and the pressure may be arbitrary. This is because a droplet may be of any volume and of any value of excess pressure  $P_e$ . Hence the conditions at equilibrium should be.

- (1) In the droplet the liquid must be in equilibrium with its vapor.
- (2) In the droplet the liquid must be in equilibrium with the solid.
- (3) The vapor should be in equilibrium with the solid substrate.

The excess pressure  $P_e$  inside the droplet is given by the Kelvin equation as;

$$P_e = \left( \frac{RT}{V_m} \right) \ln \frac{p_s}{p} \quad (2)$$

where  $V_m$  is molecular volume,  $p_s$  is saturated vapor pressure at temperature  $T$ ,  $p$  is the vapor pressure in equilibrium with the liquid droplet and  $R$  is the universal gas constant. Thus it may be concluded from the above discussion that any droplet deposited on a solid surface is always in a state of evaporation and not in equilibrium with its surroundings under a saturated vapour [12]. Kumar et al. [13] re-investigated on the effect of powder metallurgy parameters of aluminium matrix composites. Surface Roughness in EDM of Pure Magnesium was optimized Using TLBO [14]. Naik et al. [15] studied the effect of Microstructure, on Al-CNTs/Graphene Hybrid MMC. Also, a microstructural analysis on mechanical properties of 316L Stainless Steel were carried out [16].

In the remaining part of the paper, section 2 discusses the dependence of evaporation flux on droplet size and section 3 discusses the thermal phenomena during evaporation. Finally, in section 4, the application of such droplet evaporation study in developing transparent heaters is reviewed.

## 2. Evaporation flux and its dependence on the size of the droplet

Various models relating thermal effects, surface tension and vapor pressure at the evaporating surface are developed [7,17-22]. The evaporation highly depends on the droplet size at the liquid-vapor interphase. The water droplet mass evaporation rate depends linearly on the increase in droplet base radius [23-25].

The theoretical investigation and the simulation suggested that the rate of evaporation of sessile droplet is modelled as;

$$\frac{dv}{dt} = -\beta F(\theta)L \quad (3)$$

where

$$\beta = \frac{2\pi DM}{\rho [c(T_{\text{surface}}) - (Hc(T_{\infty}))]} \quad (4)$$

$V$  is the droplet volume,  $t$  is the time,  $D$  is the vapor diffusivity in the air,  $\rho$  is the density of the liquid,  $M$  is the molar mass,  $H$  is the atmospheric air humidity,  $T_{\text{surf}}$  is the average temperature of the air-droplet interface and  $T_{\infty}$  is ambient air temperature.

## 3. Thermal phenomena during evaporation

With the increase in temperature the kinetic energy of the molecules also increases. The increase in molecular kinetic energy results in the molecules escaping the forces of attraction leading to

faster evaporation. David et al. [26] experimentally showed that the temperature in the bulk of a sessile evaporating droplet is a function of the rate of evaporation and the thermal properties of the substrate. They also proved that during the course of evaporation, the temperature of an evaporating droplet almost remains constant and is different from the ambient temperature. In reference [27–28], an investigation using numerical simulations on the dependence of the droplet base radius  $L$ , the contact angle  $\theta$ , and total vapor flux  $J$  was done along with the effects of Marangoni convection (MC) and the local heat of vaporization. Here the substrates with different conductive materials were considered and the results so obtained were compared with the results calculated by Hu and Larson [29] and Schonfeld et al. [17] for the isothermal cases. It was found that the difference between the results from reference [30–31] and the present simulations remains within three percent. However, if the material with lower conductivity (less than the thermal conductivity of air) is used then it is found that the evaporation flux reduces substantially than that of the isothermal case [32]. Such a reduction of flux is due to the lowering in the surface temperature of the droplet. Transparent heaters are devices that contain electrically conductive layers and are visually transparent. Transparent heaters generate heat by Joule effect when current passes through them. Numerical studies on thin films are reported in [33] and [10]. Transparent heaters are used in a number of applications ranging from the electronic industry to solar energy and medical sensors [34]. Transmittance and other optical properties of transparent heaters are well understood. However, the evaporation properties of transparent heaters are still an active research area. This has applications in defogging and defrosting applications in windshields and goggles [35]. A recent paper from Park et al. [36] has investigated the role of aspect ratio (droplet height to base radius ratio) for transparent heaters.

$$T = \left[ 1 + \frac{z_0 \sigma_{\text{opt}}}{2RS\sigma d c} \right]^{-2} \quad (5)$$

Eq. (5) depicts the Figure of merit in an electrical to optical conductance ratio (OCR). For a low contact angle, the evaporation time was decreased by advancing the dissimilarity between the ambient temperature and the temperature of a heated substrate. The following equation depicts this dependence.

$$t_{\text{tot}} = \frac{\rho L}{2[h(T_s) - Hc_s(T_s)]} \quad (6)$$

Based on the experimental outcomes, TP with steady wettability is expected to be used as wide reference material for de-fogging in automobiles, detectors, greenhouses and bio-chips. Because of low aspect ratio (AR) or lower value of CA on a hydrophilic surface of ITO (Indium Tin Oxide) and Silver (Ag), rapid evaporation of water droplet occurs. The result demonstrates that ITO/Ag/ITO multiple layer flexible TH with hydrophilic texture was utilized as transparent de-icing appliance and can be employed in distinct operations such as in automobile windows, side mirrors, drones, cameras and CCTV lenses. Also it can be employed as a heating source and greenhouse [37]. Also if the ITO/Ag/ITO multiple layer TH having hydrophilic surface is involved in detectors, biochips, advancements in durability as well as performance are predicted due to chemical affinity and high attachment between the heater and the activity coating.

Picknett and Bexon [38] have identified two modes of evaporation for a droplet resting on a smooth surface, namely, the constant-contact-angle (CCA) mode and the constant contact radius (CCR) mode. It is observed that the evaporation rate is a function of radius of curvature ( $r$ ) of the droplet surface. It can be expressed simply by the following model

$$\frac{dm}{dt} = KC \quad (7)$$

where  $C$  represents an equivalence of capacitance of a droplet and  $K$  is a constant depending on the boundary conditions of the droplet. With some mathematical simplification, Eq. (9) can be further represented as;

$$\frac{dm}{dt} = K_1(\theta, r) \quad (8)$$

where  $F(\theta, r)$  is a function of the angle of contact  $\theta$  and  $r$ . Further, this term is defined as;

$$F(\theta, r) = \frac{C}{r} \quad (9)$$

The term  $K_1$  is constant. In the CCA mode,  $F(\theta, r)$  can be approximated as a function  $f(\theta)$ , i.e. only a function of contact angle  $\theta$ . Therefore, it is constant during the evaporation phase in CCA mode. In the CCR mode,  $r$ ,  $\theta$ , and  $F$  varies during the evaporation phase. Further, it is experimentally observed that in CCR mode the rate of evaporation falls very slowly compared to CCA mode during the period of evaporation.

Ambient interface temperature, vapor concentration, and therefore vapor pressure and the droplet curvature play a critical role in evaporation. These factors further make it complicated to determine the evaporation rate via experimental methods and mathematical modelling. Following are some further research conclusions for obtaining the evaporation rate on the droplet surface:

- Popov [39] obtained an exact mathematical model for the rate for the droplet evaporation rate by the diffusion of vapor in a specific range of contact angles. With the change in contact angle, the contact area and hence the radius also changes thereby affecting the evaporation rate [14,40].
- The role of substrate conductivity in determining evaporation is not explored well compared to other factors.

However, in recent studies, it is depicted that substrate conductivity has an important effect in defining ER of pinned sessile droplets [41]. Further, Dunn et al. [42] proposed a model, which determines the role of thermal conductivity in droplet evaporation. The model predicts well the evaporation rates of volatile liquid droplets compared to water droplets. Non-uniform form evaporation flux on the droplet is demonstrated by the accumulation of suspended particles at the outer edges of a droplet, also denoted as the “coffee-ring” phenomenon. Such in-homogeneous solute deposition due to varying evaporation flux is undesirable in certain applications such as ink-jet printing, spotting of bio-fluids, and surface coating [43–44]. Singh et al. [45–50] reported that with the increase of temperature the moisture evaporation rate was increased. Singh et. [51,52] investigated the effect of transverse speed on microstructural feature of friction stir welded Al AA2024-T351. Furthermore, Devangan et al. [53] analyzed TIG weld properties. The work of Dash et al. [54] observed that the entire time of droplet evaporation on the hydrophobic surface was expected well by a vapor-diffusion-only model for a hydrophobic surface. However, for super-hydrophobic surfaces, the vapor-diffusion model overrated the rate of evaporation remarkably. This anomaly is mainly due to the thermal conductivity effect of the substrate is not accounted for in a vapor-diffusion-only model. The mesh of the acetone droplet, the temperature profile and water-vapour concentration of the droplet are presented in the droplet simulation Figs. 3 and 4, respectively.

The rate of volume loss from the droplet due to evaporation with respect to the radius for PTFE base plate is simulated and is

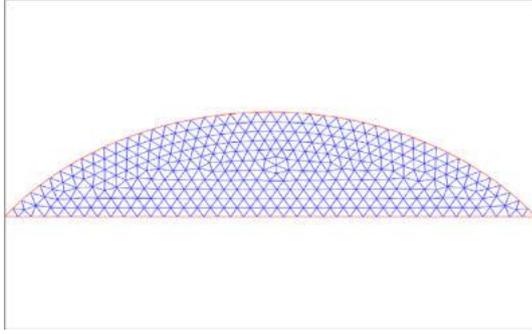

Fig. 3. A representative figure of the meshing on the droplet.

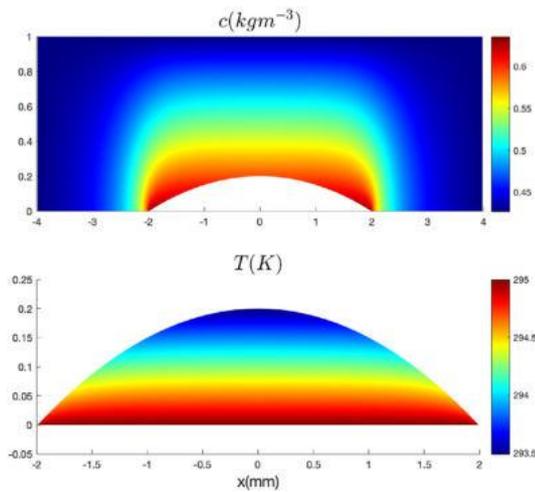

Fig. 4. Droplet Simulation for profile of the droplet and water vapor concentration above the droplet.

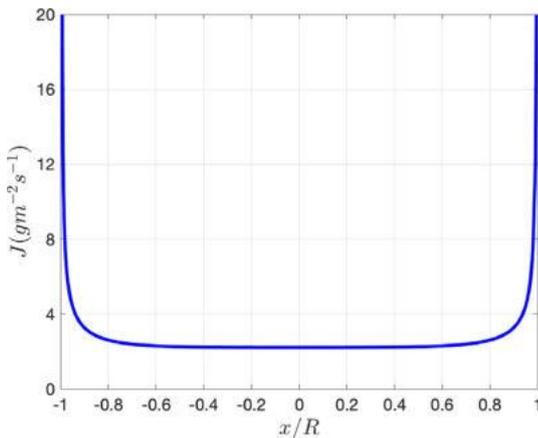

Fig. 5. Flux Val-This shows the evaporation flux on the droplet surface.

compared with the experimental result of the PTFE base plate shown in Fig. 5. The validation is carried out by comparing results of evaporation rate obtained in simulation and the experimental outcomes with the maximum difference of 2.8 %, as presented in Figs. 5 and 6, respectively.

#### 4. Conclusion

The phenomena of wetting by a droplet on a substrate is becoming the subject of interest since last three decades and

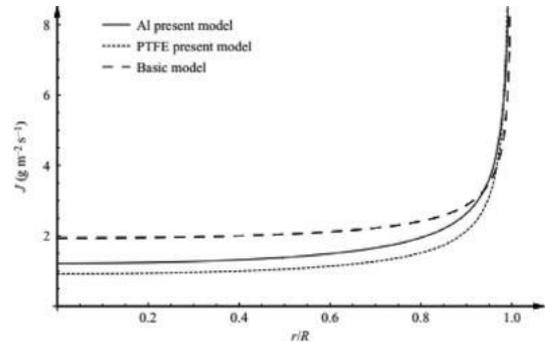

Fig. 6. Theoretical prediction for the initial evaporation mass flux from droplets of methanol of radius  $R = 1.35$  mm on different substrates [3].

becoming more prominent since 2010 because of more applications of such phenomena is in new areas. Due to huge number of publications, it is not possible to review every publication. Hence we selected publications on investigations carried on near past. The role of contact angle with respect to the droplet evaporation as well as spreading over the surface of the substrate along with the various numerical and experimental investigations on droplet evaporation phenomena is reviewed. Vapor-diffusion- only model for a hydrophobic surface, coffee-ring phenomena, ambient interface temperature, vapor concentration, and vapor pressure role on evaporation and the role of surface tension on droplet shape formation is studied. Further, the dependence of evaporation flux on various droplet physical properties has been reviewed. Finally, a special case of application of droplet evaporation study in the process of defrosting and de-fogging for transparent heaters has been studied and various papers on this specific application are reviewed.

## ABSTRACT

Many researches had been carried out to incorporate wood waste ash as a cement replacement material in the production of greener construction material (concrete/mortar) and also as a sustainable means of disposal for wood waste ash. Results of these researches indicated that wood waste ash can be effectively used as a cement replacement material for the production of structural concrete/mortar of acceptable strength and durability parameters.

In the present study water absorption, compressive test are performed in simulated environment of cement mortar, an overview of the work carried out with cement mortar in which cement is partially replaced by wood waste ash on several aspects such as the physical, chemical, strength and durability properties of mortar with wood waste ash and the result shows Compressive strength of 40mm cubes at 0% replacement of WWA is 24.07 N/mm<sup>2</sup> at 7 days of curing and 28.13 N/mm<sup>2</sup> at 28 days of curing while at 10% replacement of WWA, the compressive strength is 17.28 N/mm<sup>2</sup> at 7 days of curing and 20.67 at 28 days of curing. It is clear from results that at replacement of 10%, compressive strength decreased by 26.52% in comparison to control mortar and also Water absorption capacity of mortar decreases with increase in percentage of wood ash. The reason behind this is that the particles of wood waste ash are finer than particles of cement which also acts like a filler material in hardened state.

**KEYWORDS:** Wood waste ash; Water Absorption Coefficient of Cement Mortar ; UTM Machine; Mortar with wood waste ash.

## 1. INTRODUCTION

This chapter contains the introduction, wood ash origin, wood ash applications, factors that affect quantity and quality of wood ash and objectives of wood ash in cement industry[1]. This chapter also deals with the problems that arise from combustion of wood, from cement industries and how we can handle wood ash economically as well as environment friendly. In the

current trends of energy production, power plants which run from biomass have low operational cost and have continuous supply of renewable fuel[2].

The thermal combustion/incineration reduces the mass and the volume of the waste up to a large extent, thus providing an environmentally safe and economically efficient way to manage the solid waste. Solid wood waste is commonly preferred as fuels over other

light/herbaceous and agricultural waste as their combustion produces comparatively less fly ash and other residual material[5].

### Origin of WoodAsh

The combustion/incineration of wood biomass produces wood ash as a by-product. A major problem arising from the usage of forest/agricultural waste product as fuel is related to the ash produced in significant amount after the combustion of such wastes[3]. It is commonly observed that the hardwood produce more ash than softwood and the bark and leaves generally produce more ash as compared to the inner part of the trees.

### Applications of Wood ash

Ash by-products obtained from combustion of wood biomass are generally used in land filling for embankments, road/highway construction[8]. It can be used as soil supplementing material to reduce the alkalinity of soil in agricultural lands. And it can also be used as raw material in the manufacturing of cement in cement industries[17].

As per current situation, approximately 70% of wood ash produced is managed by land filling, 20% of total wood ash produced is used as a soil supplement material for agricultural activity and the remaining 10% is implemented for other/miscellaneous applications as metal recovery and pollution control[10].

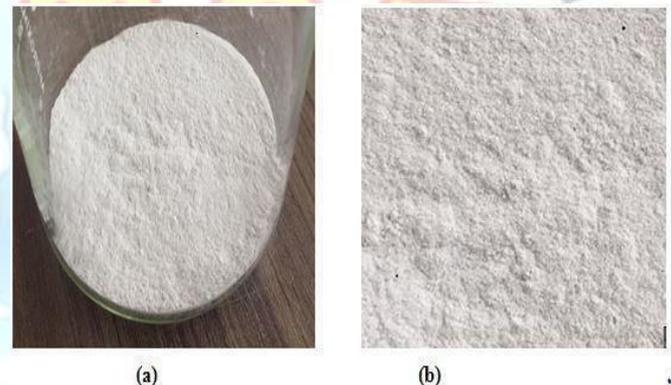

As per current situation, approximately 70% of wood ash produced is managed by land filling, 20% of total wood ash produced is used as a soil supplement material for agricultural activity and the remaining 10% is implemented for other/miscellaneous applications as metal recovery and pollution control.

**Udoeyo et al. (2006)** found the behavior of concrete containing wood ash at varying replacement percentages (0%, 5%, 10%, 15%, 20%, 25%, 30%). It was found out by experiments that concrete mix with WWA as a replacing material, decreases the workability of concrete[6,7]. This was due to that wood ash particles are smaller than that of cement particles due to which, wood ash particles has more specific surface area. Hence these particles absorb more water and ultimately, workability decreased.

Similarly, **Elinwa and Mehmood (2002)** found that when the cement is partially by wood waste ash obtained from open combustion/incineration of saw dust ash had the adverse effect on workability of grade 20 concrete. At constant w/c ratio of 0.565, when the percentage of replacement of cement is increased from

5% to 30% by weight of cement, slump value of concrete is decreased by 5-40mm with respect to control mix.

However, **Horsakulthai et al. (2011)** studied the effect of finely ground ash obtained from combustion of wood, rice husk ash, sugarcane bagasse waste (BRWA) as partial replacement of cement on chloride permeability of concrete. They used replacement percentages as 0%, 10%, 20%, 30% and 40% of total cement content by weight. It was concluded that incorporation of wood ash enhanced the chloride permeability. In the present study, The report presents an overview of the work carried out with cement mortar in which cement is partially replaced by wood waste ash on several aspects such as the physical, chemical, strength and durability properties of mortar with wood waste ash. This report shows the effect of wood ash on the workability, porosity, water absorption, compressive strength, flexural strength, thermal cycling, salt crystallization and rapid chloride permeability test etc.

**Fig 1: Wood Waste Ash Obtained from Open Burning.**

## 2. EXPERIMENTAL SETUP

### 1. Water absorption Test

To perform this test, we made prisms of size 40mm\*40mm\*160mm as per BS EN 1015:1999 Part-18, three for each replacement percentage (0, 5, 7.5, 10%). Take material in already given proportion as the cement and sand ratio is 1:3 and water/cement ratio is 0.50 and mixed it by hand or by epicyclic mixture. Prepare three specimens for each replacement percentage for testing at an age of 28 days.

**Fig 2: Moulds for Prisms of Size 40mm\*40mm\*160mm.**

**Testing:**

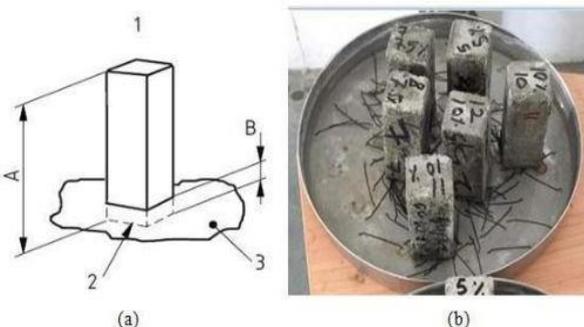

The prisms were dried at a temperature of  $60\pm 5^{\circ}\text{C}$  till constant mass is attained. The constant mass is reached when the difference between two consecutive weighing is very very negligible. Drying was done at lower temperature instead of higher temperature so that organic matter in mortar, if present, should not be decomposed and so that structural water should not be destroyed.

After drying to constant mass, samples are coated with wax/epoxy on all four faces lengthwise as shown in fig 3.10 so that evaporation from sides does not take place.

**Fig 3: Prisms with Epoxy Coating**

Now, cut these samples into two halves (i.e., 80mm) and place the samples into tray as shown in fig 3.11 with cutting edge downwards in water. Put water upto 5 to 10mm depth into the tray to allow capillarity in samples.

**Fig 4: Immersion of Samples into Water Tray**

Remove the samples after 10 minutes to get readings. Weigh individually the specimen and note down as M1. Now, take the readings after 90 minutes and note.

**2. COMPRESSIVE STRENGTH:**

Compressive strength is defined as the resistance of mortar breaking under compressive load. It is the capacity of mortar to withstand under compressive load which break the specimen or fracture occurs in specimen. Here, compressive load is applied by Universal Testing Machine or by Compression Testing Machine.

To perform compressive strength test, we used two broken pieces (two halves) of flexural strength test (as mentioned in **BS EN 1015-11:1999**). When load was applied on prisms in flexure test, these prisms broke into two halves. These two halves were used for compression test. Two bearing plates of steel of size **40mm\*40mm\*10mm** are used to apply load on broken pieces.

**Testing:**

Test the samples at 7 days and 28 days after regular curing. **Universal Testing Machine (UTM)/ Compression Testing Machine (CTM)** of capacity 3000kN are used to test the compressive strength. Prisms, to be tested, were placed on UTM/CTM as shown in fig 5.

Bearing plates were applied, one above the prism and the other one below the prism, to uniformly distribute the load and to apply load on specified area (40mm\*40mm). Fig.5 shows the different arrangements of placing the sample between

**Fig 5: Different Arrangements of Bearing Plates on UTM**

The loading rate should be uniform (without shock) at a rate of **10N/sec to 50N/sec** so that failure can occur within a period of 30 sec to 90sec.

Calculate the compressive strength as the maximum/peak load carried by the specimen divided by its cross-sectional area (area of bearing plates). Record the strength of each specimen individually.

### 3. CALCULATIONS

UTM/CTM gives us peak load (in kN) value. We have to find out compressive strength/compressive stress (in N/mm<sup>2</sup>). To get compressive strength of broken halves (obtained from flexural strength test), we use following formula:

**Compressive Strength = Peak load/ area of bearing plates**

where,

Area of bearing plates = 40mm\*40mm = 1600mm<sup>2</sup>

To get compressive strength of cubes, we use following formula:

**Compressive Strength = Peak load/ area of cube [13,19]**

where, Area of cube = 50mm\*50mm = 2500mm<sup>2</sup>

### 4. RESULTS AND DISCUSSION

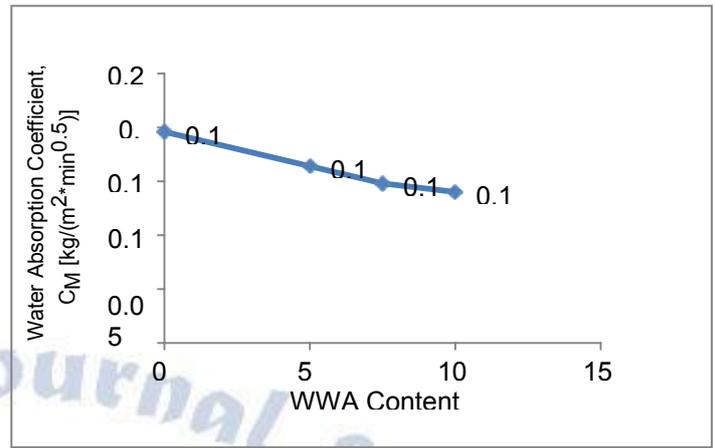

This chapter contains the outcomes of our experimental work. In this chapter, results of all the experiments are mentioned with their explanations and reasons behind the outcomes. This chapter gives the details of variation in results, graphical and tabulated representation of results.

#### 1. Water Absorption Capacity

Water absorption capacity is measured by calculating water absorption coefficient and for all replacement levels, water absorption coefficient is depicted in table 1 and Variation in water absorption coefficient [11,13], when replacement level of wood ash in cement is increased, is shown in fig 6.

**Table 1: Water Absorption Coefficient of Cement Mortar Containing WWA**

WWA Content (%)	Water Absorption Coefficient, C <sub>M</sub> [kg/(m <sup>2</sup> *min <sup>0.5</sup> )]	Mean of C <sub>M</sub>
0%	0.197	0.196
	0.184	
	0.209	
5%	0.172	0.164
	0.160	
	0.162	
7.5%	0.159	0.148
	0.145	
	0.140	
10%	0.147	0.140
	0.139	
	0.135	

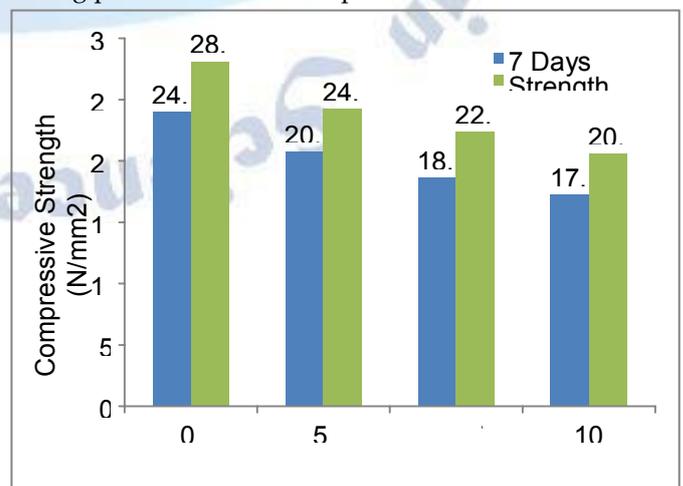

**Fig 6: Variation in Water Absorption Coefficient with Different WWA% Levels**

From figure 6, Water absorption capacity is inversely proportional to porosity and directly proportional to bulk density. Water absorption capacity of mortar decreases with increase in percentage of wood ash. The reason behind this is that the particles of wood waste ash are finer than particles of cement which also acts like a filler material in hardened state. As these particles are smaller than cement particles, they fill the void space between cement and sand particles [14,15]. As we increase the percentage of wood ash, we get compacted matrix which reduce water absorption capacity of hardened mortar.

#### 2. Compression Test

The Variation in compressive strength of broken pieces obtained from flexural test, for 7 days and 28 of curing, is shown in table 2. UTM gives load value, we have to convert these load values in stress values by dividing load value from area of samples [1,12,18].

From Figure 7, shows how the strength values differ with each other at 7 days curing period and at 28 days curing period at different replacement level

**Fig 7: Variation in Compressive Strength with Variation in WWA Content at 7 Days and at 28 Days (Broken Halves)**

the compressive strength of cubes of 50mm size with different replacement levels of wood ash in cement mortar illustrated in table 3.

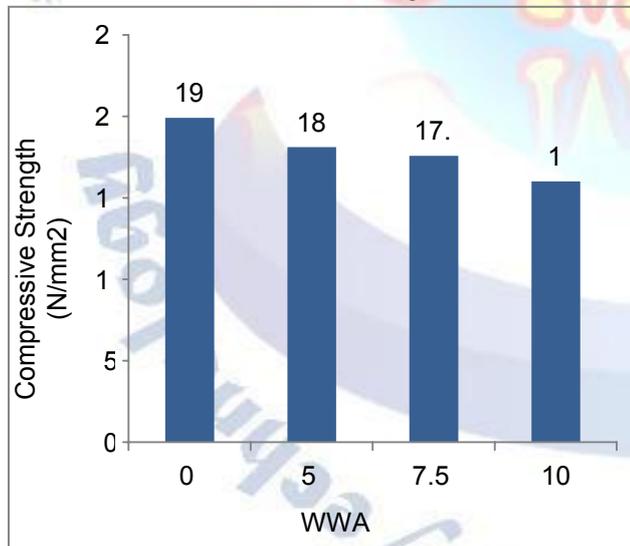

**Table 2: Compressive Strength of Mortar with WWA (Cubes)**

WWA Content (%)	28 days strength (N/mm <sup>2</sup> )
0%	19.9
5%	18.1
7.5%	17.56
10%	16

**Table 3: Compressive Strength of Mortar with WWA (Broken Halves)**

WWA Content (%)	7 days strength (N/mm <sup>2</sup> )	28 days strength (N/mm <sup>2</sup> )
0%	24.07	28.13
5%	20.81	24.23
7.5%	18.63	22.37
10%	17.28	20.67

The Variation in Compressive Strength of Cubes with Variation in WWA Content at 28 Days graph of decrease in compressive strength with increase in percentage of wood ash in mortar is shown in fig 8.

**Fig 8: Variation in Compressive Strength of Cubes with Variation in WWA Content at 28 Days**

Main components of cement are C<sub>3</sub>S, C<sub>2</sub>S, C<sub>3</sub>A and C<sub>4</sub>AF. During hydration process, C<sub>3</sub>S and C<sub>2</sub>S react with water to form calcium silicate hydrate (C-S-H) gel. C-S-H gel is important for good binding properties in mortar/concrete.

If silica content is more, more is the formation of C-S-H gel and more is the strength. But, from chemical composition of wood ash, silica is present in negligible amount which reduce the formation of C-S-H gel, hence reduction in compressivestrength[4,21,22].

## 5. CONCLUSIONS

On the basis of results and discussion following conclusions are drawn:

1. Compressive strength of 40mm cubes at 0% replacement of WWA is 24.07 N/mm<sup>2</sup> at 7days of curing and 28.13 N/mm<sup>2</sup> at 28 days of curing while at 10% replacement of WWA, the compressive strength is 17.28 N/mm<sup>2</sup> at 7 days of curing and 20.67 at 28 days of curing. It is clear from results that at replacement of 10%, compressive strength decreased by 26.52% in comparison to controlmortar.
2. Flexural strength results show that there is a significant decrease in flexural strength at upto 10% replacement level of wood ash. At 0% replacement of cement by WWA, the flexural strength is 7.1 N/mm<sup>2</sup> and at 10% replacement, strength is 5.82N/mm<sup>2</sup>.
3. If silica content is more, more is the formation of C-S-H gel and more is the strength. But, from chemical composition of wood ash, silica is present in negligible amount which reduce the formation of C-S-H gel, hence reduction in compressivestrength.
4. Water absorption capacity of mortar decreases with increase in percentage of wood ash. The reason behind this is that the particles of wood waste ash are finer than particles of cement which also acts like a filler material in hardened state.
5. Workability decreases with increase in replacement percentage of woodash.

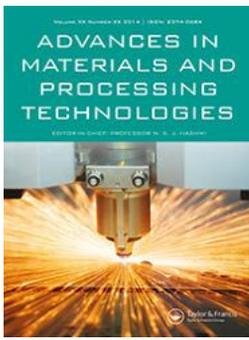

## Conflict of interest statement

Authors declare that they do not have any conflict of interest.

### ABSTRACT

Incremental sheet formation (ISF) is extensively used versatile technique for newer manufacturing processes, such as creating skull prostheses, aerospace equipment, automobile, and so on. The current work describes the techniques, history, and classification of ISF-based on the results of few aspects such as force forming, stress triaxiality, force forming, bending stress, and so on. In addition, the influence of different parameters and their effect on building force, formability, spring-back, failure, surface roughness, rupture, and so on, have been analysed. It has been noticed that an investigation of the two degrees of freedom (DF) robot-manipulators with the ISF and its influences on surface coarseness and formability are greatly suggested.

### ARTICLE HISTORY

Accepted 8 January 2023

### KEYWORDS

ISF; spring back; forming forces; SPIF

## 1. Introduction

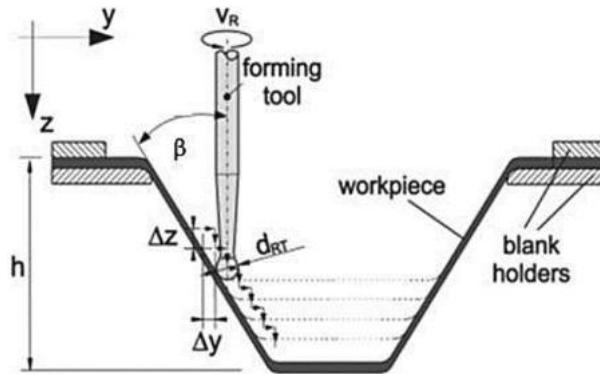

ISF technique is invented to minimise demerits of deep drawing of distinct processes, higher operation cost and the complications. Using the ISF technique, the shortcomings [1] had been excluded applying recently introduced die and punch-less methods [2] and are appropriate for short run production. In addition, the ISF practice is also used to produce a compound 3D object at a genuine price [3] that was difficult for built-up by conventional approaches. In the ISF, the forming instrument rotates inward towards a radial contour of a sheet clamped between blank pockets and support plates; hence a final shape is acquired [4]. A moderately a low price of hardware, higher flexibility of the forming process, and superior formability are the key rewards of ISF. Incremental sheet hydro-forming (ISHF) grow into a vital attention towards exploration as an advanced material processing-methodology for investigators over a decade due to its features of heightened formability than the traditional processes [5]. J. Jeswiet et al. [6] discussed about integrating surface unevenness of the deformed component, multi-pass system, tool, and SPIF at raised temperature. It was reported that a galvanised steel and tool made of stainless steel offers

an utmost outstanding combination of excellent formability and a minor surface roughness. Malwad and Nandedkar [7] used a hemispherical tool that affected both the surface coarseness and formability. It was reported that, formability decreased for lower (less than 6 mm) diameter of tool. Abbas [8] compared the effect of elliptical profile tool on final product profile, final thickness, and strain and stress distribution of formed component over results by hemispherical and flat profile tools using numerical simulation. They obtained forming limitation curve of negative slop with much higher strains by forming sheets into a variety of geometrical shapes, including dome, cone, hyperbola, pyramid, using SPIF. Chen Ke et al. [9] proposed a constitutive model of aluminium 2024 T4 sheet of 1 mm thickness for comparative (theoretical and experimental) stress-strain analysis of a truncated cone. Moreover, Behera et al. [10] stated that a higher formable wall-angle acquired by several researchers using instrument of different diameters to make a varying or fixed wall angle of a multiplicity of sheet materials of altered thicknesses. The researchers stated the scope in instantaneous governance over dimensional accuracy with thickness variation for an actual tool-path improvement strategy [11]. In the ISHF process, pressurised fluid in the chamber applies pressure on the backside of the sheet and others, similar to the ISF process. The 20 mm tool diameter, wall angle 45°, and speed of 200 mm/s move on a 0.85 mm sheet (Al6061 T6 material) in both cases ISF and ISHF. The ISHF process overcomes the drawbacks of non-uniform sheet thinning and reduces the spring back experimental done on conical and rhomboidal frustum [12]. Formability assessment of any sheet material is an interest to bring out in requisites of sheet thickness distribution after forming, maximum formable wall angle, and maximum formable depth of the component formed using single point incremental forming (SPIF) [13]. A consequence of process parameters and material property parameters on dimensional and geometrical accuracy of the produced component through SPIF is also the key interest of research. Formability is the ability of the material to withstand the stretch or draw stresses of forming before failure in terms of necking or bearing spherical tool profiles. The formability of a material mainly depends on the factors like anisotropy, strain hardening, yield strength, ductility, strain hardening, modulus of elasticity, and so on. An elastic modulus of the material plays a vigorous role that defines elastic spring-back. It meant that as the modulus of elasticity of Aluminium is one-third of that of Steel, the spring back of Aluminium will be three times that of Steel. Hence, it is desirable to carry out the deformation beyond the desired point based on the amount of spring back.

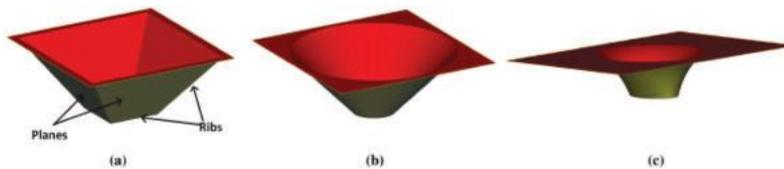

## 2. Classification of newer IF techniques

The term incremental forming (IF) [14] is meant that at any instant of time, only a slight portion of a product deforms using a deforming tool by applying incremental feed step-by-step as shown in Figure 1 [15]. For an example, three features of ISF planes-ribs, cone shown with ruled feature and freeform feature of double curved hyperboloid are presented in Figure 2. A ruled feature which swept towards directrix line, can be represented by a generatrix curve. A double curved surface cleared towards alternative curve that forms a freeform-surface [16].

Further, ISF is divided in two categories namely, traditional and hybrid methods as described below. Further, the conventional ISF methods are of three types such as a single

**Figure 1.** Basic principle of IF [15] with forming angle  $\beta$ , and incremental step-down size.

**Figure 2.** Different types of behavior during ISF (a) planes-ribs, (b) cone shown for ruled feature, and (c) Double-curved hyperboloid [16]. .

point incremental forming (SPIF) process, two-point incremental forming (TPIF) process, and multi point incremental forming (MPIF) process.

### 2.1. SPIF

In SPIF, the sheet is held between backing plate's and blank holders, to attained a preferred shape. Also, it is known as negative die-less forming. Furthermore, to distinguish the formability of a material, a forming angle is used in the SPIF method. Though, the custom of  $\beta_{max}$  provides only a rough guess due to the complexity of distortion mechanisms in SPIF, while the formability is not possible to expressed using a single constraint [17,18]. A few distinct geometries produced by SPIF method are illustrated in Figures 3 and 4.

### 2.2. TPIF

There are two styles of tools to support and form the back side of the sheet, in which both ends are clamped during the process; it is named die-less positive, positive forming. Generally, in ISF, a hemispherical-shaped instrument employed to process the sheet in stages, following a tool tack tailored to a geometry created on computer-numeric controlled (CNC) device.

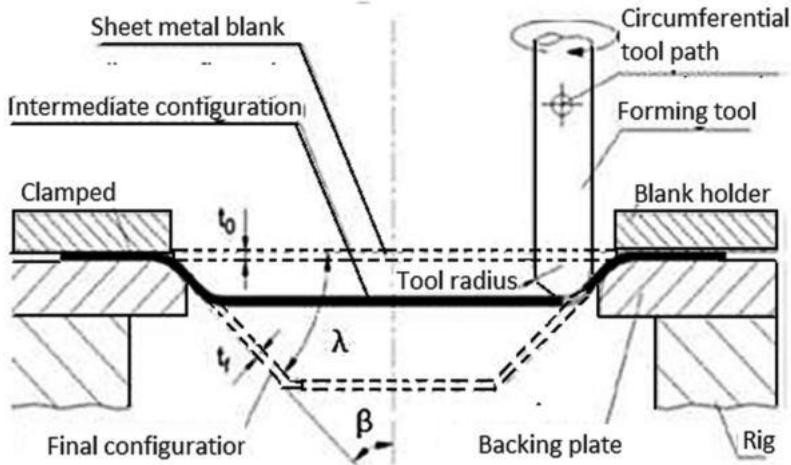

Figure 3. Schematic view of SPIF [17].

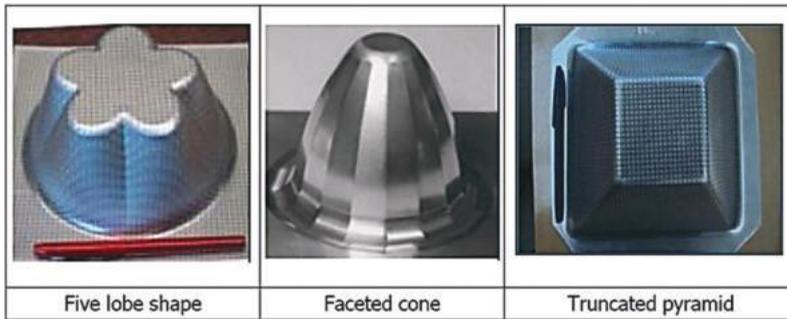

Figure 4. Examples of a few geometries created by SPIF [18]. .

### 2.3. MPIF process

MPIF process is a flexible three-dimensional manufacturing technique applied for a very long sheet. In this process, between two opposite lower and upper-dices, a matrix of multiple-punches is fitted with a climb to height via linear actuators that press a blank to find required desired shape. As shown in Figure 5, the alignment of two upper and lower blank holders was used in various sections, and every section has diverse hydraulic cylinders governed by the servo motor equipped mechanism. While the forming forces are provided from the blank holders to give the preferred shape [19].

#### 2.3.1. SPIHF

In SPIHF technique, only a forming tool is to perform required activities, while an opposite-side was supported using hydraulic-fluid by the pump [20]. Currently, various investigations are going on it because of the thinning problem.

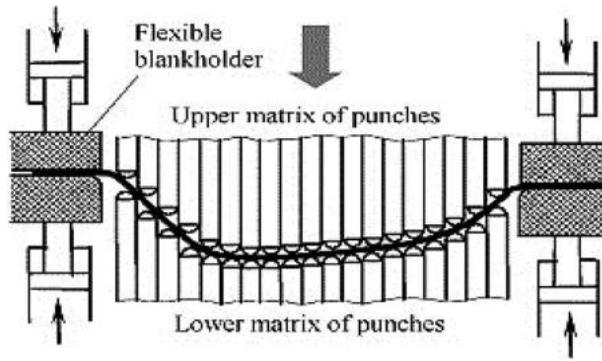

Figure 5. MPIF of sheet metal with blank holder [19].

2.3.2. TPIFPD

A forming tool travels on one face of a formable-sheet, while the other face used partial-die [20]. By comparing TPIF with PD and SPIF, the portions fabricated using these two processes. While, total geometric accuracy is found better in TPIFPD as compared to SPIF due to high negligence of elastic recovery in unloading.

2.3.3. TPIFD

In this technique, a forming tool rotates on a side, while other side, a full die is applied in Figure 6. There is applied a complete and partial in a small series production. In a double-sided ISF, the two tools were used to create geometry on the sheet while in opposite side used local associate tool to deliver local hold [21].

Various process parameters influencing incremental forming process comprises sheet blank of initial thickness of  $t_i$  and final thickness of  $t_f$ , wall angle of  $\phi$ , tool diameter, the spindle rotational speed, incremental, stage depth of  $\Delta z$ , tool-end geometry, tool-sheet interface lubrication, and tool path strategy.

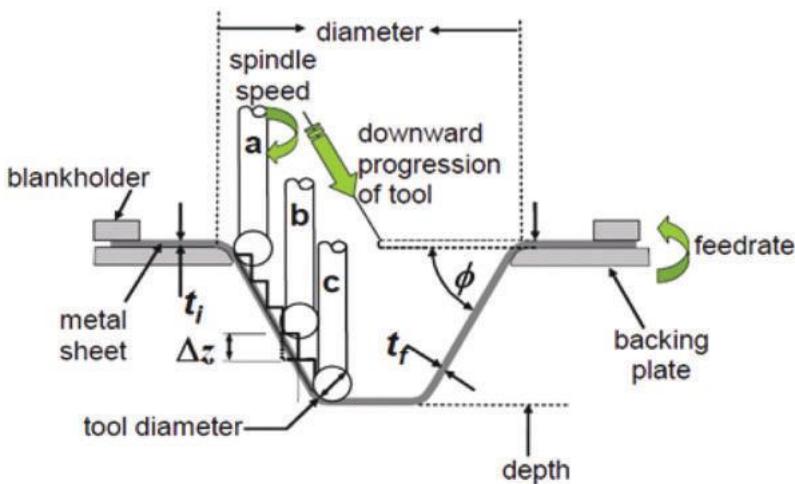

Figure 6. SPIF Terminology in a deformed part [21].

## 2.4. Sheet materials

Nowadays, many researchers have reported the effect of process parameters in relation to properties of various grades of sheet metals like AA1050-O, AA6114-T4, AA3003-O, and so on. Copper, Brass formed by SPIF. Ham and Jeswiet [21] conducted experiments using the design of experiments for deforming a cone out of AA3003-O of thickness ranging from 0.8 mm to 2.1 mm. The authors presented a methodology to develop FLDs for forming AA6451, AA5182, and AA5754 using SPIF and summarised that material with lower ultimate tensile strength offers more formability. It was reviewed the procedure to generate the contour and spiral tool paths for incremental sheet forming. Based on sheet blank materials and component geometries can be observed that the major work had been carried out for Steel sheets, Aluminium sheets, and its alloys. Similarly, major work on the component geometry of constant wall or variable wall angle frustum of the cone was found. Very less work had been found on the hard sheet metal like Ti, Mg, and its alloys to form it into pyramidal geometry.

## 2.5. Parameters affecting ISF

The number of critics arises that require distinct conversation in order to optimise the governing ISF parameters. The major process affecting parameters are wall angle, tilting angle, forming angle, sheet thickness, step depth, spindle speed, feed rate, temperature, stress tri-axiality, bending and rotational speed and interface of these parameters [22]. There are a few other considerable parameters in ISF that cannot be tolerated, such as formability, surface-roughness (SR), geometric accuracy, and forming forces.

### 2.5.1. Formability

Formability is a critical parameter in deciding the material deformation capability. Usually, there are four types: tool profiles of flat, angular, parabolic, and hemispherical shapes. Also, contour and spiral types of tool paths were used in ISF [17] that influence formability consistently as per the experimental observations on FLD [23].

SPIF affords a quick and cheaper forming process, easy however exciting form with sort of forming strategies for lubrication [24]. Multi-Stage SPIF (MS SPIF) is a variety of stages in SPIF employed for small quantities and complicated sheet metal domains of the vertical axis. Also, in MS SPIF the strain path is noticed linear and nonlinear in other succeeding steps [25]. Test the formability and to get FLD proposed on the basis of different forming techniques and it is affected through loading path and to show the feasibility. Forming test offers diverse approaches with uncommon distributions on the rupture points [26]. To further enhance the formability and surface roughness using digital image correlation (DIC) approach, to study the major and negligible strains and compare the result with FEM [27].

### 2.5.2. Surface roughness C

A surface coarseness tester can be used by inserting it into the display unit and also can be used by detaching it from the display unit. Also, process parameters are examined related to effect on surface roughness. Another main focus is on the bending effect, stress-strain analysis in Forming Limit diagram (FLD), formability, and accuracy [27]. The FLD has

for failure and safe zone of ISF, economy, flexibility, small-batch manufacturing, and remarkably rapid prototyping [20]. It is observed that the surface roughness is affected by the numerous parameters, namely feed rate, step depth, tool radius, sheet thickness after applying etching, and different tool types affect the surface roughness [28].

### **2.5.3. Geometric accuracy**

During the ISF process, produced geometry represents some errors along the oblique walls; elastic spring back reduces, and geometric is higher than in the other areas. Continuous yielding of the sheet becomes problematic at a higher rate of strain hardening for hard material, which requires a higher load and energy to deform the sheet. Deflection of smaller diameter tool during operation of SPIF against hard sheet metal also leads to deviation of geometrical accuracy.

### **2.5.4. Forming forces**

The load cell measures the occurrence of forming forces during the ISF process fitted on the tool holder [29]. During sheet deformation, analytically predict the forming forces and experimentally arises in three-dimensional perspective view analysed [30]. Analytical predictions of forming forces in SPIF with the hydraulic fluid process have developed based on analytical models used to compute part through-thickness stress in the 3-D perspective view is obtained during the sheet deformation. Experimentally, the process parameters with total force, moment, the thickness of the component, and plastic strain distribution [31] in a sequence of additional SPIF tests; to evaluate the influence of the axial forming force [32]. Finally, on the variation of the process parameters, the forming force varied [33].

## **2.6. Stress triaxiality, spring-back and fracture strain**

There are several available aspects out of them we have studied a few such that stress spring back, fracture strain, and triaxiality.

### **2.7. Stress triaxiality**

Stress triaxiality deformed a sheet in radial, circumferential and meridional directions [34]. Stress triaxiality is less stable in deformation stability, and a thinning sheet thickness occurs, leading to failure. In the maximum shear stress (MSS) criterion, the fracture condition characterised by stress triaxiality parameters is a mean to yield pressure ratio.

### **2.8. Spring back**

There are two types of spring-back in SPIF. The tool passes over the formable sheet to achieve a desired shape by removing additional geometry because it yields a poor accuracy. Also, a global spring back is formed due to other residual stress developed in the matter. Also, it has been discussed a spring-back and the accuracy of the desired product [35].

## 2.9. Fracture strain

The major and minor strains are plotted along the Y- and X-axis, respectively, in the FLD diagram in Figure 5. A combination of the stress and strain analyses the fracture initiation in ISF. The elongation at fracture, the ratio of changed to initial length after breakage of the test specimen. This fracture criterion is used to revise the scale impact and previously published experimental records are used to authenticate the feasibility [36]. Forming assessment offers diverse approaches with different deliveries at breakage points, it occurs in contact and vicinity of the contact zone [37]. In MS-SPIF comparison of measured and calculated primary and secondary forming strain distributions of a spherical and cylindrical roller [38] of experimental deformation [39] and Analytical validation of the results is achieved [6]. During the control of material provides thinning and thickening of sheet and effect tool path of forming limit curve [40]. G. Centeno et al. [37] took tool diameters 6, 10, and 20 mm rotate on AISI 304 metal sheet thickness of 0.8 mm and evaluate forming forces, failure, and fracture strain measure at failure and crack initiation. The influence of varying process parameters like tool diameter, spindle speed and step down is on suitability. At the contact area of tool and blank prediction, analytical of forces in three directions with process parameters feed rate, tool diameter, and constant sheet thickness AA2022 sheet, wall angle, and results verify by extra experiments, in which high accuracy and maximum prediction of error less than 18% of forces have obtained [41].

Poor ductility of a specimen at atmospheric conditions is hard to form employing ISF. There is numerous heat affected approaches to apply, such that, electric, induction, laser halogen lamp, hot air, oil, heat friction, are applied on different materials [42]. A laser and other heating methods improve formability by local heating of sheets [43]. A hemispherical tool used with process parameters producing a series of plastic deformations affects formability [3]. At the critical radius, 2.2 times of blank thickness was found out excessive compression with low damage maximise formability [44]. It functions at a continual feed rate, and tool-hammering, stable SR is obtained using an industrial robot [45]. Improving geometric accuracy and multistage forming have discussed and compared mechanics of deformation and forming limits, distribution of stresses- strains derived. The selected process parameters are more affected by the formability and hardening law [46]. So all the experiments observed that surface roughness varies with process parameter.

## 2.10. Process capabilities

According to several investigates, explanations, and strategies in IF recommended to the improvement in ISF about the process capability. To mark one portion at a time, noble accuracy by means of simulation, emerging time and energy depletion, water jet method is found accurate and, sheets appearance of non-simulation.

## 3. Discussion and future scopes

Influence of input constraints on surface coarseness, spring-back, precision the formability, and miscellaneous in SPIF were examined outcomes illustrations that:

An increase in tool speed, spindle rotation speeds, sheet thickness, wall angle, forming angle, and electric current, but the decrease in tool diameter, tool feed rate, step down, tensile stress sheet rotational speed, respectively, shows formability increases. The interaction of (a) smaller tool size and step size, (b) decrease in sheet rotational speed and increase in tilting angle, and (c) increase the rotational speed and decrease the feed rate all tends to formability increases. As per previous investigations, feed rate does affect the surface roughness. In the case of other parameters, spindle speed increases, but wall angle, step depth, and forming time decrease, respectively, tend to enhance the surface roughness. The utmost outstanding amalgamation of a better formability and very low surface roughness is delivered by adopting flat-ended tool. The presence of feed rate interfaces and friction coefficient upgraded surface quality and with no influence on the formability. Spring-back can also be diminished by perfect calculation and modifying the tool path. In a deformed part wall, spring-back can be diminished with the increase of the tensile force. Also, the forming force was noticed to be decreased by increasing the temperature. Finally, the destruction value along meridional direction tends increases the fracture tendency and its value higher than 1.0 leads to crack in sheet. Future prospectus conclude the consequence of many constraints and their interfaces can affect the formability, geometrical accuracy, and SR of AA3003-O by means of SPIF. Multi DOF robotics in the ISF, ISHF, and a corresponding mechanism can distort the sheet incrementally. In order to appraise formability, dimensional accuracy, and spring-back for a constant slope and force, and variable slope and force.

#### 4. Conclusions

Formability is affected due to the dissimilarity of distinct parameters and its interaction. Some elements of SPIF play a vital role in enlightening formability, flexibility, and forming time reduction, while some process constraints and parts of SPIF have noticed an effect on the surface finish and accuracy. Furthermore, it is observed that the decrease in spring-back property effects reduces elastic limit and increases strength. Also, a two degrees of freedom (DF) robot-manipulators with the ISF and its influences on surface coarseness and formability are greatly suggested for future prospective.

# Triethoxyoctylsilane-Modified SiO<sub>2</sub> Nanoparticle-Based Superhydrophobic Coating for Corrosion Resistance of Mild Steel

Konica Sharma, M.K. Malik, Amrita Hooda, Kailash Pandey, Jaishree Sharma, and M.S. Goyat

Submitted: 30 June 2022 / Revised: 18 September 2022 / Accepted: 14 October 2022

In this work, SiO<sub>2</sub> nanoparticles-based corrosion-resistant superhydrophobic coating for mild steel has been developed. A wire electrical discharge machine (EDM) was used to cut micro-patterned mild steel followed by chemical etching via Piranha solution. The etched metal was coated with triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles via the solution method to generate the hierarchical micro-nano roughness with low surface energy. The developed coating exhibited micro-nano hierarchical roughness due to SiO<sub>2</sub> nanoparticles and their clusters, verified by atomic force microscope (AFM) and field-emission scanning electron microscope (FESEM) analysis. The maximum water contact angle (CA) of  $153 \pm 2^\circ$  with a sliding angle (SA) of  $5 \pm 2^\circ$  was obtained for the coated mild steel. The electrochemical impedance spectroscopy (EIS) plots confirmed the noteworthy corrosion resistance performance of coated metal over the uncoated one. Thus, the modified SiO<sub>2</sub> nanoparticles-based superhydrophobic coating could be a good option for inhibiting the corrosion of mild steel.

**Keywords** corrosion resistance, mild steel, SiO<sub>2</sub> nanoparticles, superhydrophobic coating, triethoxyoctylsilane

## 1. Introduction

Mild steel is one of the extensively utilized types of steel due to its low-cost and exhibits such properties, which are suitable for a wide range of applications like transportation, construction and oil and gas pipelines (Ref 1). Conversely, worldwide every year, billions of dollars are spent on repairing or replacing corroded mild steel. It is well acknowledged that mild steel suffers from corrosion when exposed to moisture and air (Ref 2). Moisture protection of mild steel is more challenging forcing the researchers to manufacture water-resistant mild steel using the fundamental concepts of hydrophobicity (Ref 3). Lotus leaves, bird feathers and water strider legs are natural water-resistant objects (Ref 4, 5). Such objects exhibit superhydrophobicity. The superhydrophobic surfaces of any material have a static water contact angle  $> 150^\circ$ , which results in the bouncing of water droplets on their surface or displaying non-wetting behavior. Several researchers mimic these types of natural superhydrophobic features on

artificial surfaces to utilize their benefits for various applications, such as anti-corrosion, anti-oxidation, water drag reduction, anti-soiling and anti-icing (Ref 5-8). Superhydrophobic surfaces have unique features such as low surface energy and micro-nano scale structures (Ref 9). Numerous methods were tried out in the past to generate micro-nano level roughness on the metals using well-known techniques such as electrodeposition, sandblasting, plasma etching, chemical etching, lithography and nanoparticle deposition (Ref 3). However, the most economical and feasible routes are chemical etching and micro-nanoparticle deposition (Ref 10-12). For the generation of superhydrophobicity on metallic surfaces, low surface energy of the surface is required which can be obtained easily on a chemically etched surface by the deposition of surface-functionalized nanoparticles. Over the past few years, various nanoparticles, such as carbon nanotubes, ZnO (Ref 12), TiO<sub>2</sub> (Ref 13), and SiO<sub>2</sub> (Ref 9, 14), were explored to generate nano-scale roughness to achieve superhydrophobicity. However, SiO<sub>2</sub> nanoparticles are most commonly used for superhydrophobic surfaces because of their low cost, ease of fabrication, ease of functionalization and low density compared to other nanoparticles (Ref 15). Such properties make these nanoparticles an ideal choice for manufacturing superhydrophobic surfaces. However, the use of surface-functionalized SiO<sub>2</sub> nanoparticles on chemically etched metallic surfaces is not been fully explored yet (Ref 9).

In the present study, a unique approach was employed to protect the mild steel from corrosion. A wire electrical discharge machine (EDM) was used to generate a micro-pattern on mild steel followed by chemical etching via Piranha solution. The wire EDM and chemical etching produced micron-level roughness on the surface of the mild steel. Then the etched metal was coated with triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles to generate the hierarchical micro-nano roughness with low surface energy. The superhydrophobicity

and anti-corrosion performance of the samples produced promising results, which can be very useful for the metal industry.

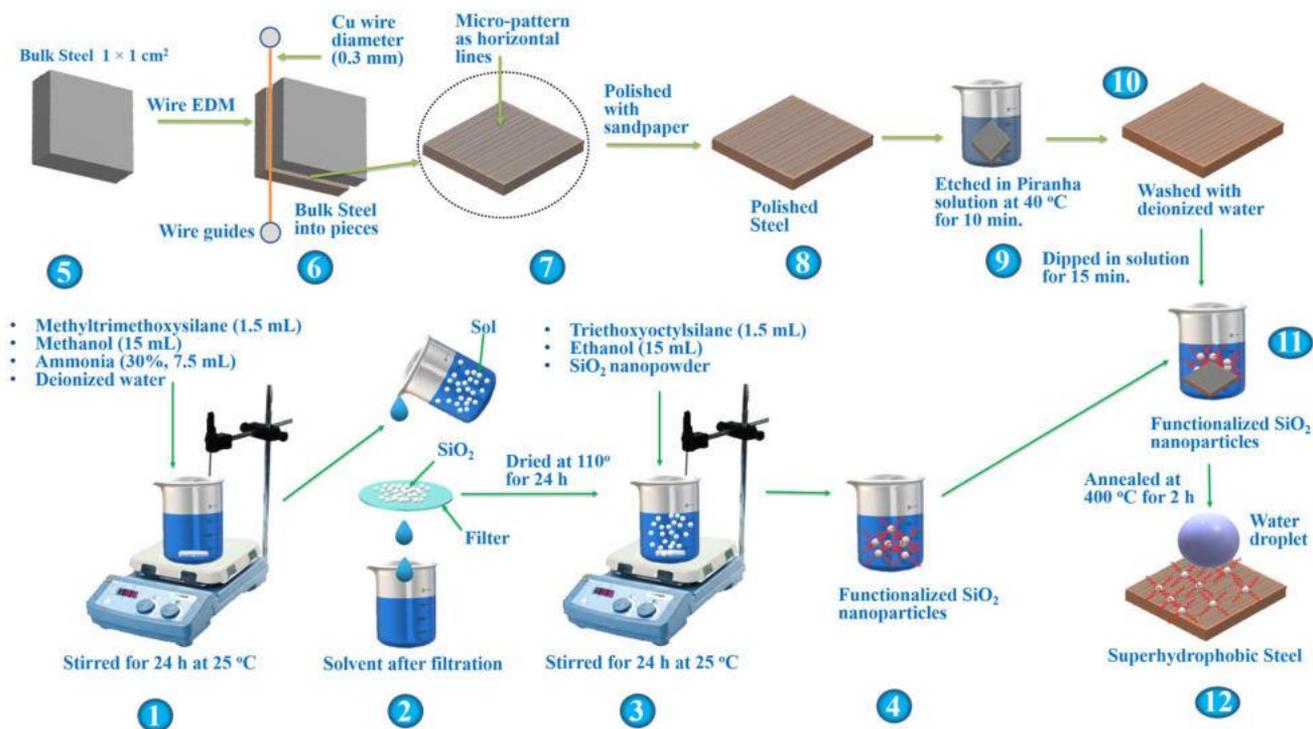

## 2. Experimental

### 2.1 Fabrication of Superhydrophobic Coating on Mild Steel

The fabrication of functionalized SiO<sub>2</sub> nanoparticles-based superhydrophobic coating on mild steel is schematically illustrated in Fig. 1. Methyltrimethoxysilane (1.5 mL), Methanol (15 mL), Ammonia (30%, 7.5 mL) and deionized water were continuously stirred for 24 h at 25 °C to obtain the silica sol. The silica sol was then filtered and dried at 110 °C for 24 h and collected as silica nanopowder. The surface of SiO<sub>2</sub> nanoparticles was functionalized by blending triethoxyoctylsilane (1.5 mL) and ethanol (15 mL) with the nanoparticles followed by magnetic stirring for 24 h at 25 °C. On the other hand, the mild steel of 1 × 1 cm<sup>2</sup> size was cut from the bulk sample using wire EDM (Ezeewin). The wire EDM created a micro-pattern in form of parallel lines over the metal substrate, which was further polished with 400-1200 Grit sandpapers. The polished substrate was ultrasonically cleaned in acetone for 30 min. The polished substrate was etched in a Piranha solution (Ref 16) (concentrated H<sub>2</sub>SO<sub>4</sub>, 98% and H<sub>2</sub>O<sub>2</sub>, 30%. Ratio 7:3) at 40 °C for 10 min. The etched substrate was washed with deionized water several times and dried at room temperature. The etched metal substrate was dipped in the solution of functionalized nanoparticles for 15 min. Later on, the coated substrate was annealed at 400 °C for 2 h to obtain the superhydrophobic mild steel.

### 2.2 Characterization

The morphology of triethoxyoctylsilane functionalized SiO<sub>2</sub> nanoparticles and deposited coatings were characterized using a high-resolution scanning electron microscope (FESEM, Quanta 200F, FEI, USA). The surface modification or functionalization of the nanoparticles by triethoxyoctylsilane was characterized by a Fourier transform infrared (FTIR) spectroscopy (Perkin Elmer FTIR/FIR Frontier, Spectrometer, USA). Both the functionalized and non-functionalized SiO<sub>2</sub> powder samples were separately mixed with high purity potassium bromide (purity 99.9%, Sigma-Aldrich) using a pestle motor and converted into transparent films using a stainless steel die and a hydraulic press. The infrared spectra of the transparent thin films was recorded at ambient conditions. Bruker D8 Advance Diffractometer (Germany) carried out the structural characterization of the samples with a Cu-K $\alpha$  radiation source. The optical micrographs of the samples were recorded using Nikon Eclipse MA200 optical microscope. The wettability of the samples was characterized using a drop shape analyzer (DSA 100, Krüss GmbH, Germany). An atomic force microscope (AFM, NT-MDT, Ntegra) was used to investigate the roughness and surface morphology of the samples. An electrochemical workstation (CHI 660E, CH Instruments, USA) was used to obtain polarization curves with a low scan rate of 0.2 mVs<sup>-1</sup>. The samples were immersed in corrosive salt solution (3.5% NaCl) to obtain polarization curves. The corrosion resistance of the samples was characterized using electrochemical impedance spectroscopy (EIS) from 200 kHz to 50 MHz frequency and via excitation of sinusoidal wave amplitude of  $\pm 5$  mV.

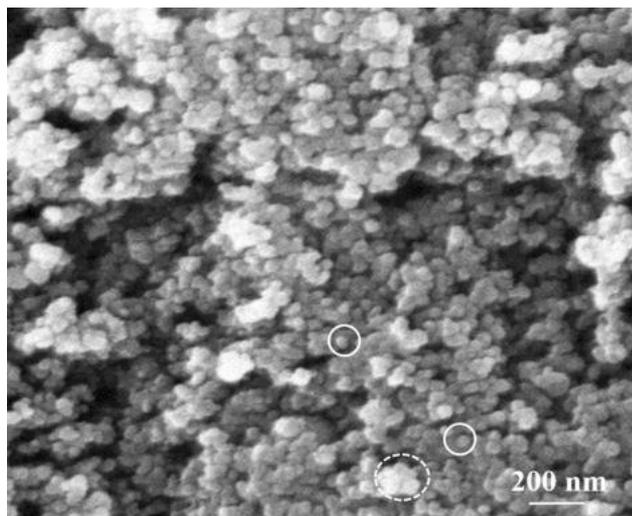

**Fig. 1** Schematic illustration of the systematic fabrication of functionalized SiO<sub>2</sub> nanoparticles-based superhydrophobic coating on micro-patterned and chemically etched mild steel

### 3. Results and Discussion

The FESEM image of triethoxyoctylsilane functionalized silica nanoparticles is shown in Fig. 2. The FESEM images revealed a very smooth spherical shape of the SiO<sub>2</sub> nanoparticles with an average size of ~ 30 nm. However, very limited large size clustered particles can be seen but most of the individual round shape particles are revealed by the FESEM image. This indicates the successful functionalization of the nanoparticle surface because the functionalization agent significantly reduced the clustering of nanoparticles (Ref 12). The particles in solid circles indicate the individual particles, and the particles in the dotted circle indicate the clustered particles (Fig. 2).

FTIR spectra of SiO<sub>2</sub> nanoparticles and triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles are shown in Fig. 3. Both the unmodified and modified SiO<sub>2</sub> nanoparticles reveal sharp absorption peaks at 1103 and 802 cm<sup>-1</sup>, which are designated as anti-symmetric and symmetric vibrational peaks of the Si-O-Si bond, respectively (Ref 17-19). A very broad peak centered at 3421 cm<sup>-1</sup>, which is common in both the spectra and a small peak at 966 cm<sup>-1</sup> in the case of unmodified nanoparticles are corresponding to the stretching vibration of Si-OH groups indicating the presence of hydroxyl groups on the surface of nanoparticles (Ref 19). In the case of modified nanoparticle spectra, the change in the position of absorption peak from 966 to 882 cm<sup>-1</sup> and the generation of new peaks at 2978, 2921 and 1381 cm<sup>-1</sup> are corresponding to C-H, CH<sub>3</sub> and C-O functional groups, confirming the surface modification of SiO<sub>2</sub> nanoparticles by long chain triethoxyoctylsilane (Ref 9, 19-22).

X-ray diffraction (XRD) pattern of uncoated and coated mild steel samples is shown in Fig. 4. The XRD analysis was performed to investigate the effect of the presence of SiO<sub>2</sub> nanoparticles-based coating on the crystallinity of the mild steel. The 2θ values were matched to the standard International Centre for Diffraction Data (ICDD) data card (04-014-0360). The XRD pattern of both the uncoated and coated mild steel samples revealed one sharp peak at 2θ = 45.26° corresponding to a plane (110) and one low-intensity peak at 2θ = 65.30° corresponding to a plane (200), which indicates polycrystalline

**Fig. 2** FESEM image of triethoxyoctylsilane functionalized silica nanoparticles

nature and body-centered-cubic (bcc) structure of mild steel (Ref 23, 24). However, the SiO<sub>2</sub> nanoparticles-based coating does not reveal any new peaks except a low-intensity peak at 2θ = 27.30°, which may be due to some impurity of the sample. Nevertheless, the relative intensity of the coated samples was reduced due to the coating on the mild steel substrate. The generation of no new peaks may be due to the amorphous nature of the SiO<sub>2</sub> nanoparticles. Thus, the coating does not change the basic structural characteristics of the steel substrate.

Optical microscopic images of polished mild steel and etched steel substrate at different magnifications such as 20X and 100X with their corresponding water contact angles (CAs) are shown in Fig. 5. The polished sample revealed parallel microscopic lines on the surface due to the use of wire EDM. The surface seems smooth and exhibits a water CA of 92° as depicted in the inset of Fig. 5(a). The water CA > 90° indicates the hydrophobic nature of the metallic substrate. However, the Piranha solution etching of the metallic substrate generates roughness on the surface, which makes the microscopic parallel lines diffused. However, the etching of the metallic surface results in a significant increase in the surface roughness from 90 to 110 nm which remarkably increased the water CA from 92° to 123° as shown in the inset of Fig. 5(c), which is in close agreement with the results reported by others (Ref 11). Thus, the etched metallic substrate exhibits a more hydrophobic character compared to the polished metallic substrate.

Optical microscopic images of the coated mild steel at different magnifications such as 20X and 100X with corresponding water CA are shown in Fig. 6. Due to the coating, the surface of mild steel seems very smooth with uniform surface roughness. The coated substrate exhibits a water CA of 153° as depicted in the inset of Fig. 6(a). Thus, the superhydrophobic character of the coated mild steel has been generated because of the presence of surface-functionalized SiO<sub>2</sub> nanoparticles. The surface functionalization of the nanoparticles reduced the surface energy of the particles and the nano-size of the particles offered nanoscale roughness. Thus, the combination of these two transformed the hydrophobic mild steel into the superhydrophobic one (Ref 12, 14).

AFM analysis was performed to characterize the topography and surface roughness of the polished, etched and coated mild steel samples. The 2-dimensional (2D) and 3-dimensional (3D) images of the polished and etched mild steel are shown in Fig. 7. The polished mild steel is revealing micro-patterned morphology (Fig. 7a, b). The parallel vertical lines with some cavities are exposed by the 2D image and uniform surface roughness is revealed by the 3D image. However, the etched mild steel is revealing a completely different morphology, which is obvious as the chemical etched away the metallic surface. The 2D and 3D images of etched mild steel reveal the non-uniform roughness and significant variation in the surface roughness compared to polished steel (Fig. 7c, d).

The 2D and 3D AFM images of coated mild steel at different magnifications are shown in Fig. 8. The 2D (Fig. 8a, c) and corresponding 3D (Fig. 8b, d) images revealed the presence of significant but uniform surface roughness on the coated mild steel. Additionally, the higher magnification AFM image (Fig. 8c) revealed the presence of individual nanoparticles and their agglomerates on the coated surface of mild steel, which is producing a combination of micro-nano hierarchical surface roughness responsible for the superhydrophobic behav-

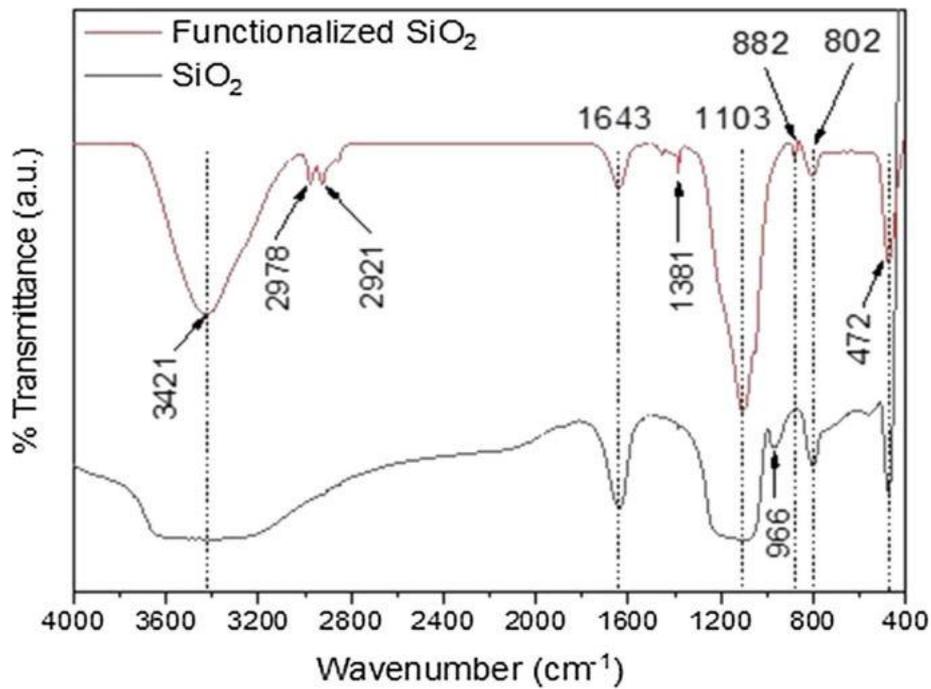

Fig. 3 FTIR spectra of SiO<sub>2</sub> nanoparticles and triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles

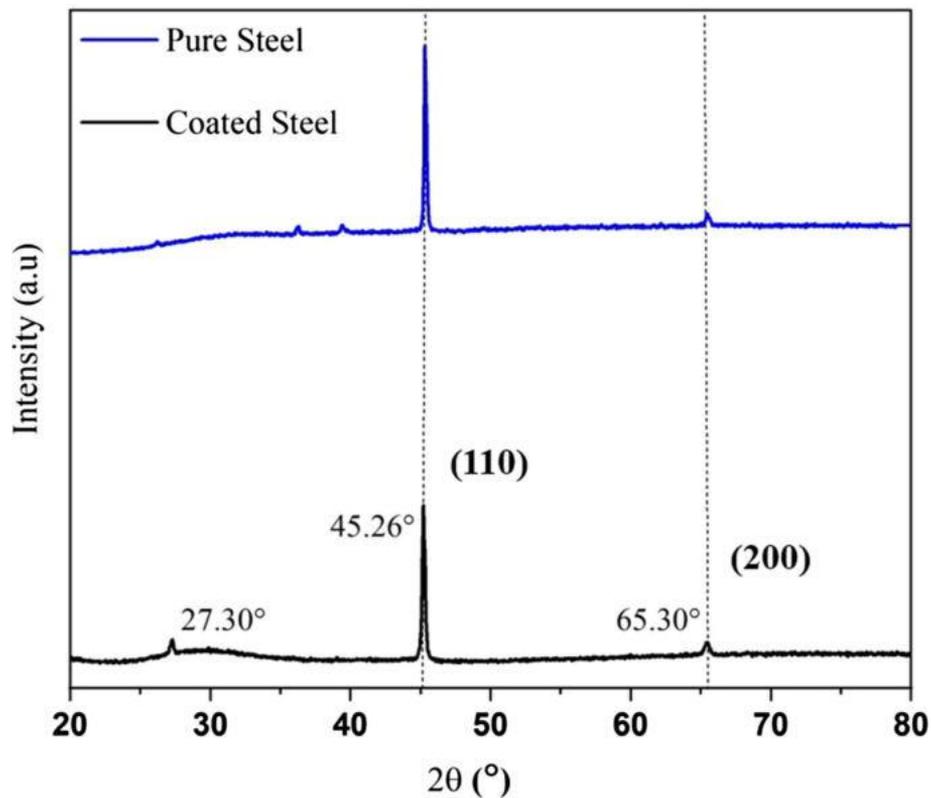

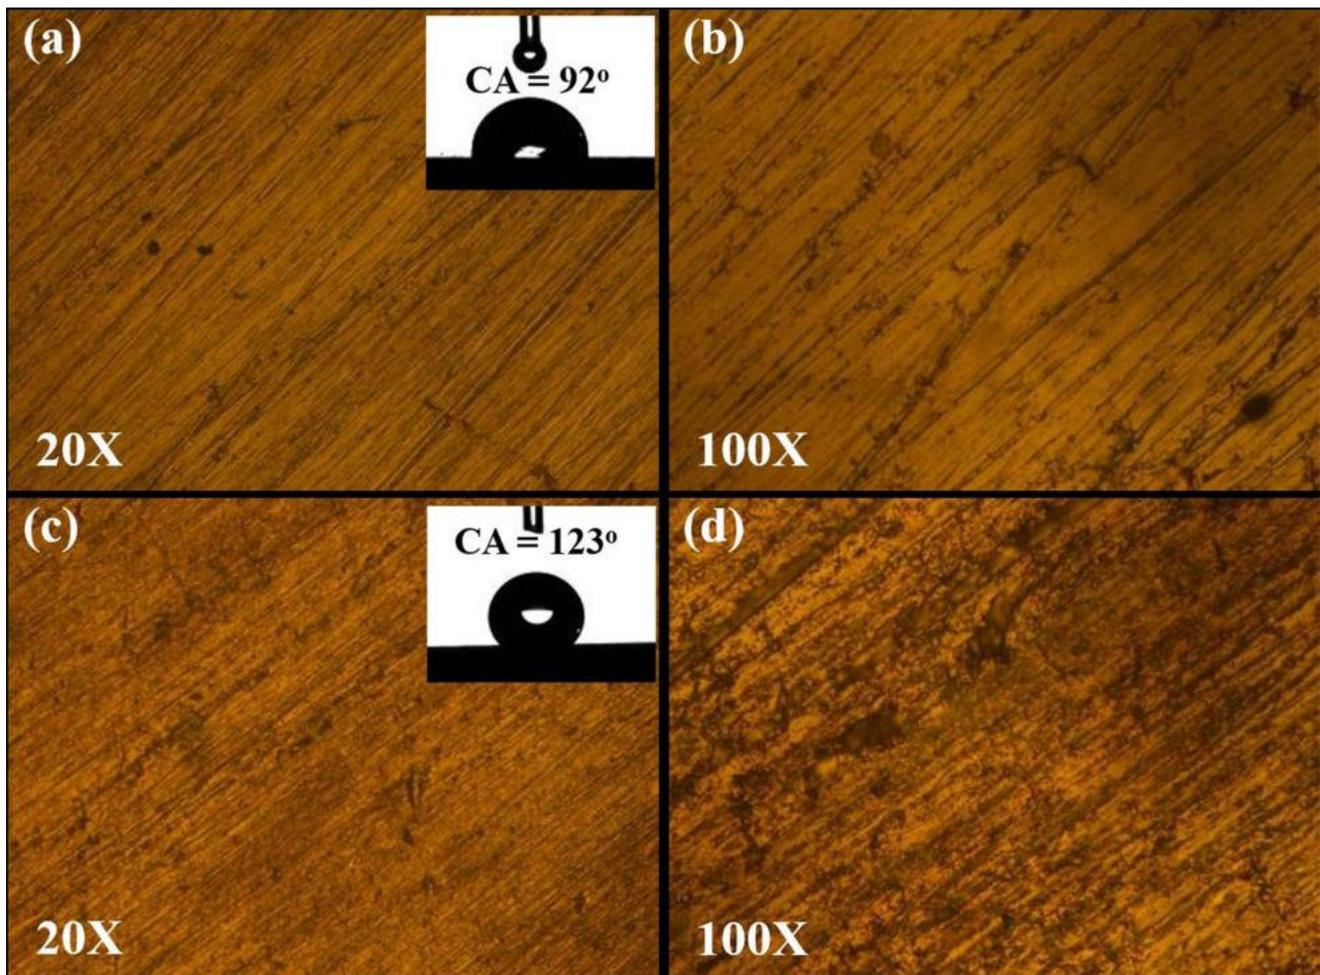

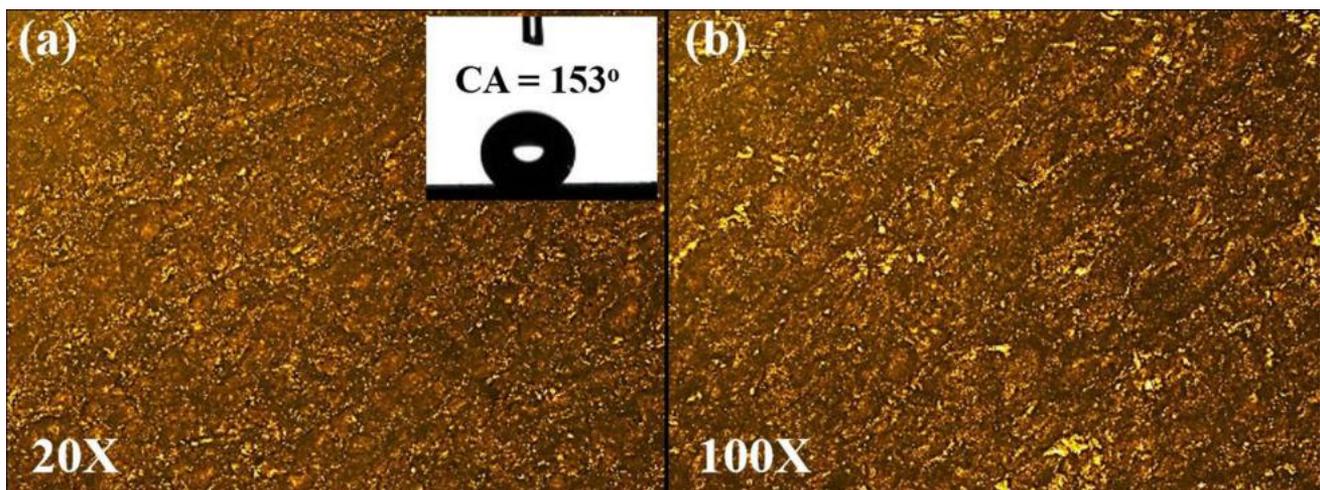

Fig. 4 X-ray diffraction (XRD) pattern of uncoated (pure steel) and coated mild steel samples

ior of the coating. The relation between an average surface roughness ( $R_{avg}$ ) and contact angle (CA) with sliding angle (SA) of the polished, etched and coated mild steel is shown in Table 1. It is evident from Table 1 that etched mild steel has higher  $R_{avg}$  (110 nm) compared to polished steel  $R_{avg}$  (60 nm)

which is obvious because the chemical eats away some portion of the metal (Ref 11). Similarly, the coated mild steel exhibits higher  $R_{avg}$  (193 nm) compared to the etched mild steel. A similar trend is followed by the water CA, because as per the literature if the  $R_{avg}$  of a surface increases then the water CA

**Fig. 5** Optical micrographs of (a, b) polished mild steel and (c, d) etched mild steel substrates at 20X and 100X with their corresponding contact angles (inset of a and c)

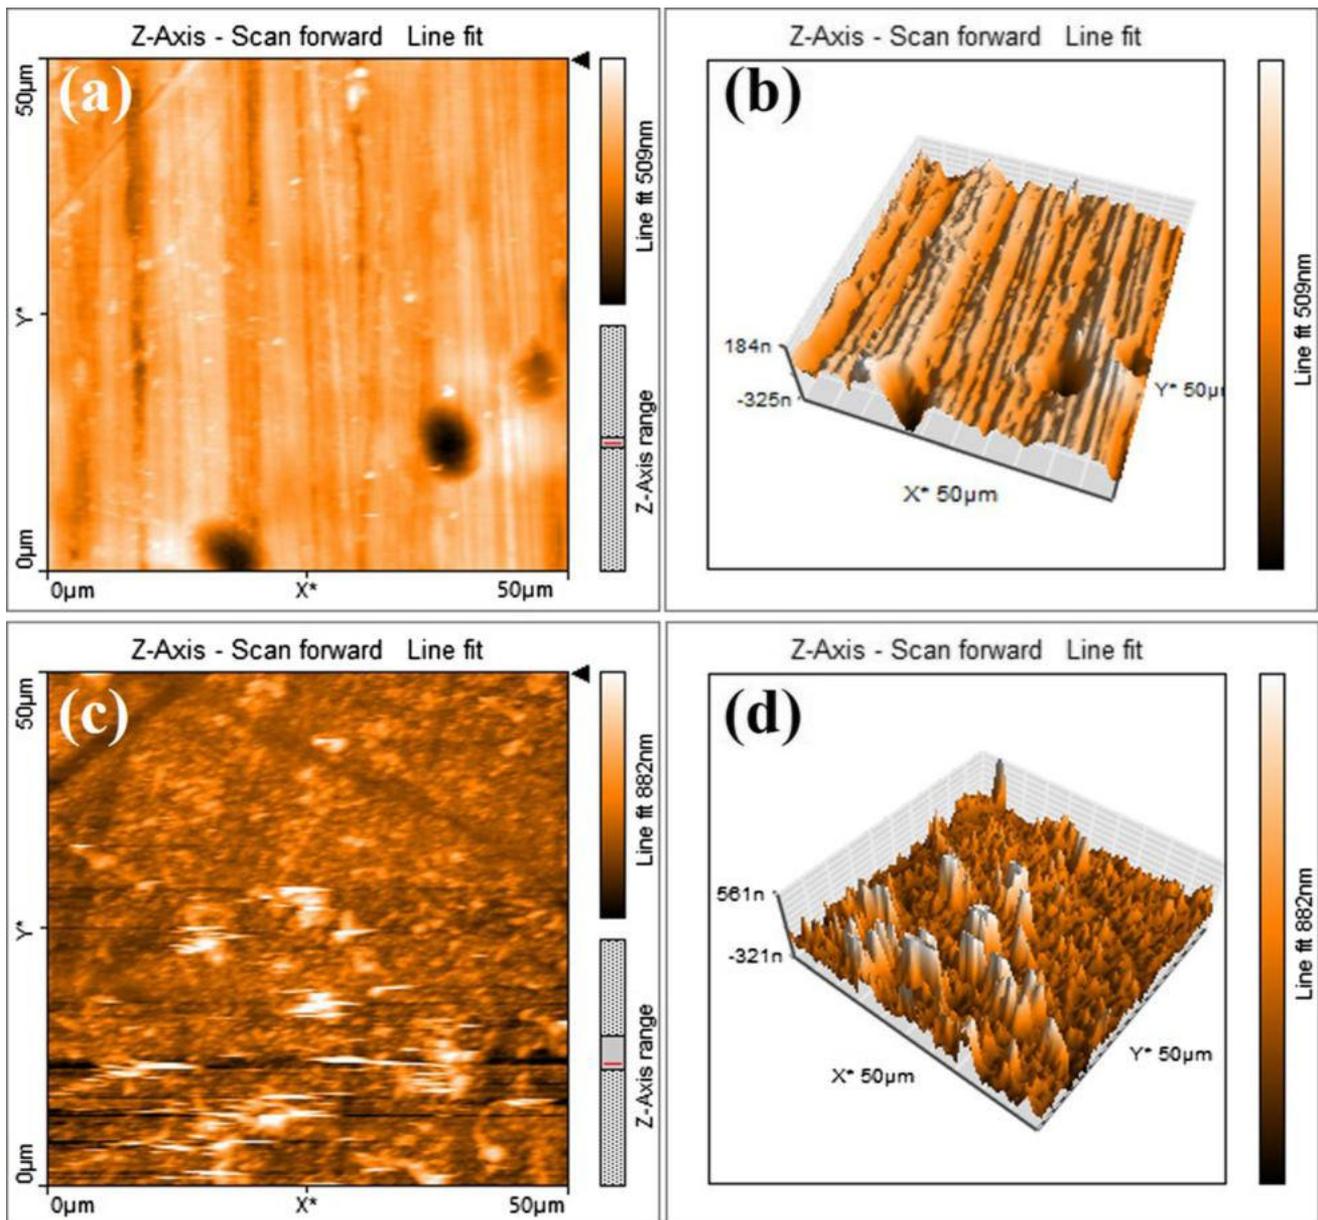

**Fig. 6** Optical micrographs of (a, b) coated mild steel at 20X and 100X with their corresponding contact angle (inset of a)

also increases (Ref 12, 14). However, with the increase in surface roughness, the SA goes on decreasing which is in close agreement with the results published by others (Ref 16). Thus, in the current study, the surface-functionalized  $\text{SiO}_2$  nanopar-

ticles are found responsible for the increased roughness of the mild steel in different situations.

FESEM analysis was performed to characterize the morphology of the coated mild steel. The FESEM images of coated

**Fig. 7** The 2D and 3D AFM images of (a, b) polished and (c, d) etched mild steel

mild steel at different magnifications are shown in Fig. 9. The lower magnification image is showing a quite rough surface of the coated mild steel. The high roughness is in close agreement with the AFM results. However, the high magnification FESEM image is showing individual nanoparticles (solid white circle) and their large size spherical agglomerates (dotted white circle) on the coated surface of mild steel. The presence of nanoparticles and their micron or sub-micron size clusters jointly produce a micro-nano hierarchical surface roughness, which is in close agreement with the AFM results. Thus, this hierarchical roughness leads to the superhydrophobic surface formation on the metallic substrate. That can be very effective in controlling the corrosion of mild steel.

The corrosion resistance of the uncoated and coated mild steel samples was characterized by immersing the samples in a corrosive salt solution (3.5% NaCl) for 30 days. Optical images of uncoated and coated mild steel after dipping in a corrosive

salt solution for a 1-month under ambient conditions are shown in Fig. 10. The physical appearance is revealing that the uncoated substrate corroded significantly, while the coated substrate remains almost non-corroded. However, the coating is damaged a little bit and reveals partially inflated spots on the surface. The water droplet sitting on coated mild steel after a 1-month corrosion test is shown in Fig. 11. The CA of the coated mild steel substrate was reduced to  $\sim 135 \pm 3^\circ$  from  $153 \pm 2^\circ$  after the 1-month corrosion test, which is obvious as the coating was found little bit damaged due to corrosive salt. Thus, it indicates the reliability of the coating and its efficiency as corrosion resistance material for mild steel.

The corrosion resistance performance of uncoated and coated mild steel samples was estimated using Nyquist plots and potentiodynamic polarization curves of EIS (Fig. 12). Figure 12(a) shows that the impedance of coated mild steel is significantly higher than that of uncoated mild steel, signifying

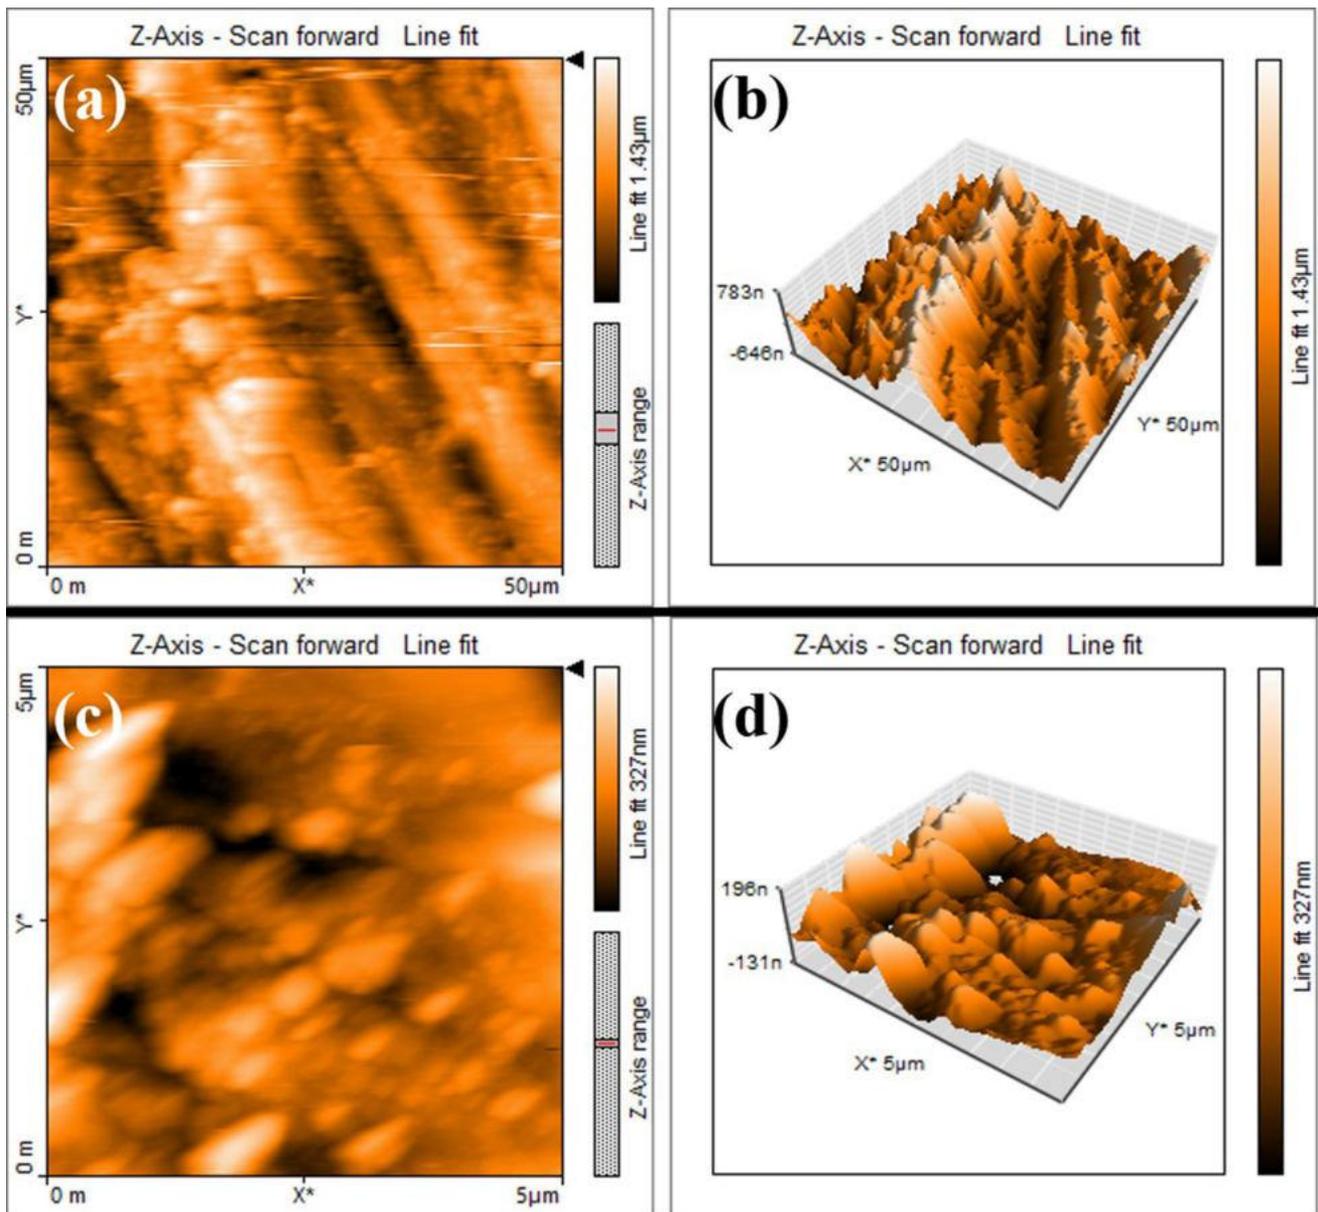

Fig. 8 The 2D (a, c) and 3D (b, d) AFM images of coated mild steel at lower and higher magnifications

Table 1 The relation between  $R_{avg}$  and CA with sliding angle (SA) of the polished, etched and coated mild steel

Metallic substrate	Avg. roughness, nm	CA, °	SA, °
Polished Steel	60	$92 \pm 2$	$50 \pm 5$
Etched Steel	110	$123 \pm 3$	$28 \pm 3$
Coated Steel	193	$153 \pm 2$	$5 \pm 2$

that the corrosion confrontation of coated mild steel is very high compared to the uncoated mild steel (Ref 16, 25). The polarization curves of coated sample (Fig. 12b) demonstrating the low current density ( $I_{corr}$ ) and high  $E_{corr}$  compared to the uncoated one specified the higher corrosion resistance due to the superhydrophobic coating (Ref 16, 25). The corrosion properties of uncoated and coated mild steel are illustrated in

Table 2. The EIS Nyquist plots exhibit typical semi-circle for mild steel and semi-circle type arc with tail for coated mild steel, therefore EIS data was fitted using two equivalent electric circuit models (Fig. 12c and d), which are typically used for bare and coated mild steel (Ref 25, 26). The fitted EIS data of uncoated and coated mild steel is shown in Table 3. Where  $R_s$  is solution resistance,  $R_{pro}$  is the resistance of corrosion products,  $CPE_1$  is the coating constant phase element which corresponds double-layer capacitance at the interface of metal and coating.  $CPE_{dl}$  corresponds to double layer capacitance occurred at the interface of metal and solution (corroded area) and  $R_{ct}$  is charge transfer resistance.  $R_s$  depends on the geometry of the area through which current is flowing as well as on the resistivity of electrolyte.  $R_s$  is technically not the main component as it is not representing the property of a coating during coating performance analysis (Ref 25). The use of modified nanoparticles-based coating on mild steel-enhanced  $R_{ct}$  value almost 8 times

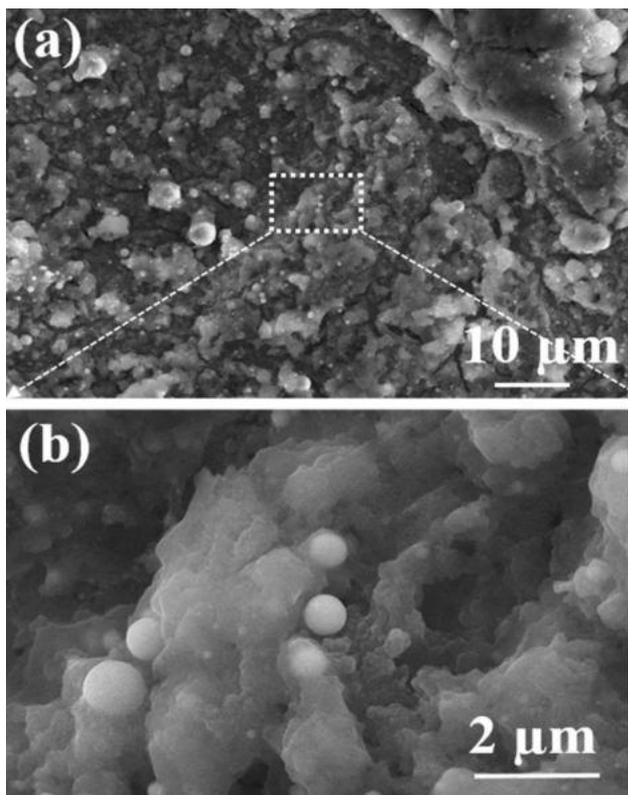

higher than the mild steel whereas diminished double layer capacitance  $CPE_{dl}$ . The low value of  $CPE_{dl}$  signified decreased coating porosity as well as better corrosion resistance performance for coated steel substrate, which is in close agreement with the results reported by others (Ref 25, 26).

Usually, low  $I_{corr}$  means a low corrosion rate. Silica is a well-known coupling element for the corrosion resistance of metals for ages. This may be due to the formation of a layer of Si-O metal bonds over the sample surface, which dominates the

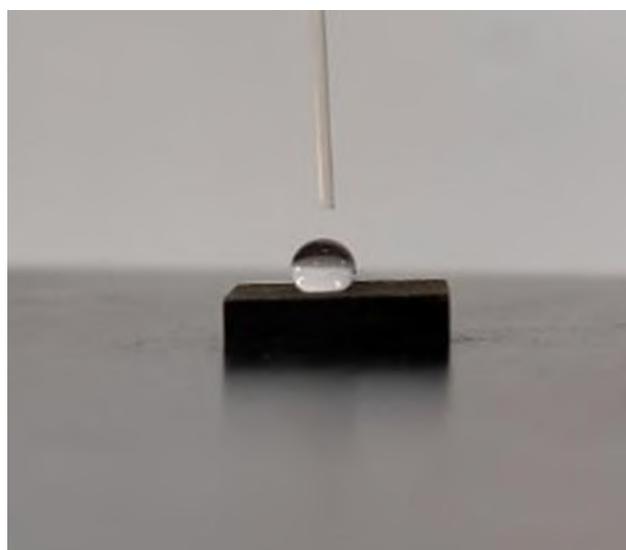

corrosion reaction and decrease its speed, even if the substrate does not possess superhydrophobic properties (Ref 27). The cathodic and anodic current goes down and corrosion potential ( $E_{corr}$ ) goes toward a positive value due to superhydrophobic coating (Ref 28, 29). Thus, the superhydrophobic coating has an inordinate potential to resist the corrosion of mild steel or other metals.

#### 4. Conclusions

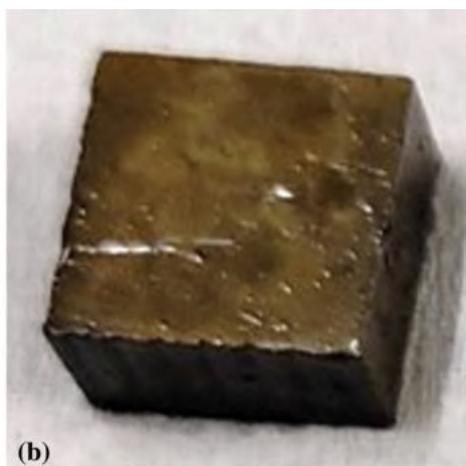

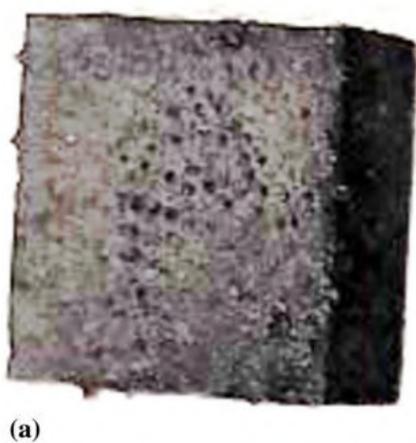

Triethoxyoctylsilane-modified  $SiO_2$  nanoparticles-based superhydrophobic coating was successfully prepared via solution method to prevent the corrosion of mild steel. The developed coating exhibited micro-nano hierarchical roughness due to the presence of individual nanoparticles and their micron size clusters as verified by AFM and FESEM analysis. The hierarchical roughness of the coating resulted in the superhy-

drophobicity of the mild steel. The maximum water CA of  $153 \pm 2^\circ$  with a SA of  $5 \pm 2^\circ$  was obtained for the coated mild steel compared to the uncoated mild steel (CA of  $92 \pm 2^\circ$  with

SA of  $50 \pm 5^\circ$ ). The EIS plots confirmed the significant corrosion resistance performance of coated metal over the uncoated one. Thus, the developed superhydrophobic coating can play a vital role in controlling the corrosion of metals. However, there is a great need to study the mechanical and thermal stability of such coatings for industrial applications.

## Abstract

In this study, SiO<sub>2</sub> nanoparticles were modified using triethoxyoctylsilane to fabricate a corrosion-resistant superhydrophobic coating on brass. The brass substrate of 1 × 1 cm<sup>2</sup> was cut from the bulk using an electrical discharge machine (EDM) that generated a micro-pattern on its surface then it was chemically etched with Piranha solution. In order to create nano roughness on the etched micro-patterned brass substrate and to reduce its surface energy, surface-modified SiO<sub>2</sub> nanoparticles were coated on the brass using the solution-immersion approach followed by annealing. AFM and FESEM analysis of the coated brass showed the presence of SiO<sub>2</sub> nanoparticles and their clusters leading to the superhydrophobicity. The coated brass exhibited a maximum water contact angle (CA) of 152° ± 2° and a sliding angle (SA) of 7° ± 3°. The electrochemical impedance spectroscopy (EIS) plots demonstrated a high impedance value for coated brass compared to uncoated brass. Conversely, the corrosion current density (I<sub>corr</sub>) of coated brass (0.068 × 10<sup>-6</sup> A cm<sup>2</sup>) is much lower than the uncoated brass (0.369 × 10<sup>-6</sup> A cm<sup>2</sup>) signifying efficient corrosion resistance of the coated brass. The present work has inordinate potential to control the corrosion of metals in corrosive conditions.

## 1 Introduction

Brass is a multipurpose alloy made up of copper and zinc. The mechanical, electrical and chemical characteristics of brass can be easily altered by changing the ratio of copper and zinc [1]. Brass has a broad range of applications in various sectors such as healthcare, defense, marine, engineering tools, musical instruments, ornaments, construction, electrical, sculptures [1–3], etc. due to its affordability and the characteristics it possesses [4]. However, billions of dollars are spent annually throughout the world on fixing or changing corroded brass. Brass corrodes significantly when exposed to corrosive media like seawater [3]. The conversion of the brass into a superhydrophobic brass is a better option to avoid the corrosion of brass [3–9]. The notion of superhydrophobicity originated from the self-cleaning surface of lotus leaves long back, which consists of hierarchical micro-nano size roughness on its surface [10]. Later on, the superhydrophobic surface features were mimicked by numerous researchers for various applications like corrosion resistance, self-cleaning, energy application, etc. [11–15]. Superhydrophobic surfaces exhibit a water contact angle (CA)  $> 150^\circ$  and roll-off angle or sliding angle (SA)  $< 10^\circ$ , which keeps the surface dry. Such a surface does not allow moisture to come in contact with the metallic surface and metal remains corrosion resistant for a longer time [16]. Several techniques, including chemical etching, nanoparticle deposition, sandblasting, lithography, electrodeposition, and plasma etching have been used in the past to produce a hierarchical micro-nano roughness on various metallic substrates [17, 18]. Chemical etching and nanoparticle deposition methods are the most practical and affordable [19–21]. Various nanostructures of 1D (dimension), 2D and 3D have been coated on various metals to change their wetting properties [22–25]. In a recent study, Dominic et al. [26] presented the preparation of superhydrophobic coating on thermally oxidized brass using 1H,1H,2H,2H-perfluorooctyltriethoxysilane for corrosion inhibition. In another work, Cao et al. [27] presented the Mussel-inspired superhydrophobic coating on brass for controlling corrosion using 1H,1H,2H,2H-perfluorodecanethiol. Yu et al. [4] developed a superhydrophobic H62 brass surface via chemical etching followed by electrodeposition to enhance the corrosion resistance. Similarly, Jie et al. [28] reported an integrated etching and heating treatment methodology to fabricate corrosion resistant superhydrophobic surface on brass. However, silica nanoparticles are one of the most explored superhydrophobic materials because of their cost-effectiveness and simplicity of their surface functionalization [29]. However, to improve the superhydrophobic performance of SiO<sub>2</sub> nanoparticles, their surface

functionalization using different silanizing agents is still not explored in full capacity [30].

In the above context, a micro-pattern on the brass substrate was created using an EDM and then chemically etched with Piranha solution. To create low surface energy and nanoscale roughness, triethoxyoctylsilane-modified SiO<sub>2</sub> nanoparticles were deposited on the etched brass using the solution-immersion approach. The anti-corrosion performance of superhydrophobic brass yielded encouraging outcomes, which can be quite beneficial to protect the metals against corrosion.

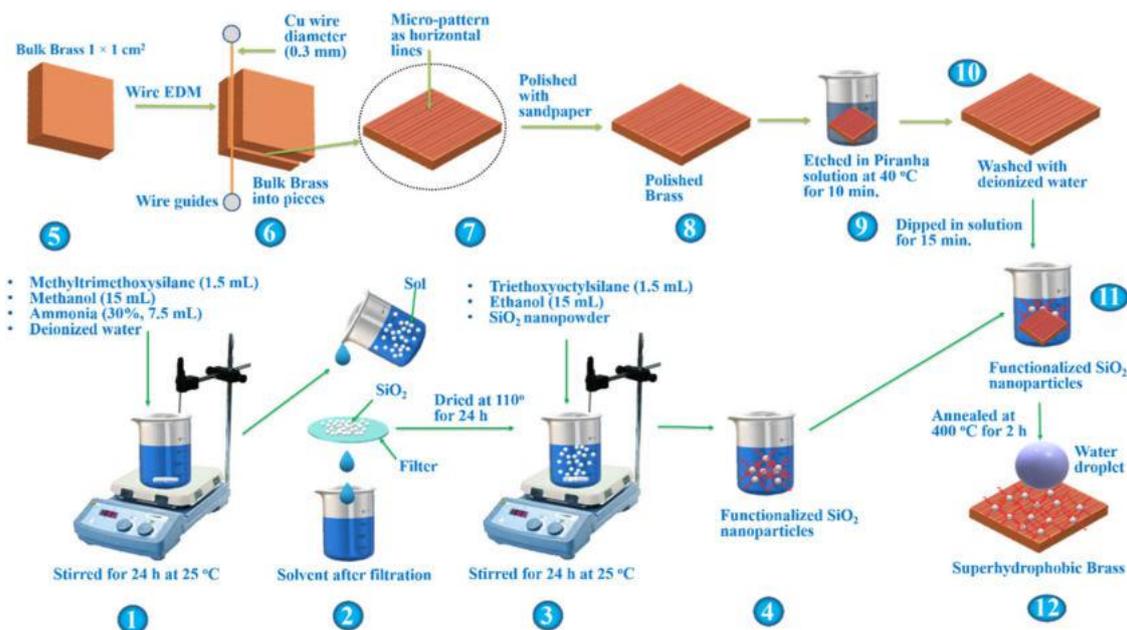

## 2 Materials and methods

### 2.1 Preparation of superhydrophobic brass

Figure 1 schematically depicts the deposition of a superhydrophobic coating on brass using functionalized SiO<sub>2</sub> nanoparticles. To make silica sols, methyltrimethoxy silane (1.5 mL), methanol (15 mL), ammonia (30%, 7.5 mL), and deionized water were blended via magnetic stirring at 25 °C for 24 h. After filtering, the sols of SiO<sub>2</sub> were heated at 110 °C for 24 h to form SiO<sub>2</sub> nanoparticles. The SiO<sub>2</sub> nanoparticles were mixed with triethoxyoctylsilane (1.5 mL) and ethanol (15 mL) to functionalize their surface using magnetic stirring at 25 °C for 24 h. A wire EDM (Ezeewin) was used to cut the brass substrate of 1 × 1 cm<sup>2</sup> size from the bulk material. The metal substrate exhibited a micro-pattern after the wire EDM processing. The micro-pattern of the brass substrate was refined by 400–1200 grit sandpapers. Acetone was used to ultrasonically clean the polished substrate for 30 min. A Piranha solution (concentrated H<sub>2</sub>SO<sub>4</sub>, 98% and H<sub>2</sub>O<sub>2</sub>, 30% in a ratio of 7:3) was used to etch the polished substrate at 40 °C for 10 min. Later on cleaning of the substrate was performed using deionized water and allowed to dry at ambient conditions. Finally, the brass substrate was immersed in silanized SiO<sub>2</sub> nanoparticle solution for 15 min followed by its annealing at 400 °C for 2 h to produce the superhydrophobic brass.

### 2.2 Characterization

A high-resolution scanning electron microscope (FESEM, Quanta 200F, FEI, USA) was considered to characterize the shape and size of silanized and non-silanized SiO<sub>2</sub> nanoparticles and the superhydrophobic brass surface. The structural information of the samples was obtained by Bruker D8 Advance Diffractometer (Germany) using Cu-K $\alpha$  source radiation. A Nikon Eclipse MA200 optical microscope was employed to capture optical images of the specimens. A drop shape analyzer (DSA 100, Krüss GmbH, Germany) characterized the wetting behavior of the

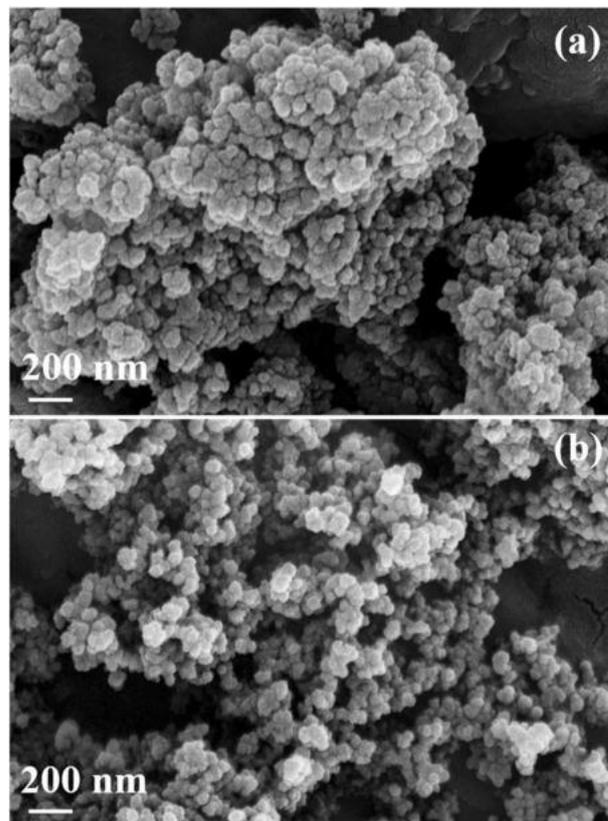

**Fig. 1** Pictorial representation of a step-by-step approach for synthesis of silanized  $\text{SiO}_2$  nanoparticles and superhydrophobic coating on a brass substrate

samples. The metallic specimens were placed on the sample holding stand of the DSA and an automatic contact angle measurement mode was set to drop a standard  $10\ \mu\text{l}$  water droplet on the specimens. Then the profile of water drop was utilized for determining a static water CA followed by automatic sample tilting to measure sliding angle via the software. At least, three different locations on the samples were used for the measurement of the CA and SA and their mean values are reported. The morphology and roughness of the specimens were examined by an atomic force microscope (AFM, NT-MDT, Ntegra). Polarization curves were acquired by utilizing an electrochemical workstation (CHI 660E, CH Instruments, USA) with a scanning rate of  $0.2\ \text{mVs}^{-1}$ . To acquire polarization curves, the specimens were submerged in a 3.5 wt.% NaCl solution. Electrochemical impedance spectroscopy (EIS) was employed to estimate the corrosion inhibition capacity of samples at frequencies ranging from 200 kHz to 50 MHz.

### 3 Results and discussion

FESEM images of silanized  $\text{SiO}_2$  nanoparticles are depicted in Fig. 2. Most of the particles are clustered into large clusters for non-silanized  $\text{SiO}_2$  nanoparticles. However, the surface-modified  $\text{SiO}_2$  nanoparticles exhibit a smooth and spherical shape with an average size of about 30 nm. The majority of the particles are appearing as individual and round shape particles but partially clustered. This might have happened

**Fig. 2** FESEM images of (a) unmodified  $\text{SiO}_2$  nanoparticles and (b) silanized  $\text{SiO}_2$  nanoparticles

because of the successful silanization or functionalization of the SiO<sub>2</sub> nanoparticles by triethoxyoctylsilane [13, 31].

X-ray diffraction (XRD) patterns of uncoated and coated brass substrates are presented in Fig. 3. The diffraction pattern of brass revealed the presence of the face-centered cubic (fcc) phase of Cu(0) and the hexagonal closed packed (hcp) phase of Zn(0). The main sharp diffraction peaks observed at 42.69°, 49.55°, 72.54° are as per JCPDS File No. 50-1333 of brass [32]. However, almost all the diffraction peaks in the present study such as 31.73°, 36.76°, 42.69°, 49.55°, 63.25°, 72.54° and 79.90° are in close agreement with the work reported by Galai et al. [33]. The presence of these diffraction peaks revealed the  $\alpha$  phase of brass consisting of copper and zinc as the main components with small traces of lead. However, the silanized SiO<sub>2</sub> nanoparticles coated brass does not disclose any novel XRD peaks. However, the relative intensity of XRD peaks of the coated brass was declined because of the superhydrophobic coating compared to the uncoated brass. Thus, even after the coating, the structure of the surface of brass remains unmodified.

Polished, etched and coated brass substrates characterized using an optical microscope at different magnifications.

The micrographs of these specimens along with CAs are depicted in Fig. 4. The polishing of the brass sample removed the micro-pattern and created some fine scratches

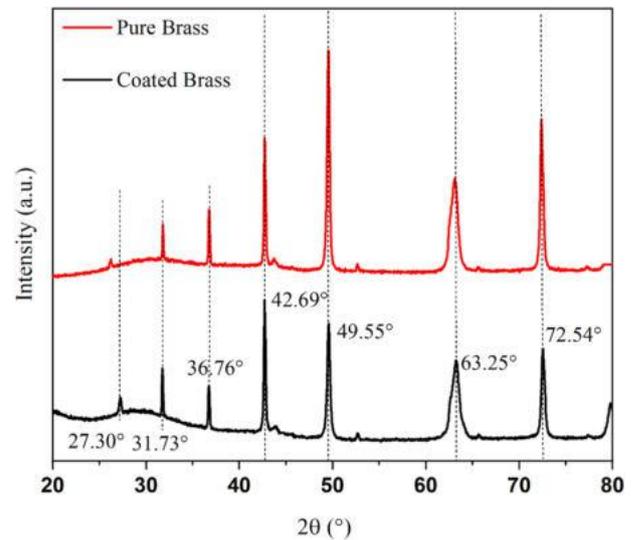

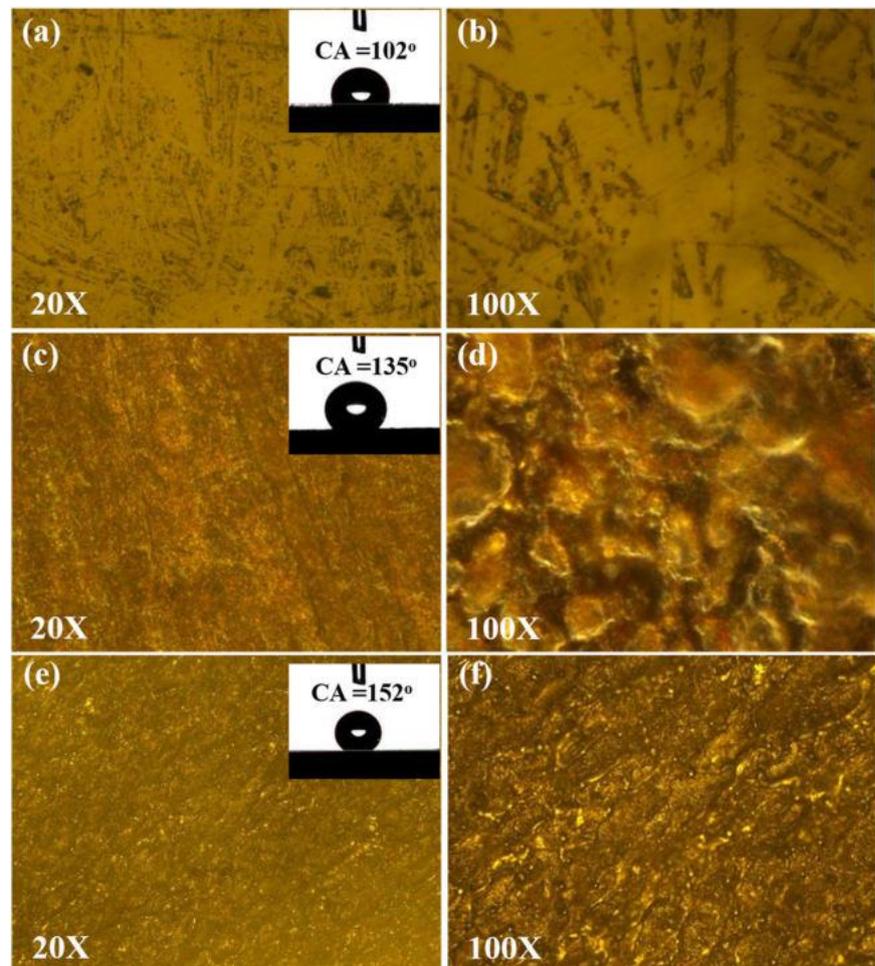

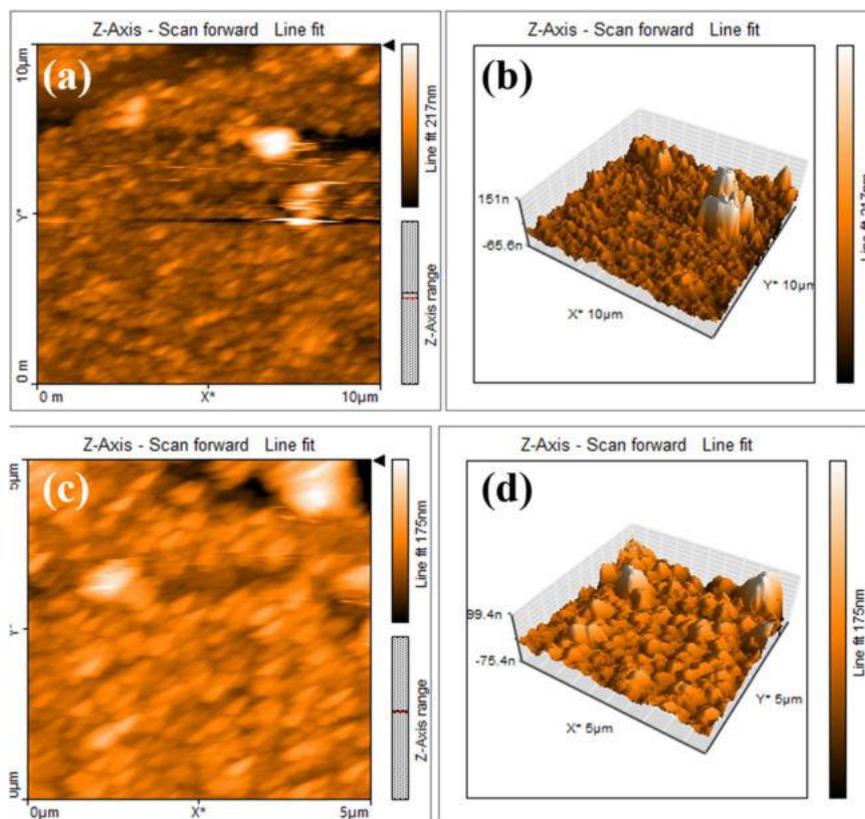

Fig. 3 X-ray diffraction spectra of pure and coated brass

Fig. 4 Optical micrographs of (a, b) polished brass, (c, d) etched brass and (e, f) coated brass at 20X and 100X magnifications with CAs (inset of a, c and e)

**Fig. 5** (a, c) 2D and (b, d) 3D AFM images of coated brass at different scales

on the surface (Fig. 4a, b). The polished brass substrate revealed hydrophobicity with a water CA of  $102^\circ$  (inset of Fig. 4a). The chemically etched brass substrate revealed a rough surface (Fig. 4c, d) compared to the polished substrate. The increased roughness increased the water CA from  $102^\circ$  to  $135^\circ$  (depicted in inset of Fig. 4c). Similar observations are stated by Jie et al. [34]. Therefore, the rough surface of etched brass can exhibit more hydrophobicity compared to the smooth polished brass. The coating significantly tuned the surface of the brass compared to the etched brass. The coated brass surface becomes smooth and exhibits even roughness. A large CA of  $152^\circ$  (inset of Fig. 4e) was revealed by the coated brass. Thus, the silanized  $\text{SiO}_2$  nanoparticles result in the superhydrophobic behavior of the coated brass by reducing the surface energy of the substrate and generating the micro-nano hierarchical roughness on the surface. Thus, the proposed methodology in the present study can easily alter the wetting behavior of brass [35, 36].

Figure 5 displays the 2-dimensional and 3-dimensional AFM images of coated brass. The 2D images (Fig. 5a, c) with corresponding 3D images (Fig. 5b, d) revealed consistent surface roughness. The AFM images demonstrated the presence of a majority of the individual nanoparticles and their limited agglomerates on the coated brass, resulting in a combined micron and nano level roughness imperative

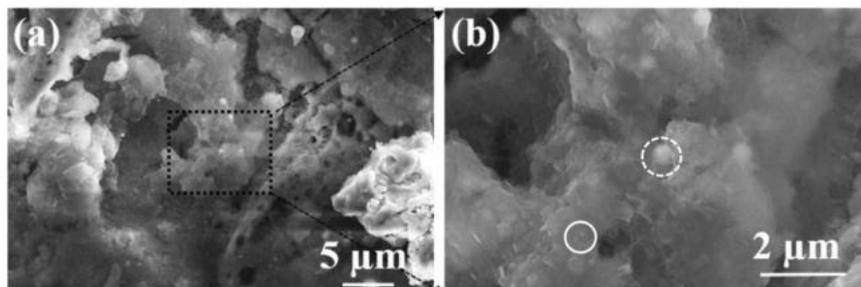

**Table 1**  $R_{\text{avg}}$ , CA and SA values of brass specimens

Sample name	$R_{\text{avg}}$ . (nm)	CA ( $^\circ$ )	SA ( $^\circ$ )
Polished brass	45	$102^\circ \pm 4^\circ$	$39^\circ \pm 4^\circ$
Etched brass	65	$135^\circ \pm 4^\circ$	$19^\circ \pm 4^\circ$
Coated brass	72	$152^\circ \pm 2^\circ$	$7^\circ \pm 3^\circ$

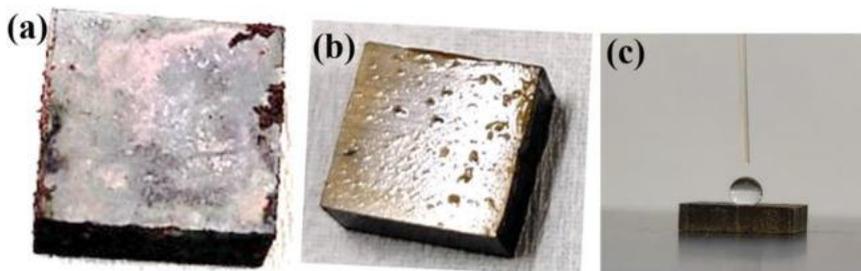

for superhydrophobicity of the brass. Table 1 illustrates the relationship among the average surface roughness ( $R_{\text{avg}}$ ), CA and SA of brass specimens. The polished brass has the lowest  $R_{\text{avg}}$  (45 nm), while the coated brass reveals the highest  $R_{\text{avg}}$  (72 nm). However, the etched brass shows the  $R_{\text{avg}}$  (65 nm) in-between as per the results reported by others [21]. The increase in water CA also follows a similar trend as in the case of the  $R_{\text{avg}}$  [10, 37]. Conversely, the rise in roughness of a surface declines the SA as per the findings of other researchers [38]. Because, in a highly hydrophobic zone, the SA decreases with the increasing CA. The rough surface features can easily trap air and play a crucial role for reducing the SA. It happened because of the transition from a liquid-solid interface to a composite surface that consists of trapped air, as proposed by Cassie's equation. Similar observations were reported by Miwa et al. [39].

The morphology of the coated brass was further studied using FESEM analysis. Figure 6 presented FESEM

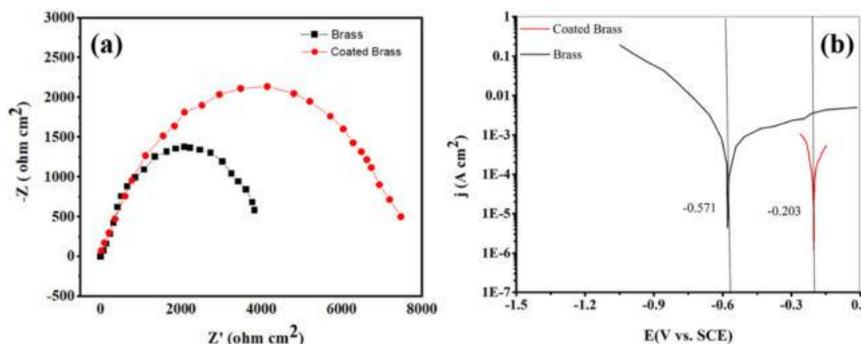

**Fig. 6** FESEM micrographs of coated brass at dissimilar scales

**Fig. 7** Photographs of (a) pure brass, (b) coated brass and (c) water droplet on coated brass after immersion in (3.5% NaCl) for one month

**Fig. 8** (a) Nyquist and (b) potentiodynamic polarization plots of pure and coated brass. SCE-saturated calomel electrode. The samples were immersed for 30 days in 3.5 wt.% NaCl solution

micrographs of coated brass at dissimilar scales. The coated brass surface seems fairly rough at lower magnification (Fig. 6a). However, the higher magnification image (Fig. 6b) reveals the presence of individual  $\text{SiO}_2$  nanoparticles and their clusters circumscribed by solid and dotted white circles, respectively. The coexistence of individual nanoparticles and their clusters generates a combination of micron and nano level roughness essential for superhydrophobic behavior of the metal substrate. Similar kind of roughness is also validated by the AFM data.

The corrosion-control capability of brass substrates was examined by dipping them in a 3.5 wt.% NaCl corrosive solution for one month. Photographs of pure brass and coated brass after the immersion test are illustrated in Fig. 7a, b. The significant corrosion can be seen in the case of uncoated brass, however, the coated brass appears almost non-corroded. Though the coating on the brass appears somewhat damaged and it is reflecting some inflated spots on its surface. The photograph of a water droplet sitting on coated brass after the immersion test is

illustrated in Fig. 7c. After the corrosion test, the CA of the coated brass was slightly reduced to  $\sim 145^\circ \pm 2^\circ$  from  $152^\circ \pm 2^\circ$ , which may be due to partially damaged coating. Thus, the developed coating is highly efficient against the corrosion of brass.

Nyquist plots along with polarization curves of uncoated and coated brass substrates are depicted in Fig. 8. Figure 8a clearly reveals the significant difference in the impedance value of pure brass and coated brass, indicating efficient corrosion inhibition capacity of coated brass [38, 40]. The polarization curves of coated brass present lower current density ( $I_{\text{corr}}$ ) and high  $E_{\text{corr}}$  values (Fig. 8b) as compared to uncoated brass resulting in higher corrosion inhibition efficiency because of the superhydrophobic coating, which is keeping the moisture content away from the metallic surface [41, 42]. The (open circuit) corrosion potential ( $E_{\text{corr}}$ ) and corrosion current density ( $I_{\text{corr}}$ ) measurements for uncoated brass and coated brass are shown in Table 2.

Generally, a lower value of  $I_{\text{corr}}$  indicates a low corrosion rate. The cathodic and anodic current goes down while

**Table 2** The  $E_{\text{corr}}$  and  $I_{\text{corr}}$  measurements of uncoated brass and coated brass

Sample name	$E_{\text{corr}}$ (V vs SCE)	$I_{\text{corr}}$ ( $\times 10^{-6}$ A/cm <sup>2</sup> )
Uncoated brass	−0.571	0.369
Coated brass	−0.203	0.068

corrosion potential ( $E_{\text{corr}}$ ) moves towards a positive value because of the superhydrophobic coating [35, 43]. Thus, the fabricated corrosion-resistant coating has the potential to protect the metals in a corrosive environment due to its superhydrophobic nature.

## 4 Conclusions

A superhydrophobic coating to protect the brass against corrosion was successfully developed using chemical etching followed by solution-immersion route in presence of silanized SiO<sub>2</sub> nanoparticles. AFM and FESEM results validated the presence of micro-nano hierarchical roughness imperative for superhydrophobicity. The hydrophobic brass (CA of  $102^\circ \pm 4^\circ$ ) was successfully transformed into superhydrophobic brass ( $152^\circ \pm 2^\circ$ ). A significant corrosion is found in the case of uncoated brass and coated brass revealed almost no corrosion confirmed by optical images. The EIS plots demonstrated that coated metal outperformed uncoated metal in terms of corrosion resistance. Thus, the developed corrosion-resistant superhydrophobic coating can be quite beneficial to protect the metals against corrosion after its thermal and mechanical performance testing.

## ABSTRACT

The compositions  $(\text{Ba}_{0.85}\text{Ca}_{0.15}\text{TiO}_3)_{1-x}-(\text{CoFe}_2\text{O}_4)_x$   $(\text{BCT})_{1-x}-(\text{CFO})_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) were synthesized to study the effect of simultaneous growth of ferroelectric and ferromagnetic phase for switching applications. X-ray diffraction confirms the double-phase formation in all composites possessing tetragonal and cubic symmetry. SEM micrograph strongly suggests the homogenous and uniform dispersion of the grains and grain size in the ceramic. The dielectric and electrical characteristics of ceramics have been thoroughly investigated in temperature range  $-50$  to  $410$  °C, and frequency ( $10^2$ – $10^6$  Hz). The grain and grain boundary also significantly contribute to relaxation process, shown by fitting of Nyquist plots. The frequency dependence of impedance plots has been used to characterize the electrical conduction of the sample at various observed temperatures, which demonstrate the Negative Temperature Coefficient of Resistance (NTCR) behavior. The composite with  $x = 0.40$  of pure CFO in  $(\text{BCT})_{1-x}-(\text{CFO})_x$  composite showed maximum value of saturated magnetization, remnant magnetization and coercive field of  $M_s \approx 38$  emu/g,  $M_r \approx 15$  emg/g and  $H_c \approx 0.66$  T, respectively.

## 1 Introduction

Multiferroics are the most appealing multifunctional materials due to their wide range of applications in magnetic sensors, actuators, transducers, spintronics, and storage media devices are unique in that they use a novel way to converting electric and magnetic fields

[1]. Electrical polarization can be operated using an external magnetic field, and magnetization can be induced by varying an external electrical field, due to the coupling between ferroelectric phases and ferromagnetic phases [2–5]. Few functional materials that have magnetoelectric coupling among multiferroics are known as magnetoelectric (ME) materials; these

Address correspondence to E-mail: shwetathakur1323@gmail.com

materials have a wide range of applications in microwave devices and magnetic field detection sensors [6–8]. Single-phase multiferroics have a very limited range of application due to their poor ME response at low temperatures. As a result, two-phase multiferroic composites were developed and are now widely used for magnetoelectric coupling due to their high ME coefficients when compared to single-phase materials [8, 9]. The elastic coupling between the magnetostrictive and piezoelectric components induces the ME effect in composites, which is a product property. ME composite characteristically consists of two phases: a ferromagnetic/ferrimagnetic phase (magnetostrictive) and a ferroelectric/piezoelectric phase (piezoelectric) [10–12]. At room temperature, composite ME coupling is recommended over single-phase coupling. Due to their excellent ferroelectric properties, composites with lead-based ferroelectric materials have the highest ME output voltage, but these materials are hazardous and volatile in nature. Due to their toxicity, there is a need for other lead-free environment-friendly materials with unique ferroelectric properties. As a result, recent research has focused on finding lead-free ferroelectric-ferromagnetic composites with a high ME coefficient [13–16]. Due to the individual properties of its constituents, BaTiO<sub>3</sub>–CoFe<sub>2</sub>O<sub>4</sub> composites are a promising candidate for ME materials. BaTiO<sub>3</sub> has polymorphs that change with temperature and have excellent ferroelectric and piezoelectric properties; and CoFe<sub>2</sub>O<sub>4</sub> has a spinel structure with high coercivity and magnetostriction. [17–19]. As a result, ME composites may be a suitable replacement for lead-based systems in integrated magneto/electric devices such as sensors, transducers, high-density memories, spintronics, and microelectromechanical systems, among other applications [20, 21]. Liu and Ren reported a new lead-free piezoelectric (1-x)Ba(Ti<sub>0.8</sub>Zr<sub>0.2</sub>)O<sub>3</sub>-x(Ba<sub>0.7</sub>Ca<sub>0.3</sub>)TiO<sub>3</sub> material for the first time in 2009 [22]; carrying certain exceptional piezoelectric properties like  $d_{33} \sim 600$  pC/N, what was reported to be significantly higher when we compare this with other lead-based piezoelectric systems. BZT-BCT

exhibits high piezoelectric response that contributes towards its morphotropic phase boundary (MPB) composition.

Ba(Ti, Sn)O<sub>3</sub> – (Ba, Ca)TiO<sub>3</sub> ( $d_{33} \sim 550$  pC N<sup>-1</sup>) [21] and Ba(Ti, Hf)O<sub>3</sub> – (Ba, Ca)TiO<sub>3</sub> ( $d_{33} \sim 550$  pC N<sup>-1</sup>) [22]. The high piezoelectric response is because 0.5BZT-0.5BCT or BCTZ composition corresponds to nominal morphotropic phase boundary (MPB) composition in which free energy anisotropy is reduced like that observed in PZT. Thus, Ba<sub>0.85</sub>Ca<sub>0.15</sub>Ti<sub>0.9</sub>Zr<sub>0.1</sub>O<sub>3</sub> or 0.5BZT-0.5BCT has emerged as potential alternative to the conventional lead-based piezoelectric materials.

ABO<sub>3</sub> based ferroelectric with large piezoelectric coefficient and ferrite with high magnetostriction are preferred in order to achieve strong magnetoelectric coupling effect. Many researchers have observed a significant piezoelectric effect in BCT based ABO<sub>3</sub>, which is a promising candidate to develop lead-free multiferroic composites and can help in producing a significant ME response. BCT has a lower Curie temperature approximately around  $90 \pm 10$  °C, while BaTiO<sub>3</sub> has a Curie temperature of around 120 °C [12, 22–26]. The symmetry of the ferroelectric crystal structure transitions from rhombohedral to orthorhombic, then to tetragonal, as the BCT content increases at room temperature [24]. Among all the ferrite families, cobalt ferrite (CoFe<sub>2</sub>O<sub>4</sub>) exhibits the highest value of magnetostriction coefficient ( $\lambda \sim -110 \times 10^{-6}$ ), high curie temperature and outstanding magnetic properties. Therefore, combining the BCT and CoFe<sub>2</sub>O<sub>4</sub> (CFO) in a composite structure is worth exploring. Sadhana et al. has synthesized xBa<sub>0.8</sub>Ca<sub>0.2</sub>TiO<sub>3</sub>-(1-x)Ni<sub>0.2</sub>Cu<sub>0.3</sub>Zn<sub>0.5</sub>Fe<sub>2</sub>O<sub>4</sub> nanocomposites with x = 0.1, 0.3, 0.5, 0.7, and 0.9 and reported the maximum magnetoelectric coefficient 280 mV/cm Oe at x = 0.3 composition [4]. Leonel et al. investigated the structural characterizations of Barium Titanate–Cobalt Ferrite (BaTiO<sub>3</sub>–CoFe<sub>2</sub>O<sub>4</sub>) composite materials and discovered that vacancies and interfacial stress were related to the ferroelectric structure's tetragonal distortion being reduced [18]. The BCZT<sub>85</sub>-CFO<sub>15</sub> composite materials were

identified by Naveed et al. as promising candidates for developing lead-free materials with higher ME coupling at room temperature. and ME coefficient around 6.03 ps/m [27]. Shrma et al. has synthesized  $(1-x)$  BaTiO<sub>3</sub>- $x$  CoFe<sub>1.8</sub>Zn<sub>0.2</sub>O<sub>4</sub> (where  $x = 10, 20, 30$  and  $40$  wt.%) by the solid-state reaction method and reported that morphology and Dielectric constant is found to increase as ferrite fraction increases. The increase in dielectric constant is attributed to the space charge effect and the hopping conduction mechanism [28]. Varma et al. fabricated  $(1-x)$  (Ba<sub>0.8</sub>Ca<sub>0.2</sub>TiO<sub>3</sub>)- $x$ (Co<sub>0.6</sub>Zn<sub>0.4</sub>Fe<sub>2</sub>O<sub>4</sub>) (with  $x = 0.00, 0.01, 0.02, 0.03, 0.04,$  and  $1.00$ ) via wet chemical method and found that the leakage current measurement value obey Ohmic conduction mechanism for all the samples and with increasing ferrite concentration saturation magnetization (Ms) was increased and attain maximum value for  $x = 0.04$  concentration [29].

The purposed (Ba<sub>0.85</sub>Ca<sub>0.15</sub>TiO<sub>3</sub>)<sub>1-x</sub>-(CoFe<sub>2</sub>O<sub>4</sub>)<sub>x</sub> (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) composite materials were synthesized by using solid-state reaction method. Individual Ba<sub>0.85</sub>Ca<sub>0.15</sub>TiO<sub>3</sub> and CoFe<sub>2</sub>O<sub>4</sub> ceramic samples were first synthesized, and then composite samples were prepared. The structural, microstructural, dielectric, electrical properties, and magnetic properties of (Ba<sub>0.85</sub>Ca<sub>0.15</sub>TiO<sub>3</sub>)<sub>1-x</sub>-(CoFe<sub>2</sub>O<sub>4</sub>)<sub>x</sub> composite materials were investigated using XRD, Impedance spectroscopy and Magnetic hysteresis loop.

## 2 Materials and methods

(BCT)<sub>1-x</sub>-(CFO)<sub>x</sub> (where  $x = 0.00, 0.10, 0.20, 0.30, 0.40$  and  $1.00$ ) composites materials were synthesized using solid-state reaction method with analytical-grade metal oxides. Barium carbonate (99.9% pure M/S Aldrich chemicals India), Calcium carbonate CaCO<sub>3</sub> (99.9% pure M/S Aldrich chemicals, India), Titanium Oxide TiO<sub>2</sub> (99.9% pure M/S Aldrich chemicals, India), ferric oxide Fe<sub>2</sub>O<sub>3</sub> (99.9% pure M/S Aldrich chemicals, India) and Cobalt oxide CoO<sub>2</sub>, (99.9% pure M/S Aldrich chemicals, India). Both the ceramic materials Ba<sub>0.85</sub>Ca<sub>0.15</sub>TiO<sub>3</sub> and CoFe<sub>2</sub>O<sub>4</sub> in the stoichiometric ratio of the compositions were weighed and mixed thoroughly in the presence of

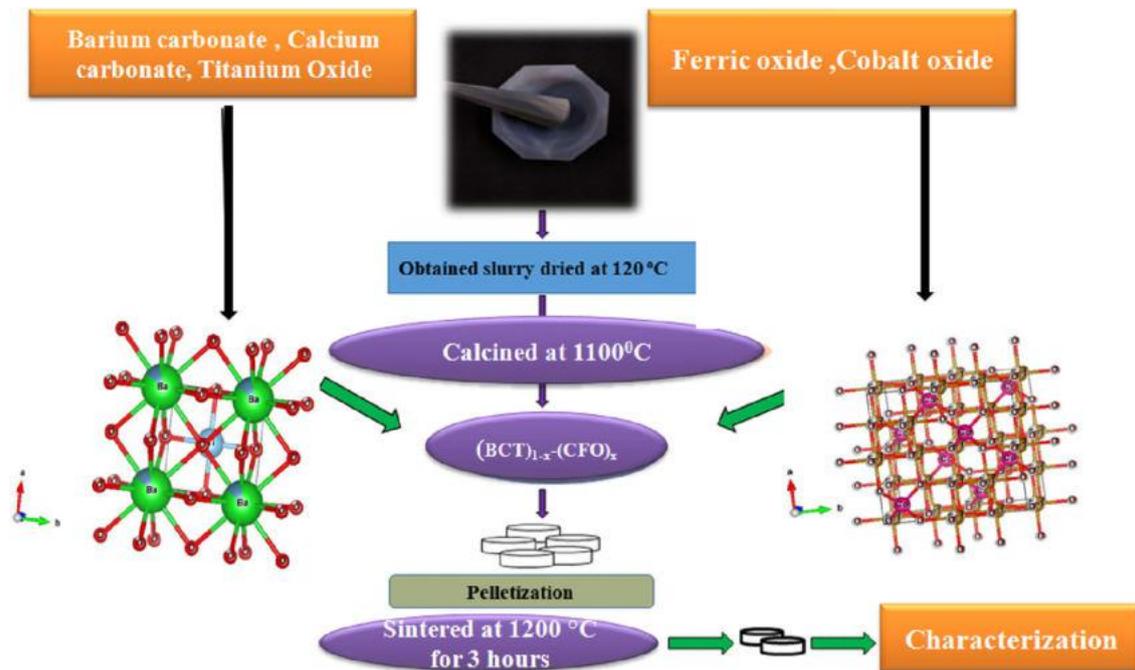

acetone. Later the composite powder was dried at 125 °C. Ba<sub>0.85</sub>Ca<sub>0.15</sub>TiO<sub>3</sub> calcined at 1100 °C for 3 h and CoFe<sub>2</sub>O<sub>4</sub> calcined at 850 °C for 4 h in alumina crucibles.

X-ray diffraction (XRD) technique was used at room temperature to confirm the formation of pure phase and compound quality. After the confirmation of pure phase these obtained samples were used for the synthesis of composites (Ba<sub>0.85</sub>Ca<sub>0.15</sub>TiO<sub>3</sub>)<sub>1-x</sub>-(CoFe<sub>2</sub>O<sub>4</sub>)<sub>x</sub> (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) by varying the weight percentage of CoFe<sub>2</sub>O<sub>4</sub> from  $x = 0.10$  to  $0.40$  and prepared the composite samples. The composite samples were calcined at 1200 °C for 3 h before being pressed into pellets with a thickness of 1–2 mm and a diameter of 10 mm using a hydraulic press at a pressure of 50 MPa. The pellets were embedded in the same composition powder and sintered in a closed alumina crucible at 1250 °C for 3 h. At room temperature, the XRD patterns of the compounds were reported using a Rigaku Miniflex (Japan) X-ray powder diffractometer with CuK<sub>α</sub> radiation ( $\lambda = 1.5405 \text{ \AA}$ ) in a range ( $20 \leq 2\theta \leq 70$ ) of Bragg angles  $2\theta$  at a scanning rate of  $1/2 \text{ min}^{-1}$ . Rietveld Refinement was performed using Full-Prof method to calculate the lattice parameters and other structural study. Scanning Electron Microscopy (SEM) JEM-2000FX (JEOL Ltd.) was used to examine the surface morphology of these composite pellets at 20 keV. The sintered pellets were ground and polished for dielectric measurements; silver paste was applied to opposite parallel faces and coated pellets were heated at 550 °C for 10 min in a furnace to create the electrode. An HP Agilent impedance analyzer (4294 A Hewlett Packed) was used to measure the dielectric properties in the temperature range of 25–400 °C sintered ceramic pellets. A vibrating sample magnetometer (VSM) was used to record the magnetic data (Cryogenic).

## 3 Results and discussion

### 3.1 Crystal structure

Figure 1 shows the Rietveld refinement of the (BCT)<sub>1-x</sub>-(CFO)<sub>x</sub> (where  $x = 0.00, 0.10, 0.20, 0.30,$

**Fig. 1** Schematic flow figure of the experiment

0.40, 1.00) XRD pattern at room temperature, with individual growth of both phases in all composite samples. From the XRD pattern, it can be concluded that composites were polycrystalline in nature. XRD pattern depicts that BCT-CFO have both tetragonal as well as cubic (spinel) structure. The peaks of XRD pattern of BCT and CFO matches with the JCPDS no. 811289 for  $\text{BaTiO}_3$  and the JCPDS no. 22-1086 for  $\text{CoFe}_2\text{O}_4$  phase. The patterns corresponding to the mentioned ICSD files, indicating that the samples possess the tetragonal phase at room temperature. All Composites have both cubic spinel and tetragonal structures in their XRD patterns, with no bias/deformation in the structure. When XRD patterns were analyzed, it was observed that all composites have only BCT and CFO peaks. No extra peaks or splitting in peaks were observed, indicating that no transition from tetragonal to cubic phase occurred during the formation of the composite structure. By envisioning the presence of the highest intensity peak of both the

pure samples in the composite materials, we can see both phases together in composite samples. As the wt.% of CFO increased in BCT, the intensity of the peaks associated with the CFO phase increases, while the intensity of the peaks associated with the BCT phase decreases.

Rietveld Refinement has been used to further analyse the crystal structure of all the samples using Full-Prof software. CFO has a spinel structure ( $\text{AB}_2\text{O}_4$ ) with cubic symmetry and space group  $\text{Fd}3\text{m}$ , while BCT has a perovskite structure ( $\text{ABO}_3$ ) with tetragonal symmetry and space group  $\text{P}4\text{mm}$ . All the samples' XRD patterns were refined using a full-prof approach that is based on space groups and an approximate structural model of these structures. Table 1 summarizes some refined lattice parameters, as well as their residual factor  $R_p$ , goodness of fit  $\chi^2$  and weighted residual factor  $R_{\text{wfp}}$ . Since the ionic radii of  $\text{Fe}^{3+}$  (0.645 Å) and  $\text{Co}^{2+}$  (0.58 Å) in the B (octahedral) site of ferrite phase

( $\text{AB}_2\text{O}_4$  structure) are analogous to the ionic radii of  $\text{Ti}^{4+}$  (0.605 Å) in the B-site of the ferroelectric phase ( $\text{ABO}_3$  structure), there could be a possibility that during sintering process, ion diffusion between the two sites of the ferroelectric-ferrite phase may occur, which might be the one of the possible reasons for the modification of lattice parameters.

As shown in Fig. 2, the bond lengths and angles were determined using rietveld refinement. The VESTA software was used to visualize and determine the electronic state of the crystal structure in three dimensions.

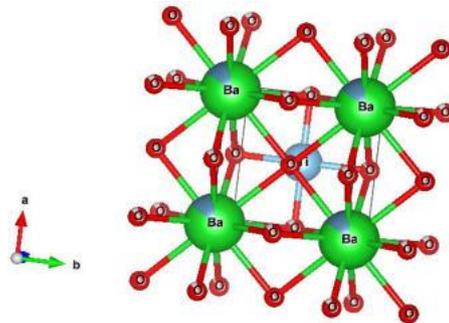

### 3.2 Morphology

Figure 3a–f shows microstructure of  $(\text{BCT})_{(1-x)}\text{CFO}_x$  (where  $x = 0, 0.10, 0.20, 0.30, 0.40$  and  $1.00$ ) were studied using SEM. The polycrystalline  $(1-x)\text{BCT}-x\text{CFO}$  composite samples had densely compacted crystal grains and grain growth that was randomly directed. The grains are evenly distributed across the surface of sintered samples, demonstrating their high compactness and polycrystallinity. The ceramics density was estimated to be about 87% of the theoretical density.

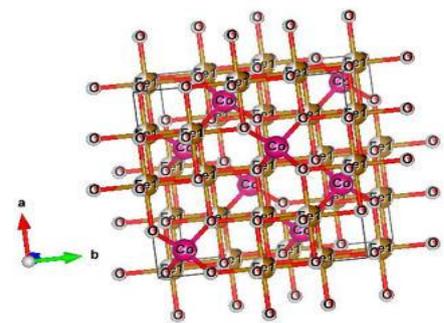

**Fig. 2 a** Rietveld refinement XRD pattern in the  $2\theta$  range of  $20\text{--}70^\circ$  of  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  where  $x = 0.00, 0.10, 0.20, 0.30, 0.40$  and  $1.00$  composites. **(b, c)** The unit cell of pure  $\text{Ba}_0.85\text{Ca}_0.15\text{TiO}_3$  (tetragonal structure) and pure  $\text{CoFe}_2\text{O}_4$  (cubic structure) constructed by using VESTA software by data obtained from rietveld refinement

### 3.3 Dielectric studies

The dielectric constant of  $\text{BCT}_{(1-x)}\text{-CFO}_x$  ceramics varies as a function of temperature at different frequencies (1, 10 and 100 kHz), as shown in Fig. 4a–d. The stoichiometry and choice of precursors have a substantial impact on the electric and magnetic properties of ferrite. Each sample had one transition temperature: initially,  $\epsilon_r$  increases with increasing temperature until it reaches the phase transition

temperature, and then with increasing temperature it decreases, that is a typical ferroelectric behavior. This transition was observed in all samples due to the orthorhombic-to-tetragonal phase transition.

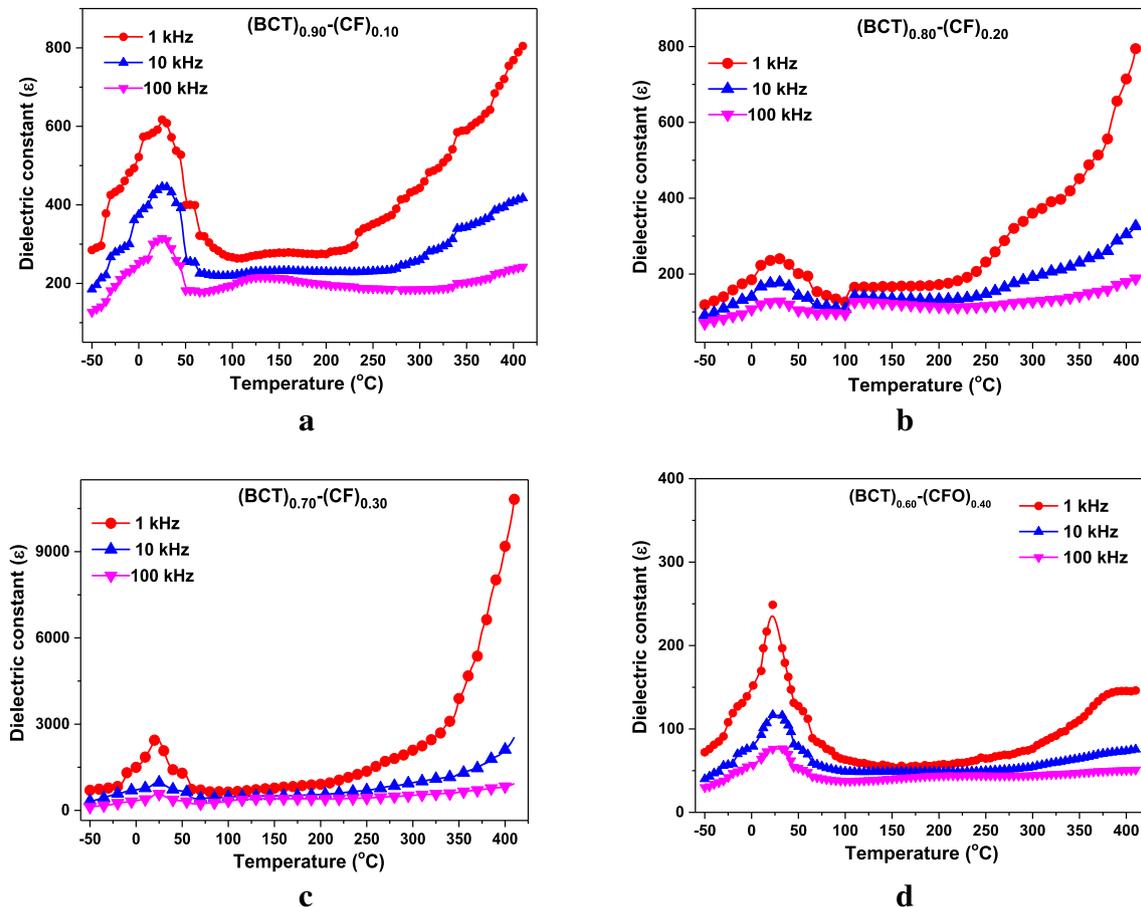

(O–T) at the range  $-50^\circ\text{C}$  to  $+50 \pm 20^\circ\text{C}$  temperature. With the increasing frequency, the peak shifts towards higher temperatures. It was also observed that the samples impregnate into the second transition at higher temperature due the tetragonal- to—paraelectric phase transition. Dielectric

**Fig. 3** a–f SEM images of  $(\text{BCT})_{1-x}-(\text{CFO})_x$  composite (where  $x = 0, 0.10, 0.20, 0.30, 0.40$  and  $1.00$ )

constant decreases with increasing CFO content, due to the excessive magnetic phase present in the ceramic. The cubic phase of CFO based magnetic material decreases the percentage of tetragonality of perovskite phase, restrict the atomic polarization.  $\text{BCT}_{(1-x)}-\text{CFO}_x$  at  $x = 0.30$  were found to have maximum value of  $\epsilon_r \sim 2515$  at temperature  $10 \pm 5$  °C). Compared to BCT, CFO exhibits lower electrical resistivity, and its inclusion in composites will have a significant impact on the conductivity of ceramics. The percolation threshold is reached when the inclusions' volume filling factor is near to one-third,

according to Bruggeman's effective medium approximation (EMA) model, which was created to characterise spherical inclusions implanted into a continuous backdrop. According to this model, the concentration of ferrite in BCT-CFO composites with composition  $x = 0.10, 0.20, 0.30$ , and  $0.40$  is close to the percolation threshold; as a result, both percolation strengths are nonzero and percolating clusters coexist, resulting in the detection of effective permittivity and permeability. It is a thermally activated technique, therefore when we raise the ferrite phase, the conductivity is improved at low frequencies and

**Fig. 4** a–d Variation of dielectric constant of  $(\text{BCT})_{1-x}-(\text{CFO})_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) with temperature at different frequencies 1, 10, 100 kHz

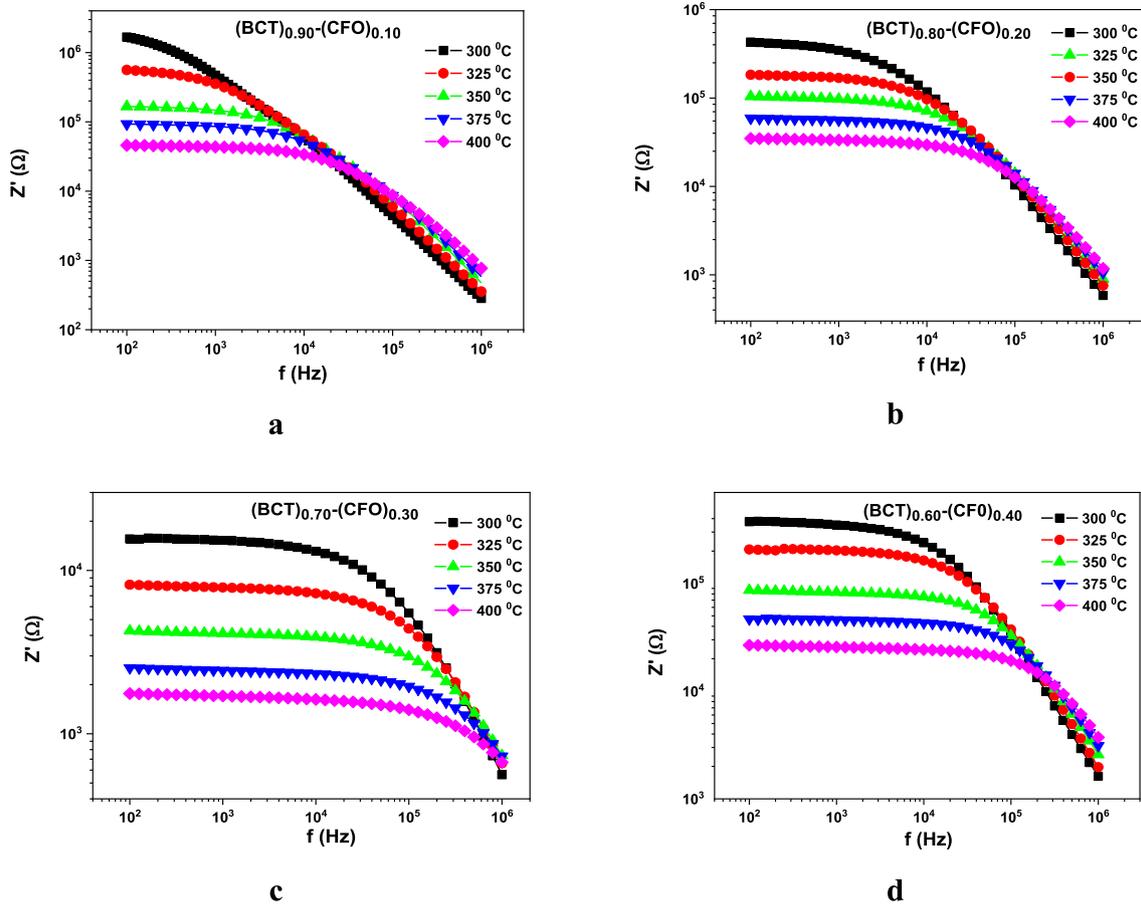

higher temperatures. As a result, the effect can be seen as a mutual rise in dielectric permittivity at the lowest frequencies and highest temperatures [30].

### 3.4 Impedance spectroscopy

Figure 5a–d shows the spectrum of real part of impedance ( $Z'$ ) at different temperatures and frequencies along with compositional variations. In low-frequency region the variation of  $Z'$  is sigmoid and a saturated behavior in high frequency region. As a result, the presence of a material with a mixed nature of polarization behavior, such as electronic, dipolar

polarizations, may be presumed. The negative temperature coefficient of resistance (NTCR) behavior of the material in the low-frequency range is depicted by lowering the value of  $Z'$  as the temperature increases. These results suggest that a rise in temperature could lead to an increase in ac conductivity. This is due to the space charge that is released as the material's barrier potential decreases.

Figure 6a–d shows the spectrum of the  $Z''$  (imaginary part of the impedance) as a function of frequency 300–400  $^{\circ}\text{C}$  for  $\text{BCT}_{(1-x)}-\text{CFO}_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) samples. Wide-ranging peaks were detected in plots, and it was determined

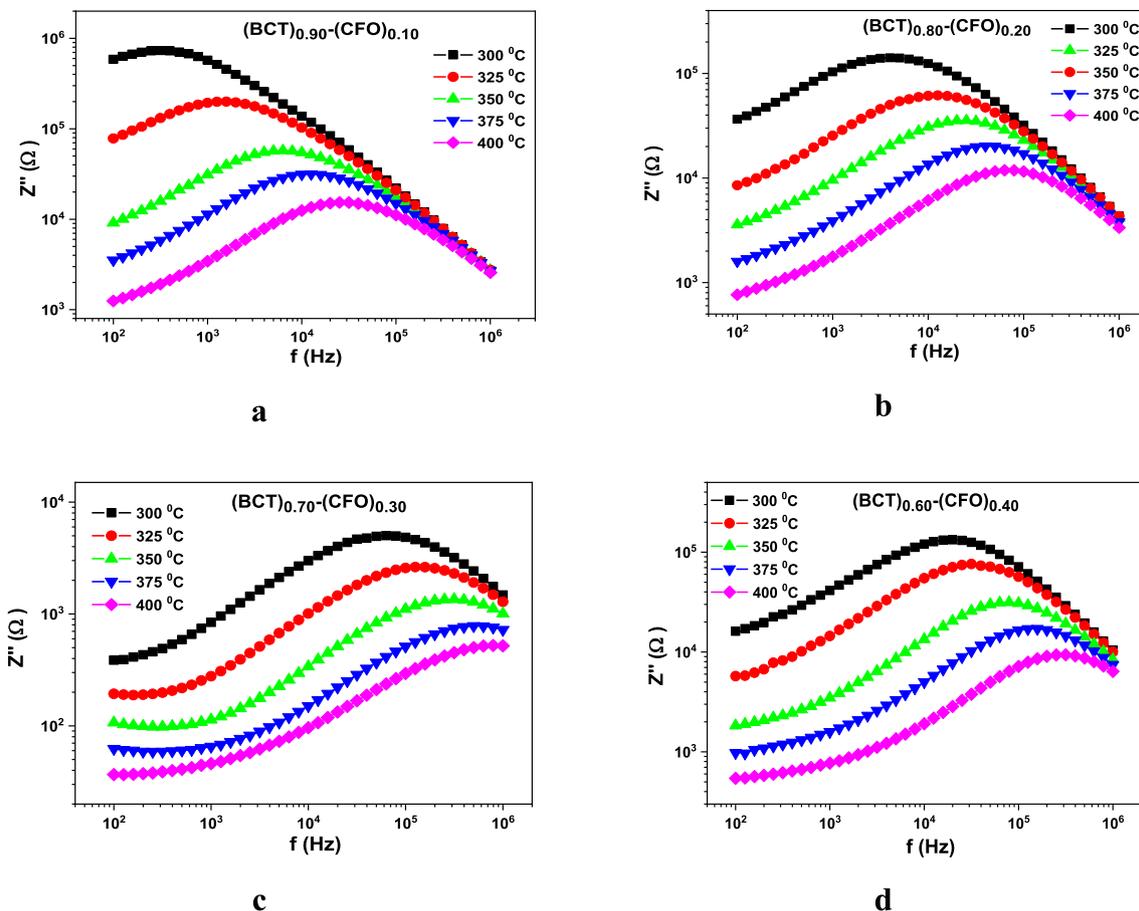

**Fig. 5** a–d Variation of real of impedance of  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) at different temperatures

that bulk resistance reduced as frequency and temperature (300–400 °C) increased. The presence of a relaxation process in the materials is confirmed by a decrease in bulk resistance as temperature rises. At high frequency, the perimeters the grain boundary effect due to low relaxation time [31–33]. This signifies that dielectric relaxation is temperature-dependent, and that there is no single relaxation time.  $Z''$  decreases continuously as frequency and temperature increase, and eventually decreases in the high frequency domain. At lower frequencies, it reveals the presence of space charge polarization, which vanished at higher frequencies [34, 35].

Figure 7a–d illustrate the temperature dependence of complex impedance spectrum  $Z'$  vs.  $Z''$  (known as

Nyquist plot) of  $\text{BCT}_{(1-x)}\text{-CFO}_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) composite samples, which displays semicircular arc at high temperatures range 300–400 °C. Semicircles arc suggest the occurrence of grain (bulk) and grain boundary contribution of the material. The material's bulk (grain) properties are represented by the high-frequency semicircle. The intersection of the semicircle arc with the  $Z'$  provides us an estimate of the material's bulk resistance ( $R_b$ ), which has been seen to decrease as temperature increased. This shows semiconducting property, i.e. NTCR behavior of the samples. The decrease in resistance with increasing temperature, indicated the reduction in charge barriers from the grains and grain boundaries, so that with the increase in

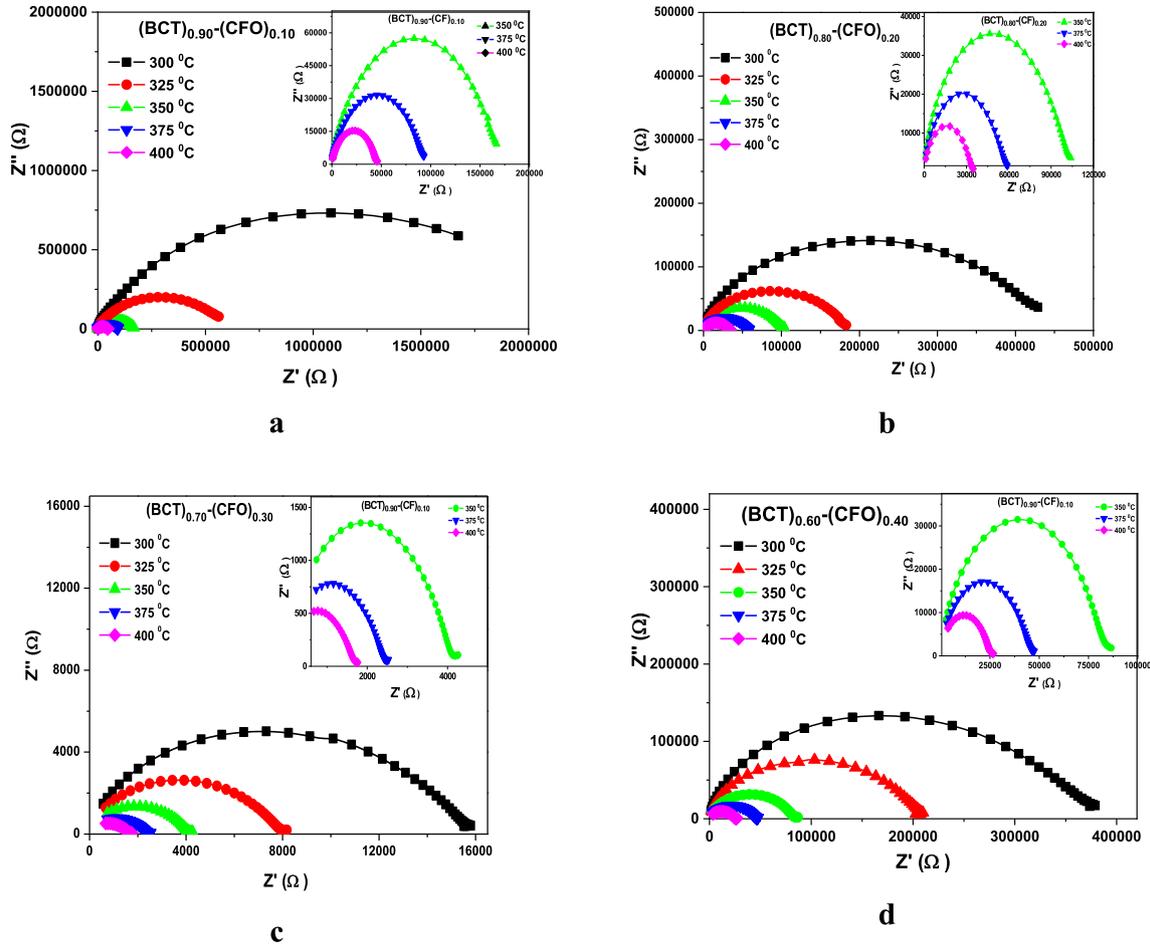

**Fig. 6** a-d Variation of imaginary part ( $Z''$ ) of impedance with frequency at different temperatures of  $(\text{Ba}_{0.85}\text{Ca}_{0.15}\text{TiO}_3)_{1-x}-(\text{CoFe}_2\text{O}_4)_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ )

temperatures the conduction is enhanced [36]. Bulk capacitance ( $C_b$ ) and bulk resistance ( $R_b$ ) correspond electrical behavior that can be described using an equivalent circuit containing of a series combination of parallel RC circuits. The material's depressed semicircles with centers below the real axis suggest a divergence from ideal Debye behavior and a non-Debye form of relaxation phenomenon. [37, 38]. Fig. 8a–d depicts the fitting of Nyquist plot of  $\text{BCT}_{(1-x)}-\text{CFO}_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) ceramics, which displays semicircular arc at high temperatures range 300–400 °C.

The variability of the Real component ( $M'$ ) of modulus with frequency at ambient temperatures of

$(\text{BCT})_{1-x}-(\text{CFO})_x$  composite samples is shown in Fig. 9a–d. The variation of  $M'$  with frequency illustrates a dispersion leading to  $M_\infty$  (the asymptotic value of  $M'$  at higher frequencies), which shifted towards the higher frequency side as temperature was raised. The stretching of exponential character of the material's relaxation time provides by  $M'$  asymmetric plot. At lower temperatures, charge carriers' short-range mobility will result in monotonous dispersion as frequency increases. These results could be the sign of a lack of restoring force regulating charge carrier mobility under the presence of an induced electric field.

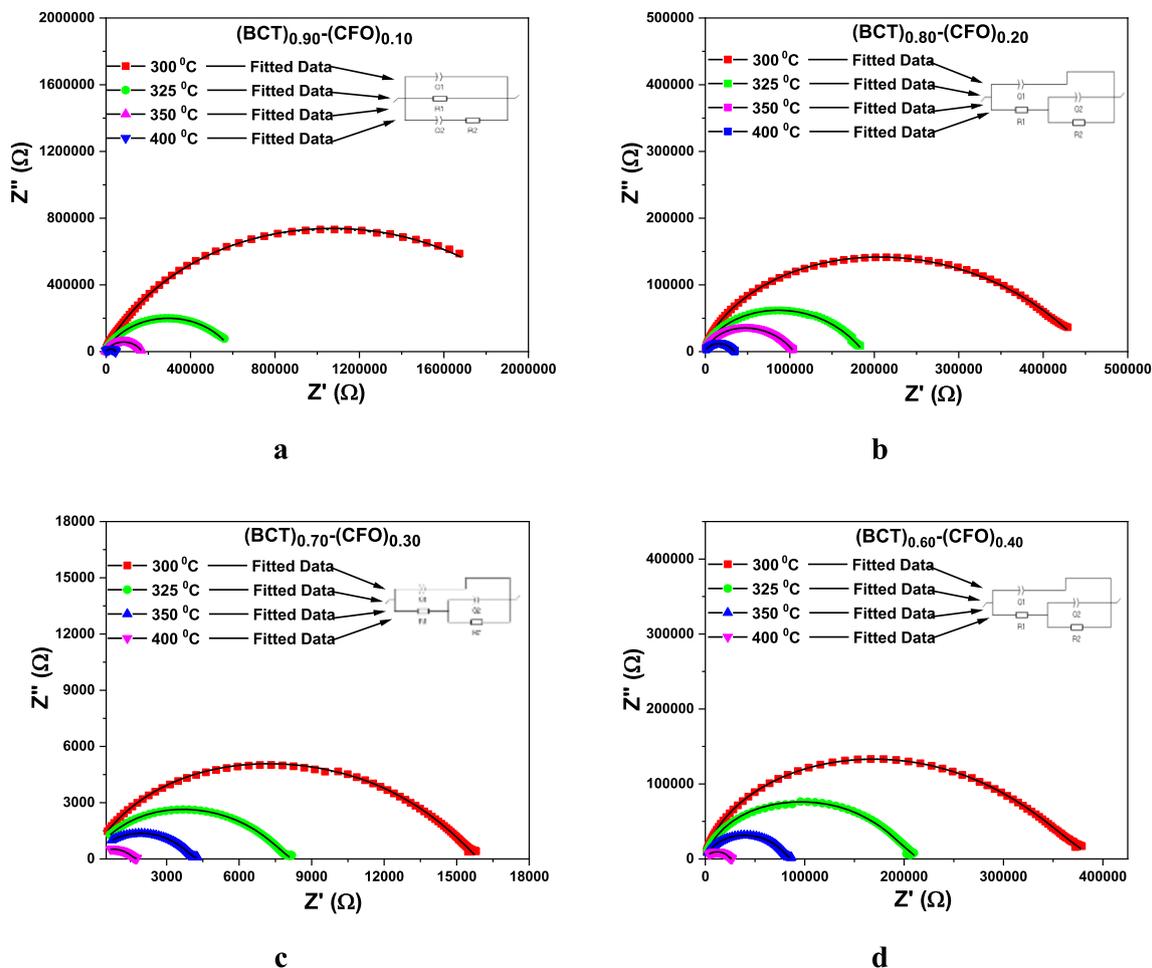

**Fig. 7** a–d Variation of real and imaginary part of impedance of  $(\text{Ba}_{0.85}\text{Ca}_{0.15}\text{TiO}_3)_{1-x}(\text{CoFe}_2\text{O}_4)_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) at different temperatures

The variability of the imaginary part of modulus ( $M''$ ) with frequency at different temperatures is shown in Fig. 10a–d. As shown by the graph,  $M''$  indicates the significant peaks and the site of the peak, i.e.,  $M''_{\text{max}}$  shifted to higher frequencies with the increasing temperature. The frequency range below peak maximum  $M''$  represents the range in which charge carriers are mobile over long distances. Carriers are only mobile over short distances and are restricted to potential wells at frequencies above peak maximum. The peaks of the observed Debye curve are asymmetric and broader than those of the ideal

Debye curve. Peaks in the frequency spectrum signify a shift in mobility from long-range to short-range.

Complex modulus analysis is a technique for investigating electrical properties of materials that magnifies any other effects present in the sample. It's a useful method for determining, analyzing, and interpreting the dynamical characteristics of electrical transport phenomena (i.e., parameters like conductivity, carrier/ion hopping rate, relaxation time etc.). Figure 11a–d indicates the complex electric modulus distribution  $M'$  vs.  $M''$  for  $(\text{BCT})_{1-x}(\text{CFO})_x$  (where  $x = 0.10, 0.20, 0.30,$  and  $0.40$ ) composite samples at different temperatures. The existence of small

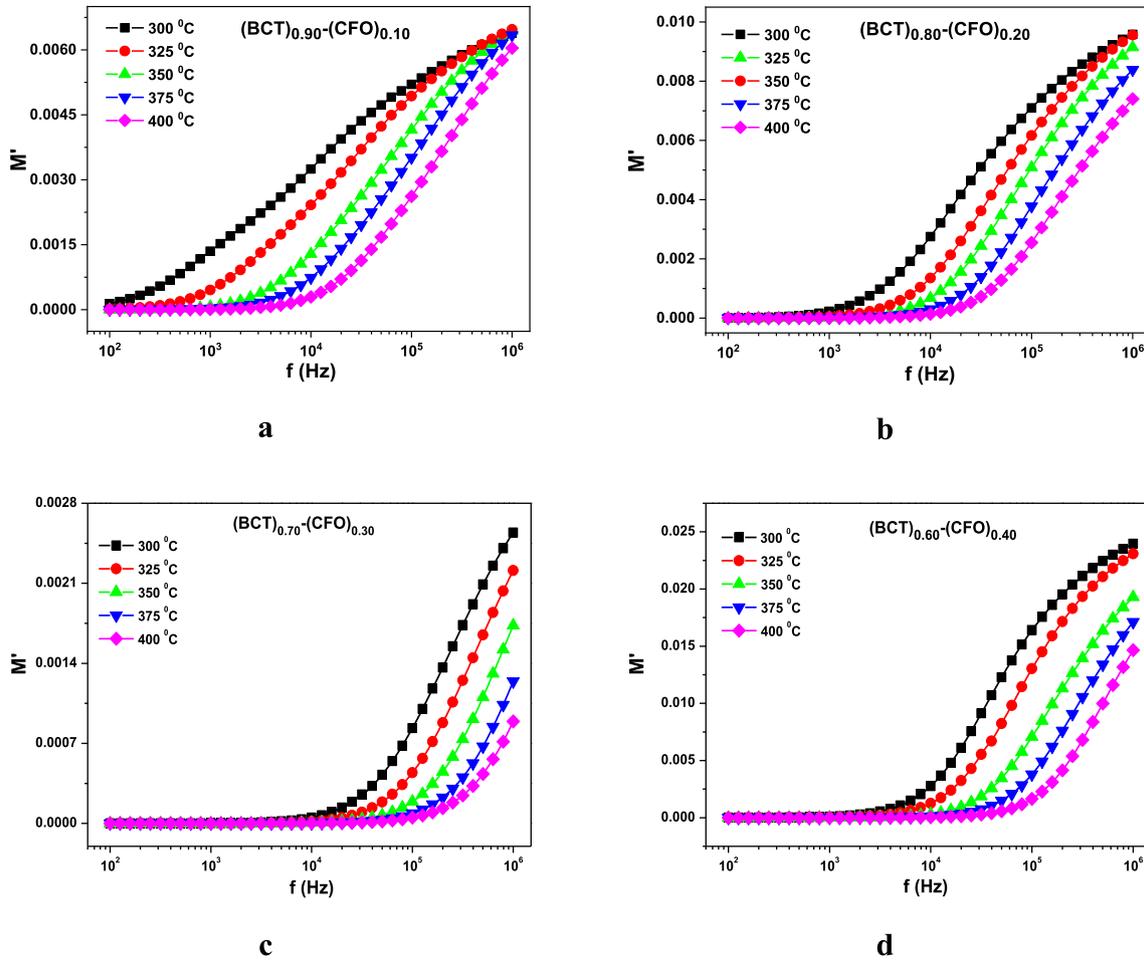

**Fig. 8** a–d Fitting of Cole–cole plot of  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) at different temperatures with equivalent circuit

asymmetric and depressed semicircle arcs with centers that does not lie on the  $M'$  axis characterizes the patterns. The pattern of the electric modulus spectrum indicates to a temperature-dependent hopping type of electric conduction (charge transport) in composite materials as well as non-Debye type dielectric relaxation.

The scaling response of the composite samples  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) impedance data is shown in Fig. 12a–c using  $Z''(f)$  spectroscopic plots. At all observed temperatures, the normalized plot of  $Z''/Z''_{\text{max}}$  overlapping on a single

master curve. With an increase in temperature, the frequencies of  $Z''$  peaks were clearly coincident and had the same shape and pattern in the peak position, with a slight variation in full width at half maximum FWHM. The master impedance plot can be used to investigate the dielectric phenomenon that occur within the material, with the conclusion that for lower temperatures, the dynamical processes are nearly temperature-independent [37, 39]. The observation is also noteworthy that the  $Z''/Z''_{\text{max}}$  curves were asymmetric and signifying the conductivity relaxation has non-exponentially behavior. The

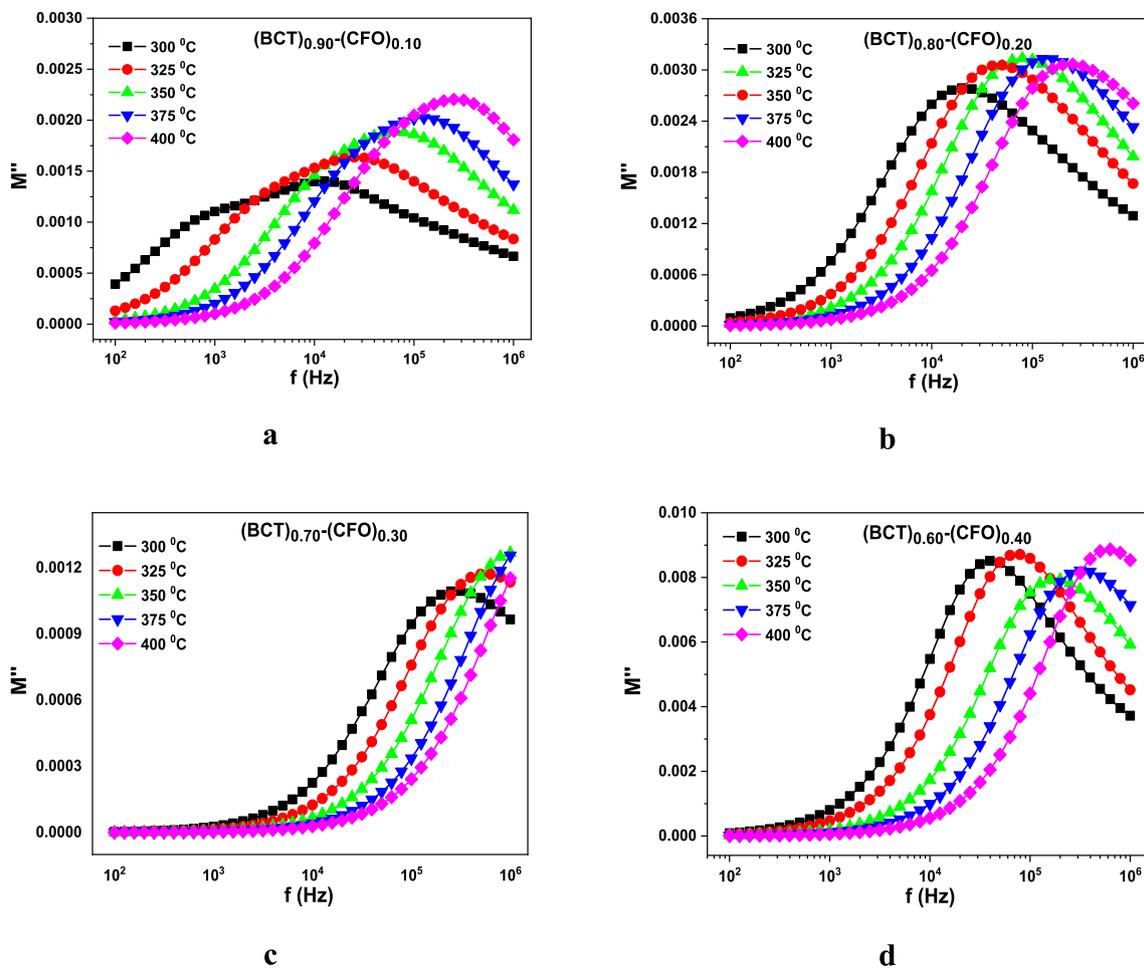

**Fig. 9 a–d** Variation of real part ( $M'$ ) of modulus with frequency at different temperatures of  $(\text{Ba}_{0.85}\text{Ca}_{0.15}\text{TiO}_3)_{1-x}-(\text{CoFe}_2\text{O}_4)_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ )

presence of a non-Debye form of relaxation process is indicated by the spectra's FWHM considerably wider than a Debye peak [40].

### 3.5 Magnetic studies

Figure 13 shows the magnetization as a temperature dependent between 5 and 300 K under Field Cooling (FC) and Zero Field Cooling (ZFC) conditions with a 1 T magnetic field. The temperature at which the ZFC and FC curves split apart is known as the transition temperature. The samples are cooled in a field of 1 T to reach a temperature of 5 K for the Field Cooled

(FC) magnetization, and they are heated in the same field of 1 T for the Zero Field Cooled (ZFC) magnetization, with the magnetization being measured as the temperature rises. It is evident that when temperature rises, ZFC magnetization rises, reaches a maximum at blocking temperature ( $T_B$ ), and then decreases again. The temperature at which the nanoparticle moments do not relax (are blocked) over the course of the measurement is known as the  $T_B$ . Only above  $T_B$  the spins capable of flipping, and at that point the ZFC magnetization and FC magnetization coincide. The materials exhibit

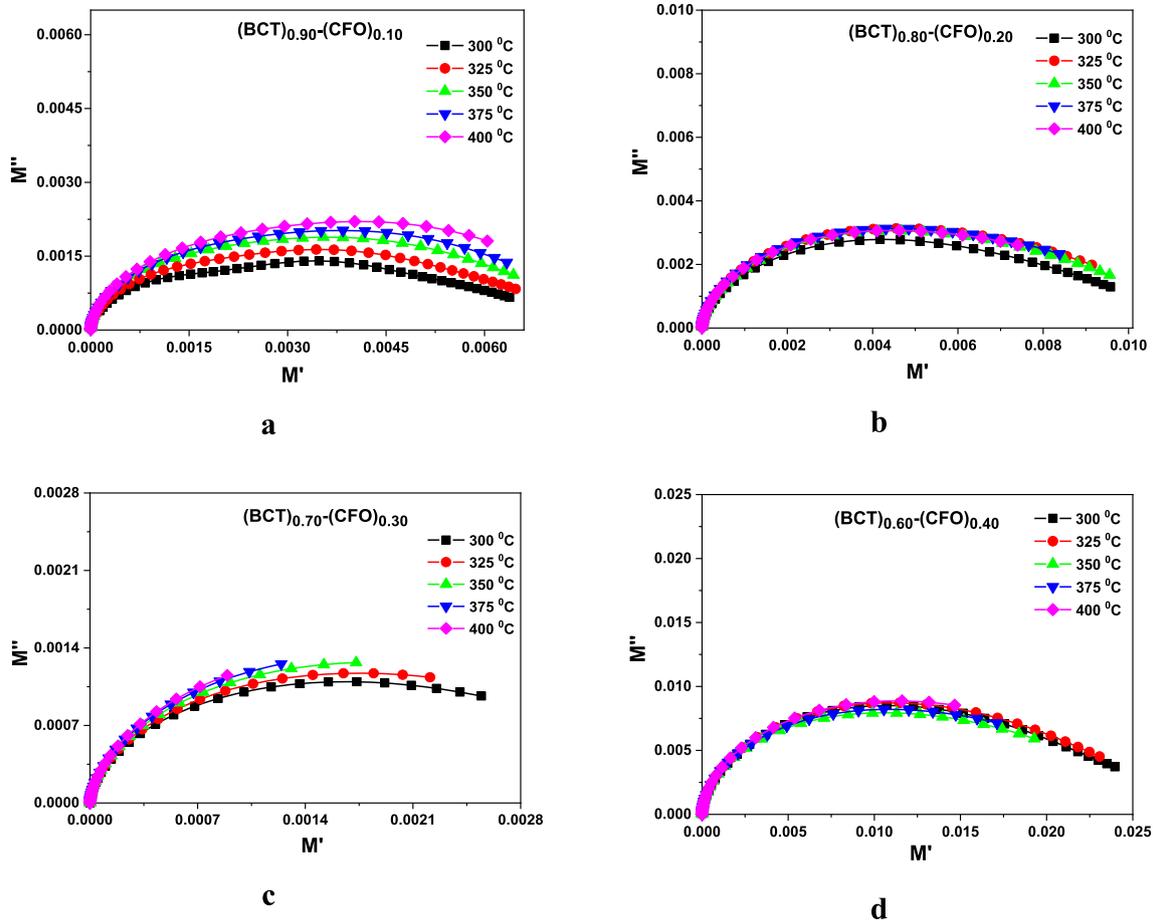

**Fig. 10** a–d Variation of imaginary part ( $M''$ ) of modulus with frequency at different temperatures of  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  composite (where  $x = 0.10, 0.20, 0.30,$  and  $0.40$ ) composites

Superparamagnetism in conformance with the Curie–Weiss law at temperatures above TB because the thermal energy is greater than the magnetic energy barrier at these temperatures. The blocking temperatures of  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) were found to be 50, 49, 48 and 47 K as the wt.% of CFO increases as mentioned. When nanoparticles are cooled from room temperature to 5 K, the magnetic direction of the particles is frozen to the direction of the applied field for FC measurements. A maximum magnetization has been seen at 5 K because the anisotropy energy barrier prohibits

the magnetic moments from flipping at this temperature. Because of the nanoparticles' anisotropic energy barrier, the FC and ZFC curves diverge, which is a key characteristic of super-Paramagnetism. Because the moments of the nanoparticles are orientated along their easy axis, they must break through the anisotropy energy barrier in the ZFC process. The FC curve is unaffected by the anisotropic energy barrier because the cooling process aligns the nanoparticle moments with the field [41].

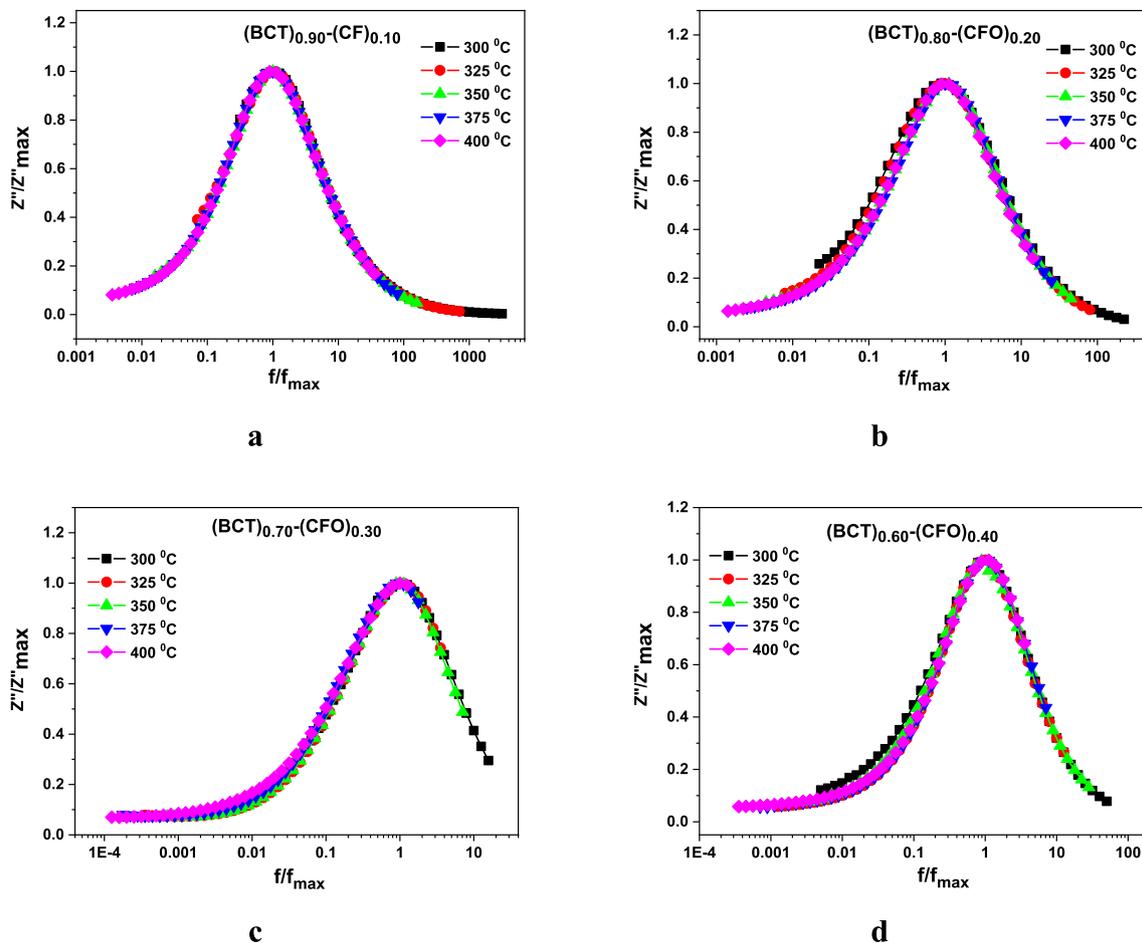

The magnetic hysteresis loops for  $(\text{BCT})_{(1-x)}\text{-CFO}_x$  composite samples with various  $\text{CoFe}_2\text{O}_4$  contents

**Fig. 11 a–d** Variation of real and imaginary part of modulus at different temperatures of  $(BCT)_{1-x}-(CFO)_x$  composites (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ )

are shown in Fig. 14 for all samples at 300 K in a field range of 0–15 T. The well-defined magnetic hysteresis loops show that  $(BCT)_{1-x}-(CFO)_x$  composite samples exhibit ferromagnetic characteristics (where  $x = 0.10, 0.20, 0.30$ , and  $0.40$ ). Ceramics' magnetic properties are influenced by particle size, sintering temperature, additives, nanostructure, and the external field applied. All the samples show the characteristic hysteresis loops seen in soft magnetic materials, confirming that incorporating  $Ba_{0.85}Ca_{0.15}TiO_3$  to the

composite has no influence on the magnetism of  $CoFe_2O_4$ . For  $(BCT)_{1-x}-(CFO)_x$  (where  $x = 0.10, 0.20, 0.30$ , and  $0.40$ ) composite samples, maximum saturated magnetizations of 15, 22, 30, and 38 emu/g were reported, respectively. With decreasing  $CoFe_2O_4$  content and increasing  $Ba_{0.85}Ca_{0.15}TiO_3$  content, the saturated magnetization was found to decrease. It may also be explained by the existence of the  $Ba_{0.85}Ca_{0.15}TiO_3$  phase, which could have disrupted the ferromagnetic  $CoFe_2O_4$  phase's continuity or

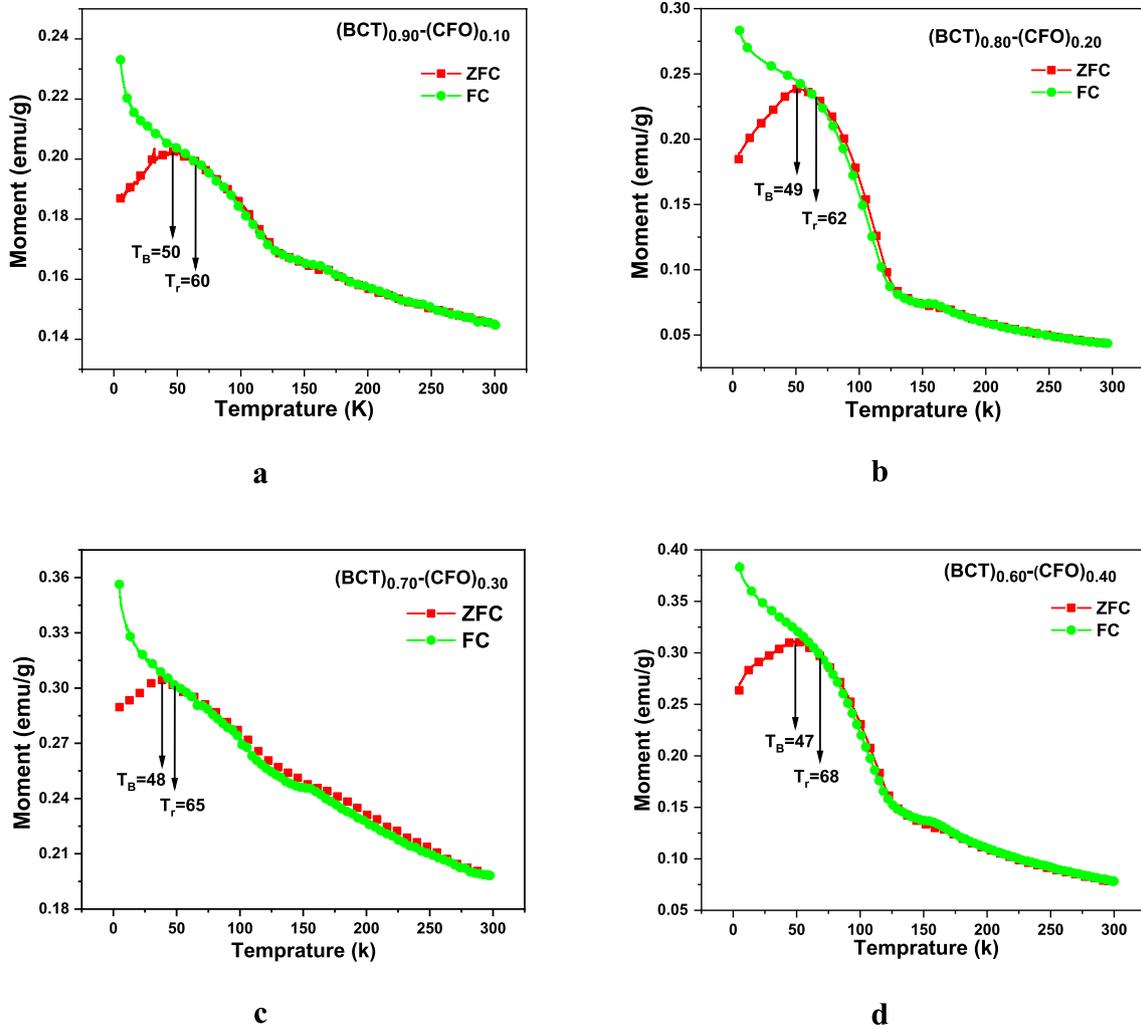

**Fig. 12** a–d Impedance and modulus scaling behavior of the master curves at different temperatures of  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  composites (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ )

magnetic ordering. As a result, as the  $\text{Ba}_{0.85}\text{Ca}_{0.15}\text{TiO}_3$  content increases, the regional magnetic moments decrease dramatically.

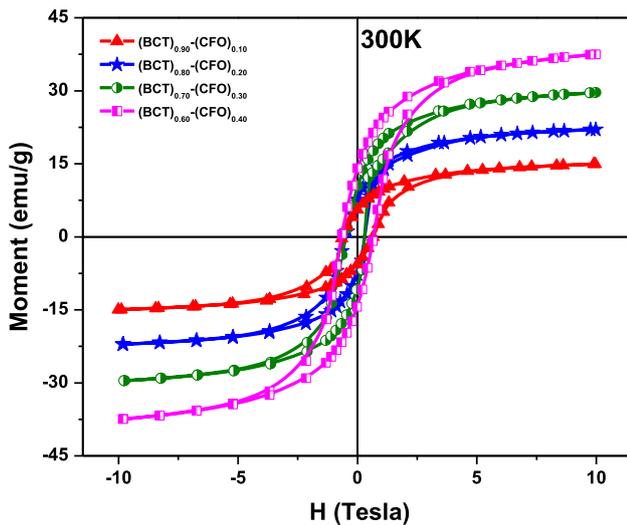

Figure 15 shows variation of saturated magnetization with value of  $x$  % in compositions of  $(\text{BCT})_{1-x}\text{-(CFO)}_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) composite materials. The saturated magnetization increases as the content of  $\text{CoFe}_2\text{O}_4$  increases from 0.10 to 0.40, as shown in the graph.

## 4 Conclusions

XRD pattern of BCT-CFO composite samples depicted both tetragonal as well as cubic (spinel) structure. Polycrystalline  $\text{BCT}_{(1-x)}\text{-CFO}_x$  composite samples exhibited dense packing of grains in SEM micrographs with randomly oriented grains. Decreasing trend of  $Z'$  with the increasing temperature in impedance spectroscopy suggested NTCR behavior of the samples in low-frequency region. The material's depressed semicircles, whose centers are below

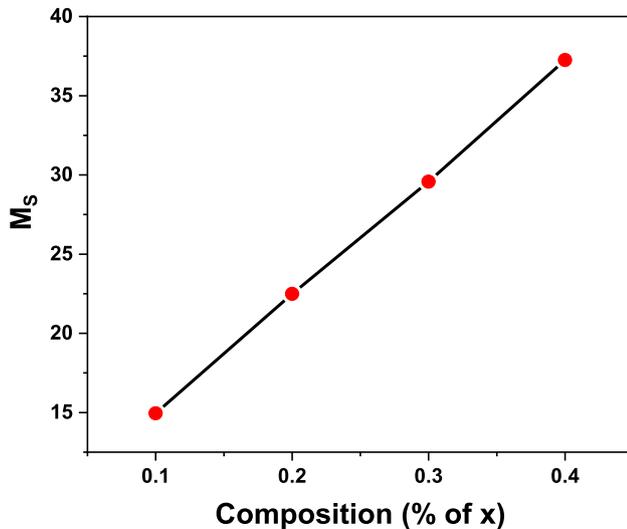

**Fig. 13** Variation of magnetization FC and ZFC with temperature (K)  $(BCT)_{1-x}-(CFO)_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ )

**Fig. 14** MH loop of  $(BCT)_{1-x}-(CFO)_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ )

the real axis, showed a deviation from ideal Debye behavior and a non-Debye type of relaxation process. The  $Z''/Z''_{max}$  curves were also identified to be asymmetric, indicating that the conductivity relaxation shows non-exponential behavior. The electric modulus spectrum's behavior indicated a temperature-dependent hopping type of electric conduction mechanism and the existence of non-Debye type dielectric relaxation in the composite samples. All the samples exhibited the characteristic magnetic hysteresis loops indicating typically soft ferromagnetic behavior. Maximum saturated magnetization  $\sim 15, 22, 30$  and  $38$  emu/g were observed for  $(BCT)_{1-x}-(CFO)_x$  (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ ) composite samples, respectively.

**Fig. 15** Variation of saturated magnetization with x content in composition of  $(\text{BCT})_{1-x}(\text{CFO})_x$  composite (where  $x = 0.10, 0.20, 0.30$  and  $0.40$ )

## Microwave-Assisted OPC-VH Mediated Synthesis of 2-Amino-1,3,4-thiadiazoles

Parmod Kumar<sup>a</sup>, Harshita Phougat<sup>b,c</sup>, Anil Kumar<sup>b</sup>, Anurakshee Verma<sup>a</sup>, and Karan Singh<sup>c</sup> 

<sup>a</sup>Department of Chemistry, School of Basic and Applied Sciences, Lingaya's Vidyapeeth, Faridabad, Haryana, India; <sup>b</sup>Department of Chemistry, Akal College of Basic Sciences, Eternal University, Baru Sahib, Himachal Pradesh, India; <sup>c</sup>Department of Chemistry, Indira Gandhi University, Meerpur, Rewari, Haryana, India

**ARTICLE HISTORY** Received 11 March 2022; Accepted 23 August 2022

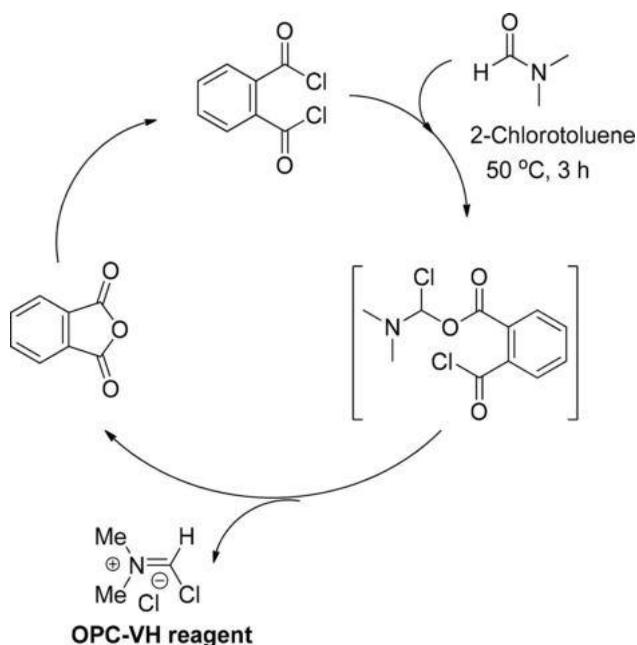

Bioactive thiadiazoles represent an indispensable class of nitrogen and sulfur containing heterocycles, in part due to their extensive applications in medicinal chemistry.<sup>1</sup> It is generally assumed that the biological activities of thiadiazoles are due to the presence of the =N-C-S- moiety and the aromaticity of the ring, responsible for the *in vivo* stability and low toxicity for higher vertebrates.<sup>2,3</sup>

Indeed, the thiadiazole ring represents a remarkably divergent scaffold responsible for numerous biological properties including antimicrobial,<sup>4</sup> antituberculosis,<sup>5</sup> antiviral,<sup>6</sup> analgesic,<sup>7</sup> antidepressant,<sup>8</sup> antihypertensive,<sup>9</sup> local anesthetic and kinesin inhibitory activities.<sup>10,11</sup> Consequently, 1,3,4-thiadiazole chemistry is a mature field and occupies an important niche in heterocyclic chemistry. The unit serves as a vital synthon for the preparation of more elaborate bioactive molecules.

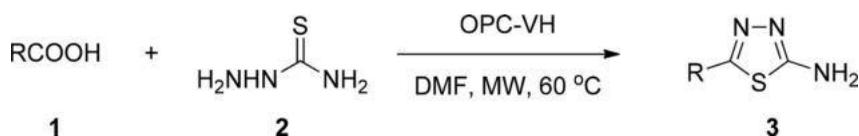

Several synthetic approaches are well known in the literature for the synthesis of 1,3,4-thiadiazoles. Some one-pot synthetic methods involve the reaction between carboxylic acids and thiosemicarbazides using (i) ionic liquids;<sup>12</sup> (ii) excess POCl<sub>3</sub>;<sup>13</sup> (iii) polyphosphoric acid;<sup>14</sup> (iv) a mixture of P<sub>2</sub>O<sub>5</sub> and MeSO<sub>3</sub>H;<sup>15</sup> and (v) polyphosphate ester (PPE).<sup>16</sup> However, high production costs, reagent toxicity, and by-product formation are disadvantages of some of the known methods.<sup>16</sup> Given the movement of the field towards greener, more efficient and lower cost methods,<sup>17</sup> microwave-assisted construction of heterocycles has truly come into its own.<sup>18–20</sup>

Recently, the Vilsmeier–Haack reagent (Scheme 1, OPC-VH) prepared by Kimura and his team<sup>21,22</sup> using *o*-phthaloyl dichloride and dimethylformamide was employed by us for the synthesis of 4-functional pyrazoles.<sup>23–26</sup> Taking into account our interest in the construction of heterocycles<sup>27–32</sup> and in light of the versatility of OPC-VH reagent, we sought a method to produce 2-amino-1,3,4-thiadiazoles, which may then be used to introduce substituents on the 5-position of the heterocycle. We now report an optimized microwave-assisted OPC-VH mediated synthetic approach for the needed 2-amino-1,3,4-thiadiazole derivatives.

**Scheme 1.** Preparation of OPC-VH reagent.

**Scheme 2.** Construction of 2-amino-1,3,4-thiadiazoles **3** using OPC-VH reagent.

The OPC-VH reagent was first prepared from phthaloyl dichloride (OPC) and dimethylformamide (DMF) using Kimura's procedures.<sup>21,22</sup> The reagent was obtained in pure form, obviating the use of toxic  $\text{POCl}_3$ . The phthalic anhydride formed as a by-product may in its own turn be reused in the preparation of phthaloyl dichloride (Scheme 1).

Recently, the conversion has been reported in the literature of numerous hydrazones to 4-formyl pyrazoles and 4-formyl pyrazoles to 4-cyanopyrazoles using OPC-VH reagent.<sup>23,24,26</sup> These results encouraged us to study the synthesis shown in Scheme 2.

We further hoped that the microwave method would increase the rate of reaction as well as improve the overall yield of the products.<sup>31</sup> As a model experiment, the one-pot reaction of benzoic acid and thiosemicarbazide using OPC-VH (2.5 equiv.) at 60 °C in acetonitrile for 3 hours afforded the desired thiadiazole **3a** (**3**, R = Ph) in 54% yield (Table 1, entry 1). The reaction was also attempted with *o*-phthaloyl dichloride (2.5 equiv.) at 60 °C in acetonitrile for 6 hours but no desired product **3a** was observed (entry 2). Microwave irradiation, operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850 W, was next studied, varying the solvent, temperature, and the amount of OPC-VH reagent.

**Table 1.** Optimization of OPC-VH mediated synthesis of 2-amino-1,3,4-thiadiazole.

The formation of the desired product **3a** in 60% yield within 5 minutes at the same temperature demonstrated the efficiency of microwave irradiation in this setting (entry 5, Table 1). In the absence of OPC-VH reagent, no product was observed. The reaction carried out in dry DMF at 60 °C for 5 minutes in microwave irradiation was best as it gave 85% yield (entry 9). We thus extended the reaction conditions of entry 9 of Table 1 to further exploration of preparing compounds **3** having different substituents at the 5-position. The results are summarized in Table 2. Under the optimized conditions, the yields of isolated 1,3,4-thiadiazole derivatives **3a-j** were uniformly good (72 – 87%) and did not depend much on the given substituents.

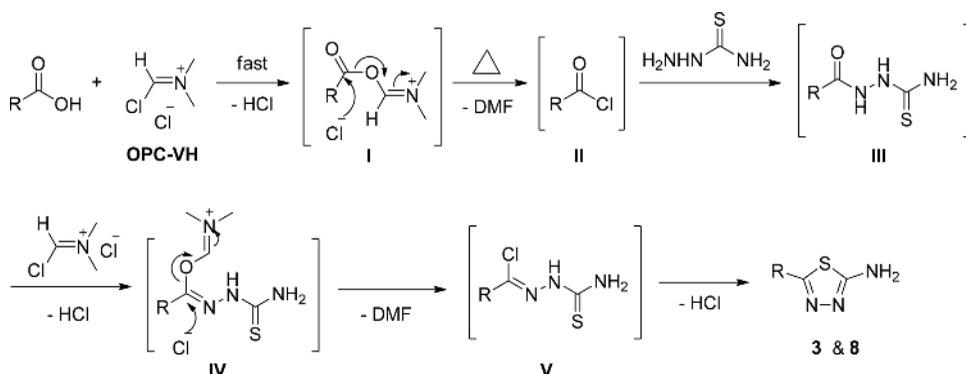

The investigation was further extended to prepare a series of pyrazolylthiadiazoles **8a-e**. The pyrazole-4-carboxylic acids **7** needed were prepared from pyrazole-4-carbaldehydes **6** using vanadium catalyst in the presence of 30% H<sub>2</sub>O<sub>2</sub> in acetonitrile as shown in Scheme 3.<sup>34</sup> The treatment of aryl methyl ketones **4** with phenylhydrazine in refluxing methanol using acidic conditions afforded the corresponding hydrazones **5**. The microwave-assisted cyclization of hydrazones **5** using OPC-VH reagent in DMF at 60 °C within 10 minutes afforded the corresponding pyrazole-4-carbaldehydes **6**.<sup>35</sup> The pyrazole-4-carboxylic acids **7** were further subjected to the optimal reaction conditions

**Scheme 3.** Microwave synthesis of pyrazolythiadiazoles **8a-e** using Vilsmeier–Haack reagent (OPC-VH).

**Table 3.** Yield of a series of pyrazolythiadiazoles **8a-e**.

Entry	Product	Ar	Yield %	Formula
1	<b>8a</b>	C <sub>6</sub> H <sub>5</sub>	75	C <sub>17</sub> H <sub>13</sub> N <sub>5</sub> S

5	<b>8e</b>	4-EtC <sub>6</sub> H <sub>4</sub>	82	C <sub>19</sub> H <sub>17</sub> N <sub>5</sub> S

**Scheme 4.** Plausible mechanism of the OPC-VH mediated synthesis of 2-amino-1,3,4-thiadiazoles **3** and **8**.

used for **3a** to obtain novel pyrazole-1,3,4-thiadiazoles **8** in good yield (75–85%) and the results are summarized in [Table 3](#). Compounds **8** were rigorously characterized.

The IR spectrum of 5-(1,3-diphenyl-1*H*-pyrazol-4-yl)-1,3,4-thiadiazole-2-amine **8a** showed bands at 3321 and 3265 cm<sup>-1</sup> (NH stretching), 1632 (C=C), 1598 (C=N thiadiazole) and 698 (C-S-C). In the <sup>1</sup>H NMR spectra, compound **8a** showed a singlet at  $\delta$  6.89 due to the –NH<sub>2</sub> protons. In the <sup>13</sup>C NMR spectra, the C=N carbons appeared at  $\delta$  173.1 and 160.2, deshielded due to the adjacent sulfur atom. The mass spectral analysis of **8a** showed the molecular ion peak at  $m/z$  320.19 (M + H)<sup>+</sup>.

In considering a plausible mechanism ([Scheme 4](#)), we believe that the intermediate **I** might be quickly formed in the reaction of the carboxylic acid with the OPC-VH reagent. After that, the chloride anion attacks the intermediate **I** to afford the acid chloride **II**. On reacting with thiosemicarbazide the acid chloride yields thiosemicarbazone **III**. The subsequent reaction of thiosemicarbazone **III** with OPC-VH reagent forms intermediate **IV**, on

which chloride ion attacks to produce the intermediate **V**. Upon cyclization compound **3** or **8** is obtained.

In summary, an efficient microwave assisted OPC-VH mediated synthesis of 2-amino-5-substituted-1,3,4-thiadiazoles from corresponding carboxylic acids has been reported. The operational simplicity, avoidance of toxic materials, easy work up and feedback into the process of a generated by-product are the advantages of this approach. Given the practicality of this method, it is our hope that pyrazolythiadiazole-2-amines can be further investigated for the development of pyrazole-based drugs.

## Experimental section

Melting points were determined in open glass capillaries on a Fisher-Johns melting point apparatus and are uncorrected.  $^1\text{H}$  NMR (400MHz) spectra were recorded at room temperature in  $\text{CDCl}_3$  as solvent and tetramethylsilane (TMS) as an internal standard. Coupling constants ( $J$ ) are reported in Hz; those for common alkyl groups were in the expected range and are not separately marked.  $^{13}\text{C}$  NMR (100 MHz) spectra were recorded in  $\text{CDCl}_3$  solutions with TMS as internal standard. The mass spectra were recorded on a JOEL JMS 600 mass spectrometer at an ionizing potential of 70eV (EI) in the electron impact ionization mode using the direct inlet system. All the reactions were monitored by thin-layer chromatography (TLC) on pre-coated silica gel 60 F254 (mesh); spots were visualized under UV light at 254 nm. Elemental analyses were obtained using a Carlo Erba EA1108 microanalyzer. Microwave irradiation was done using an Anton Paar Monowave-300 Reactor (Gaas, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850W.

### *Synthesis of 2-amino-5-substituted-1,3,4-thiadiazoles (3 and 8)*

These compounds were synthesized using an Anton Paar Monowave-300 Reactor (Gaas, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850W. The reactions were carried out in a G-4 borosilicate glass vial sealed with a Teflon septum and placed in a microwave cavity. Sufficient power was used to ramp up from room temperature to the desired temperature. Once this temperature was attained, the process vial was held at this temperature for the required time. The reactions were continuously stirred. Temperature was measured by an IR sensor. After the experiments, a cooling jet cooled the reaction vessel to ambient temperature.

For the representative preparation of compound **3a**, to a mixture of benzoic acid (0.10 g, 0.82 mmol) and thiosemicarbazide (0.082 g, 0.90 mmol) in DMF (5.0 ml) in a microwave vial was added OPC-VH (2.05 mmol) at room temperature and the mixture was stirred for 1 min. The vial was sealed with the Teflon septum and aluminium crimp, using an appropriate crimping tool. The vial was then subjected to microwave irradiation, and the temperature was ramped from room temperature to 60 °C with the holding time of 5 min. The reaction was then brought to room temperature, and the crude product was poured into ice water (approximately 15 mL), then extracted with ethyl acetate (2 x 15 mL). The organic layer was washed with brine solution (2 x 15 mL). The organic layer was dried over anhydrous  $\text{Na}_2\text{SO}_4$ , filtered and the filtrate was

concentrated under reduced pressure to afford crude 5-phenyl-1,3,4-thiadiazol-2-amine **3a**. The crude compound was purified by column chromatography using silica gel (100-200 mesh, eluting solvent 10% ethyl acetate in pet-ether) and concentrated under reduced pressure to afford 5-phenyl-1,3,4-thiadiazol-2-amine **3a** as an off white solid in 85% yield. Compounds **3** are known materials, identified on the basis of comparing their melting points with those available in the literature, as specified in Table 2.

For the preparation of representative compound **8a**, the known compound 1,3-diphenyl-1*H*-pyrazole-4-carboxylic acid **7a**<sup>34</sup> (0.200 g, 0.76 mmol) was mixed with thiosemicarbazide (0.076 g, 0.84 mmol) in DMF (5.0 ml) in a microwave vial, to which was added OPC-VH (2.05 mmol) at room temperature, and the mixture was stirred for 1 min. The vial was sealed with the Teflon septum and aluminium crimp, using an appropriate crimping tool. The vial was then subjected to microwave irradiation, and the temperature was ramped from room temperature to 60 °C with the holding time of 5 min. The reaction was then brought to room temperature, and the crude product was poured into ice (approximately 25 g), then extracted with ethyl acetate (2 x 20 mL). The organic layer was washed with brine solution (2 x 15 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and the filtrate was concentrated under reduced pressure to afford crude compound **8a**. The crude compound was purified by column chromatography using silica gel (100-200 mesh, eluting solvent 12% ethyl acetate in pet-ether) and concentrated under reduced pressure to afford 5-(1,3-diphenyl-1*H*-pyrazol-4-yl)-1,3,4-thiadiazol-2-amine **8a** as an off white solid in 75% yield.

The other derivatives **8b-e** were prepared by following the above procedure. Compounds **8** are novel and were fully characterized as shown below.

#### **5-(1,3-Diphenyl-1*H*-pyrazol-4-yl)-1,3,4-thiadiazol-2-amine (8a)**

Off white solid; 75% yield; mp 225-227 °C; TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.5; IR (KBr)  $\nu$  cm<sup>-1</sup>: 3321, 3265 (NH Str.), 1632 (C=C), 1598 (C=N thiadiazole), 698 (C-S-C); <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz):  $\delta$  8.89 (s, 1H, Pyrazole-*H*), 7.23-7.80 (m, 10H, Ar*H*), 6.89 (s, 2H, NH<sub>2</sub>). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  173.1, 160.2, 144.5, 142.6, 138.9, 131.2, 129.1, 128.9, 128.2, 127.1, 125.8, 118.1, 102.9. **ARTICLE HISTORY** Received 2 February 2022; Accepted 3 July 2022

The presence of heterocyclic units as central structural features in both natural products and synthetic molecules has been long recognized in preparative organic chemistry.<sup>1</sup> Among heterocycles, some pyrazoles have been successfully commercialized as medicines or pesticides,<sup>2–5</sup> and, as a class, pyrazoles exhibit a wide range of pharmacological properties. The latter represent remarkably divergent areas, including antimalarial, anti-glaucoma, antihypercholesterolemia, antihyperglycemic, antihypertensive, analgesic, anti-Parkinson, antipsychotic, antimicrobial, anti-inflammatory, anticonvulsant, anticancer, and estrogen receptor (ER) ligand activities.<sup>4–10</sup> Consequently, pyrazole chemistry is a mature field and occupies a prime place in organic synthesis.<sup>11</sup>

Chalcones are key synthons used to design heterocyclic compounds in drug development. It is believed that the broad range of biological activities of chalcones is due, at least in part, to the presence of the ethylene unit in conjugation with the carbonyl functionality, as removal of this functionality makes them inactive. Such biological properties as anticancer,<sup>12–14</sup> anti-oxidant,<sup>15–18</sup> anti-inflammatory,<sup>19–21</sup> antimicrobial,<sup>22</sup> antitubercular,<sup>23</sup> antileishmanial,<sup>24</sup> antimalarial,<sup>25</sup> anthelmintic,<sup>16</sup> and osteogenic<sup>26</sup> activities of chalcones are well known in the literature. The synthesis of chalcones remains a crucial area of research for synthetic organic and medicinal chemists. Several synthetic protocols are reported in the literature for the synthesis of chalcones (Figure 1). The most common involves acid or base mediated Claisen-Schmidt condensation under homogeneous conditions.<sup>27,28</sup> The search for new synthetic protocols with such advantages as shortened reaction times, high yields, and eco-friendliness remains challenging.<sup>29</sup> The advent of microwave-assisted synthesis of heterocyclic compounds has the potential to assist in this search because it offers many of the needed advantages.<sup>30–34</sup>

In our ongoing investigations into the synthesis of pyrazoles<sup>35–47</sup> we have considered Me<sub>3</sub>SiI in its role as a promising promoter and water scavenger. We now report an

 Supplemental data for this article can be accessed online at <https://doi.org/10.1080/00304948.2022.2099199>.

**Figure 1.** Some synthetic methods used for chalcone synthesis.

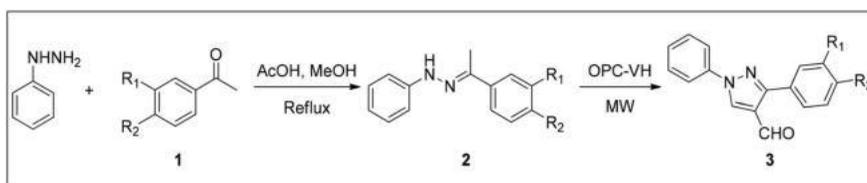

optimized microwave-assisted  $\text{Me}_3\text{SiI}$ -promoted synthetic procedure for pyrazolyl chalcones.

This closely relates to our prior work on the Vilsmeier-Haack reagent OPC-VH (prepared from phthaloyl dichloride (OPC) and DMF), enabling in a convenient way the reaction of acetophenone hydrazones to give 4-formylpyrazoles **3** (Scheme 1).<sup>35,41,48,49</sup>

Having in hand the 4-formylpyrazoles **3** prepared by this method, we sought to use them to prepare the title pyrazolyl chalcones. First, as a model, 1,3-diphenyl-1*H*-pyrazole-4-carbaldehyde **3a** (1.0 equiv.) was subjected to Claisen-Schmidt condensation with propiophenone (1.2 equiv.) to prepare pyrazolyl chalcone **5a** under the conditions noted in Table 1. Under a variety of conventional conditions (Entries 1-6) compound **5a** was formed only in yields of 30-45%. The use of dimethylformamide (DMF), higher temperatures and  $\text{Me}_3\text{SiI}$  offered encouraging improvements in the yield (Entries 7-12). Finally, the reaction of **3a** and propiophenone with 3 equivalents of  $\text{Me}_3\text{SiI}$  in DMF for 10 min at 100 °C using microwave irradiation gave 88% of the pyrazolyl chalcone **5a** (Entry 13). The great reduction in reaction time made possible by microwave irradiation is noteworthy.

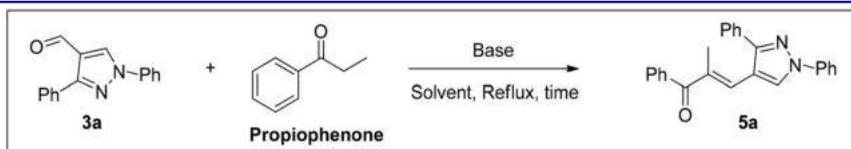

Having established the optimized reaction conditions, we extended the scope and generality of the procedure with different substituents at the aryl moieties as shown in Table 2. Each of the pyrazolyl chalcones **5a-l** could easily be prepared within 15 minutes (yields 76-93%, mean 85%). It was found that the reactions proceeded smoothly when either electron donating or withdrawing groups were present at the aryl rings. All of the novel compounds were rigorously characterized (see Experimental section).

In summary, this study presents a microwave-assisted iodotrimethylsilane-promoted synthesis of novel pyrazolyl chalcones. Hallmarks of this method include operational simplicity, easy work up procedures, very good yields and short reaction times. Now that pyrazolyl chalcones are readily available with the structural complexity

<sup>b</sup>Conventional heating (Method A) and Microwave irradiation (Method B).

demonstrated here, we hope that our methods will promote further investigation of their useful properties.

## Experimental section

Chemicals were obtained from commercial sources and used without further purification. Melting points were determined in open glass capillaries on a Fisher-Johns melting point apparatus and are uncorrected. <sup>1</sup>H NMR (400 MHz) spectra were recorded at room temperature in CDCl<sub>3</sub> as solvent and tetramethylsilane (TMS) as an internal standard. Coupling constants (*J*) are reported in Hz; those for common alkyl groups were in the expected range and are not separately marked. <sup>13</sup>C NMR (100 MHz) spectra were recorded in CDCl<sub>3</sub> solutions with TMS as internal standard. The mass spectra were recorded on a JOEL JMS 600 mass spectrometer at an ionizing potential of 70eV (EI) in the electron impact ionization mode using the direct inlet system. All the reactions were monitored by thin-layer chromatography (TLC) on pre-coated silica gel 60 F254 (mesh); spots were visualised under UV light at 254 nm. Elemental analyses were obtained using a Carlo Erba EA1108 microanalyzer. Infrared (IR) spectra were obtained

### 1,3-Disubstituted-4-formylpyrazoles<sup>35</sup>

Vilsmeier-Haack reagent (OPC-VH reagent)<sup>35</sup> (0.73 g, 5.76 mmol) at 0 °C was added to a solution of the appropriate hydrazone **2** (1.92 mmol) in dimethylformamide (10 mL) in a microwave vial. The vial was closed with a Teflon septum and aluminium crimp by using a suitable crimping tool. The vial was then irradiated in the microwave and the temperature was steadily raised from room temperature to 60 °C in the interval of 10 minutes. The reaction mixture was cooled down and the crude product was poured into ice water. The crude product was neutralized with saturated NaHCO<sub>3</sub> solution and extraction of the target compound was done with ethyl acetate (2 × 50 mL). The ethyl acetate layer was washed with brine solution (2 × 15 mL), then dried over anhyd. Na<sub>2</sub>SO<sub>4</sub>, filtered and the solvent was evaporated under reduced pressure to afford crude compound **3** which was recrystallized with refluxing CHCl<sub>3</sub>-EtOH. The physical data of all 4-formylpyrazoles are provided in Table 3.

### 3-(3-Aryl-1-phenyl-1*H*-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-ones (**5**)

#### Method A (Conventional conditions)

Propiophenone (0.064 g, 0.48 mmol) and 1,3-diphenyl-1*H*-pyrazole-4-carbaldehyde (0.10 g, 0.40 mmol) were placed in a 20 mL tube and dissolved in DMF (5.0 mL).

**Table 3.** Physical data of 4-formylpyrazoles (**3a-f**).

Iodotrimethylsilane (TMSI) (0.24 g, 1.20 mmol) was added dropwise to the solution. The tube was sealed tightly and heated at 100 °C for 10 h. The reaction progress was monitored by TLC (20% ethyl acetate in pet ether). On completion, the sealed tube was cooled and the reaction mixture was poured onto crushed ice. The organic compound was extracted into ethyl acetate (2 x 50 mL). The organic layer was washed with brine solution (2 x 20 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and the filtrate was concentrated under reduced pressure to afford crude 3-(1,3-diphenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one **5a**. The crude compound was purified by column chromatography using silica gel (100-200 mesh, 10% ethyl acetate in pet-ether) and afforded **5a** as an off-white solid in 71% yield.

#### **Method B (Microwave irradiation)**

All compounds **5** were synthesized using an Anton Paar Monowave-300 reactor (Gaes, Austria), operating at a frequency of 2.455 GHz with continuous irradiation power of 0 to 850W. The reactions were carried out in a G-4 borosilicate glass vial sealed with a Teflon septum and placed in a microwave cavity. Sufficient power was used to ramp up from room temperature to the desired temperature. Once this temperature was attained, the process vial was held at this temperature for the required time. The reactions were continuously stirred. Temperature was measured by an IR sensor. After the experiments, a cooling jet cooled the reaction vessel to ambient temperature. In a representative case, to a mixture of propiophenone (0.064 g, 0.48 mmol) and 1,3-diphenyl-1H-pyrazole-4-carbaldehyde (0.10 g, 0.40 mmol) in DMF (3.0 ml) in a microwave vial was added TMSI (0.24 g, 1.20 mmol) at room temperature and the mixture was stirred for 1 min. The vial was sealed with the Teflon septum and aluminium crimp, using an appropriate crimping tool. The vial was then subjected to microwave irradiation and the temperature was ramped from room temperature to 100 °C with the holding time of 10 min. The reaction was brought to room temperature, and the reaction mixture was poured into ice-water, and then extracted with ethyl acetate (2 x 20 mL). The organic layer was washed with brine solution (2 x 10 mL). The organic layer was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, filtered and the filtrate was concentrated under reduced pressure to afford crude **5a**. The crude compound was purified as before to afford as an off-white solid in 88% yield.

#### **3-(1,3-Diphenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one (5a)**

Off white solid; 88% yield; m.p. 126-128 °C. TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.7. IR (KBr)  $\nu$  cm<sup>-1</sup>: 1685 (C=O), 1652 (C=N), 1621 (C=C); <sup>1</sup>H NMR

(CDCl<sub>3</sub>, 400 MHz):  $\delta$  8.24 (s, 1H, Pyrazole-H), 7.81 (d,  $J = 7.8$  Hz, 2H, ArH), 7.68 (d,  $J = 7.8$  Hz, 2H, ArH), 7.60 (dd,  $J = 7.5$  & 1.8 Hz, 2H, ArH), 7.33-7.53 (m, 9H, ArH), 7.23 (s, 1H, =CH), 2.30 (s, 3H, =C-CH<sub>3</sub>). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  190.1 (C=O), 151.2 (C=N), 139.3, 139.1, 138.9, 138.3, 133.8, 132.9, 130.1, 129.1, 129.0, 128.9, 128.3, 128.1, 127.1, 125.7, 119.2, 112.6, 10.1 (CH<sub>3</sub>). ESI-MS ( $m/z$ ): 365.19 [M + H]<sup>+</sup>.

*Anal.* Calcd for C<sub>25</sub>H<sub>20</sub>N<sub>2</sub>O: C, 82.39; H, 5.53. Found: C, 82.07; H, 5.51.

### **3-(3-(4-Chlorophenyl)-1-phenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one (5b)**

Light yellow solid, 79% yield; m.p. 157-159 °C. TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.8. IR (KBr)  $\nu$  cm<sup>-1</sup>: 1687 (C=O), 1648 (C=N), 1619 (C=C); <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz):  $\delta$  8.23 (s, 1H, Pyrazole-H), 7.79 (d,  $J = 8.4$  Hz, 2H, ArH), 7.68 (d,  $J = 8.4$  Hz, 2H, ArH), 7.49-7.55 (m, 5H, ArH), 7.43 (t,  $J = 7.6$  Hz, 2H, ArH), 7.33-7.38 (m, 3H, ArH), 7.16 (s, 1H, =CH), 2.30 (s, 3H, =C-CH<sub>3</sub>). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  190.2 (C=O), 150.1 (C=N), 139.5, 139.3, 138.9, 138.4, 134.2, 133.9, 130.1, 129.2, 129.1, 129.0, 128.3, 128.1, 127.1, 125.9, 119.4, 112.5, 10.2 (CH<sub>3</sub>). ESI-MS ( $m/z$ ): 401.15 [M + H, <sup>37</sup>Cl]<sup>+</sup>, 399.25 [M + H, <sup>35</sup>Cl]<sup>+</sup>.

*Anal.* Calcd for C<sub>25</sub>H<sub>19</sub>ClN<sub>2</sub>O: C, 75.28; H, 4.80. Found: C, 74.89; H, 4.67.

### **2-Methyl-1-phenyl-3-(1-phenyl-3-(p-tolyl)-1H-pyrazol-4-yl)prop-2-en-1-one (5c)**

Light green solid, 78% yield; m.p. 124-126 °C. TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.8. IR (KBr)  $\nu$  cm<sup>-1</sup>: 1690 (C=O), 1649 (C=N), 1625 (C=C); <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz):  $\delta$  8.23 (s, 1H, Pyrazole-H), 7.80 (dd,  $J = 8.8$  & 1.2 Hz, 2H, ArH), 7.68 (dd,  $J = 8.4$  & 1.6 Hz, 2H, ArH), 7.48-7.52 (m, 5H, ArH), 7.44 (t,  $J = 7.6$  Hz, 2H, ArH), 7.35 (t,  $J = 7.6$  Hz, 1H, ArH), 7.24 (s, 1H, =CH), 7.18 (d,  $J = 7.6$  Hz, 2H, ArH), 2.37 (s, 3H, ArCH<sub>3</sub>), 2.30 (d,  $J = 1.2$  Hz, 3H, =C-CH<sub>3</sub>). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  190.1 (C=O), 149.3 (C=N), 139.5, 139.3, 138.9, 138.2, 134.1, 131.1, 130.5, 130.1, 129.4, 129.2, 129.1, 128.3, 128.1, 125.9, 119.3, 112.6, 21.1 (Ar-CH<sub>3</sub>), 10.2 (CH<sub>3</sub>). ESI-MS ( $m/z$ ): 379.10 [M + H]<sup>+</sup>.

*Anal.* Calcd for C<sub>26</sub>H<sub>22</sub>N<sub>2</sub>O: C, 82.51; H, 5.86. Found: C, 82.19; H, 5.83.

### **3-(3-(3-Bromo-4-fluorophenyl)-1-phenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one (5d)**

Light brown solid, 87% yield; m.p. 152-154 °C. TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.8. IR (KBr)  $\nu$  cm<sup>-1</sup>: 1681 (C=O), 1651 (C=N), 1620 (C=C); <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz):  $\delta$  8.22 (s, 1H, Pyrazole-H), 7.77-7.83 (m, 3H, ArH), 7.68 (d,  $J = 8.0$  Hz, 2H, ArH), 7.44-7.54 (m, 6H, ArH), 7.37 (t,  $J = 7.6$  Hz, 1H, ArH), 7.10-7.15 (m, 2H, ArH, =CH), 2.30 (d,  $J = 1.2$  Hz, 3H, =C-CH<sub>3</sub>). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>):  $\delta$  189.3 (C=O), 164.1 (Ar-F), 149.9 (C=N), 139.3, 139.1, 138.8, 138.1, 134.1, 133.9, 130.5, 130.2, 129.5, 129.2, 129.1, 128.3, 125.9, 119.3, 117.9, 112.6, 109.5, 10.2 (CH<sub>3</sub>). ESI-MS ( $m/z$ ): 463.17 [M + H, <sup>81</sup>Br]<sup>+</sup>, 461.19 [M + H, <sup>79</sup>Br]<sup>+</sup>.

*Anal.* Calcd for C<sub>25</sub>H<sub>18</sub>BrFN<sub>2</sub>O: C, 65.09; H, 3.93. Found: C, 65.15; H, 3.88.

### **3-(3-(4-Methoxyphenyl)-1-phenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one (5e)**

Light yellow solid, 90% yield; m.p. 162-164 °C. TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.8. IR (KBr)  $\nu$   $\text{cm}^{-1}$ : 1684 (C=O), 1652 (C=N), 1620 (C=C);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  8.22 (s, 1H, Pyrazole-H), 7.80 (d,  $J=7.5$  Hz, 2H, ArH), 7.68 (dd,  $J=8.4$  & 1.8 Hz, 2H, ArH), 7.34-7.54 (m, 8H, ArH), 7.22 (s, 1H, =CH), 6.91 (d,  $J=8.7$  Hz, 2H, ArH), 3.83 (s, 3H, ArOCH<sub>3</sub>), 2.30 (d,  $J=1.2$  Hz, 3H, =C-CH<sub>3</sub>).  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ):  $\delta$  190.0 (C=O), 159.9 (C-OCH<sub>3</sub>), 149.8 (C=N), 139.5, 139.3, 139.2, 138.3, 134.2, 130.1, 129.2, 129.1, 128.3, 128.2, 125.9, 125.1, 119.3, 113.9, 112.6, 51.1 (Ar-OCH<sub>3</sub>), 10.1 (CH<sub>3</sub>). ESI-MS (m/z): 395.07 [M + H]<sup>+</sup>.

*Anal.* Calcd for C<sub>26</sub>H<sub>22</sub>N<sub>2</sub>O<sub>2</sub>: C, 79.16; H, 5.62. Found: C, 78.94; H, 5.58.

### **3-(3-(4-Bromophenyl)-1-phenyl-1H-pyrazol-4-yl)-2-methyl-1-phenylprop-2-en-1-one (5f)**

Yellow solid, 87% yield; m.p. 174-176 °C. TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.7. IR (KBr)  $\nu$   $\text{cm}^{-1}$ : 1681 (C=O), 1645 (C=N), 1618 (C=C);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  8.23 (s, 1H, Pyrazole-H), 7.79 (d,  $J=7.8$  Hz, 2H, ArH), 7.68 (d,  $J=8.4$  Hz, 2H, ArH), 7.36-7.54 (m, 10H, ArH), 7.16 (s, 1H, =CH), 2.30 (d,  $J=1.2$  Hz, 3H, =C-CH<sub>3</sub>).  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ):  $\delta$  190.1 (C=O), 150.3 (C=N), 139.7, 139.4, 139.1, 138.5, 134.3, 131.9, 131.7, 130.1, 129.2, 129.1, 128.3, 128.1, 125.7, 122.9, 119.7, 112.7, 10.2 (CH<sub>3</sub>). ESI-MS (m/z): 445.14 [M + H,  $^{81}\text{Br}$ ]<sup>+</sup>, 443.17 [M + H,  $^{79}\text{Br}$ ]<sup>+</sup>.

*Anal.* Calcd for C<sub>25</sub>H<sub>19</sub>ClN<sub>2</sub>O: C, 67.73; H, 4.32. Found: C, 67.48; H, 4.29.

### **1-(3-Chlorophenyl)-3-(1,3-diphenyl-1H-pyrazol-4-yl)-2-methylprop-2-en-1-one (5g)**

Yellow solid; 76% yield; m.p. 128-130 °C. TLC solvent system: 20% EtOAc in pet-ether, Rf: 0.7. IR (KBr)  $\nu$   $\text{cm}^{-1}$ : 1685 (C=O), 1651 (C=N), 1621 (C=C);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz):  $\delta$  8.24 (s, 1H, Pyrazole-H), 7.78-7.84 (m, 4H, ArH), 7.66 (t,  $J=1.6$  Hz, 1H, ArH), 7.47-7.55 (m, 9H, ArH), 7.15 (s, 1H, =CH), 2.30 (s, 3H, =C-CH<sub>3</sub>).  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ):  $\delta$  189.9 (C=O), 149.8 (C=N), 139.3, 139.1, 139.0, 138.4, 134.5, 134.3, 132.9, 130.5, 130.1, 129.6, 129.1, 128.9, 128.3, 127.1, 125.9, 125.5, 119.4, 112.9, 10.2 (CH<sub>3</sub>). ESI-MS (m/z): 401.08 [M + H,  $^{37}\text{Cl}$ ]<sup>+</sup>, 399.10 [M + H,  $^{35}\text{Cl}$ ]<sup>+</sup>.

## Abstract

Evolutionary computation (EC) is a set of global optimization algorithms inspired by biological evolution. EC techniques, which are based on principle of evolution and survival of the fittest Darwinian Theory. It is a sub-field of Artificial Intelligent techniques and soft computing. In Evolutionary computation, we use non classical methods based on natural evolution instead of classical methods. When fitness function has several local extreme or not known derivative then it is very difficult to use classical methods for solution of optimization problem in such situation non classical methods gives very convenient and faster solution. In this paper we present Genetic algorithms, Artificial bee colony algorithm and Differential evolution algorithm of Evolutionary computation technique for solution of unconstrained non-linear programming problem. Numerical examples have solved using software MATLAB and the result has compared among evolutionary algorithms as Genetic algorithm, differential algorithm and artificial bee colony algorithm.

**Keywords:** Evolutionary computation, Genetic algorithm, Differential evolution algorithm and Artificial bee colony algorithm.

---

## 1. Introduction

Last few decades there are a lot of evolutionary algorithms subset of evolutionary computational approach have been proposed and used to many real world complex optimization problems and got the success in finding the near best optimal solution. Solution of non-linear optimization problems is one of the most important issues in many field like complex research problem and real world problems. Evolutionary algorithm uses the computational model of evolutionary processes as key

element and share a usual concept based on the processes of selection and reproduction. Mostly all evolutionary algorithms are inspired by the natural concept of Darwinian Theory and this theory tells that EAs are not static but dynamic as they can evolve over time. Evolutionary algorithms are population based local search algorithm. During the last twenty years most of the research has done in the complex objective function without using constraints. Genetic algorithm, differential evolution, Particle swarm optimization, Artificial Bee Colony algorithm, Ant colony optimization and Spider monkey optimization etc. are the evolutionary algorithms and all type of non-linear complex optimization problem can be easily solved by these algorithms. Among all Differential evolution is very easy and effective to apply. GA is evolutionary algorithm based on the theory of natural selection of Charles Darwin. GA and DE both uses same operator's mutation, crossover and selection but in GA crossover is used first then mutation while in DE mutation is used first then crossover. DE algorithm solved continuous optimization problems first and depends on the differentials of two vectors. ABC algorithm introduced by Dervis Karaboga in 2005. It is inspired by the behaviour of natural honey bees and uses three main phases employed bee phase, onlooker bee phase and scout bee phase. In ABC algorithm the aim of the bees is to find the best place of food sources with high nectar amount.

## **2. Literature Review**

### **2.1 Genetic algorithms**

Nuno Neves et al. [1] discussed the study of NON-LINEAR Optimization problem using a distributed GA. GA is used in large space for the optimization problem. Dr. Yuyi Lin et al. [2] proposed solution of non-linear optimization problems using GA with penalty method. This paper discussed the techniques of applying GAs with penalty function to solve highly constrained nonlinear engineering design problems. Subrata Datta et al. [3] proposed the efficient genetic algorithm on programming problems for fittest chromosomes. Chhavi Mangla et al. [4] proposed the genetic algorithm based optimization problem for solution of system of non-linear equations. D.E technique is applied for the solution of non-linear optimization problem. This type of problems is changed first in to multi objective problem then a new fitness function is used further process and both result is compared. Dr. Amanpreet Singh et al. [5] discussed some special type of Unconstrained Optimization Problem with using G.A and main focus of G.A is on the simulation of natural evolutionary process which can use for certain standard optimization problems. It is evolutionary algorithm which works according to the basis of natural genetics on a population string structures. The global and population based optimization technique is used to avoid the

problem like stagnation of the solution to a local minimum. Punam S Mhetre et al. [6] introduced G.A for the solution of both linear and Non-linear optimization problems and check the major benefits acquired as a result of using G.A. Gauss- Legendre integration method as a technique is used for the solution of NLPP and to get the result without changing the non -linear equation to linear. G.A result are very good for all tasks requiring optimization and highly successful in any situation where many variables interact to produce a large number of possible solutions. T Yokota et al. [7] discussed non- linear optimization problems of integer programming and also its applications. T. Yokota also introduced the new method for the solution of NLPP for better comparison. Some methods and holding property are discussed with the help of G.A. From the result it is observed that proposed method is best then the property. Chhavi Mangla et al. [8] discussed solution of non- linear optimization problem by using Genetics algorithm. Both type of problems singles and multi-objective optimization problem based on engineering, social sciences and medical sciences are solved by using standard benchmark problems. This paper carries out a comprehensive review to analysis the work of GA.

## 2.2 Artificial Bee Colony Algorithm

Lalit Kumar et al. [9] proposed solution of NP-hard Problem using ABC algorithm. ABC is considered as a newest nature-inspired swarm intelligence-based optimization algorithms. S. T S. Talatahari et al. [10] discussed solution of Parameter Identification of Nonlinear Problems by Artificial Bee Colony Algorithm. Dervis Karaboga et al. [11] discussed the ABC algorithm for solution of non -linear unconstraint optimization problem. Modified result of ABC algorithm has been compared to state of art algorithm. Result of modified ABC algorithm are tested for real engineering problems and found that it can efficiently applied for solving constrained optimization problem. Weifang Gao et al. [12] introduced a framework of constraint optimization problem by novel ABC algorithm. Bi -objective optimization problem is taken in which first part remains same (objective function) and the second part is the degree of constraint. Multi-strategy technique is used which consists three types of strategies, and play the main role between diversity and convergence. Soudeh Babaeizadeh et al. [13] discussed Constrained based ABC Algorithm for Optimization Problems. It is an optimization algorithm and compared to other optimization based algorithms. ABC has one poor exploitation ability that can be removed by using three types of phases employee bees, onlooker bees and scout bees phase by a new search technique. Soudeh Babaeizadeh et al. [14] discussed non-linear optimization problem related to enhanced Constrained ABC Algorithm. From last few years ABC with less parameters and strong global optimization ability researcher

paid their attention on these two problems. But still there is one drawback in ABC algorithm that is poor in exploitation. Numerical examples results are shown with several benchmark functions and result are compared. Nadezda Stanarevic et al. [15] proposed improved ABC algorithm for constrained optimization problem. Artificial bee colony algorithm is applicable only on unconstrained optimization problems but later a lot of modification in ABC was introduced of constraints problems. ABC modified version introduced for constraint optimization problem.

### 2.3 Differential Evolution Algorithm

Jouni Lampinen et al. [16] discussed the mixed variable non-linear optimization by differential evolution. This paper solving non-linear programming problems containing integer, discrete and continuous variables. Md. Abul Kalam Azad et al. [17] proposed the solution of non-linear continuous global optimization problems by modified differential evolution. This paper discussed about modified differential evolution in which some self-adaptive parameter is introduced. Mutation is modified and then use its inversion operator. Some non-linear continuous optimization problems are tested. Inversion operator has used in this proposed differential evolution algorithm. Musrrat Ali et al. [18] discussed simpler differential evolution algorithm. Simple and modified version of differential evolution algorithm (NSDE) is presented. In simple DE & NSDE there is only one difference of initial population between them. NSDE uses non-linear simplex method to create the initial population. Twenty benchmark problem are taken with box constraint and numerical result are compared with traditional DE and other DE. Zhang Xiao Fei et al. [19] proposed different concept related to reactive power optimization of power system based on niching differential evolution algorithm, As the problem is non-linear integer type. In this Zhang introduced the niche theory and some improvement in the differential evolution which aim of the modified RPO. Local search ability and broaden search range also increased. Different degrees of improvement are also used for speed and precision of convergence. Chiha Ibtissem et al. [20] discussed differential evolution algorithm for special multi-objective optimization problems. A new variant is discussed for DE. Proposed algorithm named based cost differential evolution generate the mutant vector. This vector is created by adding a weighted difference of two cost functions. Then performance of Bc.DE is calculated on several bound constrained non-linear and non-differentiable numerical problems and compare with the DE and other DE variants. Jeerayut Wetweerapong et al. [21] Proposed an improved differential evolution algorithm with a restart technique to solve system of non-linear equations, which often used for the solution of complex computational problems with variables. In DE –R a new approach is used for mutation and restart

technique to stop premature convergence. Proposed technique is applied on various world and synthetic problems and compare with other methods, it found that DER gives fast convergence and high quality solutions. Saeed Nezhad Hosein et al. [22] Introduced integrating differential evolution algorithm with modified hybrid GA for solving non-linear optimal control problems. Two phase algorithm is used based on IDE. Associate non-linear problems with hybrid GA of optimal control problem is discussed. In First phase DE is completely depends on initial population. In 2<sup>nd</sup> phase MHGA starts with new population.

### 3. Evolutionary Computational Approach

#### 3.1 Genetic Algorithm

Genetic Algorithms are metaheuristic optimization method and based on the biological theory introduced by Charles Darwin and provides an extended concept survival of the fittest [23]. GA is developed by Professor Johan Holland along with his students and colleagues at the University of Michigan during the 1960s and 1970s. [24] Dr Johan Holland then developed the theoretical framework for applying genetic algorithm many complex computational problems needed searching through huge search domain. In that cases G.A gives best and efficient tool to reach at an optimal solution and gives an efficient way for solving computationally hard non-linear optimization problems. GA starts with a set of possible solutions where each solution in GA, is represented as a chromosome. Set of operators are applied to the initial set of solution space. GA does not work on a single trial solution at a time but work on entire population. In special generation, the whole population comprises to the set of solution then select the fittest member and share their qualities. GA is based on the principal of Natural selection and applied to discrete optimisation problem. It is frequently used to find optimal or near optimal solution to difficult problem. GA can solve both types of problems unconstrained and constrained optimization problems [25].

GA has three main operators:

##### 3.1.1 Selection Operator

This operator gives preference to better solution allowing them to pass on their genes to the next generation of the algorithm. The main objective is to select the good solution and discard the bad solution. The individual with a higher fitness must have a higher probability of having offspring. There are different selection techniques in GA.

- (a) **Roulette Wheel Selection.** Here selection is done by Roulette wheel.
- (b) **Rank Based Selection:** Rank the all individual firstly and then give the fitness ranking to each.
- (c) **Tournament Selection:** A group of n individuals is randomly selected from the current population and from them best is selected. Here n is the tournament size the higher n the higher the pressure to select above average quality individual. A lot of tournaments are held between the individual and this process is repeated as often as desired.

### 3.1.2 Crossover Operator

The crossover between two parents string produce offspring by swapping genes of the chromosomes. With the help of crossover, we can combine partial solution from different candidate.

In GA three types of crossover are used

1-point Crossover,

2-point crossover and

3-Uniform- Crossover.

### 3.1.3 Mutation Operator

GA get better solution by using this operator. This operator is used to maintain genetic diversity from one generation of population to the coming generation. After mutation the solution may change entirely from the last solution. Mutation operator changes 1 to 0 or 0 to 1.

**Bit Flip Mutation:** We can select one or more random bits and flip them to each other

**Swap Mutation:** In swap mutation we select two position on the chromosome at random and interchange the values

**Scramble Mutation:** This is also famous with permutation representation choose, select a subset of genes and shuffled their values.

**Inverse Mutation:** In Inverse mutation, we select a subset of genes and inverse that selected subset.

### 3.2 Artificial Bee Colony Algorithm

ABC is same as swarm based intelligence, metaheuristic and global optimization algorithm and advanced proposed algorithm by Dervis Karaboga in 2005. Dervis Karaboga with his research members studied on ABC algorithm and some of its applications. The first journal article of ABC was presented by Karaboga and Basturk in 2007 in which the performance of ABC was compared to GA and PSO. First conference paper is published in 2006. In ABC algorithm [26, 27], the swarm of artificial bees are categorised in three groups of bees: employed bees, onlookers and scout bee. 50% are the employed bees and 50% are onlooker's bees to the total bees and only 1 and 2 are scout bees. The total numbers of employed bees are equal to the number of onlooker's bees. Every food source is a possible solution to the optimization problems. Here the main aim of the bees is to find the best place of food source with high amount of nectar. Fitness of bees is determined in terms of best quality of the food source. Initially first group of employed bees goes to random places for searching the food. At that time onlooker bees are at bee hive. They are waiting for the employed at the hive. When the employed returns to beehive then they share all the information like quality, quantity and distance with onlooker bees regarding the food source. After receiving all information from the employed bees the onlooker bees also start searching in neighbourhood of same food source. Food sources which are abandoned changed by scout bees in to new randomly generated food source.

#### Behaviour of Honey Bee in Nature

ABC algorithm is inspired by honey bees, where honey bee's swarm works in collective intelligence way, while searching the food. Bees have many qualities, like bees can communicate in their own language, can memorize all the information and take best own decisions based on that gathered information. By the intelligence behaviour of bees, many researchers motivate to simulate above foraging behaviour of the bees. The nature of honey bees is listed as

**Employed Bees:** Every employed Bee exploit only single food source and store every information regarding that food source like richness, direction and distance.

**Unemployed bees:** These bees divided in to two groups of bees, onlooker and scout bees. Only these bees found and shape out all information from 1<sup>st</sup> group of bees based on certain probability.

**Foraging behaviour:** Foraging behaviour is the important characteristic of the bees. In this process, bees go away from their hive and starts searching best food with high nectar amount, extracts all

nectar and stores in her abdomen. She can store nectar till 30-120 minutes, on the basis of nectar quantity and distance. Finally, they share all information.

### Four Phases of ABC Algorithm

1. **Initialization Phase:** In this phase we select the food sources randomly with the expression.

$$x_i^j = x_{min}^j + \text{rand}(0,1) \times (x_{max}^j - x_{min}^j)$$

Here  $x_{min}^j$  &  $x_{max}^j$  are the upper and lower bound of the solution space (Domain) of objective function,  $\text{rand}(0,1)$  is a random number lies between [0 1]. And fitness function is determined by this formula

Evaluate the fitness function of all new solution with the help of this formula.

$$fit = \begin{cases} \frac{1}{1+f}, & \text{if } f \geq 0 \\ 1 + f \cdot \text{abs}(f), & \text{if } f < 0 \end{cases}$$

2. **Employed Bee Phase:** Three steps are used mainly in this phase a) Generate a new solution

b) Calculate new fitness, c) Apply greedy selection

The neighbourhood food source is determined and calculated by the following equation.

$$x_{new}^j = x^j + \phi (x^j - x_p^j), \phi \in [-1,1]$$

Where  $x$  = Current solution

$x_p^j$  = Random partner,  $x_{new}^j$  = New solution

$f$  = Objective function value of a solution.

### 3. Onlooker Bee phase

Firstly, calculate the probabilities of every food source. Then generate a new solution that depends on probability value after that Calculate new fitness by applying greedy selection

$$\text{Probability} = 0.9 \times \frac{fit_i}{fit} + 0.1$$

Here  $fit_i$  is the fitness value of the solution  $i$ . Onlooker bees search the neighborhood food sources according to this expression.

$$x_{new}^j = x^j + \phi (x^j - x_p^j)$$

#### 4. Scout Bee Phase

First of all, found the abandoned solution which based on limit value. Then discard that abandoned solution and generate a new solution randomly to replace that. The new food sources are randomly generated by the scout bees. The new solution will be discovered by the scout bees by using the expression.

$$x_i^j = x_{min}^j + \text{rand}(0, 1) \times (x_{max}^j - x_{min}^j)$$

### 3.3 Differential Evolution Algorithm

Differential Evolution Algorithm is very simple and easy stochastic optimization technique for the solution of non-linear optimization problems which evolves a population of potential solutions (individuals) in order to increase the convergence to optimal solutions. DE is population based stochastic search algorithm developed by Storn and Price in 1995 for the solution of Chebyshev fitting problems [28]. DE is different from other algorithm in the sense that distance and direction from current population is used to guide the search process. DE has evolutionary operators like mutation, crossover and selection and totally depends on difference of vectors. DE is not nature inspired algorithm like PSO, ABC etc. But in DE global search algorithm employ investigate to allow escaping from local minima. Here three main operators are used mutation, crossover and last selection. The special work of DE algorithm is generating a trial vector, for this three different vectors are selected from the initial population and got the trial vector by adding a weighted difference of two randomly selected solutions to a third one which is target vector. This process is known as mutation operator of evolutionary algorithm. After mutation operator vectors are merged with another vector and this operation is called crossover operators. After this process we get a new trial vector and this trial is accepted after applying greedy selection in new population if its fitness function value is better than the target vector fitness value. It evolves generation to generation until the stopping criteria would be met. There is one difference between GA and DE algorithm is the mutation and recombination phase. In DE position of the vectors give important information about the best vectors. Diversity of the present population is determined by the distance between the individuals. If distance is large then steps size are also large for the individuals and they can explore much search space in another side if distance is small, then step size should be small to exploit local areas. Minimum population size in differential evolution should be 4.

## Three Main Operators of Differential Evolution

### 3.3.1 Mutation Operator

In DE trial vector plays an important role and it is created by mutation operator.

Trial vector is created for each solution as follow

Trial Vector=Target vector + Scale factor× (Randomly selected solution1- Randomly selected solution2)

Five mutation strategies are proposed by Storn and Price initially. Later Storn and Price discussed ten different working strategies of DE and these are derived from mutation schemes. Every mutation strategy either used exponential type crossover or the binomial type crossover.

$$\text{DE/rand/1: } U_{ij} = x_{r_1j} + F(x_{r_2j} - x_{r_3j})$$

$$\text{DE/best/1: } U_{ij} = x_{bestj} + F(x_{r_2j} - x_{r_3j})$$

$$\text{DE/target to best/2: } U_{ij} = x_{ij} + F(x_{bestj} - x_{ij}) + F(x_{r_1j} - x_{r_2j})$$

$$\text{DE/best/2: } U_{ij} = x_{bestj} + F(x_{r_1j} - x_{r_2j}) + F(x_{r_3j} - x_{r_4j})$$

$$\text{DE/rand/2: } U_{ij} = x_{r_1j} + F(x_{r_2j} - x_{r_3j}) + F(x_{r_4j} - x_{r_5j})$$

### 3.3.2 Crossover Operator

Crossover is the discrete recombination of parent and trial vector and increase the diversity.

Crossover is of two type Binomial and Exponential crossover. Binomial crossover is commonly used by the researchers as it gives best result. Any calculation work is not used in crossover operator only some conditions which are user defined gives the trial vector. Trial vector is generated as

$$U_j = \{v_j, \text{ if } r \leq p_c \text{ OR } j = \delta \text{ if } r > p_c \text{ AND } j \neq \delta$$

Here  $p_c$  is the Crossover probability

$$\delta = \text{Randomly selected variable } \delta \in \{1, 2, 3, 4, \dots, D\}$$

$r = \text{random number between 0 and 1}$

$U_j$  jth variable of trial vector

$v_j$  jth variable of donor vector

$x_j$  jth variable of target vector

### 3.3.3 Selection operator

In this operator apply greedy selection and find the best fitness vector which can take part in mutation operator to produce best trial vector which will continue in next iteration. It constructs the new generation for the next iteration and apply deterministic selection. The offspring replaces the parent if the fitness of the offspring is better than its parent otherwise the parent survive to the next generation. This ensure that the average fitness of the population does not deteriorate.

## 4. Non Linear Programming Problems

There are different types of non –linear optimization problems like continuous optimization, Bound constraint, discrete, global derivative free and non -differentiable optimization problems. Among these problems some are solved by traditional method which give the approximate solution result rather than accurate solution and some are solved by evolutionary algorithm which are derivative free algorithm. As everyone know that solution of NLPP are difficult in comparison to LPP. Many traditional methods are available for the solution of LPP and these are easy to apply. There are two types of NLPP constraints and without constraints. NLPP without constraints could be designed with several methods like steepest descent, Newton’s method. They are taking less time in comparison to the NLPP with constrains. On the other hand, various methods are available like KKT conditions, Lagrangian multiplier, penalty method, barrier method for the solution of NLPP with constraints and there are special problems of quadratic NLPP that cab solved by Beal’s method, Wolfe’s method etc. Special method is not available for the solution of both types of problems LPP and NLPP. Many non-traditional methods have been introduced for the solution of different optimization problems. These methods are very powerful, easy, populations based and metaheuristic algorithm, by which we can solve NLPP without constrains and with constraints like PSO, DE, ABC and GA to implement for the solution of complex research problems and others problems. DE is very easy to apply because this algorithm used less parameters to others algorithm. In NLPP the function may be convex or non-convex. A convex optimization problem maintains the properties of a linear programming problem and a non-convex problem the properties of a nonlinear programming problem. The basic difference between the two categories is that in a) convex optimization there can be only one optimal solution, which is globally optimal or you might prove that there is no feasible solution to the problem, while in b) non convex optimization may have multiple locally optimal points and it can take a lot of time to identify whether the problem has no solution or if the solution is global.

Suppose we are given an NLP with constraint

$$\text{Min. } f(x)$$

Subject to linear or non-linear constraints

$$g(x) \leq 0; \text{ and } h(x) = 0;$$

### 5. Numerical Examples

$$1.\text{objective function (min)} = x_1 - x_2 + 2x_1^2 + 2x_1 x_2 + x_2^2$$

$$0 \leq x_1, x_2 \leq 10$$

$$2.\text{objective function (min)} = 20x_1 + 26x_2 + 4x_1 x_2 - 4x_1^2 - 3x_2^2$$

$$-10 \leq x_1, x_2 \leq 10$$

### Genetic Algorithm problems

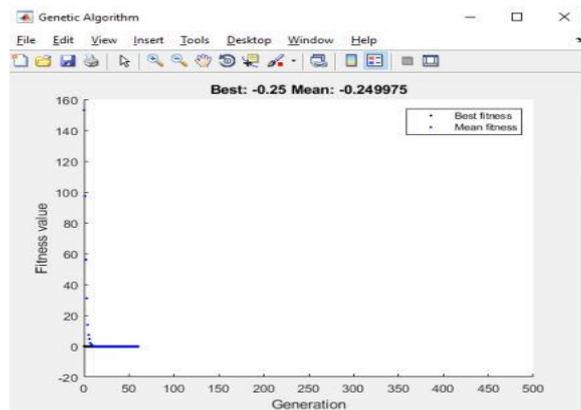

$$1.\text{Objective function (min)} = x_1 - x_2 + 2x_1^2 + 2x_1 x_2 + x_2^2$$

$$0 \leq x_1, x_2 \leq 10$$

1<sup>st</sup> Table of G.A

500	2	500	0(2iter)	0	0.5000	-0.25

For ABC solution is -0.2103 in 10 iterations with 20 populations but when iteration and population are increasing ABC gives the best optimal solution is -0.25 near to 0 in 50 iterations and all other iteration with different population. Values of  $x_1 = 0$  and  $x_2 = 0.5$ .

Figure 3(ABC)

**2.Artificial Bee Colony Algorithm problems**

2.objective function(min) =  $20x_1 + 26x_2 + 4x_1x_2 - 4x_1^2 - 3x_2^2$

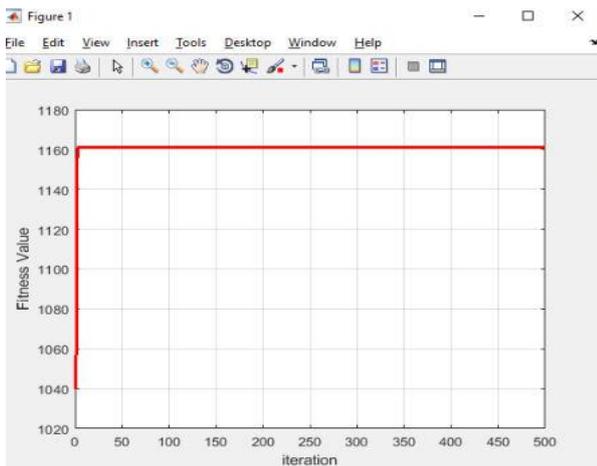

$-10 \leq x_1, x_2 \leq 10$

**2<sup>nd</sup> Table of ABC**

Pop size	Variable	Iteration	Function value	X1	X2	fnew
10	2	50	-865(50iter)	-9.9823	-4.5912	-597.5201
20	2	10	-1080.337(5iteration)	-9.9987	6.4894	-817.0251
50	2	50	-1160(20iteration)	10	-8.6092	-990.5670
100	2	50	-1160(8iteration)	10	-10	-1160
100	2	100	-1160(6iteration)	-10	-2.5203	-583.7715
500	2	100	-1160(2iteration)	-9.7807	10	-1.0095e+03
500	2	500	-1160(3iteration)	10	-10	-1160

For ABC solution is -0.2103 in 10 iterations with 20 populations but when iteration and population are increasing ABC gives the best optimal solution is -0.25 near to 0 in 50 iterations and all other iteration with different population. Values of  $x_1 = 0$  and  $x_2 = 0.5$ . In the same way for 2<sup>nd</sup> problem we got the optimal solution -1160 when we take 50 iterations with 50 populations and gives the best solution in 20 iterations. When iterations are increasing solution obtained in less number of iterations.

Figure 4

**3. Differential Evolution Algorithm**

1. Objective function (min) =  $x_1 - x_2 + 2x_1^2 + 2x_1x_2 + x_2^2$

$$0 \leq x_1, x_2 \leq 10$$

**1<sup>st</sup> Table of DE**

Pop Size	Variable	Iteration	Best Cost	X1	X2	New Sol
5	2	50	29.2154(54)	2.6437	2.0023	2.6437, 2.0023
20	2	10	-0.2498(3)	0.0104	0.5143	0,0.5221
50	2	50	0(1it)	0	0.5000	0,0.5000
100	2	50	-0.25(20ite)	0	0.5000	0,0.5000

In DE result is faster than ABC and GA here optimal solution is near to 0 in 3<sup>rd</sup> iteration with 20 populations and  $x_1=0.0104$ ,  $x_2= 0.5143$ . when iterations and population are increasing than we got optimal point in minimum no of iterations.

$$2.\text{objective function}(\min) = 20x_1+26x_2 +4x_1x_2-4x_1^2-3x_2^2$$

$$-10 \leq x_1, x_2 \leq 10$$

**2<sup>nd</sup> Table of DE**

Pop Size	Variable	Iteration	Best Cost	X1	X2	New Sol
5	2	50	-1.160(3ite)	10	-10	10,-10
20	2	10	-1160	10	-10	10,-10
50	2	50	-1.160	10	-10	10,-10
100	2	50	-1160(2ite)	10	-10	10,-10

**Result of the problems**

In GA 1<sup>st</sup> problem we got the optimal solution -0.25 near to 0 because problem is of minimization in 10 number of iterations with 20 population and values of  $x_1=0$ ,  $x_2=0.5$ . These values are same for all other iterations in the table. so we get our optimal solution in 10 number of iterations. 2<sup>nd</sup> problem gives the optimal solution -1154.695 in 10 number of iteration with 20 populations, value of  $x_1$  and  $x_2$  are near to 10 and -10. These value remain same for all other iteration also in the table.

For ABC solution is -0.2103 in 10 iterations with 20 populations but when iteration and population are increasing ABC gives the best optimal solution is -0.25 near to 0 in 50 iterations and all other iteration with different population. Values of  $x_1 =0$  and  $x_2=0.5$ . In the same way for 2<sup>nd</sup> problem we got the optimal solution -1160 when we take 50 iterations with 50 populations and gives the best solution in 20 iterations. When iterations are increasing solution obtained in less number of iterations. In DE result is faster than ABC and GA here optimal solution is near to 0 in 3<sup>rd</sup> iteration with 20 populations and  $x_1=0.0104$ ,  $x_2= 0.5143$ . when iterations and population are increasing than

we got optimal point in minimum no of iterations. In 2<sup>nd</sup> problem optimal point -1160 is obtained in second iteration when population is 100 and iteration are 50. Value of x1, x2 are 10 and -10 So we can conclude that DE gives faster convergence point in less iterations. Result of DE is better in comparison of ABC and GA.

**COMPARISON TABLE OF 1<sup>st</sup> problem**

## 7. Conclusion

This paper discussed the solution of unconstrained non-linear optimization problems by using evolutionary computational approaches Genetic algorithm, Artificial bee colony algorithm, and Differential evolution by using MATLAB. For this comparison unconstrained non-linear optimization problems are solved and result are compared. According to 1<sup>st</sup> comparison table result of DE at 50 number of iteration and 50 populations is 0 in 1<sup>st</sup> iteration but GA and ABC result are – 0.2599 and -0.25 in 40 number of iteration, so result is faster than both algorithms. In 2<sup>nd</sup> comparison table we can see result is better in with 20 particles and 10 number of iterations DE result is -1160 which is minimum but GA and ABC result are -1144.975 and -1080. So DE result is better in comparison GA and ABC algorithm in less number of iterations. These algorithms are computational algorithms and efficient for the solution of non-linear optimization problems. From tables and figures it is concluded that Differential evolution gives better result in less number of iterations. Optimal solution obtained from the DE algorithm is much better than Genetic algorithm and ABC algorithm.

## ABSTRACT

A series of heterocyclic derivatives (**2a-2n**) was synthesized and characterized by melting point, FT-IR <sup>1</sup>H, <sup>13</sup>C NMR, UV-visible spectroscopy and mass spectrometry. *In vitro* antifungal activity of the heterocyclic derivatives (**2a-2n**) was evaluated against the fungal strains: *C. albicans*, *C. glabrata* and *C. tropicalis*. The results revealed that heterocyclic analog **2a** exhibits significant activity against all three strains with MIC value of **200 µg/mL**, **2b** exhibits antifungal activity against *C. albicans* with MIC value of **400 µg/mL** and *C. glabrata* and *C. tropicalis* with MIC value of **500 µg/mL**. Analog **2m** also shows antifungal activity against *C. albicans* with MIC values of **200 µg/mL** and *C. glabrata* and *C. tropicalis* with a MIC value **250 µg/mL** as compared to the standard drug fluconazole. The binding interaction study of promising heterocyclic derivatives **2a**, **2b**, and **2m** with CT-DNA was carried out by using UV-visible, fluorescence, cyclic voltammetry, circular dichroism, and viscosity measurements. The molecular docking study of the heterocyclic derivatives (**2a-2n**) was done with PDB ID: 1BNA. The pharmacokinetics properties of the heterocyclic derivatives (**2a-2n**) showed good oral bioavailability. Antioxidant potential of heterocyclic derivatives (**2a-2n**) was further approximated through DPPH and H<sub>2</sub>O<sub>2</sub> free radical and showed that all the derivatives exhibited remarkable antioxidant activity.

## KEYWORDS

Heterocyclic derivatives; antifungal activity; CT-DNA binding; molecular docking; antioxidant properties

## 1. Introduction

Heterocyclic derivatives are an important class of ligands and have found various applications in the research area of medicinal chemistry. Heterocyclic derivatives show significant interest in the field of pharmaceutical chemistry and biology due to their antifungal<sup>1,2</sup> anticancer,<sup>3,4</sup> antibacterial,<sup>5,6</sup> antimalarial<sup>7,8</sup>, and antiviral activities.<sup>9</sup> A large proportion of the heterocyclic derivatives of the chemotherapeutic anticancer agents nowadays used are DNA-binding drugs.<sup>10,11</sup> The investigation into the DNA binding ability of small heterocyclic molecules will provide important information for the development of a new DNA-drug complex and a probe for biological activity.<sup>12</sup> Meanwhile, heterocyclic derivatives are also important reactive 'NOS' donor species, especially 4-bromo-1,8-naphthalic anhydride derivatives, which have received remarkable attention due to

 Supplemental data for this article can be accessed online at <https://doi.org/10.1080/10406638.2023.2180523>.

their unique ability to form chelates with DNA and have huge biomedical applications in living organisms.<sup>13</sup> It participates in many pathological and physiological processes and can react with numerous biological molecules in living organisms such as DNA and RNA.<sup>14,15</sup>

In the last few decades, the chemistry of heterocyclic derivatives viz. 4-bromo-1,8-naphthalimides has received significant attention in biological activities.<sup>16,17</sup> Functionalized, 4-bromo-1,8-naphthalimide and its derivatives have incredibly useful applications especially as anticancer,<sup>18–21</sup> antifungal,<sup>22–24</sup> antitubercular,<sup>25</sup> antioxidant<sup>26</sup>, and antiviral drugs<sup>27</sup> with various pharmacological applications.<sup>28,29</sup> Because of their pharmacological properties, it is a particularly versatile scaffold that has demonstrated very effective in DNA intercalation drugs and currently in a clinical investigation such as amonafide (1) and mitonafide (2) has been examined as potential anticancer therapeutics.<sup>30,31</sup>

Consequently, biological and molecular docking properties of DNA-topoisomerase-II inhibitors with different substituted 4-bromo-1,8-naphthalimide have been reported earlier.<sup>32</sup> Therefore, the synthesis of 4-bromo-1,8-naphthalic anhydride derivatives has gained much importance in the field of medicinal chemistry due to their potential as labile pro-drugs.<sup>33</sup>

In view of these investigations, we have synthesized a new series of heterocyclic derivatives and characterized using melting point, <sup>1</sup>H, <sup>13</sup>C-NMR, UV-visible, FT-IR spectroscopy and mass spectrometry. The heterocyclic derivatives (**2a–2n**) were examined for *in vitro* antifungal activity against three *Candida* strains. The lead heterocyclic analogs **2a**, **2b** and **2m** were further evaluated for binding interaction with CT-DNA. The molecular docking and pharmacokinetic study as a Lipinski's rules five parameters of the derivatives were measured through online software. Additionally, the antioxidant activity of the heterocyclic derivatives (**2a–2n**) was evaluated against DPPH and H<sub>2</sub>O<sub>2</sub> free radicals.

## 2. Materials and methods

All the chemicals and solvents were commercially available and used as received without further purification. 5-Bromo-2-hydroxybenzaldehyde, 2-quinolinecarboxaldehyde from GLR Innovations Pvt. Ltd., 4-(dimethylamino)benzaldehyde, hydrazine hydrate from SD fine chemicals Pvt. Ltd., 4-(diethylamino)benzaldehyde from Alfa Aesar Pvt. Ltd., isovanillin, 4-hydroxybenzaldehyde from LOBA chemie, ethyl vanillin from SRL Pvt. Ltd., 4-hydroxy-3-methoxycinnamaldehyde, 2-imidazolecarboxaldehyde, 4-imidazole carboxaldehyde, 3,4-dihydroxy benzaldehyde, fluconazole were purchased from Sigma-Aldrich Chemicals Pvt. Ltd., DPPH (2,2-diphenyl-1-picrylhydrazyl), hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) from Merck., 4-bromo-1,8-naphthalic anhydride, 5-methoxyindole-3-carboxaldehyde, 2,5-dimethoxybenzaldehyde, 6-methoxynaphthaldehyde, 5-bromothiophene-2-carbaldehyde from Spectrochem Pvt. Ltd.

Melting point of the heterocyclic derivatives was measured in a capillary of open tubes. The precoated silica gel aluminum plates (silica gel 20 × 20 cm, 60 F<sub>254</sub>, Merck, Germany) were used for thin layer chromatography (TLC). The Agilent technologies Cary 100 series spectrophotometer was used for UV-visible spectra in DMSO as solvent. By using Agilent Technologies Fluorescence Cary Eclipse spectrophotometer at room temperature (25 °C), emission spectral studies were performed. Circular dichroism was carried out using an Applied photophysics Chirascan spectrometer. Viscosity measurements were carried out using Ostwald viscometer at room temperature. Infrared spectra of all the neat heterocyclic derivatives were recorded by using Agilent Technology FTIR Cary 630 spectrophotometer. By using Bruker 300, 400, and 500 MHz NMR spectrometer in the solvent of CDCl<sub>3</sub>, DMSO-d<sub>6</sub> and tetramethyl silane (TMS) as internal standard, <sup>1</sup>H and <sup>13</sup>C NMR spectra analysis of all the heterocyclic derivatives were performed. Mass spectral analysis of synthesized heterocyclic derivatives was carried out by using of LCMS/MS Waters system.

### 3. Experimental section

#### 3.1. Synthesis of *N*-amino-4-bromo-1,8-naphthalimide (**1**)

Hydrazine hydrate (0.05 ml, 1 mmol) was added dropwise in a solution of 4-bromo-1,8-naphthalic anhydride (0.138 g, 0.5 mmol) in 5 ml DMF. The reaction mixture was refluxed at 80 °C for 12 h and then poured into crushed ice. The progress of the reaction was monitored by TLC (ethyl acetate and hexane; 7:3). A light-yellow precipitate (**1**) obtained was filtered and washed with cold water and then dried in a vacuum desiccator. The synthesis of heterocyclic derivative (**1**) is given in Scheme 1.<sup>34</sup>

#### 3.2. General synthesis of heterocyclic derivatives (**2a–2n**)

To a solution of *N*-amino-4-bromo-1,8-naphthalimide (**1**) (0.077 g, 0.25 mmol) in 5 ml ethanol, substituted aldehydes (0.2 mmol) in 5 ml ethanol was added. After some time, a few drops of conc. HCl was added, and the reaction mixture was refluxed at 80 °C with constant stirring for 6–12 h. The reaction mixture was monitored by TLC in 1:1 ratio of hexane and ethyl acetate. The resulting precipitates of heterocyclic derivatives (**2a–2n**) were filtered and washed several times with cold ethanol and dried in vacuum desiccators on fused calcium chloride. The synthesis of heterocyclic derivatives (**2a–2n**) is given in Scheme 2.

#### 6-Bromo-2-amino-benzo[de]isoquinoline-1,3-dione (**1**)

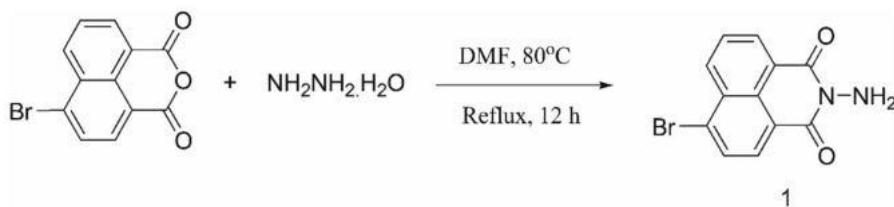

Yellow solid, Yield: 86%, M.p.: 235 °C. FT-IR (neat,  $\nu_{\max}$  cm<sup>-1</sup>): 3343–3246(NH<sub>2</sub>), 3097(C–H), 1700(C=O), 1656(C=N). <sup>1</sup>H-NMR (CDCl<sub>3</sub>,  $\delta$ , ppm): 8.57–8.56 (1H, d, Ar-CH), 8.54–8.52 (1H, d, Ar-H), 8.34–8.32 (1H, d, Ar-H), 8.21–8.19 (1H, d, Ar-H), 8.01–7.97 (1H, t, Ar-H), 5.78–5.80 (s, 2H, NH), <sup>13</sup>C NMR (75.49 MHz, DMSO-d<sub>6</sub>,  $\delta$ , ppm): 159.97, 132.70, 131.58, 131.38, 130.95, 129.75, 129.24, 128.82, 126.99, 122.42, 121.88. Mass spectrum: m/z: 291.1 [M]<sup>+</sup>.

#### 6-Bromo-2-[(4-imidazolidine)amino]benzo[de]isoquinolin-1,3-dione (**2a**)

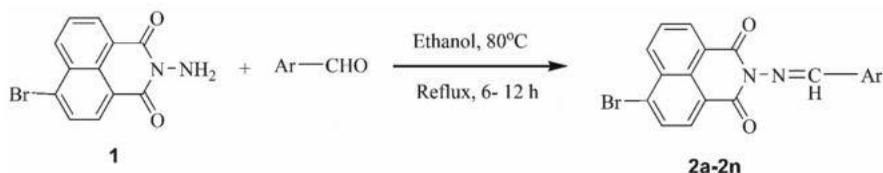

Light yellow powder, Yield. 75%,  $\lambda_{\max}$  = 342, M. p.: 242 °C. IR (neat,  $\nu_{\max}$  cm<sup>-1</sup>): 1709(C=O), 1620(C=N), 3250 (N–H). <sup>1</sup>H-NMR (DMSO-d<sub>6</sub>,  $\delta$ , ppm): 9.1 (1H, s, -NH), 8.82 (1H, s, -CH), 8.65–8.05 (7H, m, Ar-H), <sup>13</sup>C NMR (75.49 MHz, DMSO-d<sub>6</sub>,  $\delta$ , ppm): 160.61, 160.29, 133.42, 133.16, 131.74, 131.49, 130.10, 129.77, 129.26, 127.58, 122.78, 121.97. Mass spectrum: m/z: 371.03 [M + 2]<sup>+</sup>.

#### 6-Bromo-2-[(2-quinoline)-benzylidene]amino]benzo[de]isoquinolin-1,3-dione (**2b**):

Light yellow, Yield 75%,  $\lambda_{\max}$  = 342, M. p.: 210 °C. FT-IR (neat,  $\nu_{\max}$  cm<sup>-1</sup>): 1711(C=O), 1620(C=N). <sup>1</sup>H-NMR (DMSO-d<sub>6</sub>,  $\delta$ , ppm): 9.00 (1H, s, -CH), 8.90–8.88 (1H, d, Ar-H), 8.87–8.76 (1H, d, Ar-H), 8.66–8.63 (1H, d, Ar-H), 8.63–8.62 (1H, d, Ar-H), 8.52–8.50 (1H, d, Ar-H), 8.45–8.42 (1H, t, Ar-H), 8.40–8.39 (1H, d, Ar-H), 8.08–8.07 (1H, t, Ar-H), 8.05 (1H, d, Ar-H),

#### **6-Bromo-2-[(2-imidazolidine)amino]benzo[de]isoquinolin-1,3-dione (2j):**

Yellow solid, Yield 73%,  $\lambda_{\max} = 342$ , M. p.: 215 °C. FT-IR (neat,  $\nu_{\max}$   $\text{cm}^{-1}$ ): 3345(N-H), 3246(O-H), 1700(C=O), 1559(C=N).  $^1\text{H-NMR}$  (DMSO- $d_6$ ,  $\delta$ , ppm): 8.77 (1H, s, -CH), 8.69–8.67 (1H, d, Ar-H), 8.61–8.59 (1H, d, Ar-H), 8.43 (1H, s, Ar-H), 8.07–8.05 (1H, d, Ar-H), 7.88–7.86 (1H, d, Ar-H), 7.19–7.14 (1H, d, Ar-H).  $^{13}\text{C NMR}$  (75.49 MHz, DMSO- $d_6$ ,  $\delta$ , ppm): 160.02, 159.97, 132.75, 131.63, 131.43, 131.00, 129.79, 129.28, 128.88, 127.05, 122.47, 121.70. Mass spectrum:  $m/z$ : 369.90  $[M]^+$ .

#### **6-Bromo-2-[(4-hydroxy)-benzylidene]amino]benzo[de]isoquinolin-1,3-dione (2k):**

Light yellow, Yield 80%,  $\lambda_{\max} = 340$ , M. p.: 265 °C. FT-IR (neat,  $\nu_{\max}$   $\text{cm}^{-1}$ ): 3421(O-H), 1704(C=O), 1603(C=N).  $^1\text{H-NMR}$  (DMSO- $d_6$ ,  $\delta$ , ppm): 8.6 (1H, s, -CH), 8.61–8.60 (1H, d, Ar-H), 8.26–8.24 (1H, t, Ar-H), 8.58–8.57 (1H, d, Ar-H), 8.38–8.36 (1H, d, Ar-H), 8.36–8.34 (1H, d, Ar-H), 8.01–7.99 (1H, d, Ar-H), 8.05–8.03 (1H, d, Ar-H), 7.81–7.79 (1H, d, Ar-H), 6.96–6.94 (1H, d, Ar-H), 5.80 (1H, s, O-H),  $^{13}\text{C NMR}$  (75.49 MHz, DMSO- $d_6$ ,  $\delta$ , ppm): 161.64, 159.93, 132.68, 131.76, 131.56, 131.39, 131.11, 130.97, 129.76, 129.29, 128.81, 128.78, 127.59, 126.89, 123.39, 123.04, 122.33, 121.56, 115.92. Mass spectrum:  $m/z$ : 395.20  $[M]^+$ .

#### **6-Bromo-2-[(5-bromothiophene)amino]benzo[de]isoquinolin-1,3-dione (2l):**

Yellow solid, Yield 70%,  $\lambda_{\max} = 341$ , M. p.: 225 °C. FT-IR (neat,  $\nu_{\max}$   $\text{cm}^{-1}$ ): 1704(C=O), 1603(C=N).  $^1\text{H-NMR}$  (DMSO- $d_6$ ,  $\delta$ , ppm): 8.72 (1H, s, -CH), 8.72–8.70 (1H, d, Ar-H), 8.62–8.65 (1H, d, Ar-H), 8.48–8.46 (1H, d, Ar-H), 7.88 (1H, s, Ar-H), 7.30–7.26 (1H, t, Ar-H), 7.14 (1H, d, Ar-H),  $^{13}\text{C NMR}$  (75.49 MHz, DMSO- $d_6$ ,  $\delta$ , ppm): 162.99, 162.68, 137.60, 134.54, 133.82, 132.72, 132.54, 131.96, 131.85, 131.35, 130.92, 130.79, 128.30, 123.60, 106.52. Mass spectrum:  $m/z$ : 462.90  $[M + 1]^+$ .

#### **6-Bromo-2-[(6-methoxy-1H-indole)-benzylidene]amino]benzo[de]isoquinolin-1,3-dione (2m):**

Yellow solid, Yield 85%,  $\lambda_{\max} = 340$ , M. p.: 250 °C. IR (neat,  $\nu_{\max}$   $\text{cm}^{-1}$ ): 3371(N-H), 1704(C=O), 1607(C=N).  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ ,  $\delta$ , ppm): 9.8 (1H, s, NH), 8.67 (1H, s, -CH), 8.62–8.59 (1H, d, Ar-H), 8.56–8.56 (1H, d, Ar-H), 8.36–8.33 (1H, d, Ar-H), 8.33 (1H, s, Ar-H), 8.26–8.23 (1H, t, Ar-H), 8.02–8.00 (1H, d, Ar-H), 7.73 (1H, s, Ar-H), 7.45–7.43 (1H, d, Ar-H), 6.94–6.92 (1H, d, Ar-H), 3.8 (3H, s, -OCH $_3$ ),  $^{13}\text{C-NMR}$  (75.49 MHz, DMSO- $d_6$ ,  $\delta$ , ppm): 167.55, 160.53, 155.48, 135.31, 132.50, 131.94, 131.43, 130.29, 129.71, 129.13, 128.01, 127.44, 125.79, 123.84, 123.26, 121.88, 113.46, 110.87, 104.44, 55.94. Mass spectrum:  $m/z$ : 449.02  $[M + 1]^+$ .

#### **6-Bromo-2-[(5-bromo-2-hydroxy)-benzylidene]amino]benzo[de]isoquinolin-1,3-dione (2n):**

Light yellow powder, Yield 78%,  $\lambda_{\max} = 343$ , M.p.: 260 °C. FT-IR (neat,  $\nu_{\max}$   $\text{cm}^{-1}$ ): 3108(O-H), 1715(C=O), 1579(C=N).  $^1\text{H-NMR}$  (DMSO- $d_6$ ,  $\delta$ , ppm): 11.4 (1H, s, O-H), 8.95 (1H, s, -CH), 8.75–8.73 (1H, s, Ar-H), 8.67–8.65 (1H, d, Ar-H), 8.49–8.50 (1H, d, Ar-H), 8.14–8.10 (1H, t, Ar-H), 7.96–7.92 (1H, s, Ar-H), 7.92–7.91 (1H, d, Ar-H), 7.50 (1H, s, Ar-H), 7.00–6.98 (1H, d, Ar-H),  $^{13}\text{C NMR}$  (75.49 MHz, DMSO- $d_6$ ,  $\delta$ , ppm): 160.44, 160.07, 157.46, 134.94, 133.39, 132.92, 131.99, 131.67, 131.29, 129.95, 129.63, 129.27, 128.96, 127.62, 127.32, 122.70, 122.02. Mass spectrum:  $m/z$ : 474.40  $[M]^+$ .

### 3.3. Antifungal activity

#### 3.3.1. Disk diffusion assay

The heterocyclic derivatives (**2a–2n**) were screened for *in vitro* antifungal activity against three fungal strains: *C. albicans*, *C. glabrata*, and *C. tropicalis* with a concentration of 200–600  $\mu\text{g}/\text{mL}$  by Agar disk diffusion assay.<sup>35,36</sup> Solutions of the heterocyclic analogs in DMSO were plated onto the cultured agar medium and incubated for a period of 48 h at 37 °C. Fluconazole was used as a standard drug. The results were measured in terms of the zone of inhibition in mm.

#### 3.4. Growth curve

The growth motif of the heterocyclic analogs **2a**, **2b**, and **2m** was analyzed against three different *Candida* strains sustained at 4 °C which were immunized in fresh YEPD media. On the culture dish with the whisking rate of 200 rpm differing concentrations of compounds **2a**, **2b**, and **2m** were added and incubated at 37 °C. The motif was observed with pre-established time intervals of 0, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22 and 24 h before removing aliquots. At 595 nm absorbance of the compounds was recorded by using UV–Vis. spectrophotometer for every concentration in DMSO and a graph plotted against time.<sup>37</sup>

### 3.5. DNA binding studies

#### 3.5.1. Electronic absorption spectra

The CT-DNA binding ability of the heterocyclic derivatives **2a**, **2b**, and **2m** were investigated using absorption spectroscopy. In Tris–HCl buffer (50 mM) at 7.4 pH, CT-DNA stock solution was made ready, and concentration was obtained by the coefficient of molar absorption ( $\epsilon_{260} = 6600 \text{ liter mol}^{-1} \text{ cm}^{-1}$ ). The absorbance spectra ratio of 1.9:1 was recorded in between 260 and 280 nm to confirm the purity of prepared CT-DNA.<sup>38–40</sup> Experimental absorbance was determined in the range of 200–600 nm by maintaining the fixed concentrations of the compounds **2a**, **2b**, and **2m** ( $1.0 \times 10^{-5} \text{ M}$ ) with increasing concentrations of CT-DNA ( $0.1\text{--}0.8 \times 10^{-5} \text{ M}$ ) and absorption spectra were measured using UV-visible spectrophotometer in Tris–HCl buffer (50 mM, 7.4 pH). The mixture solutions of heterocyclic derivatives **2a**, **2b** and **2m** were incubated for 5–15 min at 25 °C before recording the spectra. All the experiments were carried out in triplicate. The Binding constant ( $K_b$ ) was calculated by using the given Equation (1):

$$\frac{[\text{DNA}]}{(\epsilon_a - \epsilon_f)} = \frac{[\text{DNA}]}{(\epsilon_b - \epsilon_f)} + \frac{1}{k_b(\epsilon_b - \epsilon_f)} \quad (1)$$

where,  $\epsilon_a$ ,  $\epsilon_f$  and  $\epsilon_b$  are the correlate extinction coefficients of the heterocyclic compound at every concentration of CT-DNA, for unbounded heterocyclic compounds and for totally bounded compounds to DNA respectively. For the value of  $K_b$  graph was plotted between [DNA] versus [DNA]/ $[\epsilon_a - \epsilon_f]$  with a slope of  $1/(\epsilon_b - \epsilon_f)$  and intercept  $1/K_b(\epsilon_b - \epsilon_f)$  ratio.

Gibb's free energy (G) was also calculated to observe the spontaneity of the heterocyclic derivatives **2a**, **2b**, and **2m** was calculated by the following formula;

$$G = -2.303RT \log k$$

where, K=binding constant, T=absolute temperature (298 K), R=Universal gas constant ( $8.3141 \text{ J mol}^{-1} \text{ K}^{-1}$ ) for heterocyclic compounds with CT-DNA.<sup>41</sup>

#### 3.5.2. Fluorescence study

Fluorescence emission titrations were further studied to observe the effect of CT-DNA on synthesized heterocyclic derivatives **2a**, **2b**, and **2m**. At a fixed concentration of CT-DNA (10  $\mu\text{M}$ ) in

Tris-HCl buffer solution (50 mM) at 7.4 pH with increasing concentration of heterocyclic derivatives **2a**, **2b**, and **2m** ( $0.1\text{--}0.8 \times 10^{-5}$  M). Emission titration spectra were recorded between 300–500 nm after incubating the mixture solutions for 10 minutes at room temperature.<sup>42–44</sup> From the obtained experimental data, the graph was plotted against wavelength (nm) vs intensity.

### 3.5.3. Cyclic voltammetry

Cyclic voltammetry (CV) is another method to investigate the interaction of CT-DNA with heterocyclic derivatives **2a**, **2b**, and **2m**. Cyclic voltammetry measurements were completed in the presence and absence of CT-DNA in Tris-HCl buffer solution (50 mM) at 7.4 pH. A Pt wire has been laid hold of as a counter electrode, solid Pt was used as the working electrode and Ag/AgCl was used as a reference electrode. CV measurements of heterocyclic derivatives **2a**, **2b**, and **2m** have been completed by cycling the potential of the working electrode and calculating the resulting current. All the investigations have been finalized with the  $50 \text{ mVsec}^{-1}$  scan rate in the potential interval of -1 to +1 V at 25 °C and spectra of voltammetry were plotted between potential (V) vs current (A).<sup>45,46</sup>

### 3.5.4. Circular dichroism spectroscopy

A circular dichroism measurement study is also a very important method to examine the interaction of CT-DNA with heterocyclic derivatives **2a**, **2b**, and **2m**. Spectra were obtained with an Applied photophysics Chirascan spectrometer with  $50 \mu\text{M}$  of CT-DNA in the absence and presence of  $5 \mu\text{M}$  each of heterocyclic derivatives of **2a**, **2b**, and **2m** separately in 50 mM Tris-HCl buffer (pH 7.4) at 200–300 nm by using of 1 mm path length cuvette with the scan rate of  $30 \text{ nmmin}^{-1}$ .<sup>47,48</sup>

### 3.5.5. Viscosity measurement

Viscosity titrations of the synthesized heterocyclic analogs **2a**, **2b**, and **2m** were performed at rt (25 °C) by using the Ostwald viscometer. Measurements were carried out at increasing concentrations of synthesized heterocyclic derivatives **2a**, **2b**, and **2m** ( $0.1\text{--}0.9 \times 10^{-5}$ ) with a fixed concentration of CT-DNA ( $10 \mu\text{M}$ ) and flow time was recorded with a digital stopwatch. The graph between the  $[\text{compound}]/[\text{DNA}]$  vs  $(\eta/\eta_0)^{1/3}$  respective specific viscosity was plotted.<sup>49</sup> From the average flow time (Equation 2), the viscosity of the three heterocyclic derivatives **2a**, **2b**, and **2m** was calculated from the solution having CT-DNA by using.

$$\begin{aligned}\eta_0 &= t - t_0 \\ \eta &= t_1 - t\end{aligned}\quad (2)$$

where  $t$ ,  $t_0$ , and  $t_1$  are the average flow times for CT-DNA, Tris- Buffer and compounds respectively and  $\eta_0$  and  $\eta$  are the specific viscosity for CT-DNA in with and without the heterocyclic compounds **2a**, **2b**, and **2m**.

## 3.6. Molecular docking

*In silico* molecular docking study was also done in order to determine the interaction between the DNA (PDB ID: 1BNA) and heterocyclic derivatives (**2a–2n**). The main target of the docking study for specified heterocyclic derivatives (**2a–2n**) was to approximate the experimental active binding sites. The initial structures of the heterocyclic derivatives (**2a–2n**) were generated by Chem Draw Ultra 12.0 software. 1BNA crystal structures were downloaded from ([www.rcsb.org/pdb](http://www.rcsb.org/pdb)) RCSB Data Bank of Protein in PDB format. To convert PDB structure files into PDBQT format, protein and target heterocyclic derivatives (**2a–2n**) drugs were loaded in AutoDock online

software. For the evaluation of the smallest binding energy, a grid box was created in the place of the drug and excellent corroboration was selected. The most developed model was chosen on the basis of the smallest binding energy and zero roots mean square deviation (rmsd). By using Discovery Studio 3.0 (Accelrys, DS visualizer, and pymol) software, results of AutoDock were analyzed like hydrogen bonding and hydrophobic interactions. The best docking pose result of each heterocyclic derivatives (**2a–2n**) was proved relevant information with regard to the interaction of active sites of 1BNA with the heterocyclic derivatives (**2a–2n**).<sup>50–53</sup> The 3D, 2D poses of the most active heterocyclic derivatives **2a** were taken using discovery studio.

### 3.7. Pharmacokinetics studies

ADME was used to predict pharmacokinetic properties of the synthesized heterocyclic derivatives (**2a–2n**) were determined by using Molinspiration Chemo Informatics as online free software to investigate the bioavailability of the synthesized heterocyclic derivatives (**2a–2n**) to ensure that it has drug potential.<sup>54–56</sup>

### 3.8. Antioxidant activity

#### 3.8.1. DPPH free radical scavenging assay

Antioxidant activity of the heterocyclic derivatives (**2a–2n**) was measured with DPPH (2,2-diphenyl-1-picrylhydrazyl) free radical. 2 ml of test compounds ( $10^{-4}$ M) in DMSO was added to the 1 ml of DPPH ( $10^{-4}$  M) in ethanolic solution. The absorbance of all the heterocyclic derivatives (**2a–2n**) was recorded by using a UV-visible spectrophotometer at 511 nm after the incubation of 2 h at 37 °C and ethanol was taken as a blank. The graph between percentage antioxidant activity v/s concentrations of heterocyclic derivatives (**2a–2n**) gave the IC<sub>50</sub> value in µg/ml.<sup>57,58</sup> All the experiments were performed in triplicate and the antioxidant activity of all the heterocyclic compounds was calculated by Equation 3.

$$\% \text{Inhibition} = \frac{A_{\text{control}} - A_{\text{sample}}}{A_{\text{sample}}} \times 100 \quad (3)$$

where  $A_{\text{control}}$  = absorbance of DPPH free radical in ethanol in the absence of compound and  $A_{\text{sample}}$  = absorbance of DPPH free radical in the presence of compound.

#### 3.8.2. Hydrogen peroxide scavenging assay:

Antioxidant activity of the heterocyclic derivatives (**2a–2n**) was also further determined by using hydrogen peroxide as used in the reported method.<sup>59,60</sup> 1 ml of 40 mM of hydrogen peroxide solution in the phosphate buffer (pH-7.4) was added to the 2 ml of heterocyclic derivatives ( $10^{-5}$  M). Absorbance was recorded at 220 nm after incubating the test compound for 10 minutes and phosphate buffer was used as a blank.

The % inhibition of free radical H<sub>2</sub>O<sub>2</sub> was calculated by using Equation (4).

$$\% \text{Inhibition} = \frac{A_{\text{control}} - A_{\text{sample}}}{A_{\text{sample}}} \times 100 \quad (4)$$

where  $A_{\text{control}}$  and  $A_{\text{sample}}$  = are the absorbance of H<sub>2</sub>O<sub>2</sub> free radical in presence and absence of compounds.

## 4. Results and discussion

### 4.1. Chemistry

#### 4.1.1. FT-IR spectra

In the heterocyclic derivative **1**, stretching vibration of (-N-NH<sub>2</sub>) group appears at  $\sim 3343\text{ cm}^{-1}$ . The disappearance of the stretching and bending vibration of the group (-N-NH<sub>2</sub>) indicates the formation of heterocyclic derivatives (**2a-2n**). The (-C=N) azomethine group appears in the range of  $1559\text{--}1620\text{ cm}^{-1}$ .<sup>61</sup> A broad band in the region of  $3281\text{--}3525\text{ cm}^{-1}$  attributed to the phenolic group (-OH) stretching vibration for the heterocyclic derivatives **2d**, **2f**, **2g**, **2h**, **2k**, **2n**, and a sharp peak of (-N-H) band for the heterocyclic derivatives **2a**, **2j**, and **2m** in the range of  $3108\text{--}3371\text{ cm}^{-1}$  attributed. The characteristic bands at  $3136\text{--}2831$ ,  $1339\text{--}1236$ , and  $820\text{--}775\text{ cm}^{-1}$  can conditionally be assigned to (-C-H) aromatic, (C=C) aromatic and C-Br mode of vibration spectra respectively of all the heterocyclic derivatives. The band appearing at  $\sim 2941\text{--}3190\text{ cm}^{-1}$  range in the IR spectra of the heterocyclic derivatives (**2d**, **2g**, **2i**, **2m**, and **2n**) and may be assigned to the stretching vibration of -OCH<sub>3</sub>.<sup>62</sup> Mass spectrometry and FT-IR spectra of all heterocyclic analogs (**2a-2n**) are given in [supplementary Figures S1 and S2](#), respectively.

#### 4.1.2. NMR spectra

<sup>1</sup>H NMR spectra of the heterocyclic derivatives (**2a-2n**) exhibited well-resolved signals. A characteristic peak appears at 8.60–9.63 ppm range corresponding to the azomethine proton of the heterocyclic derivatives (**2a-2n**). A broad peak assigned to O-H proton appeared in the range of 3.76–11.47 ppm for the heterocyclic derivatives **2d**, **2f**, **2g**, **2h**, **2k**, and **2n**. A sharp signal for the heterocyclic analog **2a**, **2j**, and **2m** appeared at 8.69–9.89 ppm range corresponds to -N-H proton. The aromatic proton for all the heterocyclic derivatives (**2a-2n**) appeared in the range of 6.15–8.90 ppm.<sup>63</sup> <sup>13</sup>C NMR spectra of heterocyclic derivatives (**2d**, **2g**, **2i**, **2m** and **2n**) exhibited a peak in the range of 40.53–63.91 ppm for the methoxy carbon (-OCH<sub>3</sub>). The methene (-OCH<sub>2</sub>-) and methyl (-CH<sub>3</sub>) carbon of compound **2h** appeared at 14.64 and 63.91 ppm respectively. <sup>13</sup>C NMR peak of carbonyl groups (C=O) of the heterocyclic derivatives (**1** and **2a-2n**) was found in 173.54–157.75 ppm range. The azomethine carbon was observed at 137.98–139.2 ppm range. Aromatic carbon appeared at 104.44–155.48 ppm range. <sup>1</sup>H and <sup>13</sup>C NMR spectra of the heterocyclic analogs (**2a-2n**) given in [supplementary Figure S3](#).

### 4.2. Antifungal study

#### 4.2.1. Disk diffusion assay

The *in vitro* antifungal activities of the heterocyclic derivatives (**2a-2n**) were examined at 200–600  $\mu\text{g/mL}$  concentrations by Agar Disk-diffusion assay against three fungal strains *C. albicans*, *C. glabrata* and *C. tropicalis*. Disk figures of heterocyclic derivatives (**2a-2n**) are shown in [Figure S4](#). The results were measured in terms of the zone of inhibition (mm).<sup>64,65</sup> It has been observed that the **2a** exhibited significant activity against *C. albicans*, *C. glabrata*, and *C. tropicalis* with MIC value 200  $\mu\text{g/mL}$  and **2b** exhibited activity 400  $\mu\text{g/mL}$  against *C. albicans* and 500  $\mu\text{g/mL}$  *C. glabrata*, and *C. tropicalis* **2m** exhibit greater activity against *C. albicans* with MIC value 200  $\mu\text{g/mL}$  and 250  $\mu\text{g/mL}$  against *C. glabrata*, and *C. tropicalis* fungal strains. This may be described based on the chelation theory. It is also distinguished that the activities of the heterocyclic derivatives increase as well as the increase in the concentration of the test compounds. It is because the concentration of the compounds plays a vital role in increasing in the degree of inhibition of antifungal growth. Additionally, many other important factors like the nature of the compounds, dipole moment, solubility, the geometry of the compounds and conductivity may be responsible for the

**Table 1.** *In vitro* susceptibility of test compounds (**2a–2n**) against *Candida albicans* (ATCC 90028), *Candida glabrata* (ATCC 90030) and *Candida tropicalis* (ATCC750). Fluconazole was taken as a positive control with MIC value of 10 µg/ml (ZOI of 18 mm).

Test compounds	MIC(µg/ml)			Diameter of zone of inhibition (mm)

higher activity. The relative antifungal activities of all the heterocyclic derivatives (**2a–2n**) against *C. albicans*, *C. glabrata*, and *C. tropicalis* are given in Table 1.

#### 4.3. Growth curve

The growth patterns of heterocyclic derivatives **2a**, **2b**, and **2m** were carried out in the media of YEPD and observed for a period of 24 hours as given in Figures 1, 2, 3. Fluconazole (FLC) as a standard drug showed MIC value of 10 µg/ml with ZOI of 25 mm. From the experimental observations, heterocyclic derivatives **2a**, **2b**, and **2m** indicate a concentration-dependent subduing of a pattern of growth.<sup>66</sup>

**Figure 3.** Growth pattern of *C. albicans* (A), *C. glabrata* (B) and *C. tropicalis* (C) in absence and presence of **2m** at varying concentrations.

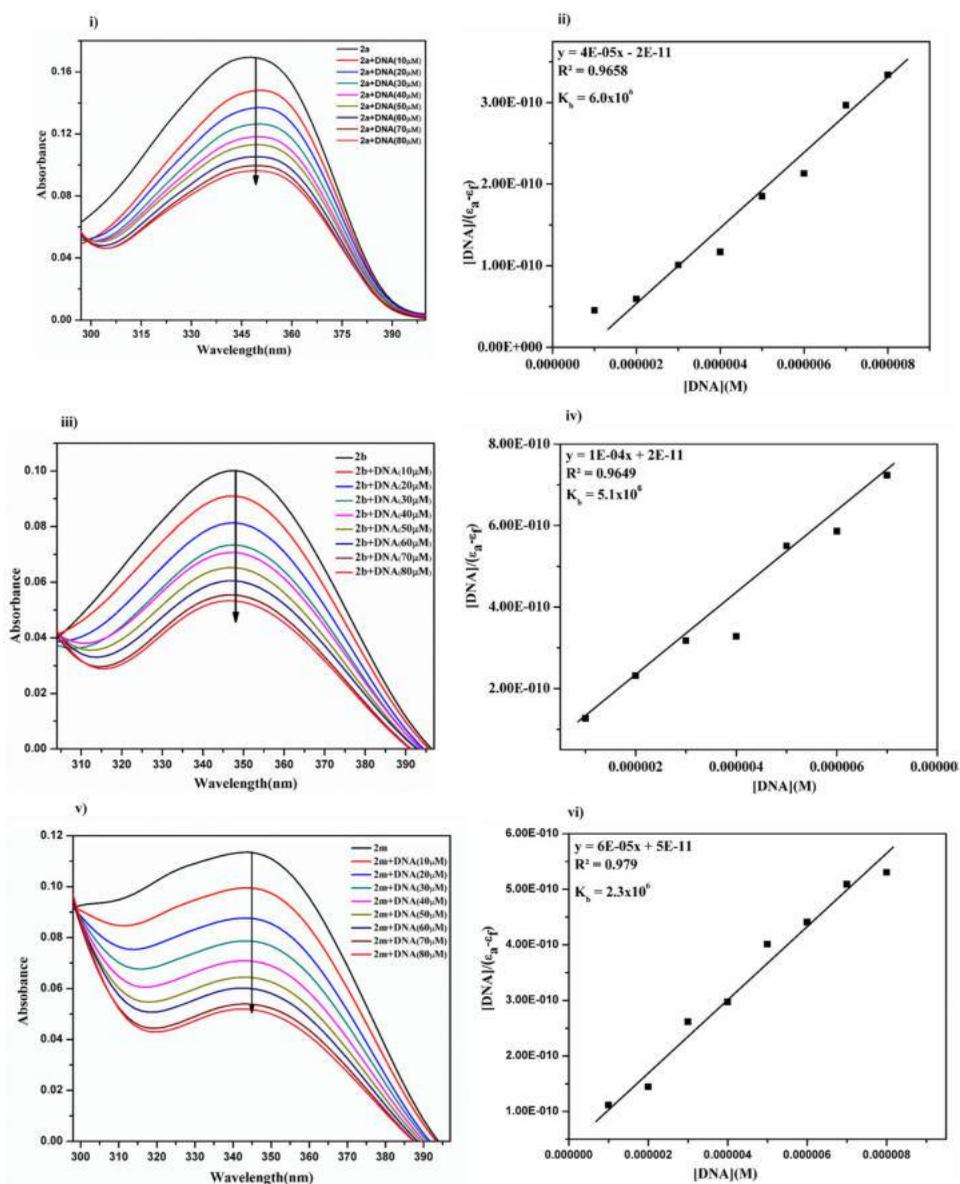

#### 4.4. DNA binding study

##### 4.4.1. Absorption study

Binding affinity of heterocyclic derivatives **2a**, **2b**, and **2m** with CT-DNA was observed using absorption spectroscopy in which two informative features arise. In DNA groove binding or electrostatic mode, the hyperchromic shift appears which is due to the cracking of the secondary structure of the DNA. Even though, in hypochromism take place in which the intercalative binding mode of the heterocyclic confirms because of  $\pi$ - $\pi^*$  transition between the DNA base pair and the aromatic chromophore of the heterocyclic compounds. The absorption spectra of heterocyclic compounds **2a**, **2b**, and **2m** were performed with and without the CT-DNA as shown in Figure 4. From the experimental observations, it was concluded that as the absorbance decreases on increasing the CT-DNA concentration. Which revealed that CT-DNA interacts with heterocyclic analog **2a**, **2b**, and **2m** through intercalative mode of the binding. The strength of binding mode of CT-DNA with compounds has also been confirmed by calculating the intrinsic binding constant ( $K_b$ ) as  $6.0 \times 10^6$ ,  $5.1 \times 10^6$ ,  $2.3 \times 10^6 \text{ M}^{-1}$  respectively and Gibbs free energy (G) as -38.6, -38.3 and -36.3 kJ mol<sup>-1</sup> which determined the spontaneity of binding interaction between compounds and CT-DNA[67].<sup>67,68</sup>

##### 4.4.2. Emission study

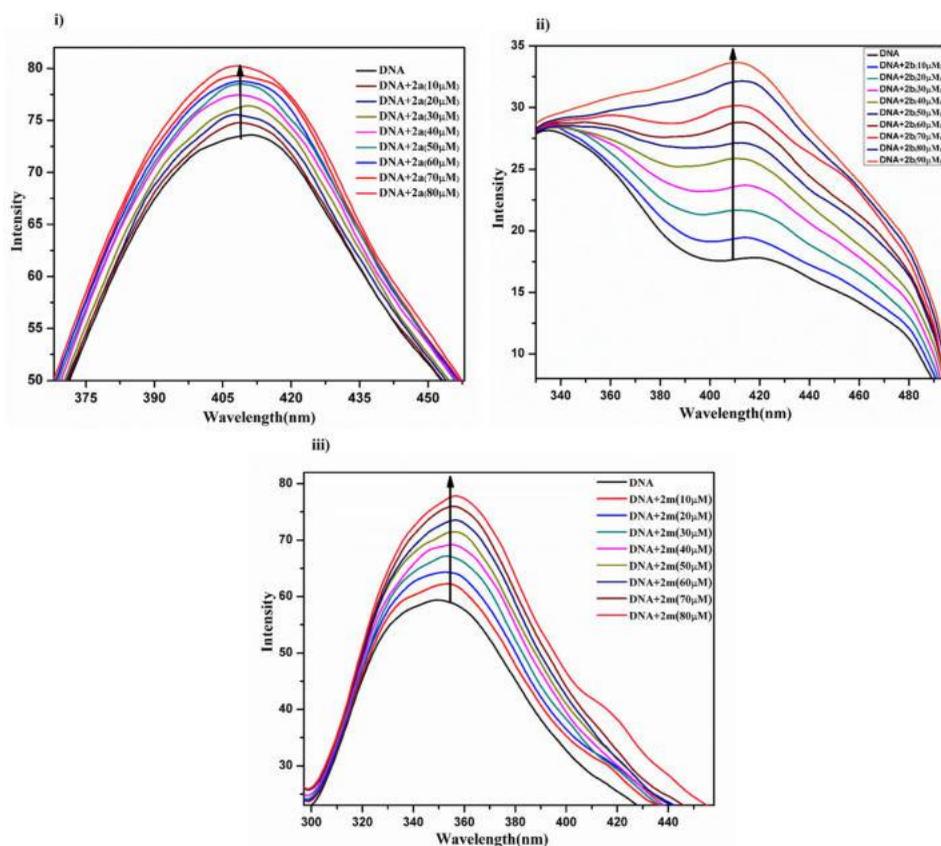

Fluorescence emissions were further carried out to understand the interaction effect between CT-DNA and heterocyclic derivatives **2a**, **2b**, and **2m** with and without the CT-DNA. From the obtained results, it was concluded that emission intensity increases continuously on every addition of heterocyclic derivatives **2a**, **2b**, and **2m** (Figure. 5) which is due to the reason the heterocyclic derivatives get into a hydrophobic environment within the DNA helix and prevented quenching effect. These results also confirmed the binding of CT-DNA with heterocyclic derivatives **2a**, **2b** and **2m**.<sup>69</sup>

**Figure 4.** Absorption spectra (i), (iii) & (v) of heterocyclic derivatives **2a**, **2b**, and **2m** in increasing concentration of DNA [ $0.1$ – $0.8 \times 10^{-5}$  M] and Plot (ii), (iv) and (vi) for calculating the intrinsic binding constant ( $K_b$ ).

#### 4.4.3. Electrochemical measurements

Further cyclic voltammetry (CV) also provides some additional support for the interaction mode of heterocyclic analogs **2a**, **2b**, and **2m** to CT-DNA. CV displayed one step irreversible oxidation–reduction process in the case of heterocyclic derivatives **2a**, **2b** and **2m**. A shift in peak potential in the cyclic voltammogram confirms the interaction of CT-DNA with heterocyclic derivatives **2a**, **2b**, and **2m**. After the eventually addition of CT-DNA ( $1 \times 10^{-4}$  M) to the synthesized heterocyclic derivatives **2a**, **2b**, and **2m** ( $1 \times 10^{-5}$  M), it has been observed that current of voltametric peaks drop remarkably which is shown in Figure 6. The decline in current of voltametric after each adding of CT-DNA referred to the complex formation which is because of the aggregation of heterocyclic derivatives **2a**, **2b**, and **2m** between the CT-DNA base pair.<sup>70,71</sup> The

**Figure 5.** Fluorometric measurements (i), (ii) and (iii) in increasing concentration of heterocyclic derivatives **2a**, **2b**, and **2m** [ $0.1\text{--}0.8 \times 10^{-5}$  M] with constant concentration of DNA ( $10 \mu\text{M}$ ).

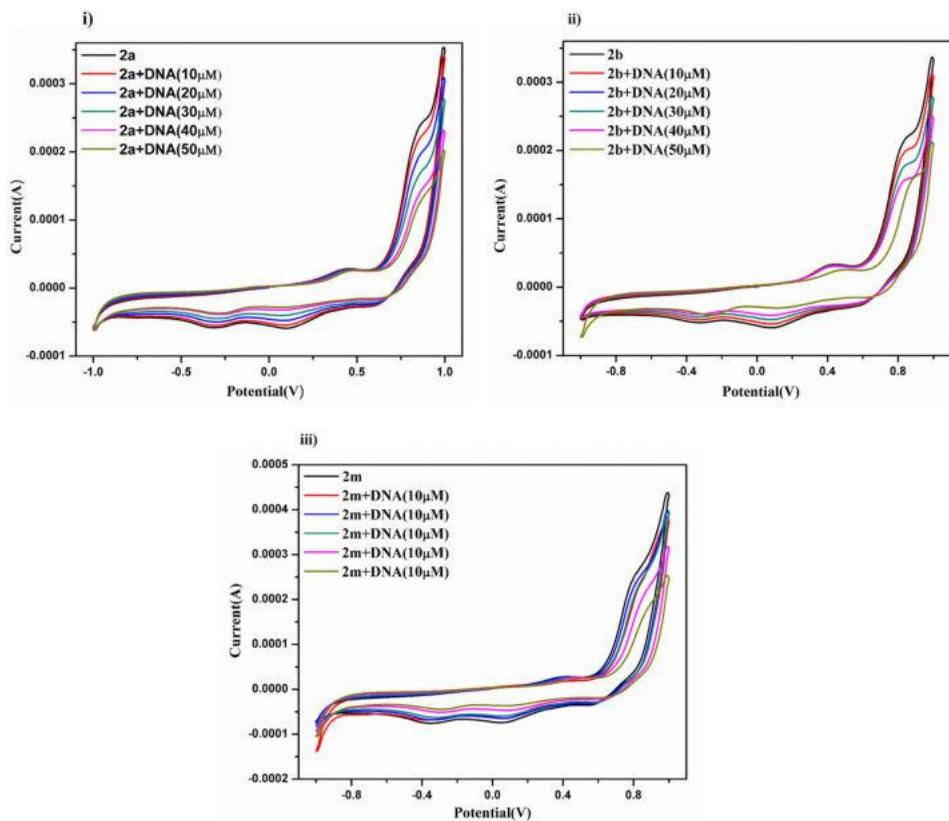

result demonstrates that the compound binds with CT-DNA via intercalative mode of binding interactions.

#### 4.4.4. Circular dichroism

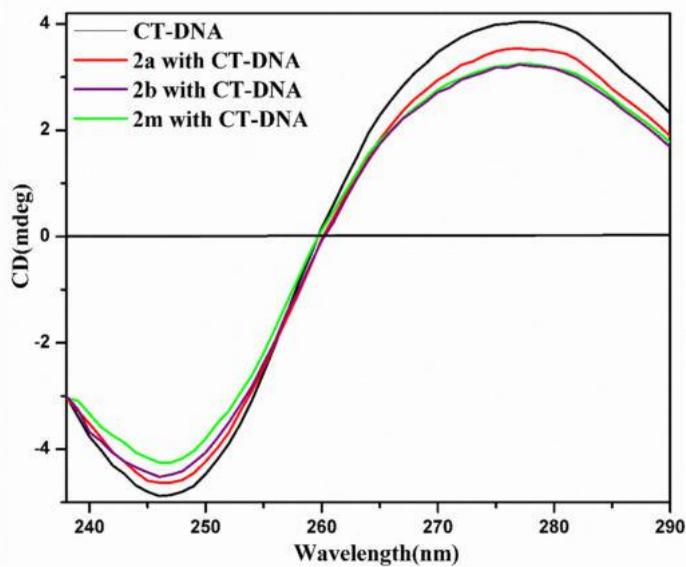

CD spectroscopy is another important method to observe the modes of binding of CT-DNA with heterocyclic derivatives **2a**, **2b**, and **2m**. In the circular dichroism spectra, the B form of CT-DNA shows a characteristic positive shift at 277 nm for the base stacking and a negative band at 246 nm for the helicity.<sup>72</sup> Intercalative mode of CT-DNA binding changes both the positive and a negative shift and in the case of minor groove binding and electrostatic interaction, minor changes with either the positive or negative shift are observed. To study the relative CT-DNA binding ability of heterocyclic derivatives **2a**, **2b**, and **2m** with the conformational change of CT-DNA, the same concentration of these heterocyclic derivatives was incubated containing CT-DNA. Significant variation in the intensity of both the negative and positive shift of CT-DNA was observed (Figure 7) which is due to the formation of intercalative binding with heterocyclic derivatives **2a**, **2b**, and **2m**.<sup>73</sup>

#### 4.4.5. Viscosity measurements

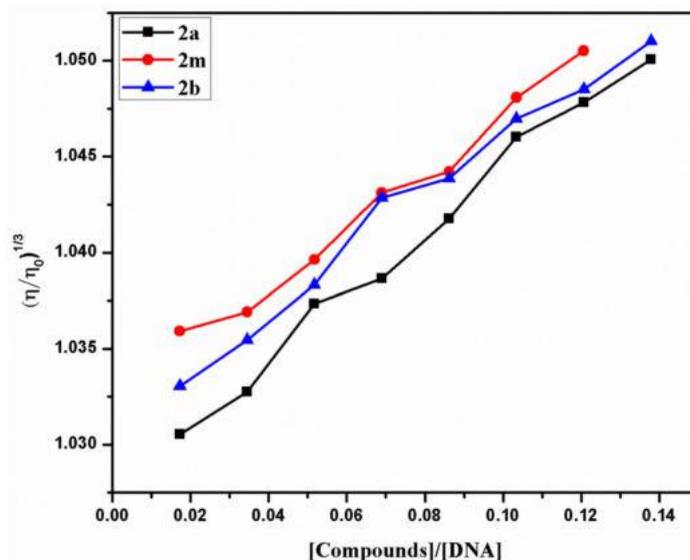

The binding interaction between the CT-DNA is further elucidated by the viscosity quantifications. Optical photo-physical probes generally do not provide sufficient indication to support the

**Figure 6.** Cyclic voltammograms (i), (ii) and (iii) of lead analogs 2a, 2b and 2m in the absence and presence of various concentration of DNA.

**Figure 7.** Circular dichroism of lead derivatives 2a, 2b and 2m with DNA.

**Figure 8.** Viscosity measurements with increasing concentration of lead derivatives **2a**, **2b** and **2m** [ $0.1\text{--}0.9 \times 10^{-5}$  M] at constant concentration of CT-DNA ( $10 \mu\text{M}$ ).

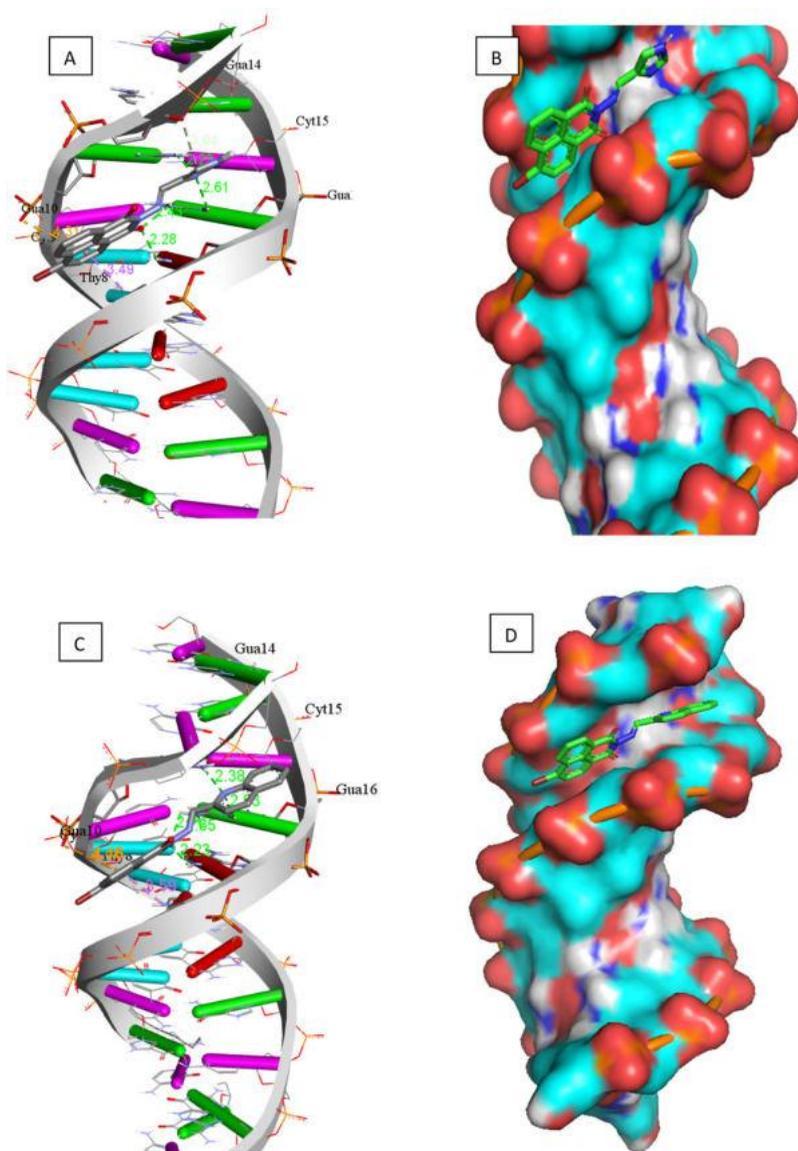

binding model of heterocyclic derivatives with CT-DNA, hence hydrodynamic measurements have been carried out. Intercalative binding mode is due to the division of base pairs at intercalation sites and hence an increase in overall CT-DNA length, thereby increase in viscosity. Groove binding or electrostatic mode is due to the diminished in CT-DNA helix length which gives rise to the CT-DNA to bend and therefore, viscosity decreases. Viscometric investigation results reveal that on varying the concentration ( $0.1\text{--}0.9 \times 10^{-5}$  M) of the tested heterocyclic derivatives **2a**, **2b**, and **2m**, the viscosity of CT-DNA increases and proposes to be bound to CT-DNA by intercalation as shown in Figure 8.<sup>74,75,76</sup>

#### 4.5. Molecular docking

We have performed experiments to investigate the binding mode of interaction of lead analogs with CT-DNA. The molecular docking study was also done using PDB ID: 1BNA for experimental validation. The binding energies (Table S1) of the heterocyclic derivatives **2a**, **2b**, **2c**, **2d**, **2e**, **2f**, **2g**, **2h**, **2i**, **2j**, **2k**, **2l**, **2m**, **2n** and fluconazole were observed **-10.2**, **-10.1**, **-9.3**, **-7.7**, **-6.7**, **-9.5**, **-9.2**, **-9.4**, **-9.1**, **-7.2**, **-9.1**, **-8.6**, **-7.7**, **-9.5**, and **-7.3**, kcal/mol respectively. Among all drugs **2a**, **2b**, and **2m** showed higher binding affinity which indicates the good-quality results for 1BNA.<sup>77,78</sup> The molecular docking poses of lead analogs **2a**, **2b** and **2m** are shown in Figure 9 and S5.

#### 4.6. Pharmacokinetics studies

According to Lipinski, the synthesized heterocyclic derivatives (**2a**–**2n**) have good membrane permeability,  $\log P \leq 5$ , number of hydrogen bond acceptors  $\leq 10$ , molecular weight  $\leq 500$ , and number of hydrogen bond donors  $\leq 5$ . The drug-like properties of the heterocyclic derivatives (**2a**–**2n**) showed that none of the compounds violates the Lipinski rule and all the properties are in a considerable range which is shown in Table 2.<sup>79,80</sup>

**Figure 9.** Molecular docking pose of lead derivative **2a** (A,B) and **2b** (C,D).

**Table 2.** Pharmacokinetics studies parameters of heterocyclic derivatives (**2a–2n**) for drug likeness properties.

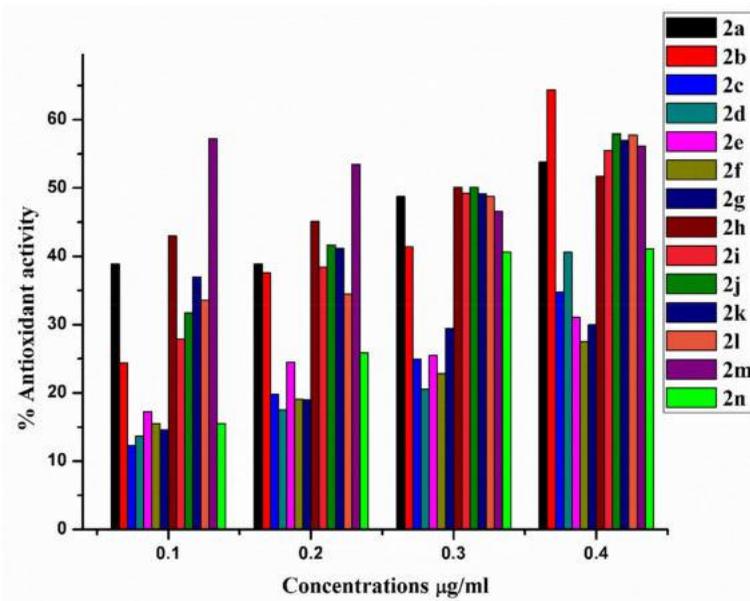

Figure 11. Antioxidant activity bar graph of heterocyclic derivatives (2a–2n).

## 4.7. Antioxidant activity

### 4.7.1. DPPH free radical scavenging assay:

*In vitro* antioxidant properties of heterocyclic derivatives (**2a–2n**) were screened by DPPH free radical. The heterocyclic derivatives (**2a–2n**) exhibited antioxidant activity against DPPH free radicals as shown in (Figure 10 and Table S2). Significant  $IC_{50}$  values were found to be  $0.158 \pm 0.003 \mu\text{g/ml}$ ,  $0.167 \pm 0.002 \mu\text{g/ml}$  and  $0.138 \pm 0.001 \mu\text{g/ml}$  for the heterocyclic analogs **2a**, **2b**, and **2m**, respectively.<sup>81,82</sup>

### 4.7.2. Hydrogen peroxide scavenging assay

*In vitro* antioxidant activity of heterocyclic derivatives (**2a–2n**) was also studied by  $H_2O_2$ . All the heterocyclic derivatives (**2a–2n**) exhibited significant antioxidant activity against  $H_2O_2$ . The significant  $IC_{50}$  values are  $0.32 \pm 0.006 \mu\text{g/ml}$ ,  $0.26 \pm 0.013 \mu\text{g/ml}$ , and  $0.14 \pm 0.018$  for the heterocyclic analogs **2a**, **2b** and **2m** respectively (Figure 11 and Table S2).<sup>83,84</sup>

## Conclusions

We have synthesized a heterocyclic derivative (**2a–2n**) and characterized by various spectroscopic techniques. Among all the heterocyclic derivatives (**2a–2n**), derivatives **2a**, **2b** and **2m** exhibited significant antifungal activity against *C. albicans*, *C. glabrata*, and *C. tropicalis*. The binding strength of all three heterocyclic analogs with CT-DNA using various measurements which showed an intercalation mode of binding. A molecular docking study of all heterocyclic derivatives (**2a–2n**) with PDB ID: 1BNA also validates to the experimental studies. Heterocyclic derivatives **2a**, **2b** and **2m** exhibited higher binding affinity. Furthermore, it was also concluded that all the heterocyclic derivatives (**2a–2n**) exhibited significant antioxidant activity against DPPH free radical and hydrogen peroxide. Also, pharmacokinetics studies revealed that none of the heterocyclic compounds (**2a–2n**) violates the Lipinski rule and all the properties are in considerable range for good oral bioavailability.

## **TECH-LIFE BALANCE IS A NEW WORK-LIFE BALANCE OF CURRENT DIGITAL SOCIETY**

**Dr. Samriti Mahajan** (HOD, SOCM)  
**Neha Guleria** (Research Scholar)  
Lingaya's Vidyapeeth (Faridabad, Haryana)

### **Abstract**

The work-life balance is most important concept in the current scenario of rat race life full with competition everywhere. Technology has entered our lives as a boon but converting into a curse as it makes a person less focused to set boundaries for different domains. Now the question arises that whether the working individuals should have focus on the balance of work-life domains, or tech-life domains, because technology itself has made a domain in our lives. While getting comfort by using technological advancements, are the employees able to set time limits of its usage? The current study has focused on the exploration of balance of work and life domains with involvement of technological domain. It also based on analysis of those factors which are responsible for creating imbalance in work and life domains. The data has been collected by telephonic interview from 80 respondents working in private power sector.

**Keywords:** Tech-life balance, Work-life balance, Digital Society, Technology, Work-from home.

### **Conceptual Background**

Technology is playing a vital role since the pandemic came on earth. Social distancing and lockdowns to slow down the virus spread upgraded the people to a new version of digital era. Online delivery of essentials at door step for the accomplishment of routine necessities has only fulfilled because of the existence of the technology. When offices were shut down, people used to work from home and students were supposed to attend online classes. From online payments to online entertainment, the whole world was revolving around the technology. But the concept of work-life balance has added one more dimension of technology to be balanced in a perfect way for better time management and mind relaxation. Work-life balance is a balance between personal and professional lives. Whereas, tech-life balance is about balancing one's life roles and usage of technology while keeping time factor in mind. Technology has made us so vast that we communicate quickly and able to send messages in a fraction of time, which keep the mobile and other interactive gadgets handy with us all the time from kitchen to washroom and balcony to gate. The detachment from technology is less as there is reduction in family communication though everyone is busy over tech-world. Social media is a biggest factor of technology and internet to spend much of the time over there as it is habit of current generation. In such a case, how are working individuals able to spare 'me time', and 'quality time' with family? Though work-life balance and tech-life balance both are of high significance to be maintained for better mental peace and happy life.

### **Need of the study**

The current study is about to explore the factors related to work-life balance and tech-life balance as both the concepts are alarming in the current scenario. There is a need to study the impact of technology on work-life balance of working individuals. There is a required phase of technology usage to maintain proper time management. Technology is not keeping us busy with official work, but also engaged us with social platforms which are followed for entertainment and time pass. The limit of technology usage has not been set by anyone. It has become a democratic factor to use, without any restrictions. The habit of spending quality time among families is depleting from the existence as mobile has overrated and work-family balance counted as underrate. The incompatible demands from work, life and technology domain create work-life imbalance and stem task and time pressure.

## Literature Review

Work-life balance is a significant concept of human resource management (Raiven & Caven, 2011). A balance is required to be maintained and to set a specific limit for work and life domain separately for better mental peace. According to Currie & Eveline (2011), the limit between work and life domain has been blurred since 1980's. But in the current scenario, development ways have been overlapped with technology. The much use of information technology systems has contributed a lot to increase boundary porosity (Hislop & Axtell, 2009). As per a United Nations (UN) report (2013), there are estimated 6 billion people who are having access to mobile phones. The more use of smart phones has made the scenario difficult to analyse work and non-work time of working individuals (Den Nagy, 2014). Particularly, Kahn et al. (1964) has defined separation of work and non-work time that work time occurs specified hours at a designated place while including distance from home. However, work time can occur anytime nowadays (Glucksmann & Nolan, 2007). Technology is enhancing the work performances and productivity of working individuals, but also serving a challenge to work-life balance. Technology has made working people more available anytime and anywhere. The moulding of boundaries has been done by some employees who actually should be segmented from one another to ensure work and non-work lives (Nippert Eng, 1996). The communication modes have changed so quickly with the advancement of computers, laptops, and mobile technology (Chamakiotis, 2014). That saves travel time to talk to someone and sending post mails. It is easy for the employer to be in touch with the employees whenever they are absent or on official visits. Information technology is vital for the workforce, but that creates time pressure and stress to technological and software experts (Teagarden, Meyer, & Jones, 2008). The connectivity between technology usage and time factor is conflicting somehow, as it is complicated. These changes have been impacted employees not only individual basis, but also on the society front and social groups (Wajcman, Bittman & Brown, 2008). The interaction of tech-life and work-life can take many forms like lack of mental presence, relationship conflicts, work-life conflict, and lack of absence from work domain. Various disadvantages have been traced out from the increase usage of technology as it is boosting the expectations of employers and closed ones with a hike in workload which sensed of on duty all the time (Towers et al., 2006). Work-life balance is difficult to gain in the era where notion of work keeps on changing so fast. Work from home portrayed as a problem solver to maintain work-life balance, but it is always contradictory which clearly depends on the number of working hours, whether individuals are extending working hours to the life domain space (Hislop & Axtell, 2007). Long working hours and larger connectivity brought a drastic change in the life of an employee, which further leads the way to allow the different domains interfering with one another's space. As per the border theory, when physical and psychological borders of an individual are best suitable in one domain but not in another one. Physical border includes workplace and temporal working hours, and psychological border is based on the behaviour, thoughts, emotions and technology (Henderson et al., 2014). It is essential part of routine operations to get supported by information system. The changing trends of technology have improved the communication around the globe and created a wider range of choices to opt for work place as remote working (Kornad et al., 2012). The concept of portable computers, mobiles and tablets has made long working hours much possible (Lewis et al., 2005). It represents all time availability of working individuals. Employees has got more flexibility in their location and also compelled to check on official e-mails and notifications (Adkins et al., 2014). Technological advantages are not all the time positive but also increase work-life conflict because of expectation of 24hour availability and this is challenging one to maintain work-life balance (Prasopoulou et al., 2006). In the era of new technology, when work is highly portable, it is highly possible that work domain will integrate with personal domain and occupies home space. If anyone wants no interruptions between different domains, then one should set boundaries for every domain (Ashforth et al., 2000). E-technologies have gone beyond the time and space, and need more management. According to Wong & Ko (2009), there is gradual enhancement in the awareness regarding issues of work-life balance as the various organisations with the adoption of technology trying for the betterment of work-life balance in a maintained way.

Extensive working hour causes mood swings, fatigue and stress that finally lead to impact personal domain in a negative way (Dierdorff & Ellington, 2008). The effects of technology on work-life balance have been studied by Greenhaus et al. (2006). The roles have been described by them that improve work-life of working individuals and opposes all the conflicts between two domains. The use of technology during working hours is much better for job of employees. The use of technology in communication means for the purpose of official work leads to work-life imbalance when it crosses the limit of working hours (Golden and Geisler, 2007). Technology has made the working hours more non-scheduled (Derks & Bakker, 2014). The work facilitated by the technology is progressing into one's personal domain, but it is helpful for those who are working from home. Skilled employees are much benefited with the technological factor rather than low- skilled workers (Fenner & Renn, 2004). Span geographies by collaborative technologies like as video conferencing is the need of the hour taught by the pandemic. To operate in the fast-moving world, technology is must to adopt by the organisations. It opens the way for new opportunities for working individual without any hustle of travelling. Technology has been proven as crucial factor by many studies which influence professional and personal domains. The employees can attain work-life balance by positive potential realization of mobile and internet technology. The development of relevant policies and sustainable workplace is required to support work-life balance (Rahman et al., 2019; Twaronite, K., 2015). People adopt technology to convenient their lives but balance requires with the usage. That does not support in working end but also comfort our personal life. The working style has changed with the change in the technology and there is an influence on the way of working with technology in work and personal domains (Hecht & Allen, 2009). The use of mobile and internet make a difference while accomplishing various roles of different domains with a count of time factor. It is not necessary that combination of work and technology hamper the personal life when cross the set limits. But over expending of time on personal calls and too much emotional dependency of working people creates a misbalance between professional and personal life. High usage of technology during pandemic COVID 19 for online work mode has resulted in techno- overload and conflicts between personal and professional domain (Molino et al., 2020). The technological use is a constituent of stress with stressors like overload, boredom, lack of control and ambiguity (Day, Paquet, Scott, & Hambley, 2012). The technological usage contributes significantly to the consequences of negative predictable stressors (Barber & Santuzzi, 2015). Stress determinants occur because of technological usage impact employees in a significant way harming their self- efficacy, reducing their well- being, and evoking stress reaction (Ayyagari et al., 2011; Srivastava et al., 2015). Cognitive emotional reaction of a person to negative experience based on technology usage involves fatigue, dropping self-efficacy, and anxiety (Salanova et al., 2013). Techno stress is responsible for dropping focus ability of employees, decision making power, and increase the ambiguity sense among them (Aghwotu & Owajeme, 2010). Technology is a boon and curse as it has been clear by various studies. It is impacting life of an employee in a negative way though benefitting him in ways too. Work-life balance is not only based on routine life rather it includes various factors which directly or indirectly impacting lives of working individuals. Technological factor is one of them which is easing the work-life but on the same side consuming much time and all-time availability impacting personal and professional life in a worst way. It causes lack of time for different roles. Technology factor does not affect time schedules but also causes stress and anxiety which need to be handling in a proper way on time better productivity and work performance. Moreover, work-life management is all about time management and stress management.

### **Study Hypothesis**

H<sub>0</sub>: There is not a vital correlation between usage of technology and work-life balance.

H<sub>1</sub>: There is a vital correlation between usage of technology and work-life balance.

### **Research Objectives**

- To explore the relationship between work-life balance and tech-life balance.

- To analyse the impact of imbalanced work and tech on life domain.

### Research Methodology

The researcher conducted a study utilising telephonic interview to gather information in a cross-sectional design in order to test these assumptions. This strategy was adopted to enable the researcher to assess the variables with the least amount of interference.

An extensive review of pertinent literature was used to create a pool of items for measuring each of the constructs. In order to get different managers' and professionals' opinions on a variety of organisational characteristics, a set of questions was created. With regard to remarks made regarding these variables, data was gathered using a five-point scale (1 being strongly disagree, and 5 being strongly agree).

The researcher approached 93 professionals from various private power sector organizations, out of which 85 respondents (91.39 %) were received. The Statistical Package for Social Science (SPSS) software further examined that, as the other questions set were disregarded due to inaccurate responses or results that were duplicated and judged invalid. In this study, there are 63.3% male respondents and 36.7% female respondents. The respondents are asked to rate the correlation between work-life balance and tech-life balance using a predetermined scale based on their own opinions.

The interview was based on following factors:

- Time Management and Time Limit
- e- Training
- Teamwork
- Online monitoring of work

### Statistical Analysis of the Survey

The researcher has tested the hypothesis of study with Pearson's coefficient of correlation to find out the relationship between two variables. The following is the analytical statistics:

**Table 1: Correlation of time factor with work-life balance and tech-life balance**

Pearson correlation coefficient		Time management and time limit
Balancing	Correlation	**0.402
	Significance	0.00
**Correlation is significant at the 0.05 level		

The Pearson correlation coefficient between allocating enough time for work and life while only using the internet or mobile devices when necessary is 0.402 at the 0.05% level of significance, indicating a relationship between time management and the allotted amount of time needed to maintain a work-life balance.

**Table 2: Correlation of variables on the basis of e-training and hybrid work model**

Pearson correlation coefficient		e-training/ online learning
Balancing	Correlation	**0.538
	Significance	0.00
**Correlation is significant at 0.005 % level		

A relationship exists between e-training and online learning to maintain a work-life balance, as shown by the Pearson correlation coefficient of 0.538 at the 0.05% level of significance between

**Table 3: Correlation of variables on the basis of teamwork and supportive co-employees**

Pearson correlation coefficient		Teamwork
Balancing	Correlation	**0.586
	Significance	0.00
**Correlation is significant at 0.005 % level		

At the 0.05% level of significance, the Pearson correlation coefficient between allocating enough time for work and life and only using the internet or mobile devices when necessary is 0.586, indicating a relationship between teamwork and supportive co-employees to maintain a work-life balance.

**Table 4: Correlation of variables on the basis of online monitoring**

Pearson correlation coefficient		Online monitoring
Balancing	Correlation	**0.556
	Significance	0.00
**Correlation is significant at 0.005 % level		

A relationship exists between online monitoring and remote working to maintain a work-life balance, as shown by the Pearson correlation coefficient of 0.556 at the 0.05% level of significance between allocating enough time for work and life while only using the internet or mobile devices when necessary.

As per the above analysis, with significance level at 5% of correlation, all the values are positive which rejects the null hypothesis and accepts the alternate one with the representation of relationship between tech-life balance and work-life balance.

### Discussions and Analysis

To attain the research objectives of this study, it is required to explore both the positive and negative side of work and technology domains which ultimately leads a way towards life domain of working individuals.

*Objective1. To explore the relationship between work-life balance and tech-life balance:*

The relationship between work and technology has lighted during pandemic when because of lockdown and social distancing imposed by all over the world governments to lower down the spreading of virus. In such a scenario, working people supposed to work from home. In such a time, technology is a significant support to work-life balance in different remote or working environment. Empirical research by Popovici (2020) has shown the impact of technology in such a way to maintain better connectivity with colleagues, and work monitoring by the superiors and top management. Socialisation is an important factor for employees and technology ensures it in a perfect manner to increase work-life balance among those who stayed at distance (Dolot, 2020). It enhances team spirit and efficient way to attainment of team goals all set together by online platform. That all is of much value as pandemic depressed the employees in a worst way and make them isolated during lockdowns (Almonacid, N., Calderon, E., Vicente, R., 2020). The factors like job satisfaction and career development also plays a significant role while balancing work-life domain. The aspect of e-training has substantially contributed to career development of employees with emergence of technology and internet usage. It is overlapping the traditional way of training because of some limitations and constraints which declines its efficiency. Online work by technology adoption has increased it significantly in the initial level (Bellmann, Hubler, 2020; Hashim, Bakar, Noh, & Mahyudin, 2020). For career development of employees, e-trainings have paid a vital role to enhance the productivity of working individuals during the pandemic COVID 19 (Wolor, et, al. 2020). It has brought light to some significant factors played a positive role in context with work-life balance such as distance connectivity, career development, online work monitoring, teamwork, and job satisfaction. The fulfilment of all these makes the work domain much controlled with effective work performances, which further brings positivity from work end. Attainment of better balance in all the domains can be done in a way to manage and organise with the help of technology.

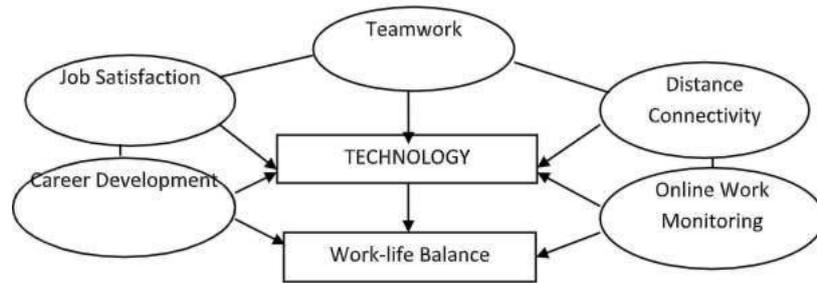

Figure 1. Positive support of technology to enhance various factors at work domain while working online or during pandemic to maintain work-life balance.

*Objective2. To analyse the impact of imbalanced work and tech on life domain:*

The excess and misuse of anything can result in a poor way. A time limit and proper work environment is highly demanded while working online. As it said by Suh Lee (2017), technology intensive online working can reduce the level of job satisfaction. Employee engagement is another factor to have an eye during online working while keeping the record of working hours is another challenge (Pattnaik, J., 2020). Various studies related to social media usage has shown the consequences by describing the way it is spoiling routine working hours (Zoonen, et al., 2017). As the way social media is consuming time of employees or working individuals, it is impacting work-life balance. This is a worst side of technology and internet. There is drastic change in the work system due to the development of internet facilities (Lewis, Gambles, & Rapoport, 2007). With the involvement of technology and human, work and life domains have become more complex. The changing technology is affecting quality of life on daily basis and difficult to balance personal and professional paradigms (Dorrestijn & Verbeek 2013; Haeger & Lingham, 2014).

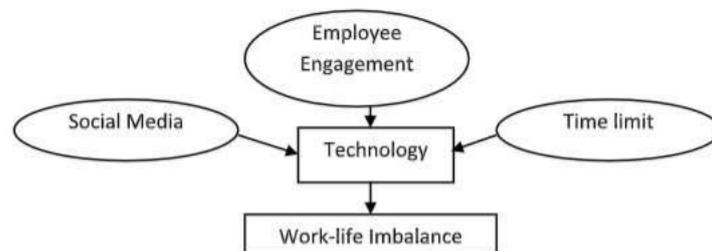

Figure 2. The negative side of technology impacting work-life balance.

### Findings

As per the data collected from respondents by telephonic interview based on some factors and statistical analysis, the following facts have been come into light:

#### *Time management and Time Limit*

Time management requires a way to be better arranged and organised while spending in a routine schedule. With a little effort one can make effective changes not for a day or week but for the months in order if noticed by working individuals (Claessens et al., 2009). The skill of time management will not be attained in a single day. That requires setting priorities for different domains while aware about what is necessary and what not to be done in a particular time. Time is a running factor which never stops, so to manage it, one should have an estimated overview the he or she spending it (Peter, 2002). Efficient time management opens the way of effective work performances while increasing the productivity of working individuals. It further helps to elevate work pressure, anxiety and depression with a good health which set up better work-life balance. Time management stays up to the mark when they follow a particular routine from home to office and office to home. They also complained for distractions while working on mobile and laptops. The random pop-ups and notifications keep them distracting. Some told that their official laptops are restricted by the organisations for using social media, which keeps them focused on work mode during official hours. Restricted to time limit is difficult to follow and they took it casually sometimes.

### *e- Training*

Amara & Atia (2016) has defined e-training as distance training about selected subjects of knowledge and skills. It is about the delivery of various methods and technology usage as a shorter time course to attain a particular goal of learning (Ramayah, Ahmad, & Hong, 2012). While talk about the concept of e-learning and trainings during the pandemic scenario, there is positive impact of technology to achieve career development and better work performances. But with the same as it seems to be difficult to learn more technical and empirical things by listening and watching only. For them offline trainings with practical knowledge were far better. E-training is an important aspect of human resource development and supports in the attainment of organisational goals.

### *Teamwork*

Technology is significant for communication and team meetings. The fact of connectivity and quick interaction is possible because of the vast technology we have. As in such a case some individuals break the time rule to call or text someone. Everyone is having different lifestyle and sleeping pattern. Some are early riser, though others are late going to bed which create a mismatch between their communication timing. But all are agreed with the fact that in case of official emergencies, it is easy to collaborate with the team.

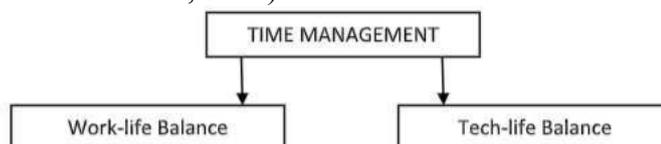

### *Online Work Monitoring and Employee Engagement*

It is easy for the top level, managers and supervisors to monitor the work by video conferences, emails and other online ways. On the other hand, the fact is that sometimes employees fake their presence with the excuses of poor connectivity. Thus, it is not easy to ensure the engagement of employees with work as with the adoption of technology, electricity and internet broad bands are some other factors to be lined up. That creates uncertainty of working hours.

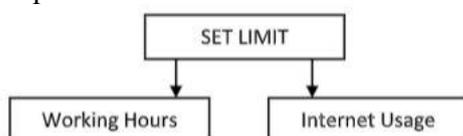

## **Suggestions**

With all the discussions by primary and secondary resources of data, some suggestions have been listed up in this study:

1. It is necessary to have a better control on time factor and routine schedules should be set in a proper way so that there will be better utilisation of time with effective work performance and productivity. This is the factor to keep in mind while dealing with work, life and as well technology domain. Nielson and Randall (2009) have suggested that time management is a method by adopting which one can attain hi/her goals in an effective manner, and will be able modify oneself efficiently for career and job. Time management is a technique to enhance work performance (Claessens et al., 2009).

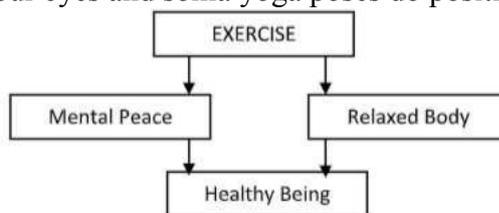

2. There is a need set some limits for every domain. If an individual is spending much time on one, then other will get affected and difficult to maintain a balance among the entire domain. The work assisted by technology enforced an employee to use laptops, computers, mobiles and tablets on remote locations which are carried by skilled working individuals (Fenner & Renn, 2010). That merged the domains and crosses the limits of each domain too. According to Currie & Eveline (2011), there is a shift in work and life domains which has increased the work hours after the office. Technology has fused the work-life balance and equilibrium is required to maintain the same.

3. One should spare some time for exercise or yoga for better health and mental peace. It releases stress also. A tuned body stay ready for all the challenges in routine life. A clear

mind helps to set priorities and keeps better focus on what to do, rather than what not to. Too much screen time affected our eyes and some yoga poses do positive impact on that.

4. Stress is one of the famous factors nowadays working individuals are facing. On a right time, it requires to be settled down for better preparation for the next day. Stress causes by one domain impacted others too. There are different ways to cope up with that without opting for temporary solutions. A stress-free person is much capable of handling various domain roles. Excess use of technology, too much workload, and poor family conditions – all are alarming to stress. Overloaded working hours and family issues impacted the productivity of working individuals and thus overall productivity of a particular organisation (Dogra et al., 2011).
5. Concentration is one of the significant individual factors to be kept in mind. There should be a schedule to get done with a particular task. Technology should be used in an efficient way. Home sickness, emotional dependency, habit of social media, and work performance pressure can distract an individual from the actual space or involvement.

### Limitations of Study

The current study involved various positive and negative factors of work-life and tech-life domains. All the working individuals vary with different psychological patterns and perceptions towards a specific domain and its related variables. Lifestyles and responsibilities are different to different persons. There is a limited and not particular capability of individuals to handle workload, working hour pressure, handling technological changes, family responsibilities, and stress or anxiety levels. Some people seem to be strong emotionally while others not. Such factors lacked to study better in the current research paper.

### Conclusion

This study has taken out the fact that work, life and technology are interrelated to each other in both positive and negative ways. But by controlling some factors, one can get better results in balancing work-life. Tech-life requires some detachment when not in use. It is the fact to be aware about for effective work-life balance. Tech-life is a need of the hour without that no one can survive in the digital era. It has overlapped all the domains at personal and professional ends. But one should not misuse it by wasting time on social media or gaming. A better utilisation leads the way for entertainment, routine needs, and official requirements while keeping time factor and screen time in mind to maintain work-life balance. On the journey of improvement and with perfect balance, one needs a better level of motivation. Motivation is a drive to an individual which supports to attain organisational goals with maximum results (Pancasila, Haryono, & Sulistyono, 2020). Performance has an impact of motivation which binds a relationship between action and behaviour needs that satisfies too (Nguyen et al., 2020). Some people are blessed with intrinsic motivation, but others required external boost up for accomplishment of a task. Without motivation it is not possible to maintain a habit of time management and taking the workload with technological usage.

## IMPACT OF ARTIFICIAL INTELLIGENCE ON APPARELS POST PANDEMIC: REVIEW STUDY OF AMPLIFIED INTELLIGENCE IN H&M

**Ms. Priya Diwan**

Research Scholar, SOCM, Lingayas Vidyapeeth, Faridabad, India

**Dr. Samriti Mahajan**

Assistant Professor, SOCM, Lingayas Vidyapeeth, Faridabad, India

### **Abstract**

Artificial Intelligence and industries are going hand in hand. Technological Advancements wherein simulation of machines and human intelligence is providing avenues for innovation and furthering technologies based on AI and AI driven processing. The apparel and fashion industry is evolving faster than words and top companies' ideation and innovation techniques like flywheel marketing, circular fashion economy has come up with wider experience in customer satisfaction, demand forecasting, product designing and sustainability. This is an exploratory paper based on primary and secondary research methods. We develop a conceptual model that shows the relation between AI tools, Human Intelligence tools, Data science tools, Amplified Intelligence and Apparel Industry which in turn leads to sustainable shopping experience. At present, there is little empirical evidence of the impact of technology in the apparel industry. PLS-SEM was used to analyze 150 survey responses to examine the research gap. The results confirmed that all hypotheses were accepted except 2. Hence, this paper shows an effort of researchers to undergo empirical study of AI investment in H&M, AI tools & Techniques in consumers shopping experience, environmental sustainability and amplified intelligence of H&M in social culture development.

**Keywords:** H&M Amplified Intelligence, Artificial Intelligence, Apparel Industry, COVID 19, Sustainability

### **Introduction :**

Fast Fashion and hybrid retail are the buzzwords that describe the Apparel Industry 4.0 trends (McKinsey 2021). The apparel and fashion industry is evolving faster than words and top companies' ideation and innovation techniques like Artificial Intelligence Tools Augmented reality (AR) and Virtual reality (VR) in circular fashion economy has wider experience in customer satisfaction, demand forecasting, product designing and sustainability (Techpacker 2021). According to luxiders (2021) sustainable apparel is a journey to sustainable fashion. Impact of Artificial Intelligence on apparel Industry 4.0 has shown a complete turnaround in experiential shopping and consumer purchase behavior (McKinsey 2021).

Fashion and Apparel is one of the biggest industries, contributing 2% of global GDP in the world economy (IBEF 2021). The word fashion encompasses everything in formal or casual fashion from the outfits that come together to the individual clothes that make it up. Today, where Artificially intelligent tools are considered necessity for experiential shopping, AR and VR are the techniques of AI have reshaped and redefined the apparel structure in Industry 4.0. (Bisen, 2020) These are the grooming tools of AI that significantly boomed up the customized buying and purchasing behavior in consumers (Bisen, 2020). They are used as digital assistants to recommend clothing and styling to customers based on their demographic facts i.e. color, height, weight, shape, and size. According to Maghan (2021) from Vogue Business Report AR clothing or try-on is a feature that creates a 3-D clothing which will automatically

appear on a person as and when the person moves (just like the concept of snap chat filters). When the body of a consumer moves the item also reacts in sync, measurements and environment appears to be realistic. On the other hand, Virtual Reality is used by top fashion designers to help consumers get a realistic sensation of being present in famous fashion shows just with the help of a VR headset and virtual fashion software. VR does assist in virtual visit view or even try on the collection. When we derive value from artificial intelligence, the key factor is not algorithms, nor technology — but it is the human in the equation,”(Sean Lang 2021) and H&M has evolved the customer experience combining AI and Analytics with human intelligence in use as “Amplified Intelligence”. This paper is a on the world's largest fashion retailer Swedish brand Hennes&Mauritz (H&M) who started its journey in 1947 with women's clothing under the name Hennes, further adding to the collection of men’s apparels in 1964 and then, the name was changed to Hennes&Mauritz.

ErolKoolmeister, the product Area Leader AI foundation H&M, at Data Innovation Summit 2019 said in his talks that they already started adopting AI into his retail business in 2016 and in order to stay relevant they need to move online. In 2018, H&M brand came up with a new mobile app and online platform. With the help of AI, it is able to deliver to its customers as per the demand predictions by applying it to RFID generated data tags.

COVID-19 in China (Dec 2019), created havoc throughout the world. Baldwin and Freeman (2020) presented a triple hit of COVID 19 on the global value chain of apparels i.e. disruptions in direct supply, supply chain contagion and global demand. Consumer behavior started to move towards digitalization and social networking (Nowland, Necka 2018). Retail locations were changed to retail-as-theatres with touch screen interfaces and holographic enchantment mirrors (Priya, 2020). Jennifer (2020) suggested few policies to be implemented like supporting technology adoption and skills development to mitigate the post COVID 19 effects on the apparel sector.

Though from the above discussion it is clear that AI initiatives have been taken long back at H&M but, when COVID 19 hit the globe, H&M like other brands was forced to close down 80% of its outlets because of high rent and other miscellaneous expenses as per Elizabeth Mixson (2021). If it had not built up its digital infrastructure previously, it would have surely gone bankrupt. In the words of Helena Helmersson (C.E.O H&M, 2021), post pandemic more of such digital transformation initiatives and investments are being made for sustainability targets and focus on enabling a transition towards a circular business model to overcome the crisis.

## **Literature Review**

### **2.1 Artificial Intelligence**

AI is defined as a field of engineering and science that focuses on computational understanding of intelligent behaviour, along with the making of traces that exhibit such behavior (Ramesh, 2004). AI technology has also been applied in the field of surgery, medicine etc for diagnosing diseases with computer analysis, making of therapeutic decisions and predictions of outcome. AI is also being used in education for solving a major problem by creating a system that is as effective as human one-on-one tutoring (VanLehn, 2011). AI tools like machine learning, deep learning and predictive analysis are intended in a way to increase planning, thinking, reasoning and decision making ability (Jahanzaib, 2018). Jarek (2019) said that AI is even used in marketing field now, though at the operational level. It also influences marketing mixes, impacts consumer delivery value and marketing organization and management.

AI started in the form of a computer in education industry and then transitioning towards a online-based intelligent education systems then finally into humanoid robots and web-based chatbots (Chen, 2020). As per Sebastian (2021), if organizations adopt a perspective of working with automation (machines takeover a human task) and augmentation (humans collaborate at a closer level with machines to finish a task) both it could reduce tensions and be beneficial for the business and society both. According to David (2021), the use of AI has increased during COVID 19 times and later. Various online digital platforms have been created which show the number of active cases worldwide, whether any positive patients have come in contact, identify and isolate covid positive patients etc... Machine Learning (ML), which is a part of AI, can be used for developing drugs against COVID 19, helps to develop vaccines, distribution of vaccines and monitor the vaccinated people.

## **2.2 Technology and Apparel**

H&M Group is optimally utilizing AI to achieve a positive value chain and sustainability by 2040. The global clothing retailer brand uses AI-driven calculations for demand prediction to optimize the supply chain, as said by Linda Leopold (2021), head of AI at H&M. According to Trieu (2020) Industry 4.0 race convinces all domains and industries to integrate digital technologies like IOT (Internet Of Things), RFID (radio-frequency identification) (Denuwara, Maijala, 2019), robots, AR (augmented reality), additive manufacturing (Khorram, Torrabi, 2019), cloud technology and big data. These techniques are considered as foremost measures for sustainability in the apparel industry. The era of manufacturing, where hardware and softwares are considered as critical elements of the production process is what we talk about in industry 4.0. As per Navodya (2019) the RFID technology in apparel industry is focusing on sustainability and giving benefits related to economies and efficiencies. Social sustainability of AI in product design (Lee, 2021) has enhanced the social culture of the apparel sector. Such benefits make it more competitive than others in the market. This leads to the impact of technological advancements on industrial sectors, distributors, suppliers, customers and potential new entrants (Porter, 2001). Technological revolution is the game changer of three pillars of sustainability i.e economy, environment and society (Nilima&Ravinder, 2017).

As per Ana (2006) smaller the size of the firm, greater is the possibility of using an external internet technology device because of less managerial abilities in the organization. However, VenuVarukolu (2008) studied the apparel sector and found that the Internet being the most widely accepted and adopted technology whereas robots were the least adopted. Also, the level of technology adoption for apparel manufacturers was directly related to the size of the firm and inversely related to export orientation.

A study was done by Jing Sun and Ting Chi (2018) that showcased a few factors like ease of usage, perceived usefulness, past non-store shopping experience and compatibility positively affects the shopping behavior of Chinese customers who opt for m-commerce transactions. Supporting this study, they constructed a consumer apparel m-commerce adoption model by way of merging both m-commerce and e-commerce theories. This trend clearly shows that the level of adoption of technology has evolved through years to come i.e. from Internet to e-commerce to m-commerce and RFID and then Artificial Intelligence. Finally paving the way to Amplified Intelligence in the apparel industry.

### **2.3 Amplified Intelligence**

As per the article in Deloitte (Forrest, 2015) on Tech trends in 2015, the usage trends show that Amplified intelligence is still in its early days, but there is a huge potential in every domain. According to PRNewsWire (2017), Amplified Intelligence is the process by which artificial intelligence is used to supplement human intelligence in making sound decisions and judgements. It creates the potential for an organization to work in a significant operational efficient manner and have competitive advantage in the market. The intelligence community is now able to inspect the world over texts, emails and calls to identify the possible location of terrorists. The medical industry is very well capable of analyzing billions of web-based links to analyze and predict the spread of a virus. Also, farmers are able to use collected data via their own equipment, from each and every foot of their plantation, to increase their crop yields. Companies in the domains of accounting and law can allow their frontline employees to harness research, case histories and diagnostics, which would help to a great extent for the practitioners with expertise to know about the knowledge of their organization's practices and with the clinical, academic and practical experience.

Even for the Information Technology department of the world, amplified intelligence is offering a big chance to emphasize its role in the broader data analytics journey and directing the advances toward real use cases with measurable impact. Amplified intelligence is creating a buzz and is becoming critical for achieving competitive success in the economy or even around the globe. USA-based companies like Uber have to use big data to match their passengers with their car services. European based grocery-company like Tesco leverages big data analytics to capture the share of sales from new parents and families.

#### **Research Gaps**

Undergoing Systematic review of literature, the researchers were able to identify the research gap that very few studies have been done on the impact of AI on apparel industry giving rise to the research questions and evolving objectives of this study. Amplified Intelligence is the only measure for structured data integration, human and artificial intelligence to support all industrial stakeholders in decision-making. Despite such importance of Amplified Intelligence, there is a lack of theory development that has resulted in ambiguity in the relationship with Apparel Industry.

#### **Research Model**

With technology growing faster than ever before, the future of Artificial Intelligence, amplified intelligence and Data Science is even more interesting than what is happening now. The model shows impact of all such technologies and Human Intelligence Tools on the Apparel Industry.

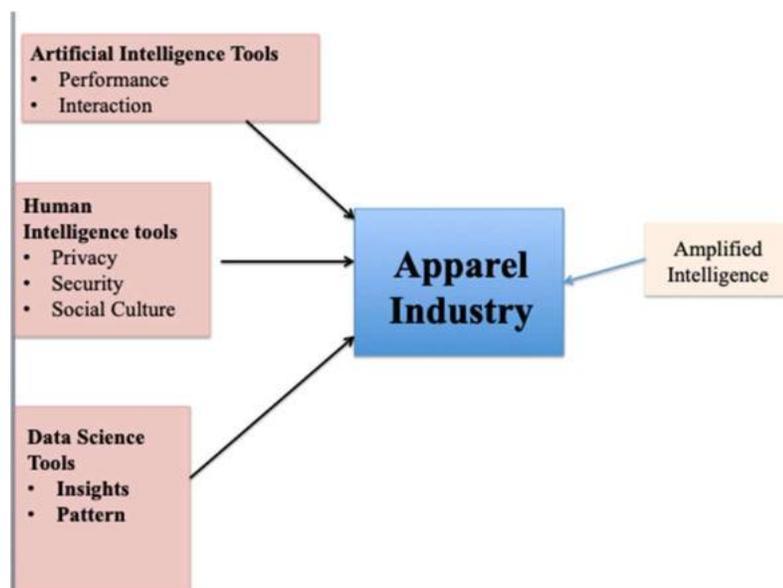

Fig. 1

## Research Objectives

1. To study the impact of Artificial Intelligence, Human intelligence & Data Science (Tools & techniques) adopted by H&M in consumer's better shopping experience.
2. To study the level of sustainability of H&M with AI (Amplified Intelligence) during pandemic.

## Methodology

Undergoing the key aspects of the pandemic that is changing the scenario of Apparel Industry, the main aim of the paper is to study and identify the impact of Artificial Intelligence and Amplified Intelligence on the Apparel Industry.

At the initial phase of study we analysed that the impact of Amplified intelligence i.e Artificial & Human Intelligence in coordination with Data science during and after COVID 19 pandemic that has changed the market structure and shopping experience have accelerated the online purchasing behavior on whole. The research design is descriptive and empirical data is collected via purposive sampling through a structured questionnaire of 150 respondents who shop from H&M brand online or offline. To ensure the reliability and validity of the research instrument pilot test was conducted on four sets of administered research questionnaires on specific domains of the apparel industry like manufacturing, distribution, warehousing and buying & merchandising. Swedish Brand H&M is the case study of current paper who has invested in Amplified Intelligence tools & techniques.

## Hypotheses Development

Artificial Intelligence Tools & Techniques (AR/VR/Rfid/IOT) concerns two constructs: tools performance and interactions. Tools (Rfid and IOT technology) include lack of transparent recommendation process (Mitchell,2019) complex interactions, safe and secure transactions. Human Intelligence (Digital Assistants/Chatbots /Robots) concerns three constructs: privacy concerns, security mechanisms, social Ethics.As ethical concerns are related to trust factors between AI-tools & consumers, regarding personal information and accountable compatibility of machine - human values with technology (DwivediHughes,Coomb 2019). Data science concerns two constructs: Data insights and

Data patterns. All these are considered as independent variables along with Amplified Intelligence. So, in this study the following hypothesis are proposed with Apparel Industry being the Dependent Variable:

- H1: Technical performance of AI tools have a positive impact on the Apparel industry.
- H2: Consumer interaction by AI tools have a positive impact on the Apparel industry.
- H3: Human intelligence tools significantly impact privacy while doing online apparel shopping.
- H4: Human intelligence tools significantly impact security concerns to personal accounts while online apparel shopping.
- H5: Human Intelligence tools impact social culture while doing apparel shopping.
- H6: Data insights from data Science tools impact apparel fashion industry
- H7: Patterns from Data science tools impact apparel fashion industry
- H8: Amplified Intelligence tools significantly reduce online shopping sustainability.

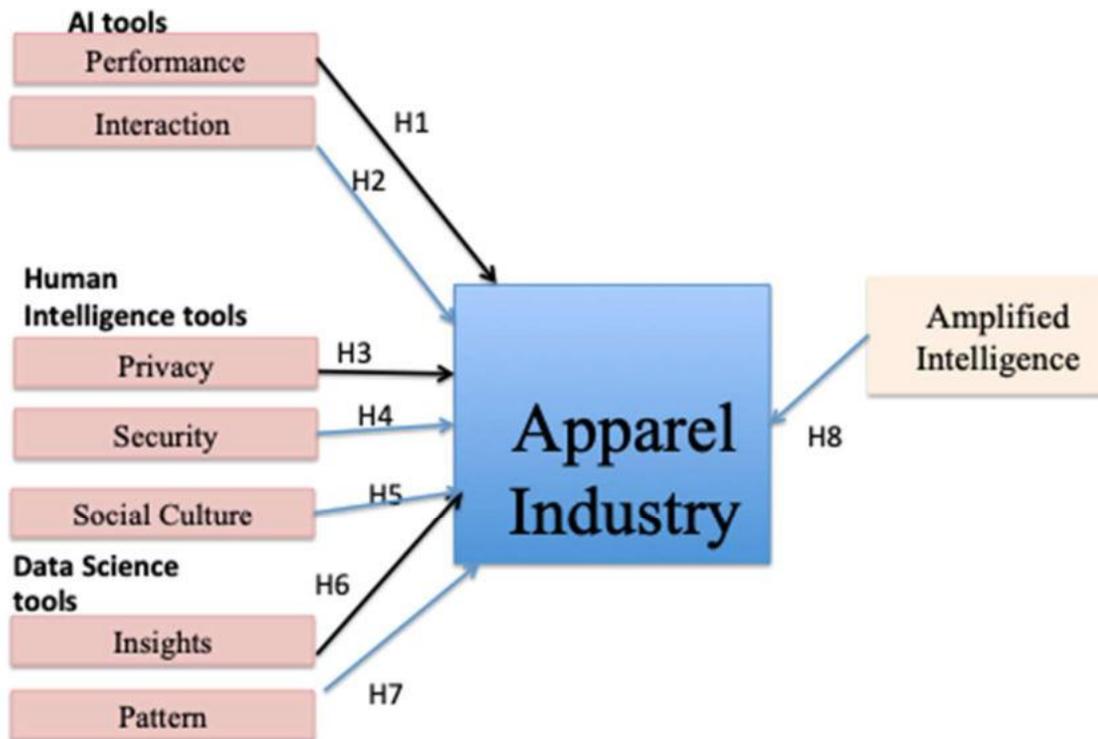

Figure3: Hypothesis Model of Research Framework

### Data collection

In this paper, the empirical data is collected via purposive sampling through a structured questionnaire of 150 respondents who shop from H&M brand online or offline. A self-managed survey in Google Structure was ready for essential information assortment to guarantee that shoppers/respondents totally appreciated the unique circumstance. Also, maintaining the emphasis on the review a circumstance was depicted in which people have the choice of utilizing AI-based instruments while selecting H&M quick style items. The advanced aides collaborate while buying, independent direction, and ongoing decision

making (AR/VR innovation).

### Data Analysis and Interpretation

As the review was intentional so reactions from ideal interest groups were limited. As referenced in the exploration model, the quantity of inert or noticed factors expected size (0.3), the likelihood esteem (0.8), and critical insights ( $\alpha = 0.05$  and power  $\beta = 0.95$ ), on the base example size of 150 in the design model. A satisfactory review shows 127 examples could decrease conceivable testing blunders and limit Type II mistakes. Thus, to test the theories inside a Structural Equation Modeling (SEM) system information is examined with IBM SPSS AMOS (form 26) in this review. Measurable investigation showed ordinariness was assessed and worked with fair and predictable models to display the attribute, with conveyances of information. Hair and Black (2006), expressed balance with skewness and kurtosis with the peakedness of dissemination. Consequently, ordinariness suspicions investigated every one of the developments utilized in the model. Testing of the build measures showed a skewness range from  $- 0.068$  to  $0.003$ , and a kurtosis range from  $- 1.192$  to  $- 0.216$ . These discoveries showed every one of the qualities falls inside the given reach and most extreme adequate levels (2) for skewness and (7)for kurtosis tests (Bansal,Gefen,2010).

**Table 2. Scores of Convergent Validity**

Confirmatory Factor Analysis (CFA) was done on the nine builds to evaluate the estimation model for approving the study instrument (i.e. poll). A concurrent and discriminant legitimacy test was attempted by SPSS AMOS (ver.26) in the paper. Normalized factor loadings, composite dependability, and the Average Variance Extract (AVE) were inspected to test (Gefen, Straub, 2010) merged legitimacy. Table 2 addresses the Convergent Validity Test Scores. Composite dependability scores similar with the edge worth of 0.7, featured the sufficiency for the unwavering quality of builds (Fiske, Heningson, 2019). The measurable normalized factor loadings were more prominent than 0.7 score in this review, which was OK Hair and Black (2006). Further AVE of each development was assessed utilizing normalized factor loadings. Measurements of the AVE were additionally more prominent than 0.5 scores, the base prerequisite. (Gefen Straub, 2018).

Construct	Mean	SD	TP	TI	TPC	TSC	TSE	DI	DP	TR	TB	SE
<b>TPerformance</b>	3.48	0.99	<b>0.845</b>

Subsequently above discriminant legitimacy scores approve the prerequisites of the satisfactory exploration model in this examination paper. Since the relationships between's developed measures were not exceptionally huge, the Variance Inflation Factor (VIF) and resilience esteem for the indicator factors were determined by multicollinearity check. The indisputable VIF scores were somewhere in the range of 1.79 and 2.64, very underneath the cutoff worth of 5, while the resilience scores were somewhere in the range of 0.55 and 0.37, i.e higher than the edge of 0.1 (Hair and Ringle 2011). Further to check in the event that the normal strategy inclination would be a problem(Cenefetelli,2008), Harman's one-factor test was embraced with build measures. It at long last reasoned that develops could represent 85.40% of the complete difference, and the elements were generally not noticed for covariance among build measures (< 15%). Thus, normal technique predisposition was found as a non-critical danger.

**Results (Descriptive statistics)**

**Table 4** portrays the Respondents' control trademark factors. The segment attributes show that the significant respondents were understudies (65.7%) and youthful representatives (66.5%). The sex was similarly dispersed with guys (45.1%) and females (58.9%). 66.1% youthful respondents between the 25-40 age bunch. 65% yearly pay among 25,000 and under 50,000. 41% responded familiar with AI tools of other sectors not fashion apparel (such as financial decision making), moderately, only 55% were familiar with AI-Apparel tools. Only 23% used an AI enabled Fashion apparel support services (such as AR/VR/RFID/IOT), and 60% were not familiar with the Amplified intelligence of H&M.

<b>Control Factors</b>	<b>Characteristics</b>	<b>Percentage</b>
Gender	Male	45.1
	Female	58.9
Age Group	15-24	42.3
	25-34	63.7
	35-44	65.8
	45-54	52.9

	Agree	38
	Strongly Agree	42
Is an AI based H&M fashion apparel environment a sustainable brand ?	Strongly Disagree	27
	Disagree	25
	Agree	38
	Strongly Agree	42
Is automated technology driven retail more sustainable at H&M?	Strongly Disagree	20
	Disagree	16
	Agree	38

	Strongly Agree	44
Is Data Insights and the pattern of smart Manufacturing ,Warehouse management , SCM & CRM at H&M working towards a sustainable apparel industry?	Strongly Disagree	23
	Disagree	22
	Agree	42
	Strongly Agree	49

### Structural model

Theories testing was additionally done in SPSS AMOS (form 26) inside an SEM system. As indicated by (HO,2006), the decency of fit measurements can assess the whole primary model and survey the general attack of the examination model.

It was critical that the measurable Chi-square worth ( $\chi^2/df$ ) was 2.24. The file scores for CFI = 0.91, NFI= 0.92, RFI = 0.91, and TLI = 0.92 were above 0.899 and the SRMR = 0.05 and RMSEA = 0.06 were underneath 0.08( Byrne, 2001). The score of AGFI was 0.91 that surpassed 0.90. All factual means were a solid match and in the adequate reach, with the exception of GFI = 0.83 which was minimal. Four of the measurable scores determined the base suggested qualities (Kline, 2015), supporting a solid match between the theorized model and the noticed information. Figure 2 shows the primary exploration model of standard way coefficients being scrutinized. The speculation testing scores are classified in Table 5.

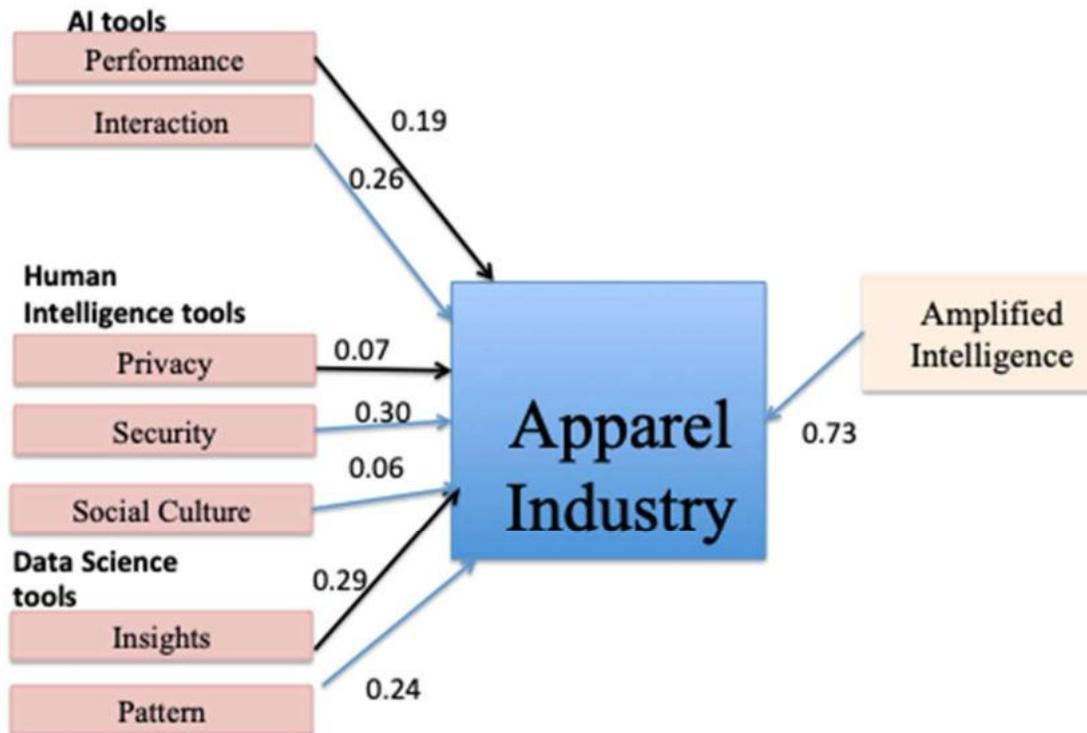

Regarding AI-based design devices, the insights acknowledge H1 by the critical positive connection among execution and attire industry ( $\beta = 0.19, p < 0.001$ ). The measurements in all actuality do acknowledge H2, where communication impacts the clothing industry ( $\beta = 0.26, p < 0.001$ ). Be that as it may, in Human knowledge concerns, H3 was dismissed, where protection concerns don't essentially add to shopping in attire ( $\beta = 0.07$ , non-critical way). H4 is acknowledged where security worries in AI systems altogether lead to more serious dangers while doing web-based shopping of attire ( $\beta = 0.30, p < 0.001$ ). H5, where social morals don't altogether affect the attire business, is rejected( $\beta = 0.06$ , non-critical way). As to information bits of knowledge and information designs, the examination likewise exhibits that partners i.e buyers, inventory network the executives, and (SCM) Customer relationship the board emphatically impacts the clothing business ( $\beta = 0.29, p < 0.001$ ), consequently acknowledges H6 and H7 ( $\beta = 0.24, p < 0.05$ ). The discoveries likewise give sufficient proof to acknowledge H9 by showing more the advantages related with Amplified Intelligence ( $\beta = 0.73$  and  $p < 0.001$ ).

### Discussion

With the promising chances made by Amplified Intelligence innovation (like AR/VR/IoT clothing emotionally supportive network ), the inquiry emerges when AI apparatuses will be business as usual? Artificial intelligence installed shrewd gadgets democratizes Fashion Apparel by bringing AI-empowered clothing administrations (like AR and VR) into the existence of customers (Zandi, Vayena Goodman 2019). In any case, a few worries connected with the utilization of AI should be tended to. Due to the affectability and oddity, the effect of AI apparatuses in style clothing might include an elective methodology with more grounded forecast power than existing models of instruments and innovation acknowledgment.

<b>Table 5 Hypothesis testing Scores</b>				
<b>Hypothesis Path</b>	<b>Standard Path Coefficient</b>	<b>S.E</b>	<b>CR</b>	<b>Results</b>
H1 Performance-> Apparel Industry	0.19***	0.04	6.24	Accepted
H2 Interaction-> Apparel Industry	0.26***	0.04	5.03	Accepted

H7 Data Patterns-> Apparel Industry	0.24*	0.09	1.89	Accepted
H8 Amplified Intelligence-> Apparel Industry	0.73***	0.45	6.27	Accepted
<b>Risk R2:0.67</b>				

**Figure 2**

### Findings

Findings of the research paper provide that AI has taken a competitive edge and is helping the Apparel Industry revive post-pandemic, in a big time. AI tools like automated warehousing, data insights, predictive market demand, algorithmic purchase patterns, one day delivery are playing a significant role in enhancing the social culture and overcoming the sustainability in Fashion and apparel sector in the market. The paper has seen the high transition in the sector from a sharp fall down in pandemic to a steep revival post-pandemic with Envirotech measures in the industry. Artificial Intelligence tools AR/VR/Rfid/IOT accessibility (i.e., performance and interaction) are the significant indicators of transaction issues, social interaction and security & privacy concerns. Human intelligence tools (Digital assistants & Chatbots) are significant indicators of privacy risk associated with personal information, security of personal accounts and social ethics. Data science tools are significant predictors of data insights and pattern recognition in SCM/CRM/automated warehouses and demand production. Except H3 and H5 all the hypotheses were accepted. Respondents risk AI performance (H1) and AI Interaction (H2) at the same time distrust AI's personal recommendation privacy and security (color, size, style) for clothing and financial Transaction (H3 & H4). Social ethics are at risk (H5). Research structure models are acceptable (80%), and being useful for future studies adding economic factors to increase exploratory context.

### Conclusion

Widespread implementation of Amplified intelligence tools and techniques has fundamental changes significant effects on the apparel industry. Artificial Intelligence is an integral element in demand for

every business model, and human factors are integrated with AI strategic components for business, in apparel fashion institutions. Study analytics demonstrate category concerns with Amplified Intelligence i.e Artificial Intelligence Performance and Interactions efficiently and effectively exhibit the shape and structure of apparel industry in coming years. Human Intelligence concerns i.e Privacy & Security in AI mechanisms, socio-cultural ethics, while only security significance to risk in AI based tools. Data Science tools concern data insights and data patterns directly contribute to risk AI in smart manufacturing, supply chain, and customer relationship management adding value to retail analytics of the global fashion retailer H&M. We suggest AI researchers conduct further studies on Fashion and Apparel perspectives. Factors such as economic (Financial variables) and organizational challenges (catering to the general mass), to be taken in a research model concerns a sufficient budget about the technology to make a decisive action.

### Limitations

Apparel industry has seen tremendous rise in business just after the AI investment and found significant relationships in Amplified intelligence tools and customer experience, sustainability and social up-gradation. Though the findings were very enthusiastic to raise the profitability margin but at the same time question mark to consumer privacy as personal demographic factors are on the board, the employment rate is slowing down, adaptability to Gen Z is tough and cost to pocket. Big players in the market do have to think about the pocket friendly measure between AI tools and society at large. Big question to various software like branding compliance have arisen in the market. Also, Intellectual Property Rights have become a major limitation for developing countries like India etc.

**Dr. K K Garg**

Guide and Professor Lingaya's Vidyapeeth, Faridabad.

**Dr. V S Somanath**

Professor Emeritus

### **Abstract:**

As one of the most essential energy sources in our nation, crude oil is also one of the most important Imported goods. India imports around 84% of its total Crude oil needs. This clearly illustrates the extent to which fluctuations in crude oil prices effect our economy. The energy industry is one of the most volatile industries, and energy dependence is substantial. Additionally, crude oil is a significant commodity traded on the commodities market. Considering all of the aforementioned variables, fluctuations in the price of crude oil have a significant influence on the nation's economy as a whole, making crude oil forecasting a necessity. This study analysed data from 2000 to 2021 to develop a very accurate predictive model. In addition to crude oil prices, macroeconomic indicators such as gold prices and dollar exchange rates have been collected and evaluated using ARIMA model.

*Key words: Crude oil, Gold, Dollar, Fluctuation, prediction, ARIMA model.*

### **Introduction:**

Crude oil is one of the vital energy sources that serves as a gauge of a nation's economic health. India is reliant on crude oil imports for more than 80 percent of its crude oil requirements. In 2016, India imported over 84% of its crude oil and petroleum products. India purchased crude oil worth around US\$77 billion or 239 million metric tonnes (MT) in 2020-21, representing more than 19 percent of the country's total imports. In 2019–20, about 85 percent of the demand for petroleum products was met by imports. Petroleum constituted twenty-five percent of India's total imports, with a gross import volume of around 270 MT valued at US\$119 billion. This is a huge increase compared to 2006–07, when imports of around 145 MT accounted for over 77% of consumption.

### **Classification of Crude oil:**

Throughout the world, oil is extracted. Brent Crude, West Texas Intermediate, and Dubai and Oman are the three primary crude oil sources that serve as standards for rating and pricing other oil suppliers.

Brent Crude is a blend of 15 unique North Sea oil sources situated between Scotland and Norway. The bulk of Europe receives oil from these sources. West Texas Intermediate (WTI) is a lighter

oil that is produced mostly in Texas, United States. It is of the finest quality and is "sweet" and "light." WTI supplies much of North America with crude oil.

Dubai crude, often popularly referred to as Fateh or Dubai-Oman crude, is a light, sour oil produced in Dubai, United Arab Emirates. Recent oil production has begun in the neighboring country of Oman. Oils from the Persian Gulf that are mostly exported to Asia are priced relative to Dubai and Oman crudes.

It is believed that the United States has the largest oil reserves, followed by Russia and Saudi Arabia. According to a 2016 survey, the numbers for the top 10 nations are presented in the table below.

Country	Estimated oil reserves (Billions of barrels)
United States	264
Russia	256
Saudi Arabia	212
Canada	167
Iran	143
Brazil	120
Iraq	117
Venezuela	95
Mexico	72
China	59

Recently, oil consumption in growing economies such as China and India has surged. This tendency is anticipated to continue, but at a slower rate (EIA, 2008). Over the last two decades, oil price fluctuations have undergone significant changes, including the introduction of new oil producers such as Canada, Alaska, and the North Sea. Moreover, the rise in oil prices has made certain oil wells commercially feasible. On the supply side, East Asian countries such as China, India, and Malaysia are expanding rapidly. China has surpassed the United States as the world's second biggest oil consumer, reflecting changes in the composition of the demand equation. New environmental restrictions have also promoted the use of light oil, which contains less Sulphur. These regulations have increased the strain on refinery utilisation. (2018) (Hamza & Alredany).

Recent emphasis has been focused on the volatility of crude oil prices, since crude oil is the most strategic and traded commodity on the planet. Oil-producing nations, oil firms, individual refineries, oil-importing nations, and speculators engage in international crude oil trading. (2015) (Bildirici & Ersin). Although the price of crude oil is mostly driven by supply and demand (Hagen 1994; Stevens 1995), it is also affected by a number of irregular occurrences, including stock levels, economic growth, political considerations, political instability, OPEC actions, and traders' psychological expectations (Yu et al. 2008). It is well acknowledged that oil price volatility has a substantial influence on economic activity. Commodity market prices change in lockstep with the rise and fall of the oil price, therefore any dramatic spike or reduction in oil prices causes an economic slowdown and price variations for other commodities. Consequently, projecting crude oil prices is a crucial field of study, and modeling/forecasting oil prices is hampered by intrinsic challenges such as excessive volatility (Wang et al. 2005).

Due to the fact that crude oil spot prices are often seen as a nonlinear and nonstationary time series that is impacted by a number of variables, it is rather challenging to properly anticipate crude oil prices (Yu et al. 2008). While oil prices may not always react instantly to fresh information, limited liquidity and infrequent trading on imperfect markets may result in a delay (McMillan and Speight 2006; Monoyios and Sarno 2002; Lee et al. 2008). When big worldwide political and economic events occur, such as changes in government policies, geopolitical dangers, investor attitude, and natural catastrophes, structural changes in oil prices and, subsequently, panic indexes adopt a nonlinear connection. 2019 (Lin, Liang, & Tsai).

The conditional variance of oil returns demonstrates time-varying volatility. The evidence for unequal effects in conditional variance is contradictory. There is no indication of risk-reward trade-offs. There is evidence that the conditional standard deviation is a more accurate estimate of the volatility of oil returns than the conventional conditional variance. (2010) (Mohammadi & Su). Numerous economists, practitioners, and analysts are intrigued by the current fluctuations in the stock market; they strive to understand the fundamental reasons of these huge swings, which cost the economy roughly billions of dollars. The key factors of the stock market are the interest rate, currency exchange rate, and oil prices in particular. (Ahmed, n.d.)

### **Crude Oil Import Scenario of India:**

- In December 2021, the average daily crude oil imports into India were 4,243.758 barrels. In December 2020, the previous peak of 4,033,050 Barrel/Day was attained.
- From December 1980 to 2021, annual data on India's crude oil imports indicate an average of 1,557.335 Barrel/Day.

- In 2018, the statistics reached an all-time high of 4,543.634 Barrel/Day and an all-time low of 278.073 Barrel/Day.

Eighty-four percent of India's crude oil requirements are covered by imports, and this proportion has continuously increased over time. Too great is the disparity between domestic demand and output. The majority of India's oil imports originate from Iraq and Saudi Arabia in the Middle East. India Imports Crude oil from various parts of the world, they are:

- Middle East – 52.7%
- Africa – 15 %
- United States of America - 14%

### **Research gap:**

After analysing prior research, it is clear that changes in economic indicators have a major influence on crude oil prices. Numerous financial time series have leptokurtic distributions, large tails, and nonlinear conditional volatility. This trait reduces the predictive power of traditional models like the ARCH and GARCH models (Bildirici, Melike).

A little amount of research has been undertaken to demonstrate the similar association between the Indian crude oil basket price and the price of crude oil. Insignificant research has also been conducted to determine the worldwide elements driving fluctuations in the Indian basket crude oil price. In other words, the Indian basket crude oil price benchmark has garnered minimal attention, similar to other international crude oil price benchmarks. This research aims to discover the elements that cause fluctuations in the price of Indian basket crude oil. As a consequence, it contributes originality to this area of study. Crude oil prices are sensitive to changes in other significant macroeconomic indices, such as the gold price, the US dollar to Indian rupee exchange rate, the Gross Domestic Product, the SENSEX, and the NIFTY. This study employs Univariate analysis to examine the relationship between significant macroeconomic indicators and crude oil prices over the medium and long term. Which in turn aids the research in determining the feasibility of crude oil price predictions after accounting for the impact of economic factors on the commodity.

### **Statement of Problem:**

Revenue and expenditures are the lifeblood of every economy, and they may be brought in via several means. Income is often broken down into two categories: taxable and nontaxable. Forex, gold prices, stock market indexes, GDP, and crude oil prices are all examples of macroeconomic factors that affect the economy. These metrics show a statistically significant positive correlation. To help reduce price volatility in the future, this research builds univariate and multivariate models to predict crude oil prices and aims to establish a linear link between these factors.

Businesses that depend on crude oil, commodities speculators, and investors may all benefit from accurate price predictions due to crude oil price forecasting. The availability of crude oil is essential to the prosperity of every country. All of the country's macroeconomic indices are

affected to some degree by it. The results of this research will help us estimate the long-term and short-term consequences of rising crude oil prices on key economic variables including the US dollar/gold exchange rate.

**Objectives of the study:**

- a) To analyse the impact of Macro Economic Indicators on Crude oil Price
- b) To forecast the Crude oil prices by considering Macro economic indicators.
- c) To interpret the forecasted price of Crude oil.

To draw the significance and to forecast crude oil price this study has adopted predictive analysis. The data has been first tested for Multiple Linear regression which runs on mean difference has high Multicollinearity within the variables hence further Quantile regression test has been tested. This study for analysis and prediction purpose has considered Crude oil as dependent variable and Macro Economic indicators such as Forex (US \$), Gold Price, Sensex, Nifty as these Indicators will have high impact on Crude oil prices.

Initially study has considered Descriptive Statistics and Correlation to check linear relationship among the variables.

**Descriptive Statistics:**

	Crude	Dollar	Gold
count	252.000000	252.000000	252.000000
mean	63.224118	54.157738	1870.536997
std	28.870070	10.678496	1133.994996
min	18.240000	39.195000	386.299579
25%	40.587875	45.643750	663.840979
50%	60.443794	48.690000	1989.640592
75%	78.345516	64.486250	2718.265889
max	132.471248	75.590000	4726.129845

**Correlation:**

	Crude	Dollar	Gold
Crude	1.000000	0.190393	0.429275

	coef	std err	t	P> t	[0.025	0.975]
<b>const</b>	0.2931	0.025	11.570	0.000	0.243	0.343
<b>Dollar</b>	-0.4844	0.091	-5.305	0.000	-0.664	-0.304
<b>Gold</b>	0.8790	0.101	8.703	0.000	0.680	1.078
	<b>Crude</b>		<b>Dollar</b>		<b>Gold</b>	
Dollar	0.190393		1.000000		0.841202	
Gold	0.429275		0.841202		1.000000	

After looking at the correlation matrix study understands positive relationship between the Dependent and Independent variables. Further study gives ample opportunity to go for predictive analysis.

The twenty-one years data has been divided into Sample data set and Forecasting data set to have a better prediction model.

Initially the data has been tested for Linear Regression with Crude oil as dependent variable and Dollar price as independent variable which gave a very less prediction factor to the data hence the study has added Gold also to the Regression equation. The equation to calculate Multiple Linear Regression in this case will be:

$$\alpha + \beta_1x_1 + \beta_2x_2$$

**Hypothesis:**

**H<sub>0</sub>: There is no significant Linear relationship between Crude oil, Dollar and Gold Prices**

OLS, using observations 2000:04-2020:03 (T = 240)

Dependent variable: Crude Oil Price

	<i>Coefficient</i>	<i>Std. Error</i>	<i>t-ratio</i>	<i>p-value</i>	
Constant	95.8684	9.88655	9.697	<0.0001	***
Dollar	-1.54591	0.240360	-6.432	<0.0001	***
Gold	0.0288687	0.00235026	12.28	<0.0001	***

Mean dependent var	64.15792	S.D. dependent var	29.15433
--------------------	----------	--------------------	----------

Sum squared resid	114254.3	S.E. of regression	21.95645
R-squared	0.437570	Adjusted R-squared	0.432824
F(2, 237)	92.19286	P-value(F)	2.42e-30
Log-likelihood	-1080.410	Akaike criterion	2166.821
Schwarz criterion	2177.263	Hannan-Quinn	2171.028
rho	0.967235	Durbin-Watson	0.099877

The regression equation from the above table is  $95.8684 - 1.54591x_1 + 0.0288687x_2$  and later Variance inflation Factor has been tested for Multicollinearity problem and model doesn't have Multicollinearity problem and p-value is less than 0.05 hence study rejects null hypothesis and accepts alternate hypothesis that is there is a significant relationship between Crude oil, Dollar and Gold Prices.

ARIMA model with Seasonal Lags has been considered to test the model. Dollar as Independent and Crude oil as Dependent variable ARIMA model has been tested.

AR - 1, I - 1, MA - 1 (seasonal) has been considered with 1 lag points for analysis purpose. The equation being;  $\hat{y}_t = \mu + \phi_1 y_{t-1} + \dots + \phi_p y_{t-p} - \theta_1 e_{t-1} - \dots - \theta_q e_{t-q}$

ARIMA, using observations 2001:04-2020:03 (T = 228)

Dependent variable: (1-Ls) Crude Oil Price

Standard errors based on Hessian

	<i>Coefficient</i>	<i>Std. Error</i>	<i>z</i>	<i>p-value</i>	
Phi_1	0.781494	0.0553394	14.12	<0.0001	***
Theta_1	-1.00000	0.0451871	-22.13	<0.0001	***
Dollar	1.19674	0.303861	3.938	<0.0001	***

Mean dependent var	1.776930	S.D. dependent var	22.94899
Mean of innovations	2.743051	S.D. of innovations	20.84486
R-squared	0.539924	Adjusted R-squared	0.535834
Log-likelihood	-1023.197	Akaike criterion	2054.394
Schwarz criterion	2068.112	Hannan-Quinn	2059.929

		<i>Real</i>	<i>Imaginary</i>	<i>Modulus</i>	<i>Frequency</i>
AR (seasonal)					
	Root 1	1.2796	0.0000	1.2796	0.0000
MA (seasonal)					
	Root 1	1.0000	0.0000	1.0000	0.0000

The model equation may be derived from the data in the previous table as follows:

$$\hat{y}_t = 1.19674 - 1 y_{t-1} - 0.781494 e_{t-1}$$

The p-value indicates that the model has a substantial effect on prediction. The value of the dollar is a reliable indicator of the cost of crude oil. The research will also examine the relationship between Gold and the predicted price of crude oil.

ARIMA, using observations 2001:04-2020:03 (T = 228)

Dependent variable: (1-Ls) Crude Oil Price

Standard errors based on Hessian

	<i>Coefficient</i>	<i>Std. Error</i>	<i>z</i>	<i>p-value</i>	
Phi_1	0.628949	0.0681103	9.234	<0.0001	***
Theta_1	-1.00000	0.0576984	-17.33	<0.0001	***
Gold	0.0114775	0.00286535	4.006	<0.0001	***

Mean dependent var	1.776930	S.D. dependent var	22.94899
Mean of innovations	3.241575	S.D. of innovations	20.81682
R-squared	0.507293	Adjusted R-squared	0.502914
Log-likelihood	-1025.709	Akaike criterion	2059.419
Schwarz criterion	2073.136	Hannan-Quinn	2064.953

		<i>Real</i>	<i>Imaginary</i>	<i>Modulus</i>	<i>Frequency</i>
AR (seasonal)					
	Root 1	1.5900	0.0000	1.5900	0.0000
MA (seasonal)					
	Root 1	1.0000	0.0000	1.0000	0.0000

From the table the ARIMA equation can be drawn as follows.

$$\hat{y}_t = 1.19674 - 1 y_{t-1} - 0.781494 e_{t-1}$$

p-value of the above table also helps the study to understand that the model has strong predictable capacity with all the variables having p-value less than 0.05.

Hence the study understands that ARIMA is one of the univariate model which has the strong predictable capacity of Crude oil against its relationship with Dollar and Gold prices.

Interpretation from the above analysis:

- In the above study Crude oil has been considered as a Dependent variable, Dollar and Gold prices as Independent Variable.
- Initially Correlation of Crude oil with Dollar and Gold prices has been established and study understood that there is a positive relationship among the variables.
- Further Multiple Linear regression has been drawn to establish Linear relationship among the variables. With no Multicollinearity study established strong relationship among Dependent and Independent Variables.
- To establish prediction of Crude oil when compared with Dollar and Gold prices study has used ARIMA model which showed a strong predicting capacity of the model.

### Conclusion:

About 82% of the crude oil used in our country is imported. Which contributes substantively to the study's ability to comprehend the impact of Crude oil Prices on the State of the Economy as a Whole. Therefore, an accurate forecast of future crude oil prices is a must for the nation.

The ability of the ARIMA model to forecast Gold and Dollar prices relative to Crude oil prices was tested using a Univariate test in this research. Insights gained from this study not only led to the realisation that ARIMA is a promising candidate for predicting future crude oil prices but also convinced the researchers that other methods, such as Univariate and Multivariate analysis, have promise as well.

## A Study on Reasons to use Microfinance Products in Rural District of Bengaluru

<b>Lakshminarayana.S</b> Research Scholar, Lingayas Vidyapeeth , Faridabad, Haryana	<b>Prof. (Dr.) K.K.Garg</b> Research Supervisor, Lingayas Vidyapeeth , Faridabad, Haryana	<b>Dr.V.S.Somanath</b> Co-Guide Professor Emeritus & Strategic Finance Expert
--	--	--

### Abstract

Savings are a key resource for Microfinance Institutions (MFIs). They need to save enough savings to meet their obligations and become self-sufficient from grant suppliers. As a result, they need to persuade customers—in this example, the general public and micro- and small-sized businesses—to put their savings in their hands. This calls for understanding the characteristics, needs, and goals of these clients. What factors affect consumers' decisions to use and save money using an MFI's microfinance products? this raises the question of research.

The purpose of this study is to determine the rural people in Bengaluru district's reasons for using microfinance products, such as farming, land purchase, medical bills, unexpected expenses, social security, and education for children.

**Key words:** Microfinance products, Reasons, Rural District, Clients, Social Security.

---

### Introduction

Microfinance is credited to Bangladeshi economist Shri. Muhammad Yunus. ING claims that Yunus has acquired the title of "the banker of the poor." In 1976, Yunus established the Grameen Bank in Bangladesh. This business provided "microcredit," which is just the disbursement of loans to borrowers in need of money. Prior to that, banks had a propensity to restrict their lending activities to middle- and upper-income clients—as well as the very affluent, of course. Yunis' idea of microcredit quickly became well-liked. Due to its tremendous

success, similar microfinance groups started to pop up all over the world, eventually resulting in the modern definition of microfinance.

Microfinance Institutions (MFIs) lending in India began in earnest in the middle of the 1990s with a suitable adaption of the Grameen model, where the al of the impoverished, Core was able to continue to prosper off of their reliance on their creditworthiness. Customer centricity has always been important to the success of the model, industry, or institution.

Microfinance institutions supplement the services provided by banks. Financial services like remittance, savings, and insurance are also provided in addition to microcredit. Additionally, non-financial services like training, counselling, and guidance for borrowers are offered in the most beneficial way possible. The borrower can use the aforementioned services as described below at their convenience. MFI interest rates are typically higher than those of conventional banks. Interest rates change depending on the purpose of the loan and the borrower's credit history. The repayment plan can be chosen by the borrower as well.

### **Research methodology**

The present study is both description & analytical study. This study is mainly based on Primary and secondary data. Primary data is collected through questionnaire.

Secondary data is collected from various sources like journals, magazines and reports.

### **Objectives of the research**

The following were the study's general and specific objectives:

1. To list the numerous justifications for utilising MFI products.
2. To research the reasons people use MFI microfinance products for improvement.
3. To research how each factor affects the beneficiaries' well-being.

### **Literature Review**

With the use of Google Scholar, we looked for old empirical investigations. The initial search produced 50 articles, including overlaps across two databases. Based on the study's title and objectives, we evaluated each research paper, taking into account the following:

Qualitative and quantitative analysis

Data analysis from underdeveloped nations is step two.

Step three is an analysis of the clientele's motivations for using microfinance programmes.

According to an investigation by Ali and Mughal from 2019, financial help provided by microfinance institutions can only produce positive outcomes when it is combined with business management expertise. This study has highlighted the significance of giving small-scale entrepreneurs managerial and non-managerial skills training in order to prepare them for fully utilising the growth opportunities provided by the financial advantages of a microbanking system.

Sussan and Obamuyi (2018) have highlighted the role that microfinance institutions play in enabling aspiring business owners to the point where they can ensure the expansion and development of their enterprises. The outcome has also acknowledged the significance of non-financial services provided by MFIs for exerting a significant influence.

Hussain et al., (2017) highlighted the significance of microfinance segment by analysing its impact on the economy. Research has particularly evaluated the influence of microfinance sector on the poverty-stricken segment of the society. The study has revealed that microfinance industry has specifically offered its contribution in the income segment, housing infrastructure, education, agriculture, health safety and food security in order to minimize the level of poverty and raises the living standard of the people.

Taiwo et al., (2016) research has examined the significance of contribution of microfinance banks or institutions on the SME sector. It has discussed about the level of support and assistance received by the small scale businesses from microfinance sector. The study has actually discussed about the kind of influence it carries on the growth of business enterprises by providing them sufficient amount of financial as well as non-financial support in every possible manner.

Ferdousi, (2015) evaluated the importance of microfinance institutions in facilitating the growth of micro-entrepreneurs by assisting them with the necessary support and sufficient guidance regarding innovative methods, market trends and latest technologies that needs to be implemented in the business. It has recommended that microfinance segments need to

support the small level entrepreneurs by educating them with some effective business knowledge to upgrade their skills along with the financial support in order to develop a sustainable business setup for them. This analysis has firmly augmented the role of client oriented services in enhancing the potential of entrepreneurs to a greater scale.

Ali et al., (2015) studied contribution of various factors such as level of education, increment in income and improvement in the business process in making an influence on the standard of living of the people. It has revealed that the financial or non-financial services availed through microfinance organisations plays a crucial role in the overall growth and development of the society.

Fwamba et al., (2015) have observed that microfinance industry expanded its service dimensions to the segments like advisory and savings rather than limiting itself to the traditional approach of offering monetary services only. It has proven to be a great help for female entrepreneurs. They are now getting themselves highly engaged in the process of decision making. This has encouraged them to a great extent since it provides an approach to satisfy their needs and empowers them by increasing their capabilities that subsequently motivates them to perform and handle all sorts of activities in the business

Modi et al., (2014) given an insight about the various dimensions of microfinance segments which are responsible for uplifting the situation of unprivileged rural women. It has also identified the contribution of some specific factors such as status of socio economic up-gradation, position of woman in society/family, autonomy for life choices and positive approach towards child development in creating an influential impact on the living standard of the society. The outcome of the research simply focuses on the role of government and microfinance institutions to setup the measures that are needed to drastically enhance the social and economic conditions of the poor rural women entrepreneurs.

Al-Shami et al., (2014) disclosed about the approaches followed by microfinance institutions to empower the clients and improve their wellbeing. It has analysed the role of microfinance institutions in the reduction of poverty and increasing the sustainability of the small level entrepreneurs. The study has subsequently discussed about the positive influences of those services which are delivered by microfinance units in the form of

monetary support, efficient training, proper guidance and social empowerment. These benefits are majorly responsible for the overall functioning and growth of the small scale business segments.

Girabi and Mwakaje, (2013) have identified the role of microfinance segments in up-scaling the standard of the small-scale farmers by enhancing their level of productivity. It has been concluded through the research that the assistance offered by the microfinance institutions contributes to a great extent in providing a better access to agricultural markets, farming products, efficient labour and suitable transportation facilities which eventually generates the chances to increase the profitability of the small farm holders. This study has also suggested some supportive measures that are needed to be taken for controlling the factors responsible for creating any hindrance in availing the micro-banking services by the poor farmers.

Awojobi, (2013) came up with the fact that an active participation of government in controlling the issues faced by microfinance banks is highly required in order to ensure an easy accessibility of the financial services provided by them. It has actually acknowledged the role of government to ensure the fund requirements of microfinance institutions so that they can perform their credit operations effectively. This study has also helped in evaluating the impact of positive influence created by microfinance in empowering women entrepreneurs by enhancing their income generating sources.

Adhikari and Shrestha, (2013) presented an image of microfinance segment as a change-maker in the society. It has revealed about the role played by the micro-banking industry in bringing a socio-economic stability in the society. This stability occurs especially due to the fund mobilisation exercises performed efficiently by micro-banking units which subsequently empower the women entrepreneurs to a great extent that helps them to raise their standard in the society.

Nwankwo et al., (2013) reflected that induction of microfinance industry in the economy became a necessity due to the result of inefficient banking mechanism to address and resolve the financial requirements of the underprivileged sections of the society. This concept of micro-banking open new avenues for the people to fulfil their economic needs and enhances their potential to achieve a sustainable growth in the business. The study

has also suggested certain measures for curbing the problems which are imposing a challenge against the efficient performance of micro-banking.

Imai et al, (2012) have analysed the overall impact of microfinance in building up the level of sustainability in an economy. It has been revealed that the active involvement of microfinance industry in the economy of a country minimises its poverty level to a large extent. In fact the study has shown a negative relationship of microfinance loan portfolio with the state of poverty in the society. Reduction in loan portfolio along with the GDP brings unemployment which eventually exemplifies the level of poverty. So, the role of micro-banking industry is considered to be huge in improving the financial performance of the country.

Yahaya and Osemene, (2011) have come up with the concept of promoting micro-banking system in the society as it helps in developing a mechanism to access and support the small level entrepreneurs. It has also highlighted the importance of governing bodies in setting up a system for offering guidance to the micro level businessmen to grow their business. It is clearly evident from the research that the microfinance industry is majorly responsible for improving the conditions of poverty-stricken community of the society through affordable financing, fund mobilisation and opportunities of employment generation.

Okpara (2010) has recognised the influence of certain factors in causing poverty and also acknowledged the role of micro-financial support in controlling these factors. It has measured the impact of microcredit facilities in two stages. Initially it observes a marginal increment in the poverty level with a reducing rate but later on it has shown a steep decline due to constant growth in credit services offered by microfinance segment. This impact clearly signifies the need to establish a system for enhancing the expansion of microfinance industry in the economy.

Anono (2009) have appreciated the role of microfinance industry in actively engaging itself with the underprivileged sections of the society. Research has greatly emphasized its contribution in poverty alleviation. This study has not only highlighted the financial contribution of micro-banking to the entrepreneurs but also focussed on the concept of offering non-financial support and guidance to them in order to enhance their growth opportunities.

**Sample Unit**

Bengaluru Rural District

**Sample size**

300 respondents/beneficiaries of Micro Finance Institutions.

**DATA ANALYSIS AND INDTERPRETATIONS****Table showing the Reasons behind the use of micro finance products**

	Reasons	SDA	DA	N	A	SA	Total
1	Agriculture	38	66	29	38	127	300
		13%	22%	10%	13%	42%	100

		46%	0	22%	15%	11%	100

**\*SDA-Strongly Disagree**

**\*DA-Disagree**

**\*Neutral**

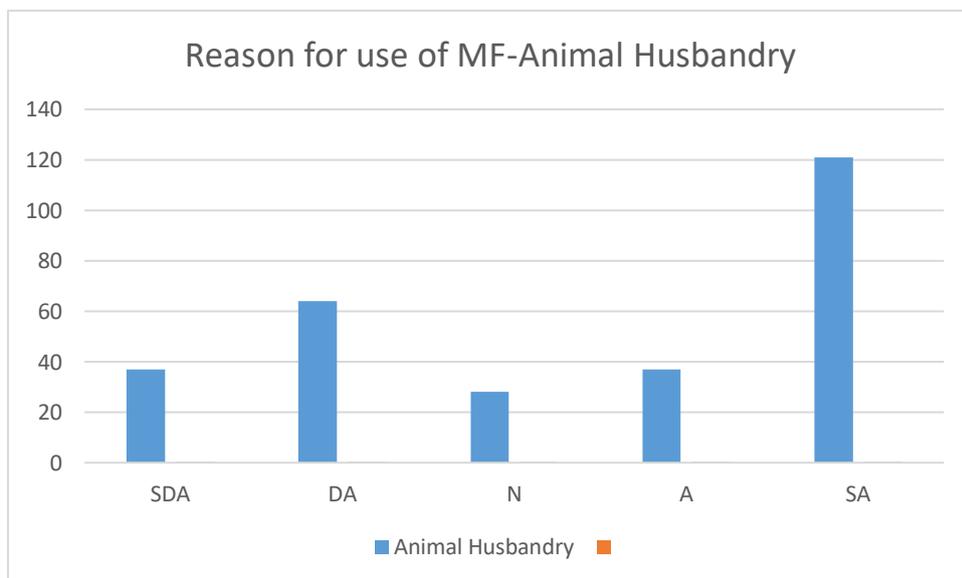

**\*A-Agree**

**\*SA-Strongly Agree**

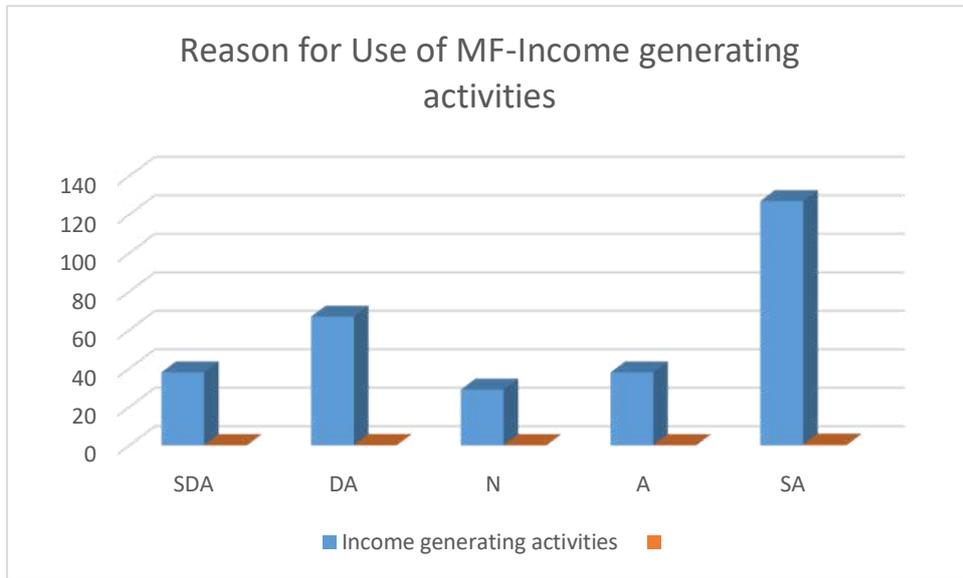

**Interpretation:**

According to above graph of 300 respondents, the reasons for use of microfinance products for Agriculture purpose is -127(44%).

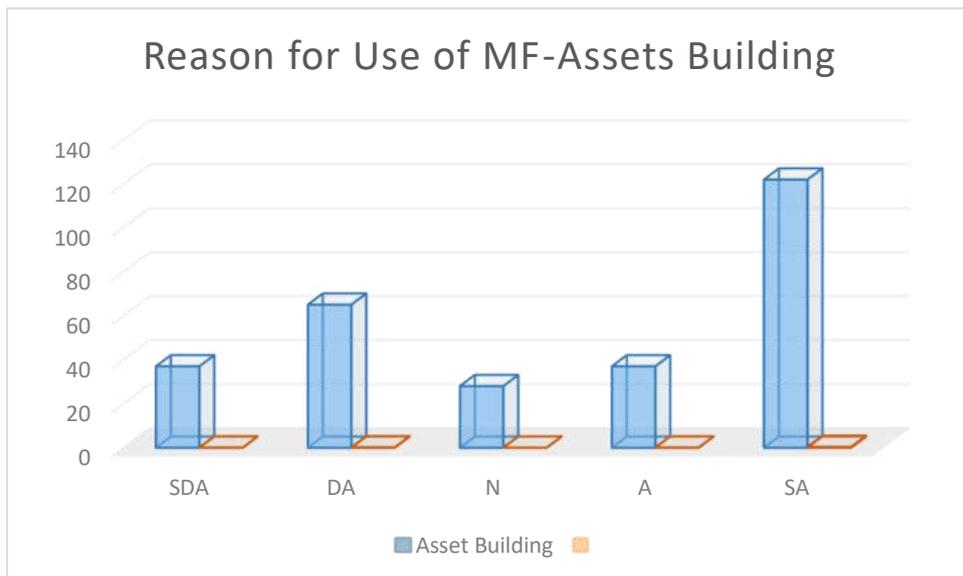

**Interpretation:**

According to above graph of 300 respondents, the reasons for use of microfinance products for Animal Husbandry purpose is -121(40%).

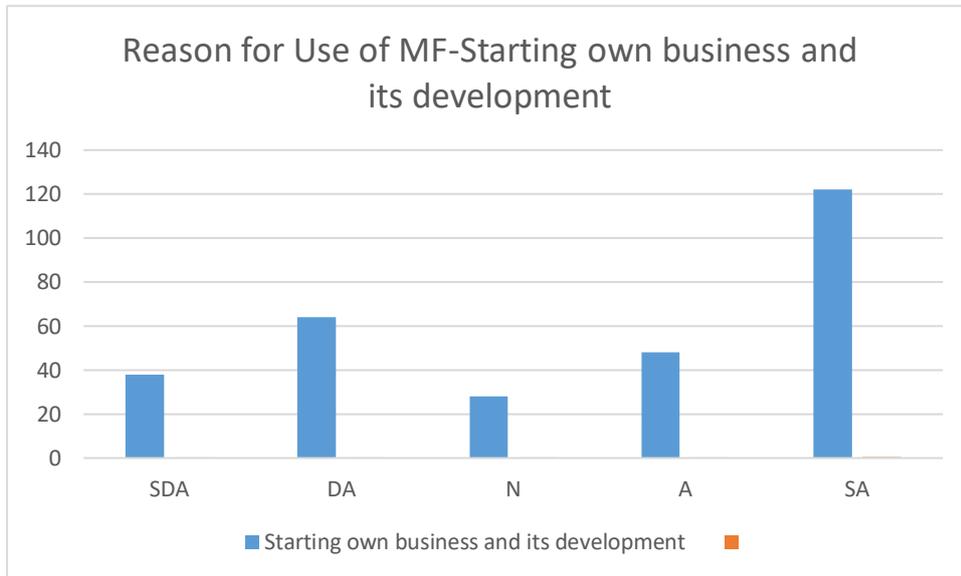

**Interpretation:**

According to above graph of 300 respondents, the reasons for use of microfinance products for Income Generating Activities purpose is -127(42%).

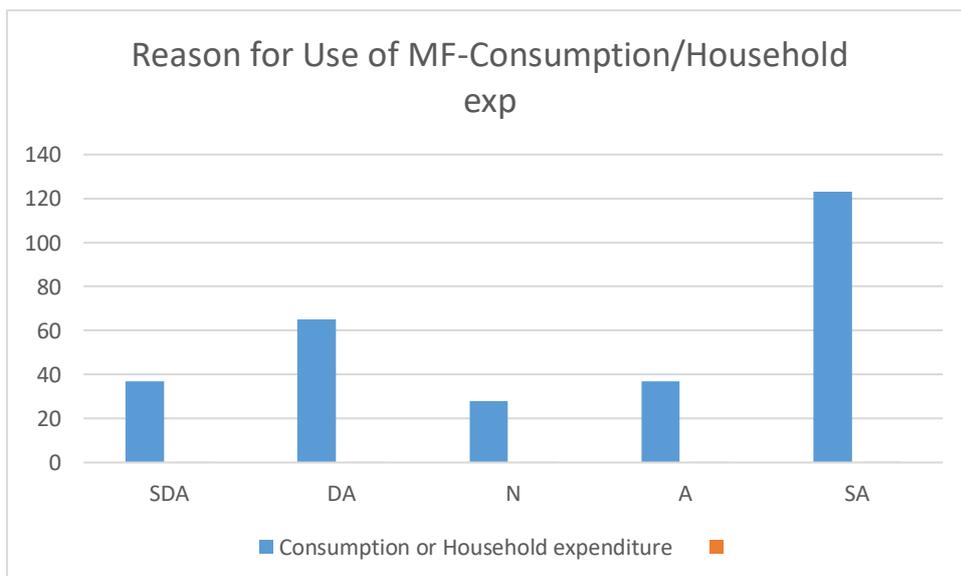

**Interpretation:** According to above graph of 300 respondents, the reasons for use of microfinance products for Asset Building purpose is -122(41%).

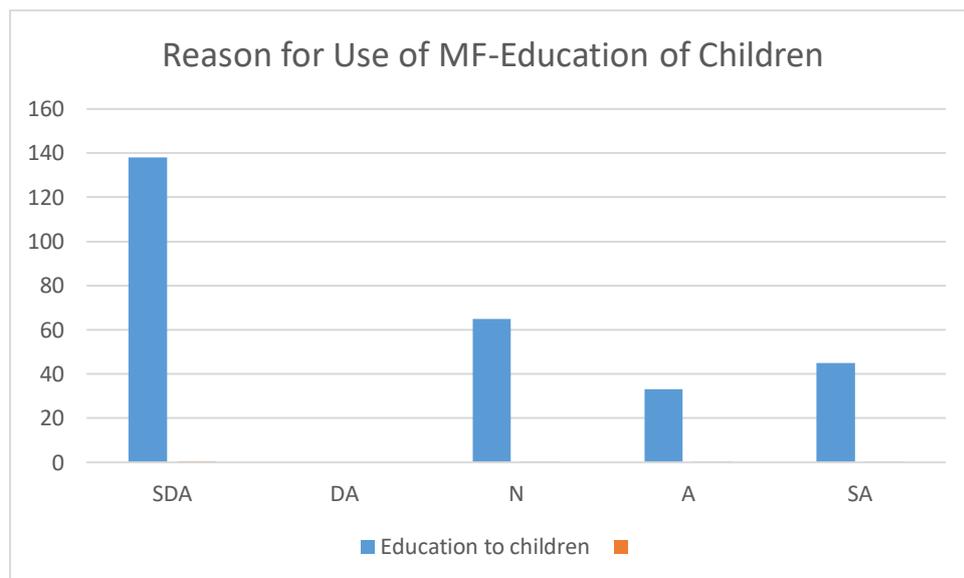

**Interpretation:**

According to above graph of 300 respondents, the reasons for use of microfinance products for starting own business and its development purpose is -122(41%).

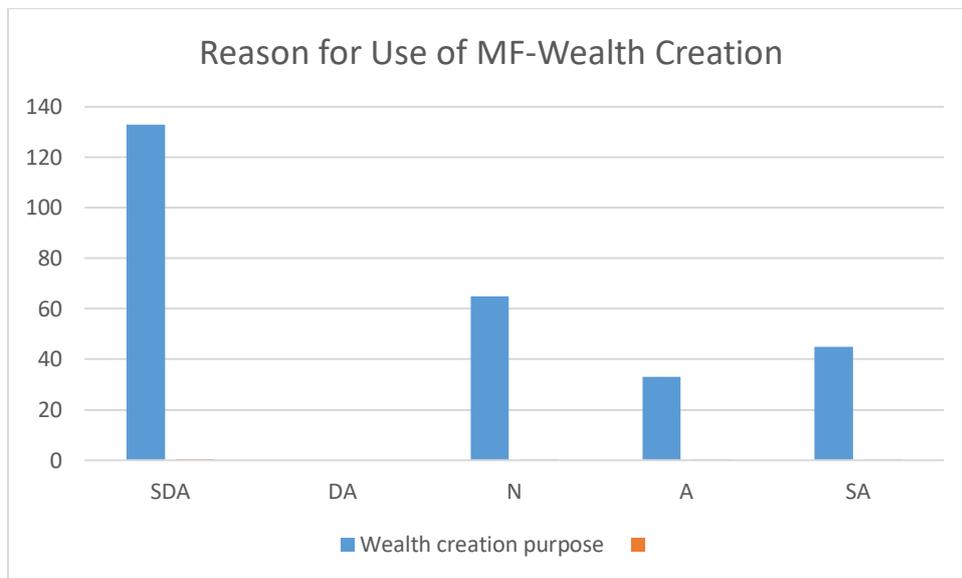

Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products for Consumption/House hold expenditure purpose is -123(41%).

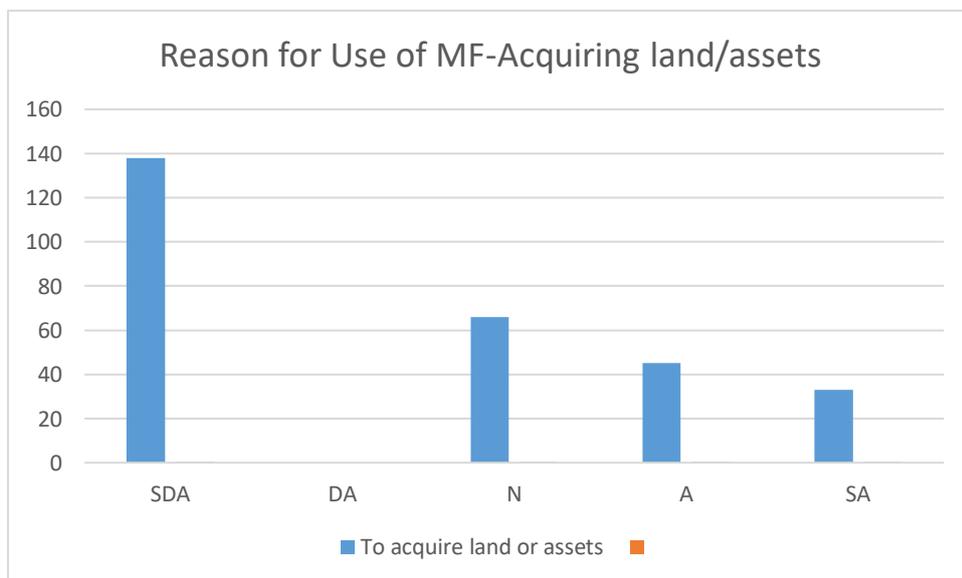

Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products for Education of Children purpose is 15% .

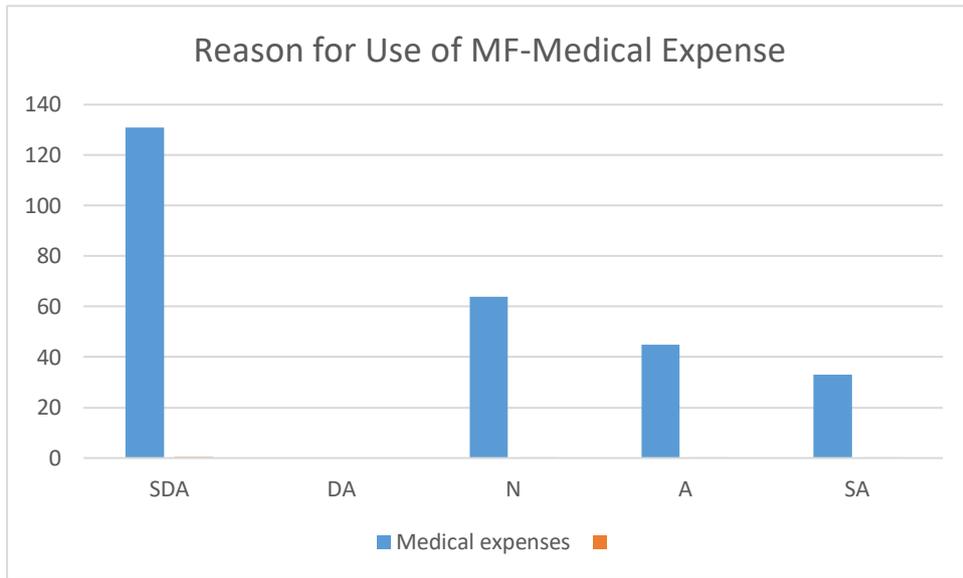

Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products not for Wealth Creation Purpose is 133(44%).

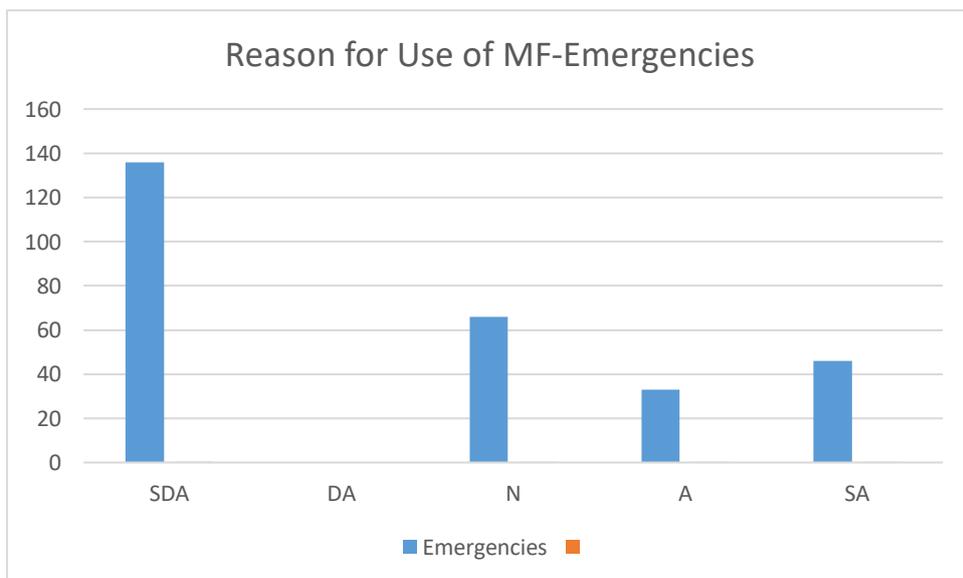

Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products not for Acquiring land or assets Purpose is 138(46%).

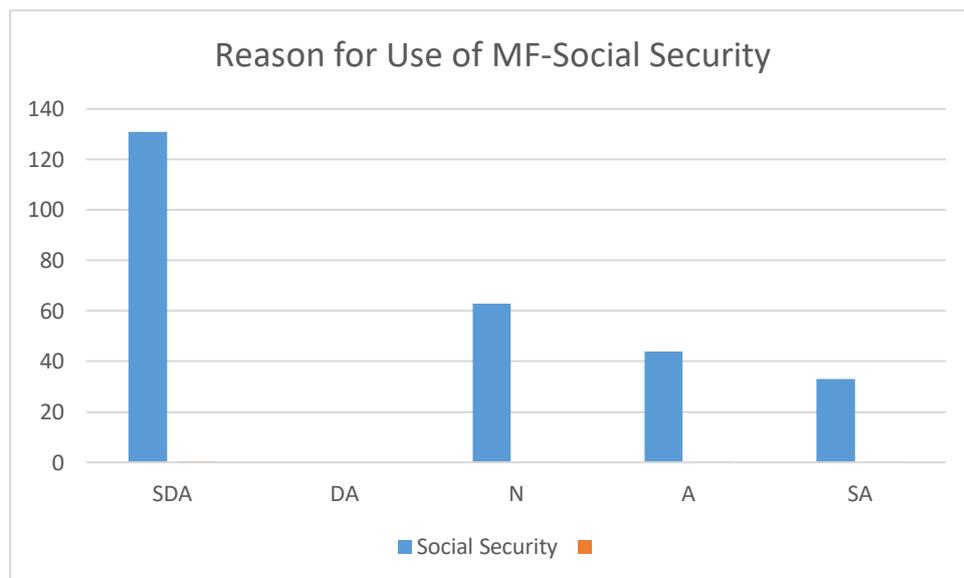

Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products not for Medical expenses Purpose is 131(44%).

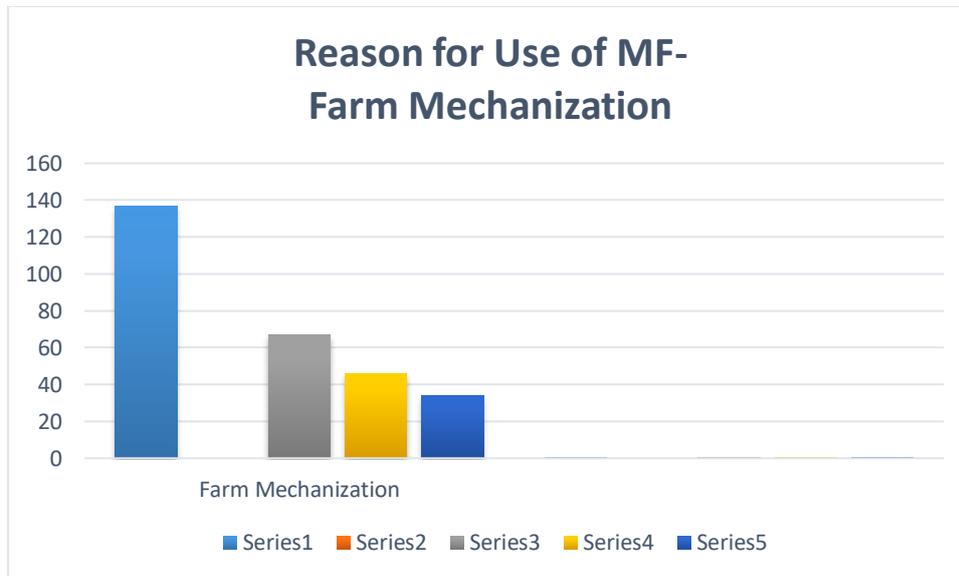

Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products for Emergencies Purpose is 46(15%).

Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products for Social Security Purpose is 33(11%).

#### Interpretation:

According to above graph of 300 respondents, the reasons for use of microfinance products not for the Farm Mechanization Purpose is 137(46%).

#### Findings/Observations

- 137 respondents, or 46%, support the use of farm mechanisation.
- 33 (11%) of the respondents attest to the Social Security purpose.
- 46 (15% of the responders) attest to the emergency purpose.
- 131 respondents (44%) testify for medical bills as their reason for responding.
- 138 respondents, or 46%, support buying property or other assets for personal gain.
- 133 respondents, or 44%, support the goal of wealth creation.
- 15% of respondents support the goal of educating children.
- The number of respondents who attest to spending for consumption or housing is 123 (41%).

- The number of respondents who attest to the use of income-generating activities is 127 (42%).
- 121 (40%) of the responders said they are doing it for animal husbandry purposes.
- The number of respondents who attest to the use of agriculture is 127 (44%).
- There are -123 (41%) respondents who attest to spending for consumption or housing.
- 127 respondents (42%) attest to the respondents' use of income-generating activities.
- 121 respondents, or 40%, are willing to attest to the use of animals in animal husbandry.
- 127 (44%) of the respondents attest to the use of agriculture.

## Conclusion

The primary conclusion of this study is that respondents have expressed the least interest in Social Security, crises, and children's education. The challenge is to find a degree of flexibility in the credit instrument that would allow it to serve the diverse credit needs of low-income borrowers without creating an unreasonable load on the lenders to supervise its end-use.

## Mediating the COVID-19 Pandemic through Positive Psychology

A. V. Shreya<sup>1</sup>, Ms. Sarita<sup>2\*</sup>, Sneha Narayan<sup>3</sup>

### ABSTRACT

In the past two years, the world has witnessed the gravest pandemic probably the present generation would ever experience. The numbers quoted about the exigencies have time and again been contested for being misguiding the humanity at large. The damage caused is multidimensional. One such area is the mode of livelihood which was deeply impacted. It has indeed exhausted quantum of psychological capital of people effected. This study aimed to explore the mediating role of optimism and hope in the relationship between coronavirus stress and those who lost their jobs during the pandemic. The sample of the study consist of people from the working age group. Qualitative method of research is used. The findings emphasize that hope and optimism are potential sources of explanation for how coronavirus stress is associated with subjective well-being.

**Keywords:** *Mediating, COVID-19, Pandemic, Positive Psychology*

### Positive psychology

Positive psychology is comparatively a new field of psychology. It has been set up as the scientific study of positive functioning and thriving on personal, social, cultural and universal levels of life. Positive psychology was presented by Seligman and Csikszentmihályi (2000) as “a science on best qualities of life”. Since its foundation, it demonstrated fruitful in making modifications in psychology and drawing consideration of psychologists from sufferings and other negative perspectives of life to endeavoring towards better understanding of well-being and building on the finest human qualities that make our life worth living.

One curious thing to take note is that the targets of western positive psychology are comparable to some extent to Indian psychology, which has its roots in Indian philosophical and spiritual literature. Positive psychology and Indian psychology have similar concerns about human life’s ultimate purpose. Rao has recommended a potential proposal in 2014, claiming that Indian psychology might give a noteworthy and compelling meta-theoretical framework for sustaining positive psychological aims.

### Hope

Hope, as a construct, can be perceived as a way into a more joyful future. Assuming that one loses the key, the entryway stays shut. Assuming an individual loses hope, the person remains secured in difficulty and vulnerability. In psychology, hope has been perceived as a multidimensional concept. Dufault and Martocchio (1985) identified six elements of hope which are - affective, cognitive, behavioral (psychological, physical, social, and spiritual), affiliative (hope in relationships), temporal (drawn from the past, the present, and the future), and contextual (initiated within a given context).

The difference between hope and other related categories such as optimism, self-efficacy, self-determination, resilience, and others has moreover been clarified by positive psychology research investigate. In reasoning, philosophy, human studies, behavioral sciences, and other social sciences, hope is characterized as a positive desire and want for something to happen within the future.

Researches differentiate between two fundamental concepts of hope: dispositional hope (individualistic, cognitive point of view) and perceived hope (supernatural, spiritual perspective). Snyder (2000), who is considered to be the creator of the cognitive theory of hope gave three components of hope: goals, pathways (plans to realize the goals), and agency (goal directed energy). He characterized dispositional hope as ‘the figure of perceived capacities to supply routes to desired goals, nearby the perceived motivation to utilize those routes. Another concept of Perceived Hope was given by Krafft in the year 2014, on the other hand is relatively a broader concept, i.e., feeling hopeful amid a deeper sense, having a fundamental trust in positive results, especially in troublesome life circumstances which can't be directly controlled.

### Optimism

Winston Churchill once said, "A pessimist sees the issues in each opportunity; an optimist sees the chance in every difficulty". According to various researches on Optimism on the normal, citizenry are wired to be more idealistic than not. To various psychologists, optimism reflects the notion that the results of occasions or encounters will usually be positive. Others contend that optimism is more an explanatory style. According to this notion it dwells inside the way individuals clarify the causes of occasions. Optimists are likely to discover the causes of failure or negative experiences as brief rather than fixed, definite rather than universal, and external instead of internal. Such an outlook empowers optimists to more effectively see the probability of change.

Optimism doesn't mean engaging in aspiring or imaginary thinking. It's how you observe the planet that provides more agency to the optimist as being a least of somewhat responsible when life goes well. These people have more advantageous viewpoints and have an inclination to degree longer than their more pessimistic partners. They are moreover less helpless to the negative impacts of illness, fatigue, and depression. Optimism though is a positive construct but an unlikely belief that a person's future is going to be filled with only positive events can lead them to require pointless dangers, especially with their wellbeing and finances.

### Optimism, Pessimism, and Realism

Some optimists attribute generous thought processes to others and interpret situations within the absolute best light; others just disassociate their inner disposition from outside circumstance. Being optimistic isn't essentially always the “best” strategy. Research appears

## Mediating the COVID-19 Pandemic through Positive Psychology

that hardening a sunny disposition with a little dose of realism, or perhaps pessimism, can be the only much appreciated to construct resilience and accomplish one's goals.

### **Covid 19**

The COVID-19 crisis has had, and continues to possess, a significant impact on individuals throughout the planet. As a result of the pandemic, individuals face continuous changes in various aspects of their lives, like health, employment, and family life. This accumulation of multiple sources of stress could increase feelings of psychological distress and reduce feelings of wellbeing for several individuals. Wellbeing is often defined because the evaluation, either positive or negative, of one's life and quality of functioning in life is dependent on our subjective evaluation. This definition is in accordance with second wave of positive psychology, which posits that wellbeing should be understood and should be supported by the situational context during which individuals may experience a mixture of positive (e.g., positive affect) and negative (e.g., distress) wellbeing. Further, wellbeing can include both hedonic (e.g., low levels of stress) and eudemonic (e.g., meaning in life) aspects. As a crucial, yet still understudied component of wellbeing, meaning in life denotes to "the degree to which people comprehend, include up of, or see importance in their lives, in the midst of the degree to which they see themselves to have a reason, mission, or overarching point in life".

### ***The Stress of Losing a Job***

Whether we've been laid off, downsized, forced to require early retirement, or seen contract work dry up, losing employment is one among life's most stressful experiences. Apart from the apparent financial anguish it can cause, the strain of losing employment can also take a crucial toll on the mood, relationships, and overall mental and emotional health.

Our jobs are often quite just the way we make a living. They influence how we see ourselves, also because the way others see us. Although you didn't love your job, it likely provided you a social outlet and gave a structure, purpose, and about to your life. Suddenly finding yourself out of labor can leave you feeling hurt, angry, or depressed. You'd possibly be questioning your identity, grieving all that you've lost, or feeling anxious about what the longer term holds.

Depending on the circumstances of your unemployment, you'll feel deceived by your boss, feeble over the heading of your life, or fault yourself for variety of seen deficiency or botch. The strain and stress can feel overpowering. But notwithstanding of how distressing things seem immediately, there's trust. With time and then the proper coping techniques, you'll come to terms with these difficulties, ease your push and uneasiness, and progress in conjunction together with your working life.

### **CASE STUDIES OF THE PARTICIPANTS**

Mr. B was temporary employee in a reputed organization. He was very much satisfied with his job. During the pandemic, his company started getting rid of the workers who were temporary and were paying only to the permanent staff as there was less production thanks to which providing salaries to any or all the workers was becoming difficult. Mr. X also had to allow resignation from the corporate. Due to these reasons, now Mr. X was very much stressed out as he was the only bread earner in his house. This happened during the primary wave of the pandemic where it had been becoming difficult for people to satisfy their basic needs. While, Mr. X didn't lose hope and was optimistic towards his future. He overcame many challenges after losing the duty, because it was becoming difficult for him to search

## Mediating the COVID-19 Pandemic through Positive Psychology

out employment during the pandemic as no company was hiring new employees. Recently, he got a permanent job in an another reputed company where he's much satisfied both with his income and also the organizational environment.

Mrs. T was a tuition teacher and accustomed to give classes to the scholar students at her home only. Her life was excellent. She was earning a decent amount and was taking care of all the members within the family as her husband was unemployed. Because of the effect of pandemic, parents were now more concerned about the lives of their children and weren't allowing them to go out from their respective homes. Also, now students started taking classes from online tutors thanks to which the duty of Mrs. T was now in danger. Only few students were taking classes from her but that too was for a short time only. Slowly and gradually not a single child came to her tuition center leading to financial problems in her family. Now over this case, she even lost her husband to Covid. Even after all these hardships she didn't lose hope as she made herself clear that she must work flat out so as to take care of her children. Mrs. T is now trying to adapt to the current online means of learning and is much confident that someday she is going to overcome all her problems and can lead an honest and far better life.

Mrs. L was a primary teacher at a reputed school from 5 years. Her son was also studying within the same school. Her husband was working in a very reputed organization. The school principal was replaced who as per Mrs. L was very cruel. She wasn't providing proper facilities and also the salaries to the teachers. Mrs. L and lots of teachers were dissatisfied with the principal but thought that complaining against the principal isn't very easy so they decided to stay quiet. Due to the pandemic, she lost her husband and now it had become very difficult to keep up her house and also to pay the varsity fees of her child. She was asked to convey resignation when she gave the letter of fee concession of her child. This worsened matters as now she was unemployed and also her child was given TC from the varsity. Mrs. L therefore decided to try and do small chores like tailoring, put her child in another school. She attended many interviews in various schools, but was rejected as schools weren't hiring teachers anymore, thanks to the pandemic. Therefore, recently she started a web business of selling clothes. Initially, it was absolutely becoming difficult as she wasn't much equipped with technology, but slowly and gradually, she got adapted thereto. Even when she was unemployed, she didn't lose hope and was optimistic towards her future.

Ms. M was the owner of a reputed event management company. Many people trusted her and were very much impressed by the work. Their earnings were totally dependent on big events. Whenever she signed a new contract, she along with her colleagues used to purchase all the materials related to that event 2-3 months prior. As the pandemic situation rose, people started to cancel their contracts with the company as lockdowns were announced and people gatherings were minimized. Many companies were providing services online. The company of Ms. M was now facing losses and their stocks were also getting damaged. Because of social distancing rules, they were facing financial problems. Due to this, she had to take out many employees from her company as providing them salary was becoming difficult. Also, she had to reduce the salary of their permanent staff. But even after this she didn't lose hope and is continuing her business because of her interest in this field. Ms. M is very much optimistic that one day everything will be normal again.

Mr. P was an employee in a reputed organization. Due to the pandemic situation, he along with many employees was taken out from the company. Initially he suffered a lot as he was the only bread earner in the family. So he decided to start a cookie business online which

## Mediating the COVID-19 Pandemic through Positive Psychology

turned into a success but also faced many problems, in which adapting to the technology was the very first one. Even after many challenges he didn't lose hope as he was doing something in which he was very much interested and was satisfied with his work. Now his business is running in a good pace. He is earning a good amount of money and now once again his life is normal. He is also very much optimistic towards his future.

Mr. D was a private taxi owner who had many clients in the city. His family was living in their native village only. He used to send money to his family as he was the only bread earner. As the pandemic situation rose, and lockdowns were announced, only few people were getting out of their homes. This affected his job and his earnings. It became difficult for him to tell this to his family as he doesn't want his family to worry. Mr. D had to leave his rented house to cut down costs in order to send money back home. Also, he could not leave the city and go back to his village as there was no work for him there. For much time, he lived under the shed of a factory and used to borrow money from his friends to send to his family. Even after facing many difficulties, he didn't lose hope and was optimistic towards his future. Now he is working in a factory as wage laborer and is working hard to pay off the debts of his friends and also to send money back to his family.

Mr. G was a salesperson who used to sell products door to door. Due to his extrovert personality and his skills, he used to please many clients. But due to the on course of the pandemic, he was told to avoid visiting outdoors and to do online sales, i.e., through phone calls. This created the problem, as from now it was becoming difficult to Mr. G to please the clients as he knew that only verbal communication will do nothing to sell a product, body language of the employee matters much more than that. It was becoming difficult for him to now maintain the job. He was told to leave the organization later, and from now the problems rose. He suffered very much in order to earn a job as he was the only bread earner in his family. But after much suffering, he got a desk job in a sales company only. Mr. G had told that during his bad time, he didn't lose hope and was very much optimistic that one day he'll get a job in which he is interested.

Mr. R was an aged employee in a reputed organization. He was committed emotionally towards his job and decided to continue the job even after the age of retirement. As the pandemic situation rose, the production of the company decreased, which resulted in the company to face losses. Therefore, the organization started to taking out the temporary employees first, in which many people became jobless. After that, employees who were much aged were also asked to give resignation in which Mr. R was one. This disappointed him as leaving an organization which he served in for many years, was very difficult. However, this didn't make Mr. R to lose hope and optimism from the future. For now, he is not working in any company.

Ms. S was a small road side food vendor. Her family consists of her husband, son (eldest) and two daughters. She is the major bread earner of the family. Her husband works as a contract labor. She is supported in her work by her son and elder daughter. Her eatery is considered to be the best spot for people of all ages. She used to serve people according to their special requirements despite being heavy hours. Due to covid 19 induced lockdown and resultant precautions her eatery was shut down. Suddenly all her business came to halt. She had to dispose off all the preparations, vegetables and other edibles she had within one week. Her husband was also not getting work as he was a contractual labor. For 2.5 months all her business was shut. Yet with her love for cooking and confidence in herself she was never found to be dejected. She was optimistic that the people who love her food will

## Mediating the COVID-19 Pandemic through Positive Psychology

definitely reach her. She started making food in small amount in her home. People nearby her started ordering food from her. Slowly other customers also came to know about where Ms. S resides and started ordering food from her. Ms. S made all efforts to follow all the covid protocols. She strictly instructed her customers to follow the same so that no-one gets into any trouble. This way with her belief in her abilities and being positive at grim situations she was able to get out of it.

Mr. K was working as an office attendant in a small organization. His family consists of his wife and 3 sons who are in the age group of 12-16 years. Due to pandemic he had to leave the organization. His life suddenly came to standstill. He was the sole earner of his life. But due to his resilience and positive attitude towards his life he was hopeful that he will find out a way out of this situation. Initially he resorted to online work like data entry but couldn't earn enough to sustain his family. Still, he didn't loose hope. Then he decides to open a grocery in the back side of his house. He made all the required arrangements in that particular room and started a small grocery store. God being kind his store is attracting a good number of customers even today. He is supplementing his earning by doing some online work as well. He is even planning to rent a small shop in a prime location in few months time.

### **DISCUSSION**

The most surprising result of the research was the positive responses the participants gave of being hopeful and optimistic towards their future. These responses, however, could be attributed to their alternative job opportunities, having high self-esteem and self- efficacy. The less surprising result of the research was the negative responses the participants gave of having high level of stress and anxiety due to job loss.

There can be a number of explanations as to why participants gave negative responses of job loss. One of this could be because of the responsibilities they manage. There were many participants who were the only bread earner in their respective families. In that condition, the job was the only way of survival, and no job meant no money.

Another possible explanation might be having no other job alternative. As many people were asked to resign from the organizations due to lack of production or having debts. No other companies were hiring them as the economy was getting weaker due to the pandemic.

The overall results of this study shows that even with job losses due to the pandemic, people have not lost hope and are optimistic about their future. They have a positive attitude that makes many of them to work hard. In summary, optimism and hope are important adaptive phenomena that promote happiness, quality of life, and psychological adjustment in the general population and in specific groups, such as those living with mental health problems. People who are optimistic and hopeful are better adapted to adversity, are less likely to develop mental disorders and exhibit healthier behaviors and related to more life satisfaction.

### **CONCLUSION**

There can be no doubt that hope and optimism are important adaptive phenomenon that foster wellbeing, quality of life, and psychological adjustment in general population. The purpose of this research was to identify hope and optimism among individuals who lost their job. Recent research on job loss incidents has provided a more complete understanding of hopeful and optimistic people who lost their jobs due to Covid-19. Based on the analysis

## Mediating the COVID-19 Pandemic through Positive Psychology

conveyed, it can be concluded that more than 50% of the participants, even though were stressed out due to their job loss, were very much hopeful and optimistic towards their upcoming future.

## Leadership: An In-depth Study of the Attributes of an Effective Leader

Avinash Wesley<sup>1</sup>, Ms. Sneha Narayan<sup>2\*</sup>

### ABSTRACT

This research paper examines the various leadership characteristics valued and practiced by employees in various workplace settings. The aim of the study is to determine whether certain common characteristics are shared by successful leaders. In depth analysis of 15 case studies were done and data was gathered from different individuals by conducting unstructured interview. According to the research, certain characteristics like honesty, integrity, transparent communication, amiability, strong decision-making abilities, emotional control and ethics are considered as essential for a leader to succeed in the workplace. The case study method of research was used as it allows for a thorough investigation of common characteristics that makes up a good leader. This method facilitates a deeper comprehension of leadership phenomena while contextualizing it in a larger organizational context. The findings of the present study will be instrumental in hiring of the employees in key leadership positions. It will further aid in developing defined leadership characteristics by people tasked to work in higher hierarchies to foster productive workplace culture.

**Keywords:** Leadership, Decision Making, Communication, Case Study, Productive Workplace

President Ronald Reagan puts it very simply for all of us that the greatest leader is not necessarily the one who does greatest things. He says that a leader is one who gets the people to do greatest things. Koontz and O'Donnell define leadership as a mechanism of positively influencing people so that they will work willingly towards the achievement of group goals. In the words of Chester I. Bernard, Leadership is a specific quality of the behavior of an individual whereby they guide people in their activities in an organized manner. It is not a trait delegated only for professionals working at the higher hierarchy. Leadership is a quality that each one of us need to possess in order to be successful both in our personal and professional life. It includes components like effective decision-making skills, assertiveness, optimism, empathy, interpersonal intelligence and the list continues. Another important quality of a leader is that she motivates individual to take a goal directed action. In the process of motivating her team he needs to know their strength and weaknesses, their preferences, emotional turmoil if any etc. It therefore means that a leader is not a person top in hierarchy rather somebody within the team who knows her team tip to

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

toe. There are many definitions of leadership, but they all generally agree on the idea that exceptional leaders have the ability to make wise, visionary decisions and persuade others to follow them. He must handle his subordinates' personal issues with great care and consideration. Therefore, treating people with compassion is crucial for creating a friendly environment. This promotes better employee communication and interpersonal relationships. In nutshell we can say that employees should receive humane treatment from the leader. These aspects in culmination make an individual an effective leader.

Even if there is no direct correlation between leadership and profit, individuals who are perceived as good leaders in corporate settings are the ones who improve their company's bottom line. Therefore, any definition of leadership must take into account the relationship between the key skills of a leader and performance in business. For best results, organizations need strong leadership. He inspires the workers with monetary and non-monetary rewards and procures the work from the subordinates as a result. By securing complete cooperation, a leader can boost morale and enable employees to work as effectively as possible toward achieving their objectives. As we all know, having leadership qualities can be learned as well as inherited. Organizational leadership involves both professional strategies and aspects of human psychology. Organizational leadership places a strong emphasis on the development of leadership competencies that are applicable across all organizations. It refers to a person's capacity to endure challenging times in their field while continuing to advance. The group's members should be capable of being controlled by the leader. A good leader in an organization shouldn't be arrogant. He should act responsibly, provide direction for those who report to him so they can successfully complete organizational goals, and lead by example. He should undoubtedly have confidence. He should be empathetic and should understand the need of the group members. An organizational leader should control the actions of the group in addition to leading people on an individual basis.

Organizational leaders are more likely to succeed if they are highly ambitious, high on energy, driven to lead, intelligent, have thorough job knowledge, are honest and flexible. People who study organizational leadership acquire the abilities and skills necessary for teamwork, effective communication, conflict resolution, and collective problem solving. Building employee morale, ensuring effective business operations, assisting employees in developing professionally and positively advancing the mission of the organization are all tasks performed by organizational leaders. An effective leader will focus on creating coordination between individual goals and organizational objectives. The main goal of a leader should be to properly and effectively coordinate in order to achieve this synchronization. Through their leadership qualities, a leader aids in balancing or integrating employees' individual goals with those of the company. He works to coordinate people's efforts toward common goal in order to accomplish goals. This is only possible if he has the ability to persuade people to cooperate willingly and feel the need to achieve the goals.

A moral leader won't use his followers as a conduit for pursuing his own objectives. He ought to respect their sentiments, choices, and principles. Respecting the followers entails giving them your full attention, showing compassion for them, and being open to hearing different points of view. Simply put, it means treating followers in ways that respect their values and worldview. He values other people. An ethical leader should prioritize the needs of his followers over his own. He must always act in a way that benefits his followers. He helps communities grow. An ethical leader strives to accomplish the goals that are appropriate for both of their purposes while also taking into account the purposes of his

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

followers. He pays attention to the followers' motivations. He is just and fair. Wherever there is differential treatment of some followers, the foundation for that differential treatment must be just, transparent, and morally sound. He is trustworthy and loyal. They consistently gain followers' respect. No matter how important or damaging a fact may be, an honest leader always presents the facts and circumstances honestly and completely.

### ***Types of Leadership***

**Autocratic leadership style-** A leader has total control and authority over their team members or employees when using this leadership style. Even if their opinions are in the best interests of the team or the organization, they cannot be presented. They are not allowed to critique or challenge the leader's methods. The leader completes the tasks by themselves. Under the direction of the leader, this style has the advantage of promoting quick decision-making and increased productivity. This leadership approach has drawbacks in that it increases employee turnover and absenteeism. This leadership style only functions when the leader is at their best, the work is monotonous, unskilled, and routine, or the project is brief and risky.

**The Laissez faire leadership style-** Here, the leader has complete faith in his or her team's ability to complete the task. He does not focus on the management aspect of his work, but rather just the intellectual/rational component. The team and employees are encouraged to express their opinions and make recommendations that are best for the objectives of the organization. This management approach only succeeds when the team members are intelligent, skilled, devoted, and experienced.

**Democratic /Participative leadership style-** Although the leader has the final say in all decisions, the team members are invited and encouraged to play a significant role in the process. The leader instructs the team members on what to do and how to do it, and the team members give the leader feedback on their experiences and suggestions, if any. This leadership approach has the benefit of producing contented, motivated, and more skilled workers. It promotes creativity and results in a positive work environment. The only drawback of this leadership approach is that it takes time.

**Bureaucratic leadership-** The leaders in this situation strictly abide by the organizational guidelines. Additionally, they ensure that the team members strictly adhere to the policies and procedures. Employees are promoted based on their capacity to follow company policies.

**Transactional leadership-** it is a type of leadership in which a leader will either reward or punish the employees with respect to the task completed by them. A transactional leader will build mutual trust among the employees. In a nutshell a team under a transactional leader will feel accountable for their performance.

## **REVIEW OF LITERATURE**

Singco.K (2021) conducted a study on leadership approaches and found that majority of the respondents possessed traits like extraversion, maintaining good relationship with administration, strong inter-personal relationship etc. In addition to it, the paper concludes that there is a need for leaders to practice more discernment in dealing with personnel.

According to a recent study by Radhika Kapoor on Characteristics of effective Leadership (2020), an effective leader ought to be someone who is honest, integral, confident, committed, resilient, emotionally intelligent and has a strong sense of alignment with the

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

vision and mission of the organization. The author emphasizes that in order to work in the leadership position she/he should have deep faith in oneself and have a positive orientation towards the team and the characteristics of the organization.

Transparency is considered to be an important characteristic of an effective leader (Rouss, 2020). It means that the leader should be lucid and comprehensible while giving instructions and delegating various tasks to the team members. The author mentions that ensuring transparency in the workplace will enable the leader to create openness between them and their subordinates. The study further emphasized upon the need to have time management skills and should know how to prioritize the tasks in hand.

The study by Hasan (2019) on leadership concludes that honesty and integrity are the two prime characteristics that make an effective leader. It includes components like keeping one's word, commitment, giving due respect to the various internal and external factors impacting the environment of the organization, upholding the traits of morality, ethics and treating the subordinates with respect.

According to Hogan (2019), an effective leader is one who is modest and will listen to his employees. He/He will be ready to accept their mistake and will be open to change the action plan if need arises.

A study was conducted by O.Victor (2019) conducted a study to explore the various prominent qualities of a good leader. The researcher employed a structured questionnaire on 150 respondents from different industry. Some of the key characteristics valued in the study are accessibility, neutrality, dignity, reliability, honesty and a light hearted approach towards work.

Rudolf.P (2016) conducted a study on qualities of good leader and its benefit to the organization. The study reviewed the work of various researchers in the same domain. The study concluded that a leader should be able to persuade and convince the team members to walk an extra mile in order to achieve the treasured goals of the organization.

The study by Lahoti and Sahoo (2016), found that leader's effectiveness and their educational qualification do not exhibit significant positive correlation. The paper concludes that though the literature do not confirms the relationship between education and effectiveness of the leader but higher level of education does create the strength associated with an effective leader.

The study by Hosain (2015) on the characteristics of a leader honesty, creativity, knowledge, competency, kindness and courage is considered to be important in the making of an efficient leader.

According to a study by Boerritger (2015), leadership is independent of the age of the leader. He asserts that there is no clear link between leadership outcome and age of the leader. The paper concludes that there is older leaders are neither better nor worse than the younger leaders in terms of effective leadership.

A study was conducted by Kayode.K et.al. (2014) on the relationship between decision making skills and leadership behavior using a semi-structured interview. The findings of the study reveal that both these constructs share an opaque relationship with each other in theory

## Leadership: An In-depth Study of the Attributes of an Effective Leader

but are highly connected in practice. The paper further asserts that the most favored leadership style is participatory leadership and the preferred decision-making style is consultative decision making.

### RESEARCH METHODOLOGY

**Sample-** The sample of the present study comprise of 15 male and female professionals working in the various leadership positions in different industries of Faridabad, Haryana. All the participants had more than one years of experience in handling leadership roles. It was made sure that the participants had strong knowledge of leadership behavior and the associated skills. In order to ensure the same snowball sampling method was employed to collect the sample for this research.

#### *Inclusion Criteria*

Only private sector employees working as in any leadership position with minimum 2 years of experience were taken. In addition to it all the samples fall between the age brackets of 25-58years.

#### *Exclusion Criteria*

Government sector employees and employees working in any unorganized sector were excluded from the present study.

**Research Design-** The present study is a qualitative research wherein case study method is employed to get a depth understanding of the various characteristics that makeup a good leader. Data was collected using Interview Method. The cases were interviewed using a self-designed unstructured questionnaire. The questionnaire consisted of demographic details and open-ended questions. In order to gain in-depth knowledge, lead questions were also included in the interview. Before conducting the interview on the target sample population, 5 pilot interviews were also conducted. The research was completed in a time span of 3 months and inferences of the cases were made to decipher the common underlying characteristics.

**Data Analysis-** The collected case studies were compared to generalize the similar personality and behavioral characteristics that are considered to be essential pre-requisites to work in the various leading positions inside an organization. Each case was compared to each other and in-depth analysis of the literature review was done to validate the findings of the study.

### RESULT

#### *Case 1*

In 2016, XYZ, 42, is working as a HR professional in a leading educational institute. She has completed her MPhil from North Hill University in Shillong and has a bachelor's degree from Delhi University. She has been working for seven years. Her view is that team cohesiveness and coherence are fundamental components of leadership. A leader is someone who inspires growth in their team and followers because they believe in unity. She believes that a leader should be self-assured because if he/she lacks self-assurance, they will not be able to inspire others. A leader should also be extremely talented, knowledgeable and someone who goes above and beyond. She further emphasizes that you can always learn from someone who is more knowledgeable than you. Therefore, a leader should be someone who always goes above and beyond and this becomes a reason everyone respects and looks up to him/her. She believed that a leader should have a humble outlook, be a good listener,

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

and be able to motivate his team. She holds that becoming a good leader is a process and not something that can be learned overnight. She believes that you always learn from your seniors and that you learn so many things subconsciously.

### ***Case 2***

Gautam Khattar, team leader at Reliance Digital, is 21 years old and has held the same position since 2020. He believes that leadership is a skill rather than a position or role. Its ultimate objective is to change a group's mindset so that they can accomplish their own and the organization's goals. It's a skill because it can be taught, learned, and developed over time, and a good leader needs to have good decision-making skills because he always has to make important decisions. He also needs to be a good motivator who constantly encourages his team, as well as creative in his work, strategic, and problem-solving abilities. Since they are responsible for a group of people with varying opinions and viewpoints that we must direct towards a single goal, leaders must be very level-headed and understanding. This is only possible when we communicate with them and put our egos aside.

### ***Case 3***

Mr. Manjeet, 43, has been a senior general manager of sales for a real estate firm in Gurugram for the past four years and has more than 20 years of work experience in this industry. He asserts that the most crucial quality of a working professional is leadership, which is not just about being a bossy person around others or giving orders. Since no one pays attention to you anymore unless they stand to gain something, leadership is about persuading others. Leadership is therefore about persuading others to understand that your profit and the profit of the company are directly correlated. Work hard and treat the business as though you are the owner. His company's owner is his role model because he spoke with him once and realised in those 20 minutes that he wanted to be like him at this point in his life. According to him, a good leader must be able to effectively communicate, make quick decisions, inspire others, treat the team like family, and have the common objective of maximising the company's profit. He claimed that since word of mouth is how the entire world operates, effective communication with your team is the only quality you need to manage them. To manage people your age, you must be aware that everyone has a unique way of thinking and seeing the world, but that success is ultimately what we all want. Being the youngest in his family, he was always pampered and obeyed the commands of his older siblings and family members. However, after planning a festival during his college years, he discovered how to manage people and how to get them to do what you want them to. When he started his career, he joined TATA Indicom as the team leader. This was not a very positive experience for him as there were significant communication gaps among all the team members. He was also new to everything, but as he developed and worked with so many leaders, he gradually learned all the qualities of a leader. Since he is currently employed by a renowned company as a senior general manager of sales, he has come to understand that he can be a good leader.

### ***Case 4***

Mr. AVK Raju, working as a Personal Assistant to CEO of an IT firm is 45 years old and has held the same position since 2019. He believes that a leader is the one who always takes his team to a consensus. Wherever there is a problem a leader should adjust and say I'm behind you to support you. Its ultimate objective is to change a group's mindset towards positivity so that they can accomplish their own and the organization's goals. Leadership is a skill because it can be taught, learned, and developed over time. One of the key characteristics of a good leader is the ability to take good decisions. He needs to have a

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

perspective which can take his team along with him in the pursuit of organizational profit. A leader should always understand his team members in order to solve any problems. Since they are responsible for a group of people with varying opinions and viewpoints that will direct towards a single goal, leaders must be very goal oriented and understanding. This is only possible when we communicate with them and put our egos aside.

### ***Case 5***

Anita aged 42 working as a manager in a premier coaching institute and has 17 years' experience in this field. According to her Leadership is about balance. A leader is not derived from designation, command or achievements. Undoubtedly, these are the people who are winners and have gained respected levels in society and we should surely be inspired by them. However, not necessarily they are your leaders. Great leaders know how to balance acumen and analytical skills with interpersonal skills, communication and empathy. They look to the future and help make today's ideas viable. They are open minded and understand the impact their actions have on others and the impact over time. As explained by her Leaders are the people you rely on. Their thoughts are far-sighted, their decisions are firm, and their conclusions are verdicts. Whether we agree with their decisions or not, we still have to follow them. Not because of the pressure, but because we believe in their confidence more than we do in our own. The truth is that everyone is a leader in their own way. Someone who helps others do the right thing, sets direction, Inspires, respects perspective, seeks to develop, and appreciates achievement. Focus more on "we" than on "me." Go beyond your limits and surpass your abilities. As mentioned by her Leaders shape nations, communities and organizations. We need great leaders to guide us and help us make the important decisions that move the world. Indeed, the best leaders consistently possess certain basic qualities and skills, such as integrity, that can become potential blind spots in their organizations. Delegating is one of the key responsibilities of a leader, but effective delegation can be difficult. The best leaders build trust in their workplaces and teams through effective delegation of authority. Effective leadership and effective communication are also linked. Effective communication and good conversations can actually improve organizational culture. They know how to show gratitude in the workplace. "Influence" feels like a dirty word to some people. However, the ability to persuade people through logical, emotional, or concerted appeal influence tactics is a key characteristic of an inspiring and effective leader. From her point of view Leaders don't micromanage. You constantly delegate to others and make them feel empowered. There are ways to personally develop leadership qualities within you, such as identifying your own strengths and weaknesses. It's not always easy. We often have blind spots in our strengths and weaknesses. By understanding these, you can increase your potential. When choosing a mentor, I was looking for someone with leadership experience and respect. Make sure you choose mentors who give honest and constructive feedback. My mentors teach me in many different ways, like a professor who inspires me, a boss who always challenges me to do a better job, or a local business owner you are friends with. The most important thing is to choose a leader who you respect.

### ***Case 6***

Mr. Gogoi aged 55 is a mechanical engineer in research and development. He has 35 years of professional experience. He asserts that leadership definitely has nothing to really do with one's level in the organization's hierarchy or one's seniority; rather, a leader should mostly listen to and mentor his subordinates in a subtle way. In his opinion his immediate boss at work serves as his leader, while his father particularly is his real leader. He for all intents and purposes believed that a leader should always literally be able to solve problems and

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

should guide his team towards a successful goal so they can all achieve it, which particularly is quite significant. According to him, a leader must really be polite, maintain order, literally be punctual, literally maintain a basically positive working relationship with the team, and basically have effective communication skills, or so they mostly thought. Delegation skills, confidence, and it took a lot of practice because he gained knowledge from dealing with numerous people and co-workers while guiding them to form the really ideal team, literally develop their self-confidence, and cultivate a leadership mindset in a subtle way.

### ***Case 7***

Bhavna, 36, is an MBA Graduate and is presently employed as a head in a cement industry. He claims that the ability to motivate and direct a group of people towards a common objective or vision constitutes leadership. Being a leader involves more than just being in a position of authority; it also involves being able to win others' respect and trust. He claims that he is her own leader! He will say her father if you ask her who he looks up to. He asserts that a leader needs to possess the following qualities: Vision, Intelligence, Decision-Making, Accountability, and Emotional Control. According to her effective leaders are able to inspire and influence their followers to succeed by having certain traits and abilities, such as communication, empathy, integrity, vision, and strategic thinking. He asserts that a good leader one who is an empathetic listener, maintains discipline and is experientially intelligent. He/he should be able to motivate others and strengthen their team.

### ***Case 8***

Mr. XYZ aged 28 years old team leader in JBL, Delhi. He has completed his Graduation and has been working for 9 years in various positions. He is married for 4 years and has a child. According to him a leader is someone who is involved in shaping as well as moulding the behavior of the group towards accomplishment of organizational goals. He emphasizes on STAR technique as the best option for any aspirant who is preparing for leadership roles. The STAR technique is defined as S stands for Situation, T for Task, A for action and R for Result. He is of the opinion that in order to be a leader one needs to train him or her in that work rigorously. This will enable oneself to work independently and with self-confidence. Therefore, whoever is expert in whatever work in one's team should be allotted the work accordingly. He himself is often seen in indulging in encouraging people and appreciating them for their minutest of achievements. In his personal life, he is always seen in indulging in positive self –talks. His colleagues report him of giving them constructive feedback and are the person of immense positivism. He believes in teaching work rather than expecting them to know it all. He is reported to take initiatives both in the personal and professional life without any hesitation. He comes out to be an active learner with immense hunger for knowledge and growth.

### ***Case 9***

Mrs. Sudheera Ranjan aged 50 is working as a Senior Manager HR in a steel manufacturing industry in Faridabad, Haryana. She has been working in various hierarchies as an HR Professional for more than 25 years. She is in her current position for 5 years and is awaiting a promotion soon. She appears to be a strong and sinister personality. According to her being a wife, mother and a working professional is though is a difficult juggle to play but is worth playing. In her opinion, a person's childhood experiences shape his or her adult personality. She being the daughter of army personnel and being the eldest of the three children had to face a lot of difficult situations. Frequent changes in the posting were a major challenge for their mother because he had to leave her job as a school teacher. All the three siblings also had to adjust to a new locality, new school, cultural differences, loss of

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

friends etc. which took a huge toll on their emotional wellbeing. Mrs. Sudheera was a very ambitious person right from her childhood hence was determined to not to get affected and continued her studies well. Her resilient behaviour landed her up in a very prestigious University in Madras where again he had to face cultural shock. In this entire tussle he developed a lot of skills that has made her an efficient leader. Right from guiding and raising her siblings, finding a place for her in different schools, being sensitive and active towards the various social evils in the society, becoming the college president to now working as a Senior Manager she has developed a lot of important skills that proves he is a leader not just by birth but also by sincere hard work. According to her, to live and work as a leader one should be assertive, open to new ideas and opinions, self-confident and should have the ability to bind together the team members to work towards the organizational goal. An important mantra to be a leader is to understand the need of the team member and give it an equal priority as organizational goal.

### ***Case 10***

Mr. Karan Sharma aged 46 is working as Training and Development Manager in an IT firm in Gurgaon. His wife is a homemaker and has a 14 years old son. He has been working in this field for more than 20 years. He comes out to be a highly assertive person with an optimistic outlook towards life. In the time of crisis, he has the potential to remain calm and chalk out a way for all. According to him, a leader will exhibit the traits of being a leader not just in an organizational setup but in every facets of life. In his interview he said that a common perception prevails among people that a leader is one who has to deal with challenges. Rather according to him a person who paves way for oneself and for others out of a challenging situation is an actual leader. He emphasizes that one needs to be democratic in order to be accepted as a leader in an organizational setup.

### ***Case 11***

Mr. XYZ aged 28 years old team leader in JBL, Delhi. He has completed his Graduation and has been working for around 9 years in various positions. He is married for 4 years and has a child. According to Mr. XYZ a leader is someone who is involved in shaping as well as moulding the behavior of the group towards accomplishment of organizational goals. He emphasizes on STAR technique as the best option for any aspirant who is preparing for leadership roles. The STAR technique is defined as S stands for Situation, T for Task, A for action and R for Result. He is of the opinion that in order to be a leader one needs to train him or her in that work rigorously. This will enable oneself to work independently and with self-confidence. Therefore, the tasks should be divided after analyzing the strengths and weakness of the team members. His friends and family reports that he is often seen in indulging in encouraging people and appreciating them for their minutest of achievements. In his personal life, he practices certain self-help techniques like positive self –talks and self-affirmations. He believes in teaching work rather than expecting them to know it all and will always give constructive feedback. He is reported to take initiatives both in the personal and professional life without any hesitation. He comes out to be an active learner with immense hunger for knowledge and growth. From his case study we can conclude that he is a true leader with prominent leadership traits like Optimism, self-confidence and compassion for others. He is lives in the spirit that development of an individual is dependent upon the collective development of the entire team.

### ***Case 12***

Mr. ABC is a 52 years old DGM, working in a manufacturing industry in Faridabad. He is married and is a father of two children. He has been working in managerial and leadership

## **Leadership: An In-depth Study of the Attributes of an Effective Leader**

post of more than 16 years. He is reported to be a very honest, straight-forward and compassionate individual with wide area of experience. According to him, a true leader is one who has a deep understanding of the nature and requirement of the work. In addition to it he/he should be careful of few things like employee's readiness to do the job, their emotional wellbeing within the organization, sensitivity towards their personal juggles (without hampering the professional commitments) and should be people centric. He has high degree of concern regarding maintaining work motivation of the employees and giving them adequate reasons to ensure job satisfaction in their workplace. He asserts that a leader needs to be a good and active listener. If one cannot understand the thought process of their fellow mates they will not be able to bring them into consensus.

### ***Case 13***

Mr. ABC is working as a finance manager in a leading manufacturing firm in Faridabad. He has been working in various industries at different levels for around 15 years. He is married and has two daughters. He is also very socially active and works enthusiastically in the community engagement activities. He is very outgoing and cheerful person. He is known for his optimism and positive approach towards all life events. He is hardly seen lamenting on any aspects of his life. Along with these qualities he is very assertive and knows how to motivate people around him to get a task accomplished. While talking to him, we come to know that he considers leadership as a skill that each one of us possess but do not know how to channelize the same. According to him most people confuse leadership with autocracy and dominance. He says that you cannot become a leader by commanding your will on other. In order to become an accepted leader, you should know the art to understand and value the different perception of people you are working with as a team. In line with the same you should also know the ways to accommodate the personal goals of the individual employees that work as a fuel to motivate them to work towards the greater organizational goal. A good leader will also possess the ability to say no as and when needed to conducts that are far beyond the level of acceptance in a professional domain. Therefore, from his case study we can understand that empathy, extraversion, optimism and assertiveness are key traits that make you a good and effective leader.

### ***Case 14***

Mrs. Ranjana is working as Assistant Manager in a textile firm for the past 15 years. She is married and is a mother of two children. She is a business graduate and has a strong hold on her profile. While interviewing her, we got to know that he is managing a team of 15 people. She says that leadership is a skill that develops with time. As learning progresses and a human attains some sense of wisdom, the leader in her/him starts growing and maturing. According to her, leadership was an ability that he possessed right from her childhood. She has been very active in school, college, workplace and has never been a passive recipient rather an active participant. She says that a leader is someone who has an in-depth knowledge about the area of work and has the ability to transfer the same to other stakeholders involved. She/he should have an opinion and possess the courage to put forth the same as and when required. According to her, one who is open to new ideas and can spearhead change comes out to be an efficient leader. She says so because as time changes, a lot of people cling to old methods. Since everybody aspire for growth therefore change is inevitable. Any person who equips him or her with the changing environment can actually motivate and help other with the same and assure a collective growth. When one is not open for such a change they even demotivate the other and friction arises. In addition to it one must be high on professional values and commitments. Honesty should always be given priority as this the basic ethical standard that is expected from any leader. She further said

## Leadership: An In-depth Study of the Attributes of an Effective Leader

that in her entire career, ethics have been her priority and gives credit to this philosophy for whatever success she has achieved.

### Case 15

Ms. Malik is working as a senior manager in a publishing house in Delhi and has been working for more than a decade. She is married and is a mother of a 6 year old daughter. Her husband is working as a general manager with a leading IT firm. She is an extroverted personality. Her family reports her to someone full of life right from her childhood. Along with it he is also praised for her thoughtful nature. She is extremely considerate and a god fearing person. As a leader he is managing a team of more than 15 people. According to her though accommodating them is a difficult task since they are from very different culture and backgrounds but this is what describes a leader. She says that knowledge of the discipline of psychology is very beneficial for people aspiring to be in good leadership positions. According to her, emotional intelligence is the most pivotal attribute a good leader. If one is not able to regulate one's emotions, it becomes very to bind the entire team together. In order to achieve an organizational goal, it is very important to motivate your team to work towards it in a union. In order to ensure the same, one need to give equal importance to the emotional and professional needs of your team member.

## DISCUSSION

Leadership is one of the most researched topics both in industries and academics. Literature provides us with various theories like The Great Man Theory, Contingency Theory, Behavioral Theory, Situational Theory etc. which explains the different dimensions of a leader. It is a well stated fact that leadership is a behavior so far which can be mastered with time. Extraversions, Openness to new experiences, amicability, clear vision etc. are the traits most commonly found in the literatures so far. From the cases discussed in the present study, it would not be wrong to conclude that leaders are both born and made. In the interviews concluded, it was very much evident that there are various life circumstances as well as a person's perception towards it that makes a person an efficient leader. In this paper we attempted to identify few key traits that work in combination to create a leader who has a strong ability to guide and motivate their team.

According to the present study, some of the common characteristics that make up a good leader include an innate desire as well as the ability to *motivate* his/her team. Our former president, APJ Abdul Kalam is a true example of ways a leader should motivate his followers. He was an epitome of straightforwardness, modesty and commitment to public service. He relentlessly inspired the younger generations to follow their goals in life. According to the findings of the study by Rudolf.P (2016) a leader should be able to persuade and convince the team members to walk an extra mile in order to achieve the treasured goals of the organization.

A leader should be able to *communicate* clearly the tasks and the expectation from the employees. It helps people to save themselves from experiencing role conflict. A study was conducted by Rouss(2020) wherein he asserts that transparency is an important characteristic of an effective leader. It suggests that the leader should be lucid and comprehensible while giving instructions and delegating various tasks to the team members. Communication is not only limited to clear instructions but also feedbacks. Feedbacks are the prime most force that enables a person to constantly keep him/ her motivated. The next most important characteristics in the making of a good leader is the ability to make the team feel like a family. As per McClelland's theory of work motivation, all of us have an innate

## Leadership: An In-depth Study of the Attributes of an Effective Leader

desire to feel a sense of belongingness. All of us have the need for belongingness. When we create a comfortable environment for our employees and give them an equal say in the important matters of the organization, it strengthens their organizational commitment. This was shown by our leaders like Ashoka who is known for his tolerant and sympathetic attitude towards his people. Raja Raja Chola of the great Chola dynasty is revered for his superb administrative ability and the care he exhibited for his countrymen. This is a very important factor which decides whether the employee will walk an extra mile to get his/her job done. This further ensures a healthy achievement of the organizational goal.

A good number of our participants believe that quick and efficient *decision making* is a key characteristic of a good leader. This is evident from the research conducted by Kayode.K. et.al which concluded that there is a strong relationship between decision making styles and leadership. A good leader believes in a democratic decision making process where all the stakeholders have equal footing. A leader will be cautious enough but will not be doubtful about his/her decision. The responsibility of the leader is not only confined to making a decision rather extends even to own the consequences of the decision. In order to be a good leader one should possess both *interpersonal and intrapersonal intelligence*. Radhika Kapoor (2020) in her study on characteristics of an efficient leader found out that a leader should be honest, integral, confident, committed, resilient and *emotionally intelligent*. This will enable them to understand the emotional challenges of the team members and accordingly regulate their emotions. This will further strengthen the bond between the team members and between the employees in different hierarchies.

When we say that a leader should be emotionally intelligent, it encompasses other traits like *extraversion, openness to new ideas, amicability and a strong sense of integrity*. The participants of the present study have highly emphasized on these characteristics. This makes them approachable as well generates a sense of trust among the subordinates. The literature on the same field pays testimony to fact that extraversion is considered to be the most dominant trait in the making of a leader. Singco.K (2021) concludes in his study on leadership approaches that majority of the leaders possessed traits like extraversion, maintaining good relationship with administration, strong inter-personal relationship etc. Another similar study was conducted by Hogan (2019) wherein he found out that a leader should be ready to accept their mistake and is open to change the action plan if need arises.

As discussed, Leader is a person who has the authority (either by rule or consensus) to shape the behavior and performance of the employees. Therefore, *ethics* is considered to be a value which should never be compromised. It defines the personality and subsequently the credibility of the leader. If a leader fails on this parameter it will be difficult for the team mates to respect and follow him/her. We have numerous examples of leaders from Indian history like Mahatma Gandhi who was revered for his unwavering moral standards and inner fortitude. Therefore, a leader should be guided by ethical and moral principle in addition to the principles of the management.

### ***Future Implication***

This research will enable employees in general and young graduates in specific to understand the various leadership characteristics they possess and the areas they should work upon to have a successful work life. Professional in various leadership positions can gain inspiration and can consequently enhance their efficiency.

## CONCLUSION

The present study focused on understanding the various characteristics of an effective leader. Case study method was employed to complete this study. In the process of gaining an in-depth understanding about leadership and its different facets, we used interview to collect our data. From the analysis, we can conclude that there are few characteristics that were found to be common across most of the case study. Self Confidence, Empathy, Empathetic listening, Personal touch, effective decision making and ethics are considered to be the most valuable characteristics in the making of a good leader.

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

Ms. Sarita<sup>1\*</sup>, A.V Shreya<sup>2</sup>

### ABSTRACT

Antidepressant medication has apparently become the most popular treatment for depression in the whole world. This paper explores relevant research data and raises questions about the beliefs related to the efficacy of the antidepressant medications. The title of this research is “Beliefs related to the efficacy of antidepressant medications: An exploratory research”. To get an answer for this question, data was collected, in a qualitative way by using interview method from different psychiatrists and clinical psychologists residing in Delhi NCR. At the end, results were concluded that when the severity is more, use of antidepressants is necessary so that the crisis situation is controlled, afterwards therapeutic methods should be used in order to completely recover the individual. But, as the antidepressant medications are a foreign agent, hence, the only use of these as a form of therapy will not completely heal the person, instead, there are more chances of relapse.

**Keywords:** *Antidepressant Drugs, Depression, Psychotherapy, Psychiatrist*

**M**DD has been ranked as one of the most common mental health issues and stands at the third position in terms of cause of impediment of disease worldwide, according to the World Health Organisation’s data in 2008, which has projected that this disease will rank first by 2030. A person with MDD not only shows mood symptoms of sadness, but also a variety of other symptoms that are more severe than those in milder forms of depression. People may lack energy and the ability to carry out their daily activities. The physical symptoms include loss of appetite and sleep disturbance. People also show cognitive symptoms of worthlessness and thoughts of death and suicide.

At the diagnostic level, there are very high levels of comorbidity between depressive and anxiety disorders. However, the issues surrounding the co-occurrence of depression and anxiety are very complex. Chronic Major Depression has been associated with serious childhood family issues and an anxious personality in childhood.

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

### ***DSM criteria for Major Depressive Disorder:***

A. Five (or more) of the following symptoms have been present during the same 2-week period and represent a change from previous functioning; at least one of the symptoms is either (1) depressed mood or (2) loss of interest or pleasure.

*Note: Do not include symptoms that are clearly attributable to another medical condition.*

1. Depressed mood most of the day, nearly every day, as indicated by either subjective report (e.g., feels sad, empty, or hopeless) or observation made by others (e.g., appears tearful).
2. Markedly diminished interest or pleasure in all, or almost all, activities performed in most of the day, nearly every day (as indicated by either subjective account or observation).
3. Significant weight loss when not dieting or weight gain (e.g., a change of more than 5% of body weight in a month), or decrease or increase in appetite nearly every day
4. Insomnia or hypersomnia nearly every day.
5. Psychomotor agitation or retardation nearly every day (observable by others; not merely subjective feelings of restlessness or being slowed down).
6. Fatigue or loss of energy nearly every day.
7. Feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick).
8. Diminished ability to think or concentrate, or indecisiveness, nearly every day (either by subjective account or as observed by others).
9. Recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide.

B. The symptoms cause clinically significant distress or impairment in social, occupational, or other areas of functioning which are important on a day-to-day basis.

C. The episode is not attributable to the physiological effects of a substance or another medical condition.

D. The occurrence of the major depressive episode is not better explained by schizoaffective disorder, schizophrenia, schizophreniform disorder, delusional disorder, or other specified and unspecified schizophrenia spectrum and other psychotic disorders.

E. There has never been a manic episode or a hypomanic episode.

The etiology of Major Depressive Disorder is believed to be multifactorial, including biological, genetic, environmental, and psychosocial factors. MDD is considered to be mainly due to abnormalities in neurotransmitters, especially serotonin, norepinephrine, and dopamine. This has been proven by the use of different antidepressants in the treatment of depression. People with suicidal ideations have been found to have low levels of serotonin metabolites.

Both pharmacotherapy, which includes antidepressants, mood stabilizing drugs and antipsychotic drugs, and psychotherapy, which includes cognitive therapies, behavioural therapies, CBTs, interpersonal therapy and family and marital therapy are used as the treatment methods for Major Depressive Disorder.

### ***Antidepressants Drugs***

Antidepressant drugs are the most commonly prescribed psychiatric medications. More than 90 percent of patients being treated for depressive disorders will be given these medications. These are the drugs involved in elevation of mood in a depressed patient (Tripathi, 2003).

#### ***Classifications:***

##### **1) Monoamine Oxidase Inhibitors (MAOI)**

Monoamine Oxidase Inhibitors were the first drug which was introduced clinically as antidepressant. These drugs inhibit monoamine oxidase enzyme. The enzyme is existing in two molecular forms i.e., MAO-A and MAO-B. However, these drugs were initially being studied for the treatment of Tuberculosis, when they were found to elevate the mood of patients. They were later shown to be effective in treating depression. Patients taking MAOIs must avoid foods rich in amino acid tyramine. This limits the drugs' clinical usefulness.

##### ***Unwanted Effects***

The unwanted effects of MAOI include hypotension, weight gain, dry mouth, blurred vision and urinary retention. Excessive central stimulation leads to tremors, excitement, insomnia and in overdose, convulsions and MAOI of hydrazine type (phenelzine and iproniazid) produce, very rarely, severe hepatotoxicity.

##### **2) Tricyclic Antidepressants (TCA)**

TCA is one of the important class, but far from ideal in practice. The TCAs operate to inhibit the reuptake of norepinephrine and serotonin once these have been released into the synapse. The discovery of first TCA, known as imiprine, was also serendipitous as it was being studied as a possible treatment for schizophrenia when it was found to elevate mood. The theory that these drugs work by increasing norepinephrine activity is now known to be oversimplified.

##### ***Unwanted Effects***

TCA produces unwanted effects that include, weight gain, mental confusion, sedation, weakness, anticholinergic, dry mouth, blurred vision, constipation, bad taste, epigastric distress, urinary retention and palpitation. Sweating and fine tremors are also noted with most TCA. Some patients may switch to hypomania or mania, seizure, postural hypotension (in older patients) and cardiac arrhythmias (Tripathi, 2003).

##### **3) Selective Serotonin Reuptake Inhibitors (SSRI)**

Earlier, the antipsychotic medications that were discovered first (so called Classical antidepressants) included monoamine oxidase inhibitors and tricyclic antidepressants (as mentioned above). These were now been replaced in routine clinical practise by 'second generation' treatments such as the SSRIs. SSRIs are chemically unrelated to the older TCAs and to the MAOIs. However, most antidepressants work by increasing the availability of serotonin, norepinephrine, or both. As their name implies, the SSRIs serve to inhibit the reuptake of the neurotransmitter serotonin following its release into the synapse. Unlike the tricyclics, SSRIs selectively inhibit the reuptake of serotonin. SSRIs are easier to use, have fewer side effects, and are generally not found to be fatal in overdose, as the tricyclics can be.

##### ***Unwanted Effects***

The SSRI produce comparatively less unwanted side effects. However, they frequently produce nausea, nervousness, insomnia, restlessness, anorexia, headache, dyskinesia and diarrhoea. This drug may impair both hepatic and renal function and are contraindicated in

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

patients with hepatic impairment. Another serious complication secondary to their effects in increasing serotonergic activity is serotonin syndrome. (Tripathi, 2003; Ferguson, 2001).

### 4) Other Antidepressants

These other antidepressants are known as atypical antidepressants which are compounds with non-selective receptor blocking effects and their antidepressant actions are poorly understood. One of such antidepressants are trazodone. Trazodone (desyrel) was the first antidepressant to be introduced in the United States that was not lethal when taken in overdose. It specifically inhibits the reuptake of serotonin. Trazodone has heavy sedating properties that limit its usefulness.

Bupropion, another atypical antidepressant is not structurally related to other antidepressants. It inhibits the reuptake of both norepinephrine and dopamine. In addition to being an antidepressant medication, bupropion (wellbutrin) also reduces the nicotine cravings, and symptoms of withdrawal in people who want to stop smoking.

Psychotherapy, or talk therapy, is a way to help people with a broad variety of mental illnesses and emotional difficulties. Psychotherapy can help eliminate or control troubling symptoms so a person can function better and can increase well-being and healing.

Psychotherapies can be used to treat the mild to moderate forms of depression. However, for treating severe forms of depression, a combination of both medications and therapeutic approaches may be used. In some circumstances, medication may be clearly useful and in others psychotherapy may be the best option. For many people, combined medication and psychotherapy treatment is better than either alone. Healthy lifestyle improvements, such as good nutrition, regular exercise and adequate sleep, can be important in supporting recovery and overall wellness.

Therapy may be conducted in an individual, family, couple, or group setting, and can help both children and adults. Both patient and therapist need to be actively involved in psychotherapy. The trust and relationship between a person and his/her therapist is essential to working together effectively and benefiting from psychotherapy. Psychotherapy can be short-term, dealing with immediate issues, or long-term, dealing with longstanding and complex issues. The goals of treatment and arrangements for how often and how long to meet are planned jointly by the patient and therapist. Confidentiality is a basic requirement of psychotherapy. Also, although patients share personal feelings and thoughts, intimate physical contact with a therapist is never appropriate, acceptable, or useful.

## REVIEW OF LITERATURE

In 2017 a systematic review was published (according to PRISMA) where all relevant databases were searched, both beneficial and harmful effects were systematically assessed, and a predefined assessment of the clinical significance of antidepressants was performed. That review found that SSRIs compared with placebo had a statistically significant effect on depressive symptoms.

Some recent studies have suggested serious potential risks. People who used antidepressants had a 14% higher risk of heart attacks and strokes and a 33% greater risk of death, according to findings in a meta-analysis of 17 studies that was published in 2017 in the journal *Psychotherapy and Psychosomatics*.

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

The big danger of going off antidepressants is the risk of relapse. People who have had one episode of depression have a 50% chance of having a second. Those who have had two episodes have an 80% chance of having another. Staying on antidepressant medication can cut the risk of relapse in half, according to a review of 15 clinical trials published in 2014 in the *Journal of Clinical Psychiatry*.

Regardless of recent controversy about efficacy (Kirsch et al., 2008, Nierenberg et al., 2011), updated evidence has confirmed the positive benefit–risk ratio for antidepressants in the treatment of moderate to severe Major Depressive Disorder (Möller et al., 2012, Dupuy et al., 2011, Vöhringer and Ghaemi, 2011, Horder et al., 2011).

Some recent quantitative research suggests that antidepressant medication is superior to placebo only for patients with very severe depressive symptoms, with negligible treatment effects observed for those with less severe symptoms (Fournier et al., 2010).

In the past decade, numerous new atypical antidepressants (neither tricyclics nor SSRIs) have also become increasingly popular, and each has its own advantages (Marcus & Olfson, 2010). For example, bupropion (Wellbutrin) does not have as many side effects (especially sexual side effects) as the SSRIs and, because of its activating effects, is particularly good for depressions with significant weight gain, loss of energy, and oversleeping. Furthermore, venlafaxine (Effexor) seems superior to the SSRIs in the treatment of severe or chronic depression, however the profile of side effects is similar to that for the SSRIs.

All the guidelines up to 2008, including the one by the American Psychiatric Association, the one by the Canadian Psychiatric Association, the one by the National Institute of Clinical Excellence in the United Kingdom and the Japanese one, recommend that the choice of antidepressants be made "on the basis of adverse effect profiles, cost, and patient preferences" because there are differences in side effect profiles but not in effectiveness among various antidepressants.

The irreversible inhibitors of monoamine oxidase (MAO) are known to block the mitochondrial degradation of enzyme and increase the brain levels of norepinephrine, serotonin and/or dopamine (Bortolato et al., 2008).

In double-blind randomized clinical trials, venlafaxine, a dual reuptake inhibitor of serotonin and norepinephrine was significantly more efficacious than fluoxetine in patients hospitalized with major depressive syndrome and melancholia (Nemeroff et al., 2007; 2008). In the treatment of bipolar depression, lithium may be no more effective than traditional antidepressants (study results are inconsistent), but about three quarters show at least partial improvement (Keck & McElroy, 2007). Nonetheless, treatment with antidepressants is related with substantial risk of precipitating manic episodes or rapid cycling, however the risk of this happening is abridged if the person also takes lithium (e.g., Keck & McElroy, 2007; Thase & Denko, 2008).

Several recent studies have provided additional evidence for early onset of antidepressant effects. Stassen et al. (2007) conducted a pooled analysis (N=2848 patients) of RCTs involving 7 antidepressants and placebo, and found that the mean time to onset of improvement was within 2 weeks.

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

There has long been a belief that antidepressants have delayed onset of action and that clinicians and patients need to wait 6–8 weeks before evaluating whether the antidepressant is having an effect (Taylor, 2007).

Recent studies show pro-inflammatory cytokine process take place during clinical depression, mania and bipolar disorder, and it is possible that symptoms of this condition are attenuated by the pharmacological effect of antidepressant on the immune system [Maes. (2005); Brien.et.al. (2006)].

It has been demonstrated that a combination of SSRIs with a noradrenergic TCA desipramine is more efficacious in the treatment of major depression (Nelson et al., 2004). The results suggest that simultaneous increase in the serotonergic as well as noradrenergic synaptic concentrations may have a synergistic effect that is beneficial for the remission of major depressive disorders (Nelson et al., 2004).

In 2003, the Committee on Safety of Medicines (CSM) in the UK advised that the majority of the selective serotonin reuptake inhibitors (SSRIs) and another new-generation antidepressant, venlafaxine, were not suitable to be used as anti-depressants by those aged under 18 years.

Proposed biological mechanisms to explain the delayed onset of therapeutic action of antidepressants included delayed desensitization of postsynaptic receptors or presynaptic auto receptors and/or downstream effects on postsynaptic signalling (Frazer and Benmansour, 2002).

Venlafaxine has provided one of the first opportunities to examine the hypothesis that a specific dual-action antidepressant would provide a superior clinical response as compared to any single-action agent (Demitrack, 2002).

The efficacy of the tricyclics in significantly reducing depressive symptoms has been demonstrated in hundreds of studies where the response of depressed patients given these drugs has been compared with the response of patients given a placebo. Though, merely about 50 percent indicate what is considered clinically significant improvement, and many of these patients still have major residual depressive symptoms. Fortunately, about 50 percent of those who do not respond to an initial trial of medication will show a clinically significant response when switched to a different antidepressant or to a combination of medications (Hollon, et al., 2002).

Neuroimaging studies have reported a loss of volume in the hippocampus, which regulates the stress response via the HPA axis (Bremner et al., 2000; Frodl et al., 2002a). Importantly, these symptoms of depression cause dendritic atrophy in the hippocampus, which too can be corrected with certain antidepressants (Watanabe et al., 1992; Magarinos et al., 1999; McEwen et al., 2002).

SSRIs are used not only to treat significant depression but also to treat people with mild depressive symptoms (Gitlin, 2002). Many mental health professionals believe that prescriptions for SSRIs are being written for these milder cases at an excessive rate. Prescribing drugs to essentially healthy people merely because the drugs make them feel more energetic, outgoing, and productive raises many ethical questions.

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

Cyclic antidepressants are used for the treatment of depressive mood disorders, primary major depression. Additionally, imipramine is used in children to treat functional enuresis bed wettings [Maes. (2001)].

Abnormal, excessive activation of the HPA axis is observed in approximately half of individuals with depression, and these abnormalities are corrected by antidepressant treatment (Sachar and Baron, 1979; De Kloet et al., 1988; Holsboer, 2001).

Abnormally high activation of the hypothalamic–pituitary–adrenal (HPA) axis is reported in almost half of the individuals afflicted with depression, and antidepressant treatment is able to reverse many of these aberrations (Sachar and Baron, 1979; Arborelius et al., 1999).

Newer groups of antidepressants regulate the level of serotonin and an additional neurotransmitter, the best-known serotonin and nor epinephrine reuptake inhibitor (SNRI) is venlafaxine. Bupropion is a serotonin and dopamine reuptake inhibitors (SDRI) [Rosowsky. (1984)].

An antidepressant is a psychiatric medication used to assuage mood disorders such as major depression and dysthymia. Though everyone experiences periods of sadness at certain point in their lives; depression is distinguished from this sadness, once symptoms are existent for a period of at least two weeks. Antidepressants are often the first choice of treatment for depression [Smalley. (1984)].

Antidepressants interact with neurotransmitters in numerous ways. They can alter the rate at which the neurotransmitters are either created or broken down within the body [Hall and Nugent. (1992)]. They can block the process by which neurotransmitters are recycled and reused, a process called “reuptake”, by blocking reabsorption of neurotransmitters into the nerve cells. Finally, antidepressants can interfere with the binding of a neurotransmitter to neighbouring nerve cells, thus leaving the neurotransmitter available [Rosowsky. (1984)].

Studies also suggest that depressed people who stop taking tricyclics immediately after obtaining relief have a 40 to 50 percent chance of relapse within six to twelve months. If patients continue to take the drugs for several months after being free of depressive symptoms, however, their chances of relapse apparently decrease to approximately 20 percent (Montgomery et al., 1989; Prien & Kupfer, 1986; Klerman, 1978; Weissman & Klerman, 1977).

In hundreds of studies, mild to severely depressed patients taking tricyclics have recovered considerably more than similar patients taking placebos (Morris and Beck, 1974; Davis, Klerman, & Schildkraut, 1967). When 387 depressed patients were treated with either tricyclic drugs or placebos for ten weeks, the tricyclic patients displayed significantly greater improvement than the placebo patients by the sixth week (Lipman, 1966). Various case reports have similarly described the efficacious impact of these drugs.

A survey of studies involving a total of 5864 patients found that overall, imipramine and two other widely used antidepressants (amitriptyline and isocarboxazid) helped almost 65 percent of the patients for whom they were used. Three other commonly used energizers (phenelzine, malarone, and iproniazid) aided in 40 to 49 percent of the cases in which they were used. Placebo controls were effective in only 23 percent of the cases in which they were employed (Wechsler, Grosser, & Greenblatt, 1965).

## **Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research**

While imipramine has been found to be the most clinically effective of the antidepressant drugs (Klerman & Cole, 1965), recent studies have reported on the similar efficacy of a group of substances known as monoamine oxidase inhibitors. A significant correlation has been found in several studies between clinical improvement in depressed patients and the degree of inhibition of monoamine oxidation produced during drug administration (Feldstein, Hoagland, Oktem, & Freeman, 1965)

Tranquilizing and anti-depressive drugs are effective in the treatment of psychotic disorders. This is the conclusion that emerges from a review of more than 400 research investigations (David, 1965)

One study has associated the effectiveness of antidepressants with respect to non-pharmacological treatment and two studies have compared antidepressants with electroconvulsive therapy for treatment of depression. Another study compared antidepressants with both electro convulsive therapy (ECT) and non-pharmacological treatment.

Seven trials have evaluated the different dosing schedules for treatment of depression. These studies suggest that parenteral imipramine is better than oral imipramine and probably the onset of action is also earlier. Studies have evaluated single dosing against multiple dosing have shown no difference in efficacy except for one study, which showed that single dose nitroxazepine was better than divided doses.

A recently published trial, which evaluated the efficacy of milnacipran, comprised subjects who had agonized from stroke. It is also one of the few trials which have included subjects more than 65 years of age. The trial done by Margoob et al, in addition to the efficacy of escitalopram, have also shown that gene polymorphism plays an imperative role in the treatment response to innumerable antidepressants.

One double blind controlled trial has evaluated the efficacy of clomipramine in the treatment of OCD and revealed that clomipramine was superior to placebo in the management of OCD. This study also disclosed that male subjects showed better response than female subjects.

A small open label study assessed the efficacy of neuroleptic and fluoxetine combination for treatment of obsessive compulsive (OC) symptoms befalling throughout the course of schizophrenia and showed that addition of fluoxetine leads to major improvement in OC symptoms.

Two studies have also studied the effectiveness of antidepressants in common mental disorders. One study showed that treatment completion rates were higher with fluoxetine than imipramine. The trial by Patel et al. included subjects with common mental disorders and evaluated the outcome at one year. It can be considered the longest study which has evaluated the efficacy of antidepressant in Indian subjects.

Studies indicate that the benefit largely depends on the severity of the depression: The more severe the depression, the vaster the benefits will be. So particularly, antidepressants are operative against chronic, moderate and severe depression. They don't help in mild depression.

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

A review of 14 naturalistic studies of long-term treatment for depression over 10 years found that outcomes for depressed patients were poor, with multiple relapses and large variability, both within and between individuals. Patients in nondrug-treated samples did not show worse outcomes, while some had superior outcomes. (Journal of Affective Disorders, a systematic Review by Hughes S and Cohen D)

A study of antidepressant use over 2 years in primary and secondary clinical care found high rates of recurrence (60%–63%) in patients continuously using adequate dosages of antidepressants. 11 Patients not treated with antidepressants after remission had the lowest recurrence rate (26%). (Journal of Psychotherapy and Psychosomatics, research paper published by Bockting C, Ten Doesschate M, and Spijker J, et al.)

Frank et al, have documented response rates for extended treatment with a single effective antidepressant. In that study, the remission rate was 82%, with 75% achieving remission by 140 days. For fluoxetine, 23% of patients who were unimproved at 8 weeks showed full remission at 12 weeks.

Two recent meta-analyses based on a considerable number of placebo-controlled trials in which patients were randomized to either continuation of antidepressants or placebo during the first three months after remission, have shown that continuation treatment with antidepressants significantly decreases relapse rates within the first three months after randomization. This evidence supports the recommendation for continuation treatment with antidepressants during the first months after remission to prevent relapse.

A Danish case-control study examined age and dose effects for selective serotonin reuptake inhibitors and tricyclic antidepressants and found that the fracture risk associated with selective serotonin reuptake inhibitors increased with age but only in medium- and high-dose users, while for tricyclic antidepressants there was only an increased fracture risk in the oldest age group (> 60 years) for the highest dose.

Two studies supported by the National Institute of Mental Health (NIMH), characterized by many methodological strengths, and had lower placebo response rates (33% –35%) and meaningful between-group differences (25%) that support antidepressant efficacy.

Papakostas et al published a systematic review of fixed-dose trials comparing different starting doses of SSRIs. In comparison with starting with the minimum of the standard dose range, starting with the maximum of the standard range may be more effective (RR = 1.12, 95%CI: 0.99 to 1.27) but less acceptable (0.74, 0.54 to 1.00). The response rate may increase from 51% to 54%, at the expense of the dropout rate also rising from 10% to 17%.

Several studies have found upper gastrointestinal bleeding to be more common among patients taking selective serotonin reuptake inhibitors, particularly when used in combination with non-steroidal anti-inflammatory drugs.

Irving Kirsch, professor of psychology at the University of Hull and lead author of the study, said, “Using complete datasets and a substantially larger dataset than previously reported, we found that the overall effect of new generation antidepressant medications is below recommended criteria for clinical significance. Efficacy reaches clinical significance only in trials involving the most extremely depressed patients, and this pattern is due to a decrease in the response to placebo rather than an increase in response to medication.”

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

A classification-based approach of data from Tranter and colleagues' study suggests that if an early change in positive processing is not seen with antidepressant treatment, patients have little chance of responding to this same treatment later. A similar effect was seen in older adults in which a group of patients with depression who did not show an improvement in the recognition of happy faces after 1 week of citalopram treatment also did not respond after 8 weeks of treatment.

In a recent study, Godlewska and colleagues found that clinical response to escitalopram after 6 weeks of treatment was associated with early change during affective processing in the amygdala, thalamus, cingulate, and insula. The responder group showed a greater reduction in neural response in these areas during the processing of negative versus positive facial expressions, consistent with the hypothesis that these early changes are important for the expression of later clinical benefit.

Data from preclinical studies show that a single dose of ketamine produces rapid antidepressant-like effects in rodent models and reverses the depressive behaviours caused by chronic stress. The results also show that a single dose of ketamine rapidly increases synapse number and function in medial prefrontal cortex neurons, and reverses the synaptic deficits caused by chronic stress.

A recently published review assessing results after 24 weeks showed that the longer-term effects of antidepressants (SMD 0.34) seem as small as the short-term effects. A clinical practice guideline from NICE showed similar results (SMD 0.28).<sup>19</sup> It is possible that long-term treatment with antidepressants may even worsen outcomes.

A recently published review found that a significant proportion of people who experience withdrawal symptoms after treatment with antidepressants do so for more than 2 weeks and that it is not uncommon for people to experience withdrawal for several months.

Ferguson has investigated the causes of various side effects profiles, especially the causes of sexual dysfunction, weight gain, and sleep disorders. An occurrence of side effects in long-term SSRI therapy is most concerning. Ferguson's results comply with ours. The statistically significant side effects of SSRI antidepressants in correlation with the duration of the treatment in our subjects are: perception of increased sleep (0.039) as well as decreased sleep ( $P = 0.009$ ), sweating ( $P < 0.001$ ), sudden heat stroke ( $P < 0.001$ ), being without orgasm ( $P = 0.004$ ), decreased libido ( $P < 0.001$ ), weight loss ( $P = 0.045$ ).

A review of 14 naturalistic studies of long-term treatment for depression over 10 years found that outcomes for depressed patients were poor, with multiple relapses and large variability, both within and between individuals. Patients in nondrug-treated samples did not show worse outcomes, while some had superior outcomes. (Journal of Affective Disorders, a systematic Review by Hughes S and Cohen D).

## **METHODOLOGY**

In order to reach upon a solution that whether antidepressants are the best form of therapy or not, we used the qualitative method of research and interviewed various psychiatrists and clinical psychologists residing in Delhi NCR. The questions were open ended and hence the participants were free to give their responses. The personal information of the participants is also kept confidential and therefore, is anonymous. At the very beginning, a short

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

introduction about the research topic was also given to all the participants and their responses for each question was recorded.

An interview is a qualitative research method that relies on asking questions in order to collect data. Interviews involve two or more people, one of whom is the interviewer asking the questions. There are several types in which the structured interview was used for our research paper. A structured interview method is a data collection method that relies on asking questions in a set order to collect data on the topic. Although, in research these are often quantitative in nature, however, they also can be used in qualitative research if the questions are open ended, which is evident in our paper.

Mr. G is a psychiatrist working in a very reputed hospital. The interview was started with a statement based question that “women are more prone to be diagnosed with depression”, do you agree with this statement? If yes, why. The answer, according to him was, yes they are, and he further added that the prevalence of depression among women is more, as emotionality and the thought processes are predominantly associated with the females than the males. Henceforth, the ratio is approximately 2:1. This is even validated by other researchers also. Mr. G included in his statement that however the risk of suicide is more in males than females, but the prevalence of depression is more in that of the females. The next question was “which age group of people are more prone to be diagnosed with depression”, to which the answer was middle age. However, he continued, that the onset of depression is multimodal, so it can start from an early age of 10-15 where the stress may be primarily related to academics. Nevertheless, dispositional age for the initiation of depression is 20-35, prevalence of geriatric depression can also be seen among individuals aging 55 and above. Mr. G, during the interview had opined about the usage of these antidepressants as, in the case of Mild Depression, non-pharmacological techniques are way better than the pharmacological methods used for the treatment, as it is less severe and the reasons behind depression are primarily the lack of coping skills. Although, when it comes to treating Moderate Depression, the severity is more, for this reason, SSRIs or the SNRIs can be prescribed for the client depending on the tolerability of doses along with the psychotherapies being given. When it comes to more severe forms of depression, higher dysfunctionality, chronicity, and most importantly treatment resistance among the clients is noticed, therefore, the pharmacological methods of treatment are used primarily. Once the crisis situation has been managed, psychotherapies are given to improve their coping skills. According to Mr.G the side effects of antidepressants varies from patient to patient. Nonetheless, the primary side effects of antidepressants what we observe usually are nausea, vomiting, abdominal discomfort, weight gain, bloating, and gaseous abdomen. Other side effects which are much milder in intensity and can be managed with other medications are associated anxiety, switch phenomenon, neurological side effects, and bleeding disorders. The next question was “can psychotherapies alone be given without antidepressants in treating a person suffering from depression”? The answer recorded was as follows, yes therapeutic approaches alone can be used but only in the treatment for the mildest forms of depression or those who are in the maintenance stage of chronic depression. As stated by Mr. G, the primary line of management with depression is to reduce the severity of the symptoms, prevention and the management of the crisis situation, management of the associated conditions related to depression which is accomplished with the help of antidepressants. The last question been asked was “according to you, are antidepressants the best form of therapy?” for which the answer recorded was as follows, no, antidepressants are not completely the best form of therapy, rather a blend of both pharmacotherapy and psychotherapy must be used in treating the more severe forms of depression such as Major

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

Depressive Disorder. However, psychotherapies alone can be given in treating the mildest forms of depression.

Ms. S is a clinical psychologist who works in a very reputed hospital. The interview was started with a statement-based question that “women are more prone to be diagnosed with depression”, do you agree with this statement? If yes, why. The answer, according to her was, yes they are, usually mental illness in women are diagnosed later, and hence the precipitating factors can be mostly disturbed marital relationships, domestic violence, or due to some traumatic incidents. However, men are also diagnosed with depression, but the prevalence may be too less due to the stigmatization by the society. According to many researchers, the occurrence of depression in males can be seen in their adolescence or early adulthood stages. Hence, the report of depression is more in women, but the prevalence may be equal. As per Ms. S experience, women between the ages of 30-45 are more prone to be diagnosed with depression, while in males it is 25-35. The risk of suicide is more in males than in females. The next question been asked was “are antidepressants used only in the treatment of Major Depressive Disorder or these can be used to treat other forms of depression too?”, for which the answer was as follows, the antidepressants can be used in treating other forms of depression too including mixed anxiety and depression, depression with psychotic symptoms or without psychotic symptoms, OCD with depression, RDD, atypical depression. There are some antidepressants used specifically for MDD, where some are used in the dual diagnosis disorders. Though the ones used for treating MDD can be used to treat other forms too. According to Ms.S, when the clients have severe depression with psychotic symptoms, the side effects of antidepressants observed are gaining weight, tremors, and drowsiness which are very common. The next question was “can psychotherapies alone be given without antidepressants in treating a person suffering from depression”? The answer recorded was as follows, yes, psychotherapies alone can be given if the client becomes treatment resistant and does not respond to the antidepressants. Psychotherapies help in a very beneficial way, especially in treating anxiety, depression or neurotic disorders and are not a foreign agent, consequently, do not have any side effects. As stated by Ms. S, by taking antidepressants the client gets immediate relief, mood stability can be seen, has good decision making power, has positivistic view towards the future, improvement in sleep and appetite, and a decline in suicidal thoughts are also seen, whereas psychotherapies takes a lot of time for the client to deal with recovery and healing. The last question been asked was “according to you, are antidepressants the best form of therapy?” for which the answer recorded was as follows, no, a client who is suffering from any severe disorder needs a combination of both pharmacotherapy and psychotherapy in order to deal with recovery. Antidepressants cannot be the best form because ultimately the client has to depend upon a foreign agent completely, yet, initial improvement can be seen, but there are more chances of relapse once the medications being taken are stopped. Thus, people are usually unwilling to take these medications.

Mr. R is a psychiatrist working in a very reputed hospital. The interview was started with a statement based question that “women are more prone to be diagnosed with depression”, do you agree with this statement? If yes, why. The answer, according to him was, yes, as the responsibilities held by a women are more than that of men. Another reason can be their hormonal instability which contributes to their mental health issues and they have double the chances of having depression than men. The next question was “which age group of people are more prone to be diagnosed with depression”, to which the answer was, there is no specific age group. Nowadays, the younger generation are more prone to be diagnosed with having depression. However the psychosocial causes may be different, but every age group

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

is equally prone. Mr. R, during the interview had opined about the usage of the antidepressants as, these are used not only in the treatment of MDD but can be used for treating Bipolar Depression, Dysthymia, and apart from depression these are used for treating anxiety disorders, headaches, OCD, phobias, etc., although the severity matters. Antidepressants are mostly prescribed only when the symptoms of the disorder are severe, otherwise psychotherapies alone can be used in treating any disorder. According to Mr. R the side effects of antidepressants depends on the classification of these. TCAs have more of constipation, dry mouth, blurring of vision, sedation whereas SSRIs have sexual side effects, acidity, gastric side effects. SNRIs have gastric side effects, constipation, dry mouth, increased sedation and drowsiness. Nevertheless, these side effects also depend on the tolerability of the dosage prescribed by the psychiatrists. The next question was “can psychotherapies alone be given without antidepressants in treating a person suffering from depression”? The answer recorded was as follows, no, I don’t think psychotherapies alone can help in treating MDD. Yes, however, I agree that the therapy can be very useful in the treating the mild to moderate forms of depression, but when the severity is more, medication is a necessity. As stated by Mr. R, by taking antidepressants the client gets immediate relief, mood stability can be seen, has good decision-making power, has positivistic view towards the future, improvement in sleep and appetite, and a decline in suicidal thoughts are also seen, whereas psychotherapies takes a lot of time for the client to deal with recovery and healing. The last question been asked was “according to you, are antidepressants the best form of therapy?” for which the answer recorded was as follows, no, antidepressants are not completely the best form of therapy, rather a blend of both pharmacotherapy and psychotherapy must be used in treating the more severe forms of depression such as Major Depressive Disorder. Though, psychotherapies alone can be given in treating the mildest to the moderate forms of depression.

Mrs. M is a psychiatrist working in a very reputed hospital. The interview was started with a statement based question that “women are more prone to be diagnosed with depression”, do you agree with this statement? If yes, why. The answer, according to her was, yes they are, and there are many factors which contribute to it. The first reason is the biological factor which include hormonal changes, pregnancy and child birth. Also, there are many psychological factors, for instance, women are more emotionally expressive than men. Women in the patriarchal societies are more prone to be diagnosed with depression which comes under the social factors. The next question was “which age group of people are more prone to be diagnosed with depression”, to which the answer was middle age. However, she continued, that all the age group of people are equally prone to be diagnosed with depression nowadays. Mrs. M, during the interview had opined about the usage of these antidepressants as, in the case of mild and moderate forms of depression, non-pharmacological techniques are way better than the pharmacological methods used for the treatment, as it is less severe and the reasons behind depression are primarily the lack of coping skills. Although, when it comes to treating more severe forms of depression medications must be prescribed for the early recovery from the symptoms along with psychotherapies for the complete recovery and healing. According to Mrs. M, the side effects of antidepressants varies from patient to patient. Nonetheless, the primary side effects of antidepressants what we observe usually are nausea, vomiting, abdominal discomfort, weight gain, bloating, gaseous abdomen, and drowsiness, which can be cured if the dosage given is properly adjusted by the psychiatrist. The next question was “can psychotherapies alone be given without antidepressants in treating a person suffering from depression”? The answer recorded was as follows, yes therapeutic approaches alone can be used but only in the treatment for the mildest to moderate forms of depression or those who are in the maintenance stage of chronic

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

depression. As stated by Mrs. M, antidepressants are very much effective as the client responds rapidly to these medications. Also, the client is again able to carry out the daily activities in a proper manner, where psychotherapies take a long time to heal and recover a person completely. The last question been asked was “according to you, are antidepressants the best form of therapy?” for which the answer recorded was as follows, no, antidepressants are not completely the best form of therapy, rather a blend of both pharmacotherapy and psychotherapy must be used in treating the more severe forms of depression such as Major Depressive Disorder. The reason behind this is that medications work biologically whereas psychotherapies work on our thinking pattern, that’s why both are necessary in the treatment of a disorder.

Mrs. P is a clinical psychologist who works in a very reputed hospital. The interview was started with a statement based question that “women are more prone to be diagnosed with depression”, do you agree with this statement? If yes, why. The answer, according to her was, yes they are, and she further added that the prevalence of depression among women is more, as emotionality and the thought processes are predominantly associated with the females than the males. Another reasons are hormonal instability, unwanted pregnancy. Hence, the risk of suicide is more in males than in females. The next question was “which age group of people are more prone to be diagnosed with depression”, to which the answer was the middle age of 25-40. In this age, work pressure is more and the individuals have more responsibilities where they have to take care of the family and also that of the career. At this age, men become as the bread earners and the women have to fulfil the household chores and also have to take care of their children. Mrs. P, during the interview had opined about the usage of these antidepressants as, in the case of Mild Depression, non-pharmacological techniques are way better than the pharmacological methods used for the treatment, as it is less severe. When it comes to more severe forms of depression, higher dysfunctionality, chronicity, and most importantly treatment resistance among the clients is noticed, therefore, the pharmacological methods of treatment are used primarily. Once the client gets recovery from the severe symptoms, psychotherapies are given in order to treat the client completely. According to Mrs. P the side effects of antidepressants varies from patient to patient and are very mild in severity. Some of the common side effects are headaches, drowsiness and sedation, gaseous abdomen, loss of appetite. Although, these can be cured with some modifications done in the dosage given by the psychiatrists. The next question was “can psychotherapies alone be given without antidepressants in treating a person suffering from depression”? The answer recorded was as follows, yes therapeutic approaches alone can be used but only in the treatment of mild and the moderate forms of depression. As in the case of severe depression, the best method of treatment is the blend of both medications and psychotherapies. As stated by Mrs. P, firstly we should know what to prescribe and that too where. Antidepressants are very much effective when the severity of the symptoms are more. These provide an immediate relief from such symptoms and help the client in his recovery. The last question been asked was “according to you, are antidepressants the best form of therapy?” for which the answer recorded was as follows, antidepressants are very much important in treating an individual suffering from severe depression, but these are not the best form of therapy as they have many side effects and once these are stopped, there are more chances of relapse. According to me, the blend of psychotherapy and pharmacotherapy can be the best form, where medications are prescribed first and once the severity reduces, therapeutic approaches are used for the complete recovery of the client.

## DISCUSSION

This qualitative study highlights the impact of antidepressants and whether these can be used as the only form of treatment for MDD. An antidepressant is a psychiatric medication used to assuage mood disorders such as major depression and dysthymia. Though everyone experiences periods of sadness at certain point in their lives; depression is distinguished from this sadness, once symptoms are existent for a period of at least two weeks. Antidepressants are often the first choice of treatment for depression [Smalley. (1984)]. In many cases, these can be prescribed to treat other health conditions such as anxiety, pain, and insomnia. Antidepressants interact with neurotransmitters in numerous ways. They can alter the rate at which the neurotransmitters are either created or broken down within the body [Hall and Nugent. (1992)]. They can block the process by which neurotransmitters are recycled and reused, a process called “reuptake”, by blocking reabsorption of neurotransmitters into the nerve cells. Finally antidepressants can interfere with the binding of a neurotransmitter to neighbouring nerve cells, thus leaving the neurotransmitter available [Rosowsky. (1984)]. Newer groups of antidepressants regulate the level of serotonin and an additional neurotransmitter, the best known, serotonin and norepinephrine reuptake inhibitor (SNRI) is venlafaxine. Bupropion is a serotonin and dopamine reuptake inhibitors (SDRI) [Rosowsky. (1984)]. Cyclic antidepressants are used for the treatment of depressive mood disorders, primary major depression. Additionally, imipramine is used in children to treat functional enuresis bed wettings [Maes. (2001)].

In this study, we explore into both the pharmacological and the therapeutic approaches of treatment for depression. The population of the study included both psychiatrists and clinical psychologists. A total of 5 participants were interviewed for the study. To begin with, I shall explain the effectiveness of the antidepressants with respect to other methods of treatment. One study has associated the effectiveness of antidepressants with respect to non-pharmacological treatment and two studies have compared antidepressants with electroconvulsive therapy for treatment of depression. Another study compared antidepressants with both electro convulsive therapy (ECT) and non-pharmacological treatment. Two studies have also studied the effectiveness of antidepressants in common mental disorders. One study showed that treatment completion rates were higher with fluoxetine than imipramine. The trial by Patel et al. included subjects with common mental disorders and evaluated the outcome at one year. It can be considered the longest study which has evaluated the efficacy of antidepressant in Indian subjects. Tranquilizing and anti-depressive drugs are effective in the treatment of psychotic disorders. This is the conclusion that emerges from a review of more than 400 research investigations (David, 1965). Some recent quantitative research suggests that antidepressant medication is superior to placebo only for patients with very severe depressive symptoms, with negligible treatment effects observed for those with less severe symptoms (Fournier et al., 2010). Participants too had opined about the effectiveness of antidepressants. To quote them, they mentioned “the primary line of management with depression is to reduce the severity of the symptoms, prevention and the management of the crisis situation, management of the associated conditions related to depression which is accomplished with the help of antidepressants’. Also they had stated about the usage of these antidepressants. The participants mentioned, “Antidepressants can be used in treating other forms of depression too including mixed anxiety and depression, depression with and without psychotic symptoms, OCD with depression, RDD, atypical depression, Bipolar Depression, and Dysthymia”.

Through the interview process, I also got to know the side effects of antidepressants. Participants mentioned, “The side effects varies from patient to patient. Nonetheless, the

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

primary side effects of antidepressants what we observe usually are nausea, vomiting, abdominal discomfort, weight gain, bloating, and gaseous abdomen". Another participant said, "When the clients have severe depression with psychotic symptoms, the side effects observed are gaining weight, tremors, and drowsiness which are very common". One other participant said, "The side effects depend on the classification of antidepressants. TCAs have more of constipation, dry mouth, blurring of vision, sedation whereas SSRIs have sexual side effects, acidity, gastric side effects. SNRIs have gastric side effects, constipation, dry mouth, increased sedation and drowsiness". The big danger of going off antidepressants is the risk of relapse. People who have had one episode of depression have a 50% chance of having a second. Those who have had two episodes have an 80% chance of having another. Staying on antidepressant medication can cut the risk of relapse in half, according to a review of 15 clinical trials published in 2014 in the *Journal of Clinical Psychiatry*. Some recent studies have suggested serious potential risks. People who used antidepressants had a 14% higher risk of heart attacks and strokes and a 33% greater risk of death, according to findings in a meta-analysis of 17 studies that was published in 2017 in the journal *Psychotherapy and Psychosomatics*.

This study also explores whether psychotherapies can be used as the only form of therapy. Participants had mentioned, "Yes, therapeutic approaches alone can be used but only in the treatment for the mildest forms of depression or those who are in the maintenance stage of chronic depression." Another participant said, "Yes, psychotherapies alone can be given if the client becomes treatment resistant and does not respond to the antidepressants. Psychotherapies help in a very beneficial way, especially in treating anxiety, depression neurotic disorders and are not a foreign agent, consequently, do not have any side effects." One participant had added, "I don't think psychotherapies alone can help in treating MDD. Yes, however, I agree that the therapy can be very useful in treating the mild to moderate forms of depression, but when the severity is more, medication is a necessity." Another participant said, "Yes, therapeutic approaches alone can be used but only in the treatment of mild and the moderate forms of depression. As in the case of severe depression, the best method of treatment is the blend of both medications and psychotherapies."

Now we shall be exploring, whether antidepressants are the best form of therapy or not. Studies indicate that the benefit largely depends on the severity of the depression: The more severe the depression, the vaster the benefits will be. So particularly, antidepressants are operative against chronic, moderate and severe depression. They don't help in mild depression. Studies also suggest that depressed people who stop taking tricyclics immediately after obtaining relief have a 40 to 50 percent chance of relapse within six to twelve months. If patients continue to take the drugs for several months after being free of depressive symptoms, however, their chances of relapse apparently decrease to approximately 20 percent (Montgomery et al., 1989; Prien & Kupfer, 1986; Klerman, 1978; Weissman & Klerman, 1977). There has long been a belief that antidepressants have delayed onset of action and that clinicians and patients need to wait 6–8 weeks before evaluating whether the antidepressant is having an effect (Taylor, 2007). Several recent studies have provided additional evidence for early onset of antidepressant effects. Stassen et al. (2007) conducted a pooled analysis (N=2848 patients) of RCTs involving 7 antidepressants and placebo, and found that the mean time to onset of improvement was within 2 weeks. A classification-based approach of data from Tranter and colleagues' study suggests that if an early change in positive processing is not seen with antidepressant treatment, patients have little chance of responding to this same treatment later. A similar effect was seen in older adults in which a group of patients with depression who did not

## Beliefs Related to the Efficacy of the Antidepressant Medications: An Exploratory Research

show an improvement in the recognition of happy faces after 1 week of citalopram treatment also did not respond after 8 weeks of treatment. Participants had mentioned, “No, antidepressants are not completely the best form of therapy, rather a blend of both pharmacotherapy and psychotherapy must be used in treating the more severe forms of depression such as Major Depressive Disorder. However, psychotherapies alone can be given in treating the mildest forms of depression”. Another participant said, “No, a client who is suffering from any severe disorder needs a combination of both pharmacotherapy and psychotherapy in order to deal with recovery. Antidepressants cannot be the best form because ultimately the client has to depend upon a foreign agent completely, yet, initial improvement can be seen, but there are more chances of relapse once the medications being taken are stopped. Thus, people are usually unwilling to take these medications”. One other participant said, “Antidepressants are very much important in treating an individual suffering from severe depression, but these are not the best form of therapy as they have many side effects and once these are stopped, there are more chances of relapse. According to me, the blend of psychotherapy and pharmacotherapy can be the best form, where medications are prescribed first and once the severity reduces, therapeutic approaches are used for the complete recovery of the client”. A recent analysis by Sado et al. (2009) shows that combined therapy for depression appears to be cost-effective from both health care system and social perspective.

### CONCLUSION

The aim of this study was to know whether antidepressants are the best form of therapy or not. Data collected from different sources and our participants who were clinical psychologists and psychiatrists working in various hospitals, concluded that only the use of antidepressants cannot completely cure an individual who is suffering from major depression. Rather a blend of pharmacotherapy and psychotherapy must be used where the medications will help in reducing the severity of the symptoms and the therapeutic approaches will further recover and heal the individual completely.

## Valmiki's Ram: A Personification Of Righteousness And Moral Development

[Neha Singh](#) , [Dr. Hanan Khalid Khan](#)

### Abstract

Valmiki's Ram is an incarnation of lord Vishnu in human form. Rama's journey is imbued with symbolism. In Hindu Mythology life of lord Ram is a treasure that conceptualises and discerns the world with the idea of life. Rama's life is much more complex than a battle between good or evil. He is an exemplar who takes birth to incorporate both mortals and immortals. Rama is symbolised as "Superior being" or the "Enlightenment". He takes life as it comes to him. He deals with his situations with his conduct. He is a virtuous human who adorns himself with his self control. He gives us solutions for our every question. He guides us how to live our life, how to triumph over desires and how to achieve inner peace. This paper pulls us back to our roots to push us forward in terms of morality and reality and to teach us that some things are not outdated but they are the fundamentals of life. In modern times we all face dilemmas and fall prey to stress depression as we don't know how to deal with them. Ram through his journey tells us and sails us through these dilemmas by following virtues.

# CONCEPT OF ALIENATION IN SHASHI DESHPANDE'S *THAT LONG SILENCE*

Akansha Khatri, Dr. Swati Sharma

M.A. II English, Assistant Professor

Department of English

Lingaya's Vidyapeeth, Faridabad, India

**Abstract:** Women have been alienated as a result of being disadvantaged in patriarchal societies. Alienation is described as "a term used with various meanings in philosophy, theology, psychology, and the social sciences, usually with emphasis on personal powerlessness, meaninglessness, cultural estrangement, social isolation, or self-estrangement" in the Encyclopedia Britannica. An individual's sense or state of separation from himself, others, and the outside world is implied by the term "alienation." "Anomic" and "anomia" are two of the Greek terms meaning estrangement. "Anomie" relates to social alienation, whereas "anomia" stands for self-alienation. The two most fundamental types of alienation are, in fact, alienation from oneself and alienation from society. A situation of alienation from oneself or is said to exist when a person's spontaneous individual self has been stunted or suppressed. An alienated individual is stranger to both himself and to other people. Both anomie and anomia affect the major character of Shashi Deshpande's *That Long Silence*.

**Index Terms-** Alienation, Indian literature, Women

## INTRODUCTION

Women have been denied the freedom to live as they choose from ancient times. Women have been made to live a life of dependence under the authority of males. Even education has not fundamentally altered their life, despite the fact that it has brought about certain changes. Whether they are housewives or working women, they are not living lives of their own choice. Although, there have been changes with the times, at least in the case of educated metropolitan women; from being little more than puppets, yet there is scope of betterment.

### Estrangement in Deshpande's heroines

Generally, the characters of Deshpande are contemporary Indian women who are very sensitive, clever, and educated. They experience alienation because, if they follow their hearts and minds, they are labelled as unworthy daughters, sisters, and wives, and they become estranged from society and other family members. On the other hand, if they adhere to male ideals of the traditional woman, they experience internal alienation. Deshpande's heroines therefore attempt to choose a middle course so that they may carry out their household or social responsibilities without significantly sacrificing their personal goals and ideals. As a result, Deshpande's handling of estrangement in her female characters has a unique complexity. Unlike Anita Desai's characters, her heroes either commit suicide nor go into self-exile as a result of a crippling sense of alienation.

For a man to be conscious of himself as an individual, alienation may be a necessary condition. It allows him the chance to answer questions about his fundamental identity and what he should do or not do in a more general sense. On the contrary, "heroines of Shashi Deshpande" are put on the path to self-discovery when specific conditions are met. Their sense of estrangement from both oneself and people around them serves as the starting point for the process. Beyond a secondary sex, everyone tries to understand who they are. Younger generations of Deshpande's women reject the stereotype of staying at home to care for their spouse and children while submissively taking whatever comes their way. They favor taking charge of their own destiny. Even if they sometimes struggle with it and are forced to make concessions, they finally come to a greater knowledge of who they are and what their lives are all about.

### **Patriarchal Society and Women**

Although women have taken up professional professions, they are nonetheless bound by the roles that patriarchal society has historically allocated to them. Their minds are now split as a result of this. The female characters in Shashi Deshpande's works experience a prolonged period of mental anguish and self-doubt as a result of this crisis, but they eventually manage to get through it and achieve a state of mental stability. They neither entirely abandon the established order nor do they lose their uniqueness. Charu Chandra concurs with Deshpande's definition of feminism, in which achieving one's own identity is weighed against family and work responsibilities. However, harmonizing the relationship between men and women as equal partners is necessary. "Beauvoir's understanding of complicity in *The Second Sex*, before evaluating Susan James's interpretation of complicity in terms of seventeenth-century accounts of slavery and republican freedom, which emphasizes the dependent situation of women as the primary cause of their complicity." (Knowles 243)

For women in Indian society, patriarchal discrimination is a more complex phenomenon. Despite the fact that this topic has received much debate at conferences, panel discussions, seminars, etc., prejudice still exists across the globe. Few women attempt to overcome these challenges despite the bias. These women seek to establish themselves in all of the traditionally male-dominated industries. It is evident that many women succeed in the twenty-first century in a variety of sectors, including literature, art, politics, science, and technology. Only when certain feminist writers began exposing the unseen hardships of the impacted women, these changes become apparent. Many women continue to experience pressure. In Indian society, prejudice is still a problem

Shashi Deshpande through her writing style speaks up in support of women and thinks that women are also humans just as males. She speaks on behalf of the cause, emphasizing the need for focus in order for the oppressed women to escape. She explores the internal struggles of her heroines and presents the truth of their circumstances. "The correspondence columns of women's magazines provide good examples of what they talk about; one can hardly imagine a 'lonely hearts' column for men only; men meet in the world, which is their world, while women have to define, measure, and explore their social domain; their correspondence deals especially with beauty counsel, recipes for cooking, directions for knitting; and they ask for advice; through propensity for chatter and self-display genuine anxiety sometimes emerges." (Rathi 31)

### **Exploration of Women's Challenges through *That Long Silence***

Deshpande utilized "silence" as a symbol in her book *That Long Silence*, which is the patriarchal emblem. The story of man's supremacy and the idea that women are the embodiment of all virtues are both explored in the book. Eloquence and loudness are not considered to be characteristics of Indian women in the society, which is clearly male-oriented. In the end, the lady controls herself to remain silent and endure everything, which causes her to go extinct. Through her book, Deshpande encourages the protagonist to flee patriarchy and the realities of life. Jaya, the main character, is shown as a writer who has started a typical role of a woman today as a wife and mother has hidden her existential self. Because expressive women characters must endure in a culture of quiet, they are very challenging to create. By giving her protagonist a wealth of creative skill, Deshpande has been able to overcome this challenge.

Women are educated to understand that this second-class status is not imposed on them automatically by their naturally 'feminine' relatives but rather by powerful, historically male-dominated environmental factors that have shaped societal norms and educational systems. In other words, woman is nothing without a man and is therefore only permitted to adopt a committed, submissive, or subordinate position in the dominant phallogocentric culture, also

known as patriarchy, which is a society that is dominated or overly controlled by males. The woman has obviously been continually exploited and marginalized, which has led to the restriction of her social, political, intellectual, emotional, and economic independence. Shashi Deshpande aims to highlight the ethical norms that have steadily deteriorated in marriage by concentrating on this connection. The current custom teaches women to take up subordinate roles in the home. Her books depict the prevalent patriarchal system and the enormous battle that newly empowered Indian women face in order to be a part of it.

The heroine Jaya, a middle-class, middle-aged Bombay housewife, tells her story in *That Long Silence*. The dissatisfaction and isolation felt by Indian women are intended to be shown by Shashi Deshpande. The clash between modernity and tradition affects her characters. Their issues adjusting to marriage and their search for identity are the root of this alienation. Women who are seeking their own voices are the protagonists in Shashi Deshpande's works. For both men and women, marriage is crucial. However, women do not have same freedom that males have. Patriarchy frequently use it as a tool to put pressure on women. One of the oddities of Indian life is the meaninglessness of husband-wife relationships. Many times, only women make an effort to strengthen the relationships. Women are the ones who must endure all hardship while yet making an effort to keep the marriage together in quiet. The heroines of Shashi Deshpande look to marriage for some form of security. Women choose marriage over the bondage that society forces on spinsters since it is not only required by the family but also seen as a better option by the women. They quickly become aware of their loss of freedom. With new duties come new bonds, to which people must become used to for the rest of their lives. They experience a sense of loneliness and are left feeling empty because they are caught in a struggle between the conventional role of the wife and a search for individuality.

Shashi Deshpande's female narrators go beyond their gender to examine the masculine mentality, as several critics have shown. It is debatable if Shashi Deshpande is a feminist or not because she dislikes having her writing categorized as feminist fiction. Typically, a book is the author's own work and vision, which is entirely subjective. The personal opinions of Shashi Deshpande on marital discord are presented in *That Long Silence*. There is truth in the statement that each Indian woman may discover her own silence in Jaya's silence.

Jaya, the novel's narrator and protagonist, is the major subject of attention. A smart lady with strong academic credentials and a job as a writer, Jaya is this novel's heroine. However, none of her attributes earned her a decent standing in Mohan's eyes. Despite the housewife and unsuccessful writer Jaya's delicate emotional swings, pleasure and misery, she is constantly at the quiet level in the story. While Mohan, her spouse, is a conservative with deep roots in traditions, and Jaya is pro-modern, they are diametrically opposed. Due to these disparities in viewpoint and attitude, they are unable to comprehend one another. Regarding the place of women in families, Mohan holds a traditional viewpoint. His image of the perfect lady is one that prioritizes her family above her job and takes care of the home. But Jaya believes that being married is like living in a cage. They are separated by the tension between being oneself and playing the traditional roles of "good daughter," "good mother," and "good wife." The husband and wife's quiet grows longer as they retreat to their Dadar flat. In an instance of workplace corruption, Mohan is engaged. He is the subject of an investigation, and is instructed to remain silent until the matter is resolved. As a result, they are staying hidden in a little flat in Dadar.

She is given the chance and time to think back on her life. She considers her importance in Mohan's life as well as her position as a daughter-in-law, sister, wife, mother, friend, and writer, among other things. She has also taken her kids Rahul and Rati on trips. She feels isolated as she views her marriage as a pointless exercise in being together. She seems frustrated, and it comes over in her remarks.

“We lived together but there had been only emptiness between us.” (Deshpande 185)

Jaya has concerns about her own identity and her marriage. As Jaya delves deeply into her old memories, she comes to the realization that she has lost herself. In many respects, Mohan (her husband) has crushed her desire to forge her own identity. He has also changed her environment and connections. Mohan has diminished her sensitivity, she realizes. The hollowness of contemporary Indian life is demonstrated by Shashi Deshpande in this masterpiece. Jaya finds refuge in her neurosis and shirks responsibilities rather than dealing with a difficult scenario.

Self-discovery is sparked. Her aloofness in this difficult familial circumstance has the effect of making their marriage unstable. Jaya would frequently laugh aloud, but she would never dare to laugh in front of Mohan. Jaya, a brave and daring individual, attempts to be like Suhasini, a helpless lady who always need male assistance. What actually makes her feel sorry for herself is that she engaged in behavior for which she would ordinarily feel ashamed.

The reader is deeply uneasy as a result of Jaya's heartbreaking stillness. She is so preoccupied with the issue of who she is that she is unable to identify herself. Her wavering mental condition reflects her feminine problem. She is committed to ending the "Long Silence." She has two children and is a married woman named Mohan, yet she lives alone. She is tormented from the inside out because her husband cannot comprehend her emotions. It is challenging for a modern, educated woman to grant her husband's every request. Jaya's character may be seen in the majority of Indian women. "Jaya, the happiness of your husband and home depends entirely on your." (138) In spite of her rejection of the stereotype of conventional women like Sita, Savitri, and Draupadi, Jaya wants to play the part of the silent victim.

"No, what have I to do with these mythical women? I can't fool myself the truth is simpler. Two bullocks yoked together... it is more comfortable for them to move in the same direction. To go in different directions would be painful; and what animal would voluntarily choose pain?" (12)

In order to describe the Indian marital system, Shashi Deshpande chooses appropriate imagery.

While considering her marital life, Jaya realizes about her frustration and isolation. Arrangements were made for Jaya's marriage. The pair did not communicate, just like in other Indian marriages. In spite of financial pleasures, her marriage life devolved into a pattern of routine. Over the course of their 17-year marriage, she has been a submissive, quiet spouse. She struggles with being stupid and mute after the marriage. "My mother never raised her voice against my father however badly he behaved to her." (83) The mentioned statement depicts the situation of a woman who did not have courage to raise voice against behaviour that she did not deserve just because she was born a woman.

"We can always hope without that, life would be impossible. And if there is anything I know now it is this; life has always to be made possible." (193)

All characters seek a companion within the boundaries set by society since they are all in need of love and affection. Isolation is a side effect of the breach between oneself and companionship. All of the characters; Jaya, Mohan, Kamat, and Rahul—find it difficult to break the silence that serves as a barrier to developing cordial relationships with others and experience psychological estrangement as a result. People appear to find it difficult to express their emotions in the ordinary world since it seems to be filled with feared regularity and boredom.

## Conclusion

In the world of the 20th century, this is a frequent image that alienates people on a psychological and spiritual level. Not only are they left alone physically, but also emotionally. Shashi Deshpande emphasizes not just her personal quiet but also the stillness of each and every character in the book. The work is not just about Jaya's attempts to break the stillness that is strangling her, as Veena Sheshadri clearly points out in her remark. Additionally, it deals with the hopelessness and resignation of women like Kusum, Jaya's mentally ill cousin, Jaya's servant Jaya, and Mohan's mother. Shashi Deshpande has examined how temperamental and emotional mismatch affect man-woman relationships. Women's feelings of suffocation, estrangement, and quiet suffering are depicted in *That Long Silence*.

## Abstract

An oxadiazole derivative 2 was prepared by condensation reaction through cyclization of semicarbazone in the presence of bromine; the structural confirmation was supported by <sup>1</sup>H and <sup>13</sup>C nuclear magnetic resonance (NMR) spectroscopy, Fourier transform-infrared spectroscopy, and liquid chromatography-mass spectrometry. Its sensing ability towards Ni<sup>2+</sup> ion was examined showing a binding constant of 1.04 × 10<sup>5</sup> compared with other suitable metal cations (Ca<sup>2+</sup>, Co<sup>2+</sup>, Cr<sup>3+</sup>, Ag<sup>+</sup>, Pb<sup>2+</sup>, Fe<sup>3+</sup>, Mg<sup>2+</sup>, and K<sup>+</sup>) using ultraviolet-visible (UV-vis) and fluorescence spectroscopic studies. The minimum concentration of Ni<sup>2+</sup> ions and limit of detection was found to be 9.4 μM. A job's plot gave the binding stoichiometry ratio of oxadiazole derivative 2 vs Ni<sup>2+</sup> ions as 2:1. Furthermore, the intercalative binding mode of oxadiazole derivative 2 with calf thymus DNA was supported by ultraviolet-visible (UV-vis) and fluorescent light, viscosity, cyclic voltammetry, time-resolved fluorescence, and circular dichroism measurements. The molecular docking result gave the binding score for oxadiazole derivative 2 as -6.5 kcal/mol, which further confirmed the intercalative interaction. In addition, the antifungal activity of oxadiazole derivative 2 was also screened against several fungal strains (*C. albicans*, *C. glabrata*, and *C. tropicalis*) by broth dilution and disc diffusion methods. In antioxidant studies, the oxadiazole derivative 2 showed potential scavenging activity against 2,2-diphenyl-1-picrylhydrazyl and H<sub>2</sub>O<sub>2</sub> free radicals.

## 1 | INTRODUCTION

The detection of specific metal ions using a chemosensor is a dynamic and interesting area at this time due to their environmental, clinical, biological, and practical applications.<sup>[1-3]</sup> Most metal ions make necessary contributions to determining and resolving anatomical functions in living systems; however, excessive quantities can cause toxic effects on human health and the environment.<sup>[4,5]</sup> An

important trace element, nickel (Ni), plays a vital role in living organisms especially in the respiratory system, metabolism, and biosynthesis, with the addition of various industrial and commercial applications such as in nickel-cadmium (Ni-Cd) batteries, as precursors for catalysts, in paint as a pigment, and for machinery, electroplating, welding, utensils, etc.<sup>[6-9]</sup> Nickel ions at low concentrations do not create severe health problems, but larger doses or prolonged inhalation may be toxic, even carcinogenic, and

can severely affect the excretory, circulatory, respiratory, and central nervous systems.<sup>[10]</sup> Excess concentrations of nickel ions can substitute for other metal ions in enzymes and proteins, or ions can bind to cellular compounds resulting in toxic effects on biological functions.<sup>[11]</sup> To detect Ni<sup>2+</sup> ions, numerous analytical methods have been used such as atomic absorption spectroscopy (AAS), inductively coupled plasma-atomic emission spectroscopy (ICP-AES), flame photometry, flame atomic absorption spectrometry-electrothermal atomization (AAS-ETA) and microwave-induced plasma.<sup>[12–14]</sup> However, these instrumentation techniques are expensive, time-consuming, use sophisticated instrumentation, and need large analysis time, indicating the requirement to search for new methods for metal analysis. In recent years, appropriate photophysical methods have attracted great attention because of their fast response, low cost, high selectivity, sensitivity, noninvasiveness, and convenience.<sup>[15–17]</sup> Derivatives containing heterocyclic rings are a very interesting research area for scientists due to their fascinating biological activities, especially in the area of drug design and development. Nitrogen-containing heterocyclic analogues, such as oxadiazoles, have been studied on a large scale because of their extensive pharmaceutical applications; consequently many of their derivatives have been under clinical investigation as medicines for various diseases.<sup>[18–21]</sup> Among the -N and -O heteroatom-containing oxadiazoles derivatives, drugs containing 1,3,4-oxadiazole moieties have had more consideration in research due to the presence of theirazole moieties, responsible for the lipophilicity of the drug. Substitution of some heterocyclic moieties to 1,3,4-oxadiazole is a very optimistic methodology to overcome numerous drawbacks such as drug resistance, toxicity, and many additional adverse properties. These molecules exhibit significant activities such as the inhibition of growth factors and enzymatic processes. Therefore, the hybrids of heterocycle derivative 1,3,4-oxadiazole have a significant place in the innovation of new bioactive medicines.<sup>[22,23]</sup> Amino group substitution at the fifth position on the 1,3,4-oxadiazole ring has generated substantial therapeutic and material attention, recognized by increased numbers of research publications and patents. Oxadiazole compounds display various biological actions such as antibacterial, anti-HIV, antimicrobial,<sup>[24–26]</sup> antifungal,<sup>[27,28]</sup> anticancer,<sup>[29,30]</sup> anti-inflammatory,<sup>[31,32]</sup> and antioxidant activities.<sup>[33]</sup> Oxadiazole derivatives also function in comprehensive applications in light-emitting diodes as organic semiconductors, and in semiconductors as field-effect transistors, and chemical, and electrochemical sensors, etc.<sup>[34–36]</sup> In particular, 1,3,4-oxadiazole derivatives have displayed good photoluminescence properties including high thermal stability and hydrolytic robustness.<sup>[37,38]</sup> With the quality of fluorescence emitters, oxadiazole derivatives also present excellent chemosensing properties towards metal ions.<sup>[39–42]</sup> Based on the above considerations, here we synthesized a novel oxadiazole derivative 2, which exhibited selectivity for Ni<sup>2+</sup> ions and was sensitive towards solvent polarity and pH, etc. In addition to chemosensing behaviours, oxadiazole derivative 2 has drug–DNA binding capabilities through interactions of small molecules with DNA. DNA–drug interactions were investigated using UV–vis spectroscopy, fluorescence

spectroscopy, circular dichroism (CD), cyclic voltammogram (CV), and viscosity measurements. In addition we examined antifungal activity against *Candida* species and antioxidant scavenging properties using 2,2-diphenyl-1-picrylhydrazyl (DPPH) and H<sub>2</sub>O<sub>2</sub> free radical assays.

## 2 | EXPERIMENTAL

### 2.1 | Reagents and instruments

All the reagents, salts, and instruments used are mentioned in the Supporting information.

### 2.2 | Synthesis and characterization of compounds (1 and 2)

#### 2.2.1 | (E)-1-([5-Bromothiophen-2-yl]methylene) semicarbazide (1)

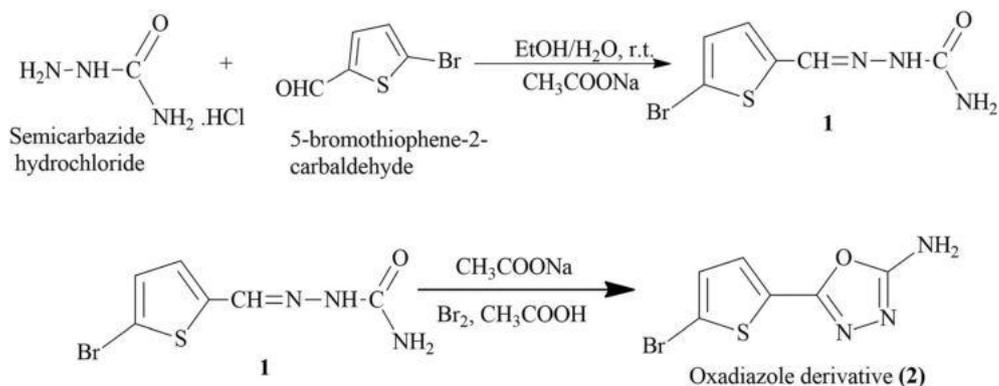

To the stirred solution of 5-bromothiophene-2-carbaldehyde (1.18 g, 10 mmol) in ethanol sodium acetate (0.82 g, 10 mmol) and semicarbazide hydrochloride (1.11 g, 10 mmol) were slowly added into the ethanol/water solution. The resulting reaction mixture was refluxed at 40°C for 2 h and the obtained precipitate of semicarbazone (1) was purified with ethanol and dried under vacuum.

Off-white solid; molecular formula: C<sub>6</sub>H<sub>6</sub>BrN<sub>3</sub>OS, yield: 91%. Melting point: 205°C. FT-IR (cm<sup>-1</sup>): 3445 and 3271 (N–H primary amide); 3105 (N–H secondary amide); 1645 (C=O); 1572 (HC=N); 798 (C–Br). <sup>1</sup>H NMR (300 MHz, DMSO-d<sub>6</sub>) δ (ppm): 10.34 (s, CH=N, 1H), 7.951 (s, 1H, -NH), 7.15–7.20 (dd, aromatic-H, 2H), 6.33 (s, -NH<sub>2</sub>, 2H). <sup>13</sup>C NMR (75 MHz, DMSO-d<sub>6</sub>) δ (ppm): 156.18, 141.45, 133.88, 130.92, 129.14, 112.96. MS (m/z): 248.9 [M + 1]<sup>+</sup>.

#### 2.2.2 | 5-(5-Bromothiophen-2-yl)-1,3,4-oxadiazol-2-amine (2)

The solution of semicarbazone 1 (2.48 g, 10 mmol) in 10 ml glacial acetic acid was added to sodium acetate (1.64 g, 20 mmol) in 20 ml glacial acetic acid with continuous stirring and 5 ml of bromine solution from stock solution (20 ml Br<sub>2</sub> in 50 ml glacial acetic acid) was added slowly with the help of a dropping funnel by continuous stirring. The resulting mixture was then refluxed at 60–70°C with constant stirring for 4 h and, after completion of the reaction, the resulting solution was poured onto crushed ice. The obtained cream precipitate was separated using vacuum filtration, dried, and recrystallized in ethanol. The synthesis of oxadiazole derivative 2 is given in Scheme 1.

Cream; molecular formula: C<sub>6</sub>H<sub>4</sub>BrN<sub>3</sub>OS. Yield: 93%. MP: 215°C. FT-IR (cm<sup>-1</sup>): 3312 and 3115 (primary amine); 1656, 1588, 1510, 1413, 1302 (C–O–C), 799 (C–Br). <sup>1</sup>H NMR (300 MHz, DMSO-d<sub>6</sub>): δ

**SCHEME 1** Synthesis of oxadiazole derivative (2)

(ppm): 7.36 (s,  $-\text{NH}_2$ , 2H), 7.35–7.33 (m, aromatic  $-\text{H}$ , 2H).  $^{13}\text{C}$  NMR (75 MHz,  $\text{DMSO}-d_6$ ):  $\delta$  (in ppm): 163.82, 153.15, 132.19, 128.40, 127.51, 115.17. MS (m/z): 247.95  $[\text{M} + 1]^+$ .

## 2.3 | Chemosensing properties

### 2.3.1 | Sensitivity of metal sensing analysis

A stock solution of oxadiazole derivative 2 at  $1.0 \times 10^{-3}$  M concentration was prepared in different solvents: dimethyl sulfoxide (DMSO), ethyl acetate (EtOAc), *N,N*-dimethyl formamide (DMF), methanol (MeOH), ethanol (EtOH), dichloromethane (DCM) and acetone and further diluted to a concentration of  $1.0 \times 10^{-5}$  M in DMSO and  $\text{H}_2\text{O}$  solution (1:1, v/v) to carry out UV-visible and fluorescence measurements. Stock solutions of various metal nitrates ( $\text{Ca}^{2+}$ ,  $\text{Co}^{2+}$ ,  $\text{Cr}^{3+}$ ,  $\text{Ag}^+$ ,  $\text{Pb}^{2+}$ ,  $\text{Fe}^{3+}$ ,  $\text{Mg}^{2+}$ ,  $\text{Ni}^{2+}$ , and  $\text{K}^+$  ions) of  $1 \times 10^{-3}$  M concentration were prepared and then diluted to  $1 \times 10^{-5}$  M concentration in double-distilled water.<sup>[43]</sup>

### 2.3.2 | Binding stoichiometry study by Job's plot analysis

A constant volume (5 ml) containing a series of solutions of  $\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  and test compound 2 was prepared so that the overall volume of metal ion and chemosensor remained the same. After mixing the metal ions in oxadiazole derivative 2, absorption spectra were recorded using UV-vis spectroscopy at room temperature. From the data obtained from the UV-vis spectra, a Job's plot was drawn between the molar fraction of test compound oxadiazole derivative 2 from 0 to 1.0 in a solution of compound 2 +  $\text{Ni}^{2+}$  at a fixed concentration of  $1 \times 10^{-5}$  M.

### 2.3.3 | Determination of detection limit

The artificial analytical parameter for limit of detection (LOD) of the metal ion by chemosensors was calculated using the standard

deviation (SD) value of the oxadiazole derivative 2 ( $10^{-5}$  M) at  $\sim 10$  times in absence of  $\text{Ni}^{2+}$  ions using absorption titration measurements. After scanning the blank solution of oxadiazole derivative 2, the resulting mixture was titrated with different concentrations of  $\text{Ni}^{2+}$  ions and recorded using UV-vis spectroscopy. A graph was plotted for the absorbance of oxadiazole derivative 2 against  $\text{Ni}^{2+}$  ion concentration. The LOD value was calculated using the following Equation 1:

$$\text{LOD} = 3\text{SD}/s \quad (1)$$

where SD is the standard deviation of oxadiazole derivative 2 (without  $\text{Ni}^{2+}$  ions) and 's' is the slope obtained by the plot of absorbance vs concentration of  $\text{Ni}^{2+}$  ions.<sup>[44,45]</sup>

### 2.3.4 | Association constant determination

The binding constant ( $K_a$ ) for oxadiazole derivative 2 with  $\text{Ni}^{2+}$  ions was calculated by the absorbance titration method using the Benesi-Hildebrand Equation 2:

$$\frac{1}{(A-A_0)} = \frac{1}{\text{Ni}^{2+}} \times \frac{1}{K_a[A_{\text{max}}-A_0]} + \frac{1}{[A_{\text{max}}-A_0]} \quad (2)$$

where A is the absorbance of the compound 2 +  $[\text{Ni}^{2+}]$  mixture,  $A_0$  is the absorbance of oxadiazole derivative 2 only,  $A_{\text{max}}$  is the absorption at a maximum concentration of  $\text{Ni}^{2+}$  ions in the presence of oxadiazole derivative 2.<sup>[46]</sup>

### 2.3.5 | Effect of pH

To show the effect of pH on oxadiazole derivative 2 with and without the addition of  $\text{Ni}^{2+}$  ion, firstly prepared different solutions of oxadiazole derivative 2 ( $10^{-5}$  M) from the pH range 2.0–12.0. Also, the solution of compound 2 +  $\text{Ni}^{2+}$  complex was prepared in different pH range from 2.0 to 12.0 in DMSO and  $\text{H}_2\text{O}$  solution (1:1, v/v), after the formation of separate pH solutions recorded

the absorption spectra by UV-vis spectrophotometry at room temperature.

## 2.4 | DNA-drug interaction studies

### 2.4.1 | Absorption measurements

To investigate the interaction between drug and nucleic acids, the most common optical technique is absorbance spectroscopy that was carried out following the standard approaches described in the literature.<sup>[47-49]</sup> A comparative binding study of oxadiazole derivative 2 with CT DNA in Tris-HCl buffer (50 mM, pH 7.4) solution was first approved through absorption measurement over the wavelength range 200–400 nm. The molar extinction coefficient ( $\epsilon$ ) with a value of 6600 L/mol.cm of CT DNA was used to determine the concentration of the stock solution of DNA at wavelength 260 nm in UV-vis.<sup>[50]</sup> These measurements were done by the addition of different concentrations of oxadiazole derivative 2 (10.0–60.0  $\mu$ M) in a fixed concentration of DNA (10  $\mu$ M) and all the prepared solutions were kept for 10 min before taking absorption spectra. The quantitative interaction of oxadiazole derivative 2 with calf thymus DNA was analyzed by calculation of binding constant using following Benesi-Hildebrand Equation 3:

$$\frac{1}{(A-A_0)} = \frac{1}{K_b[C][A_{\max}-A_0]} + \frac{1}{[A_{\max}-A]} \quad (3)$$

where  $A$  and  $A_0$  are the absorbance values of DNA in the presence and absence of oxadiazole derivative 2.  $A_{\max}$  is the maximum absorbance when saturation occurred;  $K_b$  is the association constant obtained from the intercept to slope ratio, while  $[C]$  is the concentration of oxadiazole derivative 2.<sup>[51]</sup> The calculated value of the Benesi-Hildebrand binding constant ( $K_b$ ) was further used for the calculation of Gibb's free energy ( $\Delta G$ ) to check the spontaneous behaviour of the drug and DNA interaction<sup>[52]</sup> by the following Equation 4:

$$\Delta G = -RT \ln K_b \quad (4)$$

where  $R = 8.3141 \text{ J mol}^{-1} \text{ K}^{-1}$ , and  $T = 298 \text{ K}$ .

### 2.4.2 | Fluorescence titration

The binding affinity of the compound with DNA was further examined using the emission titration method that is widely used to obtain insight into the interactions due to its high selectivity, sensitivity, and convenience.<sup>[53,54]</sup> In this process, increasing amounts of CT DNA (10–70  $\mu$ M) were added to a fixed concentration of oxadiazole derivative 2 (100  $\mu$ M) in 50 mM acidic (HCl) Tris buffer (pH 7.4) for emission titrations. Fluorescence titrations were carried out in the range 300–500 nm after equilibrating the mixture of oxadiazole derivative 2 and DNA for 30 min ( $\lambda_{\max} = 265 \text{ nm}$ ). A graph was plotted from obtained

data for fluorescence intensity vs wavelength. The value of the binding constant ( $K_f$ ) was calculated from the fluorescence titration by plotting the graph of  $\log(F_0 - F)/F$  vs  $\log[C]$  using the following Equation 5:

$$\log \frac{(F_0 - F)}{F} = \log K_f + \log [C] \quad (5)$$

where  $[C]$  = concentration of DNA;  $F$  and  $F_0$  are the fluorescence intensities of oxadiazole derivative 2 in the presence and absence of increasing concentrations of DNA.<sup>[55]</sup>

### 2.4.3 | Viscosity measurement

An Ostwald viscometer was used at room temperature for viscosity measurements of varying concentrations of oxadiazole derivative 2 (0.1–0.5  $\times 10^{-4} \text{ M}$ ) with fixed amounts of CT DNA (10  $\mu$ M). The time of flow of the solutions was measured using a digital stopwatch. To calculate the mean value this experiment was carried out in three replicates to evaluate the viscosity of the DNA with test compound oxadiazole derivative 2. A graph was plotted of relative specific viscosity ( $\eta/\eta_0$ )<sup>1/3</sup> against the concentration of  $[\text{Compound}]/[\text{DNA}]$ <sup>[56]</sup>:

$$\eta = (t_1 - t)$$

$$\eta_0 = (t - t_0)$$

where,  $\eta$  = relative viscosity of oxadiazole derivative 2 with DNA,  $\eta_0$  = relative viscosity of DNA only,  $t_1$  = time of flow of the oxadiazole derivative 2,  $t$  = time of flow of DNA without oxadiazole derivative 2,  $t_0$  = time of flow of Tris buffer.

### 2.4.4 | Cyclic voltammogram

An Ivium potentiostat was used to investigate the DNA and drug interaction through CVs to calculate the redox reaction between oxadiazole derivative 2 in the absence or presence of CT DNA. In this experiment, a gold-plated copper-based electrode was used as the reference and a film of the oxadiazole derivative 2 was used as the working electrode. Electrochemical measurements were recorded at 25°C with or without CT DNA in 50 mM Tris-HCl buffer (pH 7.4). All experiments was carried out at a scan rate of 50 mV/s in the potential range +1.0 to -1.0 V at room temperature.<sup>[57]</sup>

### 2.4.5 | Circular dichroism

The morphological modification that occurs during the DNA-drug interactions was monitored using the most convenient method through CD. Chirascan CD spectropolarimeter was used to record the spectra of DNA in the absence and presence of oxadiazole derivative

2. All the samples were prepared in Tris-HCl buffer and set aside for 30 min to equilibrate before measuring the spectra at wavelength range 200–300 nm with a scan rate of 30 nm/min.<sup>[58]</sup>

## 2.5 | Time-resolved fluorescence measurements

The measurement of fluorescence lifetime was recorded on an Horiba DeltaFlex01-DD spectrophotometer with the excitation wavelength  $\lambda_{\max} = 265$  nm at room temperature. The obtained result gave the information for suitability of decay in a lifetime based on the decreased  $\chi^2$  value and the corresponding residual distribution.<sup>[59]</sup> The tri-exponential function,  $f(t)$  and average fluorescence lifetime ( $\tau_{av}$ ) were used to fit the time-resolved decay curve according to the following Equations (6 and 7):

$$f(t) = \alpha_1 e^{-t/\tau_1} + \alpha_2 e^{-t/\tau_2} + \alpha_3 e^{-t/\tau_3} \quad (6)$$

$$\langle \tau_{av} \rangle = \sum_i a_i \tau_i \quad (7)$$

## 2.6 | Molecular docking study

An *in silico* molecular docking study was performed to explain the interaction behaviour of the proposed drug and protein to predict the experimental interaction site and computational binding of synthesized molecules. The PDB format of 1BNA was downloaded from the RCSB Protein Data Bank ([www.rcsb.org/pdb](http://www.rcsb.org/pdb)) and a PDB file of the ligand was created. AutoDock 4.0, software was used for these experiments, and the empirical scoring function was calculated based on the  $\Delta G$  binding. 1BNA and oxadiazole derivative 2 were loaded into AutoDock software and, with the help of Python script, the PDB file was converted to a PDBQT format. The grid centre was also recognized by centring the grid box on either the minor groove or the intercalation site. From one of the minimum energies, the lowest energy was selected using zero root mean square deviation to obtain the most optimized model. After that, the output results from AutoDock were analyzed using Discovery Studio 3.0 software and PyMOL software. The obtained docking score provides information about the interactions (hydrogen bonding and pi-pi interaction) of the synthesized compounds with active sites of 1BNA.<sup>[60,61]</sup>

## 2.7 | Antifungal activity

The minimum inhibitory concentration values of the oxadiazole derivative 2 for several fungal *Candida* strains (*C. albicans*, *C. glabrata* and *C. tropicalis*) were determined using the broth dilution method as per Clinical and Laboratory Standards Institute (CLSI) guidelines.<sup>[62,63]</sup> The required minimum concentration to decrease the absorbance value by 90% compared with the control is defined as the minimum inhibitory concentration (MIC) (in absence of tested compounds). The screening

of antifungal activity of oxadiazole derivative 2 was carried out as per a previous method.<sup>[64]</sup> The zone of inhibition (ZOI) was measured after 48 h of mixing and fluconazole (10  $\mu\text{g}/\text{disc}$ ) was used as a reference.

## 2.8 | Antioxidant activity

### 2.8.1 | 2,2-Diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity

Here, 1 ml of freshly prepared DPPH solution ( $10^{-4}$  M) in ethanol was added to a 2 ml ethanolic solution of oxadiazole derivative 2 ( $10^{-4}$  M) and the prepared solution was incubated for 90 min at 37°C in the incubation chamber. After the addition of oxadiazole derivative 2 in DPPH, the decrease in absorbance at 517 nm (characteristic peak of DPPH) was recorded, and ethanol was used as a blank for all the measurements. The experiment was performed in a triplicate. The DPPH % scavenging effect was calculated using the following Equation 8:

$$\text{DPPH\%absorption} = \frac{A_{\text{DPPH}} - A_{\text{compound}}}{A_{\text{DPPH}}} \quad (8)$$

$\frac{A_{\text{control}} - A_{\text{sample}}}{A_{\text{control}}}$  where  $A_{\text{DPPH}}$  is the absorbance of DPPH without oxadiazole derivative 2 and  $A_{\text{compound}}$  is the absorbance of oxadiazole derivative 2 with DPPH.<sup>[65]</sup>

### 2.8.2 | Hydrogen peroxide ( $\text{H}_2\text{O}_2$ ) scavenging activity

The  $\text{H}_2\text{O}_2$  scavenging process for the analysis of antioxidant activity was performed according to earlier reported methods.<sup>[66,67]</sup> Here, a 0.4 ml (43 mM) solution of hydrogen peroxide ( $\text{H}_2\text{O}_2$ ) was added to oxadiazole derivative 2 ( $5 \times 10^{-5}$  M) dissolved in 3.4 ml phosphate buffer. The resulting solution was incubated at 37°C for ~15 min and the absorbance value at 236 nm wavelength was recorded, taking the buffer as the blank solution. The percentage inhibition of oxadiazole derivative 2 against  $\text{H}_2\text{O}_2$  was examined using the following Equation 9:

$$\% \text{Inhibition} = \frac{A_c - A_s}{A_c} \times 100 \quad (9)$$

where  $A_c$  = absorbance value of hydrogen peroxide and  $A_s$  = the absorbance value of hydrogen peroxide in the presence of oxadiazole derivative 2.

## 3 | RESULTS AND DISCUSSION

### 3.1 | Chemistry

The FT-IR spectra of oxadiazole derivative 2 were recorded in the range 4000–400  $\text{cm}^{-1}$ . The FT-IR spectra of oxadiazole derivative

2 presented specific peaks at  $3312\text{--}3115\text{ cm}^{-1}$  and  $1659\text{--}1588\text{ cm}^{-1}$ , which were assigned to the primary amine (N-H) attached to the oxadiazole ring and the  $\text{--C=N}$  group in the oxadiazole ring, respectively (Figure S1). The  $^1\text{H}$  NMR spectrum of intermediate compound 1 exhibited sharp signals at 6.33 and 7.95 ppm corresponding to the primary amide ( $\text{CONH}_2$ ) and secondary amide proton ( $\text{CONH}$ ), respectively. The aromatic protons appeared as a doublet of doublet at 7.15–7.20 ppm. In addition, the presence of another peak at 10.34 ppm corresponded to azomethine proton ( $\text{--CH=N}$ ). The signal of the azomethine carbon of compound 1 in the  $^{13}\text{C}$  NMR spectrum was observed at 156 ppm. The signals that appeared between  $\delta$  129 and 133 ppm were attributed to carbon atoms present in the thiophene ring (Figure S2).  $^1\text{H}$  NMR spectrum of oxadiazole derivative 2 for primary  $\text{NH}_2$  was observed at 7.36 ppm. The thiophene proton signals for oxadiazole derivative 2 were observed in the 7.35–7.33 ppm range as a doublet of doublet. The carbon signal in  $^{13}\text{C}$  NMR spectrum of two  $\text{--C=N}$  group appears at 163 and 153 ppm (Figure S2). The mass spectral analysis also confirms the formation of compounds 1 and 2 as shown in Figure S3.

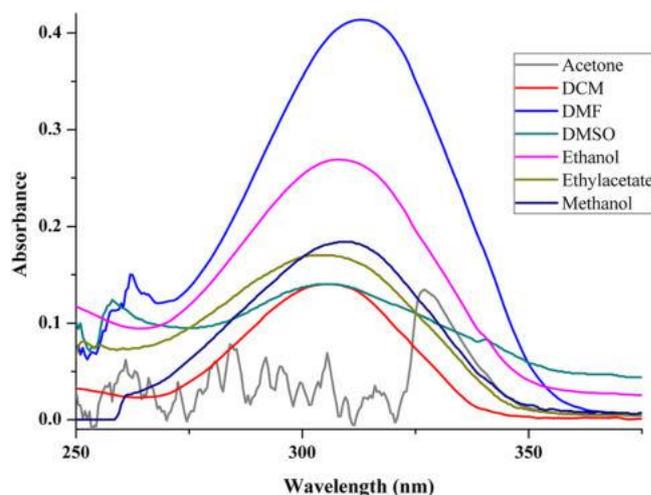

## 3.2 | Chemosensing properties

### 3.2.1 | Sensitivity of oxadiazole derivative 2 with different solvents

The photophysical sensitivity of oxadiazole derivative 2 towards various organic solvents based on polarity (ethanol, methanol, acetone, DMSO, DCM, ethyl acetate, and DMF) was studied to find out the spectral properties using UV–vis spectroscopy. The oxadiazole derivative 2 was dissolved in these solvents and spectra were recorded using UV–vis spectroscopy. Using the obtained data, the spectra of oxadiazole derivative 2 in different solvents are presented in Figure 1 and its photophysical properties such as  $\lambda_{\text{max}}$  and absorbance values are presented in Table 1. From Figure 1, we can see that the absorption maxima of oxadiazole derivative 2 in various solvents increased according to the polarity of the solvents but, for most polar solvent DMSO, the absorbance decreased and exhibited slight shifting (hypsochromic shift) with the maximum broadness in the peak in the absorption spectra. The observed hypsochromic shift in the presence of DMSO indicated that the ground state was more polar than the excited state.

### 3.2.2 | Selectivity of oxadiazole derivative 2 with different metal ions

The chemosensing activity of oxadiazole derivative 2 was accompanied by monitoring the UV–vis absorption spectra in the presence of different metal ions in DMSO or  $\text{H}_2\text{O}$  solution (1:1, v/v). The maximum absorbance value of oxadiazole derivative 2 was obtained at 305 nm. After introduction of metal ions such as  $\text{Ca}^{2+}$ ,  $\text{Co}^{2+}$ ,  $\text{Cr}^{3+}$ ,  $\text{Ag}^+$ ,  $\text{Pb}^{2+}$ ,  $\text{Fe}^{3+}$ ,  $\text{Mg}^{2+}$  and  $\text{K}^+$  (5 equivalents) in the solution of

**FIGURE 1** Absorbance spectra of oxadiazole derivative 2 in different solvents

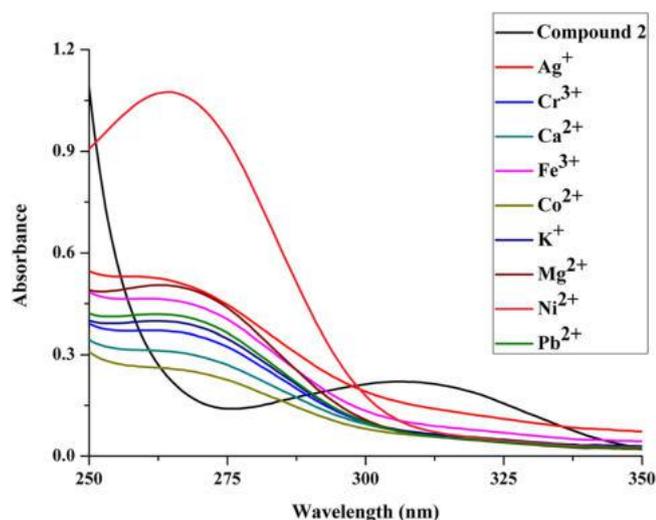

**TABLE 1** Photophysical properties of oxadiazole derivative 2 in various solvents

Solvent	Polarity	$\lambda_{\text{max}}$ (nm)	Absorbance
Ethanol	5.2	308.7	0.267
Methanol	5.1	309.5	0.182
Acetone	5.1	327.3	0.135
DMSO	7.2	305.4	0.140
DCM	3.1	306.4	0.143
Ethyl acetate	4.4	303.8	0.168
DMF	6.4	312.9	0.414

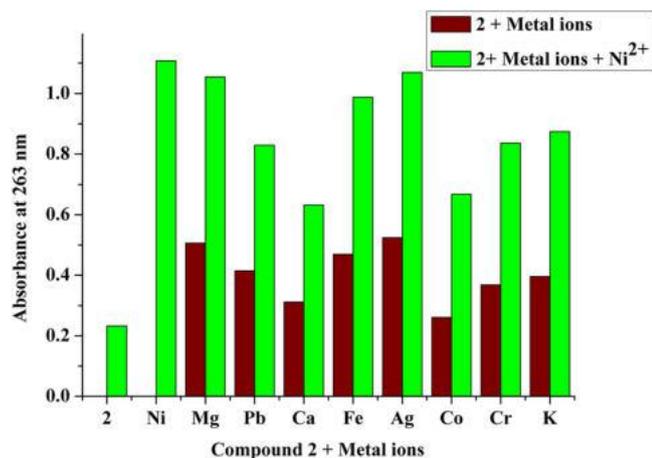

1 equivalent of oxadiazole derivative 2 in DMSO and  $\text{H}_2\text{O}$  solution (1:1, v/v), the absorption spectra of oxadiazole derivative 2 shift from 305 nm to shorter wavelengths at 263 nm with an increase in band intensity that was nearly identical for all metal salts. However, upon the addition of  $\text{Ni}^{2+}$  ions at the same concentration in oxadiazole derivative 2, a maximum increase in absorbance at 263 nm was observed, as shown in Figure 2. Based on the above results, we can propose that, among all the metal salts, the  $\text{Ni}^{2+}$  ions displayed a significantly better sensing ability with oxadiazole derivative 2.

### 3.2.3 | Competitive binding studies of $\text{Ni}^{2+}$

To validate the selectivity of  $\text{Ni}^{2+}$  ions for oxadiazole derivative 2, competitive binding studies were monitored for other tested metal salts ( $\text{Ca}^{2+}$ ,  $\text{Co}^{2+}$ ,  $\text{Cr}^{3+}$ ,  $\text{Ag}^+$ ,  $\text{Pb}^{2+}$ ,  $\text{Fe}^{3+}$ ,  $\text{K}^+$ , and  $\text{Mg}^{2+}$ ) using UV–vis spectroscopic measurements at 263 nm. The absorbance responses of derivative 2 ( $1 \times 10^{-5}$  M) in DMSO and  $\text{H}_2\text{O}$  solution (v/v, 1:1) with the occurrence of equivalent values of  $\text{Ni}^{2+}$  with other interacting metal ions are demonstrated in Figure 3. The results revealed that the enhanced absorbance values of  $\text{Ni}^{2+}$  were not considerably affected compared with other interacting metal cations during the detection of

**FIGURE 2** Absorption spectra of oxadiazole derivative 2 ( $1 \times 10^{-5}$  M) in DMSO and H<sub>2</sub>O solution (1:1, v/v) in the presence of different metal ions ( $1 \times 10^{-5}$  M)

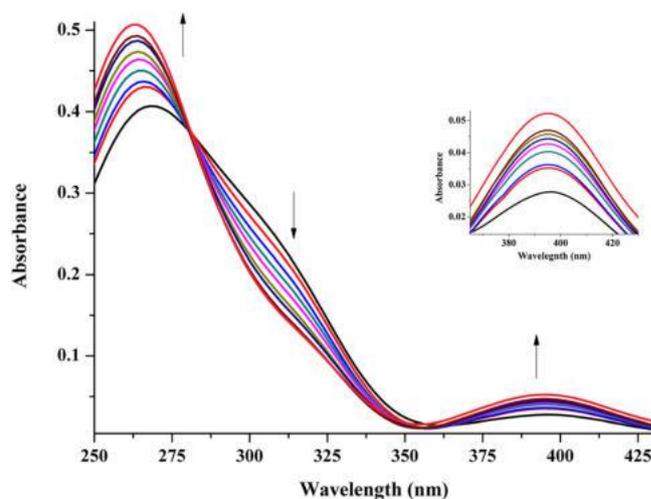

**FIGURE 3** Competitive binding of oxadiazole derivative 2 ( $1 \times 10^{-5}$  M) at 263 nm with the presence of an equivalent value of Ni<sup>2+</sup> ions and other interacting metal cations. The brown bars in the graph denote the addition of metal ions in the solution of oxadiazole derivative 2, whereas the green bars denote the Ni<sup>2+</sup> ions with oxadiazole derivative 2 in the presence of other interacting metal ions

Ni<sup>2+</sup>. These outcomes noticeably implied that derivative 2 displayed a high selectivity towards Ni<sup>2+</sup> ions compared with other competitive metal ions.<sup>[68]</sup>

### 3.2.4 | Concentration variation of Ni<sup>2+</sup> with oxadiazole derivative 2

#### Absorbance spectroscopic studies

The effect of concentration variation of Ni<sup>2+</sup> ions with oxadiazole derivative 2 was monitored using UV-vis spectroscopy and based on the change in absorption intensity after complexation with increasing concentrations of Ni<sup>2+</sup> ions (1.0–9.0 μM). With the successive

**FIGURE 4** Absorption spectrum of oxadiazole derivative 2 in DMSO and H<sub>2</sub>O solution (1:1, v/v) at different Ni<sup>2+</sup> ion concentrations (1.0–9.0 μM). The zoom view of the spectra in the region 365–430 nm is given in inset

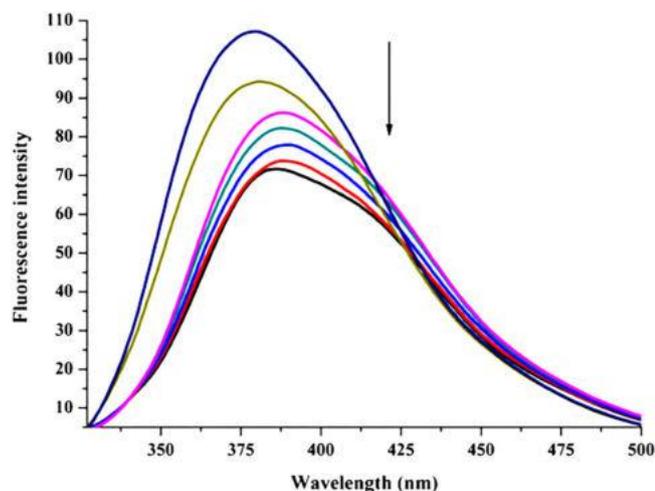

addition of Ni<sup>2+</sup> ions in a fixed amount of oxadiazole derivative 2, the absorbance at 305 and 263 nm progressively decreased and increased, respectively; a new isosbestic point at 280 nm represented the formation of a new complex between oxadiazole derivative 2 and Ni<sup>2+</sup> ions (Figure 4). The successive increase in absorption at ~263 nm occurred due to complexation between oxadiazole derivative 2 and Ni<sup>2+</sup> ions. Additionally, a new increased absorption band at 393 nm appeared with the successive addition of Ni<sup>2+</sup> ions to oxadiazole derivative 2.

#### Fluorescence spectroscopic measurement

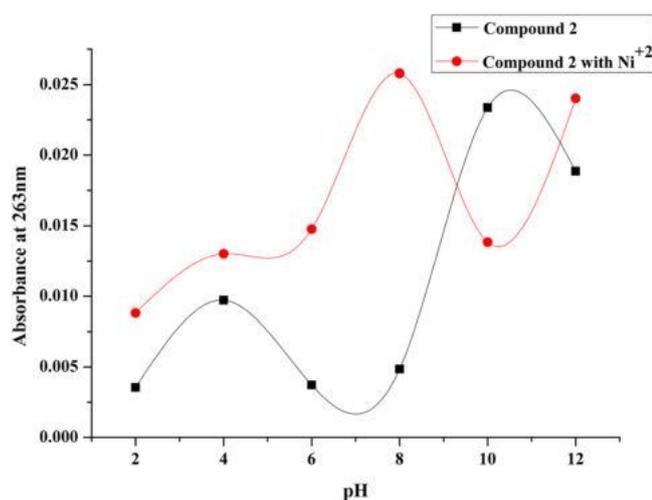

The sensitivity of oxadiazole derivative 2 in solutions of DMSO and H<sub>2</sub>O (1:1, v/v) towards Ni<sup>2+</sup> ions was further examined by fluorimetric titrations by the continuous addition of Ni<sup>2+</sup> ions (1.0–7.0 × 10<sup>-5</sup> M).<sup>[69]</sup> The emission spectrum of oxadiazole derivative 2 showed a representative peak at 375 nm ( $\lambda_{\text{max}} = 263$  nm). The fluorescence spectra of oxadiazole derivative 2 with successive additions of Ni<sup>2+</sup> ion are shown in Figure 5. We can see from Figure 5 that the fluorescence emission of oxadiazole derivative 2 showed a red shift of 10 nm that was observed at 375 nm with the decrease in fluorescence intensity and on increasing the concentration of Ni<sup>2+</sup> ions, and then becomes constant on further addition. Fluorescence quenching may occur due to the transfer of an electron between the Ni<sup>2+</sup> ion and the donor group present on the oxadiazole ring.

### 3.2.5 | Effect of pH

For detection of chemosensors, the effect of pH plays a significant role in that it shifts the absorption band and also changes the properties of the ligand at different pH values.<sup>[70]</sup> The influence of pH on the absorption spectra of oxadiazole derivative 2 with or without Ni<sup>2+</sup> metal ions was studied in the pH range 2.0–12.0 (Figure 6). The

**FIGURE 5** Fluorescence spectra of oxadiazole derivative 2 with increasing concentrations of  $\text{Ni}^{2+}$  ions ( $1.0\text{--}7.0 \times 10^{-5}$  M)

**FIGURE 6** Effect of pH of the oxadiazole derivative 2 at 263 nm in the absence or presence of  $\text{Ni}^{2+}$  ions

$\lambda_{\text{max}}$  of oxadiazole derivative 2 was observed at 263 nm at pH 10.0. After the addition of  $\text{Ni}^{2+}$  ions, oxadiazole derivative 2 showed a lower response to  $\text{Ni}^{2+}$  ions in absorbance values across a lower pH range due to protonation. At pH 7.5 it reached its maximum value, whereas at higher pH it decreased, which may be due to the fact that oxadiazole derivative 2 is less stability at higher pH values. This study indicated that oxadiazole derivative 2 might be appropriate for biological applications of  $\text{Ni}^{2+}$  ions at physiological pH 7.5.

### 3.2.6 | Validation of sensing mechanisms by spectroscopic studies and

#### FT-IR experimental studies

To further study the binding of derivative 2 with  $\text{Ni}^{2+}$  ions, the IR spectra were recorded of the oxadiazole derivative 2 +  $\text{Ni}^{2+}$  complex,

as represented in Figure S4. The FT-IR spectral studies confirmed complex formation between oxadiazole derivative 2 and  $\text{Ni}^{2+}$  ions. The IR spectra of the free oxadiazole derivative 2 presented a specific peak at  $3312\text{ cm}^{-1}$ , which was assigned to the primary amine ( $-\text{NH}_2$ ) attached to the oxadiazole ring, as shown in Figure S1. The corresponding FT-IR spectra of oxadiazole derivative 2 in the presence of  $\text{Ni}^{2+}$  ions exhibited a shift in the frequency of  $-\text{NH}_2$  and reappeared at  $3306\text{ cm}^{-1}$ , demonstrating the broadness of the peak (Figure S4).

#### Validation by $^1\text{H}$ NMR titration studies

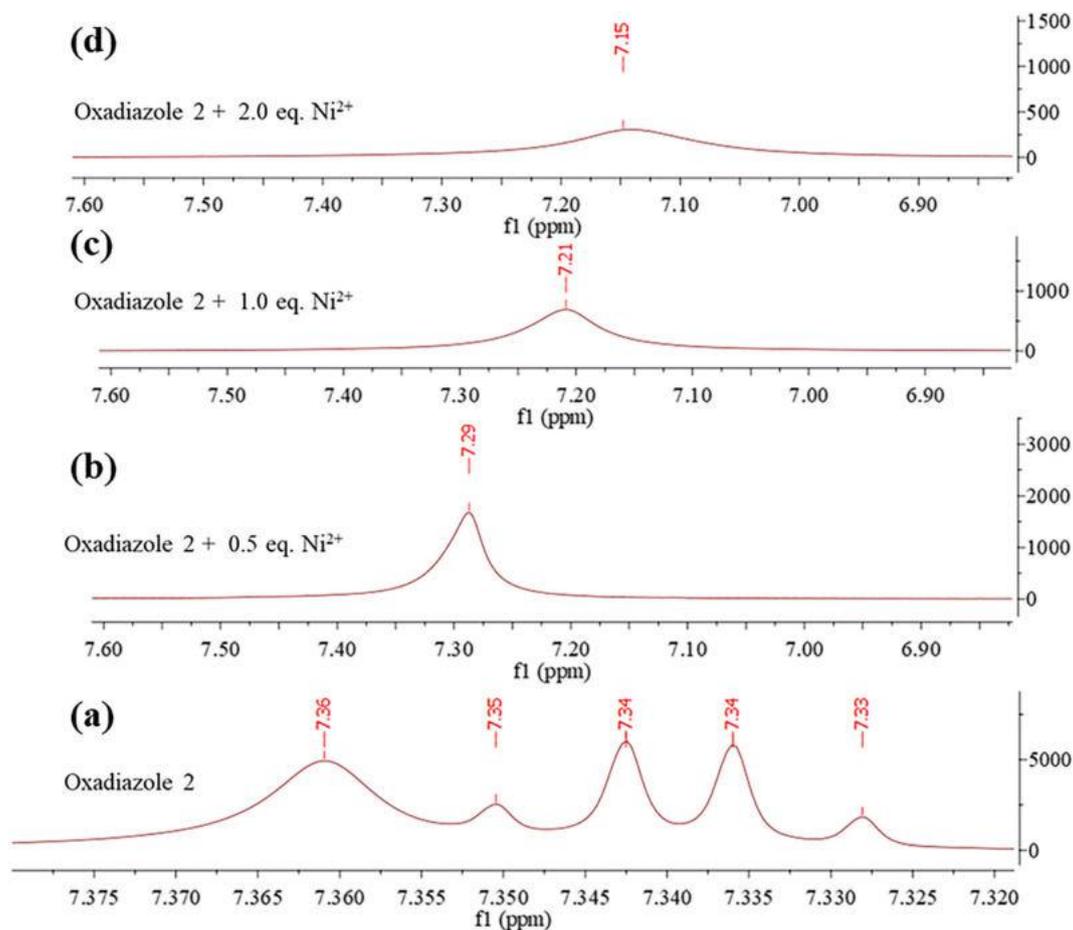

For further validation of the sensing mechanism of oxadiazole derivative 2 with  $\text{Ni}^{2+}$  cations, a  $^1\text{H}$  NMR titration was performed in  $\text{DMSO-}d_6$  with the addition of different equivalents (0, 0.5, 1.0, 2.0) of  $\text{Ni}^{2+}$  ions in oxadiazole derivative 2; this demonstrated the characteristic shift in peaks observed upon interaction with  $\text{Ni}^{2+}$  ions. From the results of  $^1\text{H}$  NMR titrations, it was seen that the signal at  $\delta$  7.36 ppm corresponded to  $-\text{NH}_2$  proton in free ligand oxadiazole 2 (Figure 7a) that disappeared after the addition of  $\text{Ni}^{2+}$  ions, as shown in Figure 7(b), and confirmed the interaction of nitrogen with the  $\text{Ni}^{2+}$  ions. In addition, the thiophene proton peaks had been changed to a greater extent.<sup>[71]</sup> The characteristic peaks of thiophene proton showed a doublet of doublet from  $\delta$  7.35–7.33 ppm in the absence of nickel ions (Figure 7a), whereas after the addition of 0.5, 1.0 and 2.0 equivalents of nickel, an upfield shift from  $\delta$  7.29 to 7.15 ppm was displayed, with a decrease in relative intensity (Figure 7b–d).

### 3.2.7 | Analysis by Job's plot method

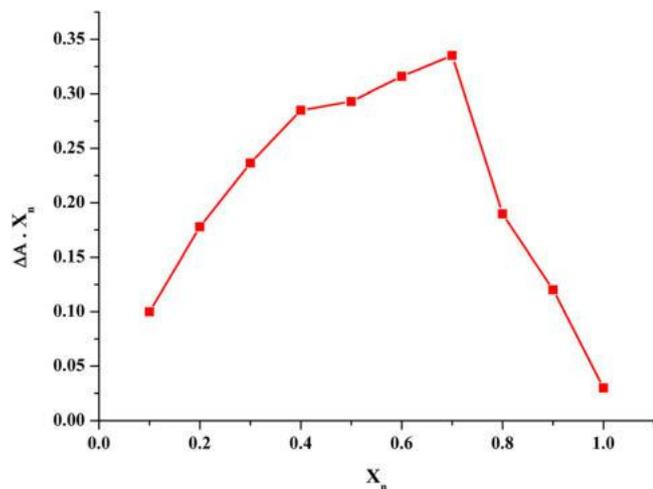

To verify the stoichiometric interaction of oxadiazole derivative 2 with  $\text{Ni}^{2+}$  ions, the absorption titration was assessed using the constant variation method and Job's plot.<sup>[72]</sup> The determination of stoichiometry ratio was observed by plotting  $\Delta A \cdot X_n$  vs  $X_n$  (where  $\Delta A$  = change of intensity of absorbance during titration at 263 and 305 nm and  $X_n$  is the mole fraction of  $\text{Ni}^{2+}$  ions) by the absorbance technique, which represented the maximum absorbance at molar ratio 0.7, as shown in Figure 8. The Job's plot measurement suggested that the oxadiazole derivative 2 and  $\text{Ni}^{2+}$  ions produced a newly formed species in a 2:1 stoichiometric ratio.

### 3.2.8 | Association/binding constant and LOD

The association constant and detection limit for the complex were determined from the absorption titration results. The calculated limit of detection was found to be  $9.4\text{ }\mu\text{M}$  using the following formula,  $\text{LOD} = 3\text{SD}/s$ , where  $\text{SD} = 0.004073$  and is the standard deviation of only oxadiazole derivative 2, and where  $s = 1288$  is the slope, calculated from the linear calibration curve between the absorbance of oxadiazole derivative 2 in the presence of  $\text{Ni}^{2+}$  cations (Figure S5). The association or binding constant ( $K_a$ ) of

**FIGURE 7** (a–d)  $^1\text{H}$  NMR spectra of oxadiazole 2 with 0, 0.5, 1.0 or 2.0 equivalent of  $\text{Ni}^{2+}$  ions in  $\text{DMSO}-d_6$

**FIGURE 8** Job's plot diagram of oxadiazole derivative 2 in the presence of  $\text{Ni}^{2+}$  ion (where  $X_n$  is the molar fraction of  $\text{Ni}^{2+}$  ion and  $\Delta A$  gives the value of the difference in absorbance at 263 and 305 nm)

oxadiazole derivative 2 with  $\text{Ni}^{2+}$  ion was obtained to be  $1.04 \times 10^5$  ( $R^2 = 0.9508$ ) using a Benesi-Hildebrand plot (Figure S6).

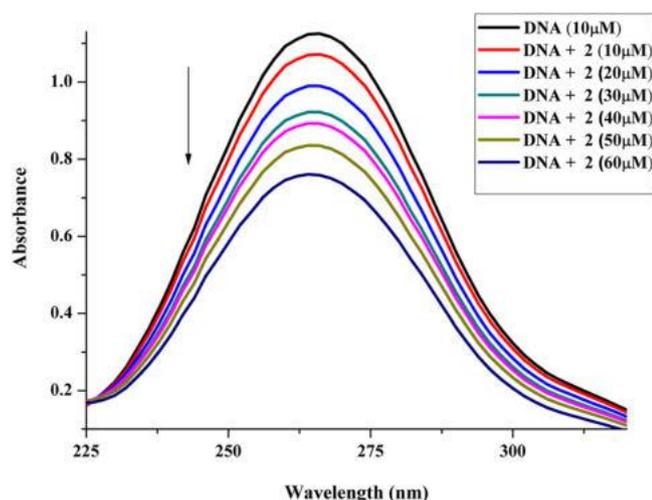

### 3.3 | DNA binding measurements

#### 3.3.1 | Electronic absorption titration

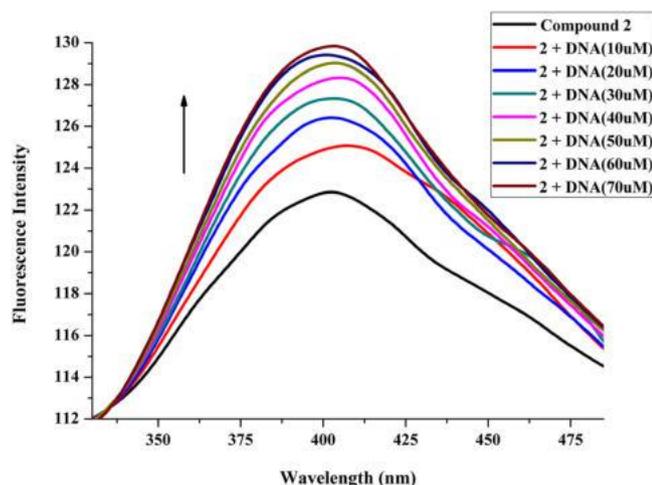

During DNA–drug interaction, some conformational changes occurred in CT DNA and this interaction has been investigated by UV–vis absorption spectroscopy. The stability of interaction was related to the change in absorbance value or the shift in the  $\lambda_{\text{max}}$  value. The hypochromic or hyperchromic shift revealed the capability of the interaction of drugs with CT DNA. A hypochromic shift or decreases in absorbance value represents the intercalative mode of binding, while the change in the secondary structure of DNA in presence of a drug occurs due to the electrostatic or groove interactions through hyperchromic shift. The absorption spectra in the presence of increasing amounts of oxadiazole derivative 2 with DNA are given in Figure 9. From the obtained spectra, as shown in Figure 9, we can see that a hypochromic shift was observed after the addition of oxadiazole derivative 2 in DNA; this revealed the intercalative mode of binding. From these data, we can estimate the intrinsic binding constant ( $K_b$ ) and Gibb's free energy ( $\Delta G$ ), which were obtained to be  $1.15 \times 10^4$  and  $-23.17$  kJ/mol, respectively (Figure S7).

### 3.3.2 | Fluorescence studies

The binding capacity of CT DNA with oxadiazole derivative 2 was further explored by emission titration in support of previous studies. The fluorescence spectra of oxadiazole derivative 2 are presented in Figure 10 and show the occurrence of increasing amounts of DNA (10–70  $\mu\text{M}$ ). From the obtained spectra, it can be seen that, on each addition of CT DNA, the fluorescence intensity increased regularly due to the intercalative mode of interaction. The increased emission intensity of oxadiazole derivative 2 with DNA might be due to the transfer of photoelectrons from the base pair guanine of CT DNA to the excited state of oxadiazole derivative 2. The emission data also supported the intercalative mode of binding for oxadiazole derivative 2 with DNA and these outcomes were related to electronic absorption titration and hydrodynamic studies. As shown in Figure 10, the

**FIGURE 9** UV-visible spectra of increasing amounts of oxadiazole derivative 2 ( $1.0\text{--}6.0 \times 10^{-5}$  M) in the presence of CT DNA ( $1 \times 10^{-5}$  M)

**FIGURE 10** Emission spectra of oxadiazole derivative 2 (100  $\mu\text{M}$ ) with increasing amounts of DNA (10–70  $\mu\text{M}$ )

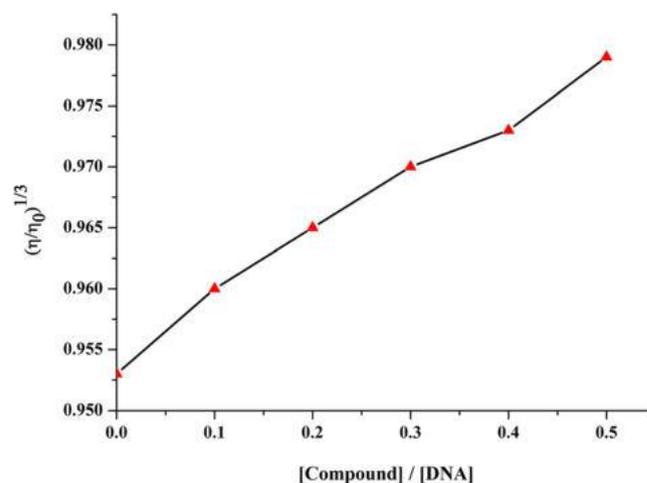

fluorescence intensity increased after increasing the amount of CT DNA in oxadiazole derivative 2; the binding constant ( $K_b$ ) was found to be  $1.22 \times 10^5$ , which was obtained by plotting the graph between  $\log(F_0 - F)/F$  vs  $\log[\text{DNA}]$  (Figure S8).

### 3.3.3 | Viscosity measurement

To study the DNA binding properties for interaction with the drug, viscometric measurements are another method that can be applied as they are a most important tool that reflects the investigation of sensitivity related to change in length of DNA. In intercalation binding, the distance between base pairs of DNA increased with adjustment of molecules, this resulted in the increased viscosity values after the addition of the compound. As illustrated in Figure 11, on the addition of different concentrations ( $0.1\text{--}0.5 \times 10^{-4}$  M) of test oxadiazole derivative 2 to the fixed concentration of CT DNA, a marked increase in viscosity was observed. The obtained results demonstrated that oxadiazole derivative 2 can intercalate in between the structure of base pairs of DNA, and this was why the viscosity increased; and this also showed similarity with conventional intercalators, as verified by absorption measurements.

### 3.3.4 | Circular dichroism studies

Circular dichroism is a very useful technique to monitor the conformational changes in the secondary structure of DNA. A negative band indicated  $\pi - \pi^*$  base stacking and a positive band was due to the helicity of B-DNA that appeared at 247 and 275 nm, respectively. Due to classical intercalators, the change in intensity of both positive and negative bands was due to the disruption in the base sequence of nucleotide, whereas little perturbation took place in small molecules due to electrostatic or groove binding. From Figure 12, it was observed that the ellipticity of both positive (plus) and negative

**FIGURE 11** Outcome of concentration variation of oxadiazole 2 ( $0.1\text{--}0.5 \times 10^{-4}$  M) with relative viscosity of CT DNA (10  $\mu\text{M}$ )

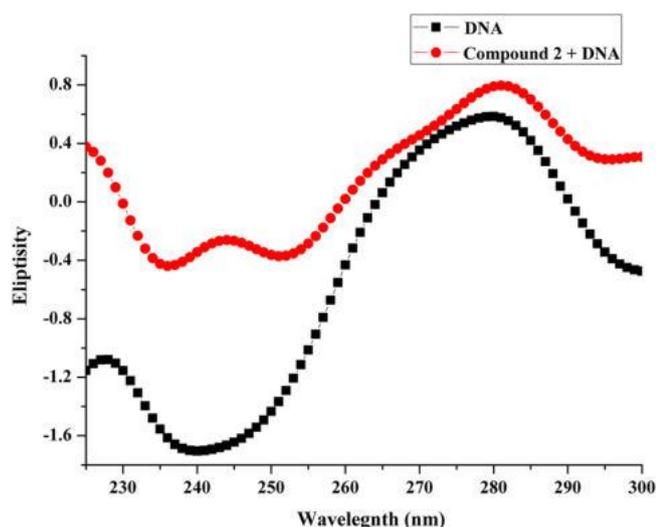

(minus) bands increased and shifted significantly as a result of the addition of oxadiazole derivative 2 to DNA (red) compared with blank DNA (black); this was an indication of changes in base pairs of DNA and also changes in the conformation during binding to oxadiazole derivative 2.

### 3.3.5 | Cyclic voltammogram

The cyclic voltammetric experiment was also supported by interaction ability between oxadiazole derivative 2 and DNA and provided further confirmation for the corroboration of the techniques described previously. Cyclic voltammetric measurements are based on the oxidation–reduction process. The change in peak potential and current produces the confirmation of binding between DNA and drug. Cyclic voltammograms of oxadiazole derivative 2 with or without DNA are shown in Figure S9. From the obtained results we can conclude that the decrease in current value might be attributed to the creation of drug–DNA complexes, because of the decrease in compound concentration.

### 3.3.6 | Time-resolved emission study

The emission decay of oxadiazole derivative 2 in the presence or absence of CT DNA was confirmed through lifetime measurements. The change in lifetime distributions was recorded based on average fluorescence decay in oxadiazole derivative 2 with or without CT

**FIGURE 12** Circular dichroism spectra of CT DNA (black) and of oxadiazole derivative 2 plus CT DNA (red)

**TABLE 2** Time-resolved emission results of oxadiazole derivative 2 with and without CT DNA

Compound	$\alpha_1$	$\alpha_2$	$\alpha_3$	$\tau_1$	$\tau_2$	$\tau_3$	$\langle \tau \rangle$	$\chi^2$
2	0.82	0.0023	0.180	0.074	3.909	1.477	0.32	1.02
2-DNA	0.60	0.0013	0.389	0.127	4.845	1.425	0.63	1.08

DNA, as presented in Table 2. The lifetimes  $\tau_1$ ,  $\tau_2$ , and  $\tau_3$  for oxadiazole derivative 2 without CT DNA were observed to be 0.074, 3.909, and 1.477 nsec, respectively. However, DNA addition to oxadiazole derivative 2 produced a considerable change in all three lifetime values. The decrease in pre-exponential factor  $\alpha_1$  was from 82% to 60%, whereas an  $\alpha_3$  increase from 18% to 38% was observed. Therefore, these changes confirmed that structural modifications occurred after binding of oxadiazole derivative 2 to CT DNA, with gradual increases in the magnitude of the shorter lifetime, whereas the relative amplitude of the longer lifetime values decreased.

### 3.4 | Molecular docking study

Molecular docking was performed to detect the best binding sites between synthesized compound oxadiazole 2 and the active site of 1BNA for the calculation of binding score (−6.5 kcal/mol). After analysis of all the obtained binding energy along with superimposition of the compound with 1BNA, the finest orientation was selected for our docked ligands (Figure 13). The oxadiazole derivative 2 showed a higher binding affinity with −6.5 kcal/mol energy, which pointed out that it gave good results for 1BNA. The docking result of oxadiazole derivative 2 with 1BNA provides the information for hydrophobic interaction, Pi-sulphur bond, hydrogen bonding, energy value, etc. The molecular docking effects clearly described that there was an intercalative mode of binding between the drug and 1BNA.

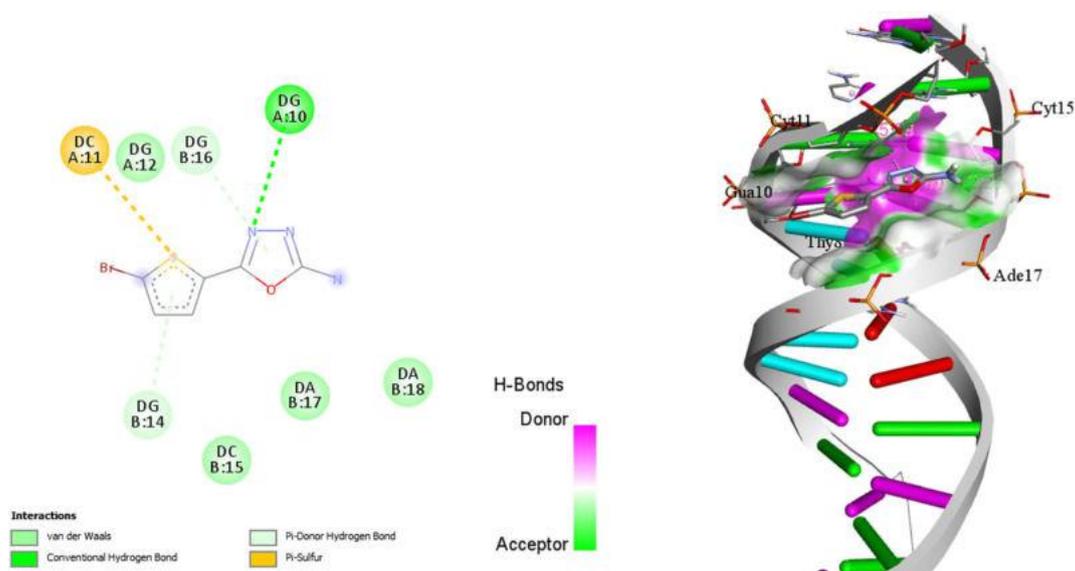

### 3.5 | Pharmacokinetics properties

To find out the molecular properties and Lipinski rule of five for oxadiazole derivative 2, the Mol Inspiration Chemo Informatics online software was used. By the Lipinski 'Rule of five', oxadiazole derivative 2 exhibited good membrane permeability,  $\log P = 2.13 (\leq 5)$ , number of hydrogen bond acceptors = 4 ( $< 10$ ), molecular weight = 246.09 ( $\leq 500$ ), and number of hydrogen bond donors = 2 ( $\leq 5$ ). The calculated pharmacokinetic properties of oxadiazole derivative 2 showed no violation of the Lipinski rule and all the properties were in the considered range shown in Table S1 (in Supplementary Information).

### 3.6 | Antifungal activity

#### 3.6.1 | Disc diffusion analysis

The inhibitory efficiency of tested oxadiazole derivative 2 towards fungal growth was studied against three *Candida* species, *C. albicans* ATCC 90028, *C. glabrata* ATCC90030, and *C. tropicalis*

**FIGURE 13** Molecular docked model of oxadiazole derivative 2 with 1BNA

**TABLE 3** *In vitro* susceptibility of test compound oxadiazole derivative 2 against *Candida albicans*, *Candida glabrata*, and *Candida tropicalis* strains. Fluconazole was used as a positive control. The MIC of FLC (positive control) was 10  $\mu\text{g/ml}$  and gave a zone of inhibition of 20 mm

Compound	MIC ( $\mu\text{g/ml}$ )			Zone of inhibition (mm)		
	<i>C. albicans</i> ATCC 90028	<i>C. glabrata</i> ATCC 90030	<i>C. tropicalis</i> ATCC 750	<i>C. albicans</i>	<i>C. glabrata</i>	<i>C. tropicalis</i>
2	600	500	600	MIC/2 9 MIC 9 2MIC 10	MIC/2 9 MIC 10 2MIC 11	MIC/2 9 MIC 10 2MIC 11

ATCC750, and illustrated in terms of MIC and agar disc diffusion. The tested strains were fluconazole (FLC) susceptible with a 10  $\mu\text{g/ml}$  MIC value and gave a ZOI value of 20 mm. The antifungal efficacy of test oxadiazole derivative 2 using agar disc diffusion was measured at the MIC, sub-MIC, and 2MIC concentrations given in Table 3 and depicted in Figure S10. The tested oxadiazole derivative 2 exhibited antifungal activity against *Candida* strains with a MIC value of 500–600  $\mu\text{g/ml}$ . The ZOI value was obtained in the range 9–11 mm.

### 3.7 | Antioxidant assay

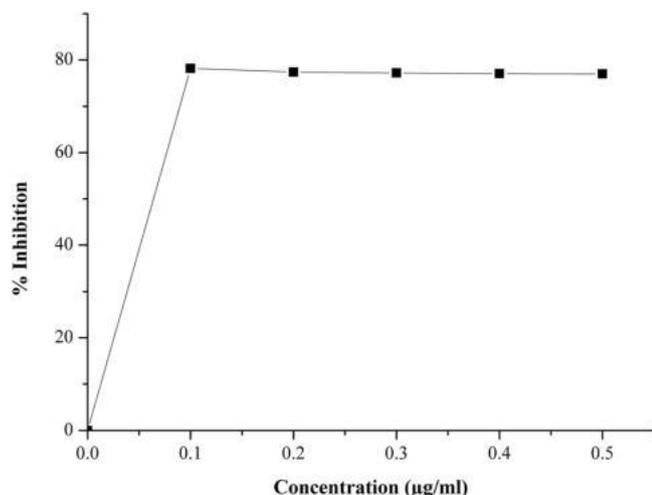

#### 3.7.1 | DPPH scavenging activity

Radical scavenging activity of the synthesized compound against violet-coloured free radical 2,2-diphenyl-1-picrylhydrazyl (DPPH) is the most common spectrophotometric procedure due to high sensitivity, ease of use, and fast analysis of many samples at one time. After incubating the mixture of DPPH and oxadiazole derivative 2 for  $\sim 90$  min, a colour change was observed from purple to yellow and a

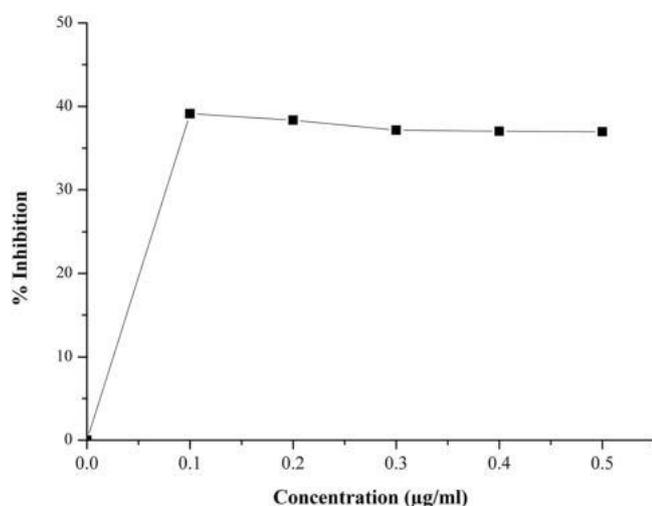

decrease was also noted in the absorbance value at 517 nm using UV spectroscopy that showed the existence of an antioxidant moiety in oxadiazole derivative 2. From the graph of percentage absorbance vs concentration we could calculate the  $\text{IC}_{50}$  value that refers to the proficiency of oxadiazole derivative 2 to scavenge 50% free radical DPPH activity, as presented in Figure 14. The calculated  $\text{IC}_{50}$  value for oxadiazole derivative 2 against DPPH was found to be  $0.11 \pm 0.0008$ , which indicated that oxadiazole derivative 2 had effective scavenging antioxidant activity.

#### 3.7.2 | Hydrogen peroxide assay

The capability of oxadiazole derivative 2 to scavenge hydrogen peroxide was also estimated. Hydrogen peroxide is a reactive oxygen species and also has strong oxidizing properties. The scavenging capability of test oxadiazole derivative 2 against hydrogen peroxide was obtained using an absorbance value at 236 nm and a UV-vis light spectrophotometer. From the obtained data, a graph was plotted for percentage absorbance vs concentration to calculate the hydrogen peroxide percentage scavenging activity, as shown in Figure 15. The

**FIGURE 14** DPPH radical scavenging activity of oxadiazole derivative 2

**FIGURE 15** Hydrogen peroxide assay of oxadiazole derivative 2

IC<sub>50</sub> value of oxadiazole derivative 2 for H<sub>2</sub>O<sub>2</sub> free radical scavenging activity was found to be 0.62 ± 0.006.

## 4 | CONCLUSION

A new oxadiazole-based chemosensor was synthesized and characterized using various spectroscopic studies. The relative absorption maxima was dependent on the polarity of the solvents, suggesting that oxadiazole derivative 2 had the capacity for use as a solvent polar sensor. Oxadiazole derivative 2 showed selective detection for Ni<sup>2+</sup> ions compared with other competitive metal cations, as confirmed by UV-vis light and emission spectroscopy. The LOD and association constant of oxadiazole derivative 2 for Ni<sup>2+</sup> ions were found to be 9.4 µM and 1.04 × 10<sup>5</sup>, respectively. The influence of pH on the absorption spectra of oxadiazole derivative 2 with Ni<sup>2+</sup> metal ions

was also studied and the binding stoichiometry obtained was a 2:1 ratio. The intercalative mode of interaction of oxadiazole derivative 2 for calf thymus DNA was examined using various DNA binding studies; the binding score was found to be -6.5 kcal/mol using molecular docking studies. In addition, antifungal activity against *Candida* strains and antioxidant scavenging properties against DPPH and H<sub>2</sub>O<sub>2</sub> free radicals of oxadiazole derivative 2 were also examined.

## ABSTRACT

This paper presents the study on the construction of pavement layers to be spread over subgrade soil starts with the calculation of the power of the subgrade and the traffic volume to be transported. The design of the different pavement layers depends very much on the strength of the sub-grade soil they are to be laid over. The power of a subgrade is expressed mainly in terms of CBR (California Bearing Ratio). Weaker sub-grade essentially needs thicker layers when stronger sub-grade works along with thinner layers of pavement. Normally CBR testing is a simple and well accepted process conducted on soil samples to determine subgrade intensity. For an engineer to understand the exact CBR strength of the sub-grade strength becomes absolutely essential. However, several other measurements are also taken into account for determining the power of the subgrade.

The use of waste material and natural fibers to boost soil quality is beneficial, because they are inexpensive, accessible locally and Ecological. The stabilizing effect of Natural Fiber (coconut coir) on soil properties was observed in this research. On the last the use of surplus material and fiber has seen a huge growth over the decade. Hence, an attempt has been made in this analysis to test the rise in subgrade intensity by supplying Coir Fiber in different layers. In this CBR study, different variations of parent sub-grade soil with Coir Fiber were performed. From the laboratory study it was observed that coir fiber's overall efficiency is higher. The CBR value of the parent subgrade soil was also found to increase as the number of coir fiber layers increased.

## 1. Introduction

Soil is the vital component of this ecosystem and all the necessities of life such as milk, household and clothes are provided by the soil. Soil functions include biomass transformations (productivity), water partitioning and reservoirs [1]. Black Cotton soils have high swelling potential and are one of India's main soil deposits as a result of the increase in moisture content [2]. India's wide geographical area is (3,287,264 km<sup>2</sup>) and India's population is (138 million approx.) demanding the massive road system. Soil is inexpensive construction material and readily usable. Road building enforces heavy pressure on constrained capital such as suitable soil, stone aggregates, and binders, etc. Soil stabilization is the production that increases soil's physical properties, such as shear strength, bearing potential and can be achieved by using controlled compaction or deposition of suitable admixtures such as cement, lime, clay, fly ash or by providing geotextiles, geosynthetics etc.

[3] Soil stabilization is a common method used by engineers and designers to enhance the properties of soil with different stabilizers. Engineers are continually faced with sustaining and improving facilities for pavements with minimal financial capital. Outmoded concrete planning and maintenance methods allow high-quality material for building requirements to be self-actualized. Premium content is not usable in certain parts of the world or is short of quantity. Because of these constraints, engineers are often forced to seek alternative designs using deficient materials, commercial building aids and advanced design practices. Concrete or tarmac paving cannot be constructed on poor soil, since it can easily be broken on hard soil pavements. The layer should have an appropriate load-carrying capacity as underneath the sub-grade pavement. This will have to replace the whole pavement segment and to be correct, the condition of the embankment affected by lack of strength or uniformity. The embankment must be built as solid, durable, uniform and cost-efficient as possible. The most econom-

Selection and peer-review under responsibility of the scientific committee of the International Conference on Futuristic Research in Engineering Smart Materials.

ical embankment is the one that maintains its life cycle by using modern technologies to help ensure sufficient strength, rigidity and uniformity.

Earlier fibers were used in soil strengthening process. Although the devices were not completely expected, roots of plants and straws were used to cob walls and render soil brick to improve the property. In the other hand, modern geotechnical engineering has mastered the use of strengthening the soil with isolated fibers which in geotechnical projects is still a comparatively recent technique.

Coir fiber is available at large scale in India which have very good property as pavement material having light weight, have ability to increase subgrade strength and can increase the life span of pavement compared to traditional method of pavement construction.

Coir fiber is part of a category of stable simple fibers [4]. It is a viable essential commodity obtained from coconut coating [5]. The coir fiber is stretchy enough to fold without breaking, and clenches a curl as though it were fluttering eternally. Soil coir fiber can be used as defective material in the stabilization cycle due to its spiral and long spike fibers [6]. The short cushion fibers were removed from the long fibers and later became waste in the coir fiber industry and this fiber waste is used in soil stabilization and can thus be disposed of efficiently. The application of fibers has had a major impact on soil and coir mixture development behavior. Reducing consolidation of clay soil settlement is caused by the addition of unsystematically distributed polypropylene fibers [7]. Because of the length of the fibers which imparts an insignificant effect on the soil characteristics, fiber content proved to be more influential and effective. Fiber inclusion results in plasticity decrease and hydraulic conductivity increase. This research has following objectives:

- To estimate the CBR strength of parent subgrade soil by placing one or more layers of coconut coir fiber at different depths.
- To understand the efficiency of coir fibre as pavement material.
- To obtain the most efficient depth for placement of coconut coir fiber.

## 2. Materials & methods

The entire research is performed in the Geotech Lab of the Lingaya's Vidyapeeth on subgrade soil, i.e. an analysis of the CBR content of subgrade soil by various layers of coconut coir fiber at different stages. Experiments have been performed to classify various soil properties, such as Index Properties i.e. Liquid Limit, Fluid Limit, Plasticity Index & specific Gravity [8]. Later on, heavy compaction experiments were accompanied to determine the optimum moisture level and the resulting overall dry pressure. The CBR experiments were then performed on a particular mixture of coconut coir fiber.

### 2.1. Material used

Subgrade Soil and coconut coir fiber are mainly used for experimental investigations [9]. Properties listed below:

#### A. Subgrade Soil

The subgrade soil used in the laboratory for analysis is obtained from the roadside of Lingaya's Vidyapeeth, Faridabad. The engineering properties of subgrade soil are going to be calculated in the laboratory in compliance with the Indian Standard Code IS 2720.

#### B. Coconut Coir Fiber (Fig. 1)

Fig. 1. Coconut Coir Fiber.

Coir is obtained from locally available coconut shells that are washed. Brown colored Coir fibers derived from coconut husks are seen in Fig. The fabrics are strong and durable. The fiber content used in this experiment is of 0%, 0.25%, 0.50%, 0.75% and 1% of 20 mm and added in discrete manner. Physical & Chemical properties of Coir Fiber is given in Table 1 & Table 2.

## 3. Experimental program

[11] CBR is the percentage of force per unit area needed to penetrate a soil mass with a standard 50 mm diameter circular plunger at a rate of 1.25 mm/min to that necessary for the equivalent penetration into a standard material. Typically, the ratio is calculated for the 2.5- and 5-mm penetration. If the ratio at 5 mm is consistently higher than at 2.5 mm, then the ratio at 5 mm is issued. The table below shows the standard loads adopted for the standard material with a C.B.R. value of 100% for different penetrations.

### 3.1. Preparation of test specimen

Remoulded specimen: The test sample should pass IS sieve of 19 mm and be held on IS sieve of 4.75 mm. For a remoulding the dry density shall be either the field density or the amount of the average dry density determined by the compaction test (Heavy Compaction Test as per IS 2720 (Part-8)-1983, for Railway Formation [12]). If the case might be, the water content used for compaction must be the optimal water quality or the field humidity. Complex compaction: A typical soil sample weighing around 4.5 kg or more for fine-grained soil and 5.5 kg or more for granular soil should be collected and thoroughly mixed with water. When the soil is to be compacted to the highest dry density at the optimum moisture content, the exact mass of the soil required shall be taken and the necessary quantity of water applied so that the soil sample water content is equal to the optimum moisture content calculated. The extension collar and base plate are attached to the mold. The spacer disk is placed over the base. Filter paper is placed on the spacer disk. Add Lubricating Oil to the mold inside. Through gentle compaction seal the soil mix in the mold. That is to say, compress the soil by 2.60 kg rammer in 3 layers of 55 blows to each layer. Then add the reinforcing material i.e. coconut coir fiber according to various variations in between different layers.

Table 1  
Chemical Properties of Coir Fiber [10].

Chemical Properties	Composition
Lignin	45.84%
Cellulose	43.44%
Hemi-cellulose	00.25%
Pectin's Related Compound	03.33%
Water Soluble	05.25%
Ash	02.22%

**Table 2**  
Physical Properties of Coir Fiber [10].

Physical Properties	Value
Length in inches	6–8
Density (g/cc)	1.40
Tenacity (g/Text)	10.0
Breaking Elongation %	30
Diameter in mm	0.1 to 1.5
The rigidity of Modulus (dyne/cm <sup>2</sup> )	1.8924
Swelling in Water (Diameter)	5%
Moisture at 65% RH	10.50

Remove the extension collar and carefully trim the compacted soil, using a straight edge, to the top of the mold. Any holes formed by removal of the coarse material on the surface of the compacted soil shall be filled with the substance of smaller size. Remove the perforated base plate, Spacer disk, and filter paper and record mold mass and compressed soil specimen. Place a filter paper into the mold over the specimen. Place annular weights at the nearest 5.0 kg to create a surcharge proportional to the base material weight and pavement.

### 3.2. Various combinations of subgrade soil with coir fiber

**Table 3**

## 4. Results and discussion

### 4.1. General

This study's key objective was to reduce the pavement thickness and increasing the efficiency of pavement systems by using coir fiber as reinforcement material. We are conducting a laboratory investigation on the parent subgrade soil to achieve this objective. In the initial stage of the laboratory analysis, we examine the index properties of parent subgrade soil (liquid limit, plastic limit, plasticity index, specific gravity, etc.). We measured the CBR value of parent subgrade soil without reinforcement after the initial analysis, and then analyzed the efficiency of parent subgrade soil by supplying coir fiber at various heights and combinations. The property of soil is given in Table 4 & the test result without reinforcement on parent soil is given in Table 5. The CBR method was used to compare the efficiency of soil strengthened with subgrade parent soil whose data is given in Table 6.

### 4.2. Properties of parent subgrade soil

**Table 3**  
Various combination of parent subgrade with coir fiber.

S. No.	Combination	No. of Layer	Fiber Content %
1.	CBR Test without Reinforcement	–	0
2.	Soil with coir fiber at a Depth of 42.43 mm (H/3) from Top.	01	0.25
3.	Soil with coir fiber in the Middle of mold specimen i.e., 63.65 mm (H/2) from Bottom.	01	0.50
4.	Soil with coir fiber at a Height of 42.43 mm (H/3) from Bottom.	01	0.75
5.	Soil with coir fiber at a Height of 42.43 mm (H/2) from Bottom & at a Depth 42.43 mm (h/2) from Top.	02	01

**Table 4**  
Index Property.

Index Property	Experimental Value
Liquid Limit	53.29%
Plastic Limit	34.01%
Plasticity Index	20.1%
Specific Gravity	2.6
Optimum Moisture Content	%

### 4.3. Result of CBR test

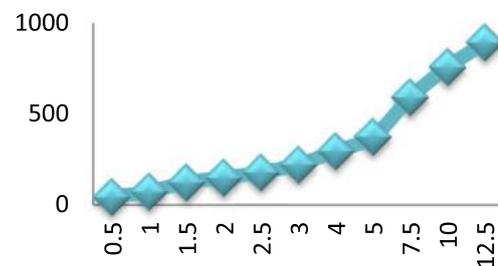

Test-01 CBR Test on parent soil, without reinforcement. The CBR test result is depicted in Table 5.

**Table 5**  
Test without Reinforcement on Parent soil.

Test Report			
CALIFORNIA BEARING RATIO (CBR) TEST (IS: 2720 PART 16/ASTM 1883-99)			
OMC	17.5%		
MOISTURE CONTENT		DRY DENSITY	
Container #	08	Wt. of the Mould (g)	3884
Wt. of Container (g)	25	Wt. of the Mould + Compacted Soil (g)	8352
Wt. of Container + Wet Soil (g)	85	Volume of Mould	2283.30
Wt. of Container + Dry Soil (g)	73	Bulk Unit Wt. (g/cc)	1.956
Moisture Content (%)	25	Dry Unit Wt. (g/cc)	1.621

### 4.4. Graphs of tests & results

- This test was performed on non-reinforced parent soil with 0% coir fibre and the CBR value at 2.50 mm was 13.026% and 18.267% at 5.00 mm (Fig. 2).
- This test was conducted on 0.25% "Coir fibre" parent subgrade soil in 01 layer at a depth of 42.43 mm (H/3) from the surface and 2.50 mm CBR value was 18.686% and 23.538% at 5.00 mm (Fig. 3).
- This test was conducted on 0.50% "Coir Fibre" parent subgrade soil in 01 layer supported in the centre (H/2) of the mould specimen, i.e. 63.65 mm from the bottom and 2.50 mm CBR was 10.690% and 14.074% at 5.00 mm (Fig. 4).
- This test was conducted on 0.75% "Coir Fibre" parent subgrade soil in 01 layer at a height of 42.43 mm (H/3) from the bottom and CBR at 2.50 mm was 8.534% and 11.379% at 5.00 mm (Fig. 5).
- This test was Conducted on parent subgrade soil with 1% "Coir Fibre" in 02 layer at a height of 42.43 mm (H/3) from the bottom and a depth of 42.43 mm (H/3) from the top and CBR at 2.50 mm was 16.171% and 20.034% at 5.00 mm (Fig. 6).

**Fig. 2.** CBR test without reinforcement.

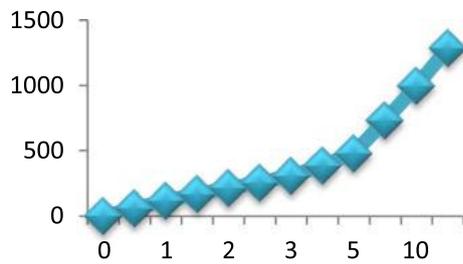

Fig. 3. Soil with 0.25% "Coir Fiber" in O1 Layer at a depth of 42.43 mm (H/3) from top.

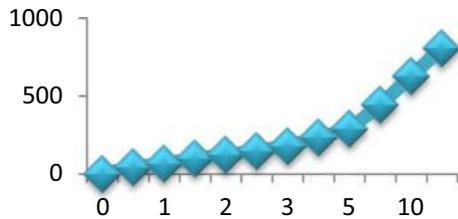

Fig. 4. Soil with 0.50% "Coir Fiber" in O1 layer provided in the middle (H/2) of mold specimen i.e., 63.65 mm from bottom.

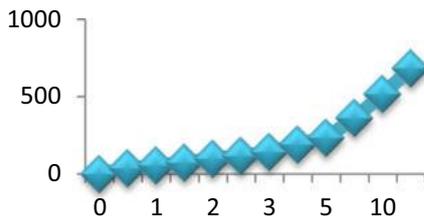

Fig. 5. Soil with 0.75% "Coir Fibre" in O1 layer at a height of 42.43 mm (H/3) from bottom.

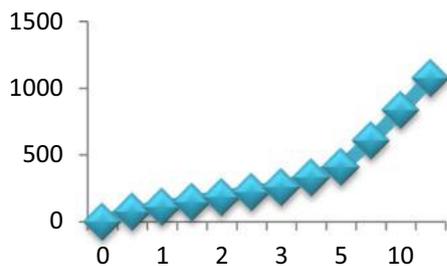

Fig. 6. Soil with 1% "Coir Fibre" in O2 layers at a height of 42.43 mm (H/3) from bottom & at a depth of 42.43 mm (H/3) from top.

Result indicates Coir Fibre's average efficiency was higher. Reinforcement at depth (H/3) from top and (H/2) from top with coir fibre gives better output. Further it was found that the Coir Fibre efficiency improves as we increase the number of layers of reinforcement, because the more layer of reinforcement, there is better binding with subgrade which helps subgrade to gain better strength.

Table 6  
CBR Test Data.

CBR TEST DATA			
CBR TEST NUMBER	01	FIBER CONTENT (%)	0%
TYPE OF CBR TEST	CBR test without reinforcement		
SURCHARGE WEIGHT(Kg)	05	PENETRATION RATE	1.25 mm/min
WEIGHT OF ORIGINAL SAMPLE (Kg)	5.5	PROVING RING CONSTANT (Kg/Div.)	6.154
Penetration (mm)	Observed unit of Dial Gauge	Proving Ring Reading (unitx5) (Div.)	Load in (Kg)
00	00	00	00
0.5	1.3	07	43.078
01	2.4	11.7	72.0018

7.5	20	96	590.784
10	24.6	123	756.942
12.5	29	145	892.33
CBR OF SPECIMEN AT 2.50 mm (STANDER 1370 KG) BY GRAPH			13.026%
CBR OF SPECIMEN AT 5.00 mm (STANDER 2055 KG) BY GRAPH			

5. Conclusions

After the results, this research was concluded as followed with justifying the objective achievements:

- When Coir Fiber's number of layers increased, it was found that the parent subgrade soil's CBR value was increased which is our first objective.
- Coir fiber is a surplus material that can be used for lightweight and solid pavements in a sub-base.
- Coir Fiber is used to increase the subgrade Strength and therefore enhances the life of the pavement, which is our second objective.
- It has been observed that better performance is given when we provide Coir Fiber at height (H/3) from the bottom, which is our third objective.

**Abstract**—Android apps have security risks due to rapid development in android devices. In the Android ecosystem, there are many challenges to detecting Android malware. Traditional techniques such as static, dynamic, and hybrid approach, most of the existing approaches require a high rate of human intervention to detect Android malware. Most of the current techniques have the most significant security challenges to detect Android malware, the inspection of Android Package Kit(APK) file structures, increased complexity, high processing power, more storage space, and much human intervention. This paper proposed Machine Learning(ML)based algorithms to detect Android malware apps through feature extraction and classification of grayscale images. In our proposed approach, convert most of the files of APK such multiDex, resources, certificate, and manifest transform into a grayscale image, using the image algorithm to extract the local feature of the image. In the paper used different ML models to classify the local features with the help of multiple images of malware families. This approach deals with the obfuscation attack. It can hide in any files of APK. The proposed approach enhanced accuracy reached up to 96.86%, and computation time did not increase more than the existing techniques. The quality of that proposed worked; it has a high classification accuracy and less complexity validation loss.

**Keywords**—Android malware; obfuscation attack machine learning; android application package (APK); android malware app; grayscale images

## I. INTRODUCTION

Android operating system (OS) is the most popular OS in the smart device ecosystem. Due to intelligence devices, every android user is very close to and dependent on Android Application Package (APK). In the present scenario, the android users sharing sensitive information, banking operation, e-shopping, locations information, the identity of the users, and privacy of data are also involved. In Android, device security is the biggest challenge and severe issue. A survey report of GDATA in 2019 [1] showed that 1,852,170 Android malware samples were detected in the first half of 2019. Here, data showed an android malware is detected every 8 seconds. The statistical report represents eight mobile infected by malicious out of ten Android devices [2]. One more research report, Google detected 86% of the total Android devices market in 2017. The most popular GlobalStats website showed that 73% of Android-based devices counted sales of total devices of Android in 2019 [3]. Due to the popularity of Android

devices, Android app becomes more targeting apps compared to other kinds of apps. As per one evolution report of mobile malware, 5,321,142 apps were installed on devices, 151,359 mobile apps were detected as Trojans, 60,176 were detected as mobile ransomware by Kaspersky 2018 [4].

Android users threaten by different types of malware families; some are distributed by Google Play stores, some type apps such as downloader, banker, and hidden ads [5]. Most of the extensive attacks pointing the Android OS. The hackers mainly focused on attacking games, banking, academics, e-shopping domain. However, this domain published many malicious apps, which have gaps between the app development and the number of works. Third-party stores have untrusted apps; most gaming apps have adware due to the repackaging technique [6]; with the help of repackaging tools, reassemble the original app and add the malicious code with the original code and then assemble again, upload on third party store. Here, the main challenging task to identify malicious apps is the most severe issue. Most existing techniques are static and dynamic; most techniques used behavior and signature base to identify the android malware.

Static techniques do not require running apps; they disassemble the code and extract the feature of apps to identify. The dynamic approach always needs to run the application and identify the android malware through behavior and signature base. These techniques have significant drawbacks; it requires more computing power, resources, and space [7]. The dynamic analysis was evaded by some powerful and intelligent malware [8]. Moreover, existing dynamic and static techniques used the manual intervention of humans. It also needs domain expertise to identify reverse engineering [9]. The existing approach used single classes.dex file, but in the current scenario, we have multiclass files, or multiDex files [10], which have not been converted into a grayscale image to detect malware.

Our proposed work takes care of all essential files such as multiDex (MD), resources.ARSC(RS), Manifest.xml(MX), and certificate (CR) files of APK to detect Android malware. The existing approaches need human intervention to separate the dex, manifest.xml resource.ARSC(RS) and certificate files convert into the grayscale image [11-12].

**META-INF:** This file very essential in Android apps, which the information about the signature and information

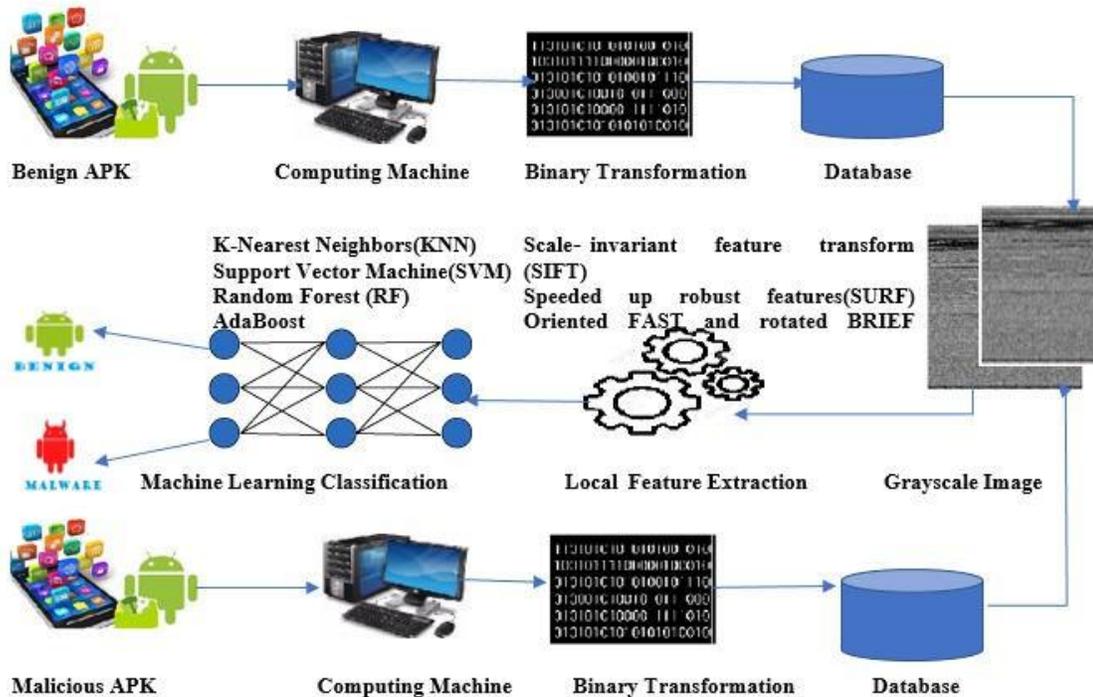

Fig. 1. Proposed Methodology to Detect the Android Malware

about the resource list.

**Lib:** lib file is used to run the specific device architectures of the native library, such as armeabi-v7a and x86.

**Res:** to Keep the resources such as images. Which is not compiled with resources.arsc

Assets: Raw information about resources

**AndroidManifest.xml:** Meta information about the apps such as version, content, and name of APK files.

**Multiple classes.dex:** Main and necessary file of apps, which run java class methods on the devices.

**Resources.arsc:** Compiled all resources on the devices which is used by the apps.

Android apps development using java.class files. By the DX tools convert multiple java.class into the DEX files. DEX and manifest are essential files in APK, and DEX consists of the data structure; the interpreter used the different data types that belong to the data structure. All static reverse engineering tools used the DEX files to reassemble the apps for reengineering. Multiple methods are proposed to protect the DEX files. Our Proposed approach does not require any human intervention, does not require separate files, and does not need reverse engineering to find different types of files. Our proposed approach takes less computation power to detect the android malware because it takes less time complexity because it worked without any reverse engineering operation. Our proposed approach used DEBIAN and AMD datasets containing 10560 apps (5000 benign and 5560 malicious apps). The grayscale image datasets, each containing 10560 samples (5000, 5560 benign, malicious samples, respectively), were constructed based on diverse files from the contents of the APK

collections. Firstly, all the benign and malicious APK convert into Grayscale images, a block diagram depicted in Fig. 2. Secondly, extract the local features from images using image-based feature extraction techniques such as SIFT, SURF, and ORB. Thirdly, apply the BOVW approach to convert multiple local feature descriptor vectors into a single feature vector to feed into ML classifiers. Finally, extract the global and local features and apply the different ML classifier techniques such as AdaBoost K-Nearest Neighbors(KNN), Support Vector Machine(SVM), and Random Forest(RF). The Proposed approach worked on the raw bytes of grayscale images; the main advantage of this approach does not require any reengineering operation and making different types of datasets. The existing approaches have the main disadvantage, approaches that require human intervention. Our approach proposed safe from human intervention and reengineering operation. Many ML algorithms are developed for the detection of malware apps. The most common challenge in Android malware detection is obfuscation attacks. Malicious code can be hidden in any files of APK, which is very dangerous to android malware app detection. Our proposed works have a novelty that now no needs to do reverse engineering to obtain all files of APK. Directly conversion of Entire APK files structure converts into a grayscale image. Most of the existing techniques used separate files to transform into grayscale scale images to analyze the image-based android malware detection. All existing methods do not care about multiple DEX, Share Object (SO), Meta-Inf, lib files, etc., just observation of manifest, single DEX files, resource files only. In the meantime, the author should explain the functions of multiDEX (MD). Resources, ARSC (RS), Manifest.xml (MX), and certificate (CR) files of APK separately because they are used to detect Android malware. Then, the proposed methodology to detect the android malware

is well represented in Fig. 1

## II. RELATED WORK

Many researchers worked in the domain of Android malware detection; some are listed below in this section. An approach designed to analyze the suspicious behaviors and detection of resources abuse [13]. The major drawback of this approach is the need to decompile the app and embedded hook code; this approach used runtime events to track and monitor the logging. The SafeDroid static framework approached, which statically analyzed the DEX (Dalvik Executable). By this approach, extract the binary feature vectors to train various ML classifiers [14]. Moreover, the multiple features are system calls, app permission, system events [15]. Those features train RF classifiers to analyze whether Apps are affected by malicious or not. Some approaches differentiate whether the app is a malicious or normal app based on patterns permission [16], the required permissions extracted statically. Most popular permissions are registered into class [17] to define whether the permission is benign or malicious. The permissions of a class determine the benign and malicious app. Moreover, a data mining technique made the constructive pattern of permission to determine whether the android app is malicious or benign. Here, the authors applied the bi-clustering method to used permissions. Also, the authors used the information of the Android app package and permissions to train of KNN, Linear Discrimination(LD) function, and Radial Basis Function (RBF) network. Moreover, Application Programming Interface(API) system calls integrated with permissions [18] are used as features to train the RF classifier of android's apps classification. It is a very lightweight method for detecting Android malware through ML and dataflow-related API system calls used in this approach [19]. In [20], the proposed approach used the n-gram series to extract the features from the opcode of malicious and benign apps. This approach used a limited number of features to train RF and Support Vector Machines (SVM) classifiers. The proposed approach [21] installed the Android application(APK) on Android devices to extract dynamic features such as networks behavior, memory consumption, computation power, time-space, battery, and binder; these features are used to classify malware. This dynamic approach [22] captured network traffic behaviors of running Android applications(APK) from different android devices. This traffic correlates with malware URLs and with DNS service network traffic for the detection of malware. An approach [23] used to fog computing reduces the load and dynamically enhances the computation power to detect Android malware. Another approach [24] used the API system calls and network behaviors, collectively applied to detect Android malware. In [25] this paper, the authors showed the multiple network behavior and emulator-based dynamic experiments to analyze android malware. Android operating system embedded by an extension kit has been proposed [26] to deals with confused delegate attacks [a genuine APK is manipulated for communicating with the trusted application for Inter-Process Communication(IPC)]. To enhance permissions-based policy [27]at runtime tracking and communication link analysis by pre-defined policy to prevent malicious behavior. Moreover, the signature set is constructed by network log and correlated with the permissions-based methods [28] for android apps classification. The recent approach [29] uses

reverse engineering techniques to decompile the APK, extract the source code, and convert it into a grayscale image. The constructed dataset of images is used to train a convolutional neural network (CNN) to detect the malicious app. API system calls and semantic information is used to train the Short-Term Long Memory (LSTM)[30] model to classify the android malware. Moreover, a hybrid approach includes CNN and deep autoencoder (DAE) [31] to detect Android malware. In [32], this proposed approach used the hybrid scheme; it extracts dynamic and static behavior features used to train the deep learning model. Also, in [33] approach extracted the four features, such as permissions, rate of permission, system events, APIs system calls used to train the collective RF classifier. DREBIN [34] is a static analysis approach; this approach used similar malicious apps as per experiment works (5,560 malicious apps). This method used as many possible features of apps and was added with joint vector space. Due maximum number of features and determination increased the complexity level. This paper [35] proposed the classification of the dependency graph. The features extracted from the dependency graph make the semantic feature set from the weighted contextual API of the graph. The metric of the homogeneous app determines same the application behaviors. The sensitive and important API call allocated the weight according to the Android malware family [36]. Every app implemented the function call graph (FCG), and each FCG construct the sensitive API call-related graph (SARG). The SARG has the parent and sensitive API call nodes. Here, train multiple machine learning approaches to classify the common behavior of the malware family. Moreover, from source code is extracted from hexadecimal representation and converted into RGB images [37]. The color RGB dataset is used to train a CNN classifier to classify Android malware. Furthermore, the Android (APK) application converted to grayscale images, then extract the feature of grayscale images for training the RF classifier for classification in [38]. Also, in [39], extracted the feature from 2D of Opcode Sequences and assigned the weight based on their occurrence. The weight value is converted into grayscale images. The image detection approach is very limited to detecting Android malware domains. Local and global feature extraction of the entire APK is more effective than existing approaches. Our paper has mainly converted the image into grayscale without any reverse engineering tools. It does not require separating the files of APK such as resource, Multidex, manifest, and certificate. Moreover, it does not require human intervention; most existing techniques have a common issue of human intervention and extracting the source code from reverse engineering tools.

## III. METHODOLOGY

This section discussed the full detail of the proposed model. The first subsection briefly describes constructed dataset, the other section described the brief details of extracted features, and the last section briefly describes the training Machine Learning (ML) classification.

1) *Dataset*: this dataset. Our experiment setup used the 5560 files of android malware and 5000 benign apps from AMD, which have 179 different Android malware families. In the investigation of research of android malware from 2012 to 2020, most of the researchers used the DREBIN dataset. The DREBIN dataset has the most famous malware such as

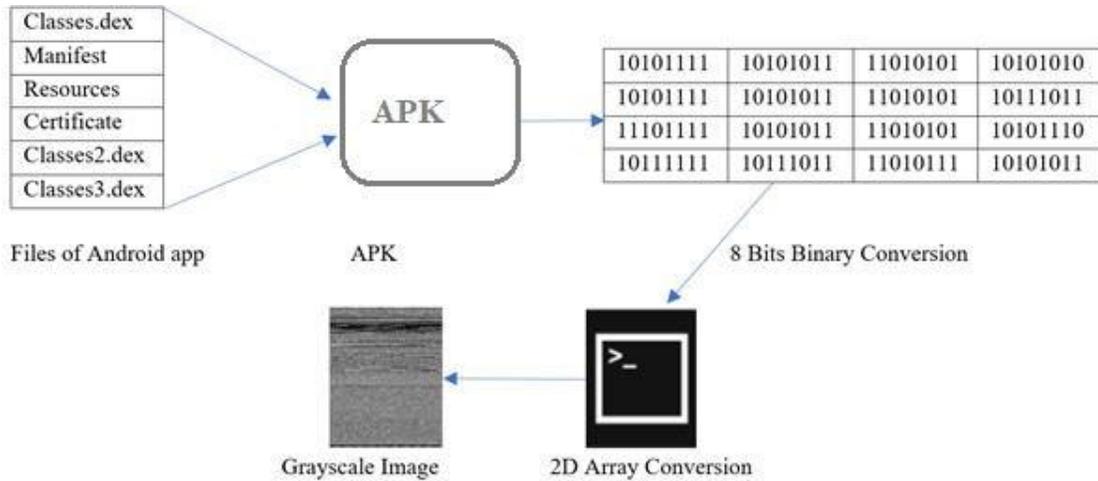

Fig. 2. APK to Image Conversion Process

DroidKungFu, GingerMaster, GoldDream, and Fake Installer. The primary objective of our proposed approach is to detect Android malware. The DREBIN dataset has the most famous malware such as DroidKungFu, GingerMaster, GoldDream, and Fake Installer. The primary objective of our proposed approach is to detect Android malware. Many researchers used the DREBIN dataset to analyze the android malware, and various institutions utilized this dataset to investigate Android malware. Our Proposed models used the DREBIN dataset because it has 179 different android malware families, appropriate for any investigation dataset.

### A. Transformation APK into Grayscale Images

The Android APK files convert into grayscale images [40]. In this proposed article, the authors construct the malware images using files of the Android app from malware APK. The APK is transformed into 8-bit vectors, and then the 8-bit vector transforms into a grayscale image. Every substring has an 8-bit value as a pixel converted into a decimal value between 0-255, shown in Fig. 2. Any digital file on the memory device is stored as a stream of a bit of '0' and '1'. In the model read every APK file as a binary stream, group every eight bits, and store them in a new file with the image file extension.

### B. Local Features Extraction

The local feature is a defined image object (basically, in the image, a cluster of pixels or small blobs) [41]. The local feature of images is the most stimulating point in the image, which defines the image descriptor vectors(DV) or feature vectors. The set of feature vectors is described by different types of algorithms. Our proposed approach used the four different algorithm types to extract the local features as Scale invariant feature transform(SIFT), Speeded up robust features (SURF), Oriented FAST, and Rotated BRIEF(ORB). Those methods are very famous in the malware domain for better accuracy.

1) *SIFT*: The Scale invariant feature transform (SIFT) method is applied to extract the local feature key points. This method computes the Laplacian of Gaussian on the multiple

scale level to provide a better result. This SIFT algorithm obtains the local minima and local maxima of stimulating points with the help of LoG at different scale levels. The several Laplacian of Gaussian on different scale levels ( $\rho$ ), by the scale, obtain the local maxima, minima of every single pixel in the image. The Laplacian of Gaussian (LoG) calculation is costly for feature points to more or less extent. The Laplacian of Gaussian(LoG) approximately is determined by Eq.1

$$\rho \nabla^2 L = \frac{\partial L}{\partial \rho} = \frac{L(x, y, k\rho) - L(x, y, \rho)}{k\rho - \rho} \quad (1)$$

where  $L(x,y,\rho)$  is the Laplacian Gaussian on the position  $(x, y)$  at scale  $\rho$ .  $L(x,y,k\rho)$  is the Laplacian of Gaussian(LoG) on the position  $(x, y)$  at scale  $k\rho$ , and the  $k\rho$  is a scale a little more than  $\rho$ . The SIFT methods identified the stimulating points at the level of 128-bit descriptors in Eq.1. The extracted feature from the input images through the SIFT matched each feature of  $k$  nearest neighbors. The main objective of SIFT is to object recognition techniques to panorama stitching. As a result, the system is insensitive to the images' ordering, positioning, scale, and illumination. Two-Dimension isotropic measure by the Laplacian to the second spatial derivative of an image. The Laplacian Gaussian approach highlights areas of speedy intensity change and is often used for zero-crossing edge detectors. In our system, the Gaussian smoothing filter reduces its sensitivity to noise for smoothing with something approximating.

2) *SURF*: The algorithm that Speeds up robust features(SURF) [42] is the faster algorithm, and it can be the replacement for SIFT. This algorithm is faster and more robust for similarity comparison and similarity invariant of images. SURF algorithm plays a vital role in the real type of tracking and recognition of the object. The main merit of this algorithm is box filters approximation and calculation of the integral images. Additionally, it has the location and scale-based determinant of the Hessian matrix. The Hessian matrix has good performance to obtain the image key points, and it has good accuracy. In the SURF algorithm filtered by Gaussian

kernel, with location  $X=(x,y)$ , and scale  $\rho$  in Eq.2

$$H(x, y) = \begin{pmatrix} S_{xx}(x, \rho) & S_{xy}(x, \rho) \\ S_{xy}(x, \rho) & S_{yy}(x, \rho) \end{pmatrix} \quad (2)$$

where,  $S_{xx}(x, \rho)$  has a Gaussian kernel derivative on the point of  $x$  in the image, and similarly for  $S_{xy}(x, \rho)$  and  $S_{yy}(x, \rho)$ . Haar-wavelet responses determine horizontal and vertical paths to the neighborhood of size six and used the 64 Bit Descriptor. Within interest point neighborhood, distribution of Haar-wavelet responses obtained from descriptor description. We used integral images to speed up the system. Additionally, using the 64 Bit Descriptor dimensions to improve the system's performance for feature computation increases robustness and matching. In the invariant to rotation, we recognized the reproducible orientation for the interest points. For this reason, we obtained the Haar-wavelet responses in the vertical and horizontal directions. The circular neighborhood of radius 6s around the interest points, with  $s$  the scale that the interesting point detected. Therefore, our proposed approach uses integral images for fast filtering again. Only six actions are needed to SURF: Speeded Up Robust Features, the seventh determines the feedback in the vertical and horizontal directions at any scale.

3) *ORB*: The feature vector Oriented FAST and rotated BRIEF (ORB) is a high-speed keypoint detector [43]; in BRIEF, descriptors have much modification to improve the algorithm performance. The ORB algorithm detects the keypoint in images by using the FAST algorithm. Also used the Harris corner to detect the key point. Moreover, it used the multiscale feature with 32 bits BRIEF-based descriptor

$$(S;x, y) = \begin{cases} 1 : S(x) < S(y) \\ 0 : S(x) \geq S(y) \end{cases} \quad (3)$$

where  $S$  is the flattened spot in the image, and  $S(x)$  is the intensity in Eq. 3. In the implementation of the FAST algorithm, we extract the kernel windows from single line buffers. In the approach, the center pixel is subtracted from each circle pixels. The result is measured with the minContrast value whenever the obligatory number of consecutive pixels exceeds the threshold level; the center is marked as the corner. For the circle region, evaluate the sum-of-absolute-difference (SAD) metric. Only the differences that exceed the minimum contrast threshold level are involved in the metric. This calculation means that the algorithm detects a light center pixel surrounded by dark pixels or a dark center pixel surrounded by light pixels as corners with high metrics. The Harris algorithm used five image filters, and three circular windows and evaluated the two gradients. The design of the calculation of the eigenvalue of the Harris matrix practices three multipliers and three adders and is pipelined to optimize performance.

### C. Machine Learning (ML) Classification

Our proposed models used four types of Machine Learning models such as Adaboost, K-Nearest Neighbors(KNN), Support Vector Machine(SVM), and Random Forest(RF) to classify the extracted local features from Grayscale images.

1) *K-Nearest Neighbors (KNN)*: K-Nearest Neighbors(KNN) is a supervised ML models, which is used for the classification of input data. It recognizes data points classified into multiple classes and calculates the class label for the new input data point. This method is famous for classifying the object into the train closest feature space. The nearest neighbors are signified by  $K$  in KNN, and the maximum unknown data points classify near to  $K$  neighbors. The primary benefit of the KNN algorithm uses the minimum distance to search the nearest neighbors. The selection of the number of nearest neighbors is essential to obtain the augmented KNN model. The selection of the number of nearest neighbors is essential to get the augmented KNN model.

2) *Support Vector Machine (SVM)*: Support Vector Machine(SVM) also is a supervised ML algorithm. In this model, take the past input data and predict the feature output. The primary purpose of SVM is classification, but it is also used for regression statements. The SVM algorithm chooses the support vectors in the dataset at the extreme points. It selects the maximum distance between the support vector and hyperplane as much as possible. A class in support vectors has the maximum distance from the hyperplane. The distance margin defines as the distance between different support vector classes. The sum of  $D+$  and  $D-$  is calculated as distance margin, where  $D-$ , hyperplane has the minimum distance from the closest negative point and  $D+$ , hyperplane has the minimum distance from the closest positive point. The main aim of SVM is to find the maximum distance margin, which gives the optimal hyperplane. The optimal hyperplane always gives excellent classification. In the case of non-linear, which produces low and no distance margin, SVM showed misclassification. In that scenario, SVM used the kernel functions to convert the non-linear data into 2D or 3 D dimension arrays. The minor dimensional feature is converted into high dimensional feature space by the kernel functions.

3) *Random Forest (RF)*: Random Forest (RF) is one of the most common and powerful supervised ML algorithms. RF executes efficiently massive datasets and predicts accurate results. This algorithm support both types of functionality, such as classification and regression—the decision tree support RF to enhance the accuracy and flexibility. In general, with more trees in the forest, the output would be more predictable. The more trees in the RF reduce the risk of when a statistical model fits exactly against its training data. RF can obtain good accuracy in case of missing a large proportion. According to attributes, the new object classifies, and the decision tree gives the classification output per the ruleset.

4) *AdaBoost*: The first boosting algorithm is AdaBoost, which solved multiple problems. The AdaBoost constructs a robust classifier from multiple weak classifiers. This algorithm keeps a single split of the decisions tree with the weak stump, known as the decision stump. AdaBoost always keeps more load on tough to classify, easy to handle the problem, and do less. This algorithm has solved both types of problems, such as classification and regression. Multiple APK's are repackaged, which steal code by reverse engineering methods and reassemble with another name by adding adware or small scripts of malicious code into repacked APK. Here the APK has very slightly changed, so the dataset has slight noise in

data We found that in the case of less noisy data, only a few hyperparameters need to be tuned to improve the Adaboost performance. In the case of the small number of input variables, KNN models provide excellent performance. Whenever we increase more number of input variables, the performance of KNN degrades. In our dataset, we used multiple DEX files based on APKs. All files structure of APK were converted into grayscale images, which increased the number of input variables and memory size and complexity of the KNN model.

#### IV. PROPOSED MODELS

In our work, we proposed an image-based detection of android malware using machine learning classification. In this process, Android APK converts into a grayscale image, extracts the image feature using image processing techniques, and trains the machine learning classification to detect malicious or benign apps depicted in Fig. 1. The novelty of this approach the entire files of APK transforms into images to deal with the obfuscation attack. Most of the existing techniques used only three files of APK to transform into the image. The main disadvantage of the other techniques requires decompiling the APK and separating the files such as DEX (MD), ARSC(RS), Manifest.xml(MX), and certificate files. Moreover, the disadvantage is that it does not take care of the multiDEX files. If APK has more than 6500 methods in the app, it needs to create the multiDex files [40]. If the malicious code is embedded with second or third classes.dex files, no existing algorithm detects the Android malware app from multiDex class files. The primary source of the malicious code is embedded into classes.dex files. Our models used three algorithms (SURF, ORB, and SIFT) to extract local features (LF) descriptors from the grayscale image dataset. One by one, local features (Extracted from each image) train to multiple machine learning algorithms (RF, KNN, DT, and AdaBoost). The multiple descriptors represent an image. Above mentioned machine learning algorithm gave the multiple vectors as outputs, which cannot be direct as inputs for any machine learning algorithm. This model used the Bag of Visual Words(BOVW) to create one feature vector with multiple local feature descriptors [41]. The BOVW uses any clustering techniques to fragment the extracted descriptors vectors into multiple clusters. Then the cluster is predicted by the clustering algorithm.

##### A. Accuracy Assessment

The accuracy metrics for multiple Machine Learning models were determined based on the precision, recall, f1-score, and accuracy in Eq. 4, 5, 6, 7 respectively, and precision in fraction of data entries of malicious activity are categorized as truly Android malware.

$$\text{Precision} = \frac{\text{True Possitive}}{\text{True Possitive} + \text{False Possitive}} \quad (4)$$

The recall is the fraction of malicious apps data of correctly classified malicious families.

$$\text{Recall} = \frac{\text{True Possitive}}{\text{True Possitive} + \text{False Negative}} \quad (5)$$

TABLE I. OBTAINED ACCURACY, PRECISION, RECALL AND F1-SCORE FROM MULTIPLE MACHINE LEARNING MODELS USING MULTIPLE LOCAL FEATURES EXTRACTOR METHODS

Performance Evaluator	Feature Vectors Methods	Machine Learning Methods			
		K-Nearest Neighbors	Support Vector Machine	Random Forest	AdaBoost
Accuracy	SIFT	92.42%	94.06%	94.65%	93.16%
	SURF	94.69%	95.37%	96.33%	96.86%
	ORB	89.41%	89.83%	91.42%	92.83%
Precision	SIFT	94.48%	91.00%	95.11%	95.71%
	SURF	95.79%	94.63%	97.44%	97.41%
	ORB	90.46%	89.13%	92.48%	93.36%
Recall	SIFT	91.31%	94.97%	93.42%	92.66%
	SURF	93.47%	96.29%	95.09%	96.35%
	ORB	88.33%	90.70%	90.24%	92.34%
F1-Score	SIFT	92.40%	94.14%	94.57%	93.18%
	SURF	94.71%	95.45%	96.25%	96.88%
	ORB	89.39%	89.91%	91.34%	92.85%

f1- score is the harmonic mean between sensitivity and precision.

$$f1 - score = 2 * \frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}} \quad (6)$$

The accuracy or complete classification accuracy is the portion of all suitably classified negative and positive records with the losses.

$$\text{Accuracy} = \frac{TN + TP}{TN + FN + TP + FP} \quad (7)$$

$$\text{Cross-EntropyLoss} = -\frac{1}{N} \sum_{o=1}^n \log p_{model}(y_o \in C y_o) \quad (8)$$

#### V. EXPERIMENT

The experiment has been designed on Intel core™ i-7 10700 CPU @ 3.8 GHz with 16 GB RAM. The experiment used the BOVW algorithm, which needs a size 120 codewords vocabulary. The K-means technique collected all key points from created datasets, and it has the codeword vocabulary size 120. Moreover, the proposed model used Opencv, Sklearn python libraries for the implementation of laboratory works.

The performance of different Machine Learning models has been achieved in terms of the whole percentage of true positive, true negative, false positive, and false-negative decisions. Our local features extractor models, such as SIFT, SURF, and ORB, extract key points from the image dataset. The extracted local feature passed to train four renowned machine learning models, i.e., K-Nearest Neighbors(KNN), Support Vector Machine (SVM), Random forest, and AdaBoost. The complete result with multiple ML models and local feature extractor models is presented in Table 1 and shown in Fig. 3. The validation set of the accuracy and losses in our proposed works proves that the results are correct, not overfitting problems depicted in Fig. 4. The high accuracies, precision, recall, and Fi-score from different machine learning models are displayed in Table 1 and Fig. 3, if the losses decrement and accuracy developments of both groups are like the same, then the process aborted changed the modeling parameters to remove the overfitting problem. Last, the AdaBoost model accuracy touched 96.86%. The traditional machine-learning algorithm shows the performance of each algorithm in Table 1 and is

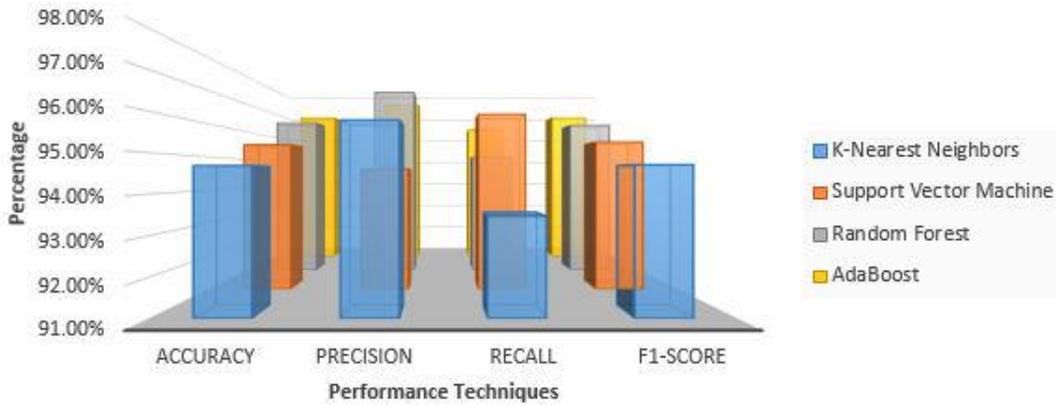

Fig. 3. Performance of Multiple Machine Learning Models

TABLE II. PROPOSED MULTIPLE MACHINE LEARNING MODELS WITH ACCURACY, PRECISION, RECALL AND F1-SCORE

ML Method	Accuracy	Precision	Recall	F1-Score
K-Nearest Neighbors	94.69%	95.79%	93.47%	94.71%
Support Vector Machine	95.37%	94.63%	96.29%	95.45%
Random Forest	96.33%	97.44%	95.09%	96.25%
AdaBoost	96.86%	97.41%	96.35%	96.86%

TABLE III. COMPARISON OF DIFFERENT EXISTING APPROACHES

Model	Accuracy	Types
Unver [11]	98.75%	Image-based
Jaiteng Singh [12].	92.59%	Image-based
AspectDroid[13]	94.68%	Hybrid analysis
SAFEDroid[14]	98.40%	Static analysis
DroidDet[15]	88.26%	Static analysis
Wang[16]	94.00%	Static analysis
Yen[23]	92.67%	Image-based
FalDroid[33]	94.20%	Static analysis
DREBIN[34]	94.00%	Static analysis
DroidSIFT[35]	93.00%	Static analysis
R2-D2[36]	93.00%	Image-based
Yang[37]	95.42%	Image-based
Karimi[38]	97.00%	Image-based
<b>Proposed</b>	<b>96.86%</b>	<b>Image-based</b>

depicted in Fig. 4. The accuracy value maximum 96.88% in the AdaBoost model, with losses, using SURF local feature extraction models in Fig. 4. In our work, computation time is scanned in each step of all ML models, inclusive of the feature extraction process, training, and testing of the model. The computation time from different ML models, the feature extraction process, training, and validation are presented in Table IV and Fig. 6.

## VI. CONCLUSION

Our proposed model uses an image-based framework to classify the android app, whether malicious or benign app. Most image-based detection techniques do not care about the multiDex files of APK, using only a single class.DEX file for image conversion. In existing techniques of image-based malware detection found [11-12,23,36,37] the maximum detection probability of malware in classes.DEX file, not in another file such as Resources.ARSC, Manifest.xml, certificate files, if the hackers hide malicious code into second or third classes.DEX files, there is no chance to detect the malware in previous approaches. In our experimental works, transform

TABLE IV. THE EXECUTION TIME OF THE PROPOSED MODEL

Feature Vectors Methods	Machine Learning Models			
	K-Nearest Neighbors	Support Vector Machine	Random Forest	AdaBoost
SIFT	941.63	945.87	941.03	943.91
SURF	827.00	830.64	826.72	828.91
ORB	43.36	44.87	44.10	266.43

all classes.DEX APK file's contents into grayscale images. We used the image processing techniques to extract the local feature of images, including SIFT, SURF, and ORB models. The Local features are classified using machine learning models (KNN, SVM, RF, and AdaBoost) to detect Android malware. The achieved results exhibited that the proposed approach overtakes the existing techniques in classification accuracy and computational time. Our work showed that the AdaBoost detection rate reached up to 96.86 %, shown in Fig. 5 and run time did not exceed 0.0195 s on average for each sample. In the future, we will try to use the local and global features of images on multiDEX files to classify the Android malware to improve accuracy.

## ACKNOWLEDGMENT

Mohd Abdul Rahim Khan would like to thank the Deanship of Scientific Research at Majmaah University for supporting this work under Project No. R-2022-162

### ABSTRACT

Curcumin, a polyphenol found in turmeric, has attracted attention from both the medical and culinary worlds because it is the primary source of the spice's medicinal qualities. Oxidative and inflammatory diseases, metabolic syndrome, arthritis, anxiety, and hyperlipidemia can all be managed with this supplement. As a result, active persons may benefit from the supplement's ability to reduce inflammation and muscular soreness following exercise. For those who have not been diagnosed with a medical ailment, even a little dose of the complex can have health benefits. Its antioxidant and anti-inflammatory properties are responsible for most of these advantages. Curcumin's poor

bioavailability, which appears to be mostly attributable to poor absorption, fast metabolism, and rapid elimination, does not contribute to the related health benefits. Bioavailability can be improved by a variety of factors. Curcumin (diferuloylmethane) is one of turmeric's most potent, non-toxic, and major bioactive ingredients. Curcumin has a weak bioavailability and

low absorption rate. Curcumin nanoparticles can be used to treat cancer and wound infections, according to the findings of this study. Antibacterial, antiviral, and antiprotozoan properties of curcumin nanoparticles are excellent. As a result of this, curcumin-loaded nanoparticles can be used for drug administration in nano-gel, microemulsion, and nano-cream forms of the nanoparticle. An important component of turmeric known as curcumin is the *Curcuma longa* Linn rhizome. Since its discovery in the 16th century, curcumin has been used to treat a wide range of ailments. Curcumin's anti-oxidant and anti-inflammatory properties play a significant role in a wide range of maladies, including cancer, cardiovascular disease, Alzheimer's disease, inflammatory disorders, neurological diseases, and so on. Although natural curcumin has made amazing achievements in therapeutic applications, the clinical implications of native curcumin are hindered by restricted solubility, chemical-physical instability, poor bioavailability, rapid metabolism and poor pharmacokinetics. There are several intriguing biological effects of curcumin that have been summarised here.

**KEYWORDS:** Curcumin, *Curcuma longa*, Anticancer, Curcuminoids, Turmeric.

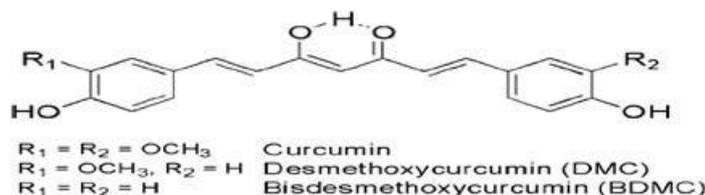

## INTRODUCTION

Turmeric is an Indian plant (*Curcuma longa*) of the ginger family (Zingiberaceae) known for its medicinal properties. *Curcuma longa* is depicted in Fig. 1. Curcuminoids, turmeric's active constituents, are thought to be responsible for the spice's health benefits. In addition to curcumin, which is a small molecular weight polyphenolic compound and lipophilic in nature, curcuminoids contain additional fascinating components such as curcuminoids, curcumin, curcuminoids, and curcuminoids. Curcumin is able to withstand the stomach's acidic environment. Additionally, volatile oils like tumerone, atlantone, and zingiberone are found in the extract. In turmeric, curcumin is extracted from *Curcuma longa*, which is the source of its colour.

An investigation on this bioactive component has been completed fully. In addition to being known as curcumin, it is also known as diferuloylmethane (1, 7-bis (4-hydroxy-3-methoxyphenyl)-1, 6-heptadiene-3,5-dione). There are two forms of this tautomeric compound: one in organic solvents, and the other in water. This is Fig. 2.

**Fig. 1: Curcuma Longa.**

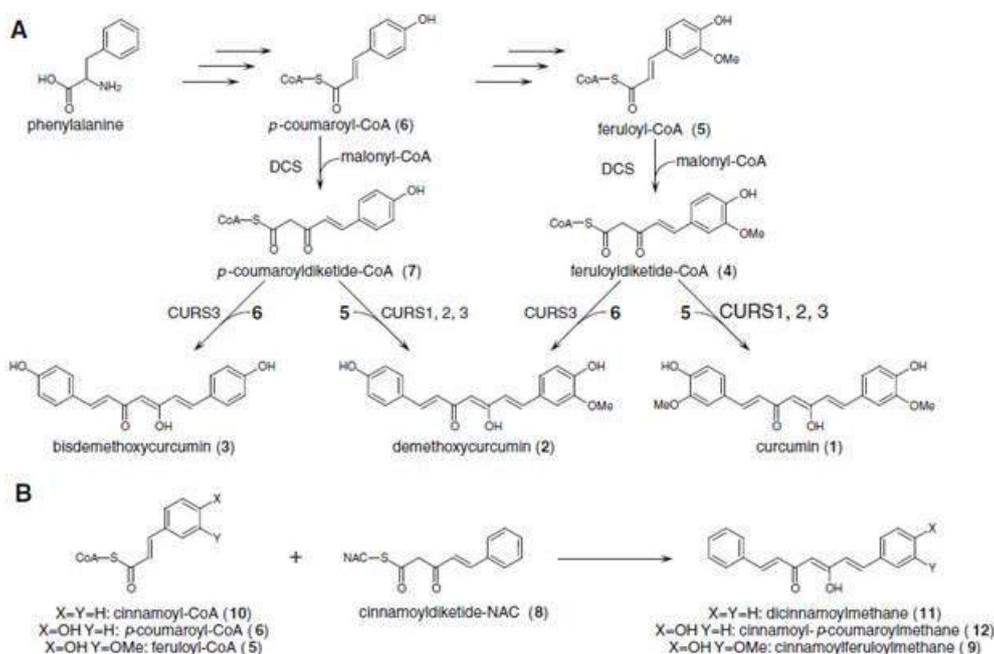

**Fig. 2: Chemical Structures of Curcuminoids.**

One of the first known polyketide synthases, diketide-CoA synthase (DCS), and curcumin-synthesizing enzyme (CURS1) were revealed to collaborate to produce curcuminoids in the herb *C. longa* (Fig. 3A). CoA (4) is formed from feruloyl-CoA (5) and malonyl-CoA by DCS. Feruloyl-CoA (5) and the DCS-produced feruloyldiketide-CoA are converted by CURS1 into curcumin (4). As a result, DCS and CURS1 are involved in the synthesis of curcumin. Bisdemethoxy curcumin (3) can also be synthesised from bisdemethoxy curcumin (6) via p-coumaroyldiketide-CoA production by both enzymes, albeit at a low efficiency. It is possible to synthesise Curcuminoids, such as curcumin (1), demethoxycurcumin (2) and bisdemethoxycurcumin (4), using a pair of DCS and CURS, but the in-vitro reaction products are different from the composition of an extract of turmeric's rhizome, which contains more bisdemethoxy curcumin (3) than the mixture of products synthesised in-vitro by DCS and CURS. Therefore, it was hypothesised that the amounts of p-coumaroyl-CoA and feruloyl-CoA in-vivo would influence the composition of curcuminoids in the mixture. It has been shown that curcuminoids (1-3) are formed from cinnamoyl-CoA, p-coumaroyl-CoA, and feruloyl-CoA incubated with NAC, an analogue of diketide-CoA, in the presence of CURSs. An illustration of the third figure.

There are two types of turmeric: ground turmeric and ground curcuma longa. Rhizomes are collected in their entirety after harvesting. Whole rhizomes are used to transport these plants. They are typically 2 to 8 centimetres long and 1 to 2 centimetres wide, with bulbous ends and splits in the middle. Processed rhizomes are then recycled to produce turmeric powder.

Nearly 4,000 years ago in India, the Vedic people utilised turmeric as a spice and a holy symbol, making it one of the oldest spices known. It's known by a variety of various names in different civilizations. Turmeric is known as "haldi" in the north and "manjal" in the south of India. Known in French as terre merite and in many other languages as "yellow root," it is a common ingredient in many cuisines. Known as Kurkum in Arabic, it is also known as Uqdah safra in Arabic. There are at least 53 different names for turmeric in the Sanskrit language. Traditionally, curcumin has been utilised as a medicinal herb because of its many beneficial properties: antioxidant, anti-inflammatory, antimutagenic, and antibacterial. Curcumin is poorly absorbed, rapidly metabolised, and rapidly excreted from the body. Curcumin's bioavailability has been improved by a variety of substances. Piperine is the most intriguing because it promotes curcumin bioavailability by blocking the metabolic pathway of curcumin. Curcumin's bioavailability is increased by a factor of 2,000. Ointments, pills and capsules are all ways to take curcumin. According to the US Food and Drug Administration (FDA), curcuminoids have been deemed "Generally Recognized as Safe." Curcumin's potential health advantages will be briefly discussed in this review.

**Fig. 3: The Biosynthesis Pathway of Curcuminoids.**

## Clinical importance of Curcumin nanoparticles

### Anticancer activity

Cancer is the most common and devastating cancer in the world. Side effects from conventional treatments like chemotherapy, radiation therapy, and surgery are severe. A safer

and more effective method of treatment is needed for this malignant illness. New drugs are currently being developed using natural resources such as plants. Non-toxic, life-saving pharmacological compounds found in plants may be used to treat a wide range of malignancies. Many types of cancer can be treated with curcumin, a natural substance derived from the turmeric plant. Cellular signalling pathways play a major role in these outcomes. It has lately been used as a cancer therapy with increased bioavailability, solubility, and tumour cell targeting by curcumin nanoformulation.

### **Breast cancer**

Every year, millions of women throughout the world are diagnosed with breast cancer, making it one of the most common diseases among women. Curcumin micelles have been shown to improve bioavailability, cytotoxicity, and half-life in *in vitro* studies of triple-negative breast cancer (TNBC) xenografts. When it comes to TNBC, chemotherapy doesn't work since it is resistant to oestrogen, progesterone, or the human epidermis factor 2 receptor. In tests on TNBC cells, magnetic nanoparticles powered by curcumin were found to be highly effective anti-cancer agents with both imaging and magnetic targeting properties (MDA-MB-231 cell line). Reactive oxygen species (ROS) production was sped up and mitochondrial membrane potentials were lost as a result. MCF-7 electroporation combined with curcumin-encapsulated nanoparticles increased human breast cancer cell activity.

### **Ovarian cancer**

There are many different types of ovarian cancer, based on the cells they produce. Ovarian cancer patients who develop resistance to chemotherapy and radiotherapy face the most significant setback during treatment. Yallapu *et al.* created a monoclonal antibody with curcumin nanoparticles to increase the specificity and sensitivity of chemoradiotherapy to ovarian cell resistance. When nanoparticle conjugate was applied to ovarian cancer cells, cisplatin-resistant A2780CP decreased cell growth and boosted apoptosis. In human ovarian cell adenocarcinoma, paclitaxel and curcumin-encapsulated nanoemulsion showed anticancer effectiveness, enhancing apoptotic response against drug-resistant SKOV3 and SKOV3 (taxol-resistant). Nuclear factor kappa B (NF5-0B) activity was repressed and P-glycoprotein expression was lowered by nanoemulsion.

### **Pancreatic cancer**

There are curcumin-loaded polymer nanoparticles in the form of N-vinyl-2-pyrrolidone and polyethylene glycol monoacrylate. Xenograft human pancreatic cancer models may benefit

from its ability to prevent tumour growth. Apoptosis induction, activation decreasing of NF- $\kappa$ B, and expression of metalloproteinase matrix MMP-9 and cyclin D1 were further halted in combination with gemcitabine. Nanocurcumin's therapeutic effectiveness was demonstrated by testing on cell viability and clonogenicity. Turcumin-powered magnetic nanoparticles significantly slowed the growth of human pancreatic cancer cells (HPAF-II and Panc-1) in the xenograft mice model. This version of curcumin has showed higher stability and enhanced bioavailability and biodistribution compared to normal curcumin.

### **Prostate cancer**

The prostate gland of men's reproductive systems is affected by prostate cancer. Bones and lymph nodes are possible destinations for this disease. Nanoparticles containing curcumin loaded with lactic-co-glycolic acid (PLGA) have been found to exhibit anti-cancer effect against prostate cancer. PLGA-curcumin nanoparticles released bioactive curcumin into the cytoplasm after embedding in cancer cells. Apoptosis was induced as a result of apoptosis-inducing effects on STAT3, AKT, and nuclear  $\beta$ -catenin expression. An increased intracellular absorption of curcumin-loaded PLGA nanospheres has been demonstrated in prostate cancer cell lines by in vitro studies in prostate cancer cell lines.

### **Antimicrobial activity**

Many human infections are caused by microorganisms. Antimicrobial agents were used to eradicate bacteria, fungi, protozoa, and viruses using a variety of chemical and natural compounds. Antibacterial properties of turmeric have long been recognised. Curcumin nanoparticles have been used because their antibacterial activity has been found to be superior to that of ordinary curcumin. Wet-milling of nanocurcumin has been shown to produce antibacterial and antifungal properties. When surfactants were absent, nanocurcumin was more water-dispersible and exceptionally active against a wide range of pathogens, including *Staphylococcus aureus*, *Bacillus subtilis*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Penicillium notatum* and *Aspergillus niger*. Cell wall damage and death resulted as a result of the nanoparticles' entry into infected cells. Gram-positive bacteria were more sensitive to nanocurcumin's effects than Gram-negative bacteria were. In a different study, curcumin was enclosed and found to inhibit the growth of methicillin-resistant *S. aureus* and *P. aeruginosa* and promote damage healing in a mouse model in vivo. The growth of *S. aureus* and *P. aeruginosa* was suppressed in vitro by chitosan tripolyphosphate nanoparticles containing curcumin.

### **Anti-HIV activity**

By destroying CD4+ T cells, the human immunodeficiency virus (HIV) attacks the immune system. In time, the immune system weakens, leading to a condition known as immunodeficiency (AIDS). Immunity is maintained by CD4+ T cells, a type of white blood cell that helps the body fight against disease. However, antiretroviral medication decreases the virus, but it hasn't removed it entirely. As a result, a new treatment is needed to cure this deadly disease. Sol-oil nanoparticles with curcumin-loaded apotransferrin were found to be particularly effective in preventing HIV-1 replication through transfer-mediated endocytosis. Transferrin receptors are commonly found on HIV-infected cells. apotransferrin nanoparticles laced with curcumin bind to and deliver medicine to infected cells. Viral production of cDNA halts HIV-1 replication as the medication is gradually delivered.

### **Antimalarial activity**

Female Anopheles mosquitoes carry parasites that cause malaria, which is transmitted to humans by these insects. Nanoparticles containing curcumin have been shown to be effective *in vivo* in the treatment of malaria. Nanoformulations have been found to have both oral and cytotoxic effects, according to toxicity studies. Plasmodium Yoelii-infected mice are cured of their infection using curcumin-laden chitosan nanoparticles.

### **Anti-inflammatory activity**

In traditional Indian medicine, turmeric was used as an anti-inflammatory agent. Compared to 400 mg/kg curcumin, nanocurcumin had a similar inhibitory impact at 50 mg/kg, which exhibited an improved anti-inflammatory efficacy. Curcumin-encased exosomes have been tested in a model septic shock mouse that was fed lipopolysaccharide. Exosome-produced curcumin was found to have higher stability, target selectivity, and high blood concentrations in this experiment.

### **Curcumin as a traditional therapeutic agent**

#### **Cardiovascular disease**

During vascular development, vascular smooth muscle cells (VSMCs) proliferate and migrate in response to vascular injury and atherosclerosis. When an angioplasty, organ transplant, or stent is performed, the arteries are damaged. As a result of statin medication, VSMC migration is effectively prevented. An amphiphilic chitosan nanomatrix with curcumin has been designed that can manipulate cells and have low-dose fatal effects on the proliferation and migration of VSMCs. There is a high risk of cardiotoxicity with the first-line

chemotherapy drug, doxorubicin hydrochloride (DOX). By reducing apoptosis and reactive oxygen species (ROS), the pluronic nanocurcumin formulation can minimise this deleterious effect (ROS). To make matters worse, it was discovered that lowering heart tissue glutathione levels and glutathione peroxidase activity using a DOX-induced intracellular oxidative stress formula helped overcome cancer cell multidrug resistance. Atherosclerosis and other cardiovascular diseases are linked to angiogenesis, which has become a serious health concern. Poly (esteramine)-coated curcumin nanoparticles effectively inhibited angiogenesis in a zebrafish model, making this a novel anti-angiogenesis treatment.

### **Neurodegenerative, Alzheimer's, and Brains Diseases**

Many diseases of the human body originate in the brain, spinal cord, or other parts of the CNS. At these locations, the blood-brain barrier must be overcome in order for curcumin distribution (BBB). Nanoparticles made from peptides synthesised from ApoE residues 141–150 are the most promising approach.

-amyloid peptide (A), which is toxic to monomeric and fibrillar species and a hallmark lesion of Alzheimer's disease (AD), is deposited in senile plaques. There is a lot of interest in curcumin because it is an amyloid pathological chemical that has been studied extensively. H<sub>2</sub>O<sub>2</sub> stimulates ROS production in human SK-N-SH neuroblastoma cells, while PLGA–curcumin nanoformulation has no toxic effect. H<sub>2</sub>O<sub>2</sub> can be used to inhibit the production of Nrf2, a redox-sensitive transcription factor that has been shown to protect neurons in the presence of DA. In addition, curcumin formulations containing biotinyl poly(ethylene glycol), biodegradable poly (halcyanocrylate), PEG liposome, anti-transferrin, lipid conjugate liposome, Nanoliposome, PEG–polylactic acid block co-polymer, and Click-chemistry-based nanosomes have been shown to inhibit A $\beta$  aggregation and toxicity. NanoCurc™ formulation has proven that in athymic mice, lower levels of H<sub>2</sub>O<sub>2</sub>, greater levels of glutathione, and lowered levels of caspase 3 and caspase 7 activity reflect a positive intracellular redox milieu that warrants this AD treatment. As an additional benefit, the combination of PBCA nanoparticles with curcumin in ApoE3 provides a significant advantage in the treatment of A-induced cytotoxicity. Gold nanoparticles containing curcumin have been shown to successfully attach to amyloid proteins and peptides while simultaneously suppressing fibrillation and disintegrating amyloid fibrils.

AlCl<sub>3</sub> (the neurotoxicant) was completely reversed by curcumin nanoformulation in male Lacca mice, resulting in 97% recovery of membrane lipids and 73% recovery of

acetylcholinesterase. As with acrolein-induced neurotoxicity, curcumin nanoformulations can counteract this effect. g-glutamylcysteine synthase, ROS, and reactive nitrogen levels were restored, however glutathione neuroprotection was not affected.

It has been shown that amyloid plaques can be seen in Tg2576 mouse brains *ex vivo* magnetic resonance imaging (MRI), however no plaques were seen in nontransgenic animals. Nanoparticle accumulation and co-localization with amyloid plaques have been seen in immunohistochemical studies on mouse brains. As a result, MRI scans have the potential to replace positron tomography (PET) scans in the noninvasive diagnosis of Alzheimer's disease. An anti-amyloid antibody and curcumin/dexamethasone-loaded gadolin/magnetic nanoparticle combination is appropriate for early diagnosis, successful targeting and therapy of cerebrovascular apolipoprotein E amyloid (s).

Several human disorders, including Huntington's disease, are caused by mitochondrial dysfunction. If mitochondrial abnormalities are reduced, this disorder might respond to treatment. An *in vitro* study of the curcumin nanoformulation library (PLGA-b PEG-TPP) shows that mitochondrial targets can be used as a chemotherapeutic. By increasing complex II activity and replenishing glutathione and superoxide dismutases, another nanoformulation of solidlipide-based curcumin attenuates Huntington's disease of three nitropropionic acid mice. Additionally, the reduction in mitochondrial swelling, fat peroxidation, protein carbonylation, and reactive oxygen species resulted in reduced mitochondrial dysfunction in HD.

### **Stroke**

Stroke permanently damages the central nervous system owing to a lack of blood, oxygen, and nourishment. Curcumin may reduce cholesterol, obstruct the arteries, and act as a blood diluting agent to reduce the risk of stroke. When curcumin is used to treat stroke as solid lipid nanoparticles in the form of lipid nanoparticles, the bioavailability, pharmacodynamics, and brain targeting are all three to four times greater than when curcumin is administered orally. Using salbutamol as an internal standard, LC-MS/MS may be used to identify curcumin simultaneously in mouse plasma and brain tissue, and this method can be used to verify the efficacy of curcumin's targeted delivery. N-trimethyl chitosan surface-modified solid lipids have been proposed as an oral nanoformulation of curcumin for effective brain distribution. Isopropylacrylamide-Curcumin Polymer The occlusion-induced cerebral ischemia created by cytokine (tumour necrosis factor alpha (TNF-) and IL-1) increased neurobehavioral activity

in the middle of the cerebrum. After the middle cerebral artery was blocked in rats, this formula was found to prevent oxidative stress-related brain injury. Strength of grip, motor activity, and biochemical brain investigations have all been used to determine this formulation's efficacy. Curcumin encapsulated as an epigenetic agent in exosomes of 200 nm size has been found to play a role in the treatment of cerebral stroke. It has been shown in animal studies that solid lipid curcumin nanoparticles reduce the damaging effects of oxygen and nitrogen radicals, acetylcholinesterase, and a variety of mitochondrial enzymes, all of which contribute to the damaging effects of cerebral ischemia reperfusion injury.

### **Inflammatory Diseases**

Damaged tissue or an infection can cause inflammation, which is the body's way of protecting itself from further harm. There are more than a dozen inflammatory conditions. The production of myeloid cells from monocytes aids in the fight against bacterial infections. For example, curcumin is antiviral, antioxidant and neuroprotective. Lipopolysaccharide-induced inflammation in rats is successfully reduced by a nanotic curcumin formulation (LPS). As a result, lactic acid concentrations in blood and the brain, kidney function, and neuronal apoptosis have no adverse effects. LPS-activated macrophages were significantly less likely to produce TNF- in response to a curcumin nanoformulation based on PLGA-Eudragit S100 (J774 cells). Neutrophil infiltration and TNF- release were similarly reduced in the mouse dextran sulphate colitis model in vivo investigations. treatment of inflammatory bowel disease should be demonstrated to be an appropriate approach (IBD). In rats, curcumin nanoemulsion reduced LPS-induced lung and liver damage by reducing neutrophil migration, TNF- levels, and oxidative stress, as well as reducing inflammation. Myeloid cells can be activated in vivo using exosome-mediated curcumin delivery in an animal model of lipopolysaccharide (LPS) septic shock.

There has been a breakthrough in the development of a non-irritating transdermal gel nanoformulation that is safe for human consumption. This can be used to treat localised inflammation in the body. Proinflammatory cytokines, such as IFN-, IL-1, and TNF-a, as well as antiinflammatory cytokines and cytokines such as TNF-a, were all reduced by curcumin-polluted solid lipid nanoparticles. The combination of celecoxib and curcumin nanoformulation medicine in rats with ulcerative colitis resulted in a synergistic effect. Hepatoprotective potential of curcumin-coated solid nanoparticles has also been investigated. These findings were backed up by a series of tests, including: I the extent of liver damage, (ii)

the extent of liver repair and repair; and, (iii) levels of alanine aminotransferase and aspartate aminotransferase, (iv) oxidative stress markers (malondialdehyde, superoxide dismutase, and glutathione reduced).

Rheumatoid Chronic inflammatory disease of the joints and cartilages causes arthritis. The entire Freund adjuvant-induced arthritic rat model was used to establish an effective solid lipid solid nanoparticles loaded with curcumin. Blood leukocyte counts, inflammation markers, oxidative-nitrotic stress, TNF-, and C-reactive protein levels all rose dramatically in the arthritic rat model. Cyclic citrullinated peptilines antibody levels spiked, as did oxidative-nitrotic stress and TNF- and C-reactive protein levels.

### **Diabetes**

People with high blood glucose levels are at risk for developing diabetes. There is evidence that curcumin can help treat heart, kidney, and liver disease-related conditions. Because curcumin is delivered in nanoparticles and lipid/liposomes, it is expected to have a positive effect on therapeutic outcomes. Male Sprague–Dawley rats were given a self-nanoemulsifying drug-containing delivery system for diabetic neuropathy and the results indicated a higher neurosensory function confirmed by many criteria, including nerve function and inflammatory protein (NF-B, IKK-, COX-2, iNOS, TNF-a, and IL-6). Free radicals and systemic proinflammatory cytokines can alter the lipid profiles of patients with diabetes. PLGA–curcumin nanoformulation reduces C-reactive protein, IL-6, and TNF in Streptozotocin-induced diabetic rats, leading to significant decreases in plasma total cholesterol, triglycerides, and high-density lipoprotein cholesterol. Treatment with liposomal nanoparticles in a leptin-deficient mouse model of insulin resistance has prevented proinflammatory pathways in the factor of liver tumour necrosis, the dendritic cells that produce nitric oxide, and the ATMs that can cure insulin resistance.

### **CONCLUSION**

Curcumin's anti-oxidant and anti-inflammatory actions appear to be the primary mechanisms via which it exerts its numerous health advantages. With the addition of substances such as piperine, curcumin's bioavailability can be considerably increased. Inflammatory and oxidative disorders, the metabolic syndrome, arthritis, anxiety, and hyperlipidemia may all benefit from curcumin's anti-inflammatory and anti-oxidative properties. As a result, active people may be able to recover more quickly and perform better after exercising, thanks to this supplement. For those who have not been diagnosed with a medical ailment, even a tiny dose

can have health benefits. Curcumin, a strong pleiotropic substance, has been utilised as traditional medicine in many nations for its medicinal properties. According to research mentioned above and the many more that are published every day, curcumin's pharmacological activities are rapidly developing and progressing. Curcumin has been used for centuries to treat a variety of ailments, including diabetes, wound healing, arthritis, Alzheimer's, Parkinson's, inflammation, angiogenesis, cataracts, cancer, atherosclerosis, and hypertension, among others. Curcumin has a wide range of phytoconstituents that have been demonstrated to be effective in both clinical and experimental studies. If you're looking for a natural remedy for everything from inflammatory conditions to allergies to hyperglycemia to cancer to microbial infections to hypertension and everything in between, this is the one for you. Curcumin's ability to effect a wide range of molecular targets and its acceptable safety profile have made it a promising contender for the prevention or treatment of a variety of disorders.

### ABSTRACT

Although significant interest in colon-specific drug delivery systems has been placing over the past few years to create a delivery system capable of releasing medications in the colon in a reliable and replicable manner, these attempts have been unfruitful so far. The colon is an area that can host both local and systemic medication delivery. Drug administration should begin in the proximal colon and be supported by protecting drugs against breakdown, absorption, and release. The purpose of this evaluation is to grasp recent advances in treatment approaches for dosage types that are currently designed to administer colon therapies utilizing a pH-sensitive framework, a microbially initiated system like prodrugs, and polysaccharide-based techniques.

**KEYWORDS:** Colon-specific drug delivery, pH-sensitive, time-controlled dependent, microbially triggered, pressure controlled, and osmotically controlled system.

### INTRODUCTION

Recent increases in colonic illness instances have prompted greater need for local colonic disease treatment and have also given rise to better and safer treatment options. It is the most

common colon ailment and is third on the list of cancers diagnosed. Among colon disorders, colon cancer in Europe causes 200,000 deaths per year and is the deadliest of all colon diseases. It is also becoming more common in Asia, where people had previously thought it to be absent. Colon disease can be tough to deal with. A world with successful treatment is one that they can survive in, and it is a goal all health care specialists are working toward. In order to bring medicine to its target in the body (in this case, the colon) in an efficient manner without adverse effects, researchers have created colon-targeted drug delivery technologies. Because of a lack of protease activity in the upper GI tract, bigger proteins and peptides that are common in pharmaceuticals have a harder time getting absorbed. In order to address this problem, alternative methods like colon-targeted drug delivery systems that increase the amount of bioavailable molecules in the GI tract are being tested. As with the tiny compounds, more research might be done to prove colonic distribution's efficiency as an oral delivery method for macromolecules. To provide colon-targeted drug delivery systems, which deliver drugs only in reaction to the colonic environment and do not release any medications in the upper GI tract, drug delivery systems have been designed to distribute drugs only in response to the colonic environment. Microenvironmental factors and colon characteristics must be accounted for when delivering drugs to the colon. There are several things that change along the course of the GI tract, and some of them vary over different parts of the tract. There is a considerable difference in the environmental characteristics of the colon region with impacted tissue compared to the unaffected regions. Patients with colorectal issues (RCs) generate extreme ROS and inflammatory cytokines. When this happens, important antioxidants are impossible to synthesise, and the cells that make up the mucosa become lacking, leading to substantial mucosal injury. Several methodologies for increasing colonic medication delivery have been investigated, such as using pH-sensitive, enzyme-triggered, and magnetically-driven devices. The strategy of going beyond local tissue alterations was employed to create therapies, since changes in the area of disease must be taken into account while planning treatments. A study focused on enzymes that interact with a specific receptor in an area where the receptor is highly concentrated, unlike other enzymes. This article is about recent formula advancements that have created colon-focused medicine delivery systems, and how those delivery systems are used to treat diseases.

**Table 1: Colon targeting diseases, Drugs, and Sites.**

Target sites	Disease conditions	Drug and active agents
Topical action	Inflammatory Bowel diseases, Crohn's disease, Irritable bowel disease	Prednisolone, Budesonide, Olsalazine, Mesalazine, Hydrocortisone, Balsalazide, Sulfasalazine,
Local action	Chronic pancreatitis pancreatectomy and cystic fibrosis Colorectal cancer	Digestive enzyme Supplements 5-Fluorouracil
Systemic action	To prevent gastric irritation To prevent the first-pass metabolism of orally ingested drugs Oral delivery of peptides Oral delivery of vaccines	NSAIDS Steroids Insulin Typhoid

**Advantages of colon targeted drug delivery systems**

- Perfect for delivering a remedy to help heal Chron's disease, amoebiasis, ulcerative colitis and other colon ailments.
- There should be local treatment requirements for smaller medication amounts.
- More minor drug interactions and adverse effects take place.
- So, it is much more cost-effective. The extended colon retention period will help medication molecules have better bioavailability in the body (up to 5 days).
- Many medicines create a stomach irritation that can be avoided if kept from absorbing into the GIT (e.g., NSAIDs).
- You will save time by bypassing the first-pass metabolism of the digestive tract.
- More long days and nights.
- limits and hardships the distal region of the alimentary canal's difficulty of accessibility, which is due to its position.
- Dietary residues, digestive secretions, and fecal debris can bind to the medication and limit its bioavailability.
- Additionally, microorganisms in the colon degrade the drug, which could further disrupt colonic functioning.
- The low surface area and close connections in the colon keep the medicine from reaching the systemic circulation via the mucosa because of the lack of space and closeness.
- In-vitro dissolving tests are required to ensure that the dosage form is adequately dissolved.

- A poorly soluble medication like the one required for efficient colon delivery will face difficulties dissolving.
- Considerations to keep in mind when planning for a CDDS.
- It understands the anatomy and physiology of the colon.

### **Limitation of colon target drug delivery systems**

- Colon is challenging to reach.
- Delivering medications must happen in solution in the colon, yet it is harder for poorly soluble pharmaceuticals to dissolve in a viscous fluid environment.
- A tight junction with lower surface area and relative tightness can hinder medication delivery in the colon.

### **Need for colon targeting drug delivery**

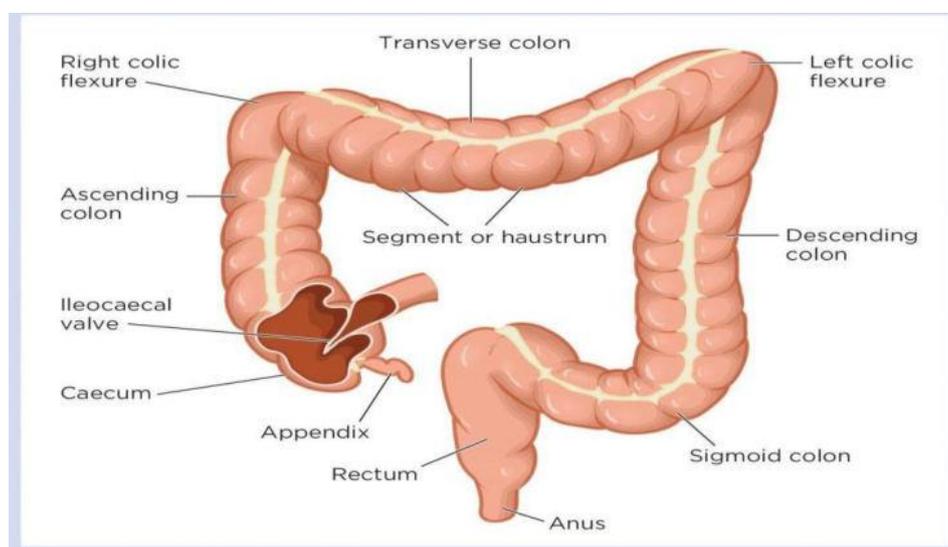

- Localized treatment by colonic medication administration to assure lower doses and more minor side effects overall
- Targeted distribution of peptide and protein medications could be achieved via oral administration.
- A medicine delivery method that only affects the colon is thought to help fight colon disorders.
- The colon is the location of two possible delivery mechanisms for inflammatory bowel disease (IBD) treatments such as ulcerative colitis and Crohn's disease: local therapy or systemic treatment. Patients diagnosed with inflammatory disorders may have to take glucocorticoids and sulphasalazine as part of treatment.
- Colorectal cancer, and many other life-threatening disorders of the colon, may potentially be treated more efficiently if medications were delivered explicitly to the colon.

### **Anatomy of the large intestine**

An intestine component located below the stomach is often made up of four segments: the cecum, colon, rectum, and anus. The term colon is also used to describe the big intestine in its entirety.

The large intestine is around a meter and a half (about 5 feet) long and is broader and shorter than the small intestine (around two-and-a-half times more expansive). Bacteria produce B12, thiamin, and riboflavin in the upper large intestine, which completes the digesting process

and supplies B vitamins. However, the large intestine's principal purpose is to extract water and electrolytes from digesting debris (which takes around 24 to 30 hours) and store fecal materials, then ejected them later. Digestive residues are gradually exposed to the absorbing walls due to the churning of the large intestine. The gastrocolic reflex is a relatively short but powerful and somewhat frequent action in the digestive system that pushes the waste matter in the system to the rectum.

**Fig. 1: Anatomy of the large intestine.**

### **Diseases of colon**

**Diverticular condition:** Weak areas in the intestinal wall, such as the diverticula, expand colonic lining sacs. Where considerable bowel pressure is maximum (the sigmoid colon), they tend to appear.

**Crohn's disease:** A digestive tract lining illness, common in older people, that is known to persist in patients above the age of 55. Crohn's disease can create serious health problems that can be fatal. Crohn's disease can suffer from abdominal pain, diarrhea, weight loss, anemia, and exhaustion. Although some people never exhibit symptoms, those who do frequently experience severe, long-term health problems.

Crohn's disease cannot be successfully treated. Steroids and immunosuppressants are used to reduce the speed of the disease's progression. If these procedures aren't successful, the patient will have to have surgery. People with Crohn's disease may need regular screening for colorectal cancer because of the high risk of developing.

**Amoebiasis:** An amoeba parasite that invades the colon, named *Entamoeba histolytica*. People who live in places with unpurified water often get amoebic infections. Raw food such as fruit washed in infected water can transmit the illness. Patients might experience moderate cramping and diarrhea if the symptoms show up at all. Severe instances are likely to have bloody stools, fever, and perhaps a liver abscess. Antibiotics are prescribed.

**Colon bleeding:** The color red indicates bleeding in the rectum or colon, leading to colon cancer or rectal cancer. Bleeding in the rectum might be a symptom of hemorrhoids.

**Diarrhea:** Diarrhea is defined as loose or watery bowel motions. Diarrhea is characterized by frequent loose, light bowel motions (or more frequently than usual). Diarrhea happens when the intestines can't properly absorb or release water.

**Colorectal polyps:** A collection of cells that are built up around the colon or rectum's lining. Some kinds are entirely safe, but others have the potential to become cancerous. Polyps usually don't produce symptoms. Before cancer is allowed to develop, routine colonoscopies, among other screening procedures, can be used to detect and remove polyps before they have a chance to grow.

**Colon cancer:** A tumor found near the end of the intestinal tract, which starts in the colon or rectum. Polyps are the earliest signs of colon cancer, which can begin as non-cancerous polyps. It is possible to detect them even though they usually lack symptoms. In light of these findings, doctors advocate routine testing for anyone at increased risk or above the age of 50. The size and location of colorectal cancer can determine the symptoms experienced. Symptoms such as bloody stools, bloating, and stomach pains are often found. To treat colorectal cancer, it's essential to understand the characteristics of the disease and how far it has progressed in the body. In cancer, people might expect surgery to get rid of it, chemotherapy, and radiation treatment.

### **Approaches used for site-specific drug delivery to the colon**

Methods used for site precise drug delivery are

#### **1) Primary approaches for CDDS**

##### **a) pH-Dependent drug delivery systems**

Altering the colon's acidity to make colonic medication distribution more effective is possible by tackling the colon. Using CAP, HPMCP 50 and 55, Eudragit® S 100, Eudragit® L,

Eudragit® FS, and Eudragit® P4135 F copolymers, it became possible to create a colon-targeted drug delivery system. The use of copolymers for colonic medication delivery is prevalent, with Eudragit polymers in particular providing mucoadhesiveness and pH-dependent drug release. A truly ideal polymer must be able to hold together in the stomach and upper small intestine but should thereafter begin to fall apart when in the lower small intestine and colon. Polymers that have a pH sensitivity level of 6.0-7.0 have a coat solubility threshold of 6.0-7.0. The polymer coat's dissolution properties will slow down the dissolution of the drug and avoid premature drug release in the upper GI tract. In spite of its inherent capabilities, this pH-dependent drug delivery system has low consistency, and it has proven incapable of handling environmental changes, such as a patient's body pH, because it has constant fluctuations.

Additionally, the pH in the GI tract can be strongly affected by factors such as the type of food, an illness, how much water the person drinks, and the digestive processes of the microbes there. Patients with ulcerative colitis, for example, show lower acidic intestinal pH than healthy individuals, which reduces the effectiveness of enteric-coated medicines and limits the amount of drug released at the target region. So, various internal and external factors can mess with pH and negatively impact the efficacy of pH-dependent drug delivery systems, with a poor site-selective drug release result. It was revealed that Eudragit® S coating was not ideal for colon-targeted drug release either because the coating broke down too soon, resulting in the colon being unable to hold the drug for any meaningful length of time or because the layer broke down too late. The prescription was released in the colon long before it could be absorbed into the bloodstream. Subsequent human investigations showed the Eudragit S tablets lack site-selective drug release, showing disintegration of the tablets is influenced by a variety of physiological parameters, including stomach pH, the food the patient is taking, and the intestinal transit time.

In addition to time-dependent and enzyme-triggered delivery systems, there have been several unsuccessful attempts to design systems which work regardless of pH, such as systems which use delivery systems which rely on time or enzymes as a means of delivery, and are paired with pH-dependent delivery systems. For example, systems made with high-amylose maize starch and Eudragit® S broke down colon microbes at different pHs. For this application, Eudragit® S was first combined with a high-amylose maize starch to form two coatings, which were applied sequentially. An alkaline water and Eudragit S were initially

sprayed on the starch in the first layer to keep it from degrading and to neutralise the starch's pH. A buffer was then added to further protect the starch. Eudragit® S, a coating made with organic ingredients, was used to speed medication breakdown at pH levels higher than 7. The breakdown of dual-coated tablets was better in the lower GI tract after the approach was studied and practised. They invented a delivery device that uses pH- and time-sensitive microspheres to provide prednisolone to patients colonoscopically. They employed ethyl cellulose and Eudragit® S to enhance colonic medicine administration and to reduce upper intestine drug release. A multi-unit drug delivery system like Eudracol® that delivers medications to the colon and leaves them there for release in equal amounts is an example of a drug delivery method. There is a delivery mechanism that targets the colon that is activated over time and in response to pH levels. Integrated systems utilising more than one method of delivery, which can all be triggered based on pH, have been more successful than only pH-controlled systems in dealing with pathological variability. However, more modifications are required to achieve the desired result. Furthermore, it is thought that small particles may aid to transport medication to inflammatory colon regions directly. To reach their target area in the colon, many types of drug delivery systems have been designed using pH-dependent components, which can make the particle they are connected to smaller.

#### **b) Time-dependent or time-controlled system**

Using a time-controlled method helps people administer their medications in the proper locations and on their predetermined schedules. Diseases that are influenced by circadian rhythms are often treated with the use of systems like this. Delayed-release formulations that use a time-controlled delivery method for the colon are also known as "delayed-release formulations" because of the delivery's use of a time-based period. The specific location of drug release in these systems is based on the transit duration of a formulation in the GI tract, making it challenging to create a formulation that will release a drug in the colon. Formulations are, ideally, made to deliver where variation in stomach emptying time, pH in the small intestine, or anaerobic bacteria in the colon won't interfere with the location. A drug taken orally takes around three hours to transit from the small intestine to the colon. A tablet form can launch a timed explosion in the colon and release the medicine. The concoction consists of three elements:

- (i) A center core containing swelling excipients and the treatment
- (ii) A plasticizer that is included in an inner semi-permeable polymer barrier, allowing water influx but preventing outward diffusion of medication

(iii) Finally, an enteric-coating that dissolves at or above pH 5.5 is included as the outermost layer.

The enteric coat, placed outside of the tablet, will keep it intact until it reaches the small intestine. The enteric covering will break down when entering the small intestine, allowing liquids to seep into the core. Consequently, the tablet bulges while traveling through the small intestine. Lastly, after the firm orb had been in the small intestine for 4-6 hours, it would expand and eventually explode, opening a hole in the semi-permeable membrane, through which the medicine was released in the colon.

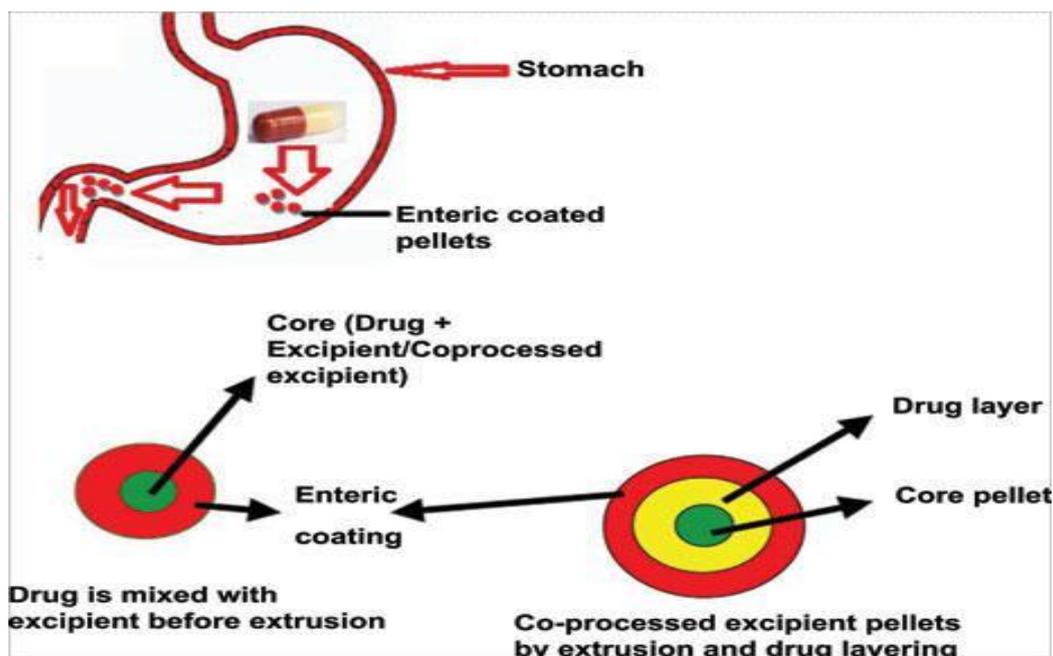

Fig. 2: Design of enteric-coated layer timed-release press coated tablet.

### c) Microbially triggered drug delivery to colon

A millilitre of colonic bacteria has roughly 100 trillion germs. Bifidobacteria, Eubacteria, Clostridia, Enterococci, Enterobacteria, Ruminococcus, and other anaerobic types are just few of the species which are contained in its arsenal of bacteria. The small intestine is deficient in digestive abilities, hence it contains lots of bacteria that can digest lots of carbohydrates. Examples include polysaccharides (e.g., long chain carbs). There are a lot of enzymes which can be created by the microflora in this fermentation. These include glucuronidase, xylosidase, arabinoside, galactosidase, nitroreductase, azareducatase deaminase, and urea dehydroxylase. To maximise colon-specific medicine administration, biodegradable polymers are a preferred choice for enzyme compartments because they reduce the chances of degradation of their polymeric medications. These polymer shields provide a

barrier to protect the drug in difficult conditions, such as in the stomach and small intestine, and help the medicine get to the colon and outside of the body. The molecular weight of the colon can be reduced with enzymes or through microorganisms. Microorganisms grow in the colon after turning it over. Reduced molecular strength means the equipment won't produce much mechanical force. At that time, the drug entity cannot be halted.

### (i) Approaches of prodrug for drug delivery to the colon

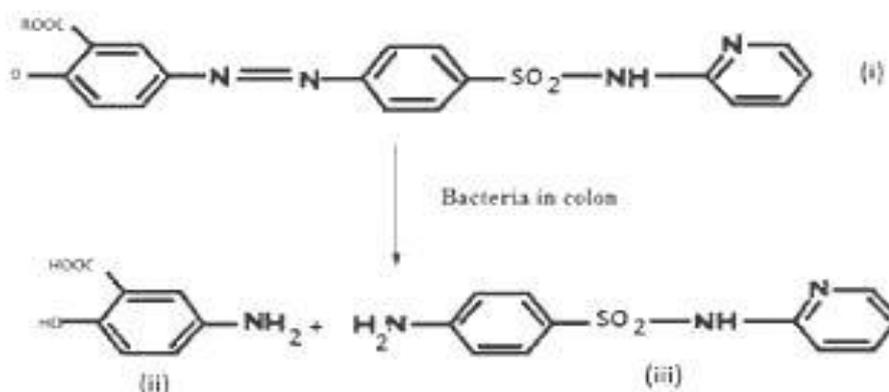

Colonic medicines undergo a minute hydrolysis in the upper intestines, and afterwards enzyme hydrolysis in the colon to ultimately produce active drug moieties.

### Limitations

- Since it depends on the functional group of a chemical bond in the drug molecule, it cannot be versatile.
- Must be thoroughly evaluated before they can be deployed as carrier organizations.

### (ii) Azo – polymeric prodrugs

When sub-synthetic polymers are utilised, a polymer containing an azo link between the polymer and drug molecule is generated. Fig. 3 illustrates the azoreductase identified in the large bowel to break down azo polymers.

**Fig. 3: (i) Hydrolysis of Sulphasalazine (ii) 5- Aminosalicylic acid (iii) Sulfapyridine.**

### (iii) Polysaccharide based delivery systems

The polysaccharide polymer of monosaccharides resists enzymatic action because of its integrity, so they are expected to retain their shape in the physiological environment of the stomach and small intestine. When they reach the colon, the polysaccharides are worked on by bacterial polysaccharides, thus degrading the matrixes. It is interesting to know that natural polysaccharide's strength lies in the fact that it is more durable, safe, and less toxic

than other polymers (Table 2). Pectin is a polysaccharide (long-chain sugar polymer) with polygalacturonic acid, which contains galactose, arabinose, and rhamnose, with short side chains of galactose and arabinose. A revolutionary approach to colonic medication administration is evaluated. High methoxy pectin compressed on tablets is enzymatically attacked in the gastrointestinal environment. Research using gamma scintigraphy confirmed that in vitro tests showed that the pectin coating tablets disintegrated in the colonic region and were degraded by microflora. This research needs to focus on devising new pectin derivatives that are less water-soluble to meet consumer demand. Using the insoluble pectin salt, calcium pectinate for colon-specific drug administration of Indomethacin was done. Turkoglu and his colleagues studied colon delivery of the 5-aminosalicylic acid tablets, which were compressed from pectin-hydroxy methylcellulose, and carried out degradation studies in pectinolytic enzyme buffer pH 1.2 and 6.4. HPMC was necessary to stabilize the pectin discovered on its own to be inadequate for supporting the structural integrity of the tablet. Pectinase is a digestive enzyme that helps to break down fibrous material. When pectinase was introduced to 6 hours of HPMC, the result was less than 30% erosion. The ichor from the vessels would then slowly leak into the colon, releasing 5-amino salicylic acid.

**Table 2: Characteristics of various biodegradable polymers for colon targeted drug delivery.**

Polysaccharide	General properties	Bacterial species
Amylose	Unbranched constituents of starch used as excipients in tablets formulation	Bacterioids, Bifidobacterium
Chitosan	Deacetylated chitin is used as absorption enhancing agent.	Bacterioids
Cyclodextrin	The cyclic structure of 6,7 or 8 units, high stability against Amylase, used as drug solubilizing agent and absorption enhancer.	Bacterioides
Dextran	Plasma expanders	Bacterioides
Arabinogalactan	Natural pectin, hemicelluloses used as thickening agents	Bifidobacterium
Guar gum	Galactomannan used as a thickening agent	Bacterioids Ruminococcus
Chondroitin sulfate	Mucopolysaccharides contains sulfate ester group at 4 or 6 position	Bacterioids

## 2) Newly developed approaches for CDDS

### a) Pressure controlled drug delivery system

Pressures of higher are found in the colon because of peristalsis. The team led by Takaya created a colon-delivery capsule that uses ethyl cellulose and is insoluble in water to support pressure regulation. Because of water reabsorption, the large intestine has more viscous contents, which induce a more significant increase in luminal pressure than the small intestine. To leverage colonic luminal pressure, studies have been done to devise colon-specific medication delivery systems. A capsule containing the medicine is the main component of the pressure-controlled drug delivery device. The polymer of water insoluble ethylcellulose is applied to the inner side of the gelatin capsules, where the drug is added along with a dissolving suppository base. When the capsules dissolve in the intestines, water from the intestinal contents is absorbed, causing the gelatin to increase viscosity and rise in pressure; this expulsion causes the drug to be released into the colon.

### b) Pulsatile colon targeted drug delivery

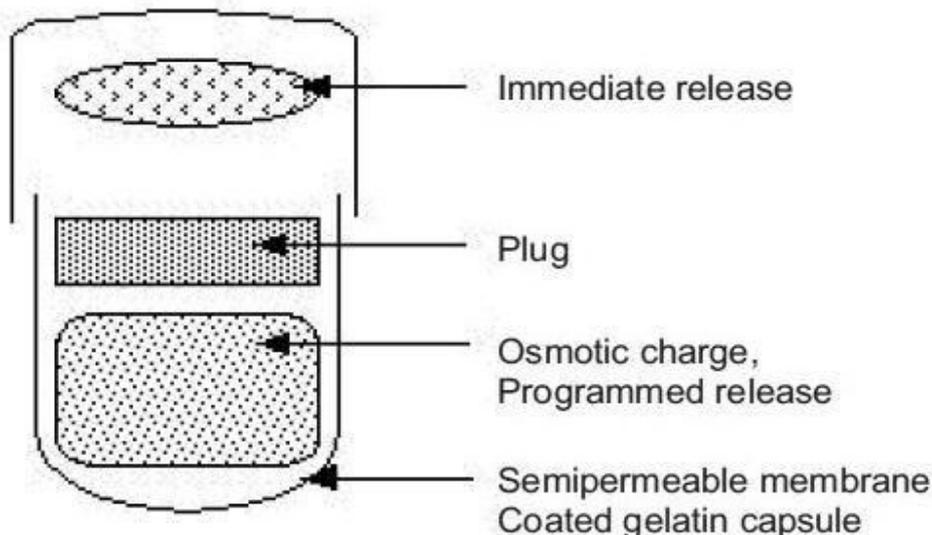

#### i) Pulsincap system

Capsule systems (single units) are where they are usually developed. By eroding the stopper inside the capsule, the medicine is "pulsed" out (control lag time). The drug capsule has a hydrogel plug, which is compressed and inserted into the capsule. Once inside, the hydrogel swells in the presence of a dissolution fluid. After a momentary delay, the swelling causes the plug to push out of the capsule and quickly release the medication. How long the pin is and where it goes into the tablet decides the length of the lag period.

#### ii) Port system

This technique utilizes delayed medication release as its fundamental premise. It has the following parts:

- Gelatin capsule housed in a cellulose acetate semi-permeable membrane
- An insoluble plug (e.g., Lipidic)
- A medication having an osmotically active ingredient added.

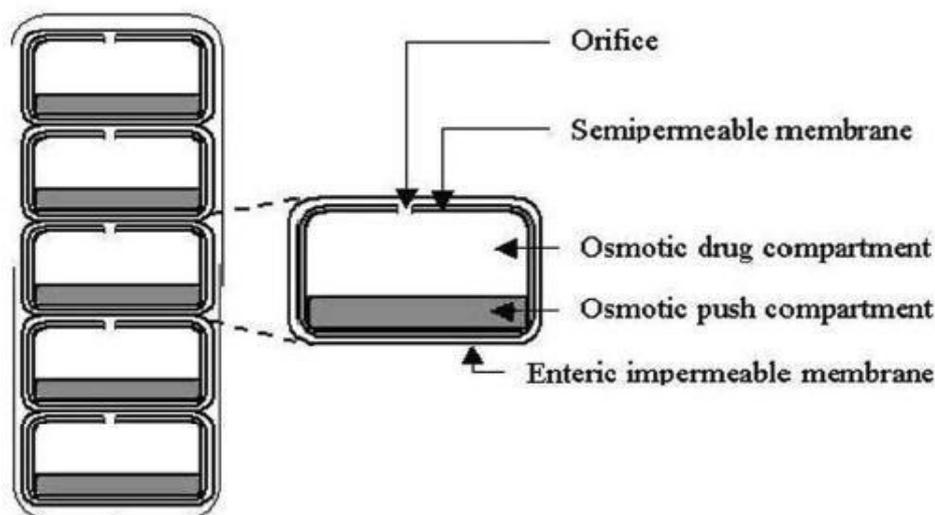

**Fig. 4: Plan of the port system.**

**c) CODES technology (Combination of pH-dependent and Microbially triggered CDDS)**

The CODES project was meant to circumvent the challenges presented by other solutions. Microbially triggered approaches control where medication release takes place and also provide control over the pH. A technique incorporating lactulose was utilized to create a specific trigger that released drugs directly into the colon. The tablets are the core of the machine, and it is made of a polymer coating applied to a base. To avoid the negatively charged polymers from interacting, an enteric polymer coating is placed on top of an acid-soluble polymer coating, with a layer of an HPMC barrier polymer placed in between. The enteric coating of the tablet dissolves when it is positioned on the stomach, and then it shields the tablet from gastric acids and pepsin while it's in the stomach. When the acidic soluble material coating goes through the small alkaline intestine, it is protected. The bacteria enzymatically degrade the polysaccharide (lactulose) into organic acid when the pill arrives in the colon. The PH becomes lowered, which will reduce the coating's disintegration and the drug's release. The polysaccharides are also in the center and work with the medication. Tablet is made of mannitol, maltose, and similar substances. Bacteria found in the colon break down polysaccharides, which are released from the middle of the tablet and then form a coating over the medication to allow it to dissolve in the stomach.

**d) Osmotic controlled drug delivery**

Osmotic drug delivery (designed by Alza Corporation) is an option for the delivery of medicine to the colon just once and twice a day through a capsule. An OROS-CT is a multi-faceted osmotic agent that can be used as a single agent or has between five and six osmotic push-pull units in a gelatin capsule. After contact with GI fluids, the gelatin capsule disintegrates, and the entry coating prevents fluids from the stomach into the system. The water transport through the membrane happens with the disintegration of the layer in the small intestine (that has a  $\text{pH} > 7$ ).

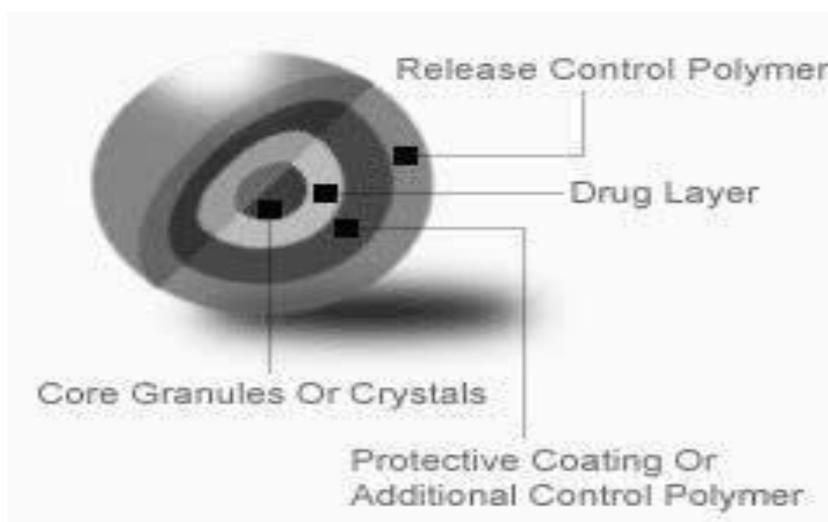

**Fig. 5: Cross-section of the OROS-CT colon targeted drug delivery system.**

**e) Multiparticulate system based drug delivery**

These formulations contain several small individual units, each housing a powerful substance to effectuate the release of medication, which is set off after a specific time interval via a set of explosion-operated release mechanisms. Pellets, granules, microparticles, nanoparticles, and beads are all included. The potential advantages of a multiparticulate system include:

- Fast, long-lasting results that stay in the body longer.
- Ensure complete absorption and even distribution in the gut.
- Fewer side effects overall, lower local irritation, and more controlled stomach emptying.

**Fig. 6: Multiparticulate drug delivery systems for controlled release.**

#### **f) Pro-biotic approach**

Currently, techniques for targeting a person's colon use three things: an implant (a microbial digestible carrier and Bifidobacterium and Lactobacillus), temperature triggering, and a particular substance (e.g., microbeads). This strain can be activated in the body at standard temperature, breaks down the drug-carrying vectors, and releases the medicine where needed. With all of these conditions readily available in the colon, this strategy has had success.

#### **Evaluation of colon targeted drug delivery system**

##### **In-vitro evaluation**

An established method for determining if someone has CDDS is missing. An ideal in vitro model must emulate the gastrointestinal system's pH, volume, bacteria, stirring, enzymes, and enzyme activity. The results are dependent on your nutrition and your physical exercise. The in-vitro dissolution and enzymatic tests are done on colon-targeted drug delivery devices.

##### **In-vitro dissolution test**

The dissolution tests are performed using the traditional basket method. To evaluate formulations at various pH levels, dissolution testing is conducted in buffers of varying pH. For the dissolution testing of colon-targeted drug delivery, several media are used, which mimic gastric fluid (pH 1.2), small intestine (pH 6.8), and large intestine (pH 7.4). The colon-targeted drug delivery devices are subjected to a series of three different environments, each lasting two hours. The first environment is 0.1N HCl (pH 2.3), the second is phosphate buffer (pH 6.8), and the third is pH 7.4 phosphate buffer. To measure colon-targeted drug delivery systems, we have designed buffers of the above pH.

### **In-vitro enzymatic test**

For this, you must take two tests:

1. Allow the bacteria to grow while the antibiotics are in their medium (*Streptococcus facial* or *B.ovatus*). We measured how much medicine was dispensed across various periods.
2. To analyze drug release, you use enzyme pectinase or rat or guinea pig or rabbit cecal contents with your buffer solution. Release rates are tied to how quickly the polymer-carriers degrade.

### **In-vivo evaluation**

A variety of creatures, such as dogs, guinea pigs, rats, and pigs, are employed in experiments that mirror the anatomic and physiological conditions of human guts, such as the presence of bacteria. These species are utilized since they're most like the conditions in human GIT. When considering the colonic disorders for an investigation, one should also think about the option of a relative model. Guinea pigs are utilized frequently to provide an IBD model for scientific purposes. There are quite a few similarities in azoreductase and glucuronidase activity levels in rat, rabbit, and human digestive systems. A new model has been developed for rapidly assessing CDDS. In this setup, human fetal bowels are transplanted under the skin of nude mice. These can affect blood vessel growth in four weeks, mature, and eventually gain the ability to create a mucosal immune system.

### **CONCLUSIONS**

Better delivery techniques are needed for localized disorders of the colon that address the existing medications. In contrast to a conventional drug that is dispersed in the whole body, a drug that targets only the colon is more likely to have side effects and needs to be more robust to be effective. This way, you don't need a dose as high to be effective, which also means that there will be less medicine in the body.

Because these materials are non-toxic, economically friendly, and chemically compatible with other ingredients, interest in biodegradable polymers is constantly expanding. The biodegradable polysaccharides in colon-specific medication delivery have been previously discussed in this article. Polysaccharides are the building blocks of a colonic delivery system with attractive characteristics. Microflora found in the colon is an attractive target for medication release in that region. Microbial degradable polymers used to create the drug's formulation are discharged from the upper GIT and pass through intact before being excreted

in the colon. Polysaccharides seem capable of delivering colon-specific drugs, a prospect that has researchers excited.

**COMPARATIVE STUDY AMONG SENIOR SECONDARY STUDENTS FOR ASSESSING  
EMOTIONAL INTELLIGENCE AND STRESS MANAGEMENT**

**Chitra Gupta** Research Scholar Lingayas Vidyapeeth, Faridabad, Haryana, India  
**Dr. Ankur Tyagi** Associate Professor & HOD, Lingayas Vidyapeeth, Faridabad, Haryana, India

---

**Abstract**

Emotional Intelligence is nothing but a trait of one's personality where an individual acquires an ability to understand his emotions as well as others too. This helps him to move forward in his life by overcoming various obstacles that come in his path. Emotional Intelligence makes an individual smart. It proves to be an invaluable asset for the individuals, especially the ones who are at the difficult stage of adolescence as this trait would help them to relieve their stress and can also act as a barrier to all kinds of negative energies. This present research study aims to assess the Emotional Intelligence and Stress Management among Senior Secondary students. The study was investigated on 100 students (50 male and 50 female) studying in various streams of Senior Secondary Public Schools. The respondents were selected randomly from 11<sup>th</sup> grade. The tools employed in the research study were Emotional Intelligence inventory (EII) constructed and standardized by Mondal and to measure the Stress Management of students, scale developed and standardized by Seema Rani and Basant Bahadur Singh (SISS) was used. Mean, Standard Deviation and to know the significant difference between the means of two groups 't' test were used by the investigators as the statistical techniques. The main findings of the research study unveiled that Science and Commerce stream secondary students differ significantly on emotional intelligence and stress management. Equivalently, the senior secondary male and female students also differ significantly on emotional intelligence and stress management.

**Keywords:** *Emotional Intelligence, Stress Management, Senior Secondary Students, Science and Commerce Stream secondary students.*

**Introduction**

“Attitude (aka Emotional Quotient / Intelligence) and not Aptitude (aka Intelligence Quotient) determines your altitude in life”. How often have we heard this timeless adage and shrugged it off as a yet another cliched advice, without realising the importance of it in our lives. Emotional Intelligence essentially means the ability to identify, understand and use your own emotions in positive ways to relieve stress and anxiety, communicate effectively, empathize with others, overcome challenges and resolve conflicts. While that might sound like a magic wand, it is like a staple which the parents should be inculcating in their kids right from the beginning. There are basically four components of Emotional Intelligence (EI) – self-awareness, self-management, empathy and social skills. Adolescence, which is very impressionable age for children's, comes with its own set of challenges the parents have to be prepared for to deal with. At this age, kids in pursuit of carving out their own identity often get rebellious, develop unhealthy behaviours, get easily swayed by peer pressure and eventually end up developing stress and anxiety issues. Inculcating strong emotional intelligence in children's from early on in their lives will thus equip them with coping stress; since by being self - aware, they can identify triggers which stress them out and express them by talking those out candidly with parents / guardians before they reach unmanageable levels and by being empathetic and socially aware, they would be able to switch the lens and see the world from other's perspective.

Thus, using Emotional Intelligence (EI), children's will be able to better harness and manage their emotions, communicate effectively, manage conflicts, manage stress, inspire and be an influence for other kids to follow and definitely proved to be as the illustrious stress buster.

**Statement of the problem**

“Comparative Study among Senior Secondary Students for assessing Emotional Intelligence and Stress Management”.

## Definitions of Key Terms

### 1. Emotional Intelligence

**According to Mayer, Salovey and Caruso (2002):** Emotional intelligence is “the ability to perceive emotions, to access and generate emotions so as to assist thought, to understand emotions and emotional meanings, and to reflectively regulate emotions in ways that promote emotional and intellectual growth”.

### 2. Stress Management

**According to Wikipedia:** Stress Management is a wide spectrum of techniques and psychotherapies aimed at controlling a person’s level of stress, usually for the purpose of and for the motive of improving everyday functioning.

## Objectives of the Research Study

The objectives for the present study were:

1. To compare the emotional intelligence of male and female students studying in senior secondary class of Public schools.
2. To compare the stress management of male and female students studying in senior secondary class of Public schools.
3. To find out the difference in emotional intelligence of Science and Commerce stream students studying in senior secondary class of Public schools.
4. To find out the difference in stress management of Science and Commerce stream students studying in senior secondary class of Public schools.

## Hypotheses

The Following were the hypotheses for the present research study

- H<sub>01</sub> – There is no significant difference in emotional intelligence of male and female students studying in senior secondary class of Public schools.
- H<sub>02</sub> – There is no significant difference in stress management of male and female students studying in senior secondary class of Public schools.
- H<sub>03</sub> - There is no significant difference in emotional intelligence of Science and Commerce stream students studying in senior secondary class of Public schools.
- H<sub>04</sub> - There is no significant difference in stress management of Science and Commerce stream students studying in senior secondary class of Public schools.

## Review of Literature

### 1. Studies conducted on Emotional Intelligence

Kar1, Dhiman, Saha, Birbal & Mondal, Chandra, Bhim (2014) investigated a study on “Measuring Emotional Intelligence of Secondary School Students in Relation to Gender and Residence: an Empirical Study”. The sample incorporated 200 respondents, selected from schools of 2 areas i.e. rural and urban. The tool used to measure the emotional intelligence of secondary school students was Emotional Intelligence Inventory (MEII) developed by Mondal (2014). ‘t’ test and One Way ANOVA were employed as the statistical techniques. The results revealed that there was no significant relationship between emotional intelligence among boys and girls. Sarita & Kataria, Sumit (2014) conducted a study on “A Study of Emotional Intelligence and Academic Achievement among Secondary school students”. The sample incorporated 100 secondary school students. Stratified sampling technique was employed for the process of data collection. Tools developed by Anukool Hyde and Sanjyot Dethe was used to measure the emotional intelligence of students. Mean, Standard deviation, ‘t’ test and Karl Pearson Product Moment Coefficient of Correlation were used as statistical techniques. The findings of the study were i) There was no significant difference in the mean score of emotional intelligence in relation to gender ii) There was slight relationship between Emotional Intelligence and Academic Achievement among secondary school students. Harjeet & Sra, Nisha (2015) administered a study on “Cor-relational Study of Stress and Emotional Intelligence among Adolescents. The sample consisted of 200 adolescents (male and female) from urban and rural areas. Stratified Random sampling was employed for data collection. Stress scale for Students, prepared by

Dr. Prerna Puri, Dr. Tejinder kaur and Prof. Manju Mehta and Emotional Intelligence Inventory constructed by Dr. S.K Mangal & Mrs. Shubra Mangal were used as tools for the conduction of the study. Mean, Standard Deviation, 't' test and Karl Pearson Product Moment Coefficient of Correlation were adopted for the interpretation of data. Through the results it was found that Male adolescents possess more emotional intelligence than female adolescents. Further it was also highlighted that the rural school adolescents possess more emotional intelligence than urban school adolescents.

## **2. Studies conducted on Stress Management**

Krishan Lal, Krishan (2014) conducted a study on "Academic Stress among Adolescent in Relation to Intelligence and Demographic Factors". The sample comprised of 200 students selected from Government and Private schools of Hisar. The tools that were employed to ascertain the data were Academic stress scale developed by Dr. Abha Rani Bist and Intelligence Test, prepared by Dr. R.K. Ojha. 't' test was employed as the statistical technique. The findings of the research study were i) There exists no significant difference in academic stress of average and low I.Q. students ii) There exists no significant difference in academic stress of Government and private senior secondary school students. Prabhu, Suresh P. (2015) investigated "A Study on Academic Stress among Higher Secondary Students". i) To find out whether there was significant difference between the following sub samples with respect to academic stress. a) Gender b) Locality c) Management [ Government / Private]. The sample consisted of 250 candidates drawn from higher secondary schools located in Namakkal District of Tamil Nadu, India. The investigator used Normative Survey method and Random sampling technique for conducting the study. For the measurement of academic stress the investigator used academic stress scale, developed by R. Balaji Rao. Mean, S.D. and 't' test were used as statistical techniques for the analysis of data. The findings showed that i) Male and female students do not differ significantly in their academic stress scores ii) Rural and urban area students do not differ significantly in their academic stress scores iii) Government and private school students do not differ significantly in their academic stress scores. Subramani, C. & Kadiravan, S. (2017) conducted a study on "Academic Stress and Mental Health among High School Students". The sample comprised of 200 respondents selected from government and private higher secondary schools. The investigator adopted stratified random sampling technique and survey method for the conduction of the study. The tools used in the study were Academic Stress scale developed by Jinadong Sun (2012) and Positive Mental Health Scale constructed and standardized by Vaingankar et al (2011). For the interpretation of data Mean, S.D., 't' test and Coefficient of Correlation were adopted as statistical techniques. The findings of the study divulged that i) students from private schools experienced high academic stress than the government school students.

## **Methodology**

The investigators have adopted survey method for the purpose of data collection in the present research study.

## **Sample and Sampling Procedure**

Hundred XI standard Science and Commerce stream students were selected through simple random sampling technique from the senior secondary schools situated in Noida region of District Gautam Buddha Nagar.

## **Instruments used in the research study**

The investigators used the following mentioned tools in this research study

1. Emotional Intelligence Inventory (EII) developed by Mondal (2014) was used for the purpose of data collection.
2. Stress inventory (SISS) standardized by Seema Rani and Basant Bahadur Singh (1986) was used to measure the stress management of the students.

## **Statistical Techniques used in the study**

In this current study different techniques of statistics were used for the interpretation. Mean and S.D. were calculated from the retrieved scores. After that 't' test was applied to know the difference between

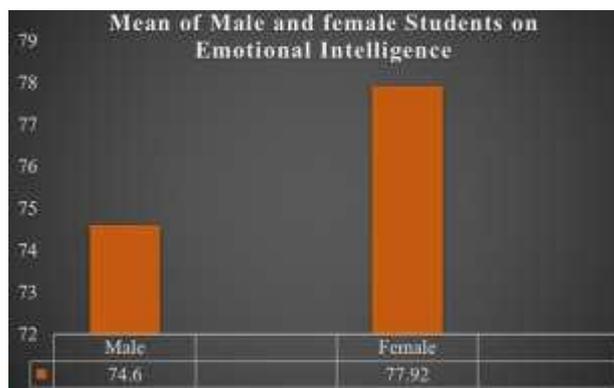

the means of two groups i.e. male and female, Science and Commerce stream on emotional intelligence and stress management etc.

**Analysis and Interpretation of Data**

**TABLE – 1 :MEAN AND STANDARD DEVIATION OF EMOTIONAL INTELLIGENCE SCORES OF MALE AND FEMALE SENIOR SECONDARY STUDENTS**

Gender	N	Mean	S.D.	‘t’ value	Significant at 0.05 level
Male	50	74.60	21.64	2.96	Significant P < 0.05
Female	50	77.92	25.83		

From the above table it was perceived that the ‘t’ value, 2.96 was found significant at 0.05 level. Therefore, it can be inferred that the H<sub>01</sub> “There is no significant difference in emotional intelligence of male and female students studying in senior secondary class of Public schools” was rejected. In other words, it can also be deduced that male and female secondary school students differ significantly on emotional intelligence.

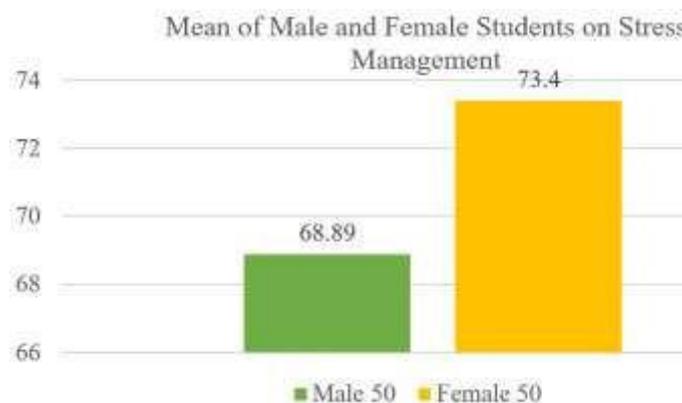

**Figure – 1 Bar Chart showing Mean difference between Male and Female senior secondary students on Emotional Intelligence**

**TABLE – 2 :MEAN AND STANDARD DEVIATION OF STRESS MANAGEMENT SCORES OF MALE AND FEMALE SENIOR SECONDARY STUDENTS**

Gender	N	Mean	S.D.	‘t’ value	Significant at 0.05 level
Male	50	68.89	18.76	2.37	Significant P < 0.05
Female	50	73.40	21.33		

From the above table it was perceived that the ‘t’ value, 2.37 was found significant at 0.05 level. Therefore, it can be inferred that the H<sub>02</sub> “There is no significant difference in stress management of male and female students studying in senior secondary class of Public schools” was rejected. In other words, it can also be deduced that male and female secondary school students differ significantly on stress management.

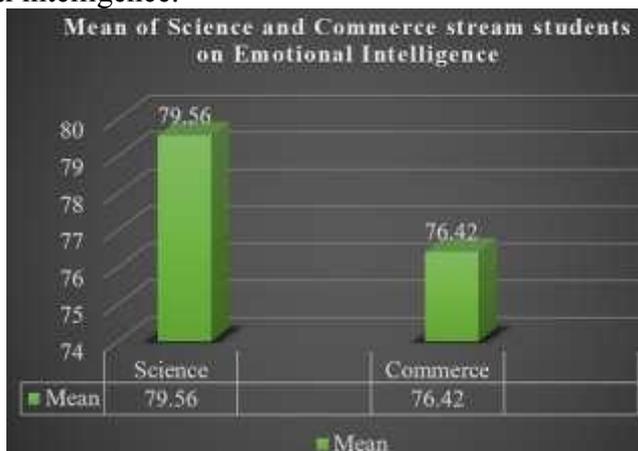

**Figure – 2 Bar Chart showing Mean difference between Male and Female senior secondary students on Stress Management**

**TABLE – 3 :MEAN AND STANDARD DEVIATION OF EMOTIONAL INTELLIGENCE SCORES OF SCIENCE AND COMMERCE STREAM SENIOR SECONDARY STUDENTS**

Stream	N	Mean	S.D.	't' value	Significant at 0.05 level
Science	50	79.56	28.80	2.83	Significant P < 0.05
Commerce	50	76.42	26.32		

From the above table it was perceived that the 't' value, 2.83 was found significant at 0.05 level. Therefore, it can be inferred that the H<sub>03</sub> "There is no significant difference in emotional intelligence of Science and Commerce stream students studying in senior secondary class of Public schools" was rejected. In other words, it can also be deduced that Science and Commerce stream students differ significantly on emotional intelligence.

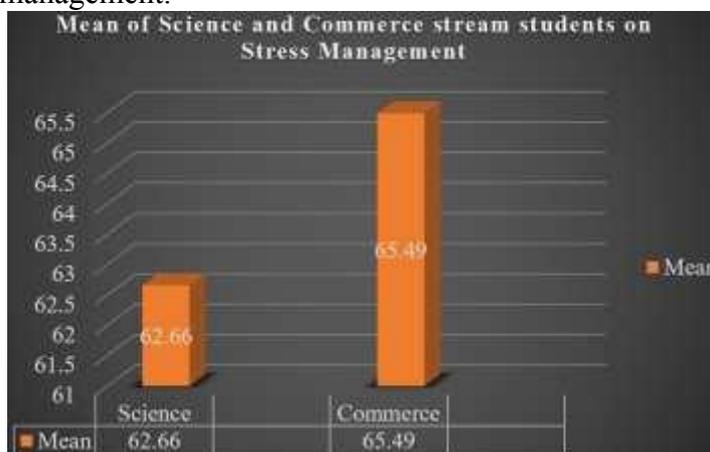

**Figure – 3 Bar Chart showing Mean difference between Science and Commerce stream students on Emotional Intelligence**

**TABLE – 4 :MEAN AND STANDARD DEVIATION OF STRESS MANAGEMENT SCORES OF SCIENCE AND COMMERCE STREAM SENIOR SECONDARY STUDENTS**

Stream	N	Mean	S.D.	't' value	Significant at 0.05 level
Science	50	62.66	16.38	2.23	Significant P < 0.05
Commerce	50	65.49	19.72		

From the above table it was perceived that the 't' value, 2.23 was found significant at 0.05 level. Therefore, it can be inferred that the H<sub>04</sub> "There is no significant difference in stress management of Science and Commerce stream students studying in senior secondary class of Public schools" was rejected. In other words, it can also be deduced that Science and Commerce stream students differ significantly on stress management.

**Figure – 4 Bar Chart showing Mean difference between Science and Commerce stream students on Stress Management**

### Findings

The major findings of the study were as follow:

- 1) Male and Female senior secondary students differ significantly on emotional intelligence. The elevated mean and S.D. in favour of female students specified that they have significantly higher emotional intelligence in comparison to male senior secondary students.
- 2) Male and Female senior secondary students differ significantly on stress management. The elevated mean and S.D. in favour of female students specified that they have significantly higher stress management in comparison to male senior secondary students.
- 3) Science stream students differ significantly on emotional intelligence.
- 4) Commerce stream senior secondary students differ significantly on stress management.

### Educational Implications

The present research study unearthed that emotional intelligence of females and Science stream students is higher as compared to the males and Commerce stream students. From the study the researcher discerned that there is an urgent need to make efforts in order to increase the level of emotional intelligence and stress tolerance among students, especially the adolescents, as these are essential traits for holistic development of personality of an individual. Therefore, in order to raise the level of emotional intelligence and stress management, subsequent steps shall be taken at school, teacher and parental level:

- In school, teachers should plan their lectures according to the correct methodology and by keeping in mind the needs of students.
- Teachers should maintain a cordial and an optimistic attitude towards growing students and their academic and personal problems. They should come up with proper solutions to the same.
- Teachers should motivate the students to participate in various extra - curricular activities according to their interests so that they can maneuver their energy in the right direction.
- School Management should arrange for Guidance and Counselling programmes for the students which might help them to get rid of negative energy and emotional stress.
- School authorities should organise several workshops, seminars, symposiums etc. so that the students can acquire some knowledge which might prove to be helpful for them in not indulging in unnecessary stress.
- Guidance and Counselling service programmes should also be systematized for the parents to provide them the knowledge about the difficult stage of adolescence and how they should be careful while dealing with their children.
- Educational tours should be arranged for the students where they learn to understand the emotions and feelings of each other while working together.

## Eco-crisis leads to the rise of Eco-consciousness

<sup>1</sup>Dr. Rashmi Maniar, <sup>2</sup>Dr. Hanan Khalid Khan, <sup>3</sup>Dr. Priya Raghav, <sup>4</sup>Ms. Vandana Kaushik

<sup>1, 2, 4</sup> Assistant Professor, <sup>3</sup> Associate Professor, Lingayas Vidyapeeth

**Abstract:** Nature and the environment play an important role in Malayalam poetry. The beauty of the landscape, which is rich in various species of flora and fauna, mighty rivers, and the shore line, adds to Kerala's vibrant culture and tradition. It demonstrates the region's ethnic diversity. Mysticism associated with the natural landscape attempts to claim its identity once more. A few writers from the area have depicted the relationship between man and nature in their writing. One of the most prevalent themes in contemporary Kerala poetry is environmental awareness. Ecological motifs, pictures, and symbols are prominently featured, giving their poetry a sense of beauty and aesthetics. In this paper, we look at how natural landscapes and myths are represented in a few river poems by two of India's most illustrious poets, K Satchidanand and G Sankara Kurup, whose works strongly reflect ecological consciousness.

**Keywords:** Ecology, Ecological Consciousness, Identity

### OBJECTIVES OF THE STUDY

The use of poetry as a medium for understanding the complex, intricate, and highly political representation of landscape experience is investigated in this study. People create empowered place identities as a result of the story-oriented and positive practise of landscape poetry, which promotes the creation of personal interaction with environmental values, attitudes, and meanings. Furthermore, it is suggested that new models of landscape education are needed to combat disempowering public discourse about youth and the environment, as well as conventional environmental education that fails to equip youth with the resources to constructively challenge it. This project utilizes a grounded theory approach to identify and analyse people's expressions of place identity through poetry. The content of the poems have been analysed to discover what environmental subjects were expressed by the poets, and what was meaningful about them for today's youth. Findings include the increased awareness of respecting nature and the nature-culture relationships in environmental experiences.

The creation of better environmental leaders is critical to solving the very real environmental challenges that we face today. The importance of a theory of landscape interaction and learning for this initiative is suggested by an analysis of these river poems. Environmental education, in other words, must evolve beyond the passive reception of knowledge about landscape ecologies and histories. Instead, the ways in which youth communicate with their surroundings must include them as active participants and contributors to political, cultural, and ecological understandings of environmental issues. The time has come when youth are allowed to participate as creators of knowledge in their own communities through poetry, they will personally and critically engage in understanding their environments in constructive ways.

Ecology has become an important subject of cross-disciplinary debate at the end of the twentieth century due to the disturbing ecological destruction. Slowly but slowly, the planet is witnessing the scale of human-caused environmental disruption. The ecological crisis has already become a global apocalyptic subject. The literary world is reacting to the global eco-crisis, realising the urgency of saving the Earth from total annihilation. Green philosophy ushered in a change in the way people thought about literature in the West. Rachel Carson's epoch-making novel, *Silent Spring*, was published in 1962. It sparked a flood of serious debates and deliberations about ecological stress, which peaked in the twentieth century. Since literature could not remain silent on the growing relevance of ecological philosophy, a new critical genre known as Ecocriticism emerged in the 1970s. Ecocriticism examines literary works from an ecological perspective.

The Corona era has made us aware that we are living in a period of profound social, cultural, ideological, and political transformation. Academicians have always been piqued by our society's evolving perspective and how it interrogates and deals with emerging ideas and trends. Malayalam literature and literati has played a crucial position in resisting the Silent Valley Hydroelectric Project (SVHP) and spreading the message of ecological conservation during the 1970s and 1980s. The cultural and literary traditions of Malayalam have always recognized and nurtured the relationship between human and natural lives. This paper explores two river poems composed, recited, and published by K Satchidanand and G SankaraKurup, examining how their poets deftly combined scientific and environmental principles with artistic, cultural, and literary traditions through such poems. The threat to the Silent Valley shocked and galvanised a large number of Malayalam authors. Never before in Kerala's socio-political past have writers shown such unity and determination in opposing the government's policies. Now is the time to duplicate this zeal and enthusiasm and bring back the lost glory of 'God's Own Country'. Now is the time to revive the past culture which is now mired in the fishing nets of pseudo-religion and sullied politics. Now is the time to revive its rivers, to bring them back to life so that

*'this dear parched earth...*

*sings the fertile songs of the ancients once again'*. (K. Satchidanand: The Peasant who committed Suicide Speaks of Rivers)

#### Origin of Eco-criticism

Literature and various forms of art have been portraying physical and the human-environment relationship since the Vedic period. The environmentalist movement, which began in the late 1800s, produced a large body of fiction and nonfiction literature focused on human understanding of nature and their evolving relationship. Eco-criticism arose from this bio-social background of unbridled capitalism, unsustainable natural resource extraction, troubling meanings and shapes of 'development,' and environmental danger. Its aim is to see how potentially informed readings of cultural texts can help not only to raise awareness but also to look at the world in new ways.

Eco-criticism is a relatively new literary field that originated in 1990. Its origins can be traced back to environmental destruction caused by human actions, and it explores and interprets man's relationship with nature, as depicted in literature. It explores the relationship between authors, texts, and the ecosphere in an

interdisciplinary analysis of interconnections between nature and culture. When academics began to collaborate on projects and environmental literature began to appear on the programmes of annual literary conferences in the mid-eighties, the field of environmental literary studies was born. In 1992, the Association for the Study of Literature and Environment (ASLE) was established. “to promote ideas and information pertaining to literature that considers the relationship between literature and the natural world.” Elaborating on the scope of ecocriticism, Cheryll Glotfelty writes, “Nature per se is not the only focus of ecocritical studies. Other topics include the frontier, animal, cities, specific geographical regions, rivers, mountains, deserts, Indian technology, garbage and the body” (xxiii) Donelle Dreese provides a thorough description of ecocriticism, encompassing all aspects of the philosophy, its goals, and its scope: Ecocriticism, also known as landscape critique, focuses on previously unrecognised problems in the landscape and ecosystem.

G Sankara Kurup or Mahakavi G was an Indian poet, essayist, and literary critic who specialised in Malayalam literature. He was a professor of Malayalam at Maharaja's College. He was the first recipient of the Njanapedam, India's highest literary honour, and is regarded as one of the greats of Malayalam poetry. From 1968 to 1972, he was a nominated member of the Rajya Sabha, and in 1967, he was awarded the Padma Bhushan, India's third highest civilian honour. He also won the Sahitya Akademi Award, the Kerala Sahitya Akademi Award, and the Soviet Land Nehru Award.

The current study aims to reveal the country's pitiful condition of rivers through the review of poems such as "The Peasant Who Committed Suicide Speaks of Rivers," and Mahakavi G's "At the River Mouth at "Vanchi," These poems are vehement criticisms of the nation's modern culture. Rivers that were once the nation's water supply flowed honey to quench people's thirst. All beings, including animals and humans, have drunk the elixir of life from those overflowing rivers. Its never-ending passion is a constant source of inspiration for all artists.

In his poem, "At the River Mouth at "Vanchi," Mahakavi. G rues the fact that Kerala was once an 'auspicious cradle' which has been reduced to a 'hearse' now. He says that Kerala is now 'broken in three', she has lost her culture:

*Gone is Kerala broken in three*

*The bow string of its culture lies loose'(44-45)*

Once upon a time, the state was rich and prosperous, now there are starving men who turn 'rotting coconut husks to golden ropes', the sea ships full of fish have been replaced with empty Chinese fishing nets. A land where the temples and mosques lay side by side has turns into a land where even the rats and snakes fight.

*"Where now snakes and rats are fighting.*

*It made restless*

*The temples the mosques the coconut groves...(68-70)"*

Mahakavi G. ends the poem on an optimistic note:

*"It was like a bouquet of coconut flowers...*

*An auspicious symbol of prosperous life"*

He has hope, that the state will become prosperous once again, once again the seas will be full of fish, once again people will live in harmony with nature and in harmony with each other.

The poem "The Peasant Who Committed Suicide Speaks of Rivers" best expresses the poet's concern for the rivers of Kerala. Kerala is known as the "Land of Rivers" because of its forty-four rivers. The state's culture thrives along these river banks, and artists represent the beauty of these rivers in the various art forms available. Kerala was once renowned for its evergreen paddy fields, which were irrigated by the water from these rivers. The state's farmers have historically relied heavily on the state's rivers for irrigation. However, as rivers become more or less extinct in modern times, the paddy's beauty has faded. The state's agricultural sector has utterly collapsed, and stories of peasant suicide have started to flood the news media on a regular basis. In this poem, Satchidanandan gives voice to one such peasant who committed suicide. The poet gives voice to the soul of a farmer who has committed suicide and meditates on the beauty of rivers in the first part of the long poem. The poem's first section is packed with enduring memories of Kerala's late rivers. The deceased farmer's soul recalls how the rivers of old offered plentiful food to the people. The river served as a nurturer for the state's children, singing them lullabies. She used her 'Breast milk' to feed her children. The poem is replete with the cultural nuances of Kerala: Kathakali, the Theyyam gods, waves of Sopana music, Mohiniyattom, Moplah songs, Pariah's dance, the All Saints Day at the church, all this signifies the fine amalgamation of socio-religious festivals and art forms in the culture of the state. This is indeed a strong message to the public of the cultural unity that the state has witnessed irrespective of the fact that which religion one follows. It is a clarion call for the disturbed mindset of today's residents of the state who have witnessed mindless violence in the name of religion or politics or any other reason, a message to learn from its rich history that unity in diversity is the norm rather than an exception.

*... River was there as divine mercy*

*In the green Kathakali mask ...*

*In the flowing forms of the Theyyam gods,*

*In the agile steps of the Pariah's dance,*

*In the wavelike petals of the Sopana music...(41-48)*

The poem recalls how the river's divinity encompassed the entire state's spirit. However, time has separated man from all of his links to nature and rivers. His greedy self, lost in the world of profit, has attached prize tags to all of nature's possessions. In narrating the dramatic shift in man's actions towards nature, the poet gives voice to the spirit of the dead peasant:

*Then the trumpeting forests*

*mowed down by the killers*

*pierced the rivers' laughter with their tusks,*

*then the sand that used to ride the water*

*with the fish and the snake*

*began to travel on the wheels of greed. (63-68)*

The poet expresses his displeasure with the fact that Kerala's rivers have become victims of the sand mafia in these lines. The destructive effects of the sand mafia could be seen all over the state's rivers. Pampa, Kabini, and Periyar, once grand rivers, have become mere rivulets. The river "Nila," which has always been a source of inspiration for poets, has become nothing more than dry land with pebbles bathing in the sunshine as a result of excessive sand looting. Despite the fact that the court has refused permission to take sand from the state's rivers due to the destructive impact it has on the rivers, the sand mafia in Kerala continues to loot the rivers with the help of the police and politicians. The death of the state's rivers has had a negative impact on peasants, as their agricultural crops have begun to die one after another. Due to a lack of irrigation water, the paddy fields, which were once the state's main attraction, have become barren. Many peasants in the agricultural sector have died as a result of crop failure in the state. Satchidanandan ends the poem by speaking for the peasant's soul, wishing to see his mother river overflowing with cool water with the blessing of nature, quenching its thirst and assisting the barren land in giving birth to healthy offspring.

Both the poets are optimistic that the glory of the land and the nearly dead rivers will be revived, one day. The concern for the environment and ecology expressed in these poems not only reflects our personal and cultural attitudes toward the environment, but it also helps to shape a formative opinion among the masses in general, and the youth in particular, about the protection of nature, environment, and ecology. The emphasis is on the notion that humans must assume responsibility for nature and the world.

The aforementioned study does not pretend to be comprehensive, as it is impossible to do in the confines of a paper; however, it adamantly asserts that we, as teachers and students, cannot neglect the undeniable fact that current environmental issues are a by-product of culture. According to historian Donald Worster:

We are facing a global crisis today, not because of how the ecosystems function but rather because of how our ethical systems function...Historians, along with literary scholars, anthropologists, and philosophers cannot do the reforming, of course, but they can help with the understanding. (1993: 27)

Values, tradition, history, point of view, and language are all topics that literary scholars and students of literature are interested in. We can make a significant contribution to environmental thinking by focusing on these areas. While reading and evaluating texts in our classes, as this study has modestly attempted to do, we should have an ecological viewpoint and emphasise how our fractured, compartmentalised, and excessively specialised way of understanding the planet has intensified the environmental crisis. As scholars of humanities, we should make a concerted effort to educate ourselves in the sciences, follow interdisciplinary approaches, learn to take responsibility for the protection and preservation of the environment and instil the same spirit in our students.

## Abstract

All over the world, because of the pandemic, the scenario for working individuals totally changed from the reality before. The complete lockdown compelled the organizations to follow the concept of work from home. The study will examine the comparative factors before pandemic and new normal which impact the domains of personal and professional end, the impediments on the way to balance work, and life roles for a working individual and identifying the factors that need to be adopted with the new normal scenario. This study will be analytical and descriptive in nature by collecting data on a primary and secondary basis. Primary data will be collected from working individuals by following the telephonic interview, whereas secondary data will be collected from various publications related to the current situation.

**Title: How to Lead a Healthy Way of Life****Sarita<sup>1</sup>, Dr. Richa khugshal<sup>2</sup>****<sup>1</sup>Research scholar (Lingaya's vidyapeeth Faridabad, Haryana)****<sup>2</sup> Professor (Lingaya's vidyapeeth Faridabad, Haryana)****Abstract**

Health is the way of life, and it leads to energies and body balances, and the quality of living is increased substantially. The Indians who lived and thrived in the medieval and post medieval era were good at practicing the philosophy - "jivem shardah shatam," all of which ultimately lead to the happiness, vigorousness and esteemed creativity. This concept aimed at building up a complete harmony with the nature, and living in the state, which is quite homeostatic.

Living a quality life balanced in nature also brings spiritual balance and one begins to feel more energetic than ever. It is the way where you begin to feel the quality. However, health is not only a dependent factor on harmony with the nature and the living, it is critical that an individual also leads a balanced food. The balanced food is going to make things easy for everyone.

Eating the natural and whole food items is better and more effective in building as well as maintains the health. It also prevents the building up of unnecessary food items like oil and fats in the body. Amidst all these, what matters is the maintaining a strong physical fitness, more or less nothing else. Having a balanced diet and well-maintained physical fitness is going to bring changes in your lives, sometimes such types of changes present a great deal of significance and innovation.

When a threshold value is maintained as the result of our physical fitness, we are also protecting the body from wide range of diseases. The fitness regimen that you plan for yourself should be well maintained and in right order. Being well structured in your fitness also means that you

going is going to ensure that you have healthy mind and body, and decisions taken as the result will matter a lot.

**Keywords:** *Exercising, Aerobic Exercises, Exercising Benefits, Health, Health Prone Food*

## **Introduction**

All of us try to keep our body weight in control as this is the only way by which means we will be in shape and balanced. Weight control in addition to the concrete diet plan plays important role in not only helps you to remain in shape, but also you prevent the obesity. If you maintain your body weight and keep the other factors balanced, it is very important that you keep the balance on the calories. The calories you are eating need to be equitable by the energy you are burning. If there is an imbalance created, the effects of which could easily be seen on your body in many ways.

Everything begins and ends with the food we are eating, and how much is really hygienic or nutritious in nature. Your food decides that you will be enjoying a healthy way of living and things will be under your balance. Along with food, there is special place for the exercises, as in this way you are going to strengthen your cardio vascular system as well as other systems.

Here your mental health is also important, because you cannot ignore the planning side, which is the result of your psychological development. Exercising and maintaining a consistent regularity is what decides the outcome. The blood sugar levels needs to be understood on several levels. On the off chance where you are exercising regularly, you are going to keep your blood pressure balanced and triglyceride levels become low, or within the limits. This is where you will keep the disease levels subdued.

A blend of a decent exercise system and a fair eating routine will deliver enduring aftereffects of sound life. Exercise keeps an individual fit as well as causes one to have a positive outlook on oneself. As the idioms go, "a sound body has a solid brain" and "the type of food you eat will

synthetic that helps an individual vibrate more loose and tranquil. A reasonable eating routine is fundamental to keep a solid weight. Exercise and nourishment go inseparably.

Studies have shown that heart stimulating exercise activities can make your bones solid which thusly assists you with maturing better. Eating a low fat, low carb and high protein diet can be useful in accomplishing objectives quicker. Practicing consistently forestalls the danger of creating heart infections, diabetes and specific kinds of malignancies. To guarantee that you are practicing hard enough without stressing your heart, ascertain pulse by utilizing the pulse adding machine. The ideal exercise requires the heart beat to go up to 75% of pulse which will consume a great deal of calories in little measure of time.

There are three fundamental parts to all activity schedules; Aerobics, Strength preparing and Flexibility or Stretching. High impact exercise work out: Walking, hopping and swimming are the best types of vigorous exercise work out. Hop rope brings the pulse up a lot quicker than strolling. Consequently, ten minutes of bounce rope, is comparable to twenty minutes of strolling. Swimming is considered as the lone exercise that permits all the muscle gatherings to cooperate at the same time to consume greatest calories.

Strength Training: Weights and Pilates are known as muscle conditioning and fortifying exercises. Weight preparing ought to be done somewhere around three times each week. Pilates are getting very well-known these days particularly in the western nations. It shows control of psyche and body and fortifies centre muscles. Adaptability works out like the Yoga and extending unwinds you internally and externally. It quiets tension and rejuvenates about a comprehensive methodology. Extending is energetically suggested after each exercise. It is a decent method to forestall wounds and calm drained and sore muscles.

The advantages of workouts are endless. With the help of workouts, you have increased cerebral activity, and there is a feeling of more vivaciousness. Your sickness will be under the control, makes the heart more grounded as well as removes tension and misery.

Adequate eating routine will give you the energy your body needs to work appropriately with good dieting propensities so your resistant framework is sufficiently able to battle sicknesses. Less than stellar eating routine can prevent the development and advancement in kids. Children with terrible dietary patterns are bound to proceed with it for the remainder of their lives.

## II – Literature Review

World wellbeing is on the move. Expanding quantities of individuals practice an inactive way of life. Also, eat unfortunate eating regimens - two propensities that are liable for the most persistent illnesses in our reality. Most youngsters should go to class; a school-based mediation is a shrewd decision; so we additionally explored some school-based intercessions.

Since research strategy is a basic region in our examination, we additionally survey a short history of wellness trial of youth, and the reasoning, unwavering quality and legitimacy of fitness program, which were utilized in our investigation. At last, we audit the examination technique for its adequacy in surveying kids' active work, weight and the components that could impact youngsters' actual wellness, for example, active work levels, phase of development.

Wellbeing has been characterized from numerous points of view since forever. The antiquated Greek doctors accepted wellbeing to be a state of amazing body balance. The antiquated Chinese accepted that wellbeing was an impression of an indispensable body power called "Qi" (Edelman and Mandle, 1986).

Great wellbeing, as indicated by Nieman (1998), may be better characterized as the presence of "adequate energy and essentialness to achieve day by day assignments and dynamic sporting pursuits without unjustifiable weariness". Great wellbeing to an individual implies that you can lead a full and dynamic life day in-and-out (working, running a family, going to classes, contemplating, taking an interest in sporting exercises, and partaking in a functioning public activity without falling into bed every evening, depleted), contract irresistible infection less regularly, and will in general ward off irresistible infection better than the individuals who are

satisfaction in later years. By and large, great wellbeing delighted in by people can be surveyed genuinely on a public level by normal life expectancies.

Wellbeing related actual wellness comprises of those parts of actual wellness that have a relationship with great wellbeing. The parts are generally characterized as body synthesis, cardiovascular wellness, adaptability, solid perseverance and strength. Ability related actual wellness comprises of those segments of actual wellness that have a relationship with upgraded execution in sports and engine abilities. The parts are ordinarily characterized as dexterity, balance, coordination, force, speed and response time. Earlier to the most recent 40 years the qualification between wellbeing related and expertise related actual wellness was not normally made. Body Composition is a wellbeing related part of actual wellness that identifies with the relative measures of muscle, fat, bone and other indispensable pieces of the body (USDHHS, 1996). Cardiovascular Fitness is a wellbeing related segment of actual wellness that identifies with capacity of the circulatory and respiratory frameworks to supply oxygen during supported physical movement (USDHHS, 1996). Cardiovascular wellness is additionally alluded to as cardiovascular perseverance, vigorous wellness and cardiorespiratory wellness. A VO<sub>2</sub> max test in the research center setting is viewed as the best proportion of cardiovascular wellness. Ordinarily managed field tests incorporate the One mile run/walk, the 12-minute run, the PACER run for kids and different bike, step, and treadmill tests.

Adaptability is a wellbeing related part of actual wellness that identifies with the scope of movement accessible at a joint (USDHHS, 1996). A few specialists determine that adaptability requires scope of movement without uneasiness or agony (Howley and Franks, 1997). Adaptability is explicit to each joint of the body, in this manner there is no broad estimation of adaptability as there is for cardiovascular wellness. Adaptability is normally estimated in the lab utilizing estimation gadgets like a goniometer, flexometer and in the field with test activities, for example, the sit what's more, reach, and the zipper.

industrialization, urbanization, financial improvement and market globalization have sped up over the previous decade.

This mix of unfortunate eating regimens and way of life is essentially affecting the wellbeing also, dietary status of populaces, especially in non-industrial nations and in nations on the move (WHO, 2003a, p.1). As of now today in the whole world, except for sub-Saharan Africa, persistent sicknesses are currently the main sources of death. The WHO gauges that in 2001, constant illnesses contributed roughly 60% of the 56.5 million complete announced passings on the planet and around 43% of the worldwide weight of infection (WHO, 2003a, p.4).

On a worldwide premise 79% of all passings inferable to ongoing infections are as of now happening in non-industrial nations (WHO, 2003a, p.5). It has been extended that, by 2020, ongoing infections will represent very nearly 75% of all passings and 57 percent of the worldwide weight of illness. They are additionally showing stressing patterns, not just in light of the fact that they as of now influence an enormous extent of the populace, yet additionally since they have begun to show up before throughout everyday life (WHO, 2003a, p.1-3).

Systemic physical work is a complex multi-useful conduct performed by everybody to keep up with day by day life. It differs impressively from individual to individual and changes all through the human life expectancy. The terms 'work out', 'active work' and 'actual wellness' are regularly utilized reciprocally, both expertly and in like manner language Caspersen, Powell and Christenson (1985).

Action is most normally estimated by computing the measure of energy, in kilocalories (kcal), required to accomplish an action. Exploration oftentimes arranges day by day action concurring to explicit components of regular living, for example word related action, family, relaxation time and rest. Late patterns, for example, an expansion in physical idleness during relaxation time

al, 2001); (Hu et al, 2004).

### **III. Objectives**

The principle objectives of this research paper are drawn here:

- 1) to find what types of health tools are used in the gyms;
- 2) to find the time used by individuals in the health centres;
- 3) to find the seriousness of the individuals;

#### **What is meant by Health and Wellbeing in Individual's Life?**

Health or well-being is a condition of physical, mental and social prosperity wherein sickness and ailment are missing. An assortment of definitions has been utilized for various purposes after some time. Wellbeing can be advanced by empowering stimulating exercises, like customary actual exercise, and by diminishing or keeping away from unhealthful exercises or circumstances, like smoking or extreme pressure.

A few variables influencing wellbeing are because of individual decisions, like whether to take part in a high-hazard conduct, and others are because of primary causes, for example, regardless of whether the general public is organized such that makes it simpler or harder for individuals to get vital medical care administrations.

The importance of health and wellbeing has advanced after some time. With regards to the biomedical point of view, early meanings of wellbeing zeroed in on the topic of the body's capacity to work; health and wellbeing was viewed as a condition of ordinary capacity that could be disturbed every once in a while by illness.

An illustration of such a meaning of wellbeing is: "a state portrayed by anatomic, physiologic, and mental uprightness; capacity to perform by and by esteemed family, work, and local area jobs; capacity to manage physical, natural, mental, and social pressure". Then, at that point in

1948, in an extreme takeoff from past definitions, the World Health Organization (WHO)

mental, and social prosperity, and not only the shortfall of infection and infirmity".

Although this definition was invited by some as being inventive, it was likewise scrutinized as being ambiguous, unnecessarily expansive and was not understood as quantifiable. For quite a while, it was saved as an illogical ideal and most conversations of wellbeing got back to the reasonableness of the biomedical model.

Progress has been restricted to numerous targets, prompting worries about the adequacy of Healthy People in molding results with regards to a decentralized and awkward US wellbeing framework. Sound People 2020 give more unmistakable quality to wellbeing advancement and preventive methodologies and includes a meaningful center the significance of tending to social determinants of wellbeing. Another extended advanced interface works with use and scattering instead of cumbersome printed books as delivered previously. The effect of these progressions to Healthy People will be resolved in the coming years.

### **Research Methodology**

It is significant to understand the sentiments of the buyers when they enter the gym or health and fitness centres and wish for something that is running in their mind. Now this something may be a product, or a service or mixture of both of these.

The research methodology implemented for the designated study is provided by the internet research and comparison. An analysis is made herewith on the basis of information received from secondary resources. However a few of primary resources have also been researched to build up the conclusion. There has been no direct material or references made from the primary researches.

focused on the ideologies of the end consumer when they step into gym or health and fitness centres.

Secondary data is collated and worked out through different formats of literatures, which includes the articles published in journal, or annual reports published in various ezines, trade journals and data directly researched from the gym or health and fitness centres owners as it appears on the internet.

Information from the gym or health and fitness centres is collated, which form the part of research methodology in particular as well as the entire research paper.

Since the occurrence of Corona Pandemic there has been limited availability of the information available about the individuals visiting the gym or health and fitness centres.

The health and fitness industry is mushrooming in small towns and this has eventually led to creation of awareness among the people. Now more and more number of people likes to join the gym and visit here for building their body or keeping themselves fit. The trend was not very common until few years ago.

The cognizance of healthcare and fitness has sprouted along every income group, in small towns as well as the cities. According to the Google searches, approximately 20 Million exclusive searches are related to the key phrase “Fitness near Me” and this is outstandingly superb.

Today, the fitness centers are offering state of the art equipment, which is also one of the reasons why people from all age groups are very much inclined to join these centers. Even the older people do not shy away from joining the main league of exercisers. The excitement in health and fitness centres sprouting in Delhi and NCR are classic example that people not only want maintain their body mass, but these centres are also working as full-fledged entertainment centres as well.

The usage of guests visiting these health and fitness centres is very high, and number is increasing surreptitiously with variation. Plenty of such centres charge money on monthly basis, while there are several others which have quarterly plan for the dedicated members.

A few of health and fitness centres like Sports Fit, Sector 7, Dwarka; Athlesis Beyond Fitness, New Friends Colony; Gold Gym, East of Kailash etc. offer custom designed services, and this is quite handy. Exercisers have got plenty of reasons now for better health and fitness near them.

Having a game plan before you enter the rec center can assist you with abstaining from meandering carelessly around while you choose what to do straightaway. In the event that the wellbeing and wellness focus isn't going out as per the arrangement of the exerciser, then, at that point there is a component of uncertainty. This uncertainty not just adds time to your exercise; it likewise makes it less effective. It's additionally a smart thought to have an arrangement B, simply on the off chance that the machine or floor space you were anticipating utilizing is taken. Continue on to different pieces of your exercise and return, or be outfitted in light of a reinforcement practice that uses distinctive hardware.

Get propelled with a strong exercise playlist, and this is the place where your wellbeing and wellness focus ought to be giving you dependable ideas. Get siphoned up en route to the exercise center and during your exercise with tunes that cause you to feel solid, incredible, and like you can do anything. In case you've been utilizing a similar ear buds since who knows when, redesign your sound quality and solace.

Put your telephone on flight mode. Fight the temptation to toll in on your gathering text or watch that Snapchat message. Your exercise is simply the time you will put resources into yourself, so turn your telephone on standalone mode to stay away from pointless interruption. On the off chance that you needn't bother with your telephone for your music or any exercise applications, leave it in the storage space in the gym or health and fitness centre.

It is additionally significant that the rec center administration helps the exerciser on the best way to start the activities in a methodical way. They should design the exercise with some unique stretches. Dynamic stretches are a center part of basically any warm-up. With dynamic extending, you'll be traveling through various stretches, instead of holding the stretch set up. This bit by bit raises your internal heat level and pulse and begins to heat up your muscles, preparing your body for movement. A dynamic warm-up likewise works on your scope of movement, so you can get further into each activity and receive the full reinforcing rewards of each move.

### **Conclusion**

In support of the conclusion of this research paper, it is found that people have become more conscious about their health and fitness in the last decade in India. Increasing use of gyms and health centres clearly demarcate that health consciousness has developed on an alarming scale in small towns besides the cosmopolitan and metropolitan towns. This development is also seen increasing in city clusters that have emerged in the hinterlands of Delhi and the NCR. The choice of health tools used by individuals varies and the amount of time spent is also variable, but the result is definitive.

### **Acknowledgements**

I am thankful to my teachers and gym and health fitness owners who provided me the support in material guidance and direction in completion of my research within the stipulated timeframe. The material for the research paper has been researched from the secondary resources and other publications. I acknowledge the information provided by the mall owners that helped a great deal in completion of the research paper in time.

regular exercise is good for you, and it can help you lose weight. But if you are like many Americans, you are busy, you have a sedentary job, and you haven't yet changed your exercise habits. The good news is that it's never too late to start. You can start slowly, and find ways to fit more physical activity into your life. To get the most benefit, you should try to get the recommended amount of exercise for your age. If you can do it, the payoff is that you will feel better, help prevent or control many diseases, and likely even live longer.

What are the health benefits of exercise?

Regular exercise and physical activity may

Help you control your weight. Along with diet, exercise plays an important role in controlling your weight and preventing obesity. To maintain your weight, the calories you eat and drink must equal the energy you burn. To lose weight, you must use more calories than you eat and drink.

Reduce your risk of heart diseases. Exercise strengthens your heart and improves your circulation. The increased blood flow raises the oxygen levels in your body. This helps lower your risk of heart diseases such as high cholesterol, coronary artery disease, and heart attack. Regular exercise can also lower your blood pressure and triglyceride levels.

Help your body manage blood sugar and insulin levels. Exercise can lower your blood sugar level and help your insulin work better. This can cut down your risk for metabolic syndrome and type 2 diabetes. And if you already have one of those diseases, exercise can help you to manage it.

Help you quit smoking. Exercise may make it easier to quit smoking by reducing your cravings and withdrawal symptoms. It can also help limit the weight you might gain when you stop smoking.

Improve your mental health and mood. During exercise, your body releases chemicals that can improve your mood and make you feel more relaxed. This can help you deal with stress and reduce your risk of depression.

Help keep your thinking, learning, and judgment skills sharp as you age. Exercise stimulates your body to release proteins and other chemicals that improve the structure and function of your brain.

Strengthen your bones and muscles. Regular exercise can help kids and teens build strong bones. Later in life, it can also slow the loss of bone density that comes with age. Doing muscle-strengthening activities can help you increase or maintain your muscle mass and strength.

Reduce your risk of some cancers, including colon, breast , uterine, and lung cancer.

Improve your sleep. Exercise can help you to fall asleep faster and stay asleep longer.

Improve your sexual health. Regular exercise may lower the risk of erectile dysfunction (ED) in men. For those who already have ED, exercise may help improve their sexual function. In women, exercise may increase sexual arousal.

Increase your chances of living longer. Studies show that physical activity can reduce your risk of dying early from the leading causes of death, like heart disease and some cancers.

How can I make exercise a part of my regular routine?

Make everyday activities more active. Even small changes can help. You can take the stairs instead of the elevator. Walk down the hall to a coworker's office instead of sending an email. Wash the car yourself. Park further away from your destination.

Be active with friends and family. Having a workout partner may make you more likely to enjoy exercise. You can also plan social activities that involve exercise. You might also consider joining an exercise group or class, such as a dance class, hiking club, or volleyball team.

Keep track of your progress. Keeping a log of your activity or using a fitness tracker may help you set goals and stay motivated.

Make exercise more fun. Try listening to music or watching TV while you exercise. Also, mix things up a little bit - if you stick with just one type of exercise, you might get bored. Try doing a combination of activities.

Find activities that you can do even when the weather is bad. You can walk in a mall, climb stairs, or work out in a gym even if the weather stops you from exercising outside.

**You know exercise is good for you, but do you know how good? From boosting your mood to improving your sex life, find out how exercise can improve your life.**

By Mayo Clinic Staff

Want to feel better, have more energy and even add years to your life? Just exercise.

The health benefits of regular exercise and physical activity are hard to ignore. Everyone benefits from exercise, regardless of age, sex or physical ability.

Need more convincing to get moving? Check out these seven ways exercise can lead to a happier, healthier you.

Exercise can help prevent excess weight gain or help maintain weight loss. When you engage in physical activity, you burn calories. The more intense the activity, the more calories you burn.

Regular trips to the gym are great, but don't worry if you can't find a large chunk of time to exercise every day. Any amount of activity is better than none at all. To reap the benefits of exercise, just get more active throughout your day — take the stairs instead of the elevator or rev up your household chores. Consistency is key.

Worried about heart disease? Hoping to prevent high blood pressure? No matter what your current weight is, being active boosts high-density lipoprotein (HDL) cholesterol, the "good" cholesterol, and it decreases unhealthy triglycerides. This one-two punch keeps your blood flowing smoothly, which decreases your risk of cardiovascular diseases.

Regular exercise helps prevent or manage many health problems and concerns, including:

- Stroke
- Metabolic syndrome
- High blood pressure
- Type 2 diabetes
- Depression
- Anxiety
- Many types of cancer
- Arthritis
- Falls

It can also help improve cognitive function and helps lower the risk of death from all causes.

Need an emotional lift? Or need to blow off some steam after a stressful day? A gym session or brisk walk can help. Physical activity stimulates various brain chemicals that may leave you feeling happier, more relaxed and less anxious.

You may also feel better about your appearance and yourself when you exercise regularly, which can boost your confidence and improve your self-esteem.

Winded by grocery shopping or household chores? Regular physical activity can improve your muscle strength and boost your endurance.

Exercise delivers oxygen and nutrients to your tissues and helps your cardiovascular system work more efficiently. And when your heart and lung health improve, you have more energy to tackle daily chores.

Struggling to snooze? Regular physical activity can help you fall asleep faster, get better sleep and deepen your sleep. Just don't exercise too close to bedtime, or you may be too energized to go to sleep.

Do you feel too tired or too out of shape to enjoy physical intimacy? Regular physical activity can improve energy levels and increase your confidence about your physical appearance, which may boost your sex life.

But there's even more to it than that. Regular physical activity may enhance arousal for women. And men who exercise regularly are less likely to have problems with erectile dysfunction than are men who don't exercise.

Exercise and physical activity can be enjoyable. They give you a chance to unwind, enjoy the outdoors or simply engage in activities that make you happy. Physical activity can also help you connect with family or friends in a fun social setting.

So take a dance class, hit the hiking trails or join a soccer team. Find a physical activity you enjoy, and just do it. Bored? Try something new, or do something with friends or family.

Exercise and physical activity are great ways to feel better, boost your health and have fun. For most healthy adults, the Department of Health and Human Services recommends:

- At least 150 minutes a week of moderate aerobic activity or 75 minutes a week of vigorous aerobic activity, or a combination of moderate and vigorous activity. The guidelines suggest that you spread this exercise throughout the week. Examples include running, walking or swimming. Even small amounts of physical activity are helpful, and accumulated activity throughout the day adds up to provide health benefits.
- Strength training exercises for all major muscle groups at least two times a week. Examples include lifting free weights, using weight machines or doing body-weight training.

Spread your activities throughout the week. If you want to lose weight, meet specific fitness goals or get even more benefits, you may need to ramp up your moderate aerobic activity to 300 minutes or more a week.

Remember to check with your doctor before starting a new exercise program, especially if you have any concerns about your fitness, haven't exercised for a long time, have chronic health problems, such as heart disease, diabetes or arthritis.

Regular physical activity is one of the most important things you can do for your health.

[Everyone can experience the health benefits of physical activity](#) – age, abilities, ethnicity, shape, or size do not matter.

If you're not sure about becoming active or boosting your level of physical activity because you're afraid of getting hurt, the good news is that **moderate-intensity aerobic activity**, such as brisk walking, is generally **safe for most people**.

Read about the benefits for improving your [brain health](#), [weight management](#), [reducing disease](#), [strengthening your bones and muscles](#), and [improving your ability to do everyday activities](#).

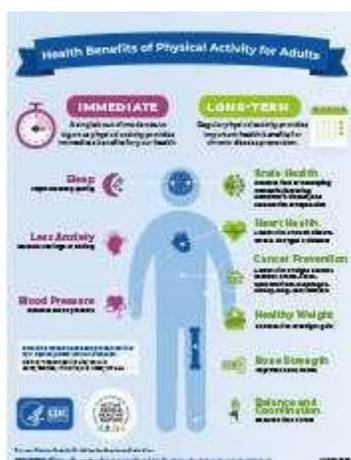

If you have not been physically active in a while, you may be wondering how to get started again. Find more tips [here](#) to get started with physical activity for a [healthy weight](#).

### Immediate Benefits

Some benefits of physical activity on [brain health pdf icon\[PDF-14.4MB\]external icon](#) happen right after a session of moderate-to-vigorous physical activity. Benefits include improved thinking or cognition for children 6 to 13 years of age and reduced short-term feelings of anxiety for adults. Regular physical activity can help keep your thinking, learning, and judgment skills sharp as you age. It can also reduce your risk of **depression** and **anxiety** and help you **sleep better**.

Learn more about the [immediate benefits pdf icon\[PDF-14.4MB\]external icon](#) of physical activity.

[Learn more about Health Benefits of Physical Activity for Adults](#)

Looking to get to or stay at a healthy weight? Both diet and physical activity play a critical role in maintaining a healthy body weight, losing excess body weight, or maintaining successful weight loss. You gain weight when you consume more calories through eating and drinking than the amount of calories you burn, including those burned during physical activity. It's important to [balance calories](#). When it comes to weight management, people vary greatly in how much physical activity they need. You may need to be more active than others to reach or maintain a healthy weight.

### Be Active: Every Bit Helps

Adults who sit less and do any amount of moderate-to-vigorous physical activity gain some health benefits. Learn more from the [Physical Activity Guidelines for Americans, 2nd Edition pdf icon\[PDF-15.2MB\]external icon](#).

**To maintain your weight:** Work your way up to 150 minutes a week of moderate-intensity aerobic activity (for example, 30 minutes a day, 5 days a week). Strong scientific evidence shows that physical activity can help you maintain your weight over time. However, the exact amount of physical activity needed to do this is not clear since it varies greatly from person to person. It's possible that you may need to do more than 150 minutes of moderate-intensity activity a week to maintain your weight.

**To lose weight and keep it off:** You will need a high amount of physical activity unless you also adjust your diet and reduce the amount of calories you're eating and drinking. Getting to and staying at a healthy weight requires both regular physical activity and a healthy eating plan. For more information about nutrition, physical activity, and weight loss, visit [Healthy Weight](#).

### Reduce Your Health Risk

#### Cardiovascular Disease

Heart disease and stroke are two of the leading causes of death in the United States. Following the recommendations and getting at least 150 minutes a week of moderate-intensity aerobic activity can put you at a lower risk for these diseases. You can reduce your risk even further with more physical activity. Regular physical activity can also lower your blood pressure and improve your cholesterol levels.

#### Type 2 Diabetes and Metabolic Syndrome

Regular physical activity can reduce your risk of developing type 2 diabetes and metabolic syndrome. Metabolic syndrome is some combination of too much fat around the waist, high blood pressure, low High Density Lipoproteins (HDL) cholesterol, high triglycerides, or high blood sugar. People start to see benefits at

Additional amounts of physical activity seem to lower risk even more.

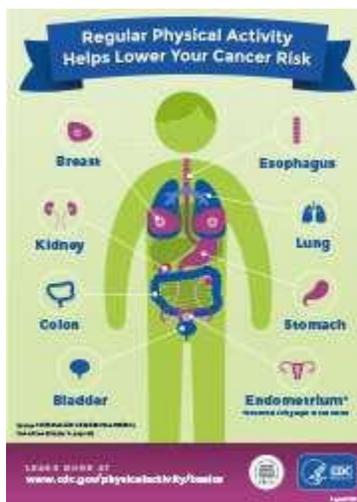

**Already have type 2 diabetes?** Regular physical activity can help you control your blood glucose levels. To find out more, visit [Diabetes and Me](#).

### Some Cancers

Being physically active lowers your risk for developing several commonly occurring cancers. Research shows that adults who participate in greater amounts of physical activity have reduced risks of developing cancers of the:

- Bladder
- Breast
- Colon (proximal and distal)
- Endometrium
- Esophagus (adenocarcinoma)
- Kidney
- Lung
- Stomach (cardia and non-cardia adenocarcinoma)

**Improve your quality of life.** If you are a cancer survivor, research shows that getting regular physical activity not only helps give you a better quality of life, but also improves your physical fitness.

[Learn more about Physical Activity and Cancer](#)  
[Top of Page](#)

As you age, it's important to protect your bones, joints, and muscles – they support your body and help you move. Keeping bones, joints, and muscles healthy can help ensure that you're able to do your daily activities and be physically active. Doing aerobic, muscle-strengthening, and bone-strengthening physical activity at a moderately-intense level can **slow the loss of bone density** that comes with age.

Hip fracture is a serious health condition that can have life-changing negative effects, especially if you're an older adult. Physically active people have a **lower risk of hip fracture** than inactive people.

Among older adults, physical activity also **reduces the risk of falling** and injuries from falls. Physical activity programs that include more than one type of physical activity are most successful at reducing falls and fall-related injuries. Different types of physical activity include aerobic, muscle strengthening, and balance physical activities. Also, weight bearing activities such as running, brisk walking, jumping jacks and strength training produce a force on the bones. These activities that can help promote bone growth and bone strength and reduce the risk of fall-related injuries and fractures.

Regular physical activity helps with **arthritis and other rheumatic conditions** affecting the joints. Doing 150 minutes a week of moderate-intensity aerobic physical activity, if able, plus muscle-strengthening activity improves your ability to manage pain and do everyday tasks and improves quality of life.

can help you increase or maintain your muscle mass and strength. This is important for older adults who experience reduced muscle mass and muscle strength with aging. Slowly increasing the amount of weight and number of repetitions you do as part of muscle strengthening activities will give you even more benefits, no matter your age.

[Top of Page](#)

#### Improve Your Ability to do Daily Activities and Prevent Falls

A functional limitation is a loss of the ability to do everyday activities such as climbing stairs, grocery shopping, or playing with your grandchildren.

**How does this relate to physical activity?** If you're a physically active middle-aged or older adult, you have a lower risk of functional limitations than people who are inactive.

**Improve physical function and decrease the risk of falls.** For older adults, multicomponent physical activity is important to improve physical function and decrease the risk of falls or injury from a fall. **Multicomponent physical activity** is physical activity that includes more than one type of physical activity, such as aerobic, muscle strengthening, and balance training. Multicomponent physical activity can be done at home or in a community setting as part of a structured program.

[Top of Page](#)

#### Increase Your Chances of Living Longer

Science shows that physical activity can reduce your risk of dying early from leading causes of death, like heart disease and some cancers. This is remarkable in two ways:

1. Only a few lifestyle choices have as large an impact on your health as physical activity. People who are physically active for about 150 minutes a week have a 33% lower risk of all-cause mortality than those who are physically inactive.
2. You don't have to do high amounts of activity or vigorous-intensity activity to reduce your risk of premature death. Benefits start to accumulate with any amount of moderate- or vigorous-intensity physical activity.

## Why Is Physical Activity Important?

Exercise and physical activity are good for just about everyone, including older adults. No matter your health and physical abilities, you can gain a lot by staying active. In fact, studies show that “taking it easy” is risky. Often, inactivity is more to blame than age when older people lose the ability to do things on their own. Lack of physical activity also can lead to more visits to the doctor, more hospitalizations, and more use of medicines for a variety of illnesses.

Including all [4 types of exercise](#) can benefit a wide range of areas of your life. Staying active can help you:

- Keep and improve your strength so you can stay independent
- Have more energy to do the things you want to do and reduce fatigue
- Improve your balance and lower risk of [falls and injuries from falls](#)
- [Manage and prevent some diseases](#) like arthritis, heart disease, stroke, type 2 diabetes, osteoporosis, and 8 types of cancer, including breast and colon cancer
- [Sleep better](#) at home
- Reduce levels of stress and anxiety
- Reach or [maintain a healthy weight](#) and reduce risk of excessive weight gain
- Control your [blood pressure](#)
- Possibly improve or maintain some aspects of [cognitive function](#), such as your ability to shift quickly between tasks or plan an activity
- Perk up your mood and reduce feelings of depression

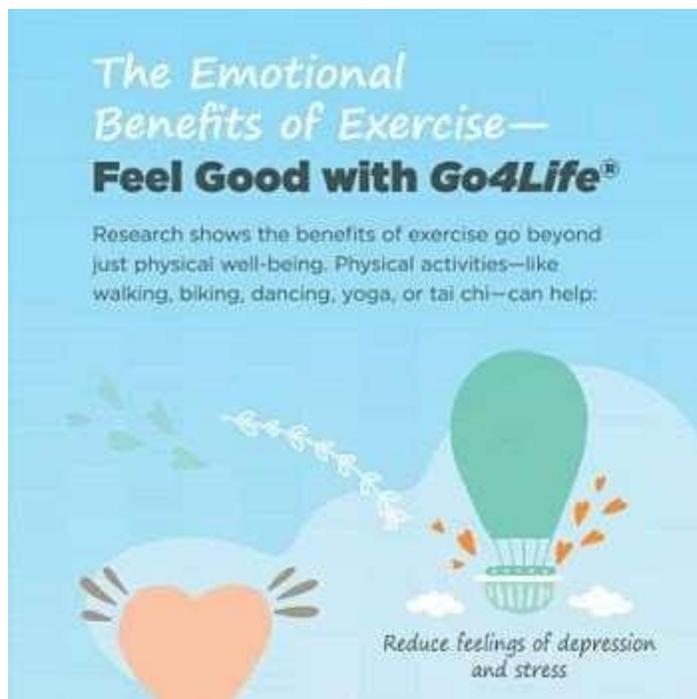

### Quick Tip

Being active can help prevent future [falls and fractures](#). For tips to help prevent falls at home, read [Fall-Proofing Your Home](#).

The [YMCA](#) offers evidence-based group exercise programs for older adults to improve [fitness](#) and [balance for falls prevention](#).

## Emotional Benefits of Exercise

Research has shown that exercise is not only good for your physical health, it also supports emotional and mental health. You can exercise with a friend and get the added benefit of emotional support. So, next time you're feeling down, anxious, or stressed, try to get up and start moving!

Read and share this [infographic](#) about the emotional benefits of exercise.

Physical activity can help:

- Reduce feelings of [depression](#) and stress, while improving your mood and overall emotional well-being
- Increase your energy level
- Improve [sleep](#)
- Empower you to feel more in control

In addition, exercise and physical activity may possibly improve or maintain some aspects of [cognitive function](#), such as your ability to shift quickly between tasks, plan an activity, and ignore irrelevant information.

Here are some exercise ideas to help you lift your mood:

- **Walking, bicycling, or dancing.** Endurance activities increase your breathing, get your heart pumping, and boost chemicals in your body that may improve mood.
- **Yoga.** This mind and body practice typically combines physical postures, breathing exercises, and relaxation.

- **Tai Chi.** This "moving meditation" involves shifting the body slowly, gently, and precisely, while breathing deeply.
- **Activities you enjoy.** Whether it's gardening, playing tennis, kicking around a soccer ball with your grandchildren, or something else, [choose an activity](#) you want to do, not one you have to do.

### The Top 10 Benefits of Regular Exercise

Exercise is defined as any movement that makes your muscles work and requires your body to burn calories.

There are many types of physical activity, including swimming, running, jogging, walking, and dancing, to name a few.

Being active has been shown to have many health benefits, both physically and mentally. It may even help you live longer (1Trusted Source).

Here are the top 10 ways regular exercise benefits your body and brain.

#### W2 Photography/Stocksy

##### 1. It can make you feel happier

Exercise has been shown to improve your mood and decrease feelings of depression, anxiety, and stress (2Trusted Source).

It produces changes in the parts of the brain that regulate stress and anxiety. It can also increase brain sensitivity for the hormones serotonin and norepinephrine, which relieve feelings of depression (3Trusted Source).

Additionally, exercise can increase the production of endorphins, which are known to help produce positive feelings and reduce the perception of pain (Trusted Source3Trusted Source).

Furthermore, exercise has been shown to reduce stress and improve symptoms of anxiety (3Trusted Source).

Interestingly, it doesn't matter how intense your workout is. It seems that your mood can benefit from exercise no matter the intensity of the physical activity.

In fact, a study in 24 women who had been diagnosed with depression showed that exercise of any intensity significantly decreased feelings of depression (4Trusted Source).

The effects of exercise on mood are so powerful that choosing to exercise (or not) even makes a difference over short periods.

One review of 19 studies found that active people who stopped exercising regularly experienced significant increases in symptoms of depression and anxiety, even after only a few weeks (5Trusted Source).

## SUMMARY

Exercising regularly can improve your mood and reduce feelings of anxiety and depression.

### 2. It can help with weight loss

Some studies have shown that inactivity is a major factor in weight gain and obesity (6Trusted Source, 7Trusted Source).

To understand the effect of exercise on weight reduction, it is important to understand the relationship between exercise and energy expenditure.

Your body spends energy in three ways:

digesting food

exercising

maintaining body functions like your heartbeat and breathing

While dieting, a reduced calorie intake will lower your metabolic rate, which can delay weight loss. On the contrary, regular exercise has been shown to increase your metabolic rate, which can burn more calories to help you lose weight (Trusted Source6Trusted Source, 7Trusted Source, 8Trusted Source).

Additionally, studies have shown that combining aerobic exercise with resistance training can maximize fat loss and muscle mass maintenance, which is essential for keeping the weight off (9Trusted Source, 10Trusted Source, 11Trusted Source).

## SUMMARY

Exercise is crucial to supporting a healthy metabolism and burning more calories per day. It also helps you maintain your muscle mass and weight loss.

### 3. It is good for your muscles and bones

Exercise plays a vital role in building and maintaining strong muscles and bones.

Activities like weightlifting can stimulate muscle building when paired with adequate protein intake.

This is because exercise helps release hormones that promote the ability of your muscles to absorb amino acids. This helps them grow and reduces their breakdown (12Trusted Source, 13Trusted Source).

As people age, they tend to lose muscle mass and function, which can lead to an increased risk of injury. Practicing regular physical activity is essential to reducing muscle loss and maintaining strength as you age (14Trusted Source).

Also, exercise helps build bone density when you're younger, in addition to helping prevent osteoporosis later in life (15Trusted Source).

Interestingly, some research suggests that high impact exercise, such as gymnastics or running, or odd impact sports, such as soccer and basketball, may help promote a higher bone density than non-impact sports like swimming and cycling (16Trusted Source).

## SUMMARY

Physical activity helps you build muscles and strong bones. It may also help prevent osteoporosis.

### 4. It can increase your energy levels

Exercise can be a real energy booster for many people, including those with various medical conditions (17Trusted Source, 18Trusted Source).

One older study found that 6 weeks of regular exercise reduced feelings of fatigue for 36 people who had reported persistent fatigue (19).

Furthermore, exercise can significantly increase energy levels for people with chronic fatigue syndrome (CFS) and other serious illnesses (20Trusted Source, 21Trusted Source).

In fact, exercise seems to be more effective at combating CFS than other treatments, including passive therapies like relaxation and stretching or no treatment at all (20Trusted Source).

Additionally, exercise has been shown to increase energy levels in people with other conditions like cancer (21Trusted Source).

## SUMMARY

Engaging in regular physical activity can increase your energy levels. This is true even in people with persistent fatigue and those with serious health conditions.

## HEALTHLINE CHALLENGE

Create a movement routine that you can do at home

Our Move Your Body Challenge has one exercise for 25 days to build a routine, no equipment needed.

Your privacy is important to us

### 5. It can reduce your risk of chronic disease

Lack of regular physical activity is a primary cause of chronic disease (22Trusted Source).

Regular exercise has been shown to improve insulin sensitivity, heart health, and body composition. It can also decrease blood pressure and cholesterol levels (23Trusted Source, 24Trusted Source, 25Trusted Source, 26Trusted Source).

In contrast, a lack of regular exercise — even in the short term — can lead to significant increases in belly fat, which may increase the risk of type 2 diabetes and heart disease (22Trusted Source).

That's why regular physical activity is recommended to reduce belly fat and decrease the risk of developing these conditions (27Trusted Source).

## SUMMARY

Daily physical activity is essential to maintaining a healthy weight and reducing the risk of chronic disease.

### 6. It can help skin health

Your skin can be affected by the amount of oxidative stress in your body.

Oxidative stress occurs when the body's antioxidant defenses cannot completely repair the cell damage caused by compounds known as free radicals. This can damage the structure of the cells and negatively impact your skin.

Even though intense and exhaustive physical activity can contribute to oxidative damage, regular moderate exercise can actually increase your body's production of natural antioxidants, which help protect cells (28Trusted Source, 29Trusted Source).

In the same way, exercise can stimulate blood flow and induce skin cell adaptations that can help delay the appearance of skin aging (30Trusted Source).

#### SUMMARY

Moderate exercise can provide antioxidant protection and promote blood flow, which can protect your skin and delay signs of aging.

#### 7. It can help your brain health and memory

Exercise can improve brain function and protect memory and thinking skills.

To begin with, it increases your heart rate, which promotes the flow of blood and oxygen to your brain. It can also stimulate the production of hormones that enhance the growth of brain cells.

Plus, the ability of exercise to prevent chronic disease can translate into benefits for your brain, since its function can be affected by these diseases (31Trusted Source).

Regular physical activity is especially important in older adults since aging — combined with oxidative stress and inflammation — promotes changes in brain structure and function (32Trusted Source, 33Trusted Source).

Exercise has been shown to cause the hippocampus, a part of the brain that's vital for memory and learning, to grow in size, which may help improve mental function in older adults (32Trusted Source, 33Trusted Source, 34Trusted Source).

Lastly, exercise has been shown to reduce changes in the brain that can contribute to conditions like Alzheimer's disease and schizophrenia (35Trusted Source).

#### SUMMARY

Regular exercise improves blood flow to the brain and helps brain health and memory. Among older adults, it can help protect mental function.

#### 8. It can help with relaxation and sleep quality

With regard to sleep quality, the energy depletion that occurs during exercise stimulates recuperative processes during sleep (38Trusted Source).

Moreover, the increase in body temperature that occurs during exercise is thought to improve sleep quality by helping it drop during sleep (39Trusted Source).

Many studies on the effects of exercise on sleep have reached similar conclusions.

One review of six studies found that participating in an exercise training program helped improve self-reported sleep quality and reduced sleep latency, which is the amount of time it takes to fall asleep (40Trusted Source).

Another older study showed that 16 weeks of physical activity improved sleep quality and helped 17 people with insomnia sleep longer and more deeply than the control group. It also helped them feel more energized during the day (41Trusted Source).

What's more, engaging in regular exercise seems to be beneficial for older adults, who are often affected by sleep disorders (42Trusted Source, 43Trusted Source).

You can be flexible with the kind of exercise you choose. It appears that either aerobic exercise alone or aerobic exercise combined with resistance training can both improve sleep quality (44Trusted Source).

## SUMMARY

Regular physical activity, regardless of whether it is aerobic or a combination of aerobic and resistance training, can help you sleep better and feel more energized during the day.

### 9. It can reduce pain

Although chronic pain can be debilitating, exercise can actually help reduce it (45Trusted Source).

In fact, for many years, the recommendation for treating chronic pain was rest and inactivity. However, recent studies show that exercise helps relieve chronic pain (46Trusted Source).

In fact, one review of several studies found that exercise can help those with chronic pain reduce their pain and improve their quality of life (46Trusted Source).

Several studies also show that exercise can help control pain associated with various health conditions, including chronic low back pain, fibromyalgia, and chronic soft tissue shoulder disorder, to name a few (46Trusted Source).

Additionally, physical activity can also raise pain tolerance and decrease pain perception (47Trusted Source, 48Trusted Source).

## SUMMARY

Exercise has favorable effects on the pain associated with various conditions. It can also increase pain tolerance.

10. It can promote a better sex life

Exercise has been proven to boost sex drive (49Trusted Source, 50Trusted Source, 51Trusted Source).

Engaging in regular exercise can strengthen the heart, improve blood circulation, tone muscles, and enhance flexibility, all of which can improve your sex life (50Trusted Source).

Physical activity can also improve sexual performance and sexual pleasure while increasing the frequency of sexual activity (50Trusted Source, 52Trusted Source).

Interestingly enough, one study showed that regular exercise was associated with increased sexual function and desire in 405 postmenopausal women (53Trusted Source).

A review of 10 studies also found that exercising for at least 160 minutes per week over a 6-month period could help significantly improve erectile function in men (51Trusted Source).

What's more, one study found that a simple routine of a 6-minute walk around the house helped 41 men reduce their erectile dysfunction symptoms by 71% (54Trusted Source).

Another study demonstrated that women with polycystic ovary syndrome, which can reduce sex drive, increased their sex drive with regular resistance training for 16 weeks (55Trusted Source).

## SUMMARY

Exercise can help improve sexual desire, function, and performance in men and women. It can also help decrease the risk of erectile dysfunction in men.

The bottom line

Regular physical activity can increase the production of hormones that make you feel happier and help you sleep better.

It can also improve your skin's appearance, help you lose weight and keep it off, reduce the risk of chronic disease, and improve your sex life.

Whether you practice a specific sport or follow the guideline of 150 minutes of activity per week, you will inevitably improve your health in many ways

# Valmiki's Ram: A Personification Of Righteousness And Moral Development

Neha Singh<sup>1</sup>, Dr. Hanan Khalid Khan<sup>2</sup>

<sup>1</sup>(Research Scholar) Faridabad, Haryana.

<sup>2</sup>(Assistant Professor) Department of English, School of Humanities & Social Sciences Lingaya's Vidyapeeth (Deemed to be University)

---

## Abstract:

Valmiki's Ram is an incarnation of lord Vishnu in human form. Rama's journey is imbued with symbolism. In Hindu Mythology life of lord Ram is a treasure that conceptualises and discerns the world with the idea of life. Rama's life is much more complex than a battle between good or evil. He is an exemplar who takes birth to incorporate both mortals and immortals. Rama is symbolised as 'Superior being' or the 'Enlightenment'. He takes life as it comes to him. He deals with his situations with his conduct. He is a virtuous human who adorns himself with his self control. He gives us solutions for our every question. He guides us how to live our life, how to triumph over desires and how to achieve inner peace. This paper pulls us back to our roots to push us forward in terms of morality and reality and to teach us that some things are not outdated but they are the

fundamentals of life. In modern times we all face dilemmas and fall prey to stress depression as we don't know how to deal with them. Ram through his journey tells us and sails us through these dilemmas by following virtues.

**Keywords :** Enlightenment, dharma, purushotam, virtue.

### **Introduction:**

The Ramayana is a sacred text of Hinduism. It is the story of Rama fighting the darkness (ignorance) with the light of virtue. The entire journey of Ram and his companions symbolically discusses duties, rights and social responsibilities of an individual. As a human, God Ram epitomizes the characteristics of an optimal person. He is considered as the sinew of dharma. He emphasises that one must pursue and live fully with a vision. He amalgamates awareness with actions which means we should be accountable for our actions. He teaches us that we should have control over our senses and we should come to a union of heart and head. Knowing Ram helps us interpret reality, solve problems and improvise our social behaviour. His story pervades the fabric of social life of the people As A.C. MacDonnell says “Probably no work of world literature, secular in its origin, has ever produced so profound an influence on the life and thought of the people as the Ramayana” The character of Ram is a storehouse of values. The values are deep seated in him and are universal and give us a positive solution to the problems or crisis of today. These crises are the odds in one's character and values. This paper is a humble attempt to highlight the mores of Rama through portrayal of his unusual valour, righteous heart and benevolence of mind by representing him as a moral guide, a problem solver and a human who with his endeavour becomes a living legend and a then a God. He is Purushottam and bears all the qualities which a man needs to possess in terms of morality. He overcomes all hardships of his life but doesn't lose his truth and virtue.

### **Analysis:**

Valmiki's Ram is not a supernatural being; he is a human with shortcomings and encounters moral dilemmas but who overcomes these by adhering to the righteous way of cosmic law. He is born for a purpose as we all are born for a cause. Valmiki's Ramayana states that all Devas pray to God Vishnu to relieve the world from Ravana's atrocities and Lord Vishnu replies as :- "Dismiss your fear : for you dear sake In battle will I smite him dead The cruel fiend, the immortal's dread.

Then, in the world of mortal men,  
Ten thousand years and hundreds ten  
I as a human king will reign,  
And guard the earth as my domain"

Canto XIV (Page 83-84)

This shows that Rama is an incarnation of God Vishnu in human form and is born to kill Ravana .But the main purpose of his birth as a 'Man' is to teach the world how a man should live righteously adhering to Dharma, which makes him an inspiration for mankind. Being an incarnation he leads his life as humanly as possible. He doesn't use any magical spell or not use a snap of finger to remove the obstacles or hardships rather face them with strong will and virtue. Today, we are facing all sorts of hardships and fall prey to negativity and mortification and expect some mighty creature will come from the sky and give us the way. Lord Ram tells us that it's we who can solve our problems with patience and look for solutions in a righteous way. Valmiki's Ram is a man who possesses all the qualities which a human should have. The first and foremost quality of man is being sensitive. Ram shows his sensitivity in each and every sphere of his life. He understands the values of the words of his father and quotes :

"Yea, for my father's promise sake  
I to the wood my way will take;

And dwell a lonely excel there  
In hermit dress with matted hair.”  
Amid all duties, Queen, I count  
This duty first and paramount,  
That sons, obedient, aye fulfil  
Their honoured father’s world and will’

Canto XIX (Page 395-397)

These lines impicts his duties and responsibilities as a son who suffers hardships just to keep the words of his father. He tells us how important relationships are.

Today, our major problem in this fast and growing world is that we have made ourselves confined to us and then we feel isolated and all alone. Here Rama teaches us the value of family system. We all have to face predicaments one day or another but there is always a way to cross it. As Franklin D Roosevelt has said, “Smooth Sea doesn’t make a skillful sailor”. This shows that hardships are must to make us perfect but what is important is to handle them gracefully. Second quality of a human is to know that violence is never a resolve. A man should never walk on the path of violence. Rama beautifully gives various chances to Ravana to surrender because he knows the aftermath of a war.

“Go Angad, Ravan’s presence seek,  
And thus my words of warning speak :  
This hour the Maithili lady bring;  
And, yielding while there yet is time,  
Seek, suppliant, pardon for the crime.”

Canto XLI( Page 1616)

Today, we are hearing various cases of terror and violence. The worst is domestic violence. Somewhere today's man does not have self control and shows vulnerability. However Rama always insists on respect for females. He refuses to fight with Tataka as she is a lady. But then Vishwamitra made him realise.

“Go Rama, smite this monster dead,  
Thy hand alone can overthrow,  
In all the worlds, this impious foe.  
Non let compassion lead they mind  
To shrink from blood of womankind”

Canto XVII( Page 129)

Sometimes we need to take difficult decisions in life. Here man should not lose his sense of righteousness. The third quality is to keep calm while taking difficult decisions. Rama has to take a very difficult decision about banishment of Mata Sita. Here Ram chooses the difficult path of self-sacrifice and sacrifices his love and keeps duties of king on priority. Ram teaches the leaders to not to concentrate on themselves alone but focus on your people. He tells them the loyalty of a leader is towards his people first, no matter if they have to lose someone dear to them .Fourthly, a human must possess the quality of forgiveness. Ram portrays this trait magnificently. After the death of Ravana he shows forgiveness and pays due respect to a deceased king.

“The warrior king has nobly died,  
Intrepid hero, firm through all,  
So fell he as the brave should fall;  
And pay the dues that yet remain”

Canto CXI( Page 1735)

Arrogance is no where around him and is down to earth despite being prince of Sooryavanshi dynasty and Ikshavaku clan .He gives respect to his enemies also. Throughout his journey he symbolically guides us how we should behave, what our ethics should be and how to live. He endures sufferings to teach us dignity and ethics and this makes him immortal to the world. Leading a life of virtue makes him great which gives us the capacity to remain true to our principles. He is one who is able to look good in others. Rama in his human form teaches us how one person should have devotion towards the task he is performing. He shows the importance of devotion to the world which is specifically a good quality of a human being. Valmiki's Ramayan quotes:

O Monarch, in thy son we find  
Do thou the godlike virtues hear  
Which Rama to our hearts endear.  
So richly blessed with graces, none  
In all the earth excels thy son  
He keeps each sense with strict control.

Canto II Book 2 (page 302)

Rama is a man with incomparable integrity, he is purushotam. He is already in the mind and soul of his people and he is always fair to them by treating them as family not subjects which is again a great quality of a human.

**Conclusion:**

Valmiki's Ram is the key to human moral inquisitions. In our everyday life we find ourselves surrounded by various obligations and questions. If we incorporate the teachings of God Ram we can sail through the rough seas of our life very easily. Life is unpredictable and has ups and downs. We should not lose hope, as it

is the beauty of it. He brings out the element of humanity and shows as principles of a good leader. He tries to tap into our potential by showing us the capability of man. He shows us that we need to forge our paths. If some forces can break us some can make us and then use them to get success. Family is our support system. No money, no assets can buy us the loyalty that a family gives. Asking for help should not be considered as weak. God Ram himself with the help of Vanaras is able to achieve his aims. He has taught us to come out from darkness within and transform to the real human being as Devdutt Pattanaik rightly said, “Ramayana has never been a tale of Rama’s life. It is a tale of how Ram lived for others. By telling his tale, we hope to inspire to live as Ram did”. Rama tells us that no human is inferior. We all are created equal by the God. It is the thoughts and the paths which we choose, makes the difference.

### **Introduction:**

The evolution of human being from that of the primate to the modern men covers a long process and time. With the emergence of men pre-history began. Technologically, the pre-history centers round the Stone Age cultural pattern. Besides, the archaeological study is the only means to understand the evolution of these cultural changes. Unlike in other parts of the world, the archaeological study is a recent phenomenon in Manipur. However, due to the ceaseless efforts of local archaeological researchers revealed the presence of Stone Age cultural remains in different parts of the state. Surprisingly, the archaeological remains discovered so far clearly indicate the evidences of the presents of pre-historic culture in Manipur. According to the nature of material culture discovered the Stone Age culture found in Manipur may be divided into three major phases, viz. the Paleolithic, *Hoabinhian* (Mesolithic) and Neolithic. Besides, the material culture characterizing the three phases of Paleolithic period, viz. early or lower, middle and late or upper Paleolithic period found in Manipur. The *Hoabinhian* cultural remains found in Manipur also may be divided into two-early and late. On the basis of pottery culture found, the Neolithic period also can be sub-divided into corded ware culture, tripod ware culture and geometric ware culture. Moreover, the cultural finds

clearly indicates the gradual extension of Stone Age cultural pattern found in south-east Asia and China into this small state in ancient times.

**Key Words** 1. *Songbu*: A cave in the *Chandel* District of Manipur; 2. *Khangkhui*: A cave located in the *Ukhrul* District; 3. *Singtom*: An archaeological site situated in the *Chandel* District; 4. *Machi*: An archaeological site in *Chandel* District; 5. *Nongpok Keithelmanbi*: An archaeological site on the bank of the River *Thoubal* in *Thoubal* District; 6. *Tharon*: A cave in the *Tamenglong* District; 7. *Phunan*: An archaeological site situated in *Thoubal* District 8. *Napachik*: A small hillock near *Wangoon* village in *Bishnupur* District; 9. *Laimanai*: A Neolithic site located in *Thoubal* District.

The Earth is mother of all living beings. The evolution of human being from that of the primates to the modern men covers a long process and time. It is said that men appeared on the earth in the early Pleistocene period of the Quaternary. Generally, it is believed that Africa was the cradle of modern men. However, recently, new evidences of the early modern men are also begun to unearth in parts of China and South-East Asia as well. Some of the researchers are of the view that Asia was the original home of human beings.<sup>1</sup> With the emergence of men on this planet prehistory began. The term, 'Prehistory' denotes the earliest period of human history. It is the period that begins with the appearance of the human being and continues till the invention of writing. In other words, 'Prehistory' is all those happenings of the past associated with the 'activity of man' before the invention of writing. Therefore, this period is being described as 'text free' period of human history. In the words of Burkitt, a renowned scholar, prehistory is the subject which deals with "the story of man and everything that concerns him from that dim remote moment when he first emerges from his animal ancestry until the time when the existence of written record leads the investigator into the realm of history".<sup>2</sup>

Since, the prehistory deals with the unrecorded events or activity of human beings, archaeological studies are the only means to understand this period of history. Archaeology is a scientific discipline which studies history through the recovered artifacts and analysis of material culture discovered by systematic excavations. Unlike in other parts of the world, the archaeological study is a recent phenomenon in Manipur.<sup>3</sup> However, in Manipur, the archaeological findings have been reported since the early 1930s by W. Yumjao Singh, who was perhaps, the first scholar to start archaeological research in Manipur.<sup>4</sup> But, the findings are still remains in its infancy. After a gap of about three decades or so, one Okram Kumar Singh (O.K.Singh), a young trained archaeologist started a pioneering archaeological study undertaken in different locations of the state. He published the first report of archaeological findings in Manipur in 1969. It was because of his work that Manipur could be included in the map of the world archaeology.<sup>5</sup> In the words of Prof. Gangmumei Kabui, a renowned historian rightly observed that "It was

O.K. Singh, a young archaeologist of Manipur to whom credit should be given for a systematic archaeological excavation and our knowledge of the pre-history of Manipur is more or less based on his studies and excavations".<sup>6</sup> The material culture discovered so far during the course of his explorations and excavations clearly indicate the evidences of the presence of 'Stone Age Culture' in Manipur. According to the nature of stone culture discovered through archaeological findings, the 'Stone Age Culture' found in Manipur can broadly be divided into three major phases: the Paleolithic, the *Hoabinhian* (Mesolithic) and the Neolithic.<sup>7</sup> However, Dr. L. Kunjeswori Devi has the view that instead of the three phases, she prefers to use the term "Pre-Neolithic and Neolithic" only. The term 'Pre-Neolithic' where she intends to use comprises all that culture before the advent of the Neolithic people.<sup>8</sup> Generally, the changes in stone-age culture from one phase to another were very gradual, and people did not altogether give up the old material or technique even when they came to know of new ones.

Paleolithic Period in Manipur:

The word, 'Paleolithic' is derived from two Greek words, '*palaios*' means 'old' and '*lithos*' means 'stone'. In short, it means 'Old Stone Age'. The people of this age belonged to a very primitive stage of civilization. The general feature of life of the people of this period was characterized by the nature of stone tools they used. During the period, men barely managed to gather their food and lived on hunting by means of rough stone implements. They had no knowledge of cultivation and house building. They lived in natural caves. According to the nature of stone tools used, the Paleolithic period may be again sub-divided into three periods, viz. early or lower Paleolithic, middle Paleolithic and late or upper Paleolithic. However, the material culture discovered, and the time span thereof, is different from place to place. Though, the evidences of material culture discovered so far in Manipur are scanty, but surprisingly, materials characterizing of all the three Paleolithic periods are found in Manipur. The main Paleolithic sites are *Songbu* caves, *Khangkhui* caves and open-air sites at *Singtom*, *Machi* and *Nongpok Keithelmanbi*.

The Early or, Lower Paleolithic period is the first phase of 'Old Stone Age' which covers the greater part of the time span of the Paleolithic period. Its characteristic features are the use of hand axes, cleavers and choppers;<sup>9</sup> during these period stone tools were mainly used for chopping purposes. In Manipur the fossils of the early men have not been discovered till date. But the presence of prehistoric men in early or lower Paleolithic period is evident from the stone tools found from *Machi* Archaeological site in *Chandel* District of Manipur. The exploration of the site was done in the year 1974 by O.K. Singh. Among other, the most stunning findings of the exploration in this site is the discovery of a pebble chopper by unifacial flaking with direct stone hammer technique. The chopper measure 11.5x13.5 x4.1 cm.<sup>10</sup> Material of the artifact is Quartzite. It has a ventral surface with pebble cortex and its upper surface is fully flat and slightly rolled. Typo-technologically, it is being compared with

that of North West India, Himachal Pradesh and South Asia.<sup>11</sup> On the findings of *Machi* exploration, T.C. Sharma, a renowned scholar of prehistory is of the view that the pebble, chopper found there "could be considered as a landmark in Paleolithic archaeology of Manipur, as it confirms beyond doubt that Manipur was inhabited by stone age ancestors since the early stone age or the lower Paleolithic period".

Universally, the Middle Paleolithic period is being characterized by the industry based upon flakes. These flakes are found in different prehistoric sites all over the world with some regional variations. The principal tools of this period comprise different varieties of blades, points, borers and scrapers. In Manipur, the artifacts of this period are found in and around the *Songbu* caves in the *Chandel* District of Manipur. The cave was explored in the year 1983 by the State Archaeology Department, Govt. Manipur, under the leadership of O. K. Singh. It faces southward and a stream also flows in the north-west direction. The cave is of fine quartzite sandstone which measures 0.8 m. in height, 6.6 m. in breadth and the interior measures 1.8 m. During the course of exploration, many stone tools belonging to the middle Paleolithic period are found. The stone tools comprises of many scrapers, borer cum hollow scrapers, knife, flakes, blades etc. The tools were mainly made of sandstone and quartzite sandstone. Tools found so far in this site can broadly be divided into two types, viz. core and flake. The number of flake tools is more than that of core tools. The flake tools are of different sizes. The largest flake measures 18.8 x 15.7 x 2.7 cm. and on the nature of technique of use of flakes, O.K. Singh is of the view that "The main flake surface is always flat with different bulb of percussion. The nature of the flake scar suggests the use of controlled stone hammer technique".<sup>12</sup> Typo-technologically, the finds at the *Songbu* cave appears to be of 'an advanced Middle Paleolithic' period.<sup>13</sup>

The Late or Upper Paleolithic is the last phase of Paleolithic period which become less humid. The period also coincides with the last phase of the Ice Age when climate became comparatively warm. The characteristic feature of this period is the appearance of new flint industries and men of the modern type (*Homo sapiens*).<sup>14</sup> In this period, a variety of tools which served very specific purposes also began to be used. In Manipur, archaeological sites associated with this period have been discovered in places like *Khangkhui* caves, *Singtom* and *Nongpok Keithelmanbi*.

The *Khangkhui* caves are located at a distance of 11 km. to the south-east of *Ukhrul* District Headquarters. There are altogether four limestone caves of different shapes and sizes. It was in the year 1969 that O.K Singh conducted the first excavation at *Khangkhui* caves on scientific line. A Small stream also flows near the western foothill which made the site suitable for habitation and settlement.<sup>15</sup> From this excavation, many stone tools, bone tools and faunal remains were found. Among the stone tools so far discovered the following may be mentioned of, viz. pebble, chopper, spearhead, scrapers, blade, burins, borers, flakes, points, knife, tabular flakes and core tools. Most of the

tools are made of limestone.<sup>16</sup> Besides, many animal bones and teeth of herbivorous animals are also recovered. The bone industry comprises various types of tools such as points, scrapers, chisels, knife etc. The faunal remains of possibly that of *Cervus*, *Sus Bovide* and wild fowls were also discovered. The findings indicate, the people in this period might have known hunting and the presence of charred animal bones also a sign of the use of fire.<sup>17</sup> Typo-technologically, the culture at *Khangkhui* caves appears to be of late or upper-Paleolithic period. In the words of T.C. Sharma, "On the basis of cultural materials consisting of stone and bone tools in addition to faunal remains, it can be argued that *Khangkhui* caves yielded evidence of upper or late Paleolithic period, the first evidence of Pleistocene man in Manipur dating back to about 30,000 B.C."<sup>18</sup> *Singtom* is another archaeological site belonging to Upper Paleolithic period found in Manipur. It is also situated in the *Chandel* District of Manipur. The open-air site at *Singtom* is explored in the year 1989 by a team of explorer under the personal supervision of O.K. Singh. During the course of exploration, a number of stone tools of different types and sizes are found. The important artifacts consisted of a broken hand axe, different type of pebbles, flakes, blades etc.<sup>19</sup> All the tools are made of 'quartzite sandstone'. The *Nongpok Keithelmanbi* is the only archaeological site which revealed all the three phases of the Paleolithic followed by the *Hoabinhian* and then by the Neolithic remains have been found in successive sequence in Manipur. It is also one of the important sites of upper Paleolithic period found in Manipur. It is situated at a distance of 15 km. north-east of *Yairipok* town on the bank of the river *Thoubal* in the *Thoubal* District. The village is located at the foothill of a mountain range which encircled the eastern periphery of the Imphal Valley. The exploration on this site is done in 1982-84 under the supervision of O.K. Singh. Surprisingly, the exploration team could discover two phase of Stone Age culture belonging to Upper Paleolithic and that of *Hoabinhian*. This site is being categorized into three localities, viz. L(1), L(2) and L(3). Out of the three localities L(2) and L(3) belonged to the Upper Paleolithic, whereas, L(1) to that of *Hoabinhian*. During the course of this exploration, artifacts of different types and sizes are discovered;<sup>24</sup> among them mention may be made of choppers scrapers, blades, flakes, pebbles, core tools, etc. The material of the artifacts is mostly made of 'quartzite sandstone'. Technologically, they were prepared by using direct stone hammer technique.<sup>25</sup> The specific age of the different phases of Paleolithic stone culture found in Manipur is not known. For ascertaining the age of each period, a scientific testing of the artifacts discovered and further Research is needed. From the reported artifacts, it appears that during the Paleolithic period men began to roam about and settled in Manipur in the same manner ad about the same time as it did in other parts of South-East Asian countries. It seems that there is a close affinity with the Paleolithic culture of Manipur with of that South East Asia. According to O.K. Singh, the origin of the Paleolithic culture in Manipur cannot be determined without having a

thorough research work of the entire archaeological evidence of the South East Asia because of its similar cultural tradition of these areas.<sup>26</sup> He also pointed out the similarity of most of the artifacts found in Manipur with that of the stone culture found in parts of China and Southeast Asia. Typo-technologically, he tentatively assigned the time period of the Paleolithic culture (all the three periods) found in Manipur to that of the 'Late Pleistocene to Terminal Pleistocene.'<sup>27</sup>

The Upper Paleolithic period came to an end with the end of the Terminal Pleistocene in Manipur which coincides with the end of the Ice Age. The climate became warm and dry which was almost the same as the present day. The climatic changes brought about changes in fauna and flora and made it possible for human beings to move to new areas.<sup>28</sup> About this time, throughout South East Asia began to witness an intermediate stage in stone age culture, which is called '*Hoabinhian*'. The term, '*Hoabinhian*' is derived from the name of Vietnamese Province, *Hoa Binh* from where Madeleine Colani, a female French archaeologist discovered a new stone culture which intervened transitional phase between Paleolithic and Neolithic stone cultures. Later on, similar stone relics are also discovered in Thailand, Burma and other parts of Southeast Asia. The *Hoabinhian* culture is the Mesolithic cultural pattern of South East Asia. However, there is no evidence about the existence of the 'Mesolithic' culture as characterized by '*microliths*' in Manipur. The chief characteristic feature of the *Hoabinhian* culture is the 'pebble tool industry'.

Archaeological evidence reveal that people in *Hoabinhian* period are 'hunter-gatherers'. The word, 'hunter-gatherers' is the term used by anthropologists and archaeologists to describe a specific kind of life: simply, hunter-gatherer hunt game and collect foods rather than grow or tend crops. In short, it is the life that men enjoyed before the invention of agriculture. Regarding the stone tools, there are regional variations in the character of the 'tools industry' from one place to another.<sup>29</sup> Typologically, the *Hoabinhian* stone tools are the continuation of the pebble tool tradition of the Paleolithic culture, but there is evidence of technological degeneration in the making of stone tools. According to O. K. Singh, almost all the stone tools, except one pebble scraper, do not show extensive workmanship and which restricts only to the making of working edge.

The *Hoabinhian* culture in Manipur is being identified with the discovery of similar nature in the characteristics of stone tools assemblages found with that of South East Asia. There are two *Hoabinhian* archaeological sites which have been discovered so far in Manipur. They are found at both at caves and open-air sites, and represented by the stone artifacts from *Nongpok Keithelmanbi L (1)* and *Tharon* cave site.<sup>30</sup> On the basis of the nature of pebble tools, O.K. Singh divided the *Hoabinhian* culture in Manipur into two-early and late *Hoabinhian* periods.

Early *Hoabinhian* period in Manipur:

The *Nongpok Keithelmanbi* L (I) archaeological site belongs to the early *Hoabinhian* period in Manipur. It is located at a distance of about 2 km downstream towards the southern side of the *Keithelmanbi* market along the left bank of the *Thoubal* River. The characteristic feature of early *Hoabinhian* period in Manipur is the chipped pebble tools. In this site, the *Hoabinhian* culture is found in a "stratum below the corded ware culture and characterized by pebble tools, spited pebbles, pebble strikers and a few flakes and blade".<sup>31</sup> The finished tools consisted of chopper, pick, scraper and blade. According to OK Singh, by the presence of a large number of batter marked pebbles and a small smooth surfaced pebble, it appears that the *Hoabinhian* people at *Nongpok Keithelmanbi* might have pounded or crushed their food.<sup>32</sup> Further, he also suggested that the pick axe with used mark might have been used in gathering of edible roots, and which further suggested that some form of vegetative food might be used.<sup>33</sup> Similar 'cultural stratum' are also discovered in parts of Thailand, Malaya and other parts of South East Asia as well. On the basis of stratigraphy, the *Hoabinhian* culture at *Nongpok Keithelmanbi* is being tentatively dated between 6000 and 5000 B.C.<sup>34</sup>

The *Tharon* cave is also another important archaeological site of *Hoabinhian* culture found in Manipur. The artifacts found in this site represented the Late *Hoabinhian* period. The characteristic feature of this period is the edged ground pebble tools. The cave is located at a distance of about 5 km towards North of the *Tharon* village in *Tamenglong* District. The exploration of this cave was done in the year 1979 and again in 1981 under the initiative of the Department of State Archaeology, Govt. of Manipur. During the course of the exploration, five caves and some rock shelters were discovered. These caves are locally known as '*Kalemki*' meaning 'house of bat'. A small stream, '*Kalem-ki-magu*' also runs along the southern side of the caves. The rock type of the area is sandstone of Barail series. The floor of the caves are filled with sandstone slabs that fall from the roofs and walls, as a result, the height inside caves and rock shelters are low and no artifacts could be collected from inside. During the exploration a number of stone tools were discovered which consisted of edged ground pebble tools, flake tools, elliptical pebble with grinding faces etc. By the presence of edge-ground pebble tools at *Tharon* cave site, it is also clear that, those *Hoabinhian* men in Manipur knew the technique of grinding in making stone tools.<sup>36</sup> According to Dr. L. Kunjeswori Devi, "the collected artifacts have a close similarity with those of Thailand, Burma, Malaysia, Vietnam". The *Hoabinhian* culture at *Tharon* cave site is being tentatively dated between 5000 and 4000 B.C.

**Neolithic Period in Manipur:** The Neolithic period is the last phase of Stone Age culture. In this period also men had to depend on stone tools and implements. But implements differed much from those of the preceding ages. The word, 'Neolithic' is derived from two Greek words, '*Neo*' means 'New' and '*Lithos*' means Stone', which means 'New Stone Age'. During this period, men began to use a variety of stone tools. The chief characteristic feature of this

period is the use of 'tools and implements of polished stone'.<sup>39</sup> People in Neolithic period had made considerable advance towards civilization. Apart from natural shelter in caves and rock-shelters, they constructed dwellings, domesticated animals, and cultivated lands. They knew how to produce fire and the art of cooking. They occupied themselves with fishing and hunting. They made pottery by hand.

In Manipur, Neolithic culture is found both in the hill and valley areas. During this period, people particularly used stone axes. This cutting tool put to various uses by the people particularly clearing of jungles for habitation. According to O.K. Singh, from the distribution pattern of the finds of the Neolithic period, it appears that in Manipur the population became more during the Neolithic than the preceding periods. Neolithic pottery is found from four different sites at *Phunan, Napachik, Laimanai and Nongpok Keithelmanbi*. On the basis of pottery culture found, the Neolithic period in Manipur can be sub-divided into three successive cultural patterns, viz. Corded Ware Culture, Tripod Ware Culture and Geometric Ware Culture

The Corded Ware Culture is the earliest phase of Neolithic culture found in Manipur. This culture is found in the archaeological site of *Nongpok Keithelmanbi Locality (L)-1*. The culture is being characterized by the used of handmade and ill-fired pottery decorated with cord marks. In this archaeological site, corded ware overlies the *Hoabinhian* culture after a short break in its stratigraphy. Due to the absence of any other Neolithic characters, the Corded Ware Culture at *Nongpok Keithelmanbi L (1)* may be categorized as a 'sub-Neolithic' type as in other parts of the South East Asia. A radiometric dating from a charcoal sample shows that the Corded Ware Culture at this site is  $4,460 \pm 120$  years old (first half of the third Millennium BC).

**Tripod Ware Culture:**The Tripod Ware Culture in Manipur is represented by the archaeological sites of *Napachik* and *Laimanai*. This culture is characterized by the used of cord-marked pottery with tripod legs. Besides, this culture is also associated with ground Neolithic stone tools. *Napachik* is a small hillock in the northern part of *Wangoo* village, on the right bank of the Manipur River in *Bishnupur* District. It is one of the major archaeological sites of the Neolithic period. It was discovered in the year 1979 while leveling a homestead land. However, officially, the excavation was done in 1981 and again in 1985 by the Department of Archaeology, Govt. of Manipur. The site was dug up through eight layers. The cultural materials discovered from this site consist of choppers, scrapers, flakes, edged ground knife, grinding stone, ground and polished Celts and potsherd, tripod leg wares, plain and corded wares. A number of charcoal pieces and ash of reeds are also found. Besides, a large number of artifacts belonging to Neolithic culture have also been collected as stray finds from many parts in and around the site. The artifact assemblages suggest that the tripod ware culture was based on plant cultivation supplemented by fishing and hunting economy and people also knew the spinning of thread. The pottery might be used in cooking also.

According to O. K. Singh, typo-technologically, the cultural materials from *Napachik* can be sub-divided into two phases. The small chipped pebble tools and other *Hoabinhian* nature like stone tools represent the earlier phase; whereas, the fully ground Celt and handmade cord marked pottery and tripod vase represent the latter phase. The pottery culture of *Napachik* has affinity with that Neolithic culture of China. In the words of Dr. L. Kunjeswori Devi, “The pottery with tripod legs from *Napachik* is very much comparable with those found in Neolithic culture of China.” The tripod wares are the characteristic feature of the Chinese Neolithic culture. Regarding the age of the artifacts, a cord marked shred from this site was dated to 1450 B. C. by radiometric method.<sup>46</sup> *Laimanai* is also another Neolithic site which belonged to the Tripod Ware Culture. It is located at a distance of about 6 km towards the south-west of *Kakching* town in *Thoubal* District. The exploration work was done in the year 1990. The main items of stone artifacts collected from this site consisted of among others chipped Celt, chipped ground Celt, fully ground Celt, broken ring stone, flat pebble hammer, grinding stone, waste flakes and many unfinished ring stones.

#### **Conclusion:**

Thus, the story of early men in Manipur is largely shrouded into mystery. We have very scanty data about the early human settlers here. However, traces of Stone Age culture are found both in the hill and valley areas of Manipur. So far as the evidence goes, Manipur was also inhabited by Stone Age people since the Paleolithic period onwards. From the present knowledge of research, it appears that Manipur was settled by prehistoric men later than that of Southeast Asia and China, although, the *lithic* technology found in Manipur shows the same manner as it found in these countries. However, the sequence of the cultural trend shows the gradual expansion of the prehistoric men of South East Asia and China into Manipur in different phases. The possibility of this cultural migration is evident from the similarity of the relics found, the available cultural sequences and the close proximity of the regions with Manipur without much geographical barrier.

**ABUL HASHIM AND EMANCIPATION OF THE  
BENGAL MUSLIM WOMEN**

**SK. MAKHLESWAR RAHAMAN**

Associate Professor of History  
Bhairab Ganguly College, Kolkata India  
& Guest Faculty  
Department of Islamic History & Culture  
University of Calcutta India

**Abstract:**

Abul Hashim, the most progressive-minded and erudite Muslim League leader of late-colonial Bengal, was a man of multifarious activities. He was an Islamic philosopher,<sup>1</sup> a lawyer, political leader-cum-activist, an editor, writer and above all a social reformer.<sup>2</sup> However, he has remained relatively a less known figure in the history of South Asia.<sup>3</sup> No extensive research work has been undertaken on him. Whatever has been written so far about him, is mainly about his political activities, especially his role as the general secretary of the BPML (1943-1947) in transforming it from an elite organization to a broad-based mass organization. But apart from liberating the Bengal League from the clutches of the 'reactionary group', he made a significant contribution to the Bengal Muslim society as a social reformer. Indeed, Hashim throughout his life worked for the weaker section of the society: the peasants, workers and most importantly, emancipation of women. Paradoxically, these aspects of his life, especially his endeavours for the promotion of education among the Muslim women and their emancipation have drawn far less academic attention than what

would seem warranted by its historical significance. This article here makes an attempt to examine his role in the emancipation of the Muslim women of Bengal in a situational context.

**Key Words:** *Abul Hashim, Emancipation, Muslim Women, Muslim League, Multi-nation theory, Social Reformer, Pakistan movement, Women Education*

### **Introduction**

Abul Hashim (1905-1974) was born in a nationalist family of Kashiara village in the district of Burdwan of modern West Bengal. His father, Abul Kasem, was a renowned Congress leader and an ardent follower of Surendranath Banerjee. A law graduate of Calcutta University, Hashim joined politics in 1936 following his father's death, to serve the country leaving his successful chosen profession of legal practice. He was different from that of other politicians with whom he worked like Maulana Akram Khan, Fazlul Huq, Suhrawardy, Khwaza Nazimuddin and others. In Ayesha Jalal's word, 'he was not cut of the same cloth, by conviction or style, as the oligarchs...'<sup>4</sup> Hashim did never support Jinnah's 'two nation theory', rather he preached the 'multi-nation theory.'<sup>5</sup> He believed that 'India is a sub-continent and not a country. India consists of many nations.' He supported the Lahore Resolution of 1940 of the All India Muslim League (AIML) because in it he saw his complete independence as a Muslim and as a Bengali.<sup>6</sup> Moreover, he believed that there was nothing communal in the Lahore Resolution since it did not contemplate partition of any country of India or partition of the Punjab or the Punjabis and partition of Bengal or of the Bengalis.<sup>7</sup> He was a staunch believer of linguistic-based nationalism. Indeed, Hashim was a 'nationalist' Muslim League politician who fought for the interests of the Bengalis where the Muslims were incidentally majority.

Hashim was elected to the post of General Secretary of the Bengal Provincial Muslim League (BPML) in 1943 and worked hard for the attainment of Pakistan according to his understanding. He was convinced that there would be two separate states for the Muslims, one in the western part of the country and other in the eastern part consisting of Assam and Bengal for the Bengali speaking people. Under his leadership, BPML emerged as a broad-based progressive democratic party. However, when partition became inevitable, Hashim made a last bid to keep Bengal united and tried to form United Independent Bengal but unfortunately it did not materialize. After partition, he served as the Leader of the Opposition in the Bengal Legislative Assembly but was forced to leave India in 1950 for Dacca following a communal riot in which his house was set ablaze by the

miscreants. In the early years of his migration to East Pakistan, Hashim was actively associated with the Language Movement and, even for this he was sentenced to jail for sixteen months by the Pakistani state for which he worked so hard to establish. Afterwards, he lost his interest in politics and then devoted his attention to the study and research of Islam.

Apart from playing a crucial role in the freedom movement of the country in the last decade preceding the partition of 1947, Hashim from his student life to till his last days worked for the emancipation of the Bengal Muslim women. The initiatives undertaken by him to emancipate the Bengal Muslim women can be discussed into three phases. From 1923 to 1936, as a social activist; from 1936 to 1950, as a political activist and after his retirement from active politics as an Islamic scholar from 1950 to till his death in 1974.

## II

It was largely due to the interaction of the Indian society, in the nineteenth century, with the British colonial power, Indian reformers became conscious about the emancipation of women. To a large extent it was the result of a comparative civilizational discourse of the colonial period. This gender question was a key issue for James Mill condemning Indian civilization in his *The History of British India*. Under such circumstances the newly emerging Hindu intelligentsia in Bengal also responded to this civilizational critique by advocating and supporting reforms to improve the status of women in Indian society.

The condition of Bengali Muslim women were more or less similar to their Hindu counterparts except for the case of *sati* system which was exclusively an anathema of Hindu reformers till its abolition in 1829. The reform movement among the Muslims, however, started a little later than that of the Bengali Hindus. One of the key factors responsible for this was that there was no formidable middle class in the Bengal Muslim community as the Muslims kept themselves aloof from learning Western education for a long time. In the absence of a substantial group of middle class, religious leaders came forward to rescue the Muslim community from its degraded position and thus started revivalist movements, like Faraizi and Wahabi. These movements instead of uplifting the socio-economic condition of the Bengal Muslims intensified their backwardness only.<sup>8</sup> It had no agenda of uplifting the Muslim society in terms of secular modern education or emancipation of the Muslim women.

However, by the mid-nineteenth century demand for English education among the Muslims of Bengal gradually increased<sup>9</sup> as economic condition

of the Bengali Muslim peasants, mainly of the eastern part of Bengal, improved due to boom in jute production.<sup>10</sup> The government too adopted some favourable policies, especially after the publication of W.W. Hunter's *The Indian Mussalman*, for the advancement of Muslims in education and governments jobs. As a result, there emerged a small group of Western educated 'middle class' towards the last quarter of the nineteenth century. Though the size of western educated Muslim middle class gradually increased in the subsequent years, however, till the next two decades of the twentieth century, they could not mobilize the Muslim masses politically since their priority was to protect the interests of the upper class *ashraf* Muslims only. The *ashraf* leaders had little contact with the rural *atraf* or low born Muslims majority of whom were Bengali speaking.

#### **Social Activist Hashim and emancipation of the Muslim women**

It was only from the 1920's, there emerged a new Muslim middle class<sup>11</sup> who endeavoured to address socio-political issues like promotion of women education, protection of the interests of the *prajas*, marginal peasants and foundation of modern educational institutions. At the same time, there emerged a new *bhadramahila*, with the commencement of a critique of conventional notions like chastity, as well as the entry of women's into politics and public sphere.<sup>12</sup> Indeed, from the 1920's a redefinition of Bengal's identity started.

Bengali Muslim intellectuals like Nasiruddin Mohammad<sup>13</sup> emphatically argued for the promotion of Muslim women education and their emancipation. His *Mahila Saogat* created a platform for the voices of Muslim women. The establishment of Dacca University in 1923 and the beginning of *Buddhir Mukti Andolan*, (Emancipation of Intellect) in 1926, played a paramount role in infusing rational thought among the Bengali Muslim youths. Young Abul Hashim, then in his early 20s, fell in love with what were known as 'Western' subjects like sociology, political science, history, law and philosophy<sup>14</sup> and gradually became an avid reader which widened his mental horizon. This intellectual engagement injected in him the spirit of fighting against the orthodox Mullahs who opposed English education and stood as a barrier in the emancipation of the Muslim women. Inspired by all these developments, Hashim at the age of just twenty three years, instead of joining politics which was quite normal for him as he hailed from a politically oriented family, embarked into the activities

<sup>14</sup> Bose Neilesh, op. cit. p.241.

of social reform, especially in the task of emancipating the Muslim women's of Bengal which had enduring impact on the Muslim community. Hashim from the very beginning of his student life considered traditional Maktab and Madrassa education as a great barrier for the advancement of the community and so vehemently opposed it and even argued for its abolition and introduction of modern uniform education for all.<sup>15</sup> He was especially pained to see the deplorable condition of the Muslim women. They were denied the right to secular education whereas Islam declares acquiring knowledge or education as mandatory for all, men and women.<sup>16</sup> To remove this discrimination and promotion of education among the Muslim women, he launched a massive campaign in his district and formed a social organization, called Young Men's Muslim Association (YMA). He persuaded the Muslims of the Burdwan town to send their girls to the Christian Missionary High English School founded by the Missionaries. To set an example, Hashim admitted his wife, Akhter Mehr Banu Begum, cousin of H. S. Suhrawardy, in this school<sup>17</sup> despite strong objection from his father, Abul Kasem.

Hashim's ancestors, though, showed quite liberal attitude towards English and western education, compared to the other Urdu speaking urban *ashraf* Muslims, and opened the door of Western education for the male members but did not do that for the female members of their family. Rather they had to observe *purdah* system strictly.<sup>18</sup> Hashim in his memoirs, *In Retrospection*, termed the environment of his family as 'feudal.' Possibly, it was because of his ancestors orthodox approach towards women education. Hashim's paternal grandfather, Abdul Jabbar, (1837 - 1918), a class-mate of Bankimchandra Chattopadhyay and Deputy Magistrate by profession, opposed to the establishment of a school for Muslim girls.<sup>19</sup> Hashim's son Badruddin Umar, a renowned intellectual and political scientist of Bangladesh, writes that the female members of their family were never allowed to go to school.<sup>20</sup>

Hashim equally opposed the social custom of seclusion or *purdah* system of the Muslim women. Begum Rokeya Shakhawat Hossain, (1880-1932) pioneer of the emancipation of Muslim women, vividly portrayed the miserable picture of this *purdah* system in her much acclaimed book

<sup>19</sup> Ahmed, Rafiuddin, op. cit., p. 23.

<sup>20</sup>*Ibid*, p. 23.

*Aborodhbasni*.<sup>21</sup> To abolish this practice of 'purdah', or liberating the Muslim women from seclusion, under Hashim's initiative a resolution was taken in the first Annual Conference of YMA.<sup>22</sup> He considered the social custom of seclusion which confined the Muslim women within the four walls of their house as one of the main causes of their degraded position.

Hashim was a very pragmatic politician. Indeed, nationalism cannot afford to ignore women, especially when it comes to counting numbers. Since Hashim's aim was to organize Bengal League as 'a broad-based democratic and progressive political party', he left no stone unturned to bring the entire Muslim community of Bengal under the banner of the League. This is why immediately after taking charge of the party in 1943, in an address, he urged the League workers to reach out to every section of the society irrespective of caste, creed and gender. He said, 'Run about cities, towns and villages and organize your brothers and sisters ... and build up your thrones in the heart of every man woman by your service to humanity...' <sup>23</sup>. A leader with overtly socialist leanings, Hashim had the vision establishing an egalitarian society. In 1944, he published a 'Manifesto' with the help of Nikhil Chakraborty, a young Communist leader. It included all the essential features of an egalitarian society. It promised equal rights and opportunities for all, both men and women, in education, employment, health and other fields of life. <sup>24</sup> No other Muslim League leader came forward with such a progressive and revolutionary agenda for women empowerment.

In fact, Hashim's endeavours for emancipation of women was very much inconformity with the ideals of Pakistan movement. There was a feminist dimension to the Pakistan movement that has hardly ever been underscored. The emancipation of women would be something that Jinnah would repeat often in the course of Pakistan movement. Throughout the Pakistan movement the question of women emancipation figure in the speeches of Jinnah. He advised the Muslims to 'emancipate the women' for that was the key to progress.<sup>25</sup> Indeed, it was the women who formed the vanguard of popular movements, struggles and even in electoral battles. Both Hindu and Muslim women's took active part in politics especially after the emergence of Gandhi. It was in Lahore in 1931 that the Asian Women's Movement was born. However, by and large, Muslim women remained oblivious. It was Jinnah who galvanized the Muslim women into a veritable

<sup>24</sup> Op.cit, p. 79

<sup>25</sup> Quoted in Hamdani, Yasser Latif., Jinnah, A Life, Macmillan, London, 2020, p.195.

arm of the Muslim League. He had been ardently working for the suffrage movement in his student days in London. He was genuinely distressed to see the state of women in the Muslim community, something he alluded to on several occasions<sup>26</sup>. He famously said in 1944; ‘No nation can rise to the height of glory unless your women are side by side with you; we are victims of evil customs. It is a crime against humanity that our women are shut up within the four walls of the houses as prisoners. There is no sanction anywhere for the deplorable condition in which our women have to live’

Hashim in course of his extensive tour from the beginning of 1944, did his best to reach out to all sections of people to build up a strong base of the party. In fact, Hashim paved the way of ‘political empowerment’ of the Muslim women through the League platform. In the provincial election of 1946, two women candidate of the League, Anwara Khatoon, a well-educated woman and Mrs. Hakim were elected to the Bengal Legislative Assembly unopposed from Dacca-Narayanganj constituency and Calcutta Constituency respectively. There was another women candidate Mrs. Sultanuddin Ahmed in the fray.<sup>27</sup> Thus a remarkable change was noticed in the approach of the Bengal Muslims towards accepting the women in the domain of the males, the world of politics.

#### **Hashim as an Islamic Scholar and emancipation of Muslim women**

Hashim left India in 1950 in a broken heart for Dacca, and, stayed there till his death in 1974. The year 1950 was also very special to him as his first book, *The Creed of Islam or The Revolutionary Character of Kalima* was published in this year. In this ground-breaking book, he explained in detail how Islam has guarded the interests of the women. After his release from jail he gradually lost interest in politics and shifted his attention to the study of Islamic research. During this phase of his life, he continued to argue for the equal rights of the women and their emancipation. In his book, *The Creed of Islam* and in his later work, *As I See It*, he categorically supported the cause of women emancipation. He writes, ‘Islam has given due respect to the woman. She is not a chattel but a person with all its legal and social implications. She is known by her own name and not by her father’s or husband’s name.’<sup>28</sup> In Islam slander of women is a heinous crime and the punishment for that is extremely severe. In this connection, he cited the Sura ‘Noor’, verse 4, of the Quran. It says, “And those who launch a charge against chaste women ... flog them with eighty stripes and reject their evidence ... for such man are wicked transgressors.” Hashim there after writes that the Prophet raised the honour of women heaven high. Being a true believer, he believed ‘paradise lies at the feet of the mother.’

---

<sup>26</sup>Hamdani, Yasser Latif, *Ibid*, p. 196.

<sup>27</sup>Hashim, Abul., *op., cit.*, pp. 100-101.

<sup>28</sup> Hashim, Abul, *As I See It*, Bangladesh Co-operative Book Society Ltd., Chittagong, 1997, p. 78.

Hashim being ‘a zealous missionary of Islam,’ legitimately championed the women’s right in property. Citing the verses of the Quran, he writes that in Islam female child enjoys the same status as that of a boy. She is legal heiress of her father, mother and children. Her property does not merge with that of her husband. She has the freedom of disposal of her property as she likes.<sup>29</sup> He believed in *ijtihad*, the practice of applying reason or practical knowledge in the absence of any clear-cut guidance from the Quran or hadith in day to day life of a follower of Islam. Quite arguably, he dismissed those customs prevalent in the Muslim society of the sub-continent which were not approved by the Quran. According to the Muslim Law of Inheritance if a mother or father of a child dies in the life time of his or her grandparents, then he or she would be disinherited from his or her mother or fathers property. He tried to prove that this law is inconsistent with the ideology of Islam. Hashim was in search of an opportunity to rectify this provision of the law and ultimately got it. In 1969, he was appointed as a member of the Advisory Council of Islamic Ideology in Pakistan. He submitted a proposal to the Council on the right of inheritance of the orphaned grandchildren. And the proposal was accepted and an Act was passed in 1969 giving the right of inheritance to orphaned grand children.<sup>30</sup>

### **Conclusion**

The success Hashim could not achieve in politics was compensated through his social reforms and his literary achievements; the book *The Creed of Islam* is considered an asset in contemporary Islamic thought. He undoubtedly emerged as a charismatic leader for the Bengalis. It’s fact that he did not reach the stature of a national leader unlike Jinnah but did enjoy the honour of being amongst the “Big Three” of the revolutionary Bengali leaders (H S Suhrawardy, Fazlul Huq). There is no denial of the fact that his efforts in the emancipation of Muslim women played a vital role in the modernization of the Muslim women’s of Bengal. His concern for the marginal and deprived sections of the society, an essential characteristic feature of a political leader reflects humanitarian aspects of his personality. Indeed, Hashim was far ahead of his time who played an important role in the self awakening of the Bengal masses. Time and again, his ideals were smashed out but since revolutions are born in the mind first, Hashim had already sown the seeds of that revolution for equality in the minds of the Bengali youth, who later became the flag bearers of Bengali Language movement which paved the way of the foundation of a modern nation state, Bangladesh, in 1971. Hence, posterity would remember him not only as a far-sighted political leader but also as a great social reformer and emancipator of Bengal Muslim women.

## **DEVELOPMENT AND STANDARDISATION OF A SCALE TO MEASURE TEACHER EFFECTIVENESS**

**DR. DIPALI DWIVEDI**

Assistant Professor  
Department of Teacher Education  
D.B.S. College, Kanpur India

### **Abstract:**

This paper explains the procedure of developing and standardizing a scale to measure teacher effectiveness of college teachers. After thorough review of literature, related to teacher effectiveness of college teachers and university teachers, nine areas are decided. Initially, 42 items are generated pertaining to teacher effectiveness belonging to all nine areas. The proper try-out is done on a group of 200 college teachers for carrying out the item analysis. 24 items with 'CR' values significant at the 0.05 level of significance are finally selected for the scale. The test-retest reliability and split-half reliability are established for the scale which are found 0.76 and 0.60 respectively. Face validity, cross-validity and item validity are established for scale. Norms are established on the sample of 350 college teachers on the scores of teacher effectiveness. The scale to measure teacher effectiveness developed and standardized can be used to study the teacher effectiveness of college teacher.

### **Introduction:**

Higher education institutions emphasize teaching, research and extension services, however the major focus may vary according to the nature of the higher education institutions. Even though Boyer (1990) recommended that teaching and research should have a better balance and that teaching should be viewed as a core requirement in higher education institution. Inadequate assessments of teaching quality still leaves room for further resolution. The problem of identification of effective teachers is, therefore, of prime importance for realizing desirable educational goals.

After thorough review of literature, related to teacher effectiveness of college teachers and university teachers, areas are decided. Literature encompasses numerous definitions and criteria regarding effective teaching and effective teachers. Scholars studied and gave definitions and criteria for assessing teacher effectiveness. For a summary of definitions of teaching effectiveness and criteria indicated by various researchers are given in the Table 1.

**Table 1 : Definition and Criteria of Teaching Effectiveness**

<b>Researcher, Date</b>	<b>Definition/ Criteria</b>
Sherman (1987)	Enthusiasm, clarity, preparation, organization, stimulating, and love of knowledge
Cashin (1989)	All the instructor behaviours that help students learn, the components of which include subject-matter mastery, curriculum development, course design, delivery of instruction, assessment of instruction, availability to students, and administrative requirements
Brophy (1986)	Time management, active teaching through discussions, follow-up assignments, and effective classroom management skills
Marsh (1982)	Value of learning, enthusiasm organization, group interaction, individual rapport, breadth of coverage, workload, grading and assignments
Wankat (2002)	Teaching that fosters student learning
Fiedler (2004)	Availability and accessibility during office hours and through emails, organization in terms of course objectives and the course content, methodology such as incorporating classroom discussions, encouraging questions from students, and using example

On the basis of review of related literature, areas are decided belonging to following teaching behavior categories –

- (i) Learning/Academic Value
- (ii) Instructor Enthusiasm
- (iii) Organization/Clarity
- (iv) Breadth of Coverage
- (v) Examination/Grading
- (vi) Group Interaction
- (vii) Individual Rapport
- (viii) Instructor Accessibility
- (ix) Communication Skills.

Shaw, Young, Schaffer, Mundfrom (2003) developed an instrument for addressing the validity of a Teacher Effectiveness Scale which comprised 12 items such as subject-matter knowledge, communication skills, enthusiasm, comfortable atmosphere, respectful of students, warm and friendly, motivate

and stimulate concern for learning, increased understanding, increased interest, course organization global item.

Kumar and Mutha (1999) constructed and standardized a Teacher Effectiveness scale. This scale consists of 69 items including areas such as academic, professional, social, emotional, moral, personality.

It is decided that only closed type items will be prepared in the scale. 42 items belonging to above nine categories are prepared. Extreme care is taken to word the items in order to avoid indication of hidden meaning for securing information. This first draft of scale is given to a group of 10 experts for opinion and comments. 42 items are screened and 32 items are retained after excluding items with overlapping and second draft of scale is developed. Second draft of scale is subjected to pre-tryout Pre-tryout is done to improve and modify the language difficulties. The 32 items are administered to a sample of 20 college teachers to check language difficulties. Minor changes are made in the language in some items as suggested by the college teachers. The proper tryout is done on a group of 200 college teachers for carrying out the item analysis. 27% of subjects with the highest scores and 27% of subjects with the lowest scores served as criterion groups (Garrett, 1961). Discriminating value for each item is then determined by calculating 'CR' on the basis of responses of upper and lower groups. Significant difference between 27% lower and 27% upper score on Teacher Effectiveness Scale on each item is shown in Table 2.

**Table-2 : Mean Difference Between Lower 27% and Upper 27% Items of Teacher Effectiveness Scale**

Items	't'	Items	't'	Items	't'
1.	2.02*	12.	2.50*	23.	1.49
2.	2.20*	13.	2.03*	24.	2.03*
3.	2.69**	14.	4.60**	25.	2.08*
4.	1.46	15.	3.98**	26.	3.57**
5.	2.20*	16.	5.80**	27.	2.07*
6.	2.30*	17.	3.85**	28.	1.57
7.	1.32	18.	1.46	29.	2.11*
8.	1.37	19.	2.69**	30.	1.69
9.	2.68**	20.	1.97	31.	2.70**
10.	3.63**	21.	2.50*	32.	2.57*
11.	6.91**	22.	2.60*		

\* Significant at 0.05 Level of Significance

\*\* Significant at 0.01 Level of Significance

24 items with 'CR' values significant at the 0.05 level of significance are finally selected for the scale.

Area-wise distribution of Teacher Effectiveness Scale items are given in Table 3.

**Table-3 : Area-Wise Distribution of Teacher Effectiveness Scale Items**

S.No.	Area	Item No.	Total Item
1.	Learning/Academic Value	1, 2, 3	3
2.	Instructor Enthusiasm	4, 5, 6	3
3.	Organization/Clarity	7, 8, 9	3
4.	Breadth of Coverage	10, 11, 12, 13, 14	5
5.	Examinations/Grading	15, 16	2
6.	Group Interaction	17, 18, 19	3
7.	Individual Rapport	20, 21	2
8.	Instructor Accessibility	22, 23	2
9.	Communication Skill	24	1
Total			24

**Reliability**

The test-retest reliability is established for the present scale by computing the coefficient of correlation between two sets of scores of same individual on Teacher Effectiveness Scale at different intervals (after 15 days) on a sample of 120 college teachers. Split-half reliability is also established.

Test-retest reliability and split-half reliability are shown in Table 4.

**Table -4 : Reliability of Teacher Effectiveness Scale**

S.No.	Reliability	N	R	Index of reliability
1.	Test-Retest Reliability	120	0.76	0.87
2.	Split-Half Reliability	120	0.60	0.77

**Validity**

The face validity of the scale is fairly high. The content validity is decided by modifying and rewording the items with the consultation of experts in the field. The scale is said to possess the cross validity since the sample selected for tryout of the items is not included in the establishment of reliability and validity of scale. This avoids the chance error of increasing the reliability coefficient. Item validity is established by selecting the items which had significant 'r' values on item total correlation. Item total correlation between score of each item and score of total items are carried out by using Karl Pearson's Coefficient of Correlation. Correlation is computed on the scores of 50 college teachers. Correlation coefficient between scores of each item and score of total items are given in Table 5.

**Table 5 : Item Total Correlation Between Score of Each Item and Score of Total Questionnaire**

Items	'r'	Items	'r'
1.	.28*	13.	.39**
2.	.36**	14.	.42**
3.	.29*	15.	.37**
4.	.33*	16.	.57**
5.	.35**	17.	.36**

6.	.30*	18.	.48**
7.	.27*	19.	.56**
8.	.32*	20.	.48**
9.	.28*	21.	.36**
10.	.39**	22.	.69**
11.	.45**	23.	.39**
12.	.58**	24.	.40**

\* Significant at 0.05 Level of Significance

\*\* Significant at 0.01 Level of Significance

All items are found significant at 0.05 level of significance. 14 items are found significant at 0.01 level of significance.

### Scoring

The Teacher Effectiveness Scale has 24 items and were positively worded. Items are given a score of '5', '4', '3', '2', '1' for most effective, more effective, average, less effective, least effective respectively. The sum of these gives the score of the teacher effectiveness for the subject. The total scores vary from 24 to 120, showing least teacher effectiveness to highest teacher effectiveness. Norms are established on the sample of 350 college teachers on the scores of Teacher Effectiveness. Norms are interpreted in the conventional manner. Norms are decided on the basis of normal probability curve. **Conclusion**

The scale to measure teacher effectiveness is developed and standardized. This scale can be used to study the teacher effectiveness of college teachers. Effective and ineffective teachers can be identified through this scale.

**Abstract:**

Objectification is a kind of thralldom in which women are expected to be silent like an object or a thing. It is a part of dehumanisation and the act of disavowing the humanity of others. Objectification is a notion central to feminist theory and it can be defined as seeing the women as an object primarily on sexual realm. In patriarchal society, especially fundamentalist countries like Afghanistan, women are viewed as an object. Based on this, the paper has been written bringing out Martha Nussbaum, an American philosopher's, objectification characteristics such as instrumentality, denial of autonomy, inertness, fungibility, violability, ownership and denial of subjectivity, and these factors are applied to Mariam, a female character, in *A Thousand Splendid Suns* by Khaled Hosseini. An analysis, through Nassbaum, shows how she has lost her space in her mother's family and also in her husband's family.

**Keywords:** *Autonomy, oppression, patriarchy, endurance, psychopath, freedom.*

Objectification calls attention to the denigratory status of women in a society where they are treated as mere objects of gratification. They are reckoned for sexual pleasure without giving significance to their thoughts and emotions. Thus, their status is reduced to a mere object that has physical existence. Their rights are denied and they are under the control of men, getting exploited and subjugated by them. They are viewed merely as a symbol of attraction and are demeaned even in their own families. The notion of objectification is focal to the feminist theory and the trauma that they undergo is phonated and penned by writers from time to time. Lundy Bancroft in her work *Why Does He Do That? Inside the Minds of Angry and Controlling Men* expresses her views on objectivity in the following manner:

Objectification is a critical reason why an abuser tends to get worse over time. As his conscience adapts to one level of cruelty – or violence – he builds to the next. By depersonalizing his partner, the abuser protects himself from the natural human emotions of guilt and empathy, so that he can sleep at night with a clear conscience. (Bancroft, 32)

Martha Nussbaum, an American Philosopher, advocates the freedom of women. She furthers her ideas on the concept of objectification which is an embodiment of a pragmatic philosophical approach which regards an activity rather than an absolute or ideal term known as instrumentalism. Nassbaum outlines seven characteristics of objectification such as instrumentality, denial of autonomy, inertness, fungibility, violability, ownership, and denial of subjectivity.

According to Nussbaum, Instrumentality, the first trait, is look upon women as mere objects and debilitated by the objectifier. Hosseini brings out this feature through Mariam in the following manner: “She was tired of being an instrument” (Hosseini, 28). Here, she also discusses how women are oppressed and treated as mere objects. Being a female, she is viewed to be a *harami*, a kind of curse by Nature itself. *Harami* in Arabic means sinful. Since childhood, she listens to her father calling her as a sinner, an illegitimate and a cursed child. Such harsh words linger around her ears continuously which in turn arouses in her a kind of internal conflict, self-doubt and psychological trauma and depression. Her illegitimate birth also leads to denial of social status and hence she suffers from inequality, suppression and discrimination. She seems to be unblinking and expressionless. The extreme depression and anxiety that she undergoes create a kind of stress and nervousness. This in turn brings a kind of emotional numbness. Thus, she becomes impassive, apathetic and shows lack of motivation towards what is happening around her own self. The impassiveness that she suffers from has been expressed in the following manner:

She understood then what Nana meant, that a *harami* was an unwanted thing; that she, Mariam was an illegitimate person who would never have legitimate claim to the things other people had, things such as love, family, home, acceptance. (Hosseini, 4)

Nussbaum discusses denial of autonomy as another objectification trait. It talks about the oppression and agony woman undergoes, when she is treated sans humanitarian attitude. It shows how women is denied of freedom, free will, independence, individualism and self-determination. Hosseini brings out this trait through Mariam, who at the age is fifteen, is married to a middle-aged man Rasheed which proves to be an excruciating experience to her. Being a psychopath, he is egocentric, lack of remorse or shame and does not show a kind of empathy towards women. His self-pride and reluctance, to learn from failure, punches Mariam to think in terms of him as cynical, narcissistic, callous, morally depraved and exhibits a manner of manipulation. He has a tendency to exploit his wife. His inability to differentiate between right and wrong proves him to be a sociopath. His dissimulation and aggressiveness towards his wife is expressed in the following manner: “But I’m a different breed of man, Mariam. Where I come from, one wrong look, one improper word, and blood is spilled” (Hosseini, 69).

When Hosseini talks about the nuptial relationship between Mariam and Rasheed, he has brought out how suspicion and misgiving that dwell in Rasheed prove to be despoliation. In fact, he is suffering from an oppositional defiant disorder. It is a condition whereby a person exhibits defiant, hostile, uncooperative, and annoying behaviour. Further, it is interesting to note that Rasheed has a suspicion that his wife Mariam is for a mutinous tie-up. This disrupts their everyday life including his relationship with family members. His lack of dissemination with his wife proves to be a hindrance to devise a solution to their predicaments. He also finds it difficult to claim a kind of reassurance from her as he feels it may be clingy. He does not, sad to note, possess conflict resolution skills. His superiority complex and uncooperative nature does not allow him to spend quality time with his wife. His skepticism regarding his wife’s trustworthiness is reflected in the following manner: “Suspicion and misgiving winked out of his eyes. He sat up straight and for a few brief moments he appeared merely thoughtful, like a ship captain informed of imminent mutiny taking his time to ponder his next move” (Hosseini, 336).

Nussbaum’s inertness, one more trait of objectification, highlights how woman remains passive and intimidated. Hosseini brings out this trait through Mariam who seems to be incapacitated and is always expected to be powerless, and remain under the control of her husband. Even her tutor teaches the qualities of inertness to her. Hosseini brings out the harmful effects of *Tahamul* (endurance) through Mullah Faizullah who is the *akhund* (tutor) to Mariam. He often advices her not to remonstrate against her parents and asks her to learn endure the pain and suffering. She compares her life with

snowflake that symbolises fragility in the following manner: “Each snowflake was a sigh heaved by an aggrieved woman somewhere in the world. ... As a reminder of how women like us suffer, she’d said how quietly we endure all that falls upon us” (Hosseini, 89).

Endurance is the strength, resilience or the ability of a person to tolerate adverse conditions like stress, fatigue and so on for a long period of time. Though Mariam faces inexplicable throbbing and excruciation at the hands of her parents, Mullah tries to convince her stating that it is inexorable. Thus, he intentionally or unintentionally seems to preach her the quality of endurance which in the long run may lead to myocardial fibrosis or atrial fibrillation. The truth of the said lines can be seen in the following manner: Only one skill. And it’s this: *tahamul*. Endure...it’s our lot in life, Mariam. Women like us. We endure. It’s all we have. Do you understand? Besides, they’ll laugh at you in school. They will. They’ll call you *harami*. They’ll say the most terrible things about you. (Hosseini, 18)

Nussbaum considers violability as anobjectification trait, whereby a person lacks integrity. Hosseini highlights this trait through Mariam’s mother, whose marriage with Jalal seems to be illegitimate. She feels repentant over her status in the society. She believes that Mariam’s birth as culpable and a crime that is worthy to be blamed. Her inability to share her suffering makes her helpless. She does not even have the freedom to lament aloud and so she frowns internally. She learns from her mother regarding the disgrace that she faced in the society and how she has been labelled as a pokeroot and weed that needs to be uprooted. She is viewed to be an allergic and addressed as a mugwort. Her pathetic situation in the society is articulated in the following manner: “I was a pokeroot. A mugwort. You too. And you weren’t even born yet” (Hosseini, 9).

Rasheed seems to be aggressive and abusive. Sexual behaviour or sexual act proves to be is a kind of violence, if it is forced upon a women or a child. Immanuel Kant in his *Lectures on Ethics* presents his opinion on objectification in the following manner: “Sexual love makes of the loved person and object of appetite: as soon as that appetite has been stilled, the person is cast aside as one cast away a lemon which has been sucked dry” (Kant, 163). Thus, sexual violence is another means of oppressing women in a patriarchal society. It is a crime committed deliberately with a goal of controlling and humiliating the victim. The aggressive behaviour of Rasheed has been observed in the following lines:

He was a man... his needs differed from hers... their coupling was still an exercise in tolerating pain. His appetite on the other hand, was fierce, sometimes bordering on a violent... the way he pinned her down ... Mariam knew that she could never talk to him... it was unmentionable. (Hosseini, 82)

Nussbaum’s objectification trait of denial of subjectivity brings out by Hosseini through Rasheed, who does not respect his wife’s feelings and emotions and treats her as a mere object. Simone de Beauvoir in her fiction

*The Second Sex* opines: “No one is more arrogant towards women, more aggressive or scornful, than a man who is anxious about his virility” (Beauvoir, 34). Rasheed has the tendency of finding fault his wife for blind reasons. His allegation mostly is unsubstantiated, groundless and tries to defame the character and reputation of his wife. Rasheed slanders Mariam on daily basis and he seems to suffer from confabulation, a kind of mental illness whereby a person possesses a kind of distorted, fabricated and misinterpreted memories regarding the self and the world. Confabulation is visible through certain characteristic features such as verbal statements or non-verbal gestures, an account of fantastic or semantic memory, actual experience inclusive of the present and the past. The person is not concerned about the errors that he has pointed out and is always ready to blame others. Hosseini brings out the accusing tendency predominant in Rasheed through in the following manner: “Like a compass needle that points north, a man’s accusing finger always finds a woman” (Hosseini, 7).

Thus, Rasheed is a nit-picker. Even he finds fault with even small or unimportant things. In Bible, fault finding is known as all flesh is of the dust. Whenever he criticises Mariam, it looks unreasonable and unfair. Without knowing that it may demoralise his wife and it seems he is deliberately looking for a mistake. This attitude of Rasheed is observed in the following manner: “Rasheed’s fault finding left her stricken in the kitchen with self-doubt” (Hosseini, 99).

Hosseini brings out the trait of ownership through Rasheed who prove to be decisive and has no concern or respect for others. He always has his emotions ramped up. His rattling character can be seen when he becomes irritable and explosive. To Mariam, anger management is a problem. She is sometimes feels shattered, when he comes out with emotional rage. She knows pretty well that he not only easily flares up, but also learn to use his anger to intimidate and manipulate Mariam into getting his way. His volatile and impulsive personality has been observed in the following words:

She lived in fear of his shifting moods, his volatile temperament, his insistence on steering even mundane exchanges down a confrontation path that, on occasion, he would resolve with punches, slaps, kicks, and sometimes try to make amends for with polluted apologies and sometimes not. (Hosseini, 97-98)

Nussbaum considers fungibility as a trait of objectification in which women are treated as mere objects or assert that is given in marriage to a man’s family. Nussbaum brings out how Rasheed treats her as a commodity, as insignificant and unimportant. He behaves as if she does not even exist and considers her as nothing, a philosophical term that generally denotes a state of non-existence. Nothingness may be associated with darkness, death, loneliness, lack of compassion, instability and emptiness. Mariam is simply alone, lonely and miserable where lack her true self in the empty and void. When one feels nothing, one may fall into the abyss and may be lost. Further,

with regard to marriage, cord is symbolic of the perpetual union of the bride and the groom. The expression cutting the cord describes necessary action to take when it is time to end a dependant relationship. Mariam takes back her power by cutting energy cords that had formed between herself, any person like her father, mother, husband or situation or thing that no longer serves her. Further, she realises that let her go call and cut all etheric cords that are no longer serving her purpose to her any cords attached that are not aligned with love and harmony which can be served, demolished and even destroyed. When someone wants to detach from negative energy one can cut cord. This has happened in the life of Mariam. “I cut the cord between us myself. That’s why I had a knife” (Hosseini, 11). Hosseini brings out this also through Mariam’s mother who easily resorts to cording. Thus, cording is the energetic result of an overwhelming situation, an effort to resolve some seemingly insurmountable situation.

Further, the childhood trauma that a person experiences has an impact throughout their lives. The emotional response that they undergo may be explosive or unpredictable. Mariam undergoes trauma since her childhood and this creates in her a kind of anxiety and depression. The United Nations Spotlight Initiative responds to all forms of violence against women and girl child and its objective is described in the following manner:

With a particular focus on domestic and family violence, sexual and gender-based violence and harmful practices, femicide, trafficking in human beings and sexual and economic (labour) exploitation. In line with the 2030 Agenda for Sustainable Development, the Initiative will fully integrate the principle of ‘leaving no one behind.

The crux of objectification has been brought out Hosseini through Rasheed who expects his wife to be submissive, pushing her to shrivel into a corner, hugging her knees, a pull of blood at her feet. With a supplicating voice, she solicits “It’s normal. Isn’t? Isn’t? isn’t it normal?” (Hosseini, 89). The Tricking mind of a women tells about her loss, grief and self-abasement. With a subjugating voice, she is expected to say to the patriarchal world ‘it is normal’. The idea of woman as destroyer is retained because it justifies man’s need to conquer and tame women as objects because the mechanistic model of patriarchy has been operated in the principles of control and power.

**Abstract:**

Environmental decay due to unbridled development unleashed in the Postcolonial nations like India has resulted in ecological imbalance and many related issues. Ostensibly, the root cause of this eco-destruction is anthropocentrism, which in the wake of modernization and globalization has marginalized and oppressed the indigenous tribal communities. On the one hand capitalism results in rampant development leading to ecological deterioration. On the other hand the caste hierarchy exploits tribal communities in the Indian context. Taking a cue from the fallacious development, misogynistic capitalism and ecological deterioration, the present paper examines Mahasweta Devi's powerful and poignant short story collection *Bitter Soil* (1998) translated by Ipsita Chanda so as to investigate the catastrophic effects of environmental decadence on tribal, marginalization of tribal by the mainstream people and ecological imbalance through the theoretical underpinnings of Ecocriticism. Further, these short stories examine Devi's intent to initiate a shift from anthropocentric tendencies to biocentric, which regards 'biological egalitarianism' as its main tenet.

**Keywords:** environment, degradation, tribal, marginalization, development  
In Postcolonial nations like India industrialization and urbanization has caused environmental deterioration, which eventually affects the lives of the

indigenous tribal communities in manifold ways. As, developmental projects hijack tribal land for the construction of dams, mining projects and deforestation which in turn have dislocated them from their vicinities as well as catalyzes global warming, ozone layer depletion, air and water pollution as Swaranalatha Rangarajan (2014) aptly points that,

With factors like rapid growth, industrialization, and population boom, environmental conflicts have become more pronounced and revolve around competing claims. Sites of struggle range from forests, unethical mines, dam projects and displacement of tribals and agriculture-dependent poor people to land and resource depletion, pollution, decimation of biodiversity and species threat (p.527) Understandably, the exploitation of nature is the consequence of anthropocentric tendencies, which adheres to the superiority of humans over other beings and dominance of culture over nature. As J. Baird Callicott (1984) rightly professes that other than humans, all other beings are mere instruments,

An anthropocentric value theory (or axiology) by common consensus, centers intrinsic value on human beings and regards all other things, including other forms of life, as being only instrumentally valuable, i.e.; valuable only to the extent that they are means or instruments which may serve human beings. (p. 299)

The representation of nature and its plunder has been one of the recurring issues reflecting in the literary texts and discourses. Cheryll Glotfelty's (1996) pioneering theory, Ecocriticism holds immense significance in the context of 'earth-centered approach' to literary studies where Mahasweta Devi's *Bitter Soil* (1998) appears as a representative text.

Ecocriticism or "green" criticism as an interdisciplinary approach analyses the relationship of humans with the environment. Disseminating the urgency to rescue nature from the grip of the government and corporate's developmental projects is the agenda of this field of study.

Eco critics argue that the shift from anthropocentrism to biocentrism is the need of the contemporary times to break the myth of the dominance of human over other forms of life. rampant development, urbanization, modernization and neo-colonization are depleting the natural resources and degrading the natural environment. The changing ecological scenario in India and its consequences makes it obligatory for the Indian writers to address the issues related to environmental decadence in their texts. Indian women writers are primarily the environmental crusaders who have dealt with the ecological issues and their repercussions in their works aptly. Writers like Arundhati Roy, Mahasweta Devi, Sarah Joseph, Anuradha Roy, Anita Desai, Kiran Desai etc. have raised an alarm against the immeasurable eco-destruction in India and their catastrophic effects.

Mahasweta Devi, a social activist, an environmental crusader and a voice of the voiceless tribal closely examines the communion of tribal people

with nature in her various works and the impact of environmental deterioration upon them. She initiates to expose the corruptive government agencies and capitalists' cruel motives behind ecological degradation as she shares her agenda a writer and an activist where she highlights her intense concern for the marginalized tribal communities in an introduction to *Bitter Soil* (1998) "I have not written these stories to please my readers. If they get under the skin of these stories and feel as the writer feels that will be reward enough" (Devi, 1998, p.x). Therefore, it is imperative to closely investigate Mahasweta Devi's short story collection *Bitter Soil* (1998). The present paper is an attempt to delve into Devi's short story collection *Bitter Soil*(1998) translated by Ipsita Chanda to trace the ramifications of environment decay upon tribal communities, marginalization of tribal by the mainstream people and ecological imbalance through the theoretical underpinnings of ecocriticism. Further, these short stories examine the contrast between the livelihood and sustenance of mainstream upper castes and the tribal. Devi's *Bitter Soil*(1998) comprises of four short stories entitled 'Little Ones', 'Seeds', 'Witch' and 'Salt', which fairly deal with the issues of environmental injustice and its effects on environs. They all explicate the despair of the tribal caused by their displacement from their vicinities, exploitation of tribal women by capitalists, patriarchal consumerism interlinked with caste based hierarchies in the villages of Kuruda, Toru, Hesadi, Murhai, Lohri and Jhujhar. The inhabitants of these villages bear the enslavement of government policies and capitalists agendas. Constructions of dams, mining projects, deforestation and pollution of streams and rivers have impelled the plight of tribal people living in these villages.

The short story 'Little Ones' is set in Lohri (Ranchi), which traces the exploitation of Aghariya tribe, by the government agencies and moneylenders. The land here is infertile and is considered a desert, "The area is a burnt-desert. As if the earth here bears a fire of unbearable heat in her womb" (Devi, 1998, p.1). Devi compares the land of Lohri to the mother earth, which bears a fire in her womb. Aagariyas are primarily iron miners and believe that their three demons, Lohasur, Kilasur and Aagaiyasur reside in the hillock. They revolt to the government's project of mining of the iron ore in their vicinity and eventually vanish into the forests, as Devi says, "the Aagariyas of Kubha attacked and cut down everyone. Then they vanished into the jungle." (Devi, 1998, p.5). The development projects led by government has turned out retrogressive and for Agariyas, violence seems the only way of rescuing themselves, as Vandana Shiva (2010) aptly asserts,

Development could not but entail destruction for women, nature and subjugated cultures, which is why, throughout the Third World, women, peasants and tribal are struggling for liberation from 'development' just as they earlier struggled for liberation from colonization (p.2).

Therefore, malnourishment and starvation has made them pygmies

“continuously on the run, not being able to eat, most of us are dead now”(19). They are considered as ghost or inhumane by the mainstream people of the Lohri village, “people say it’s haunted by asur-bonga ghosts. Those little ones fleeing with the sacks were not like human children” (Devi, 1998, p.9). The title of the story ‘Little Ones’ symbolizes the dwarfness of Agariyas due to a lack of nutritional diet. The only source of water for them is from the hole left by the hill blast where the rainwater gets collected in the monsoon,

“after the rebellion of Kubha village, the hillock was blasted out of existence, a deep hole left in its place. Water collects there in the monsoon, lasts all year long. That’s where the water is from” (Devi,1998, p.13).

Agariayas exhibit their vengeance upon government by encircling relief officer, “Like crouching animals. Violence in their stance. As if they’ll spring any moment”(Devi,1998,p.19). Devi here compares them to mere animals. Agariyas manifest their revenge through violent measures as they aspire to make mainstream people acknowledge their existence, injustice done to them and their environment as they say, “we are not kids. we’re the Agariya tribe from the Kubha village...their penises rub against him, reminders that they are men, adult, Indian males” (Devi,1998, p.20). They have been bearing the parallel exploitation of their land and body, “Our bodies have shriveled and shrunk from lack of food. The men can only piss, they cant’ get get it up any more. Women cant’ bear children, so we steal relief” (Devi, 1998,p.20). Devi compares the infertile men and women with the infertile land, which can’t bear anything. The capitalists’ failure to take into account the plight of tribal communities stimulates their starvation and malnourishment which has led to their transformation into pygmies as Devi asserts,

Starvation over generations can reduce ordinary sized human beings to pygmies. Of course, the starving Agariyas are savagely angry at a system under which some people eat three meals a day while they are forced to starve! For I believe in anger, in justified violence, and so peel the mask off the face of the India which is projected by the Government, to expose its naked brutality, savagery, and caste and class exploitation; and place this India, a hydra headed monster, before a people’s court, the people being the oppressed millions. (Devi, 1998, p.ix)

The second short story “Seeds” exhibits the catastrophic scenario of Kuruda and Hesadi villages. The land here is “ uneven, arid, sun-baked. Grass doesn’t grow here even after the rains” (Devi, 1998, p.23). The story unveils the exploitation of tribal by the landowners who offers them barren land to cultivate as well as by not providing them enough wages. The tribal, Dulan Ganju is the protagonist of the short story who is an agricultural labourer exploited by the moneylender, Lachman Singh. All the moneylenders and landowners have their links with government, as Devi posits

“the government belongs to Lachman Singh, Daitari Singh, Hanuman

Misra. If such a garment is fleeced by someone who happens to be a Dulan Ganju, then the villagers are bound to be full of appreciation”(Devi, 1998, p.32).

Lachman gives infertile land to the tribal for his dual benefit. On the one hand he has presented himself as a compassionate and on the other hand gets rid of barren and infertile land, as Devi correctly delineates“ The gifting of land has many uses. Barren land can be get rid of. The recipients are bought over. One’s position with the sarkar becomes stronger”(Devi, 1998, p.27). Distribution of the barren land is the root cause of the wide gap between the tribal and the capitalists. Therefore, Dulan wittily makes his livelihood by eating seeds that government provides them. Moreover, he collects fertilizer from the government and sell it off, as Sanichari, Dulan’s daughter-in-law says to Dulan’s wife, “ He takes the money. Collects the fertilizer and sells it at Tohri itself. Hoists the sack of seeds onto his shoulder and brings it home”(Devi,1998,p.31). Vinay Kumar Srivastava(2006) aptly documents the plight of tribal who are defiled bythe capitalistic agencies,

“alas, their hopes were belied when development programmes, instead of ameliorating their condition, displaced them to barren lands, jeopardizing their life support-systems, and making them perpetually dependent upon the state for doles” (p. 49)

Lachamn Singh sets fire on the Dushad quarters as Karan Dushadinitaites the tribal people to revolt, “ Fires rage, people burn, huts collapse” (Devi, 1998, p.35). The tyranny of Lachman Singh is revealed through the words of Dulan when Lachman buries karan and Bulaki under his fields,

How easy! Two corpses on horseback! And those corpses must have been carried off arrogantly, from right under the TamadihDushad’s noses. Lachman knows there’s no need to hide them. Those who see won’t say anything. They have read the warning in Lachman’s sharp, silent gaze. He who opens his mouth will die. This has happened before. Will happen again. Once in a while, it is necessary to send the sky with the leaping flames and the screams of the dying, just to remind the harijans and untouchables that government laws, the appointment of officers and constitutional decrees are nothing (Devi, 1998, p.36-37).

Aloe and putush bushes blooms on the land under which Lachman buries Karan and Bulaki. Dulan asserts that Karan even after being killed by Lachman is alive again through the aloe and putush bushes, “ Karan and Bulaki are now those putush bushes and aloe plants! Tears strain his eyes.Karan, you haven’t dies even in death”(Devi, 1998, p.41). On holi festival, Dhatua, son of Dulan after getting intoxicated sings a song of depicting their plight, “wWhere has Karan gone? And Bulaki?Why is there no news of them? They are lost in the police files. Where is AsrafiHajam? And his brother Mohar?” (Devi, 1998, p. 44).

In order to retaliate the ruthless deeds of Lachman, Dulan uproots the aloe and putush bushes and sows seeds and claims Dulan is trying to make his son, Dhatua alive again as he says “Is it right for only wild, thorny underbush to grace their graves? So I sowed paddy, you see, shoot, burn, houses, kill people. You’ve harvested enough”(Devi, 1998,p.55). Dulan at the end of the story revenges on Lachman by burying him under the stones on the same land where he has buried Karan, Dhatua and Bulaki as he utters, “so, malik protector, you’re like the disgusting Oraon-Munda? Buried under stones? A stony grave?”(Devi, 1998,p.56). Devi states at the end of the short story that Dulan has used the bones and flesh as precious fertilizer to reap paddy as, “what an amazing joy there is in the ripe green paddy nourished on your flesh and bones! Because you will be seed. To be a seed is to stay alive... Dhatua I’ve turned you all into seed”(Devi, 1998,p.58).

The short story “Witch” depicts the annihilation proliferated in Hesadi and Murhaivillages as the ecological imbalance is thriving into these areas. Moreover, it presents the villages as a famine and drought struck regions. Devi’s short story highlights the victimization of tribal women whereas she traces how tribal women’s body has been captured by the patriarchal system. The people of Kuruda village consider *daini* (witch) as the source of their all-encompassing plight, “The *daini* was searching for a home at the time. Everything that happened along with the famine is due to the *daini*...cattle are dying; ravens are tilting off branches and whirling down, dead. All because of the *daini*”(Devi, 1998, p.60). The concept of *daini* is initiated by the pahaan Hanuman Misra of Tahar to overshadow the heinous deed of his son who has raped a tribal woman for his physical hunger, as Misraji says that has had a dream in which he sees a woman as a famine, “

A terrifying, naked woman uttered the words, ‘I am famine’, before floating away on a blood-soaked cloud. According to the panjika, she is a *daini*. This *daini* has to be found and driven away. If she is wounded, if she bleeds, or if she is burnt to death, a terrible calamity will be visited upon them (Devi, 1998,p.61)

The *daini* is in reality a human but Misraji’s son has impregnated her and leaves her in the forest labeling her as *adaini*. Starvation has made her eat feathers of birds and visualizing this villagers eventually judge her as a *daini*. The women of Hesadi and Murhai village bear exploitation meted out to them by men due to the suspicion of being a *daini*, “ All husbands-fathers-brothers-sons were compelled to keep watch upon the women” (Devi, 1998,p.63). Particularly pregnant and menstruating tribal women are suspected of being witches, “The kith and kin of menstruating and pregnant women marked their movements with suspicion. Black cows, goats and dogs were stoned for their colour” (Devi, 1998,p.90). Vandana Shiva and Maria Mies provide enough evidence to the above mentioned facts in their book *Ecofeminism* (2010) when they assert,

The capitalist patriarchal world system has led to the destructive tendencies that threaten life on earth. This system emerged, is built upon and maintains itself through the colonization of women, of “foreign” people and their lands; and of nature, which is gradually destroying (p.2).

Similarly, tribal land is also deteriorated, as it has been struck with famine, “Murhai village suffers from endemic hunger-starvation-famine-drought-bonded- labour- mahajan oppression etc” (Devi, 1998, p.71). And inhabitants of these villages blame the *daini* for their plight. But in reality it is the repercussion of the coal mining, which has degraded the land, as the impurities of the coal mining are intermixed with rivers and streams, “These people have no niche in man-made economic cycle. Brick kiln-colliery-Bakaro steel-timber industry-railroad-crops, fields- everything has made them redundant-” (Devi, 1998,p.117). Understandably, the disaster, which has struck the Hesadi and Murha village, is man-made.

The short story “Salt” is set in the backdrop of Jhujhar village in the lap of Palamau reserve Forest. The tribals residing here depend upon forests for their sustenance, “the villagers are allowed to graze cattle and goats in the forest, and pick sticks and twigs off the forest floor for firewood.” (Devi, 1998,p.126).

Uttamchand is the *bania* and moneylender of that village who outlaws the fundamental right of existence of the villagers by refusing to sell salt as he says “not by hand, or by bread, *nimak se marega*” (Devi, 1998, p.126). RajshreeTrivedi(2020) asserts that biological egalitarianism should be adhered to balance the ecological cycle,

“mutual co-existence and harmony are what the planet has offered unconditionally to all the species on the earth and the penalty for invading each other’s terrain or exploitation of resources is death which is the end of all agonies” (6).

The only road that connects the Jhujhar village to the rest of the world is a footpath. And treading on that a youth team comes to rescue tribals from the clutches of Uttamchand. Since PurtiMunda is one of vocal personality of the village the village elders decided to organize a puja at Haramdeo’s shrine and askshim to sell their two pet chickens to the forest guard and bring salt. The forest guard offers them a dark lumpy salt used by animals to lick, “It’s for the elephants and deer-what do they care about black or white? “ (Devi, 1998,p.132). Devi here tries to argue that the animals are better off than the tribal people. Purti despite of the elephant piss collects the salt-earth and return home. Ekoa, the banned elephant witnesses Purti and his fellows stealing salt-earth from the forest. So, he revenges on Purti by smashing him, “ When Purti turned around, it seemed to him as if the ancient Palamau fort itself was coming towards them” (Devi, 1998,p.145). The theft of salt-earth by Purti and fellows seems incomprehensible to the daroga as why would they steal salt

which is the cheapest commodity, “This matter of stealing salt-earth is so incomprehensible! A thing as cheap as salt!” (Devi, 1998,p.146). The above-mentioned incident throw light on the fact that it is inevitable to protect the ecology and even wild animals from the heinous motives and greed of humans.

Understandably, all the four short stories, ‘Little Ones’, ‘Seeds’, ‘Witch’ and ‘Salt’ have an undercurrent of ill humane treatment of natural resources that mother earth withholds in her womb. Greg Gaard(2004) claims that men when rape mother earth is actually plundering his environment for his greed, “ Gaia is well beyond our capacity to ‘destroy’- although we are making it horrible uncongenial for ourselves, our symbionts and other organisms we love” (p. 205). The short stories trace the ecological deterioration done by the flag bearer of development. All the short stories project the victims as tool for raising an alarm against the injustice done to their communities and their environment. The Aghariya tribes revolt against the mining of their hillocks, Dulan wreak vengeance upon Lachman Singh by burying him under the same land where he has buried his son and fellows. Moreover, he also initiates to grow plants onto that land to symbolize their existence. The witch in the short story “Witch” protests with the pelting of stones upon the villagers whenever they as she finds solace amidst nature when abandoned by the world. Perti and his fellows also tried to take an action against the moneylender by waging a revolt against him collectively with other tribal. Mahasweta Devi has intermingled her fictional word with some tints of historical facts, oral folklore of tribal, narratives and mythological facts. Devi with the portrayal of her such powerful short stories projects herself with moral and social responsibility to awake the ecological consciousness in her readers. Moreover, she has depicted her intent behind the select short story collection to necessitate the shift from anthropocentrism to biocentrism as it the need of the hour to maintain ecological balance.

**Abstract:** Desires are the ontologically independent of action, because they are non-trivial explainers of action. The desire theory clings to the fulfillment of desire that confers to one's happiness. Desiring is a state of mind that is commonly associated with a person, with the desire tends to act in certain ways, feeling and thinking in certain ways. In theories of desire, there are six types known as Action-Based, Pleasure-Based, Good-Based, Attention-Based, Learning-Based and Holistic-Based theories are researched. Based on these theories, Action-Based and Pleasure-Based theories are taken hold of and they are to be inquired after Adah in Buchi Emecheta's *Second Class Citizen* for Action-Based and Raka in *Fire on Mountain* by Anita Desai for Pleasure-Based theory.

**Keywords:** Dreams, education, desire, fire, domination, loneliness

Action theory considers issues such as motive, desire, purpose, deliberation, purpose, decision, intention and freewill. In Ludwig Wittgenstein's formulation, 'what is left over if I subtract the fact that my arm goes up from the fact that I raise my arm?' (Wittgenstein, 621). Action-Based theory

recognizes that action can be seen from three perspectives; social meaning, internal process, that is, the cognitive and emotions that guide and steer action; and the specific behavioral elements that actually comprise the external behavior, including language. Action are embedded in context, the person's engagement with circumstances with his/her own life and more specifically the joint actor's agentic engagement with circumstances of their life together prove to be crucial. Adah, in *Second Class Citizen* by Buchi Emecheta, is lauded by African culture. When she has a desire to go for schooling, it becomes greccue. When her inclination is viewed to be a sort of extrorse, her cognition and emotion propels her to go for schooling which she believes may bring an eleutherian existence.

Adah, being an African girl, this 'what-d'you-call it' is knocked backed. But, she has become 'jacelynn' to get her desire fulfilled through her actions. To her, African culture is donjon, and she finds it very difficult to disengage from it. For that, she has to call to arms her andragathia. Adah, a girl of subteen, hankering for going to school and to get her degree. Her culture forbids her to go to school, this desire is observed in the following lines, "The dream has by now assumed an image in her mind, it seemed to take life, to breath and to smile kindly at her" (Emecheta, 19). As a young child Adah, like any other child, likes to learn the skills of reading, writing, and the ability to think critically. Normally, school refusal usually goes along with disorders like separation, anxiety, depression or panic disorder. Cognitive behavioral therapy and exposure therapy are used to treat school refusal. But in the case of Adah, she has no such problems and as a normal child she is ready to have full of joy and laughter with other children and it is clear that only cultural belief proves to be a set back to her education. Some of the cultural customs, which deny her going are her early marriage, her denial of going to school, and this is observed by the writer in the following lines. "Adah's schooling would have been stopped, but somebody pointed out that the longer she stayed at school, the bigger the dowry her future husband would pay for her" (Emecheta, 17). African parents use certain phrases to convince their children, when they are reluctant to get married. They are a) You will grow up to love him, b) He will train you through school, c) He will take good care of you, d) The family needs money to survive. Adah knows pretty well that these phrases may never happen because she may be quickly put into enceinte to either frustrate or abandon her ambition and her dreams. In order to escape from monterious existence, she has applied for her admission to school without the knowledge of her parents. To her, leaning is not a plisky.

It is a matter of seriousness and desire. Her inclination of having proper schooling is reminded, when a comfed beneficiary from Zambia puts it 'if you are not educated, you are nothing'. Though Adah has inclination to have education, she is reminded of gender inequality, which comes as a sort of imbrication to her. It permeates all tears and level of living and learning. When patriarchal dominance is internalized in schools, it impedes African

girls to grow. This is observed when Adah has applied to school, “Immediately a group of three or four tough-looking boys came out from the back row and the biggest of them all swept” (Emecheta, 20). So it is clear, culture under the pretext of patriarchy callates Adah. It enlases her to have headway towards success in her life. Still, her tobbe proclivity extricates her from tychism. Fortunately, her lear at Methodist girls school takes her to a point where her desire has come true. This is observed by the writer about her success in the following manner.

She was very happy at the Methodist girl’s school...she was going to continue her education, she was going to go to Idadan University to read classics and she was going to teach at the end of it all. There was one thing she had not bargained for. To read for a degree, to read for the entrance examination, or even for more “A” levels, one needed a home. Not just any home where there would be trouble today and fights tomorrow, but a good, quite atmosphere where she could study in peace. (Emecheta, 23)

If Adah has Action-Based desire, Raka in *Fire on the Mountain* by Anita Desai may be intercalated her into Pleasure-Based young girl desire. Pleasure principle is the driving force which seeks immediate gratification of needs, wants, and urges. Galen strawson in his *Mental Reality* highlights two grounds in the following manner:

Galen Strawson defends a pleasure-based theory on two grounds: first, Strawson holds that being a desire *for* anything (or being a belief *about* anything or otherwise exhibiting intentionality) requires consciousness, and pleasure and displeasure are the states of consciousness most closely linked to desire. And second, Strawson holds that it is conceivable that there be creatures who would lack dispositions to act but who would have dispositions to feelings of pleasure and displeasure and that these creatures would seem to have desires for the things that would please them. (Strawson 1994).

Raka, who comes under second category of Strawson, is like young creature wants only one thing. She is to be left alone and pursue her own secret life as an eremitic, and is always guided by her instincts. She is viewed by the author ‘an impatient kernel, small, and explosive’. When her grandmother Nanda Kaul sees her for first time, she is benumbed by her appearance. This is observed in the following manner “One of those dark crickets, That leap up in fright but, Do not sing or a mosquito, Minute and fine, on thin Precarious legs” (Desai, 39). But, Nanda Kaul conceives that Raka has a mind of her own. She has a peculiar desire of reconnoitring ravine’s jackals prowl. Further, she goes on to unknown and mysterious expedition on her own and she broods over strange landscape silently and ignores the people around her. Raka visits carignano, and the unexpected arrival of Raka to this place comes in the way of desire to live like a recluse, far from the society. She does not want to involve herself in any responsibilities anymore. All she wants is to be alone, to have carignano to

herself. She wishes to entertain two: one is stillness and another one is quietude.

To Raka loneliness is not a pain. In fact, her transient loneliness is related to positive effects, including an increased focus on strength of relationship with her grandmother. Even Nanda, her grandmother, acknowledges this fact in the following manner, “Raka, you really are a great grand child of mine, aren’t you? You are more like me than any of my children or grandchildren. You are exactly like me Raka” (Desai, 64). Raka does not wish to go through any duty or obligation, like school discipline and obedience. She rejects everything and the very idea of disciplined life is odium. Nada herself wonders about her desires for rejection and loneliness. “At this total rejection, so natural, instinctive and effortless when compared with her own, planned and wilful rejection of the child.” (Desai, 17). To Raka, exploring ravine is a sort of benefit in terms of intellectual, social, emotional, and physical domains. The natural world of carignano is a sort of giant, open-ended learning laboratory to her. Nature provides too much for her to discover and interacting with natural environment. It also allows her to learn by doing and experimenting with ideas. In nature she thinks, questions and make hypothesis there by developing inquisitive mind. Raka, is a type of young creature, expresses her writ large desires openly. To conclude, desire provide any human being to share his/her dreams. They are expressed by the terms like wanting, wishing, longing or carving. Desire motivate a person with belief about which action to realize it Bernard William designed this desire approach and has brought out deliberating rationally. It is to deliberate one’s options. On the desire based view, if I can either go for a walk or bake a cake and after rational deliberation, I used to go for a walk, I thereby have a reason to go for a walk. Such is in the case of Raka, when she has to go in for a school or exploring nature, she has opted for exploring nature, which she has felt more conclusive for her to grow. Desire is very important to person’s well-being rather than perception or actuality. Thus, Adah and Raka have desire to attain their goals. Adah’s desire for schooling and Raka’s desire for roaming in ravines are nothing but their options or choices or preference among options. Being rational, though they are young, their preferences are consistent and allow themselves to determine the expected utility of the choices, or options given to them. The expected utility of action, in turn, is a kind of pleasure to them. If the utility is treated as pleasure, then decision theory is compatibility with any theory of desire, that hold pleasure to be the only thing desired. Both Adah and Raka have taken seriously choice worthiness and their desires hold as belief have brought to them a kind of solace.

**Abstract:**

Employees are the most prized belongings for the organization and the existence of organizational culture has been proven to influence employees' career growth and the development of an organization. Motivational empowerment is influenced by the culture of the organization. Because it demonstrates the relationship between motivational factors and employee behavior. Employees are more fulfilled when they are given the framework to use their expertise to help the organization achieve its objectives.

A relationship-based approach and a value orientation are essential for those organizations whose core strength is human resources. Understanding the motivations and behaviors of organizations and employees who work within them is impossible without taking values into account. Organizational success depends on employees and their organizational selves being in balance.

Organizational Culture for Organizational Commitment when organizational values and goals align with their own, employees are happier, perform better, and are less likely to leave the company. The purpose of this research is to explain to the theoretical model the relationship between organizational culture and employee motivational empowerment with the necessary support of a positive organizational environment.

**Keywords:** Organizational Culture, organizational values, Motivational Empowerment

**Introduction:**

Employees coming from varied societal cultures have to accept one culture, which is organizational culture. Organizational culture can be defined as the glue that ties an organization together. Moreover, the improvement of an organization depends on how effectively and efficiently the employee perform. Employee behavior within an organization is defined as culture, as is the meaning that employees attach to those behaviors.

Barney (1986), defined "Organizational culture is defined as a complex mix of values, beliefs, assumptions, and symbols", and it determines the manner in which the organization performs its functions. Sinha (1990), defined "something that projects its employee's way of life and is a total of their heritage, tradition, and pattern of living."

Motivation is defined as a person's willingness to put effort into achieving organizational objectives. Furthermore, the word "motivation" comes from the word "move." It can be defined as an inner psychological state that initiates and guides an employee's behavior. It motivates us to take action. It exists within us at all times and is externalized through our activities.

Employee empowerment refers to a concept, attitude, or set of organizational and behavioral practises in which a corporation gives employees decision-making or approval authority (Pinchot, 2000). Empowerment refers to a collection of principles that empower self-managing teams and people to take control of their careers and futures (Pinchot, 2000).

Employee empowerment is among the most effective strategies for increasing the motivation of employees, their commitment to the organization, and their work satisfaction, and much research has gone into it. Empowerment encourages professional growth in terms of knowledge and skills, self-efficacy, and achievement, as well as lowers turnover among employees. The study to explain the relationship between organizational culture and motivational Empowerment of employees and their intention to quit carries relevance because job satisfaction is the basis for quality work.

- Organizational culture flows onto new employees through the procedure of socialization.
- Organizational culture determines the behavior at work.
- Organizational culture functions at different levels.

Organizational culture is an estimator of employees' effectiveness, efficiency, and work performance. The competing values framework differentiates organizational cultures in different organizations based on two significant factors: structure and focus. The structure ranges from flexibility to control. This aspect defines the difference between organizations based on either controlling the employee's actions in organizations or allowing flexibility to their workforce. The second factor, focus, is concerned with either an external or internal focus. An internal focus emphasizes internal factors such as

employee satisfaction, whereas an external focus emphasizes its relationship with the external environment. Based on these two dimensions, organizations can have various types of cultures such as the clan (promotes family orientation), adhocracy (opportunities towards creativity), the market (promotes competitiveness), and hierarchy culture (emphasizes on norms). Organizational culture facilitates proper communication and coordination gives a competitive advantage. Culture in terms of an organization refers to perception about an organization, its authority system, and the degree of employee involvement.. The preferred organizational cultures have been researched to differ across private and public organizations(Ramachandran, et al., 2011). The literature on culture types provides insight into achieving organizational goals by creating a strong culture (Ramachandran, et al 2011). Initiating, guiding, and maintaining goal-oriented behaviors is known as motivation. It is also the motivating factor behind human behavior. There are two types of motivation: intrinsic and extrinsic.

- 1- Extrinsic motivation is when a person is stirred by anything outside of himself, such as prizes, money, social recognition, or praise.
- 2- Intrinsic motivations arise inside the individual, and stimulation initiates adopting or varying behavior for personal satisfaction or fulfillment.

Thomas and Velthouse defined motivational Empowerment as increased intrinsic task motivation for fulfilling assigned tasks to the employees. They described four dimensions; competence, impact, meaningfulness, and choice. Spreitzer (1995) found that these components created a sense of empowerment discussed in various subjects such as psychology and management and is said to affect motivation, task performance, leadership, group processes, decision-making, and organizational design. The socio-structural perspective on empowerment views empowerment as being dependent on dimensions of the job, team design, and procedure and organizational policies (Maynard, et al. 2012). The motivational perspective is related to Bandura's work on self-efficacy and focuses on cognitive states. According to Zimmerman (1995), motivational Empowerment has three components:

- 1) There is an intrapersonal component, which involves cognitive evaluations.
- 2) An interaction component made up of crucial skills and knowledge
- 3) A behavioral component, which includes change-oriented, participative activities.

In an organization, employees with high motivational Empowerment are more confident in conceptual skills, abilities, assigned duties, and thinking abilities and have a more significant impact on organizational performance (Singh, 2019). Employee retention and job satisfaction have been researched to find that it is impacted by employee autonomy, Empowerment, organizational vision, leader's support, job security, and work environment. However, employee empowerment and retention have not been researched to the extent that employee empowerment and retention have been researched in the context

of a few business organizations. There is a dearth of literature on motivational Empowerment in organizations. This is why this research will bring to light new perspectives on motivational Empowerment in an organization and the main focus will be on the nature of motivation.

Asmawi and Mohan (2010), Organizational surroundings or climates can enable or inhibit employee empowerment. Various researchers have studied the empowerment of employees and suggested situations that have a vital role in the implementation of management and employee empowerment. A culture that encourages lightness and self-sufficiency with rewards for more participation is better suited to employee empowerment. Person – job fit framework explains the concept of organizational culture on motivational Empowerment. Various types of culture have various impacts on motivational Empowerment. Some researchers examined the culture at engineering colleges to determine its impact on the employees' intrinsic motivation (Sekar, P.C. and Narayanan, S.S.,2007). The study by Pradhan, Panda, and Jena(2017) has shown that Motivational Empowerment has a good impact on organizational commitment. As a result, researchers must focus more on different forms of organizational culture to determine the one that can boost the motivational Empowerment of the organization's overall management. Similarly, many researchers have observed the relationship between organizational learning and motivational Empowerment (Bohluli, 2004; Hashemi,2006). There is an information break regarding the relationships between organizational culture and motivational Empowerment, especially overall organizational performance. Therefore, this study is a theoretical-based model to define practical insights into the working culture in the organization.

This conceptual framework explains the inter-relate relationship among the variables. The relationship among the variables has been designed upon the sub-factor of organization culture, types of motivational empowerment, and the results of previous studies analysis of the relationship between culture, motivational Empowerment on employee retention.

Governance refers to the system that directs and controls organizations. It is concerned with the structure and processes used at the top of an organization for decision-making, accountability, control, and employee behaviour. Organizational strategies, forms, and practices are influenced by governance. The impact of governance on organizational forms and strategies, as well as interpersonal connections and organizational employee psychological states.

Culture can be attributed to reward systems, which are the processes by which incentives are distributed within an organization. The reward system conveys the standards and practices that employees should follow. On the other hand, it expresses the institutional response that employees can expect depending on their actions. Institutional Values, Institutional strategy, Institutional leadership, Governance and Reward are significant components of an organization's culture, and these values, strategy, leadership, governance and reward system are implicit determinants in maintaining and expressing

organizational cultural orientation at all levels. It is reflected in the overall quality process of the organization and becomes a determining factor in increasing employee retention. In an organization, organizational culture is valued.

Employee empowerment improves employee retention through intrinsic motivation, competency development, self-belief, perception of status, and work meaningfulness. These factors contributed to employee motivational empowerment. Organizational culture can be a powerful stimulus for Empowerment because it describes the link between culture factors and employee work behavior.

The integrated framework represents the interconnectedness of organizational culture and employee motivational empowerment that leads to employee retention.

**Conclusion:**

This paper describe the relationship between organizational culture and employee motivational Empowerment in various aspects . After a thorough review of the literature and research background, essential connected components of employee motivating Empowerment (**Intrinsic** motivation factor, Competency Development , Self-belief , Perception of status , Work meaningfulness )and factors for organizational culture (Institutional Values,**Institutional** strategy, Institutional leadership, Governance, Reward)are identified. Based on these primary dimensions a simple conceptual model has been provided. The relationship among the key independent and dependent variables, organizational culture and employee motivational empowerment, and the relationship between the dimensions of these independent and dependent variables, is clearly shown in this basic model. Motivated Employees are passionate about their jobs and play a significant role in the organization. When employees are willing to participate in organizational activities and enjoy their work, it is a positive indicator for empowering the organization. The relationships between organizational culture and employee motivational Empowerment is indispensable for any organization. This suggests that organizations support self-belief, perception of status, and provide intrinsic motivation to employees connected to the institutional values, strategies, governance, and reward systems that positively impact employee retention. Employee retention can be improved by constructive and effective organizational culture, which also provides a framework for the guidance of employees in an organization. Management is highly advised to create a supportive environment in every section of the organization to empower employees positively.

**Abstract**

The novel *Half of a Yellow Sun* set against the Nigerian Civil War is the second novel of Chimamanda Ngozi Adichie. The author captures the horrifying experiences of the Biafra war on its civilians. The novel is the winner of the 2007 Orange Broadband Prize for Fiction. The Biafra War which began on 6<sup>th</sup> July 1967 hinders the normal life of the people and also leads to mass killing. The premises are based on the philosophical theory Aggressionism and the Latin proverb *Homo Homini Lupus* meaning 'man is a wolf to a man'. The multiple conflicts in Nigeria led to aggressionism and the predatory instinct in man brought about the Nigerian Civil War. The author Adichie has thus captured violence, trauma, and sufferings in the novel that happened due to man's inhumanity. The paper explores the various sufferings

due to aggressionism faced by the five main characters Olanna, Kainene, Odenigbo, Ugwu and Richard during the war and its intensity which is felt even after three generations.

**Key Words:** Chimamanda Ngozi Adichie, Biafra War, Aggressionism, Homo Homini Lupus, predatory instinct.

Chimamanda Ngozi Adichie is a renowned Nigerian writer who grew popular globally through her novel *Purple Hibiscus*. Her second novel *Half of a Yellow Sun* gives a graphic representation of the Biafra War entwined with fiction. The novel unveils the horrendous effects of the Nigerian Civil War and the mass slaughtering of the Igbos in particular. This Genocide fiction demonstrates the political conflict and its implications that caused a huge catastrophe in Nigeria, where religion acted as a catalyst. This resulted in the Nigerian Civil War or the Biafra War that lasted for almost two and a half years and destroyed the lives of millions of civilians physically, mentally, and emotionally. Numerous families and relationships were wrecked in the course of the war and underwent humongous suffering and trauma.

Homo homini lupus est, is a Latin proverb meaning "A man is a wolf to another man," used by Plautus in his *Asinaria*. The proverb was later employed by Thomas Hobbes in his *De cive, Epistolae dicatoria*. A wolf is primarily intelligent, complex, cruel, aggressive, inhuman and predatory in nature. Human beings are compared to a wolves and situations relating to this are visible in the novel *Man Is Wolf to Man* is a popular memoir by Janusz Bardach once again the name is derived from the Latin proverb Homo Homini Lupus est that captured the events that took place during the World War II. The book voices out man's brutality to man. On the other hand, Aggressionism is a philosophical theory which claims that the only reason for war is human aggression, particularly wanting to attack members of one species.

While analysing the term aggressionism from a psycho analytical point of view, Freud claims that all homo sapiens from birth possess two basic drives that adds to personality development and behaviour: one Thanatos – the drive for aggression and the second one Eros- the drive for pleasure. Human beings were created basically to maintain peace and harmony in the world but Thanatos or destructive energy develops aggression towards one another. The nature of fighting in human beings is universal and this nature of fighting has been spoken widely in history. Then the question of peace is still debated largely because when there is a war then peace has to exist. When one fights it is natural to turn aggressive either against another or a group.

Taking all this into account the paper examines the genesis of the Biafran War that was fuelled by the aggressive behaviour of the

Nigerians and ethno-religious conflict. The paper applies horizontal analysis viz *Homo Homini Lupus* meaning “A man is a wolf to another man,” and the intensity of aggressionism that triggered the Biafran War. The paper along with aggressionism focuses on the cruelty and inhuman acts performed during the war.

The novel *Half of a Yellow Sun* written by Chimamanda Ngozi Adichie is set during the Nigerian Civil War. The war was fought between the Government of Nigeria and the secessionist state of Biafra (1966). Although Nigeria gained independence from the British, they were still under their influence which was detested by the Northern Nigerians. North Nigeria and South-East Nigeria clashed in their ideals which led to political, economic, religion and cultural strife. The tension created by the ethnic groups gave birth to Nigerian Civil War or the Biafra War that resulted in millions dying on both sides. War is an expression of the aggression instinct. It is unavoidable because humans have an inborn need to satisfy their aggressive urges. Peace is an aberration, a temporary period between wars. War has always been, and hence it will always be, with us (Adichie, 11). The Nigerian Civil War was of ethnic, cultural, political and religious conflict. South-East Nigeria, occupied majorly by the Igbos were comfortable in their new self and did not want to go back to their roots while Northern Nigeria wanted to undo westernization. There were also some traditional Igbos who still practice traditional Igbo culture and rituals.

Both the regions had multiple reasons for the war and it was complex in nature. Thus, both the regions stood at cross roads and men sought to resolve the problem through war. The novel captures the beastly nature of human beings wanting to hunt down each other inhumanly. Adichie through the eyes of Olanna, Odenigbo, Kainene and Ugwu draws the reader's attention to the 'wolf instinct' in human beings which was unleashed during the Nigerian Civil War. The author herself is an Igbo who revisits the Biafran War through the experiences of her grandparents and parents.

The root word of Aggressionism is aggression. According to Berkowitz (1993), aggression refers to goal-directed motor behaviour that has a deliberate intent to harm or injure another object or person (Berkowitz, 8). The Northern region held on to its ideal of cleansing the colonial residue which led them to slaughter the South Easterners who refused to give in to them. Similarly, a wolf fights for its territory and human beings too fight for territories to mark and maintain their identities. The Igbos were forced to retaliate to protect their land, family, children etc. Therefore, in protecting and defending their territories both the regions in Nigeria began to fight.

The novel shifts in time gradually revealing the tension between the two regions the North and the South through the character Odenigbo. He is a professor of Mathematics at Nsukka University who educates the house boy Ugwu about the rift happening between North and the South Nigeria which gives the readers a glimpse of the commencement of the Nigerian Civil War.

The author encapsulates the aggressive behaviour of man from the beginning to the end of the novel where each region combats cruelly massacring each other. Olanna witnesses the beastly killing at Kano where she finds her uncle Mbaezi, Auntie Ifeka and pregnant Arize slaughtered mercilessly. The author maps the aggression involved in killing Arize who is gang raped and her belly is cut open and hunted down by religious fanatics. The beastly act haunts Olanna throughout the novel and she is unable to forget the gory incident. She stopped when she saw the bodies. Uncle Mbaezi lay facedown in an ungainly twist, legs splayed. Something creamy-white oozed through the large gash on the back of his head. Auntie Ifeka lay on the veranda. The cuts on her naked body were smaller, dotting her arms and legs like slightly parted red lips. (Adichie, 147)

Millions of civilians are inexorably slaughtered in the Biafran War and many remained homeless as the soldiers burnt down their houses. Women undergo sexual harassment and bodily torture where women are raped and killed. Aerial Bombardments and Olanna's frightening experience on the train turns into a nightmare as she has witnessed many wounded Igbos terrified and shocked. They sit down soaked in blood and urine amidst the putrid smell in the air. Olanna watches the traumatising scene in silence and shock only later to witness a severed child's head dripping with blood in a calabash. The scene marks the beginning of the Nigerian Civil War and Olanna's panic. The violence against the Igbos is undoubtedly a genocide. The dark incident makes Olanna undergo a temporary paralysis and an episode of 'Dark Swoops'.

Everyday around 3000 to 5000 people were killed during the Nigerian Civil War. Adichie captures the rawness of the horrifying killing in the airport which is witnessed by Richard, a white journalist. He is shocked by the way they are blown up with guns splattering blood leaving the chests ridden by bullets. The inhuman act exercised on the innocent civilians is heart breaking to read. Similarly, the cruelty of war is elucidated in Chinelo Okparanta's novel *Under the Udala Tree* where the author states that "Of one Mr. Njoku, an Igbo man who was tied up with a rope, doused with petrol and then set on fire" (Okparanta, 14).

The iconography of inhuman act during the Biafran War evokes terrible pain and trauma in the readers. The aggressive act of blocking food supplies and stealing food turns everyone into a zombie which is an act of inhumane savagery. Many are killed due to starvation and especially children die of malnutrition Kwashiorkor. Kainene tries to feed the Biafran babies with protein tablets but she runs out of stock and is deeply saddened that she will not be able to save the children. The Refugee camps functioned rarely and mostly the supplies are ransacked by the vandals or by the Biafran soldiers themselves. The predatory instinct in human often surfaced which is evident when Olanna's meat tin can is snatched away by four soldiers. Olanna is unable to fight with soldiers as she has no physical and mental strength. She is frustrated that she is unable to fight and returns home empty handed. The men

pulling out food is a mere act of survival yet it reflects the predatory instinct in human beings. The soldiers' forces Ugwu participates in a gang rape which he regrets later in the novel.

Jo Groebel, Robert A. Hinde claims that 'Violence is the result of the aggressive drive' (Groebel, Hinde, 11). Violence involved in killing each other has no boundary which is visible during the aerial bombardment that wiped away thousands of people from the land. People constantly live in panic and uncertainty as they are not sure of when the air raids would happen. Kainene while fleeing from Port Harcourt witnesses her house boy Ikejide's body running headless after a piece of shrapnel cut off his head the incident leaves her shell shocked. Adichie's narration of the horrifying incidents through her characters voice out the intensity of aggressive behaviour that inhumanly took away the lives of the innocents. During Olanna and Odenigbo's wedding an air raid happens which leaves Ugwu with deep anguish as he witnesses a half burnt naked woman's body. The novel collectively speaks about the predatory instinct in human beings wanting to constantly kill each other. Ugwu recalls "A car was on fire; the body of a woman lay next to it, her clothes burnt off, flecks of pink all over her blackened skin, and when somebody covered it with a torn jute sack, Ugwu could still see the stiff, charcoal-black legs" (Adichie, 203).

Glassman claims that human aggression is an instinctive drive, one that springs from the person rather than the situation, and is therefore an unavoidable part of human life (Glassman, 2004). The saga of aggressiveness seems to run throughout the narration of the novel. The harrowing experience is portrayed through four characters belonging to different backgrounds. From Ugwu's narrations one gets a glimpse of the ghastly impact of being a soldier in the war. He is left perplexed by the harsh treatment that he experiences in the hands of his fellow soldiers "The skinny soldiers—with no boots, no uniforms, no half of a yellow sun on their sleeves—kicked and slapped and mocked Ugwu during physical training" (Adichie, 359). Ugwu is also forced by his fellow soldiers to indulge in a gang rape which he regrets immediately and feels ashamed of his behaviour.

He recalls how soldiers abducted children to work on the yam fields and when the children returned, they had huge cuts on their palms. Olanna is always cautious of her baby and her household boy Ugwu as she feared that they might be kidnapped. Soldiers exhibit their aggressiveness in the market place which is usually packed with women and children and they butchered them hard – heartedly.

Even after the war has ended the aggressive nature of the soldiers did not subside. When Odenigbo's family is returning to Nsukka they are stopped by the soldiers. The soldiers act barbaric they slap Odenigbo so hard on his face that he falls on the car and it so violent and unexpected. Likewise, a fragile man comes driving his car behind them is also stopped and is made to lie on the burning coal tar road and is flogged. "Lie down," the officer said.

The man lay down on the coal tar. The officer took a long cane and began to flog the man across his back and buttocks, ta-wai, ta-wai, ta-wai, and the man cried out something...” (Adichie, 417)

To conclude Aggressionism and the Latin proverb *Homo Homini Lupus* has been used to examine the effects of the Nigerian Civil War on the civilians. The novel vividly captures the predatory instincts that tears down one another in the cruellest way inflicting pain and suffering on each other. Human beings have become the victim to political aggressiveness and thus undergo traumatic experiences due to inhumaneness. The war has not been easy it has killed people in large on both sides thus the disaster has come to live in history books. Bloodshed, shelling, famine, blockades, Sexual harassment, Kwashiorkor tampered peoples’ living. This paper has tried to explore human beings’ aggressive behaviour and its implications in the Nigerian Civil War. In a similar way man becomes a wolf to another or to put it in a simpler way the predatory instinct is left untamed at times which results in inhumane acts, massacres and blood bath. Adichie in her discourse has thus highlighted the aggressive behaviour of human beings which results in unwarranted genocide.

**Abstract:**

Dalit Literature is the literature of the oppressed people, telling about their pains, agonies, disappointments, defeats, humiliations, oppressions, and depressions. It also speaks about their vibrant culture, dreams, and values. Convictions and their struggle for the annihilation of caste was carried out in order to build a casteless society. Like all writers, Dalit writers too have a cause and an agenda for their writing. This is because a Dalit writer faces more difficulties than writers belonging to the other castes, owing to their subaltern position with society, and especially, Dalit women confront more troubles than their male counterparts. Imayam is a prominent Indian novelist in Tamil, who has received several awards for his writings. The characters in *Beast of Burden* and *Arumugam* speak of their condition, sufferings, and struggles and the pain they undergo comes out through their speech. The present paper is an attempt to examine how dalits are represented in the society and the identity crisis faced by the Dalit people in the Tamil society as reflected in the works of Imayam, as he is using not his language but the language of his characters.

**Keywords:** Subalternity, marginalization, objectification, caste structure, subjugation.

Literature is a camera that captures not just moments but also emotions. It reveals the reality in its true colours, immersing people in nostalgic

occurrences and also mocks at the repercussive episodes. Dalit literature reverberates the melancholy of the marginalized, echoes the cries of oppressed women, demonstrates the plight of the destitute, marks the identity crisis of the anonymous people and records the revolution of the rebels. Significantly, the inceptions of Dalit's works should be pulled in the battle for social and financial change. This clarifies all parts of profound thought in Dalit's books. The Dalit writing is firmly identified with the expectation of the freedom for a bunch of individuals since they are not the casualties of social and financial disparities.

Caste ideology operates at a deeper level and the dynamics of caste and Dalit issues are closely linked with our ideas of identity and self. All Dalit writers in India wish that the people in India should show empathy with the pain of a Dalit. But to experience the pain of a Dalit what is needed is to unlearn the typical and usual response that we give to the lived experiences of a Dalit. And unlearning anything is the most difficult thing, especially when a society has to unlearn something. Iyamam, a major Tamil Dalit writer, suggests how Dalit women are forced to be used as commodities in order to hold off poverty and help themselves and their dependents to survive, in most of his novels. Ignorance, sexual harassments, poverty, anger towards rites and rituals, injustice and slavery are the main themes of Dalit Literature. These themes were also focused on Iyamam's novels. The explanations behind the utilizing realities are evidenced that, Dalit writers can uncover human suffering on the planet through their writings. The works crafted by Iyamam shows this point well.

Iyamam's novels *Koveru Kazhudhaigal (Beasts of Burden)* and *Arumugam* foregrounded the dominance of a particular Dalit communities often resulting in a duplication of the hegemonic caste structures of Hindu society among dalits and how this has percolated even among Dalits who have converted to Christianity. Iyamam's novels received hostile criticism on account of their critique of Parayar's dominance over Dalit communities who stand further way below in the caste ladder.

The novel *Beasts of Burden* is considered as one of the classic of modern Tamil literature especially in Dalit writing. The first and foremost striking feature of this novel is the portrayal of delicate caste structure among Dalits. Both the novels *Beasts of Burden* and *Arumugam* have one common feature that is sexual harassment to women by the upper caste. Iyamam's *Beasts of Burden* (1994) portrays Dalit communities, their lives, their culture and their legislative issues. In this novel, Iyamam depicts the predicament of lower-caste people who fall into double subjugation in the society. Iyamam criticizes the lower caste people who become counterfeit and battle against the individuals who are viewed as subordinates among Dalits.

The title *Koveru Kazhudhaigal* means 'mules', which have been utilized by the washer men to wash garments. It ironically refers to the washer men community and their predicament. This story is about the Poothurai

Vannaar Catholic family, who works among farming labourers in the Dalit province. The mules have the responsibility of carrying, which is a beast of burden. The story also depicts the economic changes occurring in the progress of the novel and developments taking place in the village, which are seen throughout the perspectives of the protagonist, Arokkyam. This story accentuates the monetary change achieved by the continuation of the novel and the advancement of the seventeenth town, just as a significant indication of the sufferings of washer men's community and the exploitation they meet within their own community.

Representation of Dalit women is an integral aspect of Tamil Dalit Literature in terms of space and voice granted to Dalit women characters. Dalit women characters are portrayed as lively, vibrant, earthy, witty and hard-working women who have inner strength to face crisis and work tirelessly at home and outside. Their songs, dances, community cooking at weddings bring out their innate talent. Imayam's *Beasts of Burden* carries within itself the grief and pain of the Dalits. Imayam has beautifully captured the ringing poignancy, the trials and tribulations of a washer woman, Arokkyam, who is trapped between the dilemmas of changing times. The vannaathi woman, Arokkyam, washes the clothes and serves the colony where the Dalits live. The novel discloses the intra-Dalit strife and the sorrows of the lowest of the low-born. Arokkyam's dilemma within changing systems of belief about the self and society captures the reader's interest. The voice of scriptural and patriarchal authority speaks through the mother character in the novel *Beast of Burden*. The mother character Arokkyam laments about their life in the society. The mother here is simply the medium of articulation minus subjective agency. She frames her identity and existence within this voice of scriptural and social authority.

The story revolves around the life of Arokkyam, depicting her sufferings and pains that are caused when her son Joseph moves away with his wife Sahayam. Her grief intensifies when her daughter, Mary, is seduced by Chadayan, the Kothukkaaran. As her first son Joseph is away from her, she doesn't want her second son to depart from her. Hence, she denies her second son Peter from becoming a priest. But then Peter elopes, bringing her more pain. The grief thickens by the death of Mary's husband, Diraviyaraj. When everyone is fortunate to frame his or her life to live independently, the Dalit's alone are so unfortunate that they gift their life with great devotion and diligence, unaware of the fact that surrendering oneself is slavery. This dependence on other people has paved the way for the Dalits to survive in a home without happiness and in a society without safety and security.

The Dalit people constitute a large segment of the population, and they have been forced to mobilize themselves in order to fight for their rights and justice in postcolonial India. Dalit human rights emerge in a national context but, they write about their own life explicitly referring to the atrocities that were committed on them in India; it also develops a notion of the human

subject that can be serviceable within multiple contexts of suffering. Indeed, the narrative tradition of recognizing the outcast human in India offers strong parallels with other such humans the world over. In its representation of suffering humans, Dalit writing generates abject type for possible appropriation by a global literary field for human rights. They invoke objectification - deliberately echoing objectification to signal social processes of economic and political oppression – modes of atrocity and injustice but also the representational process.

The next novel *Arumugam* (1999) is a tale of emotional bond between a mother and son woven together with strings of love, thrown from a secure, loving home into the cruel world, Arumugam learns that his perceptions of life are as unreal as wisps of smoke and finally he understands the reality of life. Iyayam in his novel *Arumugam* presents the people who are living around Pondicherry Auroville and their sufferings. It is in the recognition of the Dalit and the other that is the bearing witness to another Dalit that the protagonists of the Dalit narrative discover their own humanity. The primary witness proposes a programme for the community, nation, or even humanity. This is the ethics of primary witnessing to the survivors duty to remember. Iyayam writes in a formal style reporting the happenings and incidents with a complete lack of inhibition as he uses the colloquial conversational styles of the protagonists both in their reference to their work and in their exchange of banter between themselves.

In the novel *Arumugam*, the writer brings out different aspects through the conversion character. He explains that life is not same for all individuals in a society especially for Dalit the relationship between them and the upper class people, their way of life with the rules and regulations of Auroville, the ethics, the morals, the conventions, the beliefs, and traditions of life in the society. The characters, who are confined to a limited way of leading their life are not great thinkers or rebels but people who belong to the lower class. Iyayam criticizes the Indian dominant narrative forms and their language by exposing the duplicity of dominant discourses within the society generating a different history. Through their writings, the dalit writers reflect the narrative recovery of emotional life, pointing out the fault lines, conflicts, and repression within dominant historical narratives. Iyayam's narratives in the same way reveal that, even decades after political independence, social justice is still a dream for the Dalit.

Iyayam offers multiple voices within the ravings of the abused woman in order to foreground the Dalit condition in the novel *Arumugam*. *Arumugam*'s anguished voice narrating his trouble is the personal one. The reference to their local god, who will, he believes, avenge his humiliation, is the mythic voice. The historical voice is subsumed into these two when *Arumugam* expresses the poor Dalit's inability to be recognized as humans with dignity in the society. Their voices and the three contexts thus set out are, the personal, the historical-social and mythical.

In the novels *Beasts of Burden* and *Arumugam*, the writer takes different parts of evolving the character. He clarified that the existences are unique, their relationship with the class, their lifestyle and the standards of Auroville, moral gatherings, convictions and public customs particularly in Dalit. Individuals whose lives are confined are not extraordinary people or blasphemers, but rather detestable individuals. Iyamam censures the Indian story structure and language by uncovering the redundancy of acclaimed discourses in social orders that have made various chronicles. Dalit essayists exhibited the change of passionate life through their works and found some unacceptable lines, clashes and persecution in societal issues.

Dalit writing becomes an all – India phenomenon. Thus Dalit writing reformulates the caste question and reassesses the significance of colonialism and of missionary activity. It resists the reduction of caste to class or to non Brahminism and vividly describes and analyses the contemporary workings of caste power. So, Tamil Dalit Literature studies have to chart out its critical course of intervention as a tool to aid Tamil Dalit writer's agenda of working towards Dalit liberation or empowerment through writing.

Thus Iyamam's novels narrate the tales of the oppressed Dalit people. When the voice of the writers and their characters reaches the desired and required distance and readership, their voice will definitely be heard. The resistance that will follow may bring along with it the desired effect. Removing each and every stumbling block stands as a barrier in the way of attaining equality and dignity though a great task has already been started. Each and every attempt made by writers towards attaining that goal will become a beacon of light showing others the path and a milestone in their journey.

**Abstract:**

In the midst of all diasporic feelings lies the 'home' concept. The entire fulcrum of diaspora revolves over the axis such as conception, loss and re-possession. The diasporas, very often lose their identity as they are impelled to lead a life of 'in-between' condition. They are between a devil and a deep sea in their efforts in surmounting cultural issues and negotiating identities. What disturbs their lives is the tussle between rootedness and up rootedness. Hence, diaspora is connected to the concept of 'home', nostalgia, space, identity, hybridity, transculturalism, migration and transnationalism.

This article focuses on Chitra Banerjee Divakaruni's novels *Sister of My Heart* and its sequel *The Vine of Desire* from nostalgic perspective. An attempt is made to trace the influences made by Divakaruni's experiences in her writing and the manner in which she has portrayed cultural crisis in her works. The life journey of the cousin sisters Anju and Sudha is studied apart from the problems experienced by immigrant population which is torn between two kinds of living: one from the East and other from the West.

**Key Words: Immigrants, Home, Nostalgia, Diaspora**

Right from the days of colonization, India has been experiencing a sort of cultural crisis. As it was a colony of the British for two centuries, it reeled under tremendous western influence in administration. Further, the British imposed their language which brought along with it a huge cultural baggage.

Due to this trend, the nation experienced a decline in its traditional cultural practices. It made several writers and activists to express their concern about it. Before India became a colony of British, it had been following several cultures and religious practices. But during colonial days, the public felt their culture to be much inferior to the one followed in European countries. They discarded their traditional culture and adopted the alien one so as to project themselves as civilized individuals. This adoption of foreign culture created a crisis for the native culture. Homi Bhaba opined in this context that, “ the political moment of cultural difference emerges within the problem of colonial government mentality and eclipses the transparency between legibility and legitimate rule” ( Homi K. Bhaba 134). He opined further in the work named *The Location of Culture* thus:

“Yacabo! Yacabo! It is finished... finished’: these words stand out not for the platitudinous place of cultural diversity, but at the point of culture’s fading’. They display the alienation between the transformational myths of culture as language of universality and social generalization , and its tropic function as a repeated ‘ translation’ of incommensurable levels of living and meaning.” ( Homi K Bhaba 178)

The advent of globalization and its concomitant socio-economic practices have forced India to face yet another cultural crisis. These are issues pertaining to politics, economy, history, media and education. Among them, culture and immigration are right at the top. At present, the public in India are obsessed with capitalist formations that include individualism, consumerism and free market economy. The individuals are overly ambitious and they are into a rat race trying to fulfill their materialistic needs so as to lead a sophisticated life. This middleclass mind set has forced them to embrace an alien material culture at the expense of our spiritual traditional one. Cultural materialism has been the main focus of writers of the 20<sup>th</sup> and 21<sup>st</sup> centuries. They bring to limelight the political and cultural history of a particular period. Also, they delve into the decay of traditional culture and the space it enjoyed in their works.

Chitra Banerjee Divakaruni is a novelist who focuses on our cultural values and the lasting impacts of western culture. There are several other writers like her who focus on the same themes with marginal difference in their approaches. Since she is an immigrant, her works concentrate on the cultural crisis experienced by Indian immigrants. All her writings compare and contrast the life style of second generation settlers with the first generation migrants. It has to be understood that the second generation migrants were born and raised in an alien land and the characters in her novels are caught between the traditional values of their home country and the culture of the host nation. In fact, the second generation immigrants have a desire to follow their own culture as they have little or no desire to perpetuate the culture of their forefathers. When they discover parental imposition of native culture and denial of liberty to follow their own culture, they find themselves a confused

lot caught between two extremes namely: Indian ethos and Western culture. Divakaruni places her characters in such a situation and ventilates her feelings about her nation and culture through her writings. Bill Ashcroft expresses about her writing as follows: “the diasporic production of cultural meanings occurs in many years, such as contemporary music, film and dance, but writing is one of the most interesting and strategic ways in which Diaspora might disrupt the binary of local and global and problematize national, racial and ethnic formulation of identity” (*The Empire Writes Back* 218).

It is germane to find a definition for the word ‘culture’ here as it has many social connotations. Raymond Williams rightly opines it as one of the two or three most complicated words in English language. Andrew Milner says, “after all most of the work I was doing was in an area which people called culture’, even in the narrower sense, so that the term had a certain obviousness. But, you know the number of times I’ve wished that I had never heard of that damn word” (*Cultural Materialism* 3). Both the critics took efforts to study the cultural history and came out with different ideas. Andrew Milner defines culture as something that “runs between a generality and a particular general public sphere and a singular subculture” (Milner 4). In the words of Raymond Williams “. . . it ran between two generalities, the arts and the whole way of life” (Milner 4). In short, whenever individuals move out of their home culture, they find themselves caught between pulls and pressures of the competing cultures. It is a dilemma faced by diasporic communities in all parts of the globe.

This paper attempts to trace the influences made by Divakaruni’s experiences in her writing and the manner in which she has portrayed cultural crisis in her works. For carrying out this study, it is imperative to have a deeper understanding of Indian diaspora. It is understood that there are 1.7 million people from south Asia living in the USA. The census carried out in USA in 2010 states that the Asian American population is expected to reach 8.6 million in July 2050. From the census report, it is evident that it has been one of the rapidly growing communities in the USA.

The voyages of discovery during the end of the 15<sup>th</sup> century and throughout the 16<sup>th</sup> century accelerated geographical mobility of people worldwide. The first wave of migration started to European colonies because of mercantile economy, religious persecution and large scale unemployment back home in the 17<sup>th</sup> and the 18<sup>th</sup> centuries. The second wave of migration included slaves, refugees, exiles and indentured labourers in the 18<sup>th</sup> and the 19<sup>th</sup> centuries. The end of two World Wars and the independence of colonies spurred the third wave with many intellectuals, chiefly those who went as students, making the nations of their former colonizers as their own homes. This produced brain drain and robbed the former colonies of their intellectual wealth. The fourth wave of migration took place during the last decade of the 20<sup>th</sup> century because of globalization of trade and commerce and revolution in information and communication technology. This dislocation from their native

places is both mandatory and voluntary. Critics such as Gareth Griffiths, Bill Ashcroft and Helen Tiffin define diaspora as, “. . . the voluntary or forcible movement of the people from their homelands into new regions” (*The Empires Writes Back* 68). As a matter of fact, living in a foreign land is not living in actual sense, but it is only a mere existence trying to get assimilated with newer relations.

People who have migrated to foreign land always have this strong nostalgia for their homeland and its culture and traditions that were once integral to their daily life. This particular quality of longing for a way of life that is no more there has paved way for diasporic writing. The cultural alienation that they undergo in their uprooted state because of their racial, religious and linguistic differences has a telling effect on their everyday life. Any diasporic writing can be examined through these two distinctive frameworks. Chitra Banerjee Divakaruni belongs to the group of diasporic writers and in her novels she gives a telling account of the miseries of the immigrants and the hostile atmosphere they face through her protagonists. Her focus has become more intense on women immigrants the moment she left India. From there on, she started writing about the status of Indian women who live abroad. Chitra Banerjee Divakaruni is very much aware of the Indian cultural legacy and she gloats about the fact that she has inherited the customs of the most consistent human advancement. She is very smart in maintaining her cultural heritage. Though the present crop of Indian diasporic writers have been viewed as transcultural, transnational writers and are treated as novelists of both the countries, her desire to give a verbal expression about her diasporic identity has been clear.

Chitra Banerjee Divakaruni's novels are mostly set in the USA and they focus on day today life of Indian immigrants. In the novel *Sister of My Heart*, there are two women who share their challenges in life with each other and help each other in solving them. This helping tendency between them becomes a stumbling block in the married life of them. The novel delves into the life of Anju and Sudha, who are cousins. The entire novel is narrated in their own voices revealing their childhood, adolescence and early adulthood. Although the early part of the novel is set in the USA, subsequently the novel revolves around India and talks about the pressure felt by mothers who value Indian culture and the sisters who adapt to western culture. The novelist very diligently develops the characters' life in both the countries and makes minute changes in the plot exhibiting the values of human relationships in India. The narrative style enables an individual to understand the diasporic realities of locations as well as the attachment the novelist has towards her motherland. While studying the reason behind her choice of the subject matter, it is very well understood that she has been making attempt to educate and reconstruct the Indian society by helping individuals acquire knowledge about Indian culture. This attempt can be very well understood in the words of Homi Bhaba. He states, “. . . that it is from those who have suffered the sentence of

history-subjugation, domination, diaspora, displacement- that we learn our most enduring lessons for living and thinking” (*The Location of Culture* 172). A major part of the novel is set in south Asia and is burdened with diasporic awareness.

As Divakaruni’s novels have been situated both in India and America, it is imperative to have a discussion on the differences between cultures in these countries. American society is distinct and different from India as it is not as old as India. On the contrary, India has a long history and is blessed with several social reformers like Swami Vivekanandha who was one of the stalwarts of social renaissance in the 19<sup>th</sup> century. In the World Religious Parliament conducted at Chicago, he made the westerners sit up and listen with rapt attention to his discourse on religion. The listeners of his discourse carried an impressive opinion about India and its religions. In addition to it, it is well known that there is a whale of difference between eastern and western societies in terms of religious beliefs and practices followed. Say for example, Hinduism has immense belief in ‘karma’ and ‘rebirth’. This belief has instilled fear in the minds of Indians regarding things evil. The faith in multiple births, transmigration of the soul or metempsychosis is something unique to Hindu faith. Unlike the monotheistic religion of the West and the Islamic countries, Hindus worship a pantheon of gods and goddesses. In fact the deities are countless. Practices like worshipping the sun, doing yoga, chanting slokas from the Vedas, conducting marriage with the god of fire as witness, and ceremonies right from the birth to the death, including puberty rites are unique to the Hindu way of life. Veneration of animals, particularly the cow is very common in India. Taking annual pilgrimage to the abodes of Gods and ritual baths on sacred days in tanks and rivers that are marked as holy are part of religious duties. Days, weeks and months and even certain hours are regarded as auspicious to perform rites or start some good work. For someone steeped in Hindu beliefs and practices, the Western culture comes as a shock during the initial years of migration.

The novel *Sister of My Heart* makes a vivid discussion on opportunities and threats faced by women in a traditional Indian culture and it is compared with the modern world. The novel talks about a family dwelling in West Bengal and it is in a dilapidated state. Both Anju and Sudha are from a poorer background and the novelist focuses on the world around them. Both of them are clever, self-sufficient and practical. Being a master story teller, the novelist gives a pictorial account of the ordinary life and the dreams nurtured by them. All female characters in the novel work along with other characters so as to attain legitimate, equivalent and autonomous status. As a matter of fact, it carries an objective controlled action to liberate womenfolk from their dependence mindset. The bondage between the two siblings namely Anju and Sudha has been the crux of the novel and it is based on the novelist’s personal experience as a migrant.

The challenges before all womenfolk have been to find fulfillment for their longings, to find satisfaction in their life and career and to find equity in all situations and circumstances. Moreover, the marital discord between Sudha and Ramesh is of serious nature. Sudha even entertains the idea of parting ways with him along with her child Dayita. Her attitude is simply different from that of other Indian women who meekly submit to societal compulsions and patriarchal prescriptions. To break free from a sacred institution like marriage, she needs courage and hope to charter her life independently. The entire social framework embodies religion, myth, instruction and other social standards. The females need to get liberated from these shackles and maintain their status as individuals. Sudha is fortunate to have the complete backing of Ashok who happens to be her first love and he stands by her during her troubled times. Sudha's miseries do not end and Ashok offers unstinted support during her marriage, pregnancy and separation. America is expressed through the eyes of the sisters as follows:

“America has its own problems, she said, but at least it would give me the advantage of anonymity. No one in America would care that I was a daughter of the Chatterjees, or that I was divorced. I could design a new life, earn my own living, and give everything she needed. (*Sister of My Heart* 294).

The works of Divakaruni portray America as a comfortable place offering peace and prosperity to the migrants. She describes America in the most exalted terms as possible. In her perspective, it is a land of people with progressive thoughts whereas India is regressive needing redemption. She considers people moving from India to America to be fortunate as they are moving into a land of much promise.

While depicting her mother land, she gives importance to its culture and myth. In her opinion, the Indian women can gain prominence in America amidst the white population only by respecting her traditions. In an alien land like the USA, the Indian woman needs to reestablish her identity. This observation is very well found in her novels titled *Sister of My Heart* and *The Vine of Desire*. Between these two novels, *Sister of My Heart* carries several plots woven together in an artful manner. The novel brings out in a forceful manner the pressures experienced by Indian mothers who are sworn to the traditional Indian society and Indianism. The western theory has been the major focus of the novel. The novel talks about the circumstances leading to the birth of Anju and Sudha as well as their love relationship. As the novel moves, the readers have a very good understanding about the sister's euphoria, distresses, desire, misfortune, sadness and the vicissitudes. The novel *Sister of My Heart* enables the readers to acquire a thorough understanding of Indian family system. The novelist gives utmost importance to the specific nature of the females. In earlier days, women were brought up in an orthodox surrounding. They were forbidden from doing things like meeting strangers. The conservative and orthodox family values and practices were discussed threadbare in this work. However, things changed due to western education. In

the novel, both the sisters retain their connection with their mother land. The novelist expresses her mentality in her writings. Epics like *The Ramayana* and *The Mahabharata* were the sources very well used in *Sister of My Heart*. Divakaruni gives a pictorial description about Indian cultural heritage. She states that, “when a child is born, Bidhata Purush comes down to earth himself to decide, what its fate and fortune is to be religious ceremonials had a great attempt in describing Indian Phenomenon” (*Sister of My Heart* 15).

The plot is very simple and straight forward and concentrates on female characters. Through the life of Anju and Sudha, the novel very well depicts the traditional Indian life. The novel also talks about Dayita, the daughter of Sudha who becomes an orphan and it exhibits the will power of womanhood. In the novel, the union of the sisters is tested. The relationship between Sudha and Sunil become quarrelsome. Sudha experiences a nightmare and moves out of USA. In the life of Anju, her companion’s duplicity happens to be the dark drama. Her married life runs into rough weather and she decides to lead her life alone. Their affection surpasses all complications and Sunil has problems in prioritizing the needs of Sudha. In the opinion of Simon de Beauvoir, “once a woman is self-sufficient and ceases to be a parasite, the system based on her dependence crumbles; between her and universe there is no longer any need for a masculine mediator” (*The Second Sex* 689). The interesting part of the novel is in the way both Anju and Sudha get acclimatized to the western influence. The separation between them is explained in a subtle tone.

In all her novels, Chitra Banerjee Divakaruni does not say whether her characters are Indians or Americans. She goes on disseminating generalizations. Her novels probe into the genuine feelings of Indianness. The Indians, though naturalized as Americans, always remember their motherland and have fond memories about it. The novelist exhibits this attitude through Sunil in the novel. In a social gathering, Sunil comes across an American who talks ill of India. Unable to withstand this mudslinging, Sunil slaps him flat on his face. There are characters like Lalit, Trideep and Sara who also nurture the Indian idea of living. From her novels, the readers are able to understand the Indian style of living abroad. Sunil, Anju and Sudha are found to have these traits in them. Indianess and Indian sensibility find an incredible arrangement while Divakaruni exults in describing Indian traditions, customs and cultural goods. Even, Indian nourishments such as dal, parota, and pickle along with costumes like saree, kurta and pyjama are explained in detail. Flowers like jasmine, bangles, bindi and sindhur which are very common in India find detailed accounting in the novel.

Her next novel *The Vine of Desire* unravels the story of two youngsters who establish female freedom. The novelist considers the Indian female migration to the United States of America to be a kind of pleasant trip made and learning to lead a westernized life. Through the eyes of the characters, Divakaruni tells the story and gives vivid details about the country they have

left behind. The reader is left to wonder whether the novelist has yielded to the temptation of giving a pictorial description about India and its public. *The Vine of Desire* is the sequel to Chitra Banerjee Divakaruni's *Sister of my Heart*. The protagonists in the story are the two sisters Anju and Sudha born on the same day opening their eyes to the ill-fated death of their fathers also brothers' of the same family Gopal and Bijoy respectively, on a ruby exploration journey. The story revolves around the two women caught between hard core family traditions and the evolving modern thoughts of the 1980s. Anju migrates to America with her husband Sunil and Sudha stays in India with Ramesh. The distance does not separate them emotionally but only physically as the communication goes on through letters. The novel depicts the reunion of the two sisters in America. The sequel begins with a tragedy of miscarriage, emotion and trauma of the separation of son 'Prem' from her womb which ends in an abortion leaving Anju in bouts of depression. Sudha flees from her family to America. Anju feels the need for her sisterly support and feels obliged to stand by Sudha during her tormenting divorce. She decides "I want to bring Sudha to America" (*The Vine of Desire* 18). Sudha visits America with a hope to make a life for herself and her daughter Dayita. Divakaruni follows the trend, shows America as the land of opportunities and a refuge for all emotionally broken and mentally distressed women.

Divakaruni brings about the contrasting cultures of India and the US. The novel constantly focuses on the transculture; the characters seem to be shuttling between two worlds. Loss, alienation, rootlessness and dislocation are experienced by every immigrant. The expatriates initially try to adjust with the new culture and society into which they have joined. But something holds them back in the form of nostalgia for a way of life that is no longer possible. The sense of nostalgia is often seen among the dislocated and displaced people in most of the diaspora writings. In *Brick Lane*, *An American Brat*, *The Namesake*, *Disappearing Moon Café* and in *The Vine of Desire* one can find women characters leave their home to foreign countries after their marriage in order to settle in a new land with their unknown husbands.

Anju in *The Vine of Desire* migrates to America as Ashima in *The Namesake*. Both share a lonely life though the situations and problems differ. Anju, during her miscarriage yearns for someone to console her and liberate her from her intense loneliness. Anju's isolation reveals her acute nostalgia as well. The immigrants find themselves put out of place from the home society, they are upset emotionally and strive to remember and place themselves in a nostalgic past. There are frequent musings of the past memories, especially of the childhood days, people and surroundings. All through the story there are sentimental attachments well displayed by different characters. Anju in

this novel often finds talking to her unborn son; she names him “Prem” and to him she conveys the reminiscences of her childhood. She tells ‘Prem’ who is attached to the warmth of her womb. She journeys back in time and narrates instances of homesickness at the very memory of the old house, the white elephant of a mansion that had been in the Chatterjee family for generations: its crumbling marble facade, its peeling walls, the dark knots of its corridors, the brick terrace where she and Sudha went secretly at night to watch for falling stars to wish on. She senses pain as things change. She remembers even the smallest of the incidents in the past which she used to loath and hate as a child, but as an immigrant there is this terrible longing to retrieve the past.

In an interview to *The Telegraph* (13<sup>th</sup> March 2005), she says that women in particular responds to her work because she writes about them; women in love, women in difficulty, women in relationship. She wants people to relate to her characters so that they can feel their joy and pain, since it will be harder to be prejudiced when they meet them in real life.

Divakaruni portrays remarkable characters who build hope within themselves in an alien country. Here in the midst of different cultures the immigrants venture to set an identity battling against loneliness and overcoming tormenting emotions. They carefully discard their initial cultural shock and exhibit remarkable resilience. Divakaruni’s narration in *The Vine of Desire* is adroitly tailored from first person to second person and also to third person narration. The emotional communication through letters also expresses the family bonds, responsibilities and yearning for home. In fact, both the novels analyse and contrast the prevailing Indian mindset, attitude, prejudice and pride among the immigrants in a foreign country. Divakaruni, in short, gives an authentic pictorial description about the Indian community in an alien land and its ways of coming to terms with a newfound reality.

### **Abstract:**

In the present paper, I have attempted a critical analysis of the women characters in Khushwant Singh's novels: *Train to Pakistan*, *I Shall Not Hear the Nightingale and Delhi*, *The Company of Women*, *Women and Men in my Life*. The paper also attempts a portrayal of women in his short stories: *Karma*, *Black Jasmine*, *A Bride for the Sahib*, and *The Portrait of a Lady*. Some of the characters taken for study are Yasmeen, a Pakistani from *The Company of Women*, Nooran, a daughter of blind Muslim weaver from *Train to Pakistan*, Sabhrai from *I Shall not Hear the Nightingale*. Phoolan Devi, a bandit, Singh also portrays being a bandit, the revenge and massacre held in 1981. Indira Gandhi and Operation Blue Star and his return the award Padma Bhushan to show his condemns to the Golden temple issues. Mother Teresa helped the sick, disabled, abandoned, and the people cast away from society. Kaval Malik, Khushwant Singh's wife and so on.

**Keywords:** pedestal, docile, backbencher, vehemence, encounters, massacre, Operation Blue Star. Voluptuous, lustful, lusty, encounter, iconoclastic, hypocrisy, forthright, human traits

Khushwant Singh was a versatile personality as novelist, journalist, Member of Parliament, politician, translator, autobiographer, historian, story writer, essayist, and many more. He excelled in every field. Khushwant Singh was a man of principles; he never left the country of career. He was a professional

writer and wrote more than a hundred books. Many a time, he came into the limelight because of his controversial comments. He wore many hats. Undoubtedly he is one of the most distinguished writers of India.

In patriarchal society, the West and the East have been treated unequally and as an inferior sex. In a patriarchal set up of India, either woman is put on a pedestal and worshipped as Goddesses and are depicted as symbols of purity and keepers of tradition or degraded as sex objects. They are supposed to be and made to be traditional, religious, docile, obedient and subordinate to men. There is evidence even in the Vedas and the two Puranas (Epics), the Ramayana and the Mahabharatha, the women are restricted by social rules and norms. For example, the two classical characters of Sita and Drupati behave as ideal, obedient and docile wives to their husbands and as good mothers towards their children. They do not cross the boundaries that set up by their patriarchal societies. Submission to others is the only thing that patriarchal society expects from a woman, whether in India or the West. John Stuart Mill rightly points out, "All women are brought up from the very earliest years in the belief that their ideal of character is the very opposite to that of men; not self-will, and government by self-control, but submission, and yielding to the control of others."(45)

In a patriarchal society, a woman treated as a person dependent on others for her existence. For example, as an old woman, she has to depend on her children for her survival; in her girlhood, she has to depend on her parents, while when young, she is dependent on her husband. Men from time immemorial have not given women an individual identity in society. She restricted to a minor part of society. To use the words of J.S.Mill again:

"A place of subordination has been traditionally accorded to her at the behest of the male-dominated culture which ordains a grim existence for her. Self-abnegation, personal will dependability and denial of the right individuality made to her lot. Not self-assertion but self-denial, not self-awareness but role fulfillments are expected of her by society with its entrenched ideas of male dominance".(78)

A glance at the scene of Indo-Anglian literature shows us the impact of such a patriarchal society. Most male Indo-Anglian novelists have given a minor place to women in their novels and they portray them as restricted to the mere tradition. Khushwant Singh followed his predecessors in portraying his women characters in a similar mode.

Khushwant Singh presents to us two kinds of women characters, who are conventional, traditional, ardently religious or, in sharp contrast, women who are unfaithful, promiscuous and lascivious. The conventional women possess deep reverence for their religions and rituals, and like the classical heroines Savitri and Anusuya, they seem to symbolize deep spirituality and traditional idealness. Motherhood and love for children and reverence towards tradition is a hallmark of the virtuous women characters. They depicted as repositories of tradition and custom.

The first character taken for the study is Yasmeen from the novel *The Company of Women*. Mohan Kumar narrates this story. With a remarkable grasp of human nature, he has given a convincing and realistic portrayal. Singh treats all women in *The Company of Women* as narcotics.. The novel begins with its hero Mohan Kumar, a successful Delhi's businessman, breaking off with his wife and his everlasting "lust" efforts to set up a more flexible arrangement for appeasement of his physical needs. The initial endeavour begins at his home with the sweepers and extends to the wide world of lonely women beyond the neighbourhood to Princeton, having the most bizarre of his "triumph." in one night encounter with a devout Muslim woman from Pakistan. The novel chronologically presents the most erotic pictures of the nine women with whom the hero beds, including his wife. Of the eight on the description, one each is African, American, Kashmiri Pundit, Muslim, Dalit Hindu, Hindu Brahmin, Tamilian Christian, Goan Roman Catholic, Sri Lankan Buddhist and unnamed women of easy virtue in Bombay. Singh seems to have to extend the slogan that love and sex know no caste, class and community bar. He further confirms his belief that lust is more important than love: Love cannot last very long without lust. Lust has no time limit and is the proper foundation of love and affection. Living engaged in several sexual encounters, Mohan Kumar does not see anything wrong in adultery as it has some advantages. He thinks that adultery has some advantages also. He thinks that, in fact, adultery "did not destroy a marriage; quite often it proved to be a cementing factor, as in cases where the husband could not give his wife as much sex as she needed, or where the wife was frigid. It was silly to condemn adultery as sinful; it often saved marriages from collapsing. It could have saved his."

Khushwant is deeply aware of various social evils, oddities and eccentricities of society. He ironically highlights how their near relatives are sexually exploiting many minor girls sound social norms. Mohan's last physical contact happens with an unknown lady of about thirty in Bombay. She declined to disclose her name despite Mohan's request. The encounter proves fatal for him. The lady was suffering from the deadly disease AIDS. Mohan invites many lonely girls to come and have sex with him. This is not an isolated case or mere fictional imagination of Khushwant Singh. This is, in reality, happening in different parts of our country, especially in metropolitan cities. People from the elite or higher middle class now frequently invite men and women for a physical relationship. Such invitation is being made through a special 'add' column of certain sex magazines such as 'Fantasy', 'Bombayite', 'debonair' etc. Khushwant Singh ironically satirizes this truth through his present novel. Such cultural degradation causing AIDS in Urban and Metropolitan cities is Khushwant's main concern of the novel.

Social evils such as extramarital relation, incestuous sex, sexual exploitation of Dalits and minors, etc., are the novel's real heroes. The novel ends with the attempted suicide of Mohan by taking thirty sleeping pills at a

time. Some critics call the novel a 'fine fictional art'. Some others say 'that the novel is neither erotic nor funny, but it is, ultimately, a sad book'. Khushwant indeed ironically campaigns against the 'deadly disease', when shows Kumar getting AIDS, all in a matter of just six months from an unprotected sexual encounter in Mumbai and ultimately dies. Throughout the novel, he neither defies social norms, nor pays a moral price for his philandering. Mohan Kumar's relation with Dhanno continues for a long time. After her, he encountered Molly and Susanthika. Singh has never bothered about others. Mohan Kumar's relationship with several women during his study in New York shows that modern educational women are rapidly overcoming sex consciousness. The young are anxious or rather in a hurry to taste the forbidden apple. Hence there is a petite sex barrier between male and female in the west, and they enjoy ample freedom to work together on equal footing and discover the mystery of one another's body. Besides, this novel also explores the bitter truth about incest. Those girls, in most cases, are deflowered first by their close relatives. Susanthika is deflowered at the age of sixteen by her uncle, and Molly Gomes too met the same fate at her uncle's hands when she was barely fourteen. Boys were seduced by their aunts or older maid-servants. Mohan Kumar consoles himself that he has got a beddable wife as if to compensate for the loss of his daily sex with variations. His mental plane's concern in all relations with women is the same lust, but experiences with them are different. Singh treats all women in this novel as narcotics. He portrays the women in this novel as addicted to sex. They yield to men easily and are not concerned about any values as such. Women characters are ready to taste the forbidden fruit. Mohan met Yasmeen while attending classes in comparative religion; he describes her as being "A woman in salwar-kameez in her late thirties. She wore a lot of gold jewellery and was heavily made up. Since she did not wear a bindi, I presumed she was a Muslim. She sat in the front row. I always a backbencher" (Singh 20).

Yasmeen is a very different character. She was a bold woman and was notably the one who had much to say during discussions. It portrayed by her view on the Hindu religion, where at one point she launched a furious monologue upon a professor, where she says:

Hinduism is the only religion in the world that declares a section of its follower's outcasts by accident of birth. Hindus are the only people in the world who worship living human as godmen and god women. I am told that there are nearly five hundred such men and women who claim to be Bhagwan. They believe a dip in the Ganges washes away all their sins, so they can start sinning again! (Singh 22- 23)

"There was stunned silence" (Singh 23). Say Mohan on Yasmeen, who had spoken with such intensity. These lines also may portray Singh's satirical remark on religion, where he is inclined towards Atheism. Singh once said, "One can be a saintly person without believing in God and a detestable villain believing in him. In my personalised religion. There is no God!" (Nayar) He is

also said to have no belief in rebirth, reincarnation, day of judgement, heaven, hell, but has belief in death.

Yasmeen was a Pakistani woman but was not an anti-Indian. Her parent had lived in Srinagar. During the progress of the novel, she says that one day we will liberate Kashmir from India's clutches and I will return to Srinagar, which I have seen only in pictures" (Singh 26). This part of the novel shows the tensions that run across the borders even in the present day. There is also description of her love for Islam and how she fights it over with a Jew.

Singh's portrayal of religion depicted through Mohan's character, where he once says, "I'm happy in ignorance,' I replied. 'I don't have much patience with any religion. All I say is try not to injure anyone's feeling The rest is marginal. Gods, prophets, scriptures, rituals, pilgrimages mean very little to me" (Singh 31-32).

The next character is Nooran from the novel *Train to Pakistan*. The passages between Nooran and Juggut Singh's mother mostly touched upon the divide and the tensions between the Hindus and the Muslims during the partition in India. This is the novel that brings in the horror or the pain one experiences reading this part of the novel. It also shows the breaking up of the emotions and genuine feelings of being humane to each other during the partition hours. This is also revealed symbolically within the boundaries of possessiveness of place, objects, and of true love, when the character Imam Baksh went to his hurt and woke up Nooran saying, "Get up and pack. We have to go away tomorrow morning, he announced dramatically. 'Go away? Where?' I don't know ... Pakistan!" The girl sat up with a jerk. I will not go to Pakistan,' she said defiantly (Singh 50). This shows her love, in which she does not want to leave Juggut. Juggut and Nooran get in a relationship in the novel. Nooran comes to meet Juggut, but he was away, and she encounters his mother.

Juggut's mother, on the other hand, tells Nooran, ""You, a Muslim weaver's daughter, marry a Sikh peasant! Get out, or I will go and tell your father and the whole village. Go to Pakistan! Leave my Jugga alone (Singh 53). But even this strong character breaks apart to portray the tenderness possessed by the feminine gender, where at a point Singh writes, "Jugga's mother stood stiff, without a trace of emotion on her face. Inside, she felt a little weak and soft. 'I will tell Jugga" (Singh 53-54). By sensing the change in words. Nooran stopped crying. As revealed by Nooran areas, the feelings of possessiveness if she belonged to the house and the house to her, the charpoy she sat on the buffalo, Jugga's mother, all were hers. She could come back even if Jugga failed to turn up. She could tell them she was married. The thought of her father came like a dark cloud over her lunar hopes. (Singh 55)

These lines also portray male dominance in the figure of the father and the surrendering of the female gender to the male. With these on Nooran's mind, she hugged Juggut's mother passionately. Even Juggut's mother was in the same emotions that had filled in the mind of Nooran, for she sat there in

the charpoy staring into the dark for several hours. This is symbolic of the question of what are all our lives meant to be!

Jugga's mother in the novel *Train to Pakistan* exhorts her son when he goes out to the fields in the night. Her love for Nooran (the lover of Jugga) increased when the latter is on her way to a refugee camp. When the Muslims evacuated to the refugee camps, Nooran, before leaving for the refugee camp, goes to Jugga's house and finds Jugga's Mother. When the latter comes to know that Nooran is carrying Jugga's child in her womb, she comforts and consoles her as a concerned mother and sends her with hope. Meer Taqi's mother in the novel *Delhi* and Dalip Singh's mother in the story *Rape* are also similar characters.

We find a comparable patriarchal mode in depicting motherly women characters in other Indian English writers. Raja Rao, one of the pioneers of Indo-Anglian literature, also portrays such motherly figures. For example, in the novel *The Serpent and the Rope*, Rama's stepmother, despite her comparative youth, is still the unparalleled Indian mother. Though only two years older than the protagonist Rama, she is a good mother as any other mother figure in Indian Writing in English. In *Kanthapura* Moorthy's mother full of sacrifice and motherly love for her son, yet sticks to tradition and does not allow Moorthy inside her house after he visits the untouchable's house.

Another important attribute of these tradition-bound women in Khushwant Singh's work is their devotion to their husbands. Like Savitri, Draupadi and Sita's Puranic characters, they submit themselves to their husbands and remain loyal wives to them until their end. For example, though illiterate. Lachmi, in the short story *Karma*, shows deep reverence towards her husband and treats him as her God and master. When the railway coolie asks her, "Are you travelling alone, sister?" she replies, "No, I am with my master brother. He is in the waiting room. He travels first class. He is a vizier and a barrister, and meets so many officers and English men in the trains-" (*Karma* p.9).

Like her puranic counterparts, Sabhrai is completely devoted to her husband and is an obedient and exemplary wife. We find such kind of characters in the novels of R.K.Narayan too. In the novel, *The Dark Room*. Savitri, like Sabhrai, Kalyani and Lachmi, behaves like a good and submissive wife to her husband. She stands for love, sacrifice and other feminine qualities associated with traditional Indian women.

Conventional, eastern women are always deeply religious. In the story, *The Portrait of a Lady*," the narrator describes his grandmother as a deeply religious woman who expresses her infinite faith in God by constantly offering prayers. The reader always encounters her counting the beads of her rosary and reciting prayers in a monotonous voice. As the narrator says, "My grandmother always went to school with me because the school was attached to the temple. The priest taught us the alphabet and the morning prayer. While the children sat in rows on either side of the verandah singing the alphabet or

the prayer in a chorus, my grandmother, sat inside reading the scriptures" (the portrait of a Lady, 'p.30).

An orthodox Sikh widow, the grandmother "hobbled about the house in spotless white with one hand resting on her waist to balance her stoop" (*The Portrait of a Lady*, p.29). As a religious and peace-loving woman, she prefers vegetarian foods, and being a gracious woman shows compassion towards the lesser beings like the dogs and sparrows. While living in the village, she gives stale chappatis to the village dogs, and when she takes to a town, she feels contentment in feeding the sparrows. She also bears a motherly love towards her grandson when he stays in the village. Her devotion towards religion is so great that she feels sorry and depressed when she learns that the narrator was not taught Religion and Scriptures at his English school, even at the time of her death, she does not leave her rosary; "She lay peacefully in bed praying and telling her beads. Even before we could suspect, her lips stopped moving, and the rosary fell from her lifeless fingers' (p.31).

All the above characters portrayed as dependent people. They created as individual and independent. All women in the novels and the stories examined submit everything to their husbands or are completely dependent on their children. Khushwant Singh, like his contemporaries Raja Rao and R.K. Narayan, has followed the tradition of depicting women characters as being restricted to the ideal of Indian womanhood and tradition. All these writers have denied women's individuality and self-hood by depicting them as keepers and protectors of tradition and custom and repositories of purity and innocence.

In sharp contrast to the ideal' Indian women, Khushwant Singh presents women characters who appear to be 'unconventional'. They mostly disregard the traditional way of life and seek to subvert the restrictive and repressive norms that Indian society imposes on its women. However, what is unfortunate, as we shall presently see, is that Singh's depiction of these women borders on the vulgar and sometimes downright pornographic. The non-conventional or vicious women characters seem to be used as objects of sex to enchant readers.

In portraying the non-traditional characters, Khushwant Singh exaggerates the sexual desires that women have in general. From ancient times, women in our society have been compared to goddesses and sometimes worshipped with devotion. Women also have been depicted as beings who do not have sexual desires. In portraying women as goddesses and divine being, Indian novelists like R.K. Narayan and Raja Rao seem to have neglected this "human' part of women by depicting them as one-dimensionally religious and orthodox people. Khushwant Singh might suggest that when freedom gave to women like men, she can also prove that she is not inferior to men in any field, including sex. But in doing this, Khushwant Singh portrays them as sexual objects of sex by lavishly describing their physical beauty, sensual and sexual

transgressions in a manner that ultimately degrades them as human beings and robbing them of human dignity.

The next woman taken for the study is "The Venus of Churchgate" (Singh 57). Singh encountered while he was working as the editor of *The Illustrated Weekly* of India in Bombay. Singh describes this woman to be as "An uncommonly attractive girl, she was in her mid-twenties. Fair, beautifully proportioned, uncombed hair wildly scattered about her face, a dirty white dhoti untidily draped around her body" (Singh 58). She, in reality, was a beggar and a little mad. This statement proves that Singh notices all kinds of people, be it the rich and the poor. This incident also shows how these low people are used negatively by certain people of the society.

Singh says that the "maid in Bombay haunted me for the many days that I was away in Delhi" (Singh 60). When he returned to Bombay, he went to Churchgate, and there he saw the same paanwalas, bhelpuriwalas, but not the beggar. Singh asked the bhelpuriwala what had happened to the girl; with this question, the responder's eyes filled with tears and with a choked voice, he replied, "Saaleybharweyuthake lay Gaye (the bloody pimps abducted her)" (Singh 60). This statement shows the reality of the day, which is also an issue that prolongs in modern-day. In the short story, 'Black Jasmine.' Singh indulges himself in describing Martha Stack's beauty, concentrates more on Martha's body than any other aspect. The comparison of her buttocks to rounded water melons' and her breasts to unripe mangoes' and use of expressions like "very black and over. sized nipples," the fuzz of her pubic hair," "chocolate nude", etc. betrays Khushwant Singh's tendency to turn perfectly 'normal' stories into stale pornographic 'episodes'.

Santosh Sen's mother, in the short story *A Bride for the Sahib*, is depicted as an ideal mother and a traditional woman. Though her son is a WOG (Westernized Oriental Gentleman), she does not embrace the western way of life and instead restricts herself to the traditions and conventions.

Thus Khushwant sees women as of with no difference between the two polar that found in life. He uses Yasmeen to say about his views of religion, Nooran on the horrors of partition, the Venus of Church talk on the adverse effects faced by a woman in the society. Phoolan Devi goes a step into the world of how women suffer in the field of being a bandit. Indira Gandhi's other side, and finally the caring heart of a mother through Mother Teresa.

Singh also gives portrayals of women whom he holds in high esteem in his *The Portrait of a Lady*, he sketches his grandmother as an amicable, lovable and noble lady. Khushwant Singh was a keen observer of human traits. He has presented these human traits with his profound insight into the human mind. His portrayal of the women whom he encountered in real life is iconoclastic style. Singh's style is frank and forthright. In his unorthodox style, he hits out against hypocrisy. He is not prejudiced against woman; he presents a realistic scenario in his inimitable style. Singh also gives portrayals of women whom he holds in high esteem. In his *The Portrait of a*

*Lady*, he sketches his grandmother as an amicable, lovable and noble lady. This story is a sensitive character sketch. We can see women's personality, who can be called an embodiment of the finest elements of ancient Indian culture. Singh says that his grandmother was a highly religious person who never missed prayers. The first phase was the period of the author's early childhood. Both they shared a good friendship with each other. The second phase was the time the author and the grandmother moved to the city. This was a turning point in their friendship because they 'saw less each other. The third phase contains the author joined the university. She accepts her seclusion with silence. She spent her days spinning the wheel, reciting prayers and feeding the sparrows. She was a religious lady with a kind heart. Her one hand was always busy in telling the beads of her rosary. Khuswanth Singh writes with sympathy and understanding about the greatness of an old lady who was an embodiment of all that was best and finest in ancient Indian culture. He presents traditional, conservative women who found solace in sparrows after her grandson moved away from her.

In the novel *The Company of Women*, he treats women as voluptuous, lustful, lusty and throwing caution to the four winds. Again this is the sign of his extraordinary insight into human nature. These types of women characters also abound in modern society. Singh's style is frank and forthright. In his unorthodox style, he hits out against hypocrisy. He is not prejudiced against woman; he presents a realistic scenario in his inimitable style. Khushwant Singh was a keen observer of human traits. He has presented these human traits with his profound insight into the human mind. His portrayal of the women whom he encountered in real life is remarkable in this way.

**SELF REALIZATION IN IRIS MURDOCH'S  
BRUNO'S DREAM**

**DR. P. ANANTHAN**

Assistant Professor & Head

Department of English

Annai College of Arts and Science, Kumbakonam

Bharathidasan University, Tiruchirappalli India

**Abstract:**

Self Identity is needed to all generally which is the expectation all human beings. Mostly People struggle to get identity. This Research Paper talks about the insecure life of Bruno. He feels emptiness in his life. His life is compelled by his surroundings psychologically he confuse himself as well as his life too he loses his happiness due to over thinking. His own dream only is the tool of his hectic life.

Literature shows the reality of the society. It pictures the world happenings. All the details and evidence are documented in the name of literature. it gives idea of living life .life is not easy in this competitive world . Everyone has their own image and identity but few people plan to create a big image or identity which is little hard. It is faced by all human beings. Money making is the vital part of day to day life. Most of the people spend more times to earn money for their needs. They miss valuable life time in earning money .there are some important elements in life like love , affection , care but they are missed due to money making . Love and care are basic of human life which shows the different from animal. Now days money minded are there in life. They go on thinking about money not family. They try to explore themselves in front of others as they wish whereas they family image goes on missing. Finally they realize their mistakes when they don't have ability to rectify all due to their old age. Same character we have in the name of Bruno who is the central character of Bruno's dream which was written by Iris Murdoch Murdoch is named writer of British literature. She has touch theme of human life related. in order to focus the reality , naturalism and morality , her characters are framed by her nicely . it explores the real characters of current

situation . When we read the writings of Murdoch, we can come across all kinds' familial situation and characters. That is why Murdoch plays a vital role in British literature. She stresses that they are not individual. Society is there. She has touched with her own personal experience. Her experience is shown clearly in her characterization. She teases her readers through her character to get awareness of life. Murdoch perceives herself as a realistic writer. She has moral vision of life. She insists her readers to follow goodness in every aspect of life. People of her generation accepted her way of presenting the life. She celebrates love and lives continuously. So Murdoch emerged as one of the most productive and influential British novelists of her generation

Bruno is the protagonist in *Brno's Dream* he feels more insecure due to his old age. He is caught with nothingness and dread. Here he suffers common imbalance and unrest. Ailing Bruno has been rejected existence. He is portrayed as a guilt-ridden invalid. He lives in the past. He remembers his nostalgia. Once he had nice relationship with his wife Janie, daughter Gwen, son Miles, Son in law- Danby, Diana, Lisa and Parvathi – his daughter in law. He faces numerous traumas and each fragment tells about the different realities which Bruno experience often. Sense of rejection is there. Here he was rejected by thankless relationship his life is ruined by Janie. Murdoch affects darkness into Bruno that infiltrates through him. Bed-ridden Bruno is in the process of self realization. He views himself in the reflection of his own unhappiness. His mind overflows with full of fear, frustration. He has illegal affair with Nigel.

Bruno is perplexed by the varying attitudes of Danby and Miles but Self realization is motivated to gather his fragmentary self's together affair with Nigel is example to read and understand the mind of Bruno. It is not merely love seeking attitude. He belongs to moderate category of self seeking personality. He realizes that his room is his prison. They could not give message. They could fail to post letters. There is a telephone but they could cut the wire. Bruno's suspicion is the depressed state of self realization. He faces unfortunate situation a lot. The Most remarkable aspect in Bruno's self realization is his effort to reconcile his life with his rationalizations of the past.

Lack of self identity is main reason for confused life of Bruno. It makes him to feel lot for not having unique image. Directly or indirectly his whole life goes towards in gaining an unique image so unknowingly he misses the importance of life as well as reality too. In order to create his expected image, he suffers more without understanding the real value of life. He has good family and all but he forgets all his family goodness. His unique quest is his problem. According to him, he has no faith and balance in his life. That is major problem .having dream is nice thing .but unwanted or out of our level is not good. He creates his own hectic situation in his life. Till his death, he feels guilty. No enemy is there only his mind and perspectives of the life gives this way. Murdoch pictures the character in dark mode. Darkness is created by

himself only. Thankless relationships are connected with Bruno. His misfortune, he has to deal with them in day to day life. This is really misfortune. He could not come across. His effort is useless in his situation. it is impossible to change his situation as his wish .When he looks back his eighty year old life full of emptiness, dreams and confused mind He was imprisoned in his own house where he suffers more .

Miles does not have affection on him as father. His father Bruno has kind heart and idea to see him. He is not ready to care his father who has more affection on him. He avoids meeting as well as caring him. It is biggest one o bear this kind of irresponsiveness. Loneliness is the crucial situation which is given by Miles. Bruno is compelled to lead lonely life .this is very hard time to manage. He calls miles to save him from loneliness. The response is nothing. He has been waiting for his son .but he refuses. Bruno gets anger when his son goes away from him. Miles also reflects his father's character.

It is common things of all human beings' life that people in their old age get struggle. They expect help and care from their family member due to their old age. But when they are in young age , they also did same mistake what they feel now . they failed to teach the life morality and philosophy to their children so only finally they face struggles . Morality and reality must be taught from the beginning of the life. Young generations are ready to follow what we teach them. Human beings generally works for money lot in their young hood after that they have more money in their old age which never fulfill their basic needs like love, affection and care . Here in this *Bruno's Dream*, The protagonist did the same mistake. Without understandings the reality and morality of life, they lead their life. They are ill-treated by their relations .Bruno spills forth tears of repentance, pursed by the fear of death. This emotional outburst is not merely impulsive. But it occurs to Bruno as long as awaited opportunity to purge the false selves. Nigel is administrator to Bruno's confidence. Self realization is made finally without strength in his mind.

**ANALYSIS OF IMPACT OF NUTRIENT BASED SUBSIDY  
POLICY ON CONSUMPTION OF FERTILISERS IN  
BIHAR, ODISHA AND WEST BENGAL**

**DR. SK TIBUL HOQUE**

Assistant Professor of Economics  
AMU Centre Murshidabad West Bengal India

**Abstract**

This research article tries to assess the impact of 'Nutrient Based Subsidy' policy on consumption of chemical fertilisers for the three states such as Bihar, Odisha and West Bengal during the period 2000-01 to 2019-20. The Bai-Perron test statistics technique has been chosen to fix the period 2013-14 as a significant break point. Now the time span has been divided into (i) prior to 'Nutrient Based Subsidy' Policy (2000-01 to 2012-13) and (ii) regime of 'Nutrient Based Subsidy' Policy (2013-14 to 2019-2020). The 'Spline function' approach has been considered to determine the growth rate of fertilisers' consumption into two regimes. From the results of descriptive statistics, it is observed that the consumption of chemical fertilisers in 'Nutrient Based Subsidy' regime has increased but the variation of fertilisers' consumption has reduced continuously. From the empirical analysis it is also noticed that the growth rate of fertilisers' consumption per hectare has been diminished significantly in the same regime. Which may imply, the 'Nutrient Based Subsidy' policy has succeeded to control imbalanced application of chemical fertilisers.

**Key words**

Intensive Strategy, Subsidy, Nutrient, Inorganic fertilisers, Farm

**Introduction**

The government of India had implemented the five years' economic plan since 1950-51 to boost up the economic condition of the country and the basic outlook of plans were growth, employment, self-reliance and social justice (Indian Economy-2016). But from the overall performance of first and second five-year plan, it is noticed that both economic plans neglected the agriculture, but the agricultural growth is the key limiting factor in the process of

economic development. This is also supported by the 'Gandhian Economists'. Accordingly, the planner selected the agriculture at the top priority level in third five-year plan. In this plan period the policy makers suggested the government to implement the seed-water-fertilisers technology in agriculture which is commonly known as green-revolution. (Indian Economy-2015). Besides, they also recommended that to reach the expected targeted growth rate of agriculture in each plan, definitely it is absolutely essential to raise the availability of various inputs such as irrigation, fertilizers, better and improved quality of hybrid seeds, pesticides, provision of finance, etc. (Indian Economy-2015).

But four important findings are observed in the Indian economy behind the name of development. Firstly, during last few years the growth of gross value added (GVA) at constant (2011-12) basic prices from crops was highly volatile compared to both industry and service sectors. Secondly, the share of both marginal (less than one hectare) and small (one to two hectares) farmers has risen continuously in our country. As for example during 2010-11 ratio of marginal and small farmers were 67.1 percent and 17.9 percent respectively and this figure has reached at 68.45 percent and 17.62 percent respectively during 2015-16. The small and marginal farmers who borrowed agricultural loan from different non-institutional sources paid high rate of interest which was normally thirty-six percent and above per annum. It happened mainly due to the failure of the public sector banks. Thirdly, by the name of "development" the prime agricultural land is being diverted to the big and powerful builders through the government. Fourthly, the poverty in the rural area is growing that ultimately creates a sense of despair and anger among the rural people who live in below the poverty line.

Thus it is showed that in one side "India is Shining" through the development of manufacturing and service sectors and booming financial markets. But on the other side, the development of agricultural sector is Deeping gloom. In that circumstance the second green revolution is one of the key techniques to overcome the Deeping Glooming condition of agriculture.

After realising above state conditions, for boosting up the yield of the crops within limited period to shrink the deficit of the food supply as per requirement of growing number of population, the utilisation of excessive doses of chemical fertilisers is only the first and end option with the high yielding seeds. In this regard, the agricultural scientists instructed that the ratio 4:2:1 is suitable for Nitrogen (N), Phosphorus (P) and Potassium (K) to maintain environmental stability and sustainability of fertility power of arable land. But as large chunk of farmers (90%) are in the category of small and marginal group and since agriculture is the only earning option, they were compelled to cross the suggested ration about utilisation of N, P and K that is stood at 9.7:2.9:1. Which is adversely affected the environment.

The three states West Bengal, Bihar and Odisha have been selected in this study to analyse the impact of the advance modern technology in agriculture.

In these states, the agricultural sector continues to contribute more than twenty percent to the Gross State Value Added (GSVA). The share of agricultural and allied sector to the Gross State Value Added (GSVA) was 23.53 percent, 22.30 percent and 21.38 percent respectively to the state of West Bengal, Bihar and Odisha during 2019-20 at the current price (Government of India-2020). Again the growth rate of Gross State Value Added (GSVA) in this sector was 4.74 percent, - 0.01 percent and 11.92 percent respectively for West Bengal, Bihar and Odisha during the same time period at constant (2011-12) prices (Government of India-2020). Among the study states, Bihar (1820.50 thousand tonnes) is in top position in terms of quantity of fertilisers consumptions during 2019-20 and it is followed by the West Bengal (1599.16 thousand tonnes) and Odisha (574.38 thousand tonnes). Another important statistics is that the farmers of West Bengal, Bihar and Odisha were used fertilisers in average 167.90 kg/hect, 245.25 kg/hect and 67.19 kg/hect respectively which were greater than that of the country level (133 kg/hect) in the year 2019-20. The average land sizes have reached at the critical situation in the country as a whole. An average size of land-holdings were 0.76 hectare, 0.39 hectare and 0.95 hectare for West Bengal, Bihar and Odisha which were lower than that of the country's (1.08 hectare) size of land-holdings (Government of India 2020) during 2015-16.

In Odisha, nearly 83.3 percent of state population were in rural areas (Census Report 2011) and out of total workers about 62 percent were directly engaged in agricultural in the form cultivators (23.40 percent) and agricultural labourers (38.43 percent). The percentage share of small and marginal land holdings have been increased continuously and about 93 percent of operational holdings belong to the category of small and marginal farmers (Government of Odisha 2020-21).

The agricultural sector accommodated more than 70 percent population of the state of Bihar. In this state the share of small and marginal farmers has been raised year to year and now nearly 97 percent of the land holdings were in small and marginal groups and they acquired nearly 76 percent of the total area of operational holdings during 2015-16 (Government of Bihar 2020)

The state of West Bengal occupies only 2.7 percent land of the country while nearly eight percent of the country population live in this state (Government of West Bengal-2017-18). In this state out of total population about 72.03 percent people live in rural area where as it was 70 percent of the country (Government of India 2011, as per Census). In West Bengal around 95.4 percent farmers were small and marginal farmers where as 78 percent of the country as a whole (Government of West Bengal 2011).

The new intensive agricultural strategies started its journey in the system of Indian agriculture from mid of sixty for achieving the targeted growth rate of crop production within shortest possible time-span. By the name of intensive technology, it is intended to that the farmers cross the scientific limiting ratio that is balance ratio of the application of chemical fertilisers (N: P: K), which

is adversely affected the environment. After realising such disgraceful situation of agriculture, therefore, to control the reverse impact of excessive dosages of inorganic fertilisers in the strategy of raising the yield of crops from different corner, the Nutrient Based Subsidy (NBS) policy was launched by the government of India from 1<sup>st</sup> April, 2010. In this circumstance, the following strategies are advocated by government under the umbrella of NBS. Such as (i) to ensure food security of Nation, (ii) to improve productivity of agriculture and (iii) to ensure maintaining the balance in the utilization fertilizers. Therefore, in the research article, the impact of NBS strategies on chemical fertilizers has been taken into consideration to the state of Bihar, Odisha, and West Bengal during the period from 2000-01 to 2019-20. In these states, more than eight percent marginal and small farmers are indebted households as for example, it was 98.5 percent (marginal 91.1 percent + small 7.4 percent), 96.7 percent (marginal 86.7 percent + small 10 percent), and 93.9 percent (marginal 78.7 percent + small 15.2 percent) for West Bengal, Bihar and Odisha respectively (National Statistical Office (NSO), (Jan-Dec 2013)) which was around 10 percent greater than that of India (82.00 percent = marginal 63.6 percent + small 18.4 percent). This type of agricultural structure compelled the small and marginal farmers to use excessive quantity of inorganic fertilizers to the agricultural field for different crops in order raise surplus by raising yield.

This is an empirical analysis and the necessary data have been collected from the book, 'Agricultural Statistics at a Glance', published by the Ministry of Agricultural and Farmers and Welfare by the Government of India.

Bai-Perron tool is better to find out the numbers of break to the model. In the case of multiple break analysis, Bai and Perron (2003) stated that at the initial stage the 'Double Maximum Tests' test statistics that is, un-weighted and weighted maximum test statistics such as  $UD_{\max} F_T(M, q)$  and  $WD_{\max} F_T(M, q)$  test statistics are suitable technique to find-out the presence of at least one break into the trend model. Therefore, it is appropriate to consider the sequential estimation technique for fixing the number of suitable structural breaks as per requirement in case empirical analysis. Thus, the Bai-Perron (2003) test statistics is appropriate to determine the numbers of preferable structural breaks and also their appropriate location. Before applying Bai-Perron (2003) methodology, the suitable residual diagnostics test statistics (correlogram-Q-Statistics) is considered to find the problem of serial correlation (autocorrelation). The stationary has been tested by 'Eviews' through levelling step. In this discussion, the data series intended for West Bengal and Odisha are stationary. But the data of Bihar and India are non-stationary. Therefore, the correlogram has been checked by taking lag (first difference). In this stage, as per the spike of autocorrelation and partial auto-correlation, the AR (1) has been considered for removing serial correlation (for Bihar and India).

Now in order to discuss the impact of ‘Nutrient Based Subsidy’ Policy on the application of chemical fertilisers to the field of agriculture during the period 2000-01 to 2019-20 in the state of West Bengal, Bihar and Odisha, the ‘Spline Function’ approach has been taken into consideration. Now for specifying the appropriate break point(s), the test statistics ‘Bai-Perron’ has been selected. The period 2013 that is, 2013-14 has been selected as a feasible significant break point by the Bai-Perron test statistics. Since, the NBS policy was implemented from 1<sup>st</sup> April, 2010, but it will take time to get actual and remarkable effect in agricultural field. On the basis of break point, the total time period has been classified into two sub-periods, such as (i) Prior to regime of NBS Policy (2000-01 to 2012-13) and (ii) Regime of NBS policy (2013-14 to 2019-20).

$$\left. \begin{array}{l} \text{Prior to regime of NBS Policy: } \ln Y_t = \alpha_1 + \beta_1 t + u_t \text{ for } t \leq 2012 \\ \text{Regime of NBS Policy: } \ln Y_t = \alpha_2 + \beta_2 t + u_t \text{ for } 2012 < t \leq 2019 \end{array} \right\} \dots(i)$$

As per the norms of the estimation procedure, the selected variables are  $w_{1t}$  and  $w_{2t}$ . Where

$$w_{1t} = t \quad (\forall t = 1, 2, \dots, 20); \quad \text{and} \quad w_{2t} = \begin{cases} 0 & \text{if } t \leq 2012 \\ t - 2012 & \text{if } 2012 < t \end{cases}$$

The new trend equation is:  
 $\ln Y_t = \alpha_1 + \delta_1 w_{1t} + \delta_2 w_{2t} + u_t \dots \dots \dots (ii)$

The rate of growth of the utilisation of fertilizers (N, P and K) at the different regimes ( $i = 1, 2$ ) can be determined with the help of following expression:

$$[\exp(\beta_i) - 1] * 100 \text{ where, } \beta_1 = \delta_1, \text{ and } \beta_2 = \delta_1 + \delta_2.$$

Again, the equation (ii) is basic equation to the calculation of growth rates for selected parameters into two regimes of fertilisers’ consumption (N, P and K). The variables which are taken for the rate of growth in two phases are  $w_{1t}$  and  $w_{2t}$  respectively. The growth rate of the entire period (2000-01 to 2019-20) has been calculated by fixing the equation (iii) that is

$$\ln Y = \alpha + \beta t + u_t \dots \dots \dots (iii)$$

**Discussion**

From Table-1 which represent the values of descriptive statistics of fertilisers consumption, it is clear that the farmers are highly interested to intensive strategies of cultivation.

**Table-1:** Descriptive Statistics of Fertilisers Consumption (Unit of Measurement: Kg/hectare)

Prior to NBS Policy (2000-01 to 2012-13) (Kg/Hectare)				
Descriptive Statistics	Bihar	Odisha	West Bengal	India
Mean	131.13	53.38	140.04	110.6

Source: Author own calculation on the basis of secondary data; N=Nitrogen, P=Phosphorus and K=Potassium

The quantity of fertilizers' application to arable land in the selected states has been increased to the regime of NBS policy. In this regard, few logical points intuitively may be noted that for growing up yield of crops within recommended period, they (small and marginal farmers) think that the chemical fertilizers' is only one suitable option for HYV seeds as agriculture is their basic earning field. It helps to secure their livelihood. Besides, due to modernisation in agriculture, the farmers have replaced not only old techniques of cultivation but also harvesting strategies by advanced technology, which has created severe scarcity of organic fertilizers such as animals' dung. Therefore, such environment of agriculture automatically compelled the farmers to accept the inorganic fertilizers as prime fertilizers to cultivate the various crops. As per table-1, it is noticed that the farmers of Bihar state have applied fertilizers in larger quantity to per hectare and it is followed by West Bengal, India and Odisha to the regime of NBS policy. Besides, there is more consistency to use of per hectare chemical fertilizers for all study states in the same regime. Among three states, the consistency to the quantity of per hectare utilisation of N, P and K is the lowest to the state of West Bengal and it is followed by Bihar and Odisha. Since, the agricultural environment of West Bengal is far better than that of both Bihar and Odisha in all respect, such as, type of crops, irrigated area, qualities of cultivable land, crop seasons, number commercial crops, availability of crop loan and also transport facilities.

**Table-2.** Growth Rate of Fertilisers Consumption during 2000 to 2020 at the different Phases of NBS Policy (Unit of Measurement: Kg/ hectare)

State	Prior to NBS Policy	Regime of NBS Policy	Entire Period (2000-01 to 2019)

	(2000-01 to 2012-13)	(2013-14 to 2019-20)	-2020
Bihar (BF)	7.12*	103.10	5.27*
Odisha (ODF)	6.61*	-1.64*	3.28*
West Bengal (WBF)	3.20*	-0.15*	1.87*
India (INDF)	4.63*	-0.84#	2.34@

\*represents high level significant, # represent significant at 2% level, @ represent significant 6.6%, Source: Author Own calculation on the basis of secondary data; N=Nitrogen, P=Phosphorus and K=Potassium

From the table -2 representing the growth rate of fertilisers' consumption during 2000 to 2020 at the different Phases of NBS Policy, it is observed that the growth rate of fertilisers consumption has been reduced during the regime of the NBS policy significantly for Odisha, West Bengal and India. This growth rate is also the lowest in comparison to the growth rate of entire study period (2000-01 to 2019-20). So it may be quoted that the main objectives of the government about the NBS policy has been succeeded. This policy (Nutrient Based Subsidy Policy) is a constructive part of agricultural policies to the government because it stimulates the farmers to maintain the balance in application of differ Nutrients of fertilizers such as N: P: K to the arable land. Because it is logically appropriate for maintaining sustainability to the fertility power of arable land. It also helps to maintain the sustainability in the quality of ground water.

### Conclusion

The present agricultural scenario compelled the farmers to catch up the lucrative role of chemical fertilisers to increase the productivity of crops within the recommended period. In this environment of cultivation, they are totally careless regarding the adverse effect of imbalanced application of fertilisers to arable land as well as the negative effect on the environment.

In this paper, the impact of NBS policy on utilisation of fertilisers has been analysed by 'Spline function' approach. Now to achieve this goal, first of all, the Bai-Perron (2003) test statistics has been considered to fix the significant break point. In this analysis the year 2013 that is 2013-14 is a significant break point. Therefore, the selected period has been divided in to two regimes. One is prior to NBS policy (2000-01 to 2012-13) and other the regime of NBS policy (2013-14 to 2019-20).

From the empirical analysis it is noticed that due to popularity of intensive strategies in agriculture, the farmers have used imbalance quantity of fertilizers to arable land during the regime of NBS policy. In this regard, few logical points intuitively may be noted that for growing up yield of crops within recommended period they think chemical fertilisers is only option. The state of Bihar is in top position and the state of Odisha is in bottom position in respect of quantity to the application of fertilisers. From empirical analysis it is found that the growth rate of fertilisers consumption has reduced during the

regime of the NBS policy significantly for Odisha, West Bengal and India. It is also the lowest in comparison to the growth rate of entire study period (2000-01 to 2019-20). Therefore, it is remarked that the NBS policy may be a little helpful for controlling the adverse effect of imbalanced use of inorganic fertilisers on the sustainability of environment. In this regard, the agricultural extension service will be a vital tool for insisting the farmers to test the quality of soil regularly before utilising the chemical fertilisers to different crops as per recommended scientific ratio of Nitrogen (N), Phosphorus (P), and Potassium (K).

Tiruchirappalli Tamil Nadu India

**Abstract:**

Recent years have shown in an intense change in the sphere of marriage and family. The single most important factor which influence the family life is the quality of the marriage, The family has by common consent, been regarded as the most important and basic element of society. The need to preserve stability and continuity within the family, and to maintain the spirit of faith and confidence amongst its members is almost universally recognized. When the stability, faith and confidence are threatened by a dispute between family members the law is invoked. The very purpose of the family Court act is to promote conciliation efforts should be made to secure speedy settlement of disputes relating to marriage and family affairs and the connected matters.

**Key Words:** Marriage, family, Court, Act. Society,

**Introduction:** The last three decades of the 21<sup>st</sup> century Tamil Nadu state had made tremendous change in marriage and its impact on the family. This social problems in Tamil Nadu in the past did not receive the attention. Even after Independence though the National government accepted the 'welfare state' as its goal and was keen In tackling the various social problems confronting the country. Yet much could not be done immediately in solving these problems because of certain other important problems arises.

Ever since the Indian Constitution was adopted there has been several attempts at different levels, in Government and outside, to make justice easier and to make equal justice under law, a functional reality to all irrespective of one's sex, religion or economic level of living as guaranteed the Constitution. The family has, by common consent, been regarded as the most important and basic element of society. The need to preserve stability and continuity within the family, and to maintain the spirit of faith and confidence amongst its members, is almost universally recognize.

Marriage is an important part of family life a family arises as a result of marriage. The single most important factor which influences the quality of family life is the quality of the marriage that supports it. Marriage is a sacrament in Hinduism and other major religions. A great deal of importance was attached to marriage. The family is by far the most important primary group in society. According to Burgess and Locke have defined "Family as a group of persons united by ties of marriage, blood or adoption, constituting a single household; interacting and communicating with each other in respective social roles of husband and wife, mother and father, son and daughter, brother and sister; and creating and maintaining a common culture."<sup>1</sup> Family is the primary social institution and a pre-requisite unit of the society. Law and life are symbolic and the process of the former. Family arises as a result of marriage. The single most important factors which influence the family life is the quality of the marriage that support it. Marriage is a sacrament in the Hinduism and other major religion.<sup>2</sup>

**Forms of Marriage:**

**Polyandry:** One wife and plurality of husbands. It may be either fraternal polyandry where wife marrying brothers or non fraternal where the husbands need not be brothers.

**Polygamy:** More appropriately called polygyny, refers to one husband and many wives.

**Monogamy:** One man one wife.

**Hypergamy:** Marriage of daughter in superior family.

**Levirate:** Marrying childless widow of his brother.

**Sororate:** Marrying the sister of the deceased wife.

**Soral Polygyny:** Aman marrying several sisters.

**Anuloma marriage:** An inter caste marriage where an upper caste man marries a lower caste woman.

**Pratiloma Marriage:** An inter caste marriage where a lower caste man marries an upper caste woman.

**Concubinage:** A woman cohabiting with a man without marriage.

**Exogamy:** Marrying outside blood relationship.

**Endogamy:** Marrying within the blood relationship.<sup>3</sup>

Family and community seems to have more impact on our happiness than money and health. People with strong families who live in tight-knit and supportive communities are significantly happier than people whose families

are dysfunctional and who have never found a community to be part of marriage is particularly important. Repeated studies have found that there is very close correlation between good marriage and high subjective well being and between bad marriages and misery. Within the family are a matter of unconsciously conforming to traditional attitudes, of accepting roles which conform to the social values expressed in the mores. Most women are content to submerge their identity in adopting their husband's name. Without raising a question as to the underlying significance of the practice.

**Origin of the Family:**

It is difficult to trace the origin of the family, nor is it possible to accept any particular theory of its evolution. It may be noted that it did not come into existence all of a sudden and many factors with varying degrees contributed for its evolution. It was believed by some theorists like Morgan, Lobbok, Frazer that early stages of casual social promiscuity among women and men laid the seeds for the modern family. Realization of economic advantage in men being attached to the mother slowly developed the family system. Prior to the Industrial Revolution the daily life of most humans ran its course within three ancient frames; the nuclear family, the extended family and the local intimate community. An intimate community is a group of people who know one another well and depend on each other for survival.<sup>4</sup>

Family basically provides for home which will work as a giant shock absorber against emotional intensities, provides for warmth and affectionate relationship and sense of belonging. Recent years have shown in an intense change in the sphere of marriage and family. At present rapid industrialization, Proliferation of Multi National Companies, have created a distinct class of youngsters. The born of club culture encouraging the increased inter action and intimate relation across the gender, it causes the ending up of marriage. The primary causes for the marital discard for young couple areas follows:

Rise in violent behavior

Cruelty

Lack of trust on each other

Alcoholism and Gambling

Problems of adjustment, especially in joint family

Extra – marital affairs

Physical illness

Falling values

Hyper tension and

Lack of understanding.

All these alleged misunderstanding of either of the make overt and covert overtures with anyone, beyond the nuptial relationship and willful experiments to change the life partner, When the stability, faith and confidence are threatened by a dispute between the family members the law is invoked. An adjudication in matters concerning the family affects not only the immediate

parties to the proceeding, but also other members of the family. This led to a movement for the creation of family court in India. Family courts have been in existence for several decades in countries like United Kingdom, Japan, Australia and New Zealand etc., but the movement to establish Family Courts in India was initiated around 1958 by Smt. Durgabhai Deshmukh, the social worker from Maharashtra.<sup>6</sup>

The Committee on the Status of Women recommended in 1975 that all matters concerning ‘family’ should be dealt with separately.<sup>7</sup> The emphasis should be laid on conciliation and achieving socially desirable results with the elimination of rigid rules of procedure and evidences. The Law Commission in its 59<sup>th</sup> Report in the year 1974 had also stressed that, the courts ought to take an approach radically different from that adopted in ordinary civil proceedings and that reasonable efforts should be made towards settlement before the commencement of the trial.<sup>8</sup> The Code of Civil Procedure in 1976 which called for a different approach to some disputes and the need for effort to settle them expeditiously since existing courts were overburdened with a heavy backlog of cases and coupled with a tedious dilatory and technical procedure. The committee on the Status of Women in India in its report submitted in the Government of India emphasized the need to establish Family Court.<sup>9</sup>

The Family Court Bill was framed in 1984, this Bill provide for the establishment of Family Courts with a view to promote conciliation in, and secure speedy settlement of disputes relating to marriage and family affairs and for matters connected therewith.<sup>15</sup> The Parliament has passed the family Courts Act, 1984. Under the Act a. provide for establishment of Family Courts by the State Governments; b, make it obligatory on the State Governments to set up a Family Court in every city or town with a population exceeding one million.

The Family Court Act encourage and empowered various state governments to setup a Family Courts in all cities with a population of over one million people. The Ministry of Law Department of Justice is the Nodel Department concerned with the administration of the Act. As per the Family Court Rules of Tamil Nadu the first Family Court was started in Chennai in 1988. It was established on the following :<sup>12</sup>

S. No	Date	G.O. Nos	Courts
1.	03.10.1989		First Family Court <sup>13</sup>
2.	19. 04. 1990		I Additional Family Court <sup>14</sup>
3.	21.09. 1994	1123	II Additional Family Court <sup>15</sup>
4.	13.08.2010	719	III additional Family Court <sup>16</sup>
5.	15.07. 2011	392	Holyday Family Court <sup>17</sup>

It was followed by Madurai in 1992, in Coimbatore in 1995 and Salem in 1996. The primary duty of the Family Courts is to make efforts for settlement in every suit or proceeding, endeavor shall be made by Family Courts in the first instance, where it is possible to do so consistent with the nature and circumstances of the cases. The cases filed in five categories they are as follows:

- Original Petition;
- Original Suit;
- Maintenance Cases;
- Miscellaneous Petition;
- Interlocutory Application.<sup>17</sup>

The cases filed in Chennai Family Courts from the year 2001 to 2005 in the following order

S. No	Year	O.P	O.S	M.C	M.P
1.	2001	1960	146	307	952
2.	2002	2330	178	374	1173
3.	2003	2570	185	471	1337
4.	2004	2843	179	687	1681
5.	2005	2723	129	628	1630

The family Courts Act also covers areas of the following:

Hindu Marriage Act, 1955 ;Special Marriage act,1954;Hindu Adoption and Maintenance Act, 1956<sup>18</sup>;Parsi Marriage and Divorce Act,1936;Indian Divorce Act,1869 ;Christian Marriage Act,1972<sup>19</sup>;Dissolution of Muslim Marriage Act, 1939 ;Hindu Minority and Guardianship Act, 1956 ;Criminal procedure Code , 1973, Sec125,126,127 and 128 ;Guardians and Wards Act, 1890<sup>20</sup>

Every year shows that increasing of the filing cases. Due to the changing trends in family and marriage system affects the entire society. A marriage which is based on exclusively upon the dreaming and extravagant vagaries of romantic idealism without consideration of money, social position, cultural dissimilarities and parental objections, faces a tremendous handicap. The wives and husbands who are convinced that romantic happiness is the sole criterion of marriage are likely to think that something has happened when the edge has worn off first careless rapture. Family disorganization in the external manifestation may take the form of desertion, separation, divorce, physical violence or use of abuse language. But these manifestations are only the superficial symptoms of a break down in the intimate relationships within the family.

Status and role in marriage are also in a process of rapid change, as husband and wife are called upon to assume new social positions and play new parts in the society and family. The traditional pattern of family structure evolved with the time. But the situation has so altered by the rapid changes in the

technology that many former patterns no longer apply. Today the uncertainty and ambiguity of roles in the family mean that persons are unable to adjust to their marital obligations. They are never quite sure what their role actually are. The wife today faces the major confusion in status and role, not because of any temperamental weakness or genic incapability, but because her behavior has changed more drastically than that of man. The educated woman has undergone a considerable change regarding her role and status in society whereas the attitudes of the husband and of the in-laws towards her role and relationship in the family have remained comparatively unchanged.<sup>21</sup>

The Family Courts has increased the number of petition every year consistently the data for the year 2001- 2005 were enumerated the registers maintained by the family Court, Madurai, Tamil Nadu. The ratio of divorce petition filed under mutual consent was high, the consistently increase for the dissolution of marriage. The idea of the concept of divorce is very old and its origin is not traceable. In India being a vast country, the concept of divorce different from caste to caste and place to place.<sup>22</sup> In Hindu law, marriage being a pious obligation was treated as eternal, indissoluble, holy union. It is, in fact, treated as a tie which continue even after death. Divorce was not permitted even in extreme situations.<sup>23</sup>

Gender of Petition	2001	2002	2003	2004	2005	Total
Women	390	397	575	574	732	2666
Men	351	410	550	600	720	2631
Total	741	807	1125	1174	1452	5297

The statistics shows that the number of petitions has increased every year almost double in the 5 years. Though Counsellors and the and the Psychologist advocates the importance of family and society they never realize their position.<sup>24</sup>The family Court Act provided for the appointment of full time marriage counsellors for each court, According to their opinion of the family counsellor<sup>25</sup>, lack of commitment for marriage, failed expectations, conflict between individual, unhealthy relationship,ego clash, addictions and substance abuse, physical, sexual and emotional abuse, mismanagement conflict, poor communication, extra- marital relationship, lack of trust on each other dowry harassment, sexual in compatibility, physical illness, conflict with in-laws were expresses as the causes for the matrimonial disputes.<sup>26</sup>The socio-psychological change in the attitude of educated earning women have undergone a considerable change regarding her role and status in society. Whereas the attitudes of the educated woman have pointed out that the attitude of husband and of the in-laws towards her role and relationship in the family have remained unchanged.<sup>27</sup>Before ten years before 2000 Divorce cases were filed in Family Courts, Chennai. At present more than 8000 cases are still in the family court. IT Technocrats had failed in their marriage.

**Conclusion:** The current instability of marriage and family system is the cause for the increase in number of cases coming to the family courts. This was viewed as the outcome of many social and cultural changes of the recent times. The lack of preparation for marriage, hasty marriage, changing economic roles of husband and wife, economic independence of women, the growing individualism, emotional immaturity, economic insecurity, sexual incompatibility lack of respect for elders and in-laws, increasing alcoholism among men were attributed as the primary cause for these problems. The newly married couple, are seeking divorce within a year of their marriage The family court symbolize a very modest beginning showing an awareness that human consideration is paramount in family laws. Marriage is more than a sex relationship with prescription for caring for offspring. It is a functional relationship between two personalities involve some varied items as habits, friendship, aversion, property, ideals, attitudes, purposes and potentialities. When the husband and wife love each other their two personalities function more effectively, because of the marriage relationship. The most important aim of the family courts are achieving their goals in our society.

### **Abstract**

The women street vendors secure self-employment in the urban labour market. The women street vendors are vending the products of vegetables, fruits and flowers and who are travelling from the sub-urban area and adjacent rural area to urban area for street vending. The present researchers attempt to explore the socio-economic status, challenges and pre and post COVID-19 status of women street vendors in the Chennai Urban area. The data has been collected by interview with the structured questionnaire and convenient sampling method used to collect the data from 100 respondents. The majority of respondents having job satisfaction and continue to do the street vending further. This study focuses to identify the barriers and challenges for women street vendors and the outcome of the research will contribute to further research on the subject and policymakers and local authorities can understand the issues from the exact point of view and eliminate the barriers of women street vendors in their jurisdiction.

**Key Words:** Women, Street Vendors, Street Vending, Informal Sector.

### **Introduction**

The women street vendors are contributing good service to the public and the essential commodities are readily available in the nearby locality. The commodities are sold by the street vendors are mostly purchased on a day to day basis and generally available fresh commodities only. The women street vendors are significantly contributing to the economic conditions of their family and ensure the daily income source to their family. The women street vendors are independently purchasing their commodities, brought back to selling point and selling the entire goods by the evening irrespective of climatic conditions of hot air, cold waves, rain session and summer days and polluted air. The public is adopted to purchase small items from the big malls and online purchasing system and still, the women street vendors are performing the vending in the urban area.

The researcher has taken 100 samples through a convenient sampling method. The researcher collected the primary data through the questionnaire with the component of street vending employment and functional variables. The result was analyzed using the simple percentage method. This research and its results are only applicable to the respondents of the Chennai urban area in the category of Women Street Vendors and not applicable to any other places. It is not generalized, the results are subject to change by the personal experience in their street vending career of women and vending place of the respondents.

#### **Demographic Profile**

**Table – 1: Age of Women**

21-30	31-40	41-50	51-60	61-70	Total
34	42	19	4	1	100

The age profile of the respondents shows that the majority (42%) of street vendors are in the 31-40 years category and (34%) of women from the 21-30 years category. The table shows that (19%) of women from 41-50 years category, (4%) from 51-60 years category and (1%) women from above 60 years.

The study shows that (76%) of women from 21-40 years of age and (95%) of women from 21-50 years of age category in street vending.

**Table – 2: Residential area**

Urban	Sub-Urban	Rural	Total
27	52	21	100

The women vendors are from urban, suburban, and rural areas involving in street vending in an urban area. The study reveals that the maximum (52%) of women from Sub-urban area of the city. The (7%) of respondents are selling commodities 11-12 hours which is the maximum hours reported and (5%) of street vendors are selling commodities 3-4 hours per day reported lowest hours per day during this study. The majority (69%) of respondents are getting assistance from their family members and the remaining (31%) of respondents are not getting any assistance from their family members.

8. (43%) of respondents are earning Rs.301-400 and (18%) of respondents are earning Rs.401-600 per day. (13%) of respondents are earning Rs.601-800, (15%) of respondents are earning between Rs.801-1000. There are (11%) of respondents are earning between Rs.1001-1600 per day.
9. The (41%) of respondents are having the experience of 6-10 years category, and (34%) of respondents are having the experience of 1-5 years category, (15%) of respondents are belong to 11-15 years, (7%) of respondents are having the experience of 16-20 years category and (3%) of respondents are having the experience of above 20 years category.
10. The (39%) of respondents are travelling by train (27%) of respondents are prefer a walk, (23%) of respondents are prefer bus and (11%) of respondents are prefer share auto as the mode of travel to reach their selling point from the residence.
11. (54%) respondents are belonging to a family having an earning of 2 members, (33%) respondents are belonging to a family having an earning of 1 member, and (13%) respondents are belonging to a family having an earning of 3 members.
12. (59%) of street vendors are selling the remaining goods on the next day and (41%) of street vendors are selling the remaining goods at a discounted rate.
13. The (63%) of street vendors borrowed loan from private loan/money providers, (16%) respondents from Self Help Group (SHG), (12%) of respondents from personal savings, and (9%) of respondents are borrowing money from friends and relatives to execute the street vending.
14. The majority (54%) of involving street vendors due to lead the life, and (34%) of street vendors to support the family and (12%) of street vendors are engaging street vending due to financial crisis.
15. The majority (47%) of women vendors are reported that the public toilet facility is located far away, (41%) of women vendors are reported that the public toilets located too far away and (12%) of women vendors are reported that the public toiletis available nearby area.
16. The majority (73%) of street vendors are not having a bank account and only (27%) of women street vendors are having a bank account in their names.
17. (69%) of street vendors are reported that the purchase price of commodities is increased after the post lockdown period of the COVID-19 pandemic. (22%) of street vendors are reported that the purchase price of commodities has remained the same as pre-COVID-19 and (9%) of street vendors are reported that Purchase Price of

commodities is decreased in commodities of flowers due to a decrease in the demand.

18. The (59%) of street vendors are reported that they are selling the commodities remain the same as the pre-COVID-19 situation and no change in the pattern of selling the commodities. (18%) of the street vendors are reported that they can easily sell the products during the post lockdown period and (23%) of street vendors are expressed that they are facing difficulties to sell the commodities after post lockdown period.
19. (61%) of the street vendors are stated that the income level after the post lockdown period remains the same as earlier. (24%) of street vendors are stated that the income level has decreased after the post lockdown period and (15%) of street vendors are reported that the income level has increased after the post lockdown period.
20. The individual doing any kind of job should have job satisfaction irrespective of the job profile, income pattern, and educational qualification. This study reveals that (81%) women street vendors have stated that they are satisfied with the job and having a lot of hindrance of environmental issues and manmade issues and social causes. The least (19%) of respondents are not satisfied with the street vending career.
21. (86%) of women street vendors are expressed that they will continue the street vending in future which is being livelihood of them and (14%) of respondents are stated that they will change to some other profession and not likely to continue the street vending.

### **Conclusion**

Women street vendors were played important role in the COVID-19 period and bringing goods at doorsteps like vegetables and fruits. The lockdown period due to COVID-19 has adversely affected sources of livelihood as a result of which might have also consumed saving during this period. Therefore, is urgent to need to provide credit for working capital to resume their business recognizing this immediate requirement. The majority of women street did not have the license for street vending, due to a lack of knowledge and unaware of the procedures to avail of the license. If the authorities create more vending zones and make the formalities of the grant the license to the vendor's much easier, the women street vendors will be benefitted. The women vendors mostly depend the money on private people for the vending and banks are not offering a loan to street vendors. They borrow money with a high-interest rate from private people and returning money on daily basis. The bank loan facility for women street vendors will boost this category and they live a dignified life without any stress. The government needs to formulate various programs to address the need for women street vendors hassle-free manner.

The women street vendors have various challenges in a society like the competitiveness of neighbouring vendors, small & big shops, malls and increase the trends in online purchase. They are low wages earner and long been recognized as a driver of inequality. It has a direct link to wage inequality, lower-income, poor education outcomes and physical and mental health has been affected. The unpaid and invisible working hours has been exacerbated exponentially by COVID-19. Without adequate support, the long term cost of stretching, women works to patch up the holes in social protection and public service. Provision can be enormous so that immediate action is needed to guarantee continuity of care for those who need and recognize the women street vendors participation in the labour force.

They have been concerning weaker section to come to feed their daily bread so they are sellers, not a beggar. The women vendors are selling the goods and commodities having a low price but it does not mean they should be treated at a low level. Our society views them to be changed and treat them in a dignified manner. The impact of health pandemic can make it more difficult for receiving treatment and health service amongst women street vendors. Proper inclusion of making policy and schemes, concern needed immediate attention to women street vendors.

**Abstract**

Environmental crisis as a global emergency has been dealt by writers, thinkers, and activists in manifold ways for centuries. Since the survival of the human race depends upon the environment, any activity detrimental to it ostensibly jeopardizes the future of the human race. Nevertheless, the evolution of the human race has ushered in the development of human civilization at the cost of the environment, which is one of the major paradoxes of development. Vandana Shiva equates this development to “maldevelopment” as it entails the destruction of the environment and is bereft of “the feminine, the conservation, the ecological principle”. Admittedly raising the ecological consciousness has been a major concern of writers across the globe – be it post-war environmental destruction, industrialisation, illegal dumping, landfills, deforestation, hazardous nuclear waste, or exploitation of the environment due to technological development. Taking a cue from this, this paper juxtaposes two powerful texts from two different centuries which are T. S. Eliot’s *The Waste Land* (1922) and Sarah Joseph’s *Gift in Green* (2011) to examine the issues related to the exploitation of the environment across time, space and culture. The paper explores fraught intersections between technologically driven development and environmental

hazards in the two texts where the writer's major concern is to reclaim the lost environment by revisiting maldevelopment by highlighting the inadequacies of the developmental model adopted by modern men. Nevertheless, both the texts while depicting the adverse impact of development, industrialisation, and urbanisation on humans and the environment ends on an optimistic and hopeful note that both human and environmental loss can be renewed if approached timely with the right intentions.

**Keywords:** environment, degradation, development, maldevelopment

The dysfunctional relationship of humans with the environment is universal and can be seen in all modern societies. However, in ancient societies men used to live in harmony with their environment but due to industrialisation, capitalisation, technological advancement, the bond of humans with the environment gets ruptured. All these contemporary advancements are undertaken in the name of the development of human society but this development leads to environmental exploitation. Therefore, a prominent ecofeminist of India, Vandana Shiva (2010) equates development to "maldevelopment" and argues "what is currently called development is essentially maldevelopment, based on the introduction or accentuation of the domination of man over nature and women" (p. 6). This domination of nature results in environmental deterioration which in turn adversely affects not only the physical health of human beings but also their spiritual life across cultures and time.

Comparative literary studies emphasize such intercultural connections as illustrated by Mathew Arnold, "Everywhere there is connexion, everywhere there is illustration: no single event, no single literature, inadequately comprehended except in its relation to other events, to other literatures" (qtd. in Sahin, 2016, p.6). Later, Rene Wellek (1970) while quoting the famous Van Tieghem's understanding of comparative literature states "the object of comparative literature is essentially the study of diverse literatures in their relations with one another" (p.15). This explicitly states that the relation between different literary works requires to be addressed while comparing two works. In a similar vein, the present paper aims to undertake the comparative study of two texts belonging to different times and spaces in order to bring out the relation of one with another regarding the representation of environment vis-à-vis maldevelopment. The texts under consideration are T S Eliot's *The Waste Land* (1922) and Sarah Joseph's *Gift in Green* (2011). This comparative study is important to showcase the universal human behavior that after almost nine decades *The Waste Land* (1922) echoes in *Gift in Green* (2011) in its representation of environmental crisis at the hands of humans and thus, depict similar ecological concerns of these two writers belonging to different periods and different cultures.

T. S. Eliot, a stalwart of modern literature, has incorporated diverse modernistic themes in his works. *The Waste Land* (1922) as a masterpiece of modernist literature is partially personal as well as having universal

undertones in which he has depicted the cultural problems of the twentieth-century of his own generation and more specifically of western civilization. Eliot laments the loss of values and corruption in modern times and the dominant tone along with lament is of nostalgia of the lost past. Along with moral and spiritual decline, one of the prominent themes in the text is the immense ecological degradation caused by the human activities in the race of material advancement and development which makes *The Waste Land* (1922) a critique of modern industrialization as maintained by Archana Parashar (2015)

One major theme that Eliot treats in detail is the role of technology and industrialization in the downfall of Western civilization. Unlike earlier modern poets such as Walt Whitman, Eliot uses *The Waste Land* to draw connections between the mechanization and technological advancement in everyday life and the degradation of human dignity. In this way, Eliot's poem can be read as a criticism of the Industrial Revolution and its effects on society. As Eliot radically juxtaposes these images of modern industrial society against allusions to mythology, he uses the disjointed and chaotic structure of *The Waste Land* to demonstrate the difficulty of finding meaning in the modern world. (p. 160)

On the other hand, Sarah Joseph is a contemporary South Indian writer and is a potent voice against marginalisation and oppression of the women and exploitation of the environment. Besides, she is equally renowned for her active role in environmental movements in South India along with her writings. Her novel *Gift in Green* (2011) that is originally written in Malayalam, is translated into English by Valson Thampu. This novel traces the story of the transformation of Aathi- a serene village surrounded by pristine water bodies into a degraded and decayed place as a result of developmental projects initiated in the village. However, not only Aathi but Joseph has depicted many other places in the novel that represents the adverse impact of human activities on the environment. In the words of Sarah Joseph, "*Gift in Green* has been forged in the furnace of my anguish: anguish at having to witness the corruption of the earth and water that sustain human life and a host of other lifeforms. It is also my protest against the murderous covetousness that despoils the future of the generations to come." (Joseph, 2011)

Sarah Joseph's *Gift in Green* (2011) echoes the issues taken up by Eliot in *The Waste Land* (1922) in many ways right from the concern for a peaceful man-nature relationship coupled with human domination over the environment. The very first similarity between the two texts is their mythical design and non-linear structure. Intertextuality as a common feature in both texts illustrates the flow of the past into the present. Both Eliot's and Joseph's allusion from medieval romances, Puranas, Quran, the Bible, Zen, and Sufi traditions reinforce the ancient human wisdom pertaining human- nature bond

and balance being made in ancient times regarding their relationship with the environment.

Moreover, the works are fraught with historical, political, social, spiritual, and environmental overtones. However, to reclaim environment in both the works will be undertaken to examine the concerns of the writers towards the environment and the attitude of people then and now in order to argue that despite so much human advancement and so-called development human beings are still the same and this development is basically maldevelopment. The post-war modern industrial society of *The Wasteland* (1922) that is concerned about its own selfish pursuits can be seen in the novel too but what makes the two texts dissimilar is the fact that in Aathi there still exists one section of society, spiritually enlightened who are conscious and aware of the fact that environmental degradation is threatening. The other section, motivated by Kumaran is only after their own selfish pursuits and treats nature as well as fellow human beings as means for achieving their ends.

*The Waste Land* (1922) depicts the spiritual degeneration along with the environmental degradation caused by modern industrial activities of man and the hopelessness in modern society but ends with a positive note that by imbibing the values enshrined in oriental philosophy the wasteland can be turned into fertile and prosperous land, this same kind of faith is shown by Vandana Shiva (2010) maintains, “ Recovering the feminine principle as respect for life in nature and society appears to be the only way forward, for men as well as women, in the North as well as the South” (p. 222). Therefore, the oriental philosophy that believes in reverence towards nature and recognises life in non-humans is required to be followed to restore the environmental crisis. *Gift in Green* (2011) shows the environmental crisis brought in by the developmental activities initiated by modern city men in the village Aathi and its impact on the environment and on the life of people. What makes both works comparable is the depiction of environmental degradation as a result of masculine activities. The first world war and industrialisation is modern men's endeavor that results in human loss as well as environmental loss in *The Waste Land* (1922) whereas developmental projects in the *Gift in Green* (1922) too are initiated by men that enormously affect the environment and human lives. These patriarchal practices and the ideology of assuming nature as passive in the developmental model results in crisis and the same is illustrated by Vandana Shiva (2011)

Patriarchal categories which understand destruction as ‘production’ and regeneration of life as “passivity” have generated a crisis of survival. Passivity, as an assumed category of the ‘nature’ of nature and of women, denies the activity of nature and life. Fragmentation and Uniformity as assumed categories of progress and development destroy the living forces which arise from relationships within the ‘web of life’ and the diversity in the elements and patterns of these relationships. (p. 3)

The literal meaning of wasteland suggests the land that is barren and has no value. And metaphorically, it represents the human beings who have lost all values and the corruption in modern civilization has reduced them to waste too as depicted in “The Burial of the Dead”

What are the roots that clutch, what branches grow  
Out of this stony rubbish? Son of man,  
You cannot say, or guess, for you know only  
A heap of broken images, where the sun beats,  
And the dead tree gives no shelter, the cricket no relief,  
And the dry stone no sound of water (Eliot, 2001, p.5)

These lines suggest the despair and gloominess of modern times that cannot be even comprehended by the mythical figures ‘son of god’, the current ecological chaos can only be observed and suggests the environmental exploitation like “the dead tree gives no shelter”, “heap of broken images” (Eliot, 2001, p.5) and scarcity of water. *Gift in Green* (2011) also provides the analysis of chaotic society as a result of environmental degradation where the picturesque and pristine landscape has been turned into ‘wastescape’ and ‘desertscape’. Now there are no water bodies in the village as they have turned into landfills and innocent villagers remember those past days and mourn for the loss.

Eliot postulated the Global environmental concerns in *The Waste Land* (1922) and becomes relevant to understand the present-day predicaments through the depiction of cities that are rendered unreal by Eliot and thus making them universal across time and space when he says in “What the Thunder Said”, “Falling towers//Jerusalem, Athens, Alexandria//Vienna London//Unreal” (Eliot, 2001, pp.17-18). This description of different cities parallels the description of different places in the novel. London, Vienna, Jerusalem, Athens, Alexandria are being presented as “unreal” (p.17) wherein inhabitants are living a mechanized life and the city is covered with brown fog as a result of pollution and immense industrialization. Similarly, in *Gift in Green* (2011), one of the characters Divya who lives in Mumbai narrates the plight of the people of Mumbai and their struggles for clean water to her brother as most of the water bodies are being polluted. In her words,

The water there is heavily chlorinated. Not good to drink. Or even to bathe with. Tea made with it makes you nauseous, it tastes so awful’, Divya complained. Drinking water had to be bought. Those who could not afford to buy safe water used tanker water for drinking and cooking. Every now and then an epidemic of vomiting and diarrhea broke out and lingered as though reluctant to leave Achhu had got the infection once. It nearly killed him. (pp. 30-31)

Furthermore, in the description of various places, the author brings to fore the havoc man has wrecked on the environment through the illustration of Mumbai, Chakkam Kandam, Guruvayoor, etc. The contrasting pictures of different places narrate the story of their destruction. For example, the contrast

between Chakkam Kandam and Aathi represents the dirtiness and wastescape of Chakkam Kandam and its impact on people and on the village collectively that no one wants their daughter to get married there because of the widespread filth and polluted water bodies. However, Aathi, a pristine and serene island before the arrival of Kumaran is inhabited with mangroves and people are living happily. The longing for the lost past is one of the themes of *The Waste Land* (1922) that can be analyzed in the novel also that how people of Chakkam Kandam still remembers the happy days of clean water bodies and untouched landscape as one of the villagers, Shailja's mother-in-law tells her about how her husband used to cultivate paddy field and the land was full of coconut and areca palms with backwaters adding to the beauty of the village. Zooming further into the novel, another character living in Chakkam Kandam Chandramohan laments,

Water is our only source of livelihood. If we have survived, it is because of Chakkam Kandam Kayal. She used to breed as much fish as we ever needed. We rushed to her when guests arrived. In ten minutes we could gather enough prawns with our bare hands to meet our needs. How carefree and contented we were! Today everyone hesitates even to touch what slimes in places of that water. It is doubtful if there are any fish. Even if they are, who will eat them? (Joseph, 2011, p. 95)

Similarly, the lifelessness around the river in the village, Aathi which used to be the symbol of prosperity and growth has become the symbol of decadence as the fishermen of Aathi starts complaining "Of late, the fishermen had been complaining continually. Ever since this thing began, baskets full of empty liquor bottles, plastic bags and rotting food had been accumulating in the mangrove forests" (Joseph, 2011, p.86). Joseph highlights various other anthropogenic activities that destroy nature like the disposal of medical waste through the character of Shailaja who suspects Sweeper Mary and asked her where does the medical waste go? And to her utter surprise, the sweeper replied 'to the bottom of the earth' (p.72). It is not only the medical wastes, placenta, umbilical cords, sanitary napkins that are being dumped on the earth's surface but "Besides Placentas and murdered fetuses, Shailaja saw, emerging from innumerable cracks and crevices, several limbs, swabs oozing with pus, blood clots, decomposed phlegm, chemical agents, plastic bottles and bags, garbage" (p.75)

Nevertheless, in both the texts water has been used as a metaphor to present the degradation and deterioration of the environment by the insatiable modern man. Eliot has presented what immense industrialization has done to the water bodies, "The river sweats /Oil and Tar" (p.14). Oil and Tar is the symbol of industrial waste that is drained recklessly in water bodies and the same can be analyzed in the novel too, thus universalizing the human attitude towards the environment over time, space and culture. "None of us ever eats or drinks anything here', the women said, their faces creasing with aversion. Shailaja was horrified. The wells, the ponds, the channels, the streams, and

backwaters, which spread like an ocean in front of the house, were all covered with layer upon layer of shit” (Joseph, 2011, p.80). The picture of dying mother earth is clearly visible in the closing lines of the third section in ‘The Fire Sermon’ as

Burning burning burning burning  
O lord thou pluckest me out  
O lord thou pluckest  
Burning (Eliot, 2001, p.15)

However, the beginning of the last section “What The Thunder Said” takes the readers towards the culmination of wasteland which is apocalyptic in many ways as the very source of life- water has become polluted and scarce.

Here is no water but only rock  
Rock and Wind and the sandy road  
The road winding above among the mountains  
Which are mountains of rock without water  
If there were only water we should stop and drink  
Amongst the rock one cannot stop or think  
If there were only water amongst the rock (Eliot, 2001, p.16)

Nonetheless, while juxtaposing the two texts it is equally important to trace the differences between the two works. So, what differentiates both texts is the presence of environmentally and spiritually enlightened people in *Gift in Green* (2011). In *The Waste Land* (1922), Eliot represents the entire modern society as corrupt who are socially and morally uprooted whereas in *Gift in Green* (2011) there is Kunjimathu, Shailaja, Dinakaran, Ponmani, etc who shows resistance and are aware of the fact that Kumaran’s development project would bring no prosperity in Aathi. Another feature that distinguishes the two texts is the representation of female characters. The female characters in *The Waste Land* (1922) are living mechanical life having no concerns with nature and living a loveless life just for the sake of living as Shamsie Farzana (2015) argued “Eliot's *The Wasteland* is an appropriate exemplar of a piece of literature which presents the punishing and painful realities of women's lives during the twentieth century, as well as their enslaved role during a repressive Victorian era” (p 62). In contrast, the female characters in *Gift in Green* (2011) are self-realistic and have a deep connection with nature as they strive hard to save the water bodies of Aathi because they are aware of the fact that the destruction of the environment ultimately leads to their destruction. Vandana Shiva (2010) has pertinently drawn an intense connection between Third World Women and Environment when she propounds:

Third World Women are bringing the concern with living and survival back to center-stage in human history. In recovering the chances for the survival of all life, they are laying the foundations for the recovery of the feminine principle in nature and society, and through it the recovery of the earth as sustainer and provider. (p.224)

Understandably, both the texts analysed in this paper give a clarion call to human beings to view the environmental devastation as an emergency failure that may land the human race in a metaphoric wasteland. Loss of environment not only leads to physical loss of humanity but spiritual and emotional loss too and the forces that degrade nature lead to the degradation of human relationships. So the preservation of the environment in this consumerist culture is required to restore the loss. Moreover, the symbol of water is widely used in both texts to establish that humans have a deep connection with it as mentioned in the novel “Water: the unending, ever-renewing fountain spring of life” (Joseph, 2011, p.44). However, the optimistic ending of Eliot’s *The Waste Land* (1922) and *Gift in Green* (2011) gives hope to humanity that by mending our ways both the environment and spiritual loss can be revived. The poem ends with the falling rain that is the symbol of growth and life and the voice of Brahma from the Upanishads traced in the thunder ‘Datta, Dayadhvam, Damyata’ – that is to give (to fellow beings and to nature), to sympathise (with humans as well as non-humans) and to control (selfish desires) and this hope in oriental philosophy is reflected in *Gift in Green* (2011) wherein one enlightened section of people has saved Aathi from becoming a dystopia. Ostensibly, towards the end of *Gift in Green* (2011) it is also the rain that washes away the foul smell, waste, and the projects initiated by Kumaran and the next day a new life in Aathi begins “The whisper of seeds sprouting in the dark//The aroma of clay from the Pokkali fields//And fingerlings playing in the waters of Aathi.” (p.348). Thus, the optimistic ending given by writers provides the much-needed hope and a way forward for the survival of humanity which is otherwise in jeopardy because of human-induced environmental crisis.

## **IDENTIFYING THE VARIOUS SOCIAL GROUPS IN THE 'JĀTAKAS'**

**DR. SHWETA VERMA**

Assistant Professor of History & Archaeology  
Hemvati Nandan Bahuguna Garhwal Central University  
Srinagar Garhwal India

### **Abstract**

Caste is a highly contested question in the Indian academia. The Indian Caste System is a closed system of stratification, which means that a person's social status obligates to which caste they were born. There are limits on behavior and interaction with people from different social status.

It can be seen that the caste and identity formation are analyzed within the matrix of changing dimension of different hierarchical structures within the domains of socio-political and economic spheres. Caste is nurtured by the socio-cultural, economic and political condition of transitional time and space and institutionalized by the hierarchical values, ideology, and norms. This kind of Social Stratification distinguishes the Varna divided society found in the age of Buddha. In this background, my paper endeavors to explore the identity of caste group to bring in the evidence in the light of Buddhist texts, the 'Jātakas. By analyzing the various caste group, their experience, and identity by situating within the context of socio, political and economic sphere, we can discern how ideology, values, and norms circumscribed their roles and identity. Their identities and experiences were entangled in the manipulative strategy of the established hierarchical ideological structures. In this contextual analysis of the Jātakas stories tried to unravel these caste group which had a different identity with some freedom in the social and economic domain but were not fully detached from the socio-economic structures, of the dominant cultural system.

**Keywords:** *Varna, Occupational Identities, Social Stratifications, Hierarchical, Jātakas.*

**Introduction** A few sociologists, anthropologist and historians have written comprehensively and adequately on the caste. M.N. Srinivas (1959), G.S.

Ghurye (1969), Andre Beteille (1970), Celestin Bougle (1971), Richard Fick (1972), D.D. Kosambi (1956, 1975), R.S Sharma (1968, 1980), V. N. Jha (1991), N.K. Wagle (1966,1995) and Devanathan (1997), respectively touch the core of several themes related to caste in their books and numerous articles. Academicians like Romila Thapar (1984), Suvira Jaiswal (1991), Uma Chakravarti (1993), and Diane. P. Mines (2009) also show an awareness of the latest trends and development in disciplines like history, sociology and social anthropology regarding caste formation during the Sixth century BCE to third century CE. Different historians, sociologist, and scholars may define the association between caste and occupation as the crucial basis of caste during late nineteenth and early twentieth centuries. Though some argued that the real structure of caste is based on the rituals one practiced, while other group argued that it is based on occupation one should perform. Earlier, there were general associations between caste and occupation, that is, non-manual, ritual occupations were associated with superior caste while manual and menial occupations were associated with the lower caste. This association is true to a certain extent. However, it may change as per time and space.

#### **Historical Discourse**

Narendra

Wagle

<sup>1</sup> in “*Society at the time of Buddha*” conducts a comprehensive discussion of the social conditions, and considers *brāhmaṇa* and *kṣatriya* to be the real socially differentiated group but not the *vaiśya* and *śūdra*, as the lines between them were blurred. On their basis, Wagle concludes that *brāhmaṇas*, *buddhists*, and the *gahapatis* represent three social ranks. He also throws some light on the position of the *gamanis*. The various epithets and names applied to these functionaries disclose their tribal and military origin; the terms *Yoddhda*, *Assiroha*, *Hatthiroha*, *Asibandhaka*, for instance speak for them. The society at the time of Buddha had generally been categorized into Kshatriya, Brahmanas and Gahapatis using the term Kula for the unit of categorization<sup>2</sup>. The alternative scheme of these categories is invariably used in situations where the common people are present and represent a division of society into the domains of power, ritual, and the economy<sup>3</sup>. Regarding the society at the time of Buddha, Uma Chakravarti argues that Buddhist rejected the Brahmanical arrangements of fourfold division in society in which the inferior automatically served the superior and had different vision related to the caste system. She further said that with regard to his *varna* scheme anyone who possessed wealth, could employ other to work for him. Buddhist text also discarded the notion of the specific function of Shudras to serve the other three *varnas*. They indicated the existence of the notion of high and low for various social categories. Related to this evidence, it appears that there was no

---

<sup>1</sup>Wagle, Narendra, *Society at the Time of the Buddha*, Popular Prakashan, Bombay, 1960, P.92.

<sup>2</sup> Uma Chakravarti., *Beyond the kings and the Brahmanas in Ancient India*, pp. 258

<sup>3</sup> *Ibid.*, pp. 305

complex system of ranking in the society. They formed a two-tier system of stratification as high and low appears in the context of *ajāti*, *kula*, *kamma*(work) and *sippa*(craft). Therefore, it appeared that there were high *jāti* and low *jāti*, high *kula* and low *kula*, high *kamma* and low *kamma* and high *sippa* and low *sippas*.

Categorizing the above *Kula*, *Kamma* and *Sippa* into high and low was based on certain principles with reference to the Buddhist system of ranking. According to which those who work for themselves were called as owner and producers are high and those who work for others were low. In this regard *Gahapati*, *Gopaka*, traders are high while flower sweeper, the bamboo worker is low. In another system of ranking, there is a division of high and low as per manual and non-manual work skill. In this regard, accounting, writing considered as high while basket maker, leather work, barber and so on were considered as low.

The primary identity of the individual dependent on their economic performance during the period of fifth century BCE to third century CE. There are various caste identities depicted in the society at the time of Buddha. In *Tittira Jātakas*<sup>4</sup>, represented the three classes looked upon as narrated in their order of succession as *Khattiyakulapabbajeto* (kshatriya), *Brahmanakula Gahapatikula pabbajito* (Brahmana and Gahapati).

These are divided hierarchically into broad caste categories such as Brahman, kshatriya, Gahapati (vaishya), the Artisans and the service classes and untouchables. Instead of their traditional vocations, they constituted a source of labor to meet the requirement of agriculture and other activities<sup>5</sup>. All the above three castes of Brahman, Kshatriya, Gahapati are in an equal position in the *Modichour Jātakas*<sup>6</sup>. *Varna Vyavastha* always presents in Indian society. In this tradition social system continuously running in the society at the time of Buddha. The specificity lies here to hold the system in such a manner in which if individual of one caste by choice adopt the occupation of another caste even though their varna could not be transformed. Under the present study, the various occupational groups represented in the *Jātakas*

#### **Occupational division**

Occupation may define as a set of activities designed to produce a livelihood. These activities decided a certain of a particular occupation. The most important term associated with it is *sippa* (craft). The society at the time of Buddha divided into two groups as *uccha* or *high sippa* and *low sippa*. The high *sippa* specified as counting(*ganana*), writing(*lekhana*), teaching and low *sippa* as leather worker(*cammakara*), potter(*kumbhakara*), reed-worker(*najakara*), the tailor(*pesakara*), and the barber(*nahapita*). In another place bowmen ship, agriculture, cattle rearing, trading and king's service

---

<sup>4</sup> *Jātaka*, Vol. i, story no. 117, P. 260

<sup>5</sup> Thapar, R., *Tribe Caste and Religion in India*, 1977, pp.31

<sup>6</sup> *Jātaka*, Vol. ii, story no. 316, P. 118

differentiated from the *sippa*. ‘*Sippa*’ is a term used for both manual and non manual skills while craft is used for manual skill only. On the basis of this we defined the different categories of occupations practiced various occupations in the society at the time of Buddha:

### **Service occupations**

In *Mukha devaJātakas*<sup>7</sup>, *Kusa*<sup>8</sup>, *Gang mala*<sup>9</sup>, *Bhimsena (weaver), Jātakas*<sup>10</sup>, showed service groups. This includes washermen (*rajaka*), the painter (*cittakara*), the barber (*nahapita*), the weaver (*pesakara, tantavaya*), and cook (*alarika, suda*). But among them the most respected service occupation in instances is the *nahapita* (barber). Sometime he enjoyed a highly lucrative position in king’s court and sometime his *sippa* considered as low and is abused by angry mother queen as low born (*nihina-jacco*) and the remover of dirt (*malamajjano*). In order to refer the king by his name. His occupation is hereditary in character as his son follow the same craft when he is old. He was giving their services in exchange of food and money.

Another occupation considered as *pesakara* (weaver) as *low sippa*. In many instances he is described as poor (*daridra*). While the cook (*suda*) enjoys better position as compared to them. He provided his service to the king, in exchange received salary and clothing, house and even gratitude (*abhihara*) for good service. The last service attendant is (*nahapaka*) bath attendant. But among them both *nahapaka* and *rajakaputta* (son) work instead of them.

### **Artisans**

In *KusaJātakas*<sup>11</sup>, *Cullaka setthi*<sup>12</sup>, *Sutta vibhangaJātakas*<sup>13</sup>, shows from the stories there were different groups of artisans. It includes the reed-worker (*nalakara*), the potter (*kumbhakara*), carpenter (*palaganda*), goldsmith (*suvannakara*), metal-smith (*kammara*), vehicle-maker (*yanakara*), needlemaker (*sucikara*), gardener (*malakara*), silkproducer (*kosiyakara*), ivorymaker (*dantakara*) and so on.

*Nalakara* as basket maker and reed maker is differentiated from the vena. His craft is a *sippa*. They lived in a village of (*nalakara gama*) outside the city near forest. This might be because of need to collect reed from the forest.

*Kumbhakara* as the potter is the most important artisan in many instances. His craft is also considered as a *sippa*. His occupation was a *low sippa*. This was the only means of their livelihood. He also lived outside the city near rivers or ponds.

---

<sup>7</sup>*Jātaka*, Vol. i, story no. 9, pp. 30-32.

<sup>8</sup>*Jātaka*, Vol. v, story no. 535, pp. 142-163.

<sup>9</sup>*Jātaka*, vol. iii, story no. 421, pp. 266-270.

<sup>10</sup>*Jātaka*, Vol. i, story no. 80, pp. 203-205.

<sup>11</sup>*Jātaka*, Vol. v, story no. 535, pp. 142-163.

<sup>12</sup>*Jātaka*, Vol. i, story no. 4, pp. 14-20.

<sup>13</sup>*Jātaka*, Vol. i, story no. 89, pp. 303-307.

*Yanakara* as the vehicle-maker, very little is known for him. It is shown that he dealt with the repairing of the wheel. The next artisan is *sucikara* as needle maker and is different from the needle vendor (*suci-vanijja*).

*Kammakara* identified as a metal-smith. He deals with the iron in shaping and modifying them. His position was also considered low as compared to the *Suvannakara* (gold-smith). He dealt with most prized metal. Here the poverty and low status contrasted with wealth and high social status.

The *palaganda* identifies as a carpenter. He also lived outside the city in his village. He dealt with the wood that was the reason lived near the forest. Next to them is the ivory-worker (*danta-kara*). His craft was also valuable and made needle and many accessories from an elephant tooth. He sold his items at the market near village to maintain his livelihood. He collected all his business material from the forest, like the carpenter he too lived near the forest in a village.

*Malakara* identified as a gardener. He provided his services in the king's court and some maintained their livelihood by selling vegetables in the city and village. Former position is considered respectful as compared to the village gardener. His craft is described by the king as *sippa*. And the work of the *puppha-chandaka* identified as flower-cutter as *low sippa*.

Next artisan is the *kosiyakara* as silk-worker. He dealt with the silk-rearing and making. He worked against the ethics and moral of Buddha, not to kill animals for the sake of his livelihood.

### **Professions**

*Mahasariipa*<sup>14</sup>, *Sarabhanga*<sup>15</sup>, *Padakushala Manav*<sup>16</sup>, *Digihitakosala Jātakas*<sup>17</sup> described the next group of occupation as profession. It included the doctor (*vejja bhissaka*), writing (*lekha*), money changing (*mudda*), accounting (*ganana*), teaching, rituals practicing, future teller and so on considered as high occupational groups. From the above occupation the profession of doctor appeared socially valued the most as *Jivaka*. His paternity is unknown. He adopted the profession besides his paternity. While the *Upali* former barber later on learned the *vinaya*. Both were ascribed as low birth. And adopted the occupation besides their paternity. But the barber was abused by the mother queen and the *jivak* as doctor liked by the people.

Thus, from the above instance it is shown that the profession opted by them makes the differences between the two and considered them as low and high. It shows that intellectual occupation considered as high. It includes the writing, accounting and dealing in money to be the best profession.

### **The Entertainers**

---

<sup>14</sup> *Jātaka*, Vol. ii, story no. 212, P. 117.

<sup>15</sup> *Jātaka*, Vol. i, story no. 72, pp. 174-176.

<sup>16</sup> *Jātaka*, Vol. ii, story no. 156, pp. 13-16.

<sup>17</sup> *Jātaka*, Vol. i, story no. 137, pp. 293-296.

In *Dubbacca*<sup>18</sup>, *Bhervada Jātakas*<sup>19</sup>, *Sankha dhamana*<sup>20</sup> *Jātakas*, depicted the various group engaged in entertaining. Occupation of this group considered as respected in the society at the time of the Buddha. It includes the actor (*nata*), dancer (*nataka*), drummer (*kumbhatunika*), acrobat (*langhika*) women fortune teller (*ikk-hanika*), courtesan (*ganika*), magician (*sokajjayika*) and so on the chief entertainer. Amongst them the above four shows their art at fairs and other place. And sometime also shows in king's court. They received remuneration for their act from the audience. In contrast to that the low caste entertainer (*candela vamsika*) and his assistant (*antevasi*) were acrobat of different type. They were socially more inferior and poorer. They lived outside the city in their village.

### ***The king's service***

In *Sutta vibhanga*<sup>21</sup>, *Ajanna*<sup>22</sup>, *Kalaya Mutthi*<sup>23</sup>, *Kharassara*<sup>24</sup>, *Kuta Vanija*<sup>25</sup>, *Dhammaddhaja*, *Cullasutasoma*<sup>26</sup> *Jātakas*, and so on showed from the instances, the various kinds of skilled individual provided service to the king. They were categories in groups as follows: warrior class. It included *yodhavija* (bowmen ship), elephant riders (*hattarooha*), the cavalier (*assaroha*), the charioteers (*ratthika*), archers (*dhanugaha*), bearer (celaka), billeting officer (*calaka*), supply corps (*pindakavika*), fierce warriors (*ugga*), princes (*rajaputta*), veteran warrior (*pukkkhandino*), heroes (*sura*), warriors in buckskin (*cammayodhino*) and body disposer (*karanika*) and the *senapati* (chief of the army). They were specialized in the war.

The second groups supported the king in administration. It includes *rajaporisa*, ministers (*mahamacca*), the territorial governor (*ratthika*), the managers (*pettanikka*), the royal chamberlain (*thapati*), elephant trainer rider (*hattirooha*), cavaliers (*assaroha*), horse trainer (*assadhamaka*), policemen (*raja bhata*), jailor (*bandhanagarika*), the village headmen (*gama, gamini*), the store keeper of wood (*darugaha*), the village overseer (*gamika*), messenger (*duta*), and the slaves and their families (*dasa, dasi*), the workers (*kammakara*). Besides the above service groups there were other who provided their service as the barber, tailor, the cook and so on. They enjoyed highly lucrative position. They get good money and wealth in exchange of their service from the kings. Thus, from the above group it is to point that minister posses the highest power. They had the same power as the king. That is the reason which made their power divided as the minister of justice

<sup>26</sup> *Jātaka*, Vol. ii, story no. 178, P. 55.

(*voharamahamacca*), treasurer (*ganaka mahamatta*), minister of all affairs (*sabbhatthakam maha matta*), and so on. The next important group is the *kammikas*, *gamika* and *rajabhatas*. They act as custom officer, tax collector and safeguard the property of the people respectively. Former collected the road tax or caravan security tax. The *rajabhatakas* service is not considered as low as depicted from the text. Moreover, they manage the highway and guided the people caravan. We find brahmana make his living from them.

#### **Trading and commercial activities**

In *Nigrodhamiga*<sup>27</sup>, *Kanha*<sup>28</sup>, *Pandara*<sup>29</sup>, *Khadiranga*<sup>30</sup>, *Jarudapana*<sup>31</sup>, *Serivanija*<sup>32</sup>, *Veri*<sup>33</sup>, *Godha*<sup>34</sup>, *Silavanaga*<sup>35</sup> *Jātakas*, showed from instances various trading groups. Trading played a vital role in the occupation. *Vanijja* is a term used for it and mention together with agriculture and cattle rearing. The occupation of trading considered as high (*ukkattha kammam*) as compared to the agriculture and cattle keeping. This occupation was followed by the Brahman, gahapati and the members of the extended kin group. Besides this big trading activities, a smaller trading also existed his important role in the society. They were runs by small shopkeeper at village or city level market. They sell meat and wine and so on. It depicted from many instances in the *Jātakas* the community of the hunter practiced the following trades are prohibited to do in future. Thus, it shows that killing of animals considered as low and cruel occupation (*kururakammanta*) in the eyes of the Buddha. He said that the fishermen who sells the fish remained the poor here and hereafter. And a butcher suffers in hell.

#### **Agriculture and cattle keeping**

*Ucchanga*<sup>36</sup>, *Dasabhraman*<sup>37</sup>, *Sudhabhojana*<sup>38</sup>, *Atthana*<sup>39</sup>, *Veri Jātakas*<sup>40</sup> depicted the various groups engaged in agriculture and cattle keeping. Earlier in peasant society agriculture considered as a most important productive source. But in the society at the time of Buddha it is practiced by the people of diverse social groups as per their situation requirement. It is depicted in many instances we find the Brahman Bharadvaja ploughing his land, which requires

<sup>28</sup> *Jātaka*, Vol. iv, story no. 440, P. 7.

<sup>29</sup> *Jātaka*, Vol. v, story no. 518, P. 45.

<sup>30</sup> *Jātaka*, Vol. ii, story no. 191, P. 79.

<sup>31</sup> *Jātaka*, Vol. ii, story no. 249, P. 186.

<sup>32</sup> *Jātaka*, Vol. iii, story no. 320, pp. 44-46.

<sup>33</sup> *Jātaka*, Vol. ii, story no. 103, P. 245.

<sup>34</sup> *Jātaka*, Vol. iii, story no. 333, pp. 71-73.

<sup>35</sup> *Jātaka*, vol. iii, story no. 315, pp. 32-34

<sup>36</sup> *Jātaka*, Vol. iv. Story no. 484, pp. 175-177.

<sup>37</sup> *Jātaka*, Vol. iv, story no. 495, pp. 227-231.

<sup>38</sup> *Jātaka*, vol. iii, story no. 354, pp. 107-110.

<sup>39</sup> *Jātaka*, vol. v, story no. 532, pp. 169-173.

<sup>40</sup> *Jātaka*, Vol. ii, story no. 103, P. 245.

500 plough shares. Other instances we find that the Mallas of Kusinara referring to their gama kheta (agricultural lands). This shows that among the three occupation the agriculture considered as precedence over all. The association of each caste group with their occupation would be considered low in the society at the time of Buddha. As I have already point out that it was the *Kamma or sippa* that provided identity to the various caste group in the *Jātakas*. The important aspect of social and economic and political life reflected in the Buddhist text *Jātakas* cannot be explained by single caste-based framework. It is significant to look at the other various dimension in order to get the clear picture of society at the time of Buddha.

### **Conclusion**

From the above study, I made an attempt in my research paper to situate the identity of caste group with special reference to lower caste group in context to the Buddhist literature '*Jātakas*'. These are the collection of the stories related to the previous birth of the Buddha, written in verses and prose. Bodhisatta or the Buddha is shown in different character with different feeling and emotion. These stories are the main medium for communicating the Buddhist values, norms, and principles with the common people who were discarded from the other high culture tradition. It is in the form of the oral tradition and folk culture, reflected the changing socio-economic condition at the time of Buddha. The relation between the lower caste group and the master also exhibited a spectrum of variations, ranging from the oppressive treatment of long-term effective relationship. Within these nonlinear and flexible dimensions of relationship, few of them obtained independent identities detached from the matrix of hierarchical relationships. The representation of women workers was always portrayed in the context of the occupation that she provided to the masters, which sometimes takes the form of long-term effective relationship also<sup>41</sup>. This rendered them a kind of independent occupational, economic status and power.

Thus, it came to conclude that in Buddhist *Jātakas* we could see a contradiction in its narration of this group of caste and women workers. As egalitarian principles of Buddhism, it never tried to cast out the entrenched dominant tradition and their norms and values, alternatively it maintained a two-pronged effect. The narrative structure laid out the scope for the social mobility and not the social equality in the materialistic domain whereas it provided the space for both on the spiritual plane. Thus, Buddhism never wanted to topple the established structure of the society in its materialistic domain but it exalted the spiritual domain as a space of social equality devoid of any hierarchical unequal relationships.

***Abstract***

This paper attempt to study the economic issues of Bodo Women and the role of education. Research studies in this context found that Bodo women are involved in different activities through which they try to make themselves economically independent such activities are-agriculture, animal husbandry, weaving, sewing, cooking, etc. But they are not much aware of scientific methods, techniques and ways of productivity, they use old -traditional ways of productivity. The role of education is very significant to improve the quality of life of women, eradicate the economic discrimination and make women independent. This study is theoretical in nature therefore, descriptive research method is used for this study. The objectives of the study are- I) To identify the Issues confronted by the Bodo women in their Society. ii) To identify the government plans and policies for women in Assam specifically for economic empowerment. iii) To analyze the importance of formal and vocational education for Bodo women. iv) To provide some suggestions for improving economic life of Bodo women.

**Key -words-** economic empowerment, education, discrimination, social context.

## **INTRODUCTION-**

Women constitute half of the world total population. In the context of Indian social scenario, the status of women in different fields such as-social, political, economy, cultural, education has been subject to many changes over the span of recorded Indian history. To make a modern Indian society women must be given equal opportunities in all fields of development along with men. To achieve this objective the Indian constitution prescribes some constitutional provisions which gives emphasis on women equality, gender equality, women status, women role, women education and all kinds of development of women.( Article 14) for equality,(article 15-1 ) for no discrimination by the state authority,(article 16 ) for equality of opportunity,(article 15-3) for special precautions for women and children,(article 39d) for equal pay for equal work,(article 51A) for renounces practices derogatory to the dignity of women etc are very significant in this regard. The Indian constitution not only guarantees the equality of women but also provides the power to the states to take legal actions against the activities which hamper women rights and status. Besides this, each state of India makes some strict laws and rules which can protect women but it cannot be said that women are free from all types of social- restrictions

The Bodos are considered as the largest majority group in Assam, they are recognized as a plain tribe in the 6<sup>th</sup> schedule of the Indian constitution. Bodo women play a crucial role to ensure sound society but still they are confronting with many socio-economic and personal problems. All kinds of development of Bodo are mostly dependent on economic independency of both men and women. From the previous it is found out that Bodo women are engaged themselves in different economic activities but this is not sufficient. To make them economically empowered much emphasis should be given to education of women. Through this study it is tried to analyze the different economic issues of Bodo women and the role of education in this context.

Deka, D.N. (2008) found out major findings through his research study as Bodo women have future positive prospects in economic and education sector, ABSU has been considered as potential platform for women, Bodo women are socially conscious and now women have joined in different public spheres which is considered as good sign of empowerment. The research study has suggested that governments effort for spreading education among women, help of financial institutions and political parties etc are very significant for making women truly empowered. Talukdar. (2012) in his study found that Bodo women take important role to develop the economic status of the Bodo community but still their poor educational status is standing as a barrier in their development. It is observed that the female literacy rate of Bodo women is not equal pace of progress with the women of non-tribal due to some socio-economic problem in spite of the government's multifarious endeavors through special stipends, scholarships, free education, and reservation seats for the female of Bodo community. Baishya, N. (2017) carried out an investigation

on Bodo people of Baksa district regarding literacy rate, government's initiatives on women health care facilities, gender-discrimination, women economic and social participation. Through this study it is analysed that male literacy rate of Baksa is 67% and female literacy rate is 53.4%. Regarding health care facilities around 70.32% women are not satisfied of government's health facilities. 56.45% women think that their status is inferior to men. In Baksa district, there are 62349 are female main workers and 215948 are male main workers. The study of the result clearly shows that there are lot differences between men and women of Bodo community in the context of different socio-economic aspects. Bodo women are involved in different economic activities such as-agriculture, weaving, sericulture, production of rice beer, engage in self-help group (Islary, E.2020).

From the above studies it can be analysed that Bodo women are involved in other some economic activities also these activities are-animal husbandry, sewing, cooking, fishing, embroidery etc. Though Bodo women are involved in different economic activities but it is not enough. They used traditional way of productivity. Bodo women are not so much aware about new scientific ways of economy. Many Bodo women in rural areas of Assam have made self-help group for their own benefit of finance. Bodo society is basically male-dominated society therefore, women financial contribution towards family is not given much recognition.**Data Collection:** Both the primary and secondary sources are used for this study like Government census-reports, governmental acts-policies, journals, books, thesis, dissertations etc. are used.

#### **Economic issues confronting by Bodo women –**

Through using oral interview schedule some evidences are collected which show that Bodo women still have to face many economic issues. The identified economic issues confronting by Bodo women are-

- a) Family income is almost dependent on the income of male members of the family.
- b) Women's income is not given due recognition in family environment.
- c) Women of Bodo society are not so much aware of new scientific skills and ways of productivity.
- d) Not given equal grant to women like men. It means gender-discrimination still exists in Bodo society in working situations.
- e) Women are basically busy in house-hold activities.
- f) Women are also involved in traditional ways of agricultural activities.
- g) Majority of Bodo women are busy in some special activities only such as-embroidery, sewing, animal husbandry, agriculture, making of rice-beer etc.
- h) Now Bodo village women make self-help groups and tries to take financial benefit from it.
- I) Bodo women have faced the problem of proper vocational and professional training.

j) Poverty, illiteracy, static social norms, old superstitious beliefs, male-dominated society etc are also the factors which hindrance in economic enhancement of Bodo women.

k) Lack of adequate knowledge for economic growth among the Bodo women.

**The different government policies for women empowerment-**

The ministry of women and child development of India has launched various schemes /programmes for women empowerment and development. These schemes are-

- I. Pradhan Mantri Mahila Shakti Kendra scheme-This scheme is for rural women and their empowerment and this scheme promotes community participation.
- II. Pradhan Mantri Matri Vandana yojana –This scheme is for improving better health and nutrition of pregnant women.
- III. National Creche Scheme- this scheme provides day care facilities for the working women of the different government sectors.
- IV. Ujjawala- it provides for prevention, rescue, rehabilitation, re-integration, re-patriation of victims trafficked for commercial sexual exploitation.
- V. SwardhaGreh- it provides relief and rehabilitation to destitute women and women in stress.
- VI. Rastriya MahilaKosh-it provides micro-financeto economicallypoor women for the purpose of their socio-economic development.
- VII. Some other Assam government schemes for women and their development,these are- Arundhati Scheme, Assam Orunodoi scheme, Atal Amrit Abhiyan Health Insurance Scheme, Sarothi, Swanirbhar Nari, Assam Abhinanadan education loan subsidy scheme etc.

Special Welfare scheme for ST candidates = Pre-Metric scholarship for STstudents, Assam Bikash Yojana &CM’s special employment generation programme, Grants for ST meritorious and brilliant students, Special Stipend for craftsman training etc.

**ROLE OF EDUCATION IN WOMEN ECONOMIC EMPOWERMENT-**

1. Education eradicates gender discrimination in the context of work and efficiency.
2. Education can remove the discrimination between power and work.
3. Education is very important for women to make them economically self-sufficient
4. Education can provide proper training of economic empowerment to women.
5. Education develops innate capabilities of women.
6. Education can develop proper skills of economic efficiency.
7. Education can make a truly modern society in where women can financially contribute equally along with men towards family and society.

8. Proper vocational education and training is very important for women for their economic development.
9. Education can enhance proper skills of economic efficiency, develop capabilities, make aware towards economic growth, develop scientific thinking and eradicate gender-discrimination in the economic sector. It means the role of education in economic empowerment is very important.

#### **SUGGESTIONS-**

1. Bodo women can develop their economic status if gender discrimination can be eradicated from the society. Creating a positive attitude among common masses is very important.
2. Role of social organizations both-formal and informal regarding women economic development is very significant. Strict legal policies must be utilized in proper way.
3. Spreading of adult education, non-formal education, open and distance mode of education is very important for women welfare so that every woman can take education at any age, government must take much initiatives in this regard.
4. Role of NGO's, social medias such as-T.V, radio, newspapers, magazines etc can take much initiatives so that women are aware towards their own rights and responsibilities.

#### **Conclusion-**

Women of Bodo society have an important contribution in the economic progress of that society. The utmost expansion of women education of Bodo society is necessary for the achievement of all sided development of the society. Studies have found that women education can be considered as an essential tool as it makes women economically efficient. Though the Bodo women are now conscious about their economic independency but it is not enough, the government must take some more special initiatives to create more awareness among women for their economic welfare which can help to utilize human resource in proper way.

**Abstract**

Training and Development is the framework for helping bank employees to develop their personal and organizational skills, knowledge and abilities. The focus of all aspects of Human Resource Development is on developing the most superior work force so that the organization and individual employees can accomplish their work goals in service to customer. Transformation in the Indian Banking industry, ever increasing competition, fast moving and complex world of latest technology have compelled banks to think of and to adopt themselves to the changing banking environment. There is need to develop the competencies i.e. Skill, knowledge and attitude among the bank staff to make them more suitable to the changing conditions, through proper Training and Development programs. The present study aimed that to know the opinion on Training and Development at private sector banks employees.

**Keywords:** Training and Development, Banks, Employee performance, Employees.

**Introduction**

In competitive global business climate, Banking sector believe that human resources are their asset and their employees drive them forward and facilitate them in achieving the organizational objective in the present technological

world. Based on this idea companies invest a lot of money in the training and development programme for their employees to change their attitude in to optimistic mode and to empower their knowledge, technical skills and behavioural pattern. Most of the Banking firms believe that improved skills will help employees to improve their individual performance and it leads to increase in the operational efficiency and customer satisfaction. Therefore, Banking sector spend billions of rupees every year for employee training and development programmes. The costs are incurred for training which covers all types of training like formal as well as informal, on-the-job and off-the-job training. With this kind of huge investment for their human resource, Banking firms are very curious, in knowing if they realize maximum return on their investments, what kind of return they really realize, and what are the other opportunity costs).

Training is a set of activities designed to increase an individual's skills, knowledge and experience. It brings attitudinal change among the employees, increases the job involvement, organizational commitment and job satisfaction and in turn enhances employee performance . The success of any training programme largely depends upon the people who are identified for training. On one side, training could be of a greater value when employees acquire technical skills, knowledge and abilities to improve their individual job performance and sustain company's competitive edge. On the other side of the coin, Banking sector opined that it would be a great waste of capital investment, if the technical knowledge and skills acquired during training are not directly applied in the job performance and / or maintained over time to convert into higher productivity and better organizational performance to align with main objectives of the business. That is why a successful transfer of training should be of a paramount magnitude as of today, in which the Banking firms spend huge cost of expenditure in employee training.

Over the years, Indian Banking sector market offerings have evolved from application development and maintenance, to emerge as full service players providing various service to customers.

Source of data refers to the source or sources of relevant information to be tapped to fulfil the objectives of the research study

Secondary data have already been collected by someone else other than the researcher to address research problem other than the research problem at hand. Secondary data are cost effective and can be accessed through various offline as well as online sources promptly.

The study used primary data collected using a questionnaire containing both open and closed ended questions...The target population of study was all the employees in selected public sector Banks in Thiruvananthapuram district

For collecting primary data, proportionate stratified sampling technique will be employed in the study. The population for this study consists of Top level and middle level employees in selected public sector Banks in Thiruvananthapuram district. Sample size is 120 determined on the basis of

20 percentage of total population. Random sampling method was used for this study. The data analysis using SPSS 20 to measure the relationship and differences between variables were revealed. In doing the analysis for the collected data and to determine there was a significant relationship among the dependent and independent variables. The primary data collected by way of administering Questionnaire was analysed and interpreted by using various statistical tools and techniques. Both simple as well as advanced statistical techniques were applied to analyse the collected data. Advanced techniques such as chi-square test, and correlation and regression have been applied to analyses the data.

Null Hypothesis: There is no significance difference between demographic variables and responds opinion about training and development programs in Public sector banks.

**Table 1**  
**Chi-Square Tests**

	N	Chi-value	P-value	Significant value
Gender * Training. and Development	120	77.715	.153	0.05
Age * Training. and Development	120	140.365	.293	0.05
Education* Training. and Development	120	138.727	.327	0.05
Designation * Training. and Development	120	120.185	.761	0.05

**Gender \* Training**

The chi-square Value 77.715, and p value 0.153 accept H0 and hence, it can be inferred that there is no significance difference between gender and responds about training.

**Age \* Training**

The chi-square Value 140.365, and p value 0.293 accept H0 and hence, it can be inferred that there is no significance difference between age and responds about training.

**Education \* Training**

The chi-square Value 138.727, and p value 0.327 accept H0 and hence, it can be inferred that there is no significance difference between Education and responds about training.

**Designation \* Training**

The chi-square Value 120.185, and p value 0.761 accept H0 and hence, it can be inferred that there is no significance difference between designation and responds about training.

Null Hypothesis: There is no association between employee Performance and factors affecting training and development in Public sector banks.

		Trainin g Need analysis	Transfer of Training to the workplace	Training Designing and Implement ation	Training Evaluation	Perform ance
Training Need analysis	Pearson Correlation	1	.756(**)	.631(**)	.652(**)	.816(**)
	Sig. (2-tailed)		.000	.000	.000	.000
	N	120	120	120	120	120
Transfer of Training to the workplace	Pearson Correlation	.756(* *)	1	.823(**)	.859(**)	.937(**)
	Sig. (2-tailed)	.000		.000	.000	.000
	N	120	120	120	120	120
Training Designing and Implement ation	Pearson Correlation	.631(* *)	.823(**)	1	.909(**)	.930(**)
	Sig. (2-tailed)	.000	.000		.000	.000
	N	120	120	120	120	120
Training Evaluation	Pearson Correlation	.652(* *)	.859(**)	.909(**)	1	.955(**)

	Sig. (2-tailed)	.000	.000	.000	.000	
	N	120	120	120	120	120

\*\* Correlation is significant at the 0.05 level (2-tailed).

#### **Analysis**

The association between Performance and factors affecting training and development in Public sector banks is exhibited in Table No.2. The factors

affecting training are Training Need Analysis, Transfer of Training to the workplace, Training Designing and Implementation and Training Evaluation. The table shows that there exists a high positive correlation between Training Need Analysis and Employee performance. The correlation coefficient was 0.756. Here the Sig. (2-tailed) value is .000. When the Sig. (2-tailed) value is less than the alpha value, we reject the null hypothesis and accept the alternative hypothesis. Thus, the correlation analysis proves that there is a significant positive association between productivity and Training Need Analysis.

The table shows that there exists a high positive correlation between Transfer of Training to the workplace and Employee performance. The correlation coefficient was 0.631. Here the Sig. (2-tailed) value is .000. When the Sig. (2-tailed) value is less than the alpha value, we reject the null hypothesis and accept the alternative hypothesis. Thus, the correlation analysis proves that there is a significant positive association between Employee performance and Transfer of Training to the workplace.

The table shows that there exists a high positive correlation between Training Designing and Implementation and Employee performance. The correlation coefficient was 0.652. Here the Sig. (2-tailed) value is .000. When the Sig. (2-tailed) value is less than the alpha value, we reject the null hypothesis and accept the alternative hypothesis. Thus, the correlation analysis proves that there is a significant positive association between Employee performance and Training Designing and Implementation.

The table shows that there exists a high positive correlation between Employee performance and factors affecting training. The correlation coefficient was 0.816. Here the Sig. (2-tailed) value is .000. When the Sig. (2-tailed) value is less than the alpha value, we reject the null hypothesis and accept the alternative hypothesis. Thus, the correlation analysis proves that there is a significant positive association between productivity and factors affecting training.

### **Suggestions**

Basic understanding of Training Need Analysis - Need analysis is a process by which an organization's training needs are identified and articulated. It is the starting point of the training process. Need analysis can identify an organization's goals and its effectiveness in reaching these goals.

Basic understanding of Training Designing and Implementation – Depending on the need analysis the basic objectives of the training will be identified which further leads to select the trainer, select the methods and techniques for the trainer and selection of trainer will be carried out. Basic understanding of Transfer of Training to the Workplace – The main goal of training is to ensure that employees perform their jobs very effectively. Basic understanding of positive effects of training - Companies can get the rewards of providing training for their employees because well-trained workers help increase productivity and profits.

Basic understanding of Training Evaluation – It is the systematic collection of information necessary to make effective training decisions related to the selection, doption, value and modification of various instructional activities.

Basic understanding of Information Technology in Training - Information technologies have affected every aspect of human activity and have a potential role to play in the field of education and training.

### **Conclusion**

There is enough evidence to show that employees who were trained on a regular basis are the ones who provide a higher quality services to the costumers. To develop an integrated and proactive training and development strategy there is requirement of coherent corporate culture rather than ad-hoc programs. In a service oriented industry such as banking, people are among the most important assets and a bank must efficiently manage its employees during every face of employment in this competitive area. It is that public sector banks undertake training and development programmer for their employees to increase their efficiency. Banks provide training programmer to enhance their knowledge and skills to satisfy the customers. Growth of banking sector in India is the result of skilled manpower which is the outcome of training and development.

### **Abstract**

The early brick structures of Assam were scattered all over the landscape mostly in ruined and dilapidated condition therefore necessitating a detailed study before it gets obliterated. The present paper is an outcome of study of these brick structure ruins considering all possible archaeological and architectural parameters. A limited comparative study also is made with the nearby archaeological sites of Bangladesh and Myanmar.

**Keywords:** architecture, temple, plaque, Assam, iconography, brick, *Nagara*.

In Assam, brick structural remains of temples are found scattered everywhere. Their presence lending essence to the heritage of the native land and reflective of abstract and overlapping thought processes and spiritual bearing of the populace through generations. According to popular definition temple is a structure reserved for religious and spiritual activities such as prayer, sacrifices or analogous rites. But the Indian temples are not mere representative of the abode of gods and place of worship but also centre of knowledge, art, architecture and culture. Brick structures excavated and explored in Assam can be divided in five clusters. a) Goalpara b) Kamrup c) Tezpur d) Nagaon e) Golaghat

About the temple styles, there is no homogeneity in religious belief and practices of the two identified cultural region i.e. the western and eastern region. The extant temples and their religious affiliation, the deity or deities enshrined and the allied sculpture and other cult objects provide insights to the

nature of religious beliefs and practices. It is beyond doubt that in the region co existed many religions and indigenous cults; sometime between 5<sup>th</sup>-7<sup>th</sup> centuries there was a massive second wave of sanskritisation whose inference has been drawn from the land grant records during this period. Almost all the grants addresses territorial term as *pur*, *puri*, *pattana*, *bhumi* and *shetra* and the names of flora mentioned are in Sanskrit, not a single name of flora and fauna appearing in the grants (Sharma, 1978 ) bore local names. Early medieval patronage is a complex issue; so to understand it one has to understand the role of local community in temple building activities and their maintenance. Though these communities did not always donate lands or huge sum of money, their participation in daily worship and their offering of ritual objects like flower, *dipa* (lamp), *dhupa* (incense), *naivedya* (food) played a major role in the maintenance of the temple. Also *nritya* (dance) and *vadya* (instrumental music) were two important aspect of temple worship, which in all probability were offered by local communities. The long survival of the religious shrines depended on periodical repairs, restoration and proper maintenance. This need was also fulfilled by the local community. It's a known fact that daily worship and maintenance of a temple is as important as its construction and this was largely dependent on the local communities who lived in and around the temple rather than on the royal patron.

The various brick structures located in the Brahmaputra valley show certain similarity and differences based on their location and relative correspondence to other sites. Architecturally, earlier temples are small, squarely and symmetric with exquisite sculptural carvings on certain parts. The earlier temples like Dah Parbatia are highly symmetric and conform to the parameters prevailing to temple architecture in central India, with simple plan and high *adhithan* (platform). Arguably, Dah Parbatia has highest *adhithan* in the region in its time and can be postulated as post-Gupta *Nagar* architecture in Brahmaputra valley possibly by the masons and artisans displaced during the Hun turmoil or the ruler of the area invited artisans for its construction. However, the architecture of Dah Parbatia shows very limited regional influence in its architecture and sculptural art. Sculpturally it cannot be compared with any site in Assam and it remains the sculptural epitome. A phenomenon almost universal in Brahmaputra valley is to raise temples of stone on ravaged brick structures specially in the plain areas. Location wise the structures of Goalpara region are located on the bank of rivers and streams, Guwahati region on hills and ponds, and Kopili-Jamuna region on ponds and rivers.

Table 1. Architectural Arrangement of Brick Structure of Brahmaputra Valley

Table 4. Comparison of Northern Indian Nagara Temples and Assam Temples upto 1200AD.

<i>Diagnostic element</i>	<i>Northern temple style/Nagara</i>	<i>Assam group- Phase III</i>
Material of construction	Brick and stone, predominantly stone	Both but predominantly bricks
Shikhara	The superstructure above the cornice level	All are grounded
Roofs of axial addition to the shrine	Successive series of towers of the pitha	Superstructure not available for assessment
Elevation of the axial addition	Open mandapa type with porched balconies or entrances.	Open mandapa sometimes with mukhamandapa
Mandapa	Present	Present
Mahamandapa	Optional	Absent
Mukhamandapa	Optional seldom present	Optional
Pranala	Not very typical. May be open channel on floor level or underground.	Upper plinth level
Vertical plumb line of the cornice ( <i>manasutra</i> )	Well outside	Not available for assessment
Ceiling	Wide range of ornamentations	Not available for assessment
Dhvaja	Optional. May be on top on the shrine.	Outside on the entrance/ top of the shrine.
Superstructure above ground floor	Single mass	Diminishing top
Broad plinth	Mostly present.	
Prakaras	Optional.	Mostly present
Toranas	Often as entrance	Unknown

	features	
Door	Very elaborate and ornate	Some with stone sculptured jambs
Main deity made of	Mostly of stone	All of stone so far
Dvarapalas	Small sized	Only one found, its small at Da Parbatiya

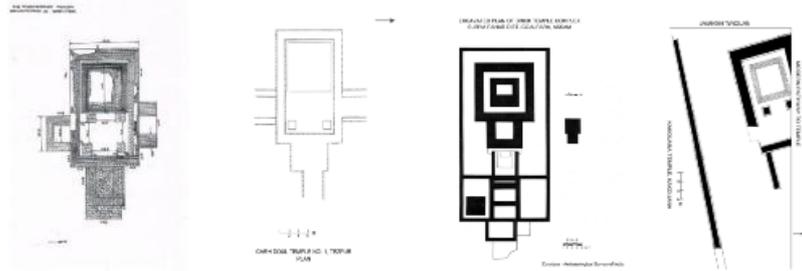

Fig. 1. Comparative plans of Garh DouI I & II, Surya Pahar and Kakoijana.

So far as the general layout is concerned, the brick structure of lower course of Brahmaputra have two ramparts (outer and inner) in case of Surya Pahar, Kakoijana, and Tamreshwar while the structure of Kopili Jamuna valley lack this feature whereas the structure of Garh DouI and Dubarani (Doiyang Dhansiri valley) has a single rampart. Another characteristic of all the structures is that the superstructure is absent. The layout and plan of Garbhagriha of Kakoijana (Bongaigaon) and Garhdoul bears a stern resemblance. However, in Garh DouI the enclosure wall (prakaar) is absent. It is also observed that the main plinth of the Garbhagriha of both Kakoijana and Garh DouI has several projections (Singha, 2021).

**Moulded Bricks and Plaques:** Moulded bricks are used alongside the plain ones. Moulded bricks are used in adorning the outer walls to beautify the structures and break the monotony of similar looking structures. Moulded bricks were made with hand moulds. Moulded bricks combined with plaques gave the structure different architectural perspective and dimension. Modern Bangladesh was a nerve centre of Buddhism under the aegis of Varmans and then Palas from 7<sup>th</sup> to 12<sup>th</sup> century and it is during this period that Buddhism was propagated to south-east Asia.

Table 5. Comparative Sizes of Plaques from Assam, Bengal and Myanmar Sites (Rao, 2014).

Site ↓ Sizes→ (in cms)	Plaque size 1 (max)	Plaque size 2 (min)	remarks
Baitbari	48X26.5X5.5	39X23X3	varying size
East and W Petleik	40X38X13		
Ananda temple,	36X32X7		

Bagan			
Mangalazeidi	38X34x10		
Paharpur	40.6X30.5X6.35	35.5X20.3X21.6	varying size
Ananda Vihar, Comilla	101X53X15.2	38X30.5X12.7	varying size

The depiction recovered from Baitbari are of *Ganesha, Brahma, Vinadhara, Kali, Ugra tara, Vaisnavi, Manasa, Uma Maheswara Arjuna in penance* and other *tantric* figures ( Sharma, 2003: 43-73). The plaques of Paharpur are thematically closer to Baitbari with predominantly Buddhist and Hindu icons. The iconography in Baitbari seems to have been influenced by Buddhist plastic art initially which later on gradually Hindu sculptures dominated the representation. Plaques are also procured from Surya Pahar, Bamgaon, Na Nath; the plaques of Na Nath are smaller in size than those found in Baitbari and Bamgaon. The typical feature of Bamgaon plaques are that they are yellowish in colour, even bricks from this site are of yellowish colour. Moulded bricks are important building material for ornate and elaborate brick edifices. Structurally they have the similar uses like general bricks as they are same building blocks with weight bearing properties. The use of these bricks is to beautify the outer walls of the structure. Elsewhere in Bihar, Bengal, Tripura, Bangladesh and Myanmar moulded bricks are profusely used in construction during 8<sup>th</sup> to 12<sup>th</sup> century. Moulded bricks are employed for two purposes, structural and decorative, sometimes serving both functions. Moulded bricks are mostly used on the outer face of the structure at its basal part. Due to the elaborate nature of their structures, brick was preferred in the Buddhist construction. Bricks moulded in various designs have been yielded from various sites of Assam. Some of the designs are popular and common whereas some are rare.

Fig 2. Types of brick mouldings from Brahmaputra valley.

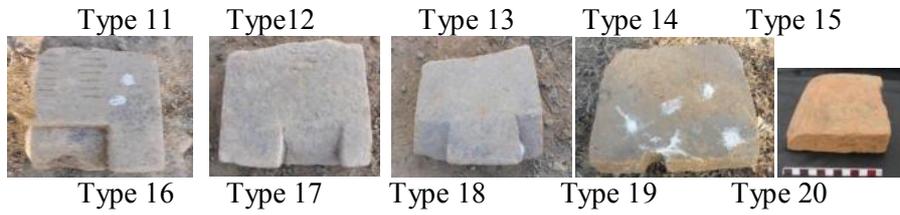

Table 6. Table Depicting Occurrence Type of Moulded Bricks.

Type→ Site↓	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Amtola			Y				Y													
Ambari																				

Y= Yes

So far twenty different types of moulded bricks are yielded from excavations and surveys from the sites under the purview of this study. As far as the types of moulded bricks are concerned the site of Bamgaon has yielded more than 5 types of mouldings of different designs, whereas in Garh Doul 17 types of moulding are used and in Paglatek and Kakoijana 3 designs have been reported so far. About the designs Type 2 and Type 3 are most popular design appearing in the five sites. Type 1, 4 and 9 appears in each of the three sites. Some of the mouldings have Buddhist connotation and that linkage can be established in more than one way. Firstly Assam (western) had always been under the Aryan zone of influence from its earliest period and politically it was ruled by kings based in Bengal or west Assam. Secondly the proselytizing and assimilating nature of Buddhism and Brahmanical Hinduism kept the region adventured throughout the past by missionaries, traders and adventurers alike.

In the Buddhist monasteries of Bangladesh and Bengal few similar mouldings can be seen, however in Assam these moulded bricks are yielded in debris and never *in situ* where it was intended in the structure, recent excavation at Dek Dua in Goalpara however throw some light to where it was originally intended. The site of Dek Dua present the most elaborate terracotta work so far from the region however the excavation report is still to be published by the Directorate of Archaeology. The type 2 and Type 3 bricks were profusely used in the monasteries of Somapura in Paharpur, Naogaon Bangladesh.

**Bonding and laying patterns:** Strength of a brick structure depends on the bonding of the bricks and the binding material. The stretcher bond pattern was widely used in construction in Brahmaputra valley, sometimes with running stretcher bonds. The mortar used in the construction is mud mortar or red soil which has good binding properties. All the sites show certain preference for stretcher bond method.

**Associated assemblages:** Pottery consist mostly of the associated assemblages, along with the structure they form the chunk of materials to establish linkages among the various structures. Almost all the sites yielded coins of colonial period specially *annas*. These coins are yielded from Paglatek, Kakoijana, Surya Pahar, Ambari, Jaljali, Madan Kamdev, Mahadeosal, Garh Doul and the Hojai sites

Fig 3. Important pottery for indexing and comparative study

Table 7. Occurrence of Few Common types of Pottery in Assam Sites

Ambari		Y	Y	Y	Y	

Baitbari		Y		Y(P)	
----------	--	---	--	------	--

Throughout red ware is the dominant pottery as most of the sites are religious in nature; the pottery generally are ritualistic and offering wares. Introduction of new pottery can be traced periodically which becomes signatures of the given period and the population. The Paglatek Phase I and Mahadeosal Phase I is similar to the Phase II of Ambari with similar pottery with appearance of mica washed pottery. This phase is marked by so called 'Ambari wares' from Mahadeosal and Ambari, both the site shows striking similarity of pottery. These two sites produced lot of other shapes which otherwise will not be considered as conventional usual shapes. Shapes yielded are all common shapes lota, pot, bowls etc.

Ambari ware pottery was followed by celadon and glazed wares. However occurrence of glazed wares is limited in fact it neither was nor recovered beyond Ambari (Guwahati).

**Chronology:** Assessment of chronology was the most complicated part of the present study. This assessment is based on three parameters namely brick size and stratigraphy, sculptural art and associated assemblage predominantly pottery. The structures of Brahmaputra valley were constructed in three phases. The first phase was the earliest phase of which we have limited structural evidence and they represent the early historical period. The second phase is from 6<sup>th</sup> to 8<sup>th</sup> century and the third is from 9<sup>th</sup> to 12<sup>th</sup> century. The first phase structure include the period-I structure of Ambari, as we can see that the period I structure of Ambari was an ablution tank with Sunga-Kushana character however we can assume that this structure went out of use due to the subsequent rise in water table and its steps got submerged. This phase is all brick phase. Structure contemporary to Ambari Phase I is not identified so far in the valley. It is widely believed that Buddhists accompanied the traders and traders, being Jaina and Buddhist found it their moral duty to help them in their missionary zeal. The second phase from 6<sup>th</sup> to 8<sup>th</sup> century show the twin tide of Brahmanical Hinduism and Buddhism and it was marked with still predominant use of brick and limited use of stone. Political situation in this period is stable Varmans ruled this period with firmness and during this period Kamarupa succeeded to come out from the stereotype of the place being inhabited by dangerous animals and cannibals and of prohibited land. Various Buddhist missionaries set foot here during this time. The marked feature of structures of this phase is Buddhist structures with Hindu influences and vice versa along with limited Jaina elements infused.

The preceding Gupta rule made a tremendous socio-cultural impact upon the valley and the Huna invasion during later Gupta period triggered migration of various people including artisans and sculptors to Bengal and to Assam afterwards the reason sculptural art of Bengal and Assam for certain period had classical bearing and within a generation or so these classical offshoot diffused into local art form. These two regions came under the political

influence of Pala in Bengal and Malechchha in Kamarupa. However Palas patronized Buddhism and Shaivism also flourished in the kingdom and in Kamarupa polytheism with predominance of Shaivism flourished during the Malechchha period. The third phase is marked by stone built temples. There was a clear shift from brick to stone in this phase. This period also is marked by infusion of tantric elements in the sculptural art. The temples of this phase are influenced by the Orissan school. The third phase show the rise of Tantric features in the construction, not much new spots were identified for constructing structures. During this phase the fallen brick structures were renovated or rebuild with stone at the same spot. Almost all the stone temples of this phase show brick temple evidence in its basement.

Jammu India

**Abstract:**

Ecological changes that have subsequently resulted in catastrophic breakdowns in the ecosystem have astounded environmentalists, and hence environmental studies pertinent to ecology have evolved into a remarkable field of investigation and academic interest. Examining two early novels of J.G. Ballard, viz. *The Wind from Nowhere* (1961) and *The Drowned World* (1962), the research paper endeavours to detail the catastrophic devastation wrought by climatic variations and deteriorating natural ecosystems, as well as their cumulative implications on humanity and the non-human realm. Additionally, it intends to critically examine the novels in order to comprehend the portrayal of catastrophic imagery that is fictionalised in order to make the audience visualise the enormity of environmental crises and thereby evoke eco-consciousness.

**Keywords:** cli-fi, climate change, global warming, nature, slow violence

Literature has long served as a medium for understanding the complex relationship between humans and the non-human world. However, in light of the recent ecological shifts that have caused the ecosystem to become seriously unbalanced, the various environmentalists and ecocritics now view ecological studies as an essential subject, notably climate change. The repercussions of anthropogenic global warming are becoming increasingly evident with each passing day throughout the planet. Most recently, global warming has resulted in the melting of ice caps throughout the world, the rising of ocean and sea levels, the extinction and migration of many species,

the loss of biodiversity, the occurrence of extreme droughts and catastrophic floods, and the like. With the extreme unpredictability of COVID-19 in this century, Amitav Ghosh(2016), while talking about climate change in his latest book, maintains, “we are now in an era that will be defined precisely by events that appear, by our current standards of normalcy, highly improbable” (p. 32). This improbability underscores the critical need of approaching climate change through the perspective of a precisely defined genre, which the mainstream canon of literature has disregarded.

Robert Macfarlane (2005) has expressed concern about the paucity of art that addressed the subject of climate change when he states, “Where are the novels, the plays, the poems, the songs, the libretti, of this massive contemporary anxiety?” (para. 7). Nevertheless, it has been a decade since climate fiction became increasingly popular, and the publishing industry has seen a significant increase in a wide range of literature reflecting this shifting trend. From Kim Stanley Robinson’s *New York 2140* (2017) to Barbara Kingsolver’s *Flight Behavior* (2012) to Amitav Ghosh’s *Gun Island* (2019), these cli-fi novels look at how human actions cause environmental disruption as a result of global warming.

It is worth noting that climate change-themed narratives reflect the rise in global warming and altering climatic patterns as a result of industrialization since its inception. J.G. Ballard earned recognition as a science fiction writer who dealt with climate change with the publication of his disaster narratives in the 1960s. J.G. Ballard was an English novelist, essayist, and short-story writer best known for his contributions to the New Wave of science fiction. Ballard’s writings are distinguished by their literary uniqueness, which has given rise to the epithet ‘Ballardian’. Specifically, according to the Collins English Dictionary, this is referred to as “resembling or suggestive of the conditions described in J. G. Ballard’s novels and stories, especially [dystopian modernity](#), bleak man-made landscapes and the psychological effects of technological, social or environmental developments” (“Ballardian”, n.d.). For this article, it will examine how Ballard represents the ecological catastrophe by employing the motifs of gigantic hurricane winds in *The Wind from Nowhere* and increasing temperatures in *The Drowned World* that wreak devastation over the planet due to climate change.

Notably, disquieting news about natural catastrophes such as severe winds, extreme storms, roaring tornadoes, typhoons, and cyclones has increasingly intensified in recent years. Indistinguishably, Ballard’s debut novel, *The Wind from Nowhere*, recounts the incidents of strong hurricane winds destroying everything and leaving nothing but ruins in its path. An all-encompassing storm with winds that are violent and uncontrollable, destroying nearly every physical structure in its path and leaving humans helpless and causing countless fatalities. Ballard describes the terrible strength of the wind right from the early passages of the novels when he asserts:

Correspondingly, in *The Drowned World*, his second published novel, Ballard depicts a post-apocalyptic vision with gloomy scenes of the flooded city of London impacted by global climate warming. Since much of the planet would be no longer habitable for humans, the survivors make their way to the North to survive in order to resist the harsh temperatures. Ballard unfolds the ruined city as “The bulk of the city had long since vanished, and only the steel-supported buildings of the central commercial and financial areas had survived the encroaching floodwaters. The brick houses and single-storey factories of the suburbs had disappeared completely below the drifting tides of silt” (Ballard, 1962, p. 11). In this odd new world with altered climate change, Dr. Robert Kerans, the central protagonist and the Biological Testing Station project coordinator, sets out to explore the evolutionary characteristics of swiftly mutated plants and animals. Along with post-apocalyptic projection, the novel reveals the characters’ dysfunctional psyches and their reactions to the rapid and catastrophic events that occur in their surroundings.

The frailty of human beings and their survival is the recurring subject in both novels, with nature turning violent toward humans, who are primarily attributable to degrading environmental practices. In this regard, Bill McKibben (1989) laments:

This home of ours, the blessed hunk of rock and sky and biology that we were born onto, becomes each day a less complex and a more violent place; its rhythms of season and storm shifted and shattered. We didn’t create this world but we are busy creating it. . . This buzzing, blooming, mysterious, cruel, lovely globe of mountain, sea, city, forest; of fish and wolf and bug and man; of carbon and hydrogen and nitrogen- it has come unbalanced in our short moment on it. It’s mostly us now. (p. xxiii)

With the humans at the centre, human civilization has transcended nature as a consequence of scientific advances and technological progress, and the connection between nature and culture has thus deteriorated in the era of so-called modernization, thus making the planet uninhabitable. Ballard deftly depicts the repercussions of catastrophe on humans attempting to survive the ecological catastrophe in the novel *The Wind from Nowhere* when he writes, “They were the helpless victims of a deep-rooted optimism about their right to survival, their dominance of the natural order which would guarantee them against everything but their own folly, that they had made gross assumptions about their own superiority” (Ballard, 1961, p. 77). There are numerous incidents in the novel when climate change has rendered numerous locales and regions uninhabitable during the course of the stories, conveying a mood and tone of melancholy and hopelessness among the characters in the face of climate change.

The author’s artistic faculty constructs devastating imaginable visions of the world by emphasizing the catastrophic challenges of survival for the characters in the ongoing threat of global climate change in both novels. Unfortunately, the vision of climate change is sometimes ignored and attracts

less attention from the global masses. Indeed, we never perceive or encounter global warming, but only its spatial and temporal representations. By and large, cli-fi authors write with artistic faculty, which is responsible mainly for perceiving the imperceptible and Ballards' novels are no exceptions. In this regard, Antonia Mehnert asserts:

While portraying humans' intricate relationship with the planet and thereby teasing out the anthropogenic dimension of global warming, climate change fiction inevitably also deals with ethical questions about humankind's responsibility in this unprecedented crisis. Finally, in depicting climate change, writers also have to engage with a variety of representational challenges such as the phenomenon's global scale and long, slow process of unfolding. (p. 38)

Furthermore, Nixon has turned his attention to global climate change as slow violence, which he defines as "a violence that occurs gradually and out of sight, a violence of delayed destruction that is dispersed across time and space, an attritional violence that is typically not viewed as violence at all" (p. 2). In view of the long-term anthropogenic implications, Ballard, in both novels, ingeniously represents the slow violence underlying climate change. His representation of the ramifications of climate change seeps through different times and across spaces (land and water). Nixon is of the view that slow violence is "rather incremental and accretive, its calamitous repercussions playing out across a range of temporal scales." (p. 2)

Interestingly, Jim Clarke (2013) maintains that "before there was climate change, there was nonetheless climate fiction" (p. 9). Before climate fiction, there was still apprehension about the prospect of climate change, and Clarke acknowledges that human activities are to blame for global warming. Ballard, in his novels as well, plays with the after-effects of climate change resulting from anthropogenic causes characterizing slow violence on human and non-human worlds. The resultant disastrous settings in Ballard's novels are an attempt to recognise the effects of slow violence in the future that is yet to be experienced. In the novels under consideration, Ballard explores the global ramifications of slow violence not only on a particular community or region but also vocalizes the effects of climate change on the global scale. The exceedingly upsetting images of a chaotic world due to extreme temperatures are the subject of the novel *The Drowned World* when Ballard writes, "All over the world, mean temperatures rose by a few degrees each year. The majority of tropical areas rapidly became uninhabitable, entire populations migrating north or south from temperatures of a hundred and thirty and a hundred and forty degrees." (Ballard, 1962, p. 13)

In a similar vein, *The Wind from Nowhere* represents the entire planet surviving a dystopian future with casualties everywhere. The fictitious city of London gets impacted by catastrophic winds as a result of global warming, and the characters in the novel deal with the challenges they face as well as the complications that come their way. Ballard describes a gloomy picture of

desolation with individuals clinging to life in cellars as a result of the disaster. Remarkably, Ballard has given a plethora of stunning imageries of socio-cultural breakdown to stress the nature and extent of the hurricane winds from the beginning of the novel.

For Ballard, the impact of global warming serves as a critical domain for his novels' narrative voice. With the use of symbols of water and wind, the tremendous heat in *The Drowned World* and the stormy winds in *The Wind from Nowhere* demonstrate the severity of global warming. Climate change is expected to have significant implications on a multitude of socio-cultural contexts, ranging from the regional to the planetary scale. In today's post-catastrophic world, the issues related to ecology are a stark warning that we may confront similar calamities as envisioned in the novels if the anthropogenic mindset persists. While exploring the thematic concerns in his book, Gregory Stephenson (1991) opines:

Ballard's novels of cataclysm represent a response and a rebuke to the scientific-materialist orientation of our age, and to the meretriciousness and rapaciousness of our technological-commercial culture. They further serve to awaken our consciousness to a new awareness of our identities, interpreting our equivocal and unsuspected motives. (p. 62)

While it is undeniable that global climate change has been significantly influenced by human anthropogenic activity as represented by the characters of Strangman in *The Drowned World* and Hardoon in *The Wind from Nowhere*, the solution is in the hands of humans, who may prevent the most catastrophic consequences from occurring. With regard to their evocation and urgency, the challenges highlighted by Ballard in both novels necessitate both scientific and literary insights to ignite climate consciousness before the deep sleep turns lethal and the planet is doomed to never wake up.

Until the closing pages of the novel *The Wind from Nowhere*, the characters are seen as hostages of nature's wrath who fight tooth and nail to survive the catastrophic winds. The personified death of antagonist characters in the novel, like Hardoon in the climax scene, exemplifies nature's triumph over human supremacy and the characters like Maitland, Lanyon, Patricia survive the disaster. In parallel, in *The Drowned World*, the author seems hopeful by showing the need for human consciousness to curb the change in climate despite extreme temperatures through the character of Kerans, who denies leaving the inundated city despite the catastrophic events and battles to survive throughout the novel. Ballard tries to show how different human actions lead toward different endings and fortunes and envisions a future society more conscious of the natural surroundings than ever before.

Climate change is a serious threat in the contemporary scenario, and the writers of cli-fi are expected to represent contemporary climate concerns through the medium of literary discourse. The challenges like ecological issues, catastrophic natural disasters, the post effects of the ultra modernized and urbanized world embarking toward planetary destruction could better be

envisioned through cli-fi narratives. In the mad rush towards modernity, mankind has become distinctively different from nature and has annihilated the natural world. Cli-fi, in this way, could help establish an ethical responsibility on the human race by showcasing the plausible and probable future that has been overlooked frequently in the name of advancement. In particular, the spectacular display of Ballard's imagination in the novels offers the worst conceivable vision of the world as a whole by extending existing crises into their worst-case scenarios in the near or distant future.

**Abstract:**

This paper is a case study of a small section of leather industry in India. Indian leather industries are divided into 5 major broad clusters; Kanpur, Mumbai, Delhi, Kolkata and Chennai. In this paper an attempt is made to have an in-depth analysis of Kanpur cluster of leather industry. This paper has been conceptualized mainly on primary data, that is, on the basis of information gathered through Council of Leather Export (CLE) , Tannery visits and interviews on various visits done. An overview of the Kanpur cluster of leather industry was gathered from CLE and later on, on the advice of the regional director of CLE, Kanpur visits were done to different tanneries to understand the ground reality. It is important to note here that all agents of information gathering were extremely cooperative in giving insightful information. The paper uses content analysis method for interpretation. All information gathered were interpreted unbiasedly. The paper has been concluded with a few suggestions given on the basis of personal understanding of the situation.

**Key words:** Leather, Kanpur, Council of Leather Export, Organised cluster, unorganised cluster

**Introduction**

The leather manufactured in the city of Kanpur holds relevance and prestige for its history of more than three centuries now. In 1840, saddlery made in Kanpur was sent to England in a fair where it was liked by all. This gave boost to the art of craftsmanship of leather in Kanpur. The first factory was established in 1855, which was a Harness and Saddlery factory (defence sector) which gave birth to a number of finished product industries in Kanpur. In the initial years raw leather was exported to England which later on exported finished items back to the country. But in due course of time it was realised that this exercise caused a lot of expense in the transportation costs. Thus, as a result of which leather goods began to be made locally. The most demanded goods manufactured by the city were belts, shoes and other useful products for soldiers and horses. With rapid industrialisation of the city; the city earned its title of being 'Manchester of East' Kanpur city is famous for its saddlery and harness product manufacturing. The business of saddlery manufacturing started during the British empire, which was then intended to cater towards the need of army. Later on, the demand for saddlery and harness product kept on increasing, especially in the European countries. Kanpur specialises in vegetable tanned buffalo hides. Saddlery manufactured in Kanpur cluster is 100% export oriented. On an average about 12.50 million pieces of Harness and Saddlery items are sold annually. Saddlery manufactured in Kanpur has also received GI (Geographical Indication) for all over India.

Apart from saddlery manufacturing, Kanpur tanners and manufacturers have diversified their operation modules by manufacturing leather footwear, footwear related components, leather garments, leather gloves and other finished leather products. Manufacturers are getting good value orders for manufacturing wide segment of leather products. One of the major reason for the city manufacturers to have this fortune of manufacturing varieties of leather products is that the city has abundance of raw material in the form of buffalo leather tanning as Kanpur is world famous for being a city with maximum livestock population of buffalo.

The council of leather export (CLE) is an autonomous non-profit organisation, which is entrusted with export promotion activities and the development of the Indian leather industry. About 3500 companies manufacturing/exporting leather and leather products are members of the council. CLE takes care of coordination between government and the industrial units, handling problems and grievances of industries, facilitating substantial international exposure for leather industry. Formal meetings and interviews have been done with Regional Director of Council of Leather Export, Kanpur regional office during the period of January,2020 to December 2021. On the advice of CLE Kanpur regional director a small scale pilot survey was done on various tanneries across the city in order to have an overview of the operation structure of Kanpur cluster of leather industry. Upon site visit it was observed that small scale tanneries are in the Jajmau area of Kanpur, where there are many small

tanning units catering mainly saddlery based order. The technique and style of operation was traditional in this area as machineries and drums for dyeing purposes are old pattern. This segment of industries are extremely vulnerable as any disruption in any economic or non-economic activities in the industrial sector impacts this segment directly. A verbal interview was conducted in around 5 industries in this segment to enquire about the problems they are facing in operations. Some of the common problems faced by this segment are:

- Financial dependency on export promoting organisations
- Operational restricting regulations laid down by National Green Tribunal (NGT) for environmental compliance adherence
- Lack of wastage management system in the area
- Stiff internal competition

A few images taken on site of Jajmau area are added beneath:

Makhdoom tannery

Visited on 28.01.2021

Gujrat Tannery

Visited on 10.02.2021

On the other hand industrial units operating in Unnao, Banthar and Kanpur Dehat are much more organised in terms of operational working capabilities as they have machineries that are upgraded. This was observed after visiting around 5 tannery units in these areas. This segment of industries of Kanpur cater towards large scale business orders of leather products from mainly international markets. The industries in these regions are lesser in number but they are based on large scale supplies and orders. Therefore, as per on site observation industries in these regions comparatively more revenue yielding towards industrial income of the overall state. But, this segment faces its share of problems. Some of the common problems noted through verbal interview by this segment are:

- Environmental compliance laid down by National Green Tribunal (NGT) have intensified in this segment due to large scale production. As leather industry is categorised as high polluting industry due to high quantity of chromium discharge. In a recent event of actions, National Green Tribunal (NGT) had instructed industrial units to restrict

production functioning at 50% capacity, regardless of them being large or small scale. Chennai is an example of a successful leather cluster as it is able to attract many international brands and has become a major hub of manufacturing quality finished leather goods. Kanpur is still lacking behind in this regard as most of the international brands now a days expect manufacturers to abide by environmental norms along with producing quality products.

- Declining global demand due to stiff international competitors. As industrial units in India lack in innovation, research, development and designing capabilities, the competitors take advantage of that and offer upgraded and better quality products to retailers to capture complete market. For example, China and Vietnam are prominent markets that are competing with Indian market
- There is an evident lack of designing creativity as manufacturing concept is based on the idea of copying the sample as it is.
- Order driven industry has a lot of fixed maintenance cost when the unit is not getting enough orders. This eventually impacts consistency in performance of the industry

A few images taken on site at Unnao area are added beneath:

Crescent tannery-Visited on 16.10.2021

Crescent Tannery-Visited on 14.12.2021

Therefore, after the complete pilot survey and insight from Council of Leather Export (CLE) regional director, it was conceptualized that the leather industry in Kanpur is divided into two broad categories:

1. Organized Cluster: This cluster has an organized approach in terms of marketing, manufacturing, development and willingness to adapt environmental norms. This covers region of Unnao, Banthar and Kanpur Dehat.
2. Unorganized Cluster: This cluster has mainly small tanners operating with traditional patterns of working, relying mainly on government funding. This covers region of Jajmau area of Kanpur.

Furthermore, upon evaluating literature review related to Kanpur cluster of leather industry it was discovered that a lot of data analysis and research work has been conducted on the unorganised cluster of Kanpur leather industry.

Whereas, substantially lesser work has been done on the organized cluster; presuming that this segment of industries need less/no assistance as they are operating on a large scale. But, in fact the organized cluster has better potential for growth and development of the overall leather industry.

Organized cluster of Kanpur leather industry includes basically large scale industries which get bigger orders of production and have more prospects to contribute towards growth through export earnings for the state and eventually the country's industrial income. Some of the prominent prospects observed in this segment of industry are as follows:

1. This segment of industries have the opportunity to reap maximum benefit from government support and funding as under the recently launch) for 2017-2020, the government has funded in upgradation of Common Effluent Treatment Plant across all leather clusters to enable them to meet the prescribed pollution control discharge norms. Moreover, the 'Make in India' government of India initiative to promote India's manufacturing sector by facilitating investment, innovation and protect intellectual property and build best in class manufacturing infrastructure. Also ODOP (One District One Product) initiative by the state government had also laid emphasis on Kanpur, Hamirpur and Agra. IDLS (Integrated Development Leather sector) scheme of Council of leather export aids leather industrialist by providing subsidies for machineries. Large scale industries get 30% subsidy of total value whereas, small to medium scale get only 20% subsidy of the total value. Now benefits like these provided by the government can be fruitful only if the industrialist are aware and willing to take initiative for getting federal benefits.
2. International promotion groups have also recently shifted their focus to Indian industrial units sighting the strengths and potential in this section of industries. For instance, LWG (Leather Working Group) is a multi-stakeholder group which aims to develop and maintain environmental compliance and performance capabilities of leather manufacturers. It integrates brands, supplier, retailers and leading technical experts within the leather industry. LWG involves major brands like ZARA, H &M, Addidas and these brand specify that they will only work with manufacturers having LWG certification (abiding by environmental norms) LWG certification also has certain ratings like Gold, Silver and Bronze.

Therefore, there are great prospects for this segment of industries by abiding to protocols and norms set by these groups to achieve dual benefit; abiding by environmental norms and manufacturing a good standard product to become a member of this group and attract international brands and buyers. This shall eventually facilitate to make Kanpur a manufacturing hub.

**Conclusion:**

After interpreting the cluster bifurcation of Kanpur cluster of leather industry it can be concluded that both the cluster of the city have their share of economic contributions towards the state and national industrial income but since one cluster (unorganised cluster) has had a lot of research work done for research problem investigation and the other cluster (organised cluster) has had comparatively lesser research problem investigation done so it is important to throw a light on the organised clusters growth prospects as this cluster is already contributing well towards export earnings and with a little more focus and aid this cluster will grow more. The unorganised cluster (Jajmau area) has density of industries operating on small and medium scale over a very long period of time. They majorly lack on the aspect of environmental awareness and business ethics as they hide their overall production volume to the authorities as they are assigned to produce a set volume of produce but instead they are producing more than their prescribed share (this insight was received while interviewing the regional director of CLE) This has a dual impact; one on environmental degradation and secondly losing respect in the eyes of the monitoring authorities as they shall doubt their business ethics in the long run. Therefore, a major chunk of their problems shall be solved if this cluster becomes more aware of environmental degradation and become honest about their producing volume. Environmental compliance awareness is very important for sustenance as not only it is impacting the health of the local public as all the waste disposal of the industrial waste is done on adjoining water bodies which eventually is consumed by locals but it is important to be focused as adhering to the environmental compliance will help in gaining business as more and more brands around the world are trying to work with manufacturing units that are taking care of waste management. The organised cluster on the other hand needs to keep focusing on attracting more international brands to get orders from them by adhering to their norms and protocols as once these brands start doing business with this cluster, they will eventually make them their manufacturing hub. Being a manufacturing hub for any international brand will aid in sustaining in the manufacturing business for long.

## **IMMIGRATION PATTERNS OF SUGARCANE CUTTERS IN PUNE DISTRICT OF MAHARSHTRA**

**PRAVIN LAXMAN SHINDE**

Assistant Professor of Geography,  
Fergusson College (Autonomous)  
Pune India

### **Abstract**

In general, uneven development is the basic cause of migration. This is explained in terms of 'pull' & 'push' factors. Migration takes place from less developed regions to more prosperous areas. Deprived people from all over the world have tendency to migrate to areas with employment opportunities for livelihood. This research paper is focusing on the seasonal migration patterns of sugarcane cutters in Pune district of Maharashtra. The study is carried out at four sugar factories, out of eighteen in Pune district. Pune district is well advanced in industry, agriculture, transport, trade, etc. The study is made by collecting both primary data by interviews of sugarcane cutters with schedule at sugar factory sites, along with secondary data. The Gravity Model of John Stewart is applied to understand migration patterns in Pune district. The study also come up with some solutions to curb the seasonal migration not only in Pune but in Maharashtra state.

**Keywords:** Immigration, Emigration, Gravity Model, Migration Index, Migration Patterns,

### **Introduction**

Migration is not always a permanent migration; it can be for a stipulated period so that the migrant again returns back to source region from destination after some time. This phenomenon is called 'seasonal, cyclical or oscillatory migration'. This migration ranges from few months to a season. It mainly happens in the rural parts of the country. Migrants from different socio-economic background migrate to seek employment. This employment is distributed in unorganized sectors of economy like agriculture, fishing, animal husbandry, construction, services and footloose industry. Rural labors are

forced to migrate due to social and economic hardship especially as most of the migrants are socially backward, the landless laborers and the poor and unskilled laborers (Breman, Jan 1979). Deshingkar, Priya and Start, Daniel (2003) in their studies of seasonal migrants of Andhra Pradesh and Madhya Pradesh finds seasonal migration as strategy of living of poor and social exclusive people. They studied patterns of seasonal migration, background of migrants and their economic condition. Keshri, Kunal and Bhagat, R. B. (2012) studied regional pattern of temporary or seasonal migration in India. They discussed the socio-economic condition of migrants with reference to caste, religion, education, landholdings etc.

The quantitative and qualitative analysis of migration process is done by many scholars. The first ever theory was credited to Ravenstein (1885) where he studied the inter-country movement of migrants within Britain in 19<sup>th</sup> century. The Gravity model was welcome addition from John Stewart where he applied Newton's Law of Gravitation to migration, where he formulized the role of population size and distance of settlements in determining spatial interaction. David Karamera et. al (2000) in their studies showcase the influence of political, economic and demographic factors on the size and composition of migrants flow to USA and Canada by modified Gravity Model. Raul Ramos and Jordi Surinach (2013) studied the flow of international migrants from European Neighborhood countries (ENC) to European union (UN) in past and future. Hye Jin Park et. al (2018) have applied generalized gravity model to study marriage patterns between the bride and the groom clans of Korea by applying geographical and clan information with census data. These studies encouraged the author to use gravity model in seasonal migration studies in Pune district with modified nature. This research has been conducted in four sugar factory sites by direct visit and interviews of sugarcane cutters in Pune district of Maharashtra.

### **1. STUDY OF MIGRATION INDEX IN BHIMASHANKAR CO-OP SUGAR FACTORY**

Bhimashankar co-op. sugar factory is situated in Pargaon Bk. of Ambegaon tehsil in northern part of Pune district. The study of migration process is made with the sample size of 150 sugarcane cutter families comprising 532 migrants from different districts of Maharashtra to the factory. The distance between sugar factory and native villages are measured with Google Map. The populations of villages are taken from census of 2011.

$$\text{Ashti Tehsil (MI)} = 1 \times \frac{6487 \times 1360}{144} = 63,016.57$$

$$\text{Patoda Tehsil (MI)} = 1 \times \frac{6487 \times 1813}{175} = 67,205.32$$

$$\text{Shirur Kasar Tehsil (MI)} = 1 \times \frac{6487 \times 1240}{168} = 47,880.23$$

$$\text{Beed Tehsil (MI)} = 1 \times \frac{6487 \times 1332}{200} = 43,203.42$$

$$\text{Pathardi Tehsil (MI)} = 1 \times \frac{6487 \times 1190}{140} = 55,139.50$$

$$\begin{aligned} \text{Shevgaon Tehsil (MI)} &= 1 \times \frac{6487 \times 1072}{149} = 46,671.57 \\ \text{Jamkhed Tehsil (MI)} &= 1 \times \frac{6487 \times 1170}{158} = 48,036.64 \\ \text{Parner Tehsil (MI)} &= 1 \times \frac{6487 \times 609}{63} = 62,707.66 \\ \text{Karjat Tehsil (MI)} &= 1 \times \frac{6487 \times 1034}{135} = 49,685.61 \\ \text{Rahuri Tehsil (MI)} &= 1 \times \frac{6487 \times 679}{92} = 47,876.88 \\ \text{Chalisgaon Tehsil (MI)} &= 1 \times \frac{6487 \times 1565}{200} = 50,760.77 \\ \text{Pachora Tehsil (MI)} &= 1 \times \frac{6487 \times 1788}{240} = 48,328.15 \\ \text{Jalgaon Tehsil (MI)} &= 1 \times \frac{6487 \times 1460}{284} = 33,348.66 \\ \text{Nandgaon Tehsil (MI)} &= 1 \times \frac{6487 \times 1201}{183} = 42,573.15 \\ \text{Ghansawangi Tehsil (MI)} &= 1 \times \frac{6487 \times 1060}{231} = 32,575.41 \\ \text{Kannad Tehsil (MI)} &= 1 \times \frac{6487 \times 741}{193} = 24,906.04 \\ \text{Vashi Tehsil (MI)} &= 1 \times \frac{6487 \times 1626}{211} = 49,989.86 \\ \text{Dhule Tehsil (MI)} &= 1 \times \frac{6487 \times 1700}{240} = 47,947.39 \end{aligned}$$

The application of Gravity Model to migration data shows the maximum results as per the expectation of formula. The Table1 showcase that the values derived for each tehsil is positively correlated to the actual migrants to the factory. The highest migration volume figure is derived for Patoda tehsil is 67,205.32 which represents the highest migrant families of 40 to the Bhimashankar factory. The Pathardi tehsil has migration volume figure of 55139.50 represented by 36 families at factory, while Ashti tehsil has migration volume figure is 63,016.57 which represents 29 migrant families to factory. The figures of Ghansawangi and Kannad tehsil are 32575.41 & 24906.04 respectively represents only one migrant family. There are some exceptions with the migration volume figure, tehsils like Jamkhed, Karjat, Rahuri, Parner and Vashi have high volume figures but they have only one migrant family to Bhimashankar sugar factory. It is because the native villages have high population or distance to factory is less.

**Table 1 : Tehsil-Wise Mi And Actual Migrants At Bhimashankar Co-Op Factory**

Sr. No.	Tehsil	Migration Volume (MI)	Actual Migrant Families at factory
1	Patoda	67205.32	40
2	Pathardi	55139.50	36
3	Ashti	63016.57	29
4	Shevgaon	46671.57	8
5	Chalisgaon	50760.77	8
6	Dhule	47947.39	8

7	Shirur Kasar	47880.23	5
8	Pachora	48328.15	3
9	Nandgaon	42573.15	3

## 2. MIGRATION VOLUME OF SUGAR FACTORIES IN PUNE DISTRICT

The migration volume figures for each district are derived by getting averages of MI for all tehsils having migrants in that district. The high migration volume positively represents high number of migrant families from concerning district. In Bhimashankar factory 56,228.96 figure represents 75 migrant families, like wise 24906.04 figure represents only one family. In Sant Tukaram factory, 39,799.00 represents 77 families while 16,203.75 figure indicates only one family. In Malegaon factory MI 34,440.33 figure represents 114 families and 10,195.69 figure only two families. Venkateshkrupa factory 47,965.61 figure indicates 67 families while 17,883.25 indicates only one family. There are some exceptions to these figures.

**Table 2:** District-Wise Mi And Actual Migrants at Sugar Factories In Pune District

Sr. No	Sugar Factory	Districts	Average Migration Volume (MI)	Actual Migrant Families to Factory
1	Bhimashankar Co-op Sugar Factory	Beed	56,228.96	75
		Ahmednagar	51,686.31	48
		Jalgaon	44,145.86	13
		Dhule	42,706.08	8
		Nashik	42,573.15	3

### 3. Migration patterns of sugarcane cutters in Pune district

Sugarcane cutters in Maharashtra are mainly belongs to the rain shadow areas of Marathwada, Khandesh and eastern parts of western Maharashtra. The districts like Beed, Osmanabad, Latur, Ahmednagar, Aurangabad, Jalna, Dhule, Jalgaon, etc. are main suppliers of sugarcane cutters to the sugar factories in Maharashtra. The main migration pattern is Rural to Rural, labors from rural areas migrate to sugar factory sites in rural areas. People from this area have adopted a strategy of seasonal migration during dry season to sugar factory sites in Western Maharashtra for many decades. They come back around April to their native villages and start agricultural practice.

#### Inter-district migration in Pune district

The study revealed that almost 99% sugarcane cutter families are from outside the Pune district. They mainly belong to the districts of Beed, Ahmednagar, Jalgaon, Aurangabad, Nashik, Jalna, Osmanabad, etc. It is visible from Table 3 that maximum 278 families i.e. 46.33% of total sample sugarcane cutters families are from Beed district alone. They are mainly concentrated (41%) in Malegaon Sahakari Sakhar Karkhana, Shivnagar (Baramati). It followed by 205 families (34.16%) are from Ahmednagar district. They are concentrated in Sant Tukaram SSK, Kasarsai (Mulshi). Jalgaon district accounts for 70 families with 11.66% of total sample sugarcane cutters in Pune district. Only 3 families i.e. 0.5% of sample size is from Jalna & Osmanabad district. It is evident that maximum sugarcane cutters are from Beed district which is known as economically and socially backward district of Maharashtra.

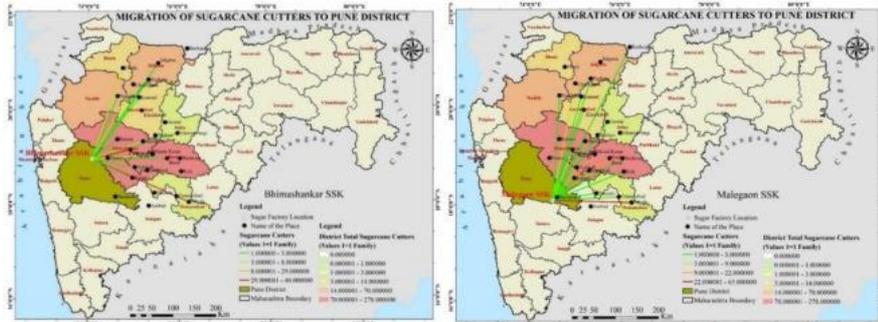

**Table 3: District-Wise Migration Of Sugarcane Cutters To Pune District**

District	Sugar Factory					
	1	2	3	4	Total Families	% to Total Families

Ahmednagar	48	77	13	67	205	34.16
Aurangabad	1	0	7	6	14	2.33

### INTRA-District migration in Pune district

Intra-district sugarcane cutting migrant means families within the Pune district migrates seasonally to sugar factories within Pune district. It is observed at Malegaon Sahakari Sakhar Karkhana, Shivnagar. There is one family belonging to same Baramati tehsil of Pune district found at factory site.

**Table 4: Tehsil-Wise Migration Of Sugarcane Cutters To Sugar Factories**

Tehsil	Sugar Factory					
	1	2	3	4	Total Families	% to Total Families
Ambad	0	1	0	1	2	0.33

<b>Total</b>	150	150	150	150	600	100

Source: Field work Note: 1-Bhimashankar SSK, 2-Sant Tukaram SSK, 3-Malegaon SSK, 4-Venkateshkrupa Pvt.

From Table 4, it is clear that there are sugarcane cutters from 27 tehsils of various districts of Maharashtra in Pune district. Pathardi tehsils in Ahmednagar district has maximum 169 families which accounts 28.16% of total sample families. They are mainly settled at Sant Tukaram SSK, Kasarsai. It is followed by Patoda tehsil with 106 families (17.66%) and Ashti tehsil with 80 families (13.33%). Around 9% families are from Chalisgaon and Shirur Kasar tehsils. There is only one family (0.16%) from Baramati, Ghansawangi, Khultabad, Paranda, Parner and Rahuri tehsil. As the Pathardi, Ashti, Patoda and Chalisgaon tehsils are having low rainfall and economically

underdeveloped, people from these tehsils migrate as seasonal sugarcane cutters to various sugar factories.

### **Conclusion**

Seasonal migration is a widespread phenomenon in Maharashtra. It is mainly occurring from rain shadow and economically backward areas to more progressed areas of Maharashtra. It is apparent from the study that out of total sugarcane cutter migrant, 46.33% belongs to Beed district, followed by Ahmednagar with 34.16%. Jalgaon district ranks third with 11.66% of total migrants. Districts like Osmanabad and Jalna have only 0.5% share in migrants. In migration pattern we can see that inter-district pattern is dominant in Pune district. The solution for this problem is decentralisation of industry to offer employment in those areas. Proper infrastructure like electricity, roads should be built by government, so industries can be attracted in those areas. Some tax concession should be given by government to those industries which are setting plants in such backward areas.

**Abstract**

Double marginalization of women is a talked-about issue that hinders her liberty and rather adds to her clutches. This becomes evident when one reads the dared-voices of the Indian Dalit women writers like Faustina Mary Fatima Rani (famously known as Bama Faustina) in her life- narratives *Karukku* (1992) and *Sangati* (1994). How Bama attempted to relocate her status as a Dalit woman and voiced her identity is worthy of research, added with the fact that she has paved the way for more Dalit writers, especially women. This paper shall also make a humble attempt to analyze the resistance of Dalit women from 1980's to the present.

**Keywords:** *Sangati*, Resistance Literature, Bama, Dalit Literature  
Who is Dalit? According to Prof. Aravinda Malagatti:

The people who are economically, socially and politically exploited from centuries, unable to live in the society of human beings have been living outside the village depending on lower level of occupation, and unable to spell out their names, lived as "untouchables" are regarded as Dalits (qtd. in Kargi 17).

Dalits are the marginalized section of society who for centuries have occupied the lowest lamina of the Indian society and have always been considered 'outcastes' in the graded caste system. They have been deprived of any inclusion be it socially, politically, economically, or culturally. The entire oeuvre of Dalit literature deliberates around the structural domination of the

caste system. Dalit feminism, in particular, voices not only the structural domination of caste but also the gender, for Dalit women are dual victims of hegemony as well as of phallogocentric system.

Robert Frost's idea of double marginalization in his poem "A Servant to Servants" in 1914 is universal and all-encompassing. We apply this fact of double- removal from liberty to Dalit women in this study because Dalit women share the same plight for being a Dalit and also being a woman. Their suppression on the social and domestic level is throttling to their path of emancipation, betterment, and happiness. On a societal front, this feeling of being put at the back and behind others is explored by the subaltern writers like Bama, Urmila Pawar, Shantabai Kamble and many more. Bama has written two autobiographical narratives – *Karukku* (1992) and *Sangati* (1994) among many other stories to voice out the impoverished and pitiable conditions of Dalits. While the former is personal in nature and deals with "Bama centric" events as a Dalit Christian, *Sangati* takes the story up to a larger level and address the community at large. Even the characters of *Sangati* are her own community members. This paper does not only look at *Sangati* as a narrative of the voiceless and a part of resistance literature that is even applicable for today's Dalits, but also studies the present status of the Dalit women of India, to outline the improvements made in the social framework.

To 'resist' means to withstand or oppose any powerful force by some manner. Resistance literature includes dramas, novels, poetry or visual arts that narrates the act of resisting oppression of any sort. This art form allows movements to communicate within the exploited subaltern social subcultures and help preserve stories of resistance that has a long history. Long back, the suppressed groups shall often document the tortures inflicted on them. For example, in the American abolitionism, a large number of poems, newspaper articles were written to increase enthusiasm to collect people for a protest against slavery. The slave literature also falls under the category of resistance literature. So, in literary studies, resistance literature is one of the genres that are socio-political in nature and attempts to resist the dominant ideologies. Barbara Harlow's book *Resistance Literature* (1987) provides a detailed insight into this sub-field of socio-cultural literary studies. The point being proven is that literary creation and analysis can help in emerging newer concepts of political, social, and cultural resistance. Women's suffrage, the awareness related to feminism, and especially Black Feminism and other forms of social set-ups, all fall under this category. They all are resisting the dominant ideologies in some or the other manner. Many resistance literature writers have created a stir in their respective circles. James Baldwin, the American writer who addresses race, sexuality, and morality has moved many civil rights and gay celebration events. Alice Walker did the same for the civil rights movement regarding Black Feminism. Art Spiegelman uses resistance

literature to address the issue of trauma and stigma related to Holocaust movement denial narratives.

Bama Faustina is a similar name for Dalit rights activism in India. Her writings have highlighted the excluded status of Dalits and how they lack any power to live a decent life. By translating Bama's works into English, Lakshmi Holmstrom has established Bama's distinct voice in the Indian literary circle. Bama was born in 1958 to a poor landless family and her father served the Indian military. She owes her education to her father who somehow knew that Dalit's emancipation is laid in their education. Education helped her to free herself from the clutches of casteism and oppression. Highlighting the importance of education in her life, Nirupama Dutt in her article "Caste in her Own Image" (2003) quotes Bama- "I read Tamil writers like Jayakantan, Akhilan, Mani and Parthasarthy. In college, I read my favorites - Kahlil Gibran and Rabindranath Tagore. I didn't have many books to read so I read the same ones again and again" (para 6). Thus, education helped her to 'resist' the casteist forces, making her fight against Indian caste oppression in its own way. Her literature clearly falls under that of resistance.

Indian society is inflicted with the social categorization of caste. This system is strictly hierarchal, meaning a baby born to a Dalit couple will automatically inherit their 'Dalit' caste. They are marginalized based on the Hindu notions of physical pollution and impurity and are denied all rights civil, cultural, political, social, economic. Most of them are poor and are dependent on others for a livelihood because of meager resources. Despite various initiatives, many fall below the poverty line and lack in literacy and education, trapping them in the vicious circle of illiteracy, unemployment, impoverished life, low access to healthcare and high mortality, and no emancipation. Structural discrimination, physical segregation, downtrodden lives amidst filth, and inhabitable conditions further their oppression because even for the slightest of efforts to improve, they need money for which they work as domestic cleaners, etc. They, thus, fall under the category of what Gayatri Spivak calls 'subaltern' – who are low in rank or status. Anthony Faramelli in his 2010 article called "Can you Represent the Subaltern?" says that Spivak clarifies the true meaning of 'subaltern' as:

Subaltern is not just a classy word for oppressed, for Other, for somebody who's not getting a piece of the pie.... In postcolonial terms, everything that has limited or no access to the cultural imperialism is subaltern—a space of difference. Now who would say that's just the oppressed? The working class is oppressed. It's not subaltern.... Many people want to claim subalternity. They are the least interesting and the most dangerous. I mean, just by being a discriminated-against minority on the university campus, they don't need the word 'subaltern' They should see what the mechanics of the discrimination are. They're within the hegemonic discourse wanting a piece of the pie and not

being allowed, so let them speak, use the hegemonic discourse. They should not call themselves subaltern. (Faramelli)

The beauty of *Sangati* must be first understood through the meaning of autobiography and how *Karukku* is different from its following story *Sangati*. While both the novels are life-narratives 'about' Bama's world, the former voices out Bama's life, and the latter gives identity to many other Dalit women through its narrative technique. This makes *Sangati* a reading about Dalit women and not just Bama. Its patrilineal, virilocal and patriarchal social set-up is directly challenged and it is pleasantly surprising to see that even the downtrodden women in their own way have resisted and, in some cases, subverted a society where women have always been attached with men of their family for any matter of their existence. The fact is that though women are domestically central, they are yet socially marginalized; they are culturally active but yet socially victimized. In this relation, the meaning of 'domestic violence' is highlighted in Bama's narrative using many narrators in form of live characters. It is the story of the whole community of Paraiya women who are neighbours, friends, or family but they are all in a collective struggle against patriarchy more than caste. The meaning of *Sangati* is events and it is a collection of many anecdotes that Bama recollects, she says in the acknowledgment of her book:

My mind is crowded with many anecdotes: stories not only about the sorrows and tears of Dalit women, but also about their lively and rebellious culture, their eagerness not to let life crush or shatter them, but to swim vigorously against the tide; about the self-confidence and self-respect that enables them to leap over threatening adversities by laughing at and ridiculing them; about their passion to live life with vitality, truth, and enjoyment; about their hard labour. (ix)

*Sangati* voices out many complexities – physical, verbal, emotional, and sexual – those women face as a matter of the control of the victim patriarchal strategy. Be it Dalit women being paid less than men for the same amount of work, their struggle with childcare, the games they play as children, or women not being allowed to voice their opinions during the village meeting is just to name a few. Bama says,

The position of women is both pitiful and humiliating, really. In the fields they have to escape from upper-caste men's molestations. At church they must lick the priest's shoes and be his slaves while he threatens them with tales of God, Heaven, and hell. Even when they go their own homes, before they have had a chance to cook some kanji or lie down and rest a little, they have to submit themselves to their husband's torment. (35)

There are a lot of narrations voiced by the characters, like in the case of the story of Pecchiamma who marries twice. This power of ending her 'own' marriage is shocking yet empowering for women, especially Dalit women. Even women of upper caste needed the grit to take such a step. Then

there is the story of Pey (about the ghost that only possesses a woman) that is narrated by Bama's Patti, Vellaiamma that talks about superstitions, cultural beliefs, machismo, and the death of her daughter (murdered by Patti's own son-in-law) highlighting women oppression. Bama believes that in order for things to change, women need to demonstrate strength and stand up for themselves. She says,

It's like the proverb that says, if a man sees a terrified dog, he is bound to chase it. If we continue to be frightened, everyone will take advantage of us. If we stand up for ourselves without caring whether we die or survive, they'll creep away with their tails between their legs. (66)

Patti's story brings the fact to the limelight that one of the many reasons of Dalit men's violence is that they do not get to show their machismo to the outside world and when left with no place of their ego- display, they find their wives easier and vulnerable options. It can also be believed that these women get less sleep and no rest which drives them to irritability, verbal abuse, and quarrelling behaviour revealed in their language which is repulsively abusive. Similarly, in the story of Marypillai we learn how lucky she feels to be born in the family of a low caste for she is saved from the rules and regulations that the women of the upper caste face. Bama shares the fact that in their own community the groom's family also partake in the marriage expenditure and the groom gives money to the bride's father and marries the daughter, contrasting this practice with the dowry system that throttles the upper castes:

It's only on the surface that they look so good, really. It isn't that easy for them to get their daughters settled. They have to cover the girls' necks with jewellery, give them cash in their hands, and write off property and land in their names. Even after all this do you think the girls are happy in their new homes? Their in-laws keep on complaining that this and that is not enough, and they torment the girls. (112)

In *Sangati*, Bama showcases the ability of the Dalit women to "independently" think, earn their own money and operate their domestic lives – she shows the Dalit women walk out of marriage, remarry, change religion, strongly assert their voice and in this process end up as 'brown women saving other brown women' because they know their brown- men will not help them. This validates the comparison we stated with Frost's "A Servant to Servants" but in a modern feminist subservient manner. The style of narrative technique adds a charm to *Sangati*. It is imprinting how Dalit women have their own strong-willed and independent thinking mind that helps them establish their own 'voice' through Bama's pen. She becomes a journalist and paints vivid images of her co- Dalit community members leaving the readers with a pungent impression of the community whilst giving us time to contemplate the wrongs of our social gender/ caste- system. *Sangati* becomes a meta-narrative that involves, like an anthology, the lives of many Dalit women, inspiring and

paining both. This presentation of the social history and culture of Dalit women of Tamil Nadu makes the narrative special among the Tamil cultural literature circles.

The New Indian Express newspaper reports on 26th December 2020 the present condition of Nagapattinam district of Tamil Nadu. CPI(M) state secretary K Balakrishnan said that the Dalits continue to face atrocities. He says,

The situation which existed for Dalit farm labourers 52 years ago has not changed a bit. Dalits are still subject to limitless cruelty. We will strive to remove obstructions created by Varnashrama Dharma” (New Indian Xpress).

Shambhavi Raj in her article “#DalitLivesMatter: Why Are Atrocities Against Dalits on the Rise?” point out the fact that the Covid pandemic has become a newer excuse for practicing untouchability. The fact of virus-protection and social distancing has led to certain sections twisting the norms of a pandemic to promote casteism – “The virus is frightening and it is pushing people’s prejudices and ignorance to the forefront leading to scapegoating of marginalized populations” (para 1). Shambhavi Raj recounts for the purpose of proving the practice of untouchability an incident from upper-caste Corona patients from Nainital and Uttar Pradesh. These upper-caste patients were admitted in the hospital but they refused to eat food because it was cooked by the hospital’s cook who was a Dalit and “Such incidences of refusal to eat food have been reported in several other states” (para 5). Raj also narrates of gender-based subjection. Dr.Payal Tadvi, a medical practitioner committed suicide because she was mentally tortured and harassed on the basis of her caste.

Gautham Subramanyam in his article “In India, Dalits still feel bottom of the caste ladder” (2020), shares the fact that in the 2018 report of the NCRB (National Crime Records Bureau), 42793 cases were registered by Dalits for the atrocities inflicted upon them, “meaning a Dalit was a target of crime, on average, every 15 minutes. The number of cases has increased 66 percent over the last decade” and even today “beyond police violence, inter-caste violence is also widespread. The triggers can be acts as innocuous as entering a temple or falling in love”. The report also shows violence against Dalits actively existing in the Indian states of Bihar, Tamil Nadu, Maharashtra, Uttar Pradesh, Gujrat and Jharkhand etc. The Una (a town in Gujrat) violence case of public naked- marching of a Dalit family of seven on the alleged slaughtering of a cow shows the dehumanizing punishments the non-Dalit communities can stoop down too. A national strike was announced in India on 2<sup>nd</sup> April, 2018 by the Dalits against the Supreme Court diluting some provisions of the Atrocities Act which galvanised the government to the extent of the SC recalling its own judgement. About their status today, a United States survey called “Caste in the United States” conducted in 2016 revealed some shocking findings about the oppression in which Dalits lived even in the United States:

a) 25% of Dalits who responded said they had faced verbal or physical assault based on their caste, b) one in three Dalit students report being discriminated against during their education, c) two out of three Dalits surveyed reported being treated unfairly at their workplace, d) 60% of Dalits report experiencing caste- based derogatory jokes or comments, e) 40% Dalits and 16% Shudras are made to feel unwelcome at their place of worship because of their caste f) over 40% of Dalits respondents have reported being rejected in a romantic partnership on the basis of their caste etc. (equalitylabs.org). These findings are shocking.

So, when the servant of the servants in Frost's poem "A Servant to Servants" says that "there's nothing but a voice-like left inside" is because she has double work to do; one that the society expects her to and the other that her own household expects her to do – what one refers to as double-marginalization. Frost's woman says it in other words, "He (doctor) thinks I'll be all right with doctoring. But it's not medicine Lowe is the only doctor dared to say so – it's rest I want" because she is exasperated with physical toiling at the double level. Her pain continues, "From cooking meals for hungry hired men and washing dishes after them – from doing things over and over that just won't stay done" (Frost). This poem also most explicitly reveals the fact that men "by his shouts at night" make his wife's life miserable.

Certain social structural changes must be introduced and enforced like a common cremation ground, allowing Dalits to worship in the same temples as Brahmins, etc. The #MeToo movement in India was initiated by a Dalit woman, says Ruth Manorama in the article "Dalit Women in Politics" (2019). Many women have appreciated the fact that their involvement/ participation in politics is essential for their betterment. In India's politics, there has been no Dalit prime minister till date, just a woman chief minister of Uttar Pradesh and now a male CM for Punjab. It is important for Dalits to increase their presence in the political paradigm, especially women so that a hopeful vision is planted at the very rudimentary level using the highest power of politics.

*Karukku* (especially) and *Sangati* have already made their way into the syllabi of many universities and their courses on Dalit literature, marginal literature, feminist/ subaltern literature etc. These narratives have at least created a sense of boldness and identity so much so that a Dalit rape survivor in Uttar Pradesh has fought vehemently against her rape. Four upper-caste men preyed upon her honor and threatened her with to viral her rape video if she told anyone. Her father suffered a fatal heart attack while one of the trials and her brother is running for his life fearing the upper caste's life-threatening violence. Refusing a handsome sum of 9,72,000 as settlement, she chose to fight for justice saying "I want them in jail. Then everyone watching will know that people can get punished for this", shared the article by Think Change India in 2015. Surprisingly, she has got her rapists put behind the bars and there have been no rape cases in her village. In a country where rape

victims are humiliated with no fault of their own, sex crimes are overlooked, this girl's example is inspiring for society at large.

Then, in the cases where the victims lack voices, there is no dearth of external sources of encouragement in the form of NGOs that help the victims come out in the open and voice out their trauma. One such bravery is shown by a victim who understood the need for a detailed police report. The NGOs volunteer Ms. Pradeep recounts the episode of the Dalit victim's valour and the entire narrative of Pradeep becomes all the more important because Pradeep herself was a rape survivor around 1992. Divya Arya in her article "The Dalit activist fighting for rape survivors" (2021) in BBC shares: "Ms. Pradeep stresses boosting the morale of the survivor and helping her understand the need for a detailed police complaint. That instinct came from her own experience of loneliness as a survivor of child sexual abuse, she said. She was just four years old when she was sexually assaulted by four men in her neighbourhood" (Arya). Pradeep is fighting for Dalit women's rights for three decades and also co-founded the National Council of Women Leaders. The success of such initiatives is proven by the fact that the reports of cases of rapes in Dalits have seen a steep rise by 50% in the last decade.

The emancipation of Dalit women is also seen in the case of a 60 years old rape victim of Tamil Nadu who rose to "restore her SC name" with honour, as reported by Arun Janardhanan in the newspaper Indian Express in 2015. The state of Tamil Nadu is already infamous for its crime against the lower castes. The article elucidates the day of rape in her life and how hard it was to recoup from the trauma. The height of iniquity was seen when the police filed her complaint under simply Tamil Nadu Protection of Women Harassment Act instead of the SC/ST Prevention of Atrocities Act, 1989 knowing the fact clearly that the latter provided stricter and enhanced forms of punishments. Arun Janardhanan shares:

Her lawyer R Krishnan says, "That was the stage police altered her name, removing a letter in the FIR and cooking up a forged community certificate to project her as from a backward Christian community. After I showed the alterations to the district collector, he ordered a probe by the revenue divisional officer. They found that she belongs to the Scheduled Caste Pallar community," he says (Janardhanan)

The case was registered finally, but it took her a lot of struggles at such an age; her courage paid off though. This profound rise in their voices is commendable but it also highlights the reality that their exploitation still exists. Similar stories of Dalit victims raising voices are on a rise and this reflects the reality that the condition of Dalits is improving. Whether they get justice or not is a different area of study, the focus here is on the naked truth of more women shouting out their stories. Once this increases, there will surely be a higher rate of convictions.

Western feminism has affected the status of Indian women with Dalit women no exception. Even though there has been not much decline in Dalit treatment, but women, in general, have shown betterment in terms of education and financial stability. The proliferation of Dalit literature, on top of it, has brought the question of identity to the forefront and women are grasping it well. The contemporary Dalit discourse goes beyond the defined realms of social spheres and challenges the interactions of intersectionality. While earlier caste-inflicted women could hardly raise a voice, now they have access to legal aid, financial independence, and social respect in its basic form. Erik Fraser in “The Dalits of India: Education and Development” (2014) says:

The Dalits have experienced a bit of progress in establishing an equal position in Indian society. Under the Poona Pact, a reserved number of seats in the national legislature were reserved for Dalit candidates only who would be elected based solely on the votes of their Dalit constituents ... Their movement has also been encouraged by slow societal shifts towards a greater acceptance of Dalit equality and a greater role played by local and international nongovernmental organizations ... The Dalit population continues to struggle for equality, though the progress of the past few decades shows hope for an improved level of equality within Indian society. (Frazer)

Some benefits of government policies and social programs for women which have been designed to increase the primary education rate are noticeable in society but still, the Dalit population still remains much lower in literacy than that of the rest of India. The growth rate is slight and modest, but at least the direction is laid. As already highlighted, the mere fact that these women have mustered courage and honed skills of grit and determination is commendable. The earlier generations never dreamt of such fights for justice. Their desire for education and awareness about the places of justice clearly shows their condition is improving and progressing at both personal and social levels.

**Abstract**

Yoga is a science of life. It gives wisdom about life, protection of health and way to achieve Samadhi. Yoga prescribed eight folded paths to achieve the aim of life. i.e. liberation. The second limb is niyama, which have five parts, Tapas is one of them, actions which are practice while doing our Swa-Dharma (practicing own duties) such as individual's unique duties, responsibilities and righteousness is known as Tapas. To achieve righteousness fasting is prescribed. Fasting is considered as one of the purification actions which is needed for healthy body and mind. Many researchers have found that fasting activated autophagy. Yoshinori Ohsumi a known Japanese cell biologist who had won Nobel Prize in Medicine in 2016 for his work, how cell rejuvenate themselves is known as autophagy. Many published studies have shown the affirmative effect of fasting on neuroprotection and longevity.

Key Words- Fasting, Upavas, Yoga, Niyam, Tapas, Autophagy

**Introduction**

According to yoga the ultimate aim of a person is liberation which can be achieved by samadhi and to achieve the aim the important element is stable and healthy body. Yogashchittavrittinirodhah (1,2) According to Maharishi Patanjali in Yoga-Sutra chapter -1 (verse-2) restrain the chitta from fluctuation or modification is Yoga. There is certain action which are prescribed to achieve it. We will discuss one part in this research. {1}

**concept of Niyama**

shauchasantoshatapahsvadhyayeshvarapranidhanani niyamah (2,32)

According to Yoga-Sutra chapter-2 (verse-32) it is been said that Niyama is divided in to five parts, souch (Maintaining the purity), Santosh (contentment), Tapas (purification action), Swadhyaya (reading text and analysis) and Ishwar-pranidhana (Surrender to divine). Every part has its importance but focus will be there on Tapas (purification action). {2}

**Importance of tapas (purification action)**

kayendriyasiddhirashuddhikshayat tapasah (2,43)

By the process of tapas (purification action), when the impurities are destroyed then physical body and senses become perfect. Purification action is been performed to destroy the dirt of veil of impurities. After the destruction of this veil of impurities our physical body perform best of his potential and the senses remains in control.

The question arises what is tapas (purification action)? It can be understood, all those actions which are practice while doing our Swa-Dharma (practicing own duties) such as individual's unique duties, responsibilities and righteousness is known as tapas. One of those action is fasting. While practicing fasting properly the debris of the physical body and sense organ is destroyed and the body of Yoga-Sadhaka (yoga practitioner) remains healthy, clean and light and that person can attain various siddhis (extra ordinary powers). {3} Fasting (upavasa) means giving up the desire, anger, delusion etc. to do our Swa-dharma and follow the path of truthfulness. As said "complete dissociation from sinful act (mind and body) and association of virtuousness or refined qualities or persons of refined qualities can be understood as upavasa not the emaciation of body (Charak Samhita Sutrasthna, 1/6). Fasting is of two types as per Vachaspatyama, one is 'vaidha' (lawful fasting) and another is 'avaidh' (unlawful fasting) (Vachaspatyama, 1322). Ayurveda has very detail analysis about it.

The prevailing wisdom in today's world when we fast, we feel sleepy or tired and we think we need energy and want to eat food or energy bars. when we eat or drink it, we are supposed to get energy and it's not true always. when we go and take food or an energy bar, we suddenly feel great that's because we're a junkie. we just got high just took a shot that boosted our brains dopamine and we felt better. It's because we are a sugar junkie, that's why we felt good. Biochemically there's no parameter that is measured in the person to say that person is lacking energy and now he took this energy shots or an energy bar he feels great. Do something's changed in body?

Various study shows no, nothing has been changed as shown in animals nor in human beings. clearly there's no biochemical change going on, none whatsoever it's all mental. Let's understand what happens, when we are junkie, whenever we eat sugar or simple carbohydrates and we get that high it goes to the dopamine center in the brain produces all that dope in cityward center and we get addicted to it and then we need it and then we feel better.

when we are fasting also, we're feeling tired and fatigued and there are reasons for that but taking another shot of sugar or taking another energy bar is not the solution. It's nothing to do with that, it's the reward center and eventually after a few days when we will come out of that habit, same as we take an alcoholic person and put him in a room and when he can't drink anymore after a few days' person won't crave anymore. It's all craving so one thing is a biochemical craving the second thing is Pavlovian reflexes.

Its mind game lets understand it, its timetable, we want to eat are we hungry no, I'm not hungry but I want to eat it's time to eat its evening or morning, it's our behavior and behavior is incongruent of physiology. Our brain has interfered our body and we stopped listening to our body. Why did we stop listening to the body? It's because we were told to stop listening to our body. By whom we were told, by the advertisement, press, media, people around us, parents maybe friends that we have to eat five times maybe six times a day. This knowledge is totally false we don't have to eat six times a day we don't need to have that calorie input all the time. Homo sapiens are about two and fifty million years old. About twelve thousand years ago, we have changed and we started going into agriculture so until then we were the Paleolithic being and we eat mostly meat some vegetables and drink lots of water. when we are Paleolithic being none of us are such fantastic hunters that we could hunt and kill and eat every three hours. For all those years (millions of years) we generated genetics and that genetics is what we still have found because it was evolved over two million years.

In the last twelve thousand years we became more intelligent and started agriculture, now our food changed so when we into agriculture did our genetics keep up with the two million years of genetic change the answer is hardly, because it takes another two million years to develop a new genetic package. We did not change genetically as our diet change, but we continued to be an agricultural society because the population grew and we need food, so agriculture was easier. In the last 200 years we change our diet again and now we are industrialized and start eating processed foods vegetables seed oils.

To understand this, if we look at our entire evolution as 24 hours, that food only came to us in the last 10 milliseconds, how do we expect our body to respond genetically and hormonally to that food that we only just introduced to our genetics. Paleolithic being eat maybe once a day and he eat during the day time because if we try to eat at night time where the caucus is outside i.e. dangerous animals we remain in our cage and even we don't drink water in the night because we don't have latest facility.

So, our body is made to fast. we should be fasting and feasting as well because if there was no food around and if our sugar level just went down and our energy go down then we'll be dead in 24 hours because we're going to get cramps and we'll just crawl down and we just going to get terrible and die. But this is not the case you don't die it means fasting does not kill people in fact we were used to of fasting from Paleolithic age. In fact, when we're sick, we

fast when we have the flu we don't eat. when our pets are sick didn't eat, we don't see our dog running and eating his food he stays in the corner and does not eat. There's a wisdom in that and that wisdom is the physiology. Physiology of the body is saying that he knows eating is dangerous eating takes up a lot of energy. If we put in about a hundred calories of food into our body it takes about 60 to 70 calories of our body to digest that food and then we get a little excess. So eating is an energy consuming activity but most of us don't think of it. Let's understand biochemistry of body, we stop eating in the first 12 hours, our bodies understand no food coming out now it's going to wipe up all the glycogen that is in our liver and in our muscles that's a normal process. Now body going to use glycogen so our sugar level or our glucose levels will be maintained. Question arises what about protein? we got plenty protein in our body, what about vitamins so a normal body got at least a month's worth of vitamins in the body. When we eat, we store in the form of fat and that fat should be utilized now so for the first 12 hours we not going to use the fat. In fact, we are going to use our glycogen stores, we feel ok and our sugar level will not go down its a key concept. we can fast for seven days our blood sugar will come down but we will not become hypoglycemic and have an attack unless we're on insulin or we're taking diabetes medications. Question arises how does the body keep the sugar? Let's understand it in the first 12 hours, we get glycogen and after 12 hours we get gluconeogenesis that means new glucose is being made. Gluconeogenesis, whereas that glucose comes from, it comes from protein but it's not the protein in the muscles. protein is always being turned over in our body, but this time the protein that's normally going to turn over turns into blue so our glucose level is maintained for another 12 hours or so. During this next 12 hours as a small increase in ketosis. It's an important concept so I am explaining it, where does ketosis come from?

when insulin level goes down then body understand it and the insulin levels must drop so the insulin levels are now low because we're not eating. when our insulin level is high, we store energy and when our insulin levels are low, we pull energy out of the fats. Through the hormonal action we know hormone sensitive lipase and the action of LPL, fat stores open up because our insulin level is low so the fats start being devoured the fat gets converted to triglycerides and fatty acids the fatty acids flood the bloodstream as we don't utilize it directly so fatty acids go to our liver and in the liver our fatty acids get converted to ketones there's two ketones 3-beta-hydroxybutyrate acid (3HB) and acetoacetate acid these two ketones now go up and ketones can be utilized by the body and this is the great breakthrough. I want to tell that ketones can be utilized by every cell of our body including our brain.

We were told that the brain is an obligate glucose utilizer and can only utilize glucose it's absolutely wrong there was a study done in Britain where what they did is that they brought the blood sugar down to 30 but they pump patient full of ketones all was fine. we should be having convulsion in the brain can

utilize ketones after a seven-day fast, 70% of the energy utilization of the brain is through ketones and the brain likes it. There are even studies to show that, when the brain utilizes the ketones it is a cleaner burn. It burns more cleanly. what happens if there is a slow increase in the ketones which actually starts around 18 hours and gradually goes up and up, so by 24 hours, we have some ketones maybe 10 to 15 % of our entire energy source is now going to be ketones.

How are we going to feel with ketones? Answer is very fine without any problem, because ketones are giving all the energy that we need then let's say another 12 hours go, at the 35 hours the ketones go even higher and higher and by 3 days we're really beginning to get even better and even higher, so by the fifth day of fasting we enjoy the process. If we've been on a low-carb diet low sugar diet we will go into ketogenesis earlier than somebody who eats a lot of sugar because it's got a whole bunch of glycogens in the liver. Because glycogen burn first before we start burning ketones. {6}

I'm will take an example 24 hours, our insulin levels have been low and now we eat our next meal we're only going to make very less insulin. we can make a much less amount of insulin so our body is going to deal with that meal differently then had we eaten in a fed state. so, eating after a fast is metabolized totally different than eating in a fed state. What will happen is that we produce less and less insulin even in the next few days as we fasted one day. Paleolithic being, especially after 18 hours the epinephrine levels increase and our adrenaline levels go up and cortisol levels go up. Our metabolic rate goes up we start feeling better more bushy-tailed, bright-eyed because we are looking for our next kill. If we walk out there with our eyes droopy how we're going to see the kill? Here our energy is very high, we pumped up our metabolic rate is high, we more alert, awake and we will get what we want to kill.

There's another thing that happens when we're fast, we produce a stuff called B-brain-derived neurotropic factor. so, what happens is that the body starts producing a hormone that goes to our brain and tells our brain switch on and we actually make new brain cells. No drug is there which can produce new brain cell only fasting situation make new brain cells. As nature wants to teach us that the cell, we got into the situation learn from it remember it and behave according to situation. Fasting also produces growth hormone. If we're fast just a one and half to two days the study shows we produced a two thousand percent increase in our growth hormone production in a man and thirteen thousand in a woman, so it is the best way to boost our growth hormone level too. {7}

when we're fasting so growth hormone increases, about 20 to 24 to 48 hours, if we really want to get the full benefit of growth hormone now there's a condition called autophagy. Autophagy starts actually at about 18 hours and then gradually increases and its maximum at 3 days.

#### **CONCEPT OF AUTOPHAGY**

Now let's understand autophagy, Yoshinori Ohsumi a known Japanese cell biologist who had won Nobel Prize in Medicine in 2016 for his work, how cell rejuvenate them self which is known as autophagy, during fasting the cells break down proteins and other cellular component and use them to supply energy to the body. When we are nutrient deficient at time of fasting like this body senses that there are no nutrients coming in and there's thing called mTOR. mTOR levels go really low this is a protein kinesis in the body and that turns on autophagy. what turns autophagy is mTOR levels are high, what causes mTOR levels to go high is because of mostly eating proteins. what eating do, it takes protein to our cells and the cell has a lipoprotein membrane around it and there's all the intracellular organelles in it, but in the course of time those cells and the intracellular organelles, some of them become redundant there's.

During fasting protein which was lying around as a garbage and old intracellular organelles and some proteinaceous materials that are just lying on in the cytoplasm, so the body says I need energy that time, cell need to recycle itself, and it takes those intracellular organelle, breaks them down and exports it out of the cell. Once it is exported from the cell into the bloodstream and body got some new building blocks and the body utilizes it. Now body starts utilizing our interest cellular organelles so we're recycling our self. so, our cell doesn't die it goes into a state of recycling and we recycle our mitochondria as well.

what happens is the cell is now going to be deplete of its old non-functional parts and repair, so we basically rejuvenate ourselves. If we're constantly eating what will happen? Simply we will not rejuvenate those cells. Now we are functioning better more resilient to disease, it's like a reset switch like a rebooting mechanism. Now when we eat because now, we have autophagy, a signal goes from those cells to the bone marrow that my intracellular organelles were used, when we get new ones or new supplies send them to cells. Concept of new stem cells comes here, now bone marrow when we eat makes stem cells which rejuvenate the whole-body including brain. {8}

#### **CONCLUSION**

We need to harness nature's way of giving stem cells to our body. If we want plenty of growth hormone or stem cell in natural way the most efficient way is to do fasting (upavasa) and it does not cost any money. By fasting or intermittent fasting person become healthy, more resilient to disease, strong and immunity of body increases. Studies over humans in animals says fasting boost the growth hormone and further which boost our stem cells this has been well-documented. There is no drug which can produce new brain cell only fasting situation make new brain cells will makes us mentally strong that is the concept of Tapas (purification action). Fasting is the purification action which is been performed to destroy the dirt of veil of impurities as mention in Yoga. In Tapas the debris of the physical body and sense organ is destroyed and the body of Yoga-Sadhaka (yoga practitioner) remains healthy, clean and light the

same concept is scientifically stated. From Paleolithic being we are used to fasting and it needs to be followed now to attain the maximum benefit. So, before we put anything new in our mouth, we need to decide it keeping in mind about our genetic. If body is light and healthy then we can achieve samadhi and can fulfill the purpose of life.

**Abstract**

The development in the field of assisted reproduction technology brings new hope to individuals and families dealing with life-threatening diseases. Let us imagine that a child is born with a life-threatening heritable disease and the only way to cure the disease is the umbilical cord stem cell, bone, or blood marrow transplantation from a genetically matched child. This is where the concept of a saviour sibling emerges. With the help of new technologies such as In Vitro Fertilisation (IVF) and Preimplantation Genetic Diagnosis (PGD), a saviour child is created to save the elder sibling. Thus, a saviour sibling is a genetically matched child specifically designed to cure the disease of the existing sibling. In conceiving the saviour child, PGD plays an important role; the process is used to select the genetically similar embryo prior to the implantation in the womb of a woman. The use of PGD for the creation of a saviour sibling raises some moral and ethical issues. This article analyses the procedure of PGD, its regulation and the legal position of the PGD in countries like the USA, UK, and India and discusses the issues and challenges relating to the savior sibling.

**Keywords:** in vitro fertilization, designer babies, assisted reproductive technology

**Introduction**

The PGD technology has become an integral part of the Assisted  
Reproductive Technology (ART)

<sup>1</sup> procedure. The testing can be used to select positive traits to be present in the child and neglect the embryos with serious genetic diseases or disabilities.<sup>2</sup> This diagnosis is primarily used to identify serious heritable disorders, such as cystic fibrosis or Tay-Sachs. However, this technique is used for more controversial purposes, such as selecting a child whose tissues can be used to save the sick child and selecting a child of a particular sex. The use of PGD technology involves several moral questions, as it involves the question as to what extent the parents should enjoy reproductive liberty. The term saviour sibling is used for the cases where parents of a sick child wish to conceive another child so that the tissue of the child can be used to provide treatment for the sick sibling.<sup>3</sup> The Cambridge dictionary defines it as; ‘saviour sibling is a child who is born with particular genes that have been chosen to treat an older brother or sister who has a disease.

In other words, we can say that a saviour sibling refers to the creation of a genetically matched child to that of the ill child to provide biological materials such as blood, bone marrow, or even organs to a fatally ill sibling. The saviour sibling is conceived either by taking the chance with traditional procreation or by IVF technology. IVF (In vitro fertilization) is a process of fertilisation where an egg is fused with the sperm outside the human body in a laboratory. Once the embryo is formed, it is placed in the uterus of the woman. However, before implanting the embryo in the uterus the zygotes are tested for genetic compatibility (human leukocyte antigen (HAL) typing), using a pre implantation genetic diagnosis (PGD), and only zygotes that are congenial with the ill child are implanted in the uterus.

PGD is the genetic profiling of embryos prior to their implantation in the uterus. The PGD involves the screening of the embryos to select the embryos which do not carry disabilities like that of the ill child. This requires an assessment of the different embryos to see if they carry desirable or undesirable characteristics. The PGD is usually done on a single cell removed from an embryo of about eight cells in development. An inspection is made of the removed cell. If the cell is free from genetic defect then the remaining cells of the embryos are implanted into the uterus and the remaining seven cells continue to divide and it giving rise to a child without a specific genetic defect<sup>4</sup>, present in the elder sibling of the child. It is important to note that PGD

---

<sup>1</sup> It refers to fertility treatments and procedures that can help with difficulties or an inability to conceive children. ART techniques involve the manipulation of eggs, sperm, or embryos to increase the likelihood of a successful pregnancy.

testing is not used to analyze every embryo with the notion that each embryo is normal. It is only used to identify the absence of a specific defect similar to that of the ill child. The PGD is not used for creating the designer baby. With the help of the PGD technique, it becomes possible to select an embryo to create a child who will be compatible for the use of the blood, bone marrow, or even organ transplantation for its sibling.

Reproductive endocrinologists developed Pre implantation genetic diagnosis in England in the mid-1980. It was initially developed to identify genetic defects in embryos of women undergoing IVF. The procedure involves removing a single cell from a six-to-eight-cell-stage embryo. The cell is evaluated in a genetics laboratory. Embryos are not damaged by this procedure and make new cells to replace the one removed. Evaluation of the cell can determine if the embryo from which it came has evidence of genetic abnormalities. If it does, the embryo is discarded. If it is normal, it can be transferred to the egg donor's uterus.

Preimplantation genetic diagnosis (PGD) involves genetically tested cells or two after removal from an early embryo. This technique was first successfully used in 1989. The usual procedure for couples using IVF is to create a number of embryos and implant them two at a time into a woman. The question here is whether it is permissible to select from the embryos created which will be implanted. There is generally no objection to a selection being made on the basis of which embryos are most likely to survive birth, but more controversially a couple who are at risk of having a child with a genetic disability may wish to select an embryo that does not carry that disability. This requires an assessment of the different embryos to see if they carry desirable or undesirable characteristics. This process is known as preimplantation genetic diagnosis (PGD). Infertile couples that use PGD have fewer children with genetic disorders than those who do not use PGD. Nevertheless, many people believe that the use of PGD is morally wrong. They believe that life begins when a sperm fertilizes an egg and that discarding a genetically defective embryo is a type of murder. Others object to PGD because it allows for gender selection. PGD is the single most accurate way of ensuring the sex of a fetus..

## **LEGAL ANALYSIS OF SOME COUNTRIES**

### **I. LEGAL POSITION IN THE USA**

Adam Nash a baby boy born in October 2000, was the world's first savior child born in the United States through the PGD technology to save his elder sister Molly who was suffering from Fanconi anemia (FA). The only known solution for FA today is hematopoietic stem cell (HSC) transplantation, which requires a donor with a perfect genetic match who can replace the damaged immune system. With the help of the PGD technology, Adam Nash was born with a perfect genetic match and the umbilical cord blood stem cells from the Nash were used to treat his sister. With the success of the Nash case, the demand for the PGD has increased in the US to transplant stem cells to cure sick siblings. The USA is lagging behind the European countries to enact any law or issue any robust guidelines or standards governing the use or creation

of saviour siblings.<sup>5</sup> Indeed, there are no formal federal restrictions in the United States that deal with the use of PGD. As a result, contemporary PGD applications, such as the production of a saviour sibling, are left to the discretion of doctors and patients.

The US Congress has enacted the Fertility Clinic Success Rate and Certification Act, 1992. The objective of the act was to keep records of the success rates of ART in fertility clinics in the United States. However, the states are left with the discretion of whether or not to implement the scheme. Due to this flexibility, no state has adopted the model program entirely. However, the scheme does not consider a saviour sibling. Yet, the US government does not play a substantial role in the process and regulation of IVF, PGD, or decisions regarding saviour siblings.

In the absence of any regulatory framework in the USA, some professional groups like the American Society for Reproductive Medicine, the American Congress of Obstetricians and Gynecologists, and the American College of Medical Genetics have made some guidelines concerning the use of IVF and PGD, but such guidelines are of little relevance. Importantly, these organisations have yet to take a formal position on saviour siblings, and as a result, their advice manuals do not adequately address saviour siblings.

## **II. LEGAL POSITION IN THE UK**

The United Kingdom was the first country in the world that laid down the regulatory framework for IVF. In 1990 the parliament of the UK enacted the Human Fertilization and Embryology Act which regulates IVF and donor insemination in the country. Initially, the act does not deal with the PGD directly but created the Human Fertilization and Embryology Authority (HFEA), which has the power to license clinics for particular uses of PGD. The licence given by the authority for the use of PGD was uncontroversial in the first ten years of the HFEA's existence. The controversy emerged in 2004 when the HFEA granted permission to the Hashmi's to go for PGD to conceive the saviour child so that stem cells can be used to cure the Zain Hashmi, who was born with beta-thalassemia. In 2005 Josephine Quintavalle brought an action against the HFEA, arguing that the HFEA could not license the tissue-typing of embryos under the 1990 Act. The House of Lords unanimously ruled that HFEA has the authority to issue such a license and rejected the challenge from a group that argued such 'designer babies' violated their licensing authority. After the judgment of the Quintavalle case, the parliament of the UK amended HFE Act in 2008. After the amendment, the creation of saviour siblings is legally permissible, subject to certain qualifications. Paragraph 1ZA(1)(d) of Schedule 2 allows testing where: "a person ("the sibling") who is the child of the persons whose gametes are used to bring about the creation of the embryo (or of either of those persons) suffers from a serious medical condition that could be treated by umbilical cord blood stem cells, bone marrow or other tissue of any resulting child, establishing

whether the tissue of any resulting child would be compatible with that of the sibling.” There are, however, limitations on the use of PGD for the use of selecting ‘saviour sibling’. First, the statute makes it clear that it can only be used in the case of siblings.<sup>6</sup> Secondly, the statute makes it clear that the selection cannot be made if it is planted that the whole organ is to be donated. Thus, tissue typing can only be licensed if the intended recipient and the prospective donor are siblings, and the intended recipient suffers from a medical condition that could be treated by the umbilical cord blood stem cells, bone marrow, or other tissue (excluding the whole organ) from a donor sibling.<sup>7</sup>

### III. LEGAL POSITION IN INDIA

Unlike the UK, India lacks any specific legislation governing the saviour sibling. But in 2021, the Government of India enacted the Assisted Reproductive Technology (Regulation) Act, to regulate the Assisted Reproductive Technology (ART) procedure in the country. However, the Act is silent regarding the provisions of the saviour sibling. But the act does allow the PGD under certain conditions. Pre-implantation Genetic testing shall be used to screen the human embryo for known, pre-existing, heritable, or genetic diseases only.<sup>8</sup> Though, there is no direct law on the saviour sibling, but there are certain other laws that can be interpreted in respect of the saviour sibling. As per Rule 5(3)(g) of Transplantation of the Human Organs and Tissues Rule, 2014 minor is not permitted to donate a living organ or tissue except on exceptional medical grounds and with prior approval of the appropriate authority, appointed under Section 13 of the Transplantation of Human Organs Act, 1994. The Delhi High Court dealt with the issue of organ donation in *Anshita Bansal v. Secretary Ministry of Health and Family Welfare &ors.* ruled that “there is no complete prohibition in a minor donating an organ or tissue prior to attaining majority. Donation is permissible but in exceptional circumstances and accordance with the rules.” The court ordered to constitute a committee of two senior doctors and the committee shall render its advice to the respondent.

#### A Case Study of Kavya Solanki

India’s first saviour child, Kavya Solanki was conceived by her parents for bone marrow transplantation, to save her brother Abhijeet Solanki who was diagnosed with thalassemia major. An inherited blood disorder, causes the body to have less hemoglobin and fewer red blood cells in the patient, which, in turn, affected the supply of oxygen in the body. The only cure for thalassemia is bone marrow transplantation and the average life span of a thalassemia patient is 25-30 years. The birth of Kavya has brought a ray of

<sup>8</sup> The Assisted Reproductive Technology (Regulation) Act, 2021 (No. 42 of 2021), s. 25 (1).

hope and a source of joy to her parents Sahdev singh Solanki and Aparna Solanki. Both of them have a thalassemia minor and had a healthy elder daughter Namrata Solanki and a son Abhijeet Solanki who was born in November 2013. After his birth, the parents of Abhijeet notice that he had slow growth than that of a normal child. In the 10 months, the doctors found that Abhijeet is suffering from thalassemia major, and to live a normal life he required a blood transfusion every 20-22 days.

To develop a basic understanding and the possible cure for thalassemia, Mr. Solanki started reading the available literature and also searched for the available treatment to cure thalassemia. In his research, he also consulted the various medical experts and sought their advice. After extensive research, he found that the bone marrow transplant is only the permanent cure for the disease. Mr. Solanki consulted the doctors for the bone marrow transplantation and after the test, the doctors found that neither family member had a bone marrow similar to that of the Abhijeet. Mr. Solanki started searching for the bone marrow tissue similar to that of Abhijeet. Meanwhile, in 2016 the Christian Medical College, Vellore informed him that they found a bone marrow tissue match in the United States. But the cost to import the bone marrow was so high (5 million – 10 million Rs.), and the success rate of the transplantation would be 20-30% because a bone marrow was from an unrelated donor. Mr. Solanki agreed to take such a risk. But in the year 2017, Mr. Solanki came across an article on ‘saviour sibling’, so he approached Dr. Manish Banker (India’s best-known fertility specialist). Dr. Banker uses PGD technology to develop a thalassemia-free fetus for Abhijeet treatment. To create a thalassemia-free fetus, 18 embryos were created, and each embryo went through the PGD. It took nearly 6 months to find the perfect match, when the match was found the fetus was planted in Mrs. Solanki’s womb.

After 9 months of the fetus plantation, India’s first saviour sibling, Kavya Solanki was born in October 2018. Before initiating a bone marrow transplantation, the doctors have waited for 16-18 months so that Kavya could gain weight up to 10-12 kg. The bone marrow transplantation was done on 17<sup>th</sup> March 2020 at Sankalp – CIMS Center for Paediatric Bone Marrow Transplantation, Ahmedabad under the supervision of Dr. Deepa Trivedi. During the procedure, 150 to 200 ml of bone marrow was harvested from kavya’s pelvic region in an hour-long operation and then given to Abhijeet through transplantation. By the time Abhijeet has gone through 80 blood transfusions in his life. After the operation, Dr. Deepa Trivedi kept them under the supervision and found that Kavya’s haemoglobin level had dipped a bit and there was localised pain for a few days in the pelvic region from where the marrow was extracted, but after a few days, she’s fully healed. While in the case of Abhijeet the doctors found that after 6 months of the operation, Abhijeet does not need any blood transfusion and his haemoglobin count was normal. And the doctor declared that the Abhijeet is cured. In an interview, Mr. Solanki said, “we love Kavya even more than our other children. She’s

not just our child, she's also our family's saviour. We'll be grateful to her forever".

## **ETHICAL ISSUES**

### **I. Saviour child as a commodity:**

Whenever the saviour sibling is born the first question which appears in the mind is whether the child was really wanted or merely created as a medical commodity." Dr. Lord Robert Winston, a fertility expert, described generating children to donate cells for an elder sibling as "using an unborn child as a commodity." And he believes that bringing children into the world on a conditional basis is bad. The critics argue that it is unethical to create a child as a means to an end. The classic aphorism of Immanuel Kant, "Never use people as a means, but always treat them as an end," provides intellectual support for this issue.

Those who disagree with this viewpoint argue that when parents decide to have saviour children, they do so for a variety of reasons and expectations. They further argue that Kant's dictum was misinterpreted, as it does not stop people from being used as means, but it does prohibit them from being used mainly or solely as means. What would be considered unacceptable from a Kantian standpoint is having a child purely for the sake of furthering some goal and then discarding the saviour child when the purpose is achieved.

### **II. Making a Designer Babies**

The second argument against the creation of saviour siblings is that, allowing the deliberate creation of saviour siblings will lead to the acceptance of "designer babies." The aim is that this procedure will pave the way for parents to use embryo testing to select specific features for their children, such as eye colour, hair colour, athleticism, or height of the child. If PGD technology becomes an accessible medical practice, a division will emerge between those who can afford the service and those who cannot. As a result, economic inequalities may evolve into genetic divisions, with social distinctions separating enhanced from non-enhanced people. This is a straightforward argument based on the fear of technological overuse.

The Council on Ethical and Judicial Affairs of the USA released a statement in 1994 opposing the use of PGD for selecting specific traits to be present in the unborn child. The use of PGD to design a baby is strictly prohibited by law in countries like the UK, India, etc, but what about the countries like the USA, Israel, etc. where PGD is not regulated by the law.

But the supporter argues that saviour siblings should also be banned because it also involves the selection of the particular traits (embryos), as in the case of designer babies. But the above view is rejected and argued that the saviour child is created for a different purpose than that of the designer babies.

### **III. Physical Health Issues**

The major ethical issue with the saviour sibling is the physical health of the unborn child. One cannot be 100 per cent sure that the PGD is not physically harmful to the selected embryo. The Lancet published the report in 2001 and claim that "embryo biopsy for PGD does not seem to produce adverse physical

effects in the short term, but it is too early to exclude the possibility of later effects. The saviour child is created to extract the umbilical cord stem cell or the blood or bone marrow, what if the procedure wasn't successful for the first time. The saviour child has to undergo a subsequent number of painful operations for the extraction of the blood or bone marrow to cure the elder sibling. As already discussed, the PGD technology is to select the embryo which can be a potential donor. To date, no studies have been done on the long-term implications of the PGD on the health of the saviour child. It is possible to harm the embryo itself because the testing involves extracting one or more cells from the embryo. The life of the saviour child is put at risk when the organ is harvested, it can lead to a lifetime of specialised care and health issues.

#### **IV. Psychological Harm**

The critics of the saviour child raised the concern that the child might suffer psychological or emotional harm from the knowledge that they are conceived to save another's life. The critics also argue that the child might develop a lack of self-confidence as a result of believing that his or her parents only wanted him or her to assist in the treatment of older siblings. There are also fears that if the transplant is unsuccessful, the child may feel guilty, or that they would be pressured to undertake repeated transfusions or perhaps organ donation in the future.

#### **V. Risk of Eugenics**

Some scholars argue that by selecting embryos, we put our genetic diversity at risk and expose the human race to unforeseen dangers. If the human society is more biologically or genotypically homogeneous then it is more vulnerable to ecological destruction. But such contention is rejected by Boyle and Savulescu as they are of the view that due to the financial cost of the procedure the number of requests for the PGD is likely to remain limited. The selection of the particular traits in the child raises the concern about eugenics at a family and societal level. The practice of eugenics is harmful to society, the state is duty-bound to regulate the use of PGD so that its misuse can be prevented.

#### **Conclusion**

It's vital to remember that saviour siblings usually allow a sick child to live a longer and healthier life. Not only does this benefit the kid, but it also benefits the entire family unit. It is the PGD technology that offers the possibility to have a child that can save a sick sibling. From the above discussion, two areas of consensus seem to emerge, one advocated the creation of the saviour child, while the other condemn the procedure on ethical grounds, claiming that the child will be used as a commodity, or has to suffer physical or psychological harm, etc. While condemning the procedure one must give due weightage to the life of a sick child, as there is no indication that the saviour child will be harmed. In the absence of any legal framework for PGD in the USA, the doctors and the clinics are free to make life-impacting moral and ethical decisions. If PGD is not regulated the clinics can use the technology to create designer babies, resulting in the division of the

society. HFE Authority has the power to regulate assisted reproductive technology. After the judgment of the Quintavalle case, the UK parliament has amended the HFE Act in 2008, thus legally authorizing the creation of saviour siblings with certain restrictions. The countries like India and USA should enact the law to prevent the misuse of the technology and to keep a check on the practice of medical tourism. Lastly, the use of IVF and PGD in the case of a saviour child should be regulated on a case-by-case basis, as each case is unique in its own way and required a proper evaluation. Based on the above discussions the following suggestions can be made to incorporate into the law regulating PGD:

1. PGD should not be used to screen every normal embryo. Its use should be restricted to identify specific defects.
2. PGD should not be used for making a designer baby.
3. PGD should be used for patients who have a high risk of miscarriage.
4. PGD should be used only after informed consent about the abnormalities and potential risks.
5. There should be a strict mechanism for using the PGD only in cases of savior sibling.

COMPULSORY LICENCE AND THE THREE STEP TEST: A  
CRITICAL ANALYSIS OF THE  
INDIAN COPYRIGHT ACT, 1957

**DR. M. SAKTHIVEL**

Assistant Professor

University School of Law and Legal Studies

Guru Gobind Singh Indraprastha University

New Delhi India

**Abstract**

The compulsory licencing system, which is one of the non-voluntary licences, usually places the owner in an abnormal position of having almost no direct control over how his composition or work can subsequently be exploited. This compulsory licence system under the copyright was devised as a compromise measure to protect composers' rights while ensuring that the public would not suffer at the hands of those in a position to monopolise the works under the Berne Convention. However, with the TRIPS regime, the scope for invoking such limitations and exceptions have been narrowed down due to the restrictive constructions in Article 13. In the light of the Berne Convention, this paper attempts to examine the scope of the compulsory licenses vis-à-vis three-step of Article 13 of the TRIPS in detail by discussing the provisions of the Indian Copyright Act, 1957 in detail.

**Keywords:** Copyright, Access to Works, Three-Step Test, Compulsory Licence, Non-Voluntary Licence

**Introduction**

Ownership of copyright grants a bundle of exclusive rights such as the right to reproduce, distribute, perform, display his creation, communicate to the public, prepare derivative works, etc., by which owners of the copyright enjoy a limited monopoly to reap the economic returns. These exclusive rights inevitably restrict the free flow of information/dissemination of the works, ultimately affecting the users' interest. If the works are not accessible by the public, it is not only the free flow of the information, furthering of creativity is also hampered. Thus, the economic interest of the copyright holders and the interest of the users/general public are conflicting with each other, which

would not pave the way for achieving the intended objectives of the copyright system. To balance these two conflicting interests, some limitations and exceptions to the exclusive rights have been placed as an inbuilt mechanism to ensure the persistence of creativity in society. Among these limitations and exceptions, the compulsory licence is one of the potential tools to harmonise the conflicting interests. (Gopalakrishnan, 2014)

The Berne Convention, at first Internationally, introduced the non-voluntary licencing system through Article 13(1). However, the scope and application of the same have been very limited only to the work of sound records. As per the provision, the compulsory licence can be invoked only when the sound record comprises musical and literary works. Therefore, if the sound record has already been made available through a normal mode of exploitation to reap the economic benefits, the authority can grant a compulsory licence for recording the musical work and literary work. When the compulsory licence has been granted to make the work available to the public at an affordable price, it shall substantially affect the usual mechanical reproduction of the work by the owners or by the authorised persons. Thereby the copyright holders' economic interest is substantially influenced. However, this mechanical reproduction right granted through the compulsory licence, in any way, shall not affect the moral rights of the authors. Even though there can be some alterations to the original works only for adaptation purposes, such alteration should not affect the integrity of the original work. This process safeguards authors' moral rights when the compulsory licence is invoked. (Ricketson, 2006) Therefore, from the above, it could be summarised that the compulsory licence places the copyright owners in the out of the normal position having direct control over how their compositions may subsequently be recorded or used. (Lewinski, 2008)

Further, Article 11 *bis* of Berne deals with the compulsory licence for broadcasting. It is a matter of national legislatures to decide the conditions to issue a compulsory licence for broadcasting. (Ginsburg, 2015) In addition, there should be prescribed procedures to be followed while invoking the compulsory licence for broadcasting. However, this shall not affect the authors' moral and equitable remuneration rights.

When the Triple Test was first introduced in 1967 under Berne Article 9(2), many countries objected to such insertion. (Ricketson, 2015) Berne's Triple Test was aimed to cover and regulate the exceptions to the reproduction right alone. Since Article 9(2) does not refer to other convention provisions, their operation is unaffected by Article 9(2). Further, it conveys that the exceptions available under other provisions of the Berne are excluded from Article 9(2) and its conditions. (Lewinski, 2008) India proposed an addition to the fourth paragraph to allow compulsory licence by saying that such provision is inevitable to ensure that monopolistic interest would not hamper the dissemination of the works available to the public. As this is the position under Berne, let us examine the compulsory licence provided under the TRIPS.

### **TRIPS and Compulsory Licence**

In the present context, TRIPS is the sole multilateral-international intellectual property document incorporating Berne Article 1 to 21 and the Paris Convention to protect Industrial Property, 1883. Incorporating Berne Article 1 to 21 into TRIPS means that it covers only the text of the said articles and not the entire Berne acquis relating to these articles. Because Berne's acquis provides some exceptions to the developing countries concerning reproduction rights. There is no such exception expressly stated under TRIPS. TRIPS has incorporated the 'Triple Test' as a whole. The only difference between Berne and TRIPS is that Berne gives importance to the authors, but TRIPS says owners of the work. It means the interest of the actual holder of the work shall be taken care of rather than addressing the authors' interest. Touse the compulsory licencing system, the only available provision under TRIPS is Article 13. (Gervais, 2003) It has also incorporated the same provisions as Article 9(2) of the Berne. The Triple Test under the TRIPS reads as follows:

1. The reproduction must be for specific and limited purposes. It means it is allowed only in special circumstances or special cases.
2. It should not conflict with the normal exploitation of the works.
3. It should not unreasonably prejudice the legitimate interest of the authors.

As per the first condition, any limitation or exception should be specific or special and unique circumstances. It means "not only should the use in question be before 'a quite specific purpose', that there must also be 'something special' about this purpose. In this context, the special means that it is justified by some apparent reason of the public or some other exceptional circumstances. If so, these conditions cannot be complied with by any non-voluntary licencing systems. The same is the case with compulsory licences as well. However, this 'certain special case' can be understood based on national law and public policy exceptions. Invoking of compulsory licence could be well within the ambit of any 'public policy'. Thus, such an interpretation would very well accommodate the compulsory licence within the first step.

The second step is that any limitations or exceptions should not conflict with the work's normal exploitation. The usual interpretation of the work's normal exploitation is that those forms of exploitation that currently generate significant or tangible economic returns to the holders should not be affected. It means any limitations and exceptions should not influence or come in direct conflict with the normal exploitation of the work in question. In the case of any non-voluntary licence, any of those forms of exploitation would impact or conflict with the ordinary course of exploitation of the right holders. (Gervais, 2003) Therefore, it could be well stated that the limitation cannot be imposed without affecting the normal exploitation of the authors or owners. Thus, the compulsory licence would also have an adverse impact on the normal exploitation of the right holders.

The third step envisages that the limitations on the exclusive rights shall not unreasonably prejudice the authors' interests. Though the compulsory licence

would inevitably invade into the legitimate interest of the right holder, providing compensation or an equitable remuneration would address the concern. Due to the equitable remuneration system, the compulsory licencing system shall comply with the third step. Therefore, this will not affect the third step.

Though the compulsory licence would justify the 1<sup>st</sup> and the 3<sup>rd</sup> steps, the 2<sup>nd</sup> step will not. As there is a requirement of fulfilling all the three steps cumulatively, a compulsory licence cannot fulfil all the three steps as stated; it cannot meet the 'three-step test' requirements. Thus, one can conclude that TRIPS does not expressly provide space for accommodating the compulsory licencing system. However, the TRIPS does accommodate the same indirectly as it has incorporated the provisions of the Berne Convention, i.e., from Article 1 to 21, the compulsory licencing scheme which has been well articulated within the Berne becomes an integral part of the TRIPS too. (Gervais, 2003) Therefore, from the overall reading of TRIPS with the Berne Provisions, it could be well concluded that though the TRIPS does not expressly address the issue of compulsory licence, the Berne Convention, the same has been well covered within it. Thus, the Compulsory licence under the copyright regime is well within the TRIPS framework.

#### **Compulsory Licence Provisions in Indian Copyright Act**

In India, the history of compulsory license provision could be traced from 1911 through the Imperial Copyright Act. (Suthersanen, 2013) The 1911 Act had a provision for the invoking compulsory license for the works that were withheld from the public. The same provision has been retained in Indian Act with limiting its scope only to the Indian works. (Agitha, 2013) As of now, chapter 6 of the Copyright Act deals with various licencing forms of copyright works. There are three provisions dealing with compulsory licences. There are two more provisions dealing with statutory licences. Let us examine the compulsory licence provisions in detail.

Section 31 of the Act deals with works withheld from the public. This provision can be invoked when the owner of the copyrighted work has withheld his work from the public by way of refusing to give licence to re-publication of the work or refused to allow performance in public, a complaint can be made to the Appellate Board to issue compulsory licence at any time. Further, it says the same can be invoked if the author refuses to allow the work's communication to the public by broadcast or sound recording. The procedure under section 31(1) is that the complainant should have approached the original owner of the work to make use of his work, and the same has been rejected. If so, he can make an application under section 31. After receiving such applications, Appellate Board shall proceed with the hearing, enquiry and direct the registrar to grant or refuse to grant compulsory licence. The amount of compensation shall be determined by the Appellate Board, and the same shall be made to the owner of the copyright.

In a nutshell, it could be summarised that section 31 states that the said work should have been withheld from the public for invoking the compulsory

licence. This provision applies to all types of economic rights of the copyright holders, such as reproduction right, right to republish, right to communicate by broadcasting and making sound recording rights. Before the 2012 Amendment, this provision was available only for the 'Indian works'. Pre 2012 version insisted that the works in question should have been Indian works for invoking the compulsory licence under this provision. Thereby, the provision excluded the foreign works from the ambit of compulsory licence. However, there was no such international obligation to differentiate the Indian works with foreign work as far as the compulsory licence was concerned.

The sole purpose of keeping the provision is to bring the works available and accessible to the public. Such unwarranted discrimination was criticised that foreign works were extended with advantage. By the 2012 Amendment, the same has been taken care of, and the Indian and foreign works are put at the same level. If any work is withheld from the public, then the same could be subjected to section 31. As a result of the amendment, one could argue that the Copyright Act paves the way for invoking compulsory licence if the works are available and accessible at an affordable price for furthering creativity in society. Unreasonable or excessive pricing of the works or any accessible forms would also be understood as withheld from the public, and thus, compulsory licence provision could also be invoked.

Further analysing the two categories specified in section 31, i.e., 31(1)(a) & 31(1)(b), it is much evident that section 31(1)(a) is to make available the work to the public which has been withheld from the public. This has been aimed to serve the public interest. In the case of section 31(1)(b), irrespective of whether the work has been withheld from the public or not, on the complainant's subjective satisfaction, the compulsory licence application can be made. It means it regulates trade activities in the name of compulsory licencing. Considering section 31 in the light of the three-step test, it could be well summarised that section 31(1)(a) can very well comply with the three-step test as it is much concerned about the concerning public interest. However, the same is not the case with section 31(1)(b). It cannot comply with the three-step test as there are not many public interest concerns compared with section 31(1)(a). Though it does not fulfil Article 13 of TRIPS requirements, the same is well within the scope and ambit of the Berne Articles 11 *bis* and 13. Therefore, from the above discussion, it could be concluded concerning section 31 that the same is well in compliance with TRIPS.

Section 31A speaks about the Compulsory licence in unpublished or published works where the author is dead or unknown or cannot be traced or are withheld from the public, anyone can apply to issue a compulsory licence to publish or communicate the works to the public or translate the work to any language. The intention of the legislature has been spelt out in the enactment clause itself. The works withheld from the public due to the non-traceability of authors or the author are unknown. The provision has been brought in to make the works available to the public in such circumstances.

The procedure for invoking compulsory licence under this provision is that before making an application, he has to make a publication in the daily newspapers. One publication should be in English, and at least one should be in the local language of the local newspaper of the concerned area. If it relates to the translation of a work, he has to propose his intention in the regional language. The application should be made with the appropriate form, and a copy of the notice and fee should be attached with the application. After holding the enquiry, the Appellate Board may direct the registrar to grant compulsory licence subject to a royalty payment. If the author is dead, the Central Government may ask the legal heirs or executives of the author to publish such work within the specified period. If they fail to do so, a compulsory licence shall be issued.

Similar to section 31, the pre-2012 version of this provision was only confined to Indian works that were unpublished. Thereby the unpublished foreign works were excluded. Even the published works of which the authors were not traceable or unknown were also kept outside the purview of the Act. Only through the 2012 Amendment have these rectification measures been brought in. Thus, the current provision facilitates access to the works withheld from the public due to anonymity and traceability without differentiating between Indian and foreign works.

This category of compulsory licence would be on some special cases where the published or unpublished works have been withheld from the public, this also fulfils the first requirement of the three-step test. However, it would not fulfil the other requirement of the three-step test. However, as stated, though it does not fulfil Article 13 of TRIPS requirements, the same is well within the scope and ambit of the Berne Articles 11 *bis* and 13. Therefore, from the above discussion, it could be concluded concerning section 31A that the same is well in compliance with TRIPS.

#### **Compulsory Licence for the Benefit of Disabled**

A newly introduced provision through the 2012 Amendment Act, i.e., Section 31B, another compulsory licence has been introduced to benefit differently-abled to access and enjoy the copyright works. (Gopalakrishnan, 2014) This enables the entities or organisations involved in the betterment of the differently-abled people on a non-profit basis to approach the Appellate Board for the grant of compulsory licencing. The provision does not insist that any minimum time period be expired for invoking this licence. Further, applications filed should be disposed off within two months. This category of compulsory licence would also be in some special cases where the accessibility of the works by the differently-abled persons is in question. Therefore this also fulfils the first requirement of the 'three-step test'. However, it would not fulfil the other requirement of the three-step test. However, as stated, Though it does not fulfil Article 13 of TRIPS requirements, the same is well within the scope and ambit of the Berne Articles 11 *bis* and 13. Therefore, from the above discussion, it could be

concluded with respect to section 31A that the same is well in compliance with TRIPS.

### **Some Non-Voluntary Licences Other than Compulsory Licences**

As far as translation is concerned, there is a separate licencing practice spelt out in section 32 of the Act. It insists on invoking the non-voluntary licence after the expiration of 7 years. After the said seven years period, the Appellate Board could be approached for the grant of licence. This is a general provision. However, after the expiry of 3 years from the first publication, this licencing model could be invoked for teaching, scholarship or research. Further, it states that If the translation is in a language not in general use in a developed country, such application can be entertained after the expiry of one year. In the above-said cases, the application should be made in the appropriate form with the proposed retail price of the work and fees. After holding an enquiry, the Appellate Board may direct the registrar to grant a compulsory licence. However, such licence shall not extend to the exportation of goods other than India.

Section 32A of the Copyright Act deals with another non-voluntary licence to reproduce and publish works for certain purposes. Suppose the copies of such editions are not made available in India or have not been put on sale in India for six months, after the expiration of the relevant period, from the first publication. In that case, anyone may apply to the appellate board. The licence may be granted subject to the conditions mentioned in the section. Section 32B says about the termination of the non-voluntary licences granted under section 32(1A) if the owner or authorised person publishes a translation of work in the same language with the same content and at a reasonable price, the non-voluntary licence may be terminated. Before making such termination, three-month notice should be given. After the expiry of three months, such non-voluntary licence so granted shall be revoked. However, this revocation shall not affect the copies made at the time of non-voluntary licence. It means such copies shall be allowed to be sold in the market. Though there are a few more provisions on statutory licencing, as they do not fall under the ambit of this paper, they are not discussed. However, it is worth pointing out that all the non-voluntary licences could not pass through the triple test. However, they could do very well with the ambit of TRIPS as they comply with Berne Convention.

### **Conclusion**

From the above, it is apparent that the Indian copyright Act has a set of compulsory licencing provisions along with other forms of the non-voluntary licences. Prior to 2012, the compulsory licensing provision were the some unwarranted restrictions like 'invoking after the expiration of specified period' or 'invoking was possible only with respect to Indian works'. As stated above, they were inserted without any international obligations. However, through the Copyright Amendment Act, the same obstacles or unwarranted insertions have been omitted and paved way for the smooth implementation irrespective of being Indian or foreign works. At the same time, sometimes limitations are

available in sections 32, 32A. Such a time period is not necessary because there is no international mandate on the part of India to have such limitations while granting the compulsory licence. These provisions had been incorporated from the Berne appendix, which benefits developing countries. However, the TRIPS has not incorporated the same, and we may say that they cannot comply with TRIPS. Even after the considerable period of time, we have been merely travelling with the copyright legal framework without invoking any of these provisions. There have been the few occasions in which Indian Courts have had the opportunity of examining broadcasting related compulsory or non-voluntary licences. However, they could not make use of the provisions effectively. (*ENIL v. SCIL*, 2008) Almost, these compulsory licence provisions have been left unused. The ongoing litigation before the Delhi High Court against sci-hub has opened the academic discourse on invoking compulsory licence to the literatures that are not affordable to Academic community. Govt should explore academic licensing formula to tackle this affordability issue. This could be achieved through 'one nation – one licence policy'.

## **OMANDURAR – THE FACE OF REDDI COMMUNITY**

**V. SELVARAJU**

Part-Time Research Scholar

Department of History

Bharathidasan University

Tirucirappalli India

Gardon Allport gives the classic definition of personality. According to him, personality is the dynamic organization, within the individual, of those psycho-physical systems, that determine the unique adjustment to his environment. In other words, personality is all about the unique response of an individual to a given challenge from the environment. In this sense, every individual has a personality. What distinguishes a leading personality from the ordinary personalities in a group is the ability of the extraordinary personality to establish a vision, set goals, motivate people and obtain their commitments, to achieve the goals and realize the vision.

<sup>1</sup> These leading personalities are individuals within a group, 'who have influence, who provide focus, co-ordination and direction for the activities of the group'.<sup>2</sup> In other words, they are the face of the group. In communication theory, they are called the Icons<sup>3</sup> Icon is a sign, that describes or resembles the object. For example, when somebody mentions the abbreviation, OPR, immediately one could recall the Reddi Community.<sup>4</sup>

An outstanding example of an iconic personality, among the Reddis of Tamil Nadu, was Omandur Peria Vazhaivu Ramasamy Reddiar, fondly referred to as the 'OPR', who was an activist in the national movement for freedom and also the first Premier of the independent Madras Presidency, from March 23, 1947 to April 6, 1949. He was generally considered to be the southern edition of Mahatma Gandhi of all India stature because both pursued 'Saintly, employed non-violent methodology to pursue the struggle for political independence and realize social justice. Both were not enamoured of any office. When Lal Bahadur sastri offered governorship to OPR, he declined similarly, Gandhi also did not choose to accept the presidantship of the congress, save once. OPR passionately participated in the national movement, led by Gandhi and he was responsible for the successful implementation of Gandhi's call for boycott of foreign products, toddy shops, for organizing salt satyagraha etc.. Gandhi's dream of building a new India, based on village industries, was fully endorsed by OPR. The only difference between them, was that Ramasamy Reddiar was born an agriculturist and he supported the village movement while Gandhi was a fully westernised gentleman, trained to be a barrister in London and turned towards village autonomy through his search for a non-violent model of economy, which J.C. Kumarappa would call the Economy of Permanence.<sup>5</sup> Just as Gandhi did not allow his family commitments to distract him from serving the public cause, Ramasamy Reddiar also did not get distracted by the death of his wife nor the death of his only son. Both lived the Dharma of a Brahmachari and spent their mortal life for the enduring cause of the nation.

His limited knowledge of English language engendered a lot of speculation when he was elected the leader of the legislative party. Ramasamy Reddiar defeated Prakasam to the post of congress party in Tamil Nadu. In the year 1947, it was believed that only a leader, who was proficient in the English language, could operate as the Premier of the Madras Presidency and therefore, many expected OPR to remain party leader and nominate someone else as the premier. But he surprised everyone by accepting the post of premier. When OPR first met the Governor, regarding the formation of the Ministry, he was accompanied by C.Subramaniam and M.Baktavatchalam. During the subsequent meetings with Archibald Nye, the Governor, C.Subramaniam expected a call from OPR. But Ramasamy Reddiar boldly met the Governor and held his own in the conversation with the Governor in the English language. It was this bold step by OPR to accept the premiership, despite the limited knowledge of English that paved the way for Kumarasamy Raja and Kamarajar to accept the office, without any reservation.

---

<sup>5</sup>J.C. Kumarappa, Economy of Permanence, Sarva Seva Sangh Prakasham, Varanasi, 2017, p.30.

Even when he was premier, he would read the files, written in the English language by ICS officers and would make relevant remarks in English, without consulting any officer. On one occasion, when he noted on the file, in my opinion, with the wrong spelling of the word, opinion, his Personal Secretary, P.V. Krishayya, pointed out the mistake. Ramasamy responded with a smart answer. He said that 'It is O.K. Type the note the way I have written because the officer concerned, has only asked for my opinion and not whether I knew the spelling of opinion'.<sup>6</sup>

It is said that when the Ali brothers returned from London, Gandhi honoured them with a hand woven cotton shawl. When Ali brothers asked Gandhi about the hand woven shawl, Gandhi replied that it was khadi. Gandhi also explained that Khadi means Dignity, which comes from Indians, economically standing on their own legs. In other words, in the Gandhian discourse, khadi represented the honour of India.<sup>7</sup> Omandur Periaavazhaivu Ramasamy Reddiar, popularly referred to as OPR, was a dyed-in-the-wool Gandhian and no wonder OPR wore only khadi clothes. Since OPR considered Khadi to be sacred, he washed his own clothes. During the period of 1924, when Gandhi was engaged in the campaign for Khadi, OPR was so devoted to Gandhi that he carried khaddar products on his shoulders and went about selling them on the streets. OPR, a man of extensive landed property, responded to the call of Gandhi to popularise Khadi and vended Khadi products on the streets. This was possible because OPR, like Gandhi, did not believe in material possessions or birth-based status. Just as Gandhi pursued saintly politics, OPR also was an advocate of saintly politics. Both believed in abdicating self interest and working for the upliftment of the Indian masses, through the new economic model, called the Economy of Permanence.

Ramasamy Reddiar, being a sincere Gandhian, did not consider carrying Khadi cloth on his shoulders for marketing them, as a burden but a sacred duty. When Gandhi wanted to promote Khadi, he formed the All India Spinners Association in the year 1925. There was a branch in Madras also. In the year 1939, when this branch in Madras had an unsold stock, worth seven lakhs of rupees, at a time when a sovereign of gold was sold at rupees 13. At this juncture, it was Ramasamy Reddiar, the Gandhian, who devised a strategy to clear the dead stock. When OPR became the Premier of the Madras Presidency and continued to be the First Premier of Madras Presidency of India, he created a marketing division for Khadi sales, in every government department. Thus Ramasamy Reddiar totally supported Gandhi's Khadi promotion programme. All officials, connected with Khadi and all teachers, connected with Basic Education, were ordered to be trained in the art of operating the spinning wheel (charka).

<sup>7</sup>Souvenir on Omandur Birth Centenary, p. 133.

Ramasamy Reddiar understood the value of Khadi in the context of national movement. According to Lisa N. Trivedi, in a largely illiterate and multi-lingual, South Asian context, Gandhi's Khadi Movement adopted visual medium of expression, to disseminate messages, forge national consciousness and map the geographical and political boundaries of newly invented nation.<sup>8</sup> Bean also concurred with this observation and maintained that by wearing loins cloth, Gandhi transcended the limitations of language in a multi-lingual country.<sup>9</sup> According to Chakrabarty, this visual vocabulary was an attempt to stop the drain from India and reverse the trend of colonial exploitation by the British Raj in India.<sup>10</sup> In the year 1948, Khadi Development Conference was organized at the secretariat in Madras and private manufacturers of Khadi also participated. It was at this conference that Omandur ordered the private manufacturers also to produce Khadi.

Omandur Ramsamy Reddiar was actively associated with the activities of Gandhi Niketan Ashram at T.Kallupatti in the District of Madurai. It was the brain child of G.Venkatachalapathy and R.Guruswamy, sincere followers of Gandhi, who wanted to introduce the Village Swaraj as visualized by Gandhi. It was Omandur Ramsamy Reddiar who gave concrete shape to the dream project at T. Kallupatti in the District of Madurai. This project of village swaraj has an interesting history. As stated earlier, Gandhi first valorised the Charka for manufacturing Khadi, which was deemed to be a response to British colonialism and also a strategy to empower the impoverished masses. It was J.C. Kumarappa, who argued with Gandhi, that he had been over emphasizing the Khadi and instead he advocated the resuscitation of village industries for rural reconstruction. As stated earlier, Gandhi had already formed the All India Spinners Association in 1925. Since he was convinced by the arguments of J.C. Kumarappa on the revival of village industries, he organized the All India Village Industries in 1934, under the leadership of J.C. Kumarappa, an academician – turned – Gandhian. Its office was located at Maganvadi in Wardha.

The Gandhian idea of Village Movement, under the auspices of the All India Village Industries Association (AIVIA), was presented as an alternative developmental model, to both capitalism, which was founded on predatory economics and communism, which valorised unhealthy levels of centralisation and regimentation. The AIVIA undertook research, production, training and publication. It supported village industries like flour grinding, oil pressing, gur

making, bee keeping, growing cotton, leather tanning, soap making, paper making, pottery, converting human excreta into manure etc.<sup>11</sup>

The Gandhi Niketan at T. Kallupatti, reputed to be the Maganvadi of South India, was the place where the founder of AIVIA, J.C. Kumarappa, spent the last days of his mortal life and breathed his last breath on January 30, 1960, exactly the same day on which his Guru, Gandhi, was shot dead twelve years ago. Omandur Ramasamy Reddiar took a lot of interest in the training programme, designed for the Gram Sevaks (Village Workers). Reddiar found that the trainees needed more grounding in Tamil language without which these Gram Sevaks could not establish rapport with the target audience. Hence he requested R.B. Sethu Pillai, a great scholar in Tamil language, to teach these trainees the finer points of the Tamil language, which has a rich literary tradition.<sup>12</sup>

Since Omandur Ramasamy Reddiar was passionately committed to the Gandhian alternative development model, he organized a conference to facilitate the progress of the constructive programmes of Gandhi. It is worth recording that Reddiar had invited J.C. Kumarappa, the man who had exposed the exploitative nature of British imperialism in India, through his famous paper on public finance and the spirit behind the village industries movement. K.Venkatachalapathi, the founder of Gandhi Niketan at T. Kallupatti, Kelappan, a Gandhian from Kerala, G.Ramachandran, founder of Kasturba Gram, A.Vaidyanatha Iyer of Madurai, a leading personality in the temple entry movement, N.M.R.Subbaraman, known as the Madurai Gandhi, Dr.Gurupadam etc were invited to the Conference, for the stated purpose of suggesting a strategy to implement the village swaraj, as visualised by Gandhi. One of the important outcomes of the conference on Gandhian village swaraj was that Omandur appointed K. Venkatachalapathi, the founder of Gandhi Niketan at T.Kallupatti, as the Assistant Commissioner for the development of village industries. Further, Reddiar also organized another round of training programme, for those who had undergone training programme one year earlier. It was a kind of refresher programme. Reddiar appointed R. Gurusamy, the co-founder of Gandhi Niketan at T.Kallupatti, to be responsible for conducting annual refresher programmes, to sustain their enthusiasm for this task of village regeneration and also to equip them with necessary inputs for effective implementation of the village industries movement. When S.K.Dey, Minister for Social Development, the Government of India, visited the Gandhi Niketan at T.Kallupatti, he was surprised to find the development works and the availability of infrastructure. It is worth recording that this laudable performance was possible mostly by the intervention of Reddiar, who supported the village programmes enthusiastically. When J.C. Kumarappa suggested infrastructural facilities like rooms for trainees, class

---

<sup>11</sup> J.C. Kumarappa, Economy of Permanence, Sarva Seva Sangh Prakashan, Varanasi, 2017, pp.144-153.

<sup>12</sup> Souvenir on Omandur Birth Centenary, p.103.

rooms etc, Omandur Ramasamy Reddiar provided these facilities for the successful conduct of training programmes.

Hence Omandur Ramasamy Reddiar, being a Gandhian, extended prohibition of alcoholic drinks, to the entire Madras Presidency also.<sup>13</sup> This policy decision was in consonance with the Gandhian Economics of Service according to which consumption of alcoholic beverages is a case of self indulgence and a drunkard is rendered physically incapable of doing any work, either for himself or for altruistic purpose.<sup>14</sup> In the Gandhian utopia of village swaraj, self control<sup>15</sup> is valorised and a drunkard loses control over himself in the alcohol-induced state of stupor. While Omandur Ramasamy Reddiar enforced prohibition in the entire length and breadth of the Madras Presidency, he was empathetic to the plight of the ex-addicts. Hence he also organised alternative programmes, to ease the desperation of the ex-addicts. He organized mobile vans, to supply tea, free of cost, to the poor people and also launched awareness campaign, among the ex-addicts, to switch over 'to the cup that cheers but does not inebriate.' Omandur also arranged for dramas, street plays and musical shows, to impress upon the ex-addicts the advantages of being teetotalers. Further, Omandur also introduced the ancient, rustic games like Sadu Kudu, Kizhi Thattu etc, to keep the minds of ex-addicts engaged because it is mostly the idle men who become addicts to alcohol.

Though Omandur Ramasamy Reddiar did not smoke, he did not treat smokers like outcasts. But smokers did not dare smoke before him. When an ICS officer was smoking on the verandah, he hastily put the lighted cigarette in his coat pocket, when he heard that OPR was walking towards his direction. When the Premier approached him, he raised his hand to wish him. Only then he realized that his coat pocket was on fire. But when Cariappa, the retired General, called on him, he wanted his permission to smoke. Omandur politely replied that since he did not smoke, he could not offer him a regular ash tray. But he could offer a tumbler, half full of water, as an alternative ash tray. This reveals his personality to be flexible enough to move with smokers also even though he was not a smoker.<sup>16</sup> A Similar trait could be observed in Gandhi also, who offered meat to his non-vegetarian guests even though he was a strict vegetarian.

Omandur Ramasamy Reddiar, a Gandhian, did not stop with the implementation of the constructive programmes of Gandhi like Khadi etc and he enthusiastically participated in the Gandhi inspired political programmes also. Due to his active participation in the political programmes of Gandhi, he had to suffer four terms of incarceration. The first jail term was imposed on

<sup>14</sup>J.C. Kumarppa, Economy of Permanence, p.14.

<sup>15</sup> M.K. Gandhi, Village Swaraj, compiled by H.M.Vyas, Navajivan Publishing, House, Ahmedabad, 1962,p.138 (Taken from Young India, 27-5-1926, p. 190).

<sup>16</sup> Somalay, op. cit, p. 117.

him for participating in the famous programme of Salt Satyagraha,<sup>17</sup> initiated by Gandhi in Dandi, in the year 1930 and followed by a similar programme, under the leadership of Rajaji, at Vedaranyam.

The third stint of imprisonment was suffered by Omandur Ramasamy Reddiar during the period of individual satyagraha. Gandhi designated Vinobhave to launch the individual satyagraha<sup>18</sup> He was immediately arrested on the grounds that Vinobhave indulged in acts injurious to the war efforts of the Imperial Government. The arrest of Vinobhave provoked thousands of people to take up individual satyagraha and 30,000 people were arrested all over India. It was against this background that Omandur Ramasamy Reddiar was arrested under Section 38, Sub-section 5 of the Defense of India Act. Omandur was awarded imprisonment for one year.

In this connection, the role of Omandur Ramasamy Reddiar in preventing the import of cloves from South Africa is worth mentioning. As mentioned earlier, the racist South African government had humiliated and brutally treated the indentured labourers from India. In the year 1936, the Indian labourers, working in the plantations of cloves, were subjected to inhuman treatment by the white owners of plantations. Hence the Indian National Congress formed a Committee, under the leadership of Sardar Patel, to initiate appropriate action against the white owners of clove plantations. The Committee decided to boycott the import of cloves from South Africa and teach the white owners a lesson. The dock workers at Bombay and Madras blocked the unloading of cloves at their ports. Hence they tried to offload the cloves at the port in Pondicherry, which was then a French colony. At this juncture, it was Omandur Reddiar who organized the port workers to block the import of cloves. As a result, the ship had to return to South Africa. Even when the authorities at the port offered extra money to unload the cloves, workers, fired by the spirit of nationalism, refused to oblige the authorities. In this campaign against the import of cloves at Pondicherry, Omandur was greatly helped by S.R. Subramaniam, a leader of the communist party and V.Subbaiah. Thus Omandur Ramasamy Reddiar proved that he was the undisputed leader of the District of South Arcot, extending up to Pondicherry.

It was Omandur who was responsible for organizing individual satyagraha in the District of South Arcot. He mobilized volunteers in places like Chidambaram, Cuddalore, Villuppuram and Tindivanam. The level of his leadership could be measured by the fact that the individual satyagraha programme was more vigorous in the District of South Arcot than in any other part of Madras Presidency. It is reported that the sale of foreign textiles was totally stopped thanks to the vigorous pursuit of individual satyagraha, by Omandur and his companion satyagrahis.

The fourth stint of jail term was experienced by Omandur Ramasamy Reddiar during the final thrust for independence, under the Quit India

---

<sup>17</sup>Souvenir on Omandur Birth Centenary, p. 81.

<sup>18</sup>Somalay, op.cit,p.77

Movement, initiated by Gandhi. Ramasamy Reddiar was taken into preventive custody. He was awarded a 12 month long jail term.

It is interesting to recall that Omandur Ramasamy Reddiar read books during his jail term just as Gandhi spent his stay in the jail by reading books. Gandhi read Ruskin's 'Unto This Last', Tolstoy, Plato, Gita etc, during his first period of incarceration in a South African prison in the year 1908 and during his second period of incarceration, Gandhi read Thoreau's essay on civil disobedience.<sup>19</sup> Similarly Omandur also read books during his jail term but with one major difference. Ramasamy Reddiar read only religious books like Arutsudar Vallalaar by Sri. Swami Suddananda Bharathi, Palani Sthala Varalaaru, Sri Ramana Naarpathu and some nationalist books like Namadu Thaa Naadu by Swami Vivekanandar, Manitha Vazhkaiyum Gandhi Adigalum by V. Kalyana Sunderanaar etc... He also read a book of poems by Bharathi. All his jail mates like T.R. Arunachalam, recorded that Omandur was very fond of reading. During his period of incarceration, Omandur would never miss a class on Thirukkural, arranged by Avinasilingam Chettiar or the class on Economics, conducted by R. Venkataram. When Omandur was in the Central Jail at Trichy, he would regularly attend the exposition of Thirukkural, by Rajaji, in the year 1930.

Omandur Reddiar sent a circular, to instruct the officials to ignore any recommendation by an elected member of the Assembly and take decisions only on the basis of the procedures. Even when congress party members requested Omandur to withdraw the circular, which was damaging to the dignity of the members of the Assembly, he refused to withdraw the controversial circular.<sup>20</sup>

While Omandur ruffled the feathers of the legislators, through the impugned circular, banning the legislators from interfering with the officials, he also antagonised heads of Hindu Mutts also, by introducing amendments to the Hindu Religious Endowment Bill. Mutts were endowed with rich properties and they were governed by Mutts, which were autonomous. Omandur was annoyed that the huge properties, endowed to Mutts, were exploited to the advantage of a few and it was this widespread prevalence of corrupt practices that helped E.V.R. to promote atheism in Tamil Nadu. When Omandur visited Vedaranyam, he found that the 16,000 acre property of the temple, could fetch only a paltry income of rupees 75,000. Hence Omandur introduced amendments to the Hindu Religious Endowment Bill, according to which the Board, which was monitoring these temples, with no real powers, became a regular Department of the Government and jewels of the temples were registered and leasing of temple properties was not to be a loss to the temples.<sup>21</sup>

---

<sup>19</sup> Anuradha Ray, op.cit, pp.56 to 57.

<sup>20</sup> Somalay, op. cit, p.351

<sup>21</sup> Viduthalai January 3, 1949.

When opposition to Omandurar was increasing due to his no nonsense approach, he decided to quit on April 6, 1949. Omandur Ramasamy Reddiar, just like Gandhi, pursued saintly politics but after his voluntary retirement from politics on April 6, 1949, he became a full-fledged saint and returned to the life of ashram. Vidhuthalai, the party organ of Dravida Kazhagam of EVR, sadly wished him 'goodbye' in its editorial<sup>22</sup> and declared him to be another victim at the altar of Brahminism.

Omandurar decided to spend the rest of his life, after the exit from politics, in Vadalur. Omandurar developed interest in Vallalar of Vadalur, when he read about him in the book, 'Manitha Vashkaiyum, Gandhi Adigalum, by Thiru.Vee.Kaa. Soon this incipient interest grew into glowing passion for the simple teachings of Vallalar. After the exit from political life in 1949, he decided to form his own ashram at Vadalur, with the help of Swamy Sudhananda Bharathiar. Omandurar formed the kind of Gurukulam he was dreaming of and called it Suddha Sanmarga Sangham. It was registered on June 18, 1951, with Swamy Sudhananda Bharthiyar as the President. The objectives of this Sangham were to create an ashram, where facilities could be provided to train selfless workers in the ways of Suddha Sanmargam, The sangham was designed to attain self-sufficiency (Economy of Permanence), values of wellbeing based on traditional medicines, to print the sayings of Vallalar, Yogi Sudhananda Bharathiyar etc, to move with the rural population in the neighborhood and help them in times of crisis like famine, and to promote village industries. In short, the Gurukulam, founded by Omandurar at Vadalur, resembled the Gandhi's ashram at Sabarmati and also accommodated the principles of Economy of Permanence, expounded J.C. Kumarappa, a close associate of Gandhi. Thus Omandurar shaped his life philosophy after the principles of Gandhi and he was truly the South Indian version of Gandhi, the Mahatma. In a way, Omandur Ramasamy Reddiar outdid Gandhi because Omandurar took up the political office of Premiership of Madras Presidency and proved that one could be a saint even in the midst of political rivalry and corrupt politicians as well as corrupt bureaucrats. As explained earlier, Omandur was more Gandhian than Gandhi himself. However, Omandur Periyavzhaiivu Ramasamy Reddiar, the first Chief Minister of Madras Presidency when India woke up to the freedom of August 15, 1947, remains a forgotten hero not only among the general population of Tamil Nadu but also among the Reddi community. May be his incorruptible public life does not go down well with the present generation, which has taken corruption of public life for granted.

## **IMMORALITY & PUBLIC POLICY UNDER LAW OF CONTRACT**

DR. NAWAL KISHOR MISHRA

Assistant Professor

Faculty of Law

Banaras Hindu University

Varanasi India

### **Abstract:**

According to Indian law of Contract, the object and consideration of the contract shall be lawful; even if the part of the object or consideration is unlawful then whole agreement will be void. There are various grounds on the basis of which an agreement can be declared as unlawful which have been mentioned under section 23 of the Indian Contract Act 1872. This paper will discuss particularly about two things i.e. Immorality and Public Policy which has been mentioned U/s 23 of the Indian Contract Act, on the basis of which, an agreement can be declared as void. An attempt has been made here to analyze the provisions in reference of Indian law as well as in reference of English law.

### **Introduction:**

Only those agreements become contract which is enforceable by law, this can be concluded by the meaning of Contract which is given U/s 2(h) of the Indian Contract Act. Agreements having lawful objects & considerations are enforceable by law.

“The consideration or object of an agreement is lawful, unless it is forbidden by law, or is of such nature that, if permitted, it would defeat the provisions of any law, or is fraudulent, or involves or implies, injury to the person or property of another, or the Court regards it as immoral, or opposed to public policy. In each of these cases, the consideration or object of an agreement is said to be unlawful. Every agreement of which the object or consideration is unlawful is void.”<sup>1</sup>

---

<sup>1</sup> Section 23 of the Indian Contract Act 1872

Sometimes the word ‘object & consideration’ are used at the place of each other but in Section 23 of the Indian Contract Act both the words have distinct meaning. Here the word object is used in the reference of motive or purpose of the agreement, & consideration is used for something in return.

This Article will further explain about the immorality & public policy in detail.

### **Immoral**

The term immoral is not defined in the Act, but it can be explained as something which is generally against the prevailing norms, values, principles & standards of the society. According to the dictionary<sup>2</sup> meaning the word immoral means morally wrong or outside society’s standards of acceptable, honest, and moral behaviour. What will be the immoral for the society it may change from time to time, For example, live-in-relationship was earlier immoral in the context of the Indian society but now gradually society is accepting this kind of relationships. Any immoral agreement will not amount to a valid contract because law doesn’t allow enforcing an immoral agreement. There is a Latin maxim “*Ex dolo malo non oritur action*” which means the Court will not help a person who found his cause of action on an immoral act. What will be the moral or immoral will be decided by the Court in every cases. But there are certain acts which are regarded as immoral from time long back till now and perhaps will always be regarded as immoral.

**Anson** in his Law of Contracts states at P. 222 “The only aspect of immorality which Court of Law have dealt is sexual immorality.....”<sup>3</sup>

Supreme Court of India in the case of *Gherulal Parakh v. Mahadeodas*<sup>4</sup> Explained the word immoral as; “The word “immoral” is a very comprehensive word. Ordinarily it takes in every aspect of personal conduct deviating from the standard norms of life. It may also be said that what is repugnant to good conscience is immoral. Its varying content depends upon time, place and the stage of civilization of a particular society.

In short, no universal standard can be laid down and any law based on such fluid concept defeats its own purpose. The provisions of S.23 of the Contract Act indicate the legislative intention to give it a restricted meaning. Its juxtaposition with an equally illusive concept, public policy, indicates that it is used in a restricted sense; otherwise there would be overlapping of the two concepts. In its wide sense what is immoral may be against public policy, ‘for public policy covers political, social and economic ground of objection. Decided cases and authoritative text-book’ writers, therefore, confined it, with every justification, only to sexual immorality. The other – limitation imposed on the word by the statute, namely, “the court regards it as immoral”, brings out the idea that it is also a branch of the common law like the doctrine of

---

<sup>2</sup> Cambridge Dictionary

<sup>3</sup> *Gherulal Parakh v. Mahadeodas Maiya & Others.*, 1959

<sup>4</sup> 1959 AIR 781, 1959 SCR Supl. (2) 406

public policy, and, therefore should be confined to the Principles recognized and settled by Courts.”

Court cited some instances: settlements in consideration of concubinage, contracts of sale or hire of things to be used in a brothel or by a prostitute for purposes incidental to her profession, agreements to pay money for future illicit cohabitations, promises in regard to marriage for consideration or contracts facilitating divorce are held to be void on the ground that the object is immoral. Supreme Court further made observation that no case has been brought to the notice of the Court where it has been applied to any head other than sexual immorality; precedents confine the concept of immorality only to the concept of sexual immorality. The concept and scope of immorality further explained by the Delhi High Court and widened its ambit in the case of Union of India v. M/S. N.K. Garg & Co.<sup>5</sup> Court observed that “*in case where there is illegal/wrongful holding on to the principal amounts payable to another person for long period. The aforesaid wrongful/illegal action will thus simultaneously be both immoral and /or against public policy*”.

*Illustration*<sup>6</sup> A agrees to let her daughter to hire to B for concubinage. The agreement is void, because it is immoral, though the letting may not be punishable under the Indian Penal Code (45 of 1860).

#### **(1) Interference in marital relations**

Interfering in any marital relations in any way is considered as one of the immoral act. Thus any agreement to interfere in marital relations shall be held as void on the ground of immorality. In a case where a man advanced certain sum of money to a married woman so that she may obtain divorce from her husband & subsequently marry him(the man), it was held that such agreement is void on the ground of immorality & the man could not recover the amount back.<sup>7</sup> In the same way, if a married man enters into an agreement with a woman to marry her after the death of his wife or after getting divorce from his wife then this agreement shall be void.<sup>8</sup> If the woman does not know that the man is already married then also agreement shall be void but the woman can bring action for breach and can claim damages.<sup>9</sup>

#### **(2) Agreement regarding prostitution**

Any agreement with a prostitute to facilitate her, a helping hand to carry on her services is an immoral act; therefore such agreement shall be void on this ground. If a person agreed to provide his house on rent to a prostitute even after knowing the fact that the house will be used for providing the services of the prostitution, such agreement shall be void on the ground of immorality & the man cannot recover the amount of rent.<sup>10</sup> However, if the person was unaware of the purpose even then agreement will be void but he is entitled to

recover the amount of the rent.<sup>11</sup> If loan has been given, some articles, horse carriage or car has been given or hired or sold to a prostitute for helping her in her profession, such agreement shall be void & no amount /articles/ horse carriage/ car can be recovered or taken back.<sup>12</sup>

### **(3) Past or future cohabitation**

A promise to pay for past illicit cohabitation is held to be enforceable in English law if it is made under seal. If it has not been made under seal then it would not be enforceable.<sup>13</sup> Under Indian Law the issue of past cohabitation is controversial issue.

If past cohabitation was adulterous then in many cases it has been declared unenforceable as earlier adultery was an offence under section 497 of IPC, but now adultery is not an offence as Sec. 497 has been declared as unconstitutional by the Supreme Court of India in Joseph Shine v. Union of India, 2018 case. In the cases, where, past cohabitation was not adulterous, some High Courts have held it enforceable while some other high Courts have held it unenforceable. Where an agreement was made to pay for the past cohabitation with a motive to continue such cohabitation even in the future, such an agreement was held to be against the public policy.<sup>14</sup>

An agreement to pay for the future cohabitation is always unenforceable under English Law as well as under Indian Law.

### **(4) Dancing Girls**

It was held in a case<sup>15</sup> that giving or promising to give help to a dancing girl is not immoral. Court also observed that singing is a distinct mode of obtaining a livelihood which is not necessarily connected with prostitution.

### **Public Policy**

The agreements are unlawful & void if the consideration or object of such agreements are against the public policy. The term “public policy” is not defined in the statute; neither any precise definition can be given to the term. Whether the agreement is according to the public policy or against the public policy it is decided by the Court. The doctrine of public policy is based on a latin maxim “*ex turpi causa non oritur actio*” which means “an agreement which opposes public policy would be void and of no use.” The determination of what is contrary to the so called policy of the law necessarily varies from time to time. Many transactions are upheld now which in a former generation would have been avoided as contrary to the supposed policy of the law.”

Earl of Halsbury made observations<sup>16</sup>; “I deny that any Court can invent a new head of public policy; so a contract for marriage brokerage, the creation of a perpetuity, a contract in restraint of trade, a gaming or wagering contract, the

assisting of the King's enemies ; are all unlawful things and contrary to the public policy." According to Lord Halsbury the categories of public policy are closed. Lord Atkin could not agree with Lord Halsbury's observation that categories of public policy are closed, according to Lord Atkin "the doctrine of public policy should be invoked only in clear cases in which harm to the public is substantially incontestable.."<sup>17</sup>

Borough J. In the case of *Richardson v. Mellish*<sup>18</sup> observed against the public policy by saying, "it is a very unruly horse, and when once you get astride it, you never know where it will carry you".

Lord Denning<sup>19</sup> expressed his opinion against the aforesaid view and observed that if control of the unruly horse is given in the hand of a good rider then he can manage well. Supreme Court of India explained the doctrine of public policy in the case of *Gherulal Parakh v. Mahadeodas*<sup>20</sup> as;

"The doctrine of public policy may be summarised thus: Public policy or the policy of the law is an illusive concept; it has been described as an "untrustworthy guide", "variable quality", "unruly horse", etc.; the primary duty of a court of a law is to enforce a promise which the parties have made and to uphold the sanctity of contract which forms the basis of society; but in certain cases, the Court may relieve them of their duty on a rule founded on what is called the public policy; for want of better words Lord Atkin describes that something done contrary to public policy is a harmful thing; but the doctrine is extended not only to harmful cases but also to harmful tendencies; this doctrine of public policy is only a branch of common law, and just like any other branch of common law, it is governed by precedents; the principles have been crystallised under different heads and though it is permissible for courts to expound and apply them to different situations, it should only be invoked in clear and incontestable cases of harm to the public; though the heads are not closed and though theoretically it may be permissible to evolve a new head under exceptional circumstances of a changing world, it is advisable in the interest of stability of society not to make any attempt to discover new heads in these days."

The Supreme Court in the case of *State of Rajasthan v. Basant Nahata*<sup>21</sup> observed that "it would not, in our opinion, be correct to contend that public policy is capable of being given a precise definition. What is 'opposed to public policy' would be a matter depending upon the nature of the transaction." The Court further stated that when "opposed to public policy" is a defence for a contract then the Court should consider the following points while deciding the validity of the contract:

- a) Pleading in terms of Order VI, Rule of the Code of Civil Procedure
- b) Statute governing the case

In *Chitty on contracts*, it is stated<sup>22</sup>:

Objects which on grounds of public policy invalidate contracts may, for convenience, be generally classified into five groups:

1. Objects which are illegal by common law or by legislation
2. Objects injurious to good government either in the field of domestic or foreign affairs
3. Objects which interfere with the proper working of the machinery of justice
4. Objects injurious to marriage and morality
5. Objects economically against the public interest

This classification is adopted primarily for case of exposition. Certain cases do not fit clearly into any of these five categories.

### **Agreements opposed to public policy**

#### **(1) Agreement to stifle prosecution**

Agreements which are entered into with an object to stifle prosecution shall be void on the ground of 'against the public policy'. To prevent crime & protect the society against crime and criminality is one of the important objectives of the criminal justice system. Prosecuting and punishing the guilty person is an essential step towards prevention of crime. Thus, an agreement to withdraw pending prosecution or to not initiate prosecution against a guilty person would defeat the objective of criminal justice system & shall be void. Such agreements are called agreement to stifle prosecution. The underlying principle is "you shall not make a trade of a felony."

#### **Illustration<sup>23</sup>**

A promises B to drop a prosecution which he has instituted against B for robbery and B promises to restore the value of the things taken. The agreement is void, as its object is unlawful. There are certain offences referred as compoundable offence<sup>24</sup> and offences compoundable with the leave of the Court, parties can enter into an agreement to not prosecute or to withdraw the prosecution for the offences of former category and for the later one, permission of the Court is required. Another category of offence is non-compoundable offences for which no Court of law can give permission to compound it. In the case of *Narasimharaju v. Gurumurthy Raju* the honourable Supreme Court held that "If a person sets the machinery of the Criminal Law into action on the allegation that the opponent has committed a non-compoundable offence and by the use of this coercive criminal process he compels the opponent to enter into an agreement, that agreement would be

<sup>22</sup> 28<sup>th</sup> edition, at Page 838

<sup>23</sup> Illustration (h) of Section 23 of the Indian Contract Act

<sup>24</sup> Section 320 of Criminal Procedure Code, 1973

treated as invalid for the reason that its consideration is opposed to public policy.” Mukherji J. Has observed<sup>25</sup> “no Court of law can countenance or give effect to an agreement which attempts to take the administration of law out of the hands of the judges and put it in the hands of private individuals.”

Privy Council has observed in the case of *Bhowanipur Banking Corporation Ltd. v Sreemati Durgesh Nandini Dasi*<sup>26</sup>

“In dealing with the question as to whether the consideration for the agreement is opposed to public policy or not, it is immaterial that the debt in respect of which an agreement is made for the illegal consideration was real, nor is it necessary to prove that a crime in fact had been committed. All that is necessary to prove in such a case is “that each party should understand that the one is making his, promise in exchange or part exchange for the promise of the other not to prosecute or continue prosecuting.””

The fact of the case is that, a mortgage bond was executed by respondent in favour of the bank as part of the consideration for bank’s promise to withdraw criminal proceedings which was instituted by it against the mortgager’s (respondent’s) husband. Mortgage bond was held invalid by the Privy Council. Their Lordships observed that the whether the debt exist in real or not would not matter at all because the consideration for the execution of the mortgage was against the public policy so, it will become illegal and void.

If an agreement is entered into before filing of any criminal complaint but enforced after filing of complaint and subsequently complaint was withdrawn then such agreement will not be void, neither would it be held as made to stifle prosecution.<sup>27</sup>

## **(2) Agreement of maintenance and Champerty**

Maintenance means helping any party of suit for continuance the litigation in which he himself has no justified personal or legal interest.

Maintenance is genus of which champerty is species. Champerty is an agreement in which a person provides help to the any party of the suit without any justified interest on the condition that he will share the gains or proceeds of the suit which he is maintaining. In the case of *Ram Coomar Coondoo v. Chunder Canto Mookerjee* Privy Council held that law of maintenance and champerty of England is not adopted in totality in India. In India these agreements are not void if they are not against the public policy. Agreement of champerty would not be void-ab-initio in India if the agreement is for taking reasonable share of proceedings or property. An agreement according to which an advocate will take his fees from client only after winning the case<sup>28</sup> was held void on the ground of against the public policy. A case<sup>29</sup> in which, it was agreed that the person will give  $\frac{3}{4}$  share of the property in dispute to the financier, was held void and court observed that it was unconscionable bargain.

---

<sup>25</sup> *Sudhindra Kumar v. Ganesh Chandra*, ILR (1939) 1 Cal 241, 250

<sup>26</sup> (1941) 54 LW 529:

<sup>27</sup> *Ouseph Poulo v Catholic Union Bank Ltd.*, AIR 1965 SC 166, 1964 SCR (7) 745

<sup>28</sup> *Kothi Jai Ram v. Vishwanath*, AIR 1925 Bom. 470

<sup>29</sup> *Nuthaki Venkataswami v. Katta Nagi Reddy*, AIR 1962, A.P. 457

An agreement for giving  $\frac{1}{4}$  share of the disputed property to the person who is providing help in litigation was held valid.<sup>30</sup> The fact that agreement of giving or receiving for how much share of the proceeding will be valid it may vary from case to case, and it is the responsibility of the court to decide whether the agreement is valid or not.

### **(3) Interference with the course of justice**

Any agreement with the object to create hindrance in the smooth functioning of the justice system or to use kind of influence on judges or judicial officers is void.

In the case of *Bhagwan Dat Shastri & Anr. v. Raja Ram*<sup>31</sup>, there was an agreement according which plaintiff would perform a 'puja' (anushthan) for the defendant's win in an ongoing suit and in consideration of this defendant agreed to give  $\frac{1}{10}$ <sup>th</sup> of the decree amount. This suit was brought for the recovery of this amount.

Court held that this agreement is void as its purpose is to influence the judges' mind by performing puja.

### **(4) Trading agreement with enemy**

After the declaration of war between two countries, it is against the public policy to enter into trade agreement for both the country with each other.

Even if the agreement has been entered into before the declaration of war it cannot be executed after the declaration.

Such agreement is permissible only with the permission of the Government.

### **(5) Trafficking in public offices**

An agreement to buy or sell public offices for oneself or for others is against the public policy and shall be void.

#### **Illustration<sup>32</sup>**

'A' promises to obtain for 'B' an employment in the public service and 'B' promises to pay Rs. 1000 to 'A'. The agreement is void, as the consideration for it is unlawful. An agreement to pay certain amount to a person in consideration of procuring the title of knighthood, was held void and against the public policy. The person cannot recover the amount back.<sup>33</sup>

### **(6) Marriage brokerage contract**

Marriage brokerage contract means a contract entered into to procure marriage for someone in consideration of certain money or property.

In the case of *Gopi Tihadi v. Gokhei Panda and Anr.*<sup>34</sup> Orrisa HC explained that "a marriage brokerage contract is a contract to remunerate a third person in consideration of his negotiating a marriage & as such is contrary to public policy and cannot be enforced." In the case of *Dholidas Ishvar v. Fulchand Chagga*<sup>35</sup> it was held that a contract by which mother/father or guardian was

<sup>35</sup> 22 B. 658, (1898)

to be paid money in consideration of their agreement of giving their daughter or son in marriage was against public policy and could not be enforced in a Court of law. It was held in many cases<sup>36</sup> that payment made under an agreement for procuring the marriage for someone, can be recovered back if marriage couldn't be solemnized due to any reason. However, if, the marriage has been solemnized, the paid amount cannot be taken back.<sup>37</sup>

### **Conclusion**

The word immorality and public policy has not been defined anywhere in the statute but with the help of various judicial decisions and interpretations the meaning of the words has settled and various classification has also been made, which is explained above. Any agreement which falls in the ambit of immorality or against the public policy will be void.

**Abstract**

The maximum punishment that may be inflicted upon someone's loss of life. Though death punishment has been used in the past, it is no longer used now. utilized nearly each a part of the global, seventy percent plus of the global's international locations having eliminated the death penalty in regulation or exercise in cutting-edge period. Nonetheless, the death penalty is still used. currently exist in lots of components of the global. The Indian Penal Code includes positive prescription offences loss of life. The legality of loss and the penalty as a punishment of life the sentence was upheld. via way of means of the Supreme Court. To byskip a loss of life a penalty imposed on a criminal, a tribulation courtroom docket's based at the doctrine of, and instances of every case individually.

**Keywords :** capital punishment , constitutionality , culprits of crimes

**Introduction**

Indian judiciary has mentioned its perspectives concerning dying penalty by way of the aid of using ruling out in Bacchan singh vs nation of Punjab that the dying penalty ought to be limited to the "rarest of uncommon" instances, this view of Supreme Court become very lots favoring to limit the usage of capital punishment to penalize the criminals, however this view of maximum courtroom docket become contradicted by way of the aid of using the rules by way of the aid of using growing the variety of crimes for which capital punishment's awarded. Death penalty's a now no longer a obligatory punishment, and ought to be resorted to most effective if the Court's pressured by way of a case concerning the "rarest of the uncommon" instances in which

loss of life penalty's important to repair the collective sense of right, and wrong of the state. The precept "Rarest of rare" has its origin within the example of *Bachan Singh v. State of Punjab*, & similarly advanced via different landmark decisions together by way of *Macchi Singh & Ors. v. State of Punjab* in which the Highest Judicature mounted numerous pointers for evoke the "Rarest of Rare" precept. Nevertheless, the significance of this rule had questioned positioned to impeach as maximum of the evolved global has get rid of loss of life penalty as a shape of penalty. In a contemporary-day ideology of maximum significance that the punishment method within the crook judicature gadget transitions from punitive to reformative, requires termination of loss of life punishment were growing interpretation the rarest of uncommon doctrine unreasonable within the twenty first century's democratic society. In *Bachan Singh* case Supreme Court expressed a few remarkable motives referring to wrongdoing, and crook in which. In segment 163, *Bacchan Singh* in addition noted: "...in determining the scope of the field or the appropriate sentencing for certain acts, such as on below sec 302 of Penal Code, courtroom docket ought now no longer bind its thought "chiefly" or simply to the occasions related to the unique wrongdoing, moreover supply due interest to the occasions of the crook. When determining matters involving capital penalty, the Court follows this doctrine, taking into account all other circumstances and If the circumstances of the case show that the case fits within the scope of this Doctrine, which is stunning and mind-boggling, and that the conduct of such a crime is an exception, the Court, taking into account the sensitivity or seriousness of the case, renders a verdict of capital sentence. Later on as in line by way of the possibility's within the society, and alternate within the nature, and way of doing a crime. Because of that during this regard regulation should have taken exclusive form in crook justice machine of India. It become an possibility to the best courtroom docket of India to in addition give an explanation for within the decision of *Santosh Kumar Bariyar vs State of Maharashtra*. To give an explanation for this in addition: "The rarest of uncommon dictum serves as a guiding principle in implementing sec 354(3), and entrenches the coverage that existence imprisonment's the guideline of thumb, and dying punishment's an exception. It's a settled regulation of interpretation that exceptions are to be construed narrowly. That being the case, the rarest of uncommon dictum locations an first-rate burden at the courtroom docket, in case it selects dying penalty as the popular penalty, to perform an goal evaluation of statistics to meet the exceptions ingrained within the rarest of uncommon dictum." Constitution in reality states that "No man or woman will be disadvantaged of Right to existence until executed following due technique of regulation" however Capital punishment denies due technique of regulation. Its imposition's continually irrevocable – for all time depriving an man or woman of the possibility to gain from new proof or new legal guidelines that could warrant the reversal of a conviction, or the placing apart of a dying sentence. When the outcomes are existence, and dying, we want to call for the identical

widespread for our machine of justice as we'd for our airlines. It's valuable pillars of our crook justice machine that it's miles higher than many responsible humans move unfastened. than that one harmless need to suffer. Let us mirror to make sure that we're being simply. Let us pause to be positive we do now no longer kill a unmarried harmless man or woman. This's absolutely now no longer an excessive amount of to invite for a civilized society." Since the reinstatement of the present day dying penalty, many humans were free of dying row due to the fact they have been. Hence I assume it's miles very hard to head in element that what result in the versions in sentence in such instances. What it need to be?"s it crime"? Or "crook" or the "choose"? In the 1982 Supreme Court taken into consideration all occasions regarding each crime, and crook. Again in 1983 the Supreme Court has modified its measurement, and declared for rarestrs of the uncommon that courtroom docket need to attention at the crime, and now no longer at the crook . As a ways as challenge to the statutory definition of the rarest of the uncommon doctrine Indian legislative machine has now no longer modified however best courtroom docket of India has grew to become its view, and took every other course it has commuted the dying sentence for rape, and homicide of a 1 12 months, and six months vintage woman to existence sentence. Also there are exclusive assumptions of this doctrine as to whilst the collective moral sense of society's shocked; which differs from choose to choose or benches to benches which represent case to case... When the outcomes are existence, and dying, we want to call for the identical widespread for our machine of justice. It's valuable pillars of our crook justice machine that it's miles higher than "many responsible humans move unfastened than that one harmless need to suffer.

**Meaning of the Doctrine of Rarest of uncommon:**

The Doctrine "rarest of uncommon case" has its starting place in 1983 in a highest Court Decision, Machhi Singh v. State of Punjab<sup>438</sup>. This judgment tailed the courtroom docket's in advance choice in Bachan Singh v. State of Punjab<sup>439</sup> (1982), in it supported the constitutional validity of capital punishment however brought a caveat this's now famous, if possibly not possible to pin down exactly that dying sentences might be accorded most effective withinside the "rarest of uncommon instances".. The best courtroom docket of India has mentioned the components for the rarest of the uncommon case on occasion a few suggestions has given in identity of rarest of uncommon instances like; "The motives why the network as an entire does now no longer approve the humanistic approach meditated in dying sentence in no case doctrine aren't a ways to seek."Thiat should only be done in the moist extremed of circumsstances if there is no other optiion,' said the decision says the dictum of the "rarest of rare doctrine". Bachan Singh (above) proposed using the death sentence as a final option when the alternative punishment of life imprisonment would be fruitless and useless. As will be described in greater detail later, punishment of death is fundamentally distinct

from other methods of penalization. It is remarkable in that it is completely irreversible.

Firstly, the very humanistic organization's built on the foundation for existence precept. When a social unit of the network infringes this very precept by way of the aid of using killing every other member, the society might not experience itself sure by way of the aid of using the fetters of this doctrine.

Secondly, it must be found out that each member of the network's capable of stay by way of protection by way of out his or her very own existence being endangered due to the protecting arm of the network, and due to the guideline of thumb of regulation enforced by way of the aid of using it. The sheer existence of the rule of thumb of regulation, as well as the threat of being handed to an e-e book, acts as a deterrent to those who have no qualms about murdering others if it serves their purposes. Scope:

As in line by way of Indian prison machine until 1973, Judges have been required to nation motives for now no longer awarding a dying Sentence, and who prefer the change sentence of existence imprisonment, in a capital offence. Hence judges have been making dying sentence the 'rule', and existence imprisonment the 'exception In Jag Mohan Singh v. St of U.P. xiii "The Supreme Court upheld the dying consequences Constitutionality, locating that it become now no longer simply a deterrent, however a token of emphatic Disapproval of the crime by way of the aid of using the society. In this situation Hon'ble the Court felt that India couldn't chance Experimenting by way of the abolition of dying penalty,, and any mistakes in sentencing might be corrected by way of the aid of using appeals to better courts. But, the Court articulated a widespread that the dying penalty become the slim exception,, and now no longer the guideline of thumb in sentencing. The occasions of the case needed to compel it, to guard nation security, public order or public interest." Thereafter as in line by way of new modifications in Indian prison machine the accused has proper of pre-sentence listening to, and obliged the courtroom docket to nation unique motives for awarding the dying penalty in preference to opportunity time period of existence imprisonment. The discount of dying sentence to existence withinside the Priyadarshini Mateo decision displays the churned-up withinside the SC in latest years at the sheer uncertainty of its very own "rarest of uncommon" doctrine. Even when death sentences are being handed down in a number of homicide cases, ostensibly in song as a "call for justice from society," There was a flurry of verdicts the SC admitting that the management of the "rarest of uncommon" doctrine's damaged by way of "chaos", "subjectiveness", and "capriciousness". This doctrine, the courtroom docket should take advantage to dying penalty most effective withinside the "rarest of uncommon" state of affairs whilst the opportunity choice of existence sentence, after drafting up a stability sheet of "diminish, and anxious elements",s "actual forbid". In the Matto case, the SC spared Santos Kumar Singh from going to the instrument of execution on the idea of its end that diminishing elements consider anxious elements given the inherent subjectivity of each of these components, the weight given to each of

them is discretionary, murmuring of self-doubt from the SC have grown roaring in latest ages as a response to an more, and more more blood-thirsty public opinion, meditated by way of the aid of using a hyper ventilating media.

The maximum punishment that may be inflicted upon someone's dying. Human existence's treasured, and precious, and there may be no humane manner to kill someone, despite the fact that that dying's available in shape of punishment. Infliction of dying penalty's regularly capricious, and continually irrevocable thus, for all time withhold an man or woman of the possibility to gain from new proof or new legal guidelines that can result in a conviction being overturned or the death sentence being abolished . Though past times, death sentence has been utilized in nearly each a portion of the global, extra than seventy % of the global's international locations have declined demise punishment in regulation , exercise in cutting-edge periods. Yet, demise penalty currently seen in lots of elements of the global, particularly in lots of 1/3 global international locations, and international locations by way of dictatorial leadership.

According to Amnesty International, as a minimum 2,307 dying conviction in fifty six international locations in 2019, a moderate lower from the full of 2,531 pronounced in 2018. At least 26,604 human beings had been sentenced to dying globally in 2019 (amnesty.org, 2019). Death penalty continues to be legitimate in India however best in fantastic cases. Certain offences are included in the Indian Penal Code. demise as a form of punishment. A few examples of such infractions encompass sec 121 (waging struggle towards the State), sec 302 (murder), sec 364A (kidnaping by way of ransom) amongst others. Other statutes awarding demise penalty encompass The Commission of Sati (Pre-vention) Act, 1987, and The Narcotic Drugs, and Psychotropic Substances Act, 1985, etc. The legality of the death punishment was questioned within the landmark case of (JAGMOHAN SINGH V STATE OF UP, 1973) in which The SC maintained the legitimacy of capital punishment in cases when there are motivations no longer simply a deterrent. However, it is a symbol of societal rejection of crime. . It become located via way of means of the no regulation may be imposed, according to the Supreme Court. which abridges the proper to existence of someone until it's far affordable, and in public interest. If the complete manner for a crook trial below the Code of Criminal Procedure, 1973 if the imposition of a death sentence is legal, then the method in which it is imposed by regulation cannot be considered unconstitutional. However, in order to keep the number of death sentences handed down to prisoners to a minimum, Indian courts have relied on the concept of the "rarest of unusual situations" in deciding crimes that carry the death penalty..

#### **RAREST OF THE RARE DOCTRINE**

An ordeal courtroom docket is founded on the notion of doctrine's reach is unclear; instead, the concept has evolved through time as a result of judicial version. A sentence of death is given down at the judges' discretion. The facts

of the case requisite be such that the Bench is left with no other alternative except to impose the death penalty in order to maintain social order and control. While determining whether a case justifies the death sentence for the crime committed, the Bench must consider the cruelty and barbarity of the crime committed, the magnitude of the act, the public abomination, and the society's desire for justice in contrast to the prisoner.

A death sentence is handed down after each case's fact and circumstances are examined independently. If the circumstances surrounding the crime are in any way favourable, the sentence may be reduced, but a judge cannot bypass a judgement of death under the "rarest of unusual" precept during an ordeal for an offence punishable by death. A judge upon his discretion may also skip a life sentence simply if the records suggest heinous instances primarily based totally on which the offender has devoted the crime. As a result, while determining the sentence for death, it must be meticulously and thoroughly evaluated to see if the judicial execution is commensurate to the gravity of the crime. It deters crime and has a societal deterrent impact.

The precept of Rarest of rare has its rootage within the decision of *Bachchan Singh v. State of Punjab*. In this case, the SC via way of means of a 4:1 majority decision the "Rarest of rare" via way of means of enforcing the constraints on death execution. The judges trusted the judgments of *Jagmohan Singh v State of Uttar Pradesh*, and *Rajendra Prasad v State of Uttar Pradesh*. It was discovered that when someone is given a death sentence, he loses his right to life, so abridging his basic right. However, if a hardened criminal's deadly activity repeatedly, deliberately, and threateningly jeopardises society safety, his enjoyment of vital rights can be rightfully revoked. The following ideas had been laid down within the case:

The intense punishment of death can now no longer be imposed besides in gravest instances of intense guilt;

Before deciding on the death penalty, the 'offender's' cases must be evaluated with the 'crime's' cases.

The rule of thumb is life imprisonment, with the death penalty being an exception. To put it another way, a death sentence should be issued only when life imprisonment appears to be an insufficient penalty in light of the circumstances of the crime, and only if the option to impose a death sentence is available. Imprisonment for life can't be rigorously based on the type and circumstances of the offence, as well as all other relevant circumstances.

The Highest Court located that death punishment constitutionality, and may be obligatory in most effective in rarest of uncommon conditions in which an opportunity of punishment's excluded. However, the scope of the phrase Rarest of rare changed into left undefined, and the doctrine has developed for the duration of the years through judicial interpretation.

In *Mithu Singh vs State of Punjab* 1983 The Supreme Court reiterated that death penalty is now no longer a obligatory social control, and have to be resorted to simply if the Bench is confused by way of a case concerning the "rarest of

the rare” occasions in which demise penalty's essential to repair the collective judgment of right, and wrong of the society. The courtroom docket liaid empasis on the guideline of thumb that lifestyles imprisonment's the norm while demise penalty's an exception,

.The Court determined in case of Mithu Singh that the following considerations must be considered while delivering a demise sentence: –

- Method of murder fee
- Need for fee of execution
- The character of the crime is antisocial or socially reprehensible.
- Crime's magnitude
- Personality of Homicide Victim

The Court determined that the suggestions in Bachan Singh's case Will must be culled out along those pointers, and carried out to the data of every character case wherein the query of enforcing of dying sentences arises.

In **(SANTOSH KUMAR SATISHBHUSHAN BARIYAR V STATE OF MAHARASTRA, 2009)** SC Affirmed the "Rarest of rare" precept, & held that suitable penalization to decided on a cased-with aid of using-case foundation.

The loss of life sentence isn't to be offered shop withinside the rarest of uncommon’ case wherein reform isn't possible.The Court also established that there is no consistency of past record within the "rarest of unusual circumstances," and that in most instances, the death sentence has been affirmed or denied to be upheld by means of the Court without any criminal precept being laid down.

The foundation of drawbacks of the doctrine with inside the unclearness withinside the software of the doctrine. This principle developed to present however, this theory has been misread and misunderstood in several occasions by employing the court in making decision as well as the general public in understanding its true meaning and spirit. This may be definitely observed in **(DHANAJAY CHATTERJI V STATE OF WEST BENGAL, 1994)** . **(UTTAR PRADESH V KUMUDI LAL, 1999)** Both instances worried young girl’s rape, and homicide but the highest Court reported unique verdicts. Dhananjay Chatterjee changed into sentenced to loss of life. The Court in Kumodi Laal case did not talk over the loss of life penalty at the suspect for the rape, and homicide of fourteen-yeear-vintage female child.

### **Conclusion**

Calls to abolish the death penalty in its entirety were rising, making the theory unworkable in a democratic society in the twenty-first century. In its 262nd The Death Penalty Reepport, the Law Commision had highlighted that – “...The capital punishment employer because it operates in India, consequently perpetrates in any other case outlawed punitive practices that inflict pain, affliction, and torture that's regularly a ways past the most struggling authorized via way of means of Article 21. The debilitating results of this complicated development obligatory to prisoners what can most effective be known as a residing loss of life.

The loss of life penalty does now no longer function the penological purpose of deterrence any greater than lifestyles captivity.... specializing in loss of life penalty because the last degree of Victim justice, restorative justice, and rehabilitative justice are all undervalued..The Committee hence recommends that the loss of life penalty be get rid of all crimes aside from terrorism associated offences, and waging war.” (THE REPORT OF LAW COMMISSION, 2015).

over a current political system it's of maximum significance that the method of penalization withinside the crook justice machine shifts from retributory to reformatory. Social control must receive in any such manner at the crook had to proportionally paid for the crime, and in a manner such that the existence of that crook, and the society's saved non violent, and consonant. The reason of penalization must be to “improve the perpetrator as a human, in order that he might also additionally emerge as a everyday law-abiding member of the network as soon as again. As Maartin Luither King said – “regressive violence for violence multiplies violence, including deeper darkness to a night time not yet without celestial body”.

## **ASSIDUOUS CONCINNITY OF SCIENCE AND RELIGION IN RICHARD MORGAN'S *ALTERED CARBON***

**DR. M. N. V. PREYA**

Assistant Professor

PG & Research Department of English

National College (Autonomous)

Bharathidasan University Tiruchirappalli

### **Abstract:**

Literature consistently portrayed religion as a mythologized mode apparently in the past. In such a way, it creates an impact in literary criticism, perceiving religion as a symbol. Science fiction, while connecting literature and science, also portrays the essence of religious ideas and beliefs. The article showcases the two contrasting images, religion and science, in Richard Morgan's *Altered Carbon*. It delineates the hidden religious aspects of Neo-Catholicism, beliefs, philosophies and ideas of the characters. It witnesses how the characters of the novel, despite all the technological advancements, adhere to the religious faiths. It also depicts the consequences of the religious actions in the scientific world that takes place in the novel. The article emphasizes the non-separateness between religious ideology and scientific advancements with reference to the human and techno realm.

**Keywords:** Religion, Science-fiction, Neo-Catholicism, Posthumanism, Technology

History was the primary concern of English literature at the beginning of the twenty-first century. In the late twenty-first century, writers were not interested in looking back in history, but rather in moving forward. Writers such as David Mitchell, Michel Faber, and Ian McEwan imagined future eras influenced by technology and sophistication. In the nineteenth and early twentieth centuries, technology enabled more scenes in fiction. Writers advanced not only in terms of ideas, but also in terms of style and technique. There was, however, some imitation of earlier literary styles and techniques.

The evolution of science fiction can be traced back to the history of mankind and their lifestyles. Great writers such as H.G.Wells and Mary Shelly have contributed to the legacy of science fiction. The advancement of science and technology prompted the authors to think far beyond the realm of possibility. This idea not only provided a description of human society, but also discussed how science and technology could affect human society. Science fiction writers examined Victorian reality from a scientific standpoint. Many intriguing themes emerged at the turn of the twentieth century. Utopias, dystopias, time travel, and space travel were among the most popular themes. Science fiction evolved in a new direction soon after World War II.

Religion, according to common definitions of science fiction, is the most alien to its concerns. Science fiction is a genre that frequently asks philosophical problems, such as what technology will be available in the future. It employs exaggeration to raise questions about awareness, morality, and the bonds that link society. One of the fundamental issues is the role of religion in society. When religion is discussed openly in popular science fiction films, it is at best unclear. When spirituality is spoken, however, the power of any microscopic thing in the system immediately contradicts it. Religion is more of a technique of building mystique about the JEDI than it is an examination into what happens when so many diverse races and religious systems come together. While Greek religion had a long-lasting influence on key genres of ancient writing, the Christian faith's influence on Western literature is far more pronounced and far-reaching. However, there is a significant distinction between Classical Greek literature and Christian writing. The former is generally indicative of a religious ethos specific to one civilization, whilst the latter is far from being the creation of a single group. Even the language and structure of Christian canonical literature are influenced by previous religious contexts, particularly the Jewish and Greco-Roman. It is hardly strange that Catholic contemplative practices and Protestant biblical poetics would unite to generate an abundance of the greatest Christian devotional poetry in the late English Renaissance. Many science fictions however, are embedded in speculative fiction traditions strongly associated with the religious fantasy, and contemporary science fiction retrieved a strong interest in several mystical and spiritual themes and visuals. Modern science fiction typically explores age-old theoretical questions related to metaphysics and theology.

Speculative fiction has a tendency to go beyond the purely empirical issues that pragmatic scientists are concerned with. Whether the thrust of the narrative is toward reconciliation or conflict, the antagonism of the scientific and religious imaginations is evident in practically all late-nineteenth-century and early-twentieth-century speculative fiction. These fictions are heightened by controversies regarding Darwinian Evolution, socialism, and humanism. As a result of modern science, science fiction depicts modern reality with the discovery of new technology and its potential to illustrate man-made acts, and sometimes more. Richard Morgan, who was born in the United States, is one

such author. He is a British science fiction and fantasy novelist who has written dark fantasies on occasion. His writings are largely dystopian contributions to literature, with settings in a futuristic world. His writing style for science fiction or fantasy books provides a fresh perspective on reading such novels in a more realistic and futuristic aspect.

Morgan published his debut novel, *Altered Carbon*, in 2002. The novel combines cyberpunk and hardboiled detective science fiction themes. The novel was eventually made into a film and a television series titled *Altered Carbon*, which aired on Netflix in 2018. After *Altered Carbon*, he authored *Broken Angels*, which was released in 2003. It's a combination of bloody science fiction and war fiction. Richard Morgan has authored another work, *Market Forces*. It was originally intended to be a short story, but it evolved into a novel. The novel is a battle between those who believe in determinism and those who believe in free will. Those in the clouds with all the power, of course, do not believe in determinism. The impoverished on the ground have a tendency to do so, because their lives are mostly governed outside, not by Gods, but by Meths, politicians, and the police, among other things. From the perspective of someone impoverished, defenceless, and unaware of influences impacting their existence, it's simpler to blame a single entity, God, because it's such a complicated web of control and tyranny. There is no one to blame, and it becomes a simple myth of how the world actually works.

Morgan depicts a fantastic and violent topic in which alterations in the human psyche and society are depicted as a result of tremendous expansion and progress in science and technology. Characters in science fiction will be exceptionally well-developed. Takeshi appears to be a loyal individual to his family, friends, people, and the organization to which he is engaged in *Altered Carbon*. It is clear that no one in his community can break his loyal quality, even if they have ceased to be loyal to him. Despite the fact that Morgan provides a grandiose view of posthumanism and technology, he never fails to provide us with a familial and religious basis in it. Kovacs thus pledges himself to both the organization and his sister. However, his devotion is finally destroyed when he learns that the organization sold her to the Yakuza.

Takeshi Kovacs is an intellectual individual with a more verbal vocabulary and a little school in him. His knowledge of things makes us feel curious about him. His acts show how a normal man with intellect tries to figure out why he is struggling. His passion for understanding the meaning and purpose of life's consequences was both courageous and witty. Richard Morgan depicts the conflict between the intellect and the body in the face of violence and terror. Morgan places the people in his science fiction in a way that does not disrupt or progress the plot. Reileen is one such character that takes on the worst characteristics of a meth addict. Morgan portrays Reileen as manipulating and arrogant, despite the fact that she is manipulative and arrogant.

Kristin Ortega works for the Bay City Police Department. Because she is a Neo-Catholic, her cortical stack is coded in such a way that it can never be

resleeved. Ortega wants to be against the truth of being unable to escape bodily death as the tale progresses. As a result, she abandons her religious claims. She has been assigned and is dedicated to locating and solving Laurens Bancroft's murder. Ortega lends his support to Kovacs in making such a commitment. She is of Mexican ancestry and comes from a deeply religious family. Ortega lost her father while she was quite young, giving her the opportunity to denounce Neo-Catholicism. She is in a love relationship with her former coworker, Elias Ryker. Kristin Ortega, who had been on Earth, is a tough human and someone who is committed to her profession. Unlike Kovacs and Reileen, Ortega's character is never in conflict, yet she nonetheless serves as a developmental activity. She is thought to be quite forceful and cold to the vulnerability that occurs. Her function as a loveable person is restricted primarily to her friends and family. As Kovacs is sleeved in the body of her old boyfriend Elias Ryker, a tangled connection develops between him and Ortega. She even believes Kovacs has something up his sleeve considering Bancroft's insistence on projecting her negatively. With a frigid disdain, she attempts to distinguish between Takeshi and Elias. Through Kristin Ortega, Richard Morgan attempts to convey an idealistic perspective. With the presence of Ortega and her family, a familial attitude is established. She is close to her family, particularly her mother, although their connection has been strained as a result of Ortega's religious renunciation.

The Christian morality is one of the acquiring and exercising virtues. Human virtues can be acquired in a variety of ways. They are gained by the repeated performance of virtuous actions, which establishes a pattern of virtuous conduct. There is a bidirectional link between virtue and actions because virtue, as an internal reality, predisposes us to behave morally decent ways in the exterior world. However, it is through doing good deeds in the real world that we nurture and expand our virtue. Christian morality opines such human virtues as,

Human virtues form the soul with the habits of mind and will that support moral behavior, control passions, and avoid sin. Virtues guide our conduct according to the dictates of faith and reason, leading us toward freedom based on self-control and toward joy in living a good moral life. Compassion, responsibility, a sense of duty, self-discipline and restraint, honesty, loyalty, friendship, courage, and persistence are examples of desirable virtues for sustaining a moral life. (Archdiocese of Saint Paul and Minneapolis)

The narrative incorporates human virtues such as trust, hope, loyalty, capitalism, and leadership. Morgan assigns a virtue to each character to play a role in the plot. Poe gradually gains Elizabeth Eliot's trust as he enables her to reconstruct herself. Only because of Poe does she regain her confidence. As a result, she transforms from a selfless young lady to a more forceful and hostile cold personality. Elizabeth's change may be seen at the moment where she kills guards and a patron at Head of the Clouds. She strives to save her parents, as well as Ortega and Takeshi. Finally, the use of virtual reality is

examined in depth in relation to Elizabeth's strengths and limitations. She attempts to recognize her mother Irene despite the fact that she is cross-sleeved, revealing that she has an incredible ability to distinguish sleeves and individuals. Morgan explains the conditions of his imagined world as,

There's a plant on Harlan's World called belaweed, grows in the sea and on most shorelines too. Dry it out, treat it with chemicals and you can make something like cotton from it. During the Settlement Newpest was the belacotton capital of the World. Conditions on the mills were pretty bad even back then, and when the Quellists turned everything upside down it got worse. The belacotton industry went into decline and there was massive unemployment, unrelieved poverty and fuck all the Unsettlers could do about it. They were revolutionaries, not economists. (Morgan 251)

Mister Leung is Reileen Kawahara's hitman and personal enforcer. His faith in cortical stacks and people who employ them is divine. He believes they are the ones who will spread the holy doctrine. He is well-known for his invention, which allows him to conceal his identity from all sorts of electronic surveillance. He is both religious and a psychopath. He thinks that everything occurs for the benefit of a greater power. He, like Takeshi, is devoted to Kawahara. He regards Reileen as a god-like figure and follows everything she says. He is a tough adversary with martial arts abilities. Leung is extremely effective at defeating many opponents at once. He is as calm as he is focused on his aims.

Elias Ryker, a Bay City Police Department officer, is similar to Ortega. He was Kristin Ortega's former lover. Ryker is Mary Lou Henchy's childhood acquaintance who is alleged to have committed suicide. Ryker goes insane in his pursuit of the truth about his friend's death. He behaves so differently that he may even investigate a senior administrator with impunity. He feels that religious coding is the result of a plot, and Mary Lou is unable to convert to NeoCatholicism. Reileen Kawahara, on the other hand, kidnaps and murders Ryker. Kawahara believes he is the sole impediment to applying religious coding to murder victims in order to conceal her business and misdeeds. Laurens Bancroft then buys Ryker's sleeve, and so Kovacs obtains the sleeve.

Apart from significant technical developments, Richard Morgan employs a biblical reference known as Meth. Meth is the one who lives for several lifetimes. The notion of sleeving and resleeving to new bodies is only available to the wealthy. Laurence Bancroft, a former Meth user, is one such wealthy individual. He is the only one who can consistently afford the sleeve technology of virtual immortality. Unlike in the human realm, death comes only when the stack is destroyed. Even when the stack is destroyed, the awareness, according to Richard Morgan, may be re-sleeved. This is only conceivable if the world's wealthy begin to retain copies of their thoughts in distant storage. Resolution-653 is described as a proposition by Richard Morgan which he describes with a reference in the novel as,

Ortega was standing in the doorway wearing a NO TO RESOLUTION 653 T-shirt on which the NO had been stylistically daubed out with a red cross and overwritten with a definitive YES in the same colour. The columns of her naked legs disappeared under the T-shirt as if they might conceivably go on for ever inside. (Morgan 304)

It is concerned with the law that overrides religious coding in order for the sleeve to be tested even after the death of the Catholics. Because Neo-C coding does not allow humans to resurrect after death and hence cannot be tested, Reileen illegally switches her workers' codes to Neo-C in the novel. Takeshi Kovacs works hard to have Resolution-653 enacted and contributes to the resolution of Bancroft's death. He also solves the enigma of Rawlings' virus, which is the cause of Laurence Bancroft's suicide. Morgan thus transports us to faraway realms in order to make us think about how we live in the world, which turns out to be a massive allegory.

In *Altered Carbon*, scientific progress is so redefined. However, racial, religious, and social class divisions persist. Religious coding is engaged in the cortical stacking process, but Neo Catholicism never allows re-sleeving. They assume that because the soul travels to heaven, it cannot be re-sleeved. This type of religious coding is being used in virtual reality. The terminators believe that murdering Catholics is a simple task. As a result, the sleeve killing is regarded a lesser crime, while the destruction of the stack is far more heinous. Since Catholicism is limited to the earth, Takeshi is oblivious of the term itself. The Catholic Church opposes not just resleeving after death, but also any technology that would remove the human spirit from the body. It incorporates needlecasting, the use of Synth bodies, and cloning. For many of these highly religious organisations, simply existing is a source of misery. Because of the afterlife, death is an important aspect of their beliefs. In the instance of Neocatholicism, people use religious coding to prevent their cortical stack from resleeving or spinning up. Morgan also highlights the existence of Islam through a number of occurrences. It comes from the soil. Takeshi and his colleagues were previously sent to a planet populated primarily by Muslims.

Jihadists opposed to the UNIP are also referred in the storyline. Kristin Ortega is fathered by a character named Samir Abboud, who is of Islamic origin. Apart from religion, there is a semi-religious group known as The Renouncers that operates in Harlan's universe. Poe, the artificial intelligence and proprietor of The Raven Hotel, finds out about the renouncers. Members of this specific organisation practise renunciation of all personal fortune, family, and friends. They are oblivious to the actual world and prefer to live in Virtual Reality. The impact of religion in such scientific world can be put into discourse. John C. Hawley opines such coherence of literature and religious discourse as,

But if meaning is only demonstrated in the actual telling of stories, many of our contemporaries would protest that such subjective testimonials are hardly acceptable as unbiased evidence of Ultimate

meaning. No one historian can step beyond the web in which she or he lives, nor can anyone know everything related even to one given moment. His historical method inevitably selects the correlations and mutual influences it chooses to foreground as meaningful "glue." (Hawley 231)

Morgan uses practically all of the five senses to create a well-rounded atmosphere that seems authentic and relevant to the scientific as well as religious world. He explains Bay City, which is located on North America's western shore. He describes it as a megalopolis that was formerly known as San Francisco. The city has a population of ten million inhabitants. It is the continent's cultural, financial, commercial, and economic centre. The area is populated by a large number of wealthy persons known as Meths. They live in the city sector known as The Aerium, which is located above the clouds and is made up of skyscrapers. Richard Morgan provides an ultramodern perspective on the city. Tall towers with a tech appearance are used, while people are housed in shipping containers. The Aerium is where the Meths used to reside. Morgan depicts the area with high towers, thus there is no reason to be concerned about the city's congestion. The Bancrofts dwell at The Aerium's Suntouch House.

Head in the Clouds is the most luxurious floating house over the Bay City. Reileen Kawahara is claimed to be the proprietor of the Head in the Clouds in *Altered Carbon*. It caters to all Meths by providing them with illicit sexual fetishes. This house becomes the focal point for all illicit activities, sexual delights, and vices. As a result, it is popularly referred to as the Satellite of Sin. Meths would routinely visit the residence, raping, torturing, and killing the men, women, and children that lived there. All of the sex workers here are really young and don't wear sleeves. They think they can be resleeved at any cost, even if they have been horribly tortured and slain. The unfortunate reality is that their stacks are Neo-C coded and thus cannot be resleeved after death, which they are unaware of. Every heinous deed committed by the Meths is done for their sadistic pleasure.

The extensive analysis, explanation, and narrative of Richard Morgan's novels *Altered Carbon* thus provides the impression of being posthuman fiction and religious fiction in the minds of readers. As a result, it boosts science fiction's visionary and theological image. It is sensed through the readers' curiosity, which is purposefully piqued by the author using posthumanism and spiritual beliefs and approaches. The influence of the text's stern and detailed examination caused the novel's protagonists to progress in futuristic, technical and religious directions. It explains how the presence of religion as well as posthuman components has altered the lives of people. Humans and aliens have different perspectives on life and death. Human existence has been enhanced by the development of advanced technologies. *Altered Carbon* demonstrates such sophistication successfully. Although it is impossible to analyze every element of cyberpunk, it is critical to maintain the system of planets with their acknowledged borders in order to ensure reality.

Initially, the article discusses both posthuman and religious notions as represented by Richard Morgan in *Altered Carbon*.

The novel *Altered Carbon* is based on speculative ideology, in which the logic of present society, its politics, culture, religion and technology are tested to their limits. Morgan's work creates an imagined future rather than predicting the future in the literal sense. Science fiction authors, rather than prophets, will always be the ones who envisage the future. The narrative of *Altered Carbon*, on the other hand, investigates humanity's future. The novel's storyline, theme, and characters interact with religious and technological settings. As a result, the combination of religious writing and posthumanism finally depicts the proximity of the mind and body through the use of technology. The novel is based on the posthuman concept that people can coexist with robots via the human intellect, which appears to be feasible. The plot also has a lot of ebbs and flows. Despite the fact that the protagonist is built via recognisable human behaviours, the narrative becomes distinct and unexpected. Thus the author's depiction of each circumstance is incredibly accurate and credible. The blending and exposing of scenes captures the spirit of reality. The history of posthumanism and its research provide diverse opinions concerning the storyline's imagination and output. Morgan develops an universe in which the human characters and non-human beings are inextricably linked.

The storyline thus depicts human and religious traits such as loyalty, affability, love, compassion, and familial feelings, which maintains the novel incredibly realistic. Takeshi Kovacs and Reileen Kawahara are brothers and sisters. However, Reileen develops feelings for Kovacs, which is thought to be incestuous. Richard Morgan handles the human vices of being deceived, betraying others, and envy in a better way to promote the positive and bad viewpoints of human existence. The examination of the cyber world provides a realistic view of human civilization, which has not lost its common and essential behaviours. The majority of the novel's characters are dedicated to their positions and jobs. Each character has the potential to serve, protest, and withhold from the author. The biblical allusion to Meth demonstrates the level of science's growth to that of religious thinking.

Thus, immortality is derived from science and religious codes. The Elders truly demonstrate the value of physical power. They have also come upon virtual reality. Many minor characters contribute to the plot through their evolving reactions. Poe, the artificial intelligence, aids Kovacs in whatever way he can. His feelings toward other humans are completely indifferent. Medical services and biological demands are prominently displayed with the assistance of several main and minor characters. Any difficulties that a person has to go through are scarcely taken into deeper consideration, resulting in an unexpectedly nasty and violent picture. Psychological well-being has nearly always been spread equitably across the characters. The author handles human vices and virtues with care. They are braided with great care so that they do not interfere with the novel's philosophical and religious undertones. Richard

Morgan creates the narrative that is destined for greatness. Character transformations are both skilled and acceptable.

To continue the failure of the ethical method, illegal hacking, programming, and needlecasting are added. Some characters appear briefly and have little impact on the storyline. Communication, health, warfare, the government, and other institutions and religious ideas are being devoured by technology. When confronted with a threatening scenario, even the most devout individuals might be transformed into psychopaths. Laurens Bancroft, the novel's meth, is a man of great wealth and political power. In Meth society, the power to control everything and everyone is elevated. Morgan's narrative is thus regarded to be both technically sound and realistic. His approach to spread philosophical and sociological ideas is highly profound. Morgan's writing style is as obvious as it would be for his contemporaries. His grandiose use of religious atmosphere also supports metaphorical notions such as the socialist novel. The survival of the cortical stack, rather than the human body, is the dichotomy between life and death. In terms of law and order, sleeve technology and religious coding are polar opposites. Morgan's envisaged universe hence constantly related to the power to manage religious beliefs and technology.

### **Abstract:**

Reports imply all documents created under the watchful eye of the courtroom and for their view of archives created. Public reports and private archives are the two fundamental sorts of documents. Essential confirmations are more dependable and best proof consider by official courtroom. Without essential proof, auxiliary proof is what the witnesses were given based on his own viewpoint. Thus, that archive is composed which is a narrative proof. Sections 91 and 92 absolved oral proof by narrative proof. Oral confirmation can't be subbed in that frame of mind of composed documents where the composed archive exists in proof of specific exchanges of offense alluded to in Section 91 as composed declaration, more certain and more solid than oral proof.

**Keywords:** Documents, transaction, evidence, offence, provision

### **Introduction:**

The Indian Evidence Act has been revised by goodness of section 92 of Information Technology Act, 2000. Section 3 of the Act was altered and the expression "all archives created for the examination of the court" was snubbed by "All reports including electronic documents delivered for the review of the court". In connection with narrative proof, the phrasing of section 59 which states "content of archives" has been subbed to "content of reports or electronic documents" and section 65A and 65B, which depict the strategy to create electronic proof in courts during criminal preliminaries and the tolerability of the equivalent. These sections limit the gamble of misrepresentation of computerized proof through different expectations. All proof comes to the Court either as a proclamation of an observer or

explanation of a report, i.e., oral or narrative. The maxim "narrative proof" as it is characterized in section 3 (LAL, 2020) methods all proof created for the assessment of the court. The motivation behind delivering reports is to depend upon the reality of the assertion contained therein. The subject of narrative proof is managed the focuses that,-

1. How are reports to be demonstrated,
2. What are assumptions about the different sorts of reports, and
3. Exclusion of oral proof by narrative proof. 62 of The Indian Evidence Act, 1872 characterizes essential proof. It implies the actual report created for the review of the court. As indicated by the clarifications given under Section 62 essential proof likewise implies where various documents are completely made by one uniform cycle, as on account of printing, lithography or photography, each is the essential proof of items; at the same time, where there are duplicates of a typical unique, they are not essential proof of the items in the first. For instance For the situation of a check, the principal check is endorsed by cabinet so it is essential proof against him, and the counter foil might be endorsed by the payee of the check so it will be essential proof against the payee.

Section 63 of The Indian Evidence Act, 1872 arrangements with auxiliary proof which incorporates -Optional proof of the items in composed instruments can't be given, except if there is some lawful reason for non-creation of the first. Further, optional proof must be given when the essential proof or the actual record is allowable. Optional proof can't be given of a record when the first is viewed as in allowable. On the off chance that a deed of gift is prohibited in proof for need of enlistment, no auxiliary proof of the deed can be given in a suit to recuperate the talented property.

Section 74 characterizes the public reports;

1. Public documents kept in Sovereign power (to be specific, the parliament and the authoritative get together)
2. Held under the authority bodies and councils and
3. Under open officials, legal, chief, authoritative or of any piece of India and of unfamiliar country

Section 75 characterizes that any remaining reports are private documents

- These sorts of reports are kept under the hands of a hidden individual
- Guaranteed duplicates don't present in private guardianship

It is an archives which is use by private individual for their deals and interchanges d) tin private record, there is no such insurance..

In demonstrating archive, 3 things should be demonstrated,

1. Existence of the archive,
2. Condition of the archive,
3. Contents of the archive.

Section 59<sup>3</sup> gives that among these three; just the items in the record can't be demonstrated by oral proof. In this way, the presence and state of the report can be demonstrated by oral proof which is considered as optional proof u/s

63. Yet, when a reality is expected to be demonstrated by report, the principal necessity of regulation is that the actual record i.e., the first archive ought to be created in the Court. Section 64 runs as that the archives should be demonstrated by essential proof. Furthermore, the essential proof means the actual report (S-62). However, a similar section puts an exemption as well.

As per Section 2(1) (t) of the Information Technology Act, an e data is "information, record or information produced, picture or sound put away, got or sent in an electronic structure or miniature film or PC created miniature fiche". Section 65A and 65B of The Evidence Act (Malik, 2021), 1872 states that-

1. Data created by an individual who is having a legitimate command over the PC's utilization.
2. The electronic record contained should be routinely taken care of onto the PC.
3. The PC should be in appropriate use or in the exactness of documents,
4. Recording should repeat the data appropriately and such data took care of into the PC in the normal course of movement.

Section 65B sets out the above-notice conditions, it expresses that electronic record should contain a certified assertion and it should be endorsed by the official responsible for the administration of related exercises.

The Indian Proof Demonstration shows this norm in Ch. II, which reports, from ss.6 to 55, those real factors that are viewed as pertinent to a system. With respect to electronic confirmation, it is ss.22A and 47A of the Proof Act<sup>4</sup> that are of phenomenal importance. Segment 22A gives that oral attestations in regards to the things in the electronic record wouldn't be relevant aside from assuming the genuine legitimacy of the record is being alluded to. In like manner, when an issue influences a person's high level signature, the evaluation of the affirming power which gave the mechanized imprint is perceived to be an appropriate truth as indicated by s.47A. Various segments of the Proof Demonstration that game plan with electronic verification are segments 34, 5 35, 6 and 39.7 Assumptions about diaries in electronic form,<sup>8</sup> electronic agreements,<sup>9</sup> electronic reports and automated signatures,<sup>10</sup> messages<sup>11</sup> and as to electronic records (more settled that five years)<sup>12</sup> furthermore find a spot in the Proof Demonstration. Segment 131 is about the circumstance when another person, who is in charge of reports and electronic records, could decline to make it under the watchful eye of court.

Section 65B (4) (GAUR, 2017) specifically, requires an endorsement which needs to make reference to the electronic record containing the part, the way of creation of the record, the points of interest of the gadget utilized in delivering the record and be endorsed by an individual involving a capable situation comparable to the gadget to be delivered alongside the proof when it is submitted. This prerequisite has gone under investigation throughout the long term, with different decisions giving contradicting perspectives on the part which has brought about an extremely agitated position of regulation. The law on the issue is as yet hazy

Assuming there ought to be an event of Anvar P.V vs. P.K. Basheer and ors the High Court has resolved the disputes arising out of the different conflicting choices as well as the arrangements with being happened in the different High Courts and the Starter Courts concerning the value of electronic Confirmations. The Court has translated Segment 22A, 45A, 59, 65A and 65B of the Proof Demonstration and held that discretionary data in Cd/DVD/Pen Drive are not permissible without an announcement U/s 65 B(4) of Proof Demonstration. It has been explained that electronic verification without confirmation U/s 65B can't be exhibited by oral evidence and moreover the evaluation of the expert U/s 45A Proof Demonstration can't be gone to make such electronic evidence adequate.

Nevertheless, in case of Sonu v. Region of Haryana, the high court couldn't resist the urge to go against Anvar case and wouldn't be restricted by it. By clashing with a seat of higher strength and examining its authenticity, they made one more component to the issue. The Court presumed that it was not keen to apply this case brilliantly as it would provoke the re-opening of many closed cases yet furthermore felt that it couldn't make the approaching choice and in like manner gave it to be picked by another seat of more conspicuous strength. The effect of this case is that Anvar v. Basheer has been brought into question and its restricting worth on future cases doesn't know. Further, by setting out that the agreeableness of evidence couldn't be tended to in the analytical stage; the Court restricted mitigation in all cases wherein the decency was not tested at starter. Similarly. In another case of Shafhi Mohammad v. The Territory of Himachal Pradesh(Shafhi Mohammad vs The state of himachal pradesh, 2017 ), The Court couldn't resist the urge to go against the Anvar case on the pin that the Segments 65A and 65B were a completed code on the subject of cutting edge verification. It held that the necessities of Segment 65B were just procedural in nature and that they may be free or certain considering a genuine worry for value, and expecting the Court was content with the validity of the evidence, it could relax the methods considering current real factors considering a genuine worry for value.

In recently referenced case the middle issue was whether video graphy of the area of wrongdoing or scene of recovery during assessment should be critical to propel trust in the verification? Over the range of hearing for the circumstance stress was imparted on the subject of relevance of state under Segment 65B(4) of the Proof Demonstration to such an extent that expecting a decree was given in evidence, a confirmation was normal to the extent that the said arrangement from an individual involving a capable situation comparable to activity of the pertinent gadget or the administration of applicable exercises.

It was presented that assuming the electronic proof was a not in pertinent and delivered by an individual care of the gadget from which the electronic record was produced, necessity of such declaration couldn't be required.

On account of Tomaso Bruno and Anr. v. State of U.P. Supreme court

vindicated the appellants based on the indictment neglecting to illustrate CCTV film. The impact of non-creation of not illustrating the best proof, is seen by the Court as material concealment which prompts an unfavorable derivation under Section 114(g) of the Evidence Act. It is critical to take note of that the thinking of the Court isn't restricted to the shortfall of CCTV film.

Segment 2(i) portrays PC as "any device or any other high speed data taking care of device or system which performs reliable, calculating, and memory limits by controls of electronic, appealing or optical main impetuses, and consolidates all data, yield, dealing with, limit, PC programming, or correspondence workplaces which are related or associated with the PC in a PC structure or PC association". This definition integrates the phones moreover. It infers that SMS/WhatsApp message would be reasonable under the authority court for the chronicles are adequate under the Segment 65 of Indian Proof Demonstration, 1872. Regardless, it requirements to fulfill four conditions referred to in the segment before it will in general be considered as a record. Such conditions are a) the PC that conveyed it likely been used regularly at the hour of making of such electronic files; (ii) the kind of information contained in the PC ought to be so much that it is reliably and normally gave to the electronic device; (iii) the PC should be in fitting condition and ought to work properly at time of development of electronic record; and, (iv) the duplicate copy ought to be an age of the main electronic record. It is presently well established by the court that SMS, MMS and messages are adequate. In Province of Delhi v. Mohd. Afzal and Others, it was held that electronic reports are admissible. It furthermore cleared he uncertainty that regardless of whether there is an extent of abuse of framework or disappointment of working framework or addition as to influence the exactness of such electronic information then the onus on the individual is testing such electronic information. The court said that simple hypothetical and general misgivings can't clarify proof unacceptable in court. The Delhi High Court held that any report got as forward on WhatsApp can't be treated as archive without the Original or duplicate of the Original.

No man can be prosecuted for an offense where the speculation of his obligation isn't any more plausible than the theory of his blamelessness.

In a criminal starter the degree of probability of culpability should be especially higher-almost amounting to a sureness than in a typical system, and, expecting there is littlest reasonable or logical chance of trustworthiness of a reprimanded, the upside of it ought to be given to him. Regardless, that is a truly exceptional thing from battling that even where the commitment to demonstrate any cases, say of showing an extraordinary case, is on the reprovved, the term exhibited should be differently and more liberally perceived than when the commitment to demonstrate any cases is on the prosecution. The Verification Show, doesn't consider and doesn't set out that the satisfaction as would be considered normal to be caused in the mind of a

sensible man preceding circling back to or enduring the arraignment story is to be of a substitute kind or degree from the satisfaction which is required when the accused needs to deliver the weight which is given event to feel hesitations about him by regulation. The standard of proof expected in political choice matters in it is something almost identical to exhibit degenerate practice as that for a criminal offense. The Onus of proof never moves to the charged, and they are under no obligation to exhibit their faultlessness or refer to verification with all due regard or proposition any expression. In a typical case it is the commitment of the get-togethers to put under the watchful eye of the Court s they think best, while in a crook case it is the commitment of the Court to invite exceedingly significant confirmation on record and to see that value is done.<sup>26</sup> In criminal fundamental, it is for the court to choose the subject of the culpability of the condemned moreover, it ought to do this upon the evidence before it, unreservedly of decisions in a typical suit between comparative social events. A judgment or statement isn't suitable in confirmation in that frame of mind which is generally expected, and, when in doubt, a judgment is basically reasonable to show its date and genuine result.

### **Conclusion**

Oral proof has lesser worth than narrative proof. Court will undoubtedly acknowledge the narrative proof. Be that as it may, oral proof might take in thought. It is additionally need some authentication .In momentarily presented that two kinds of proof are given by the gatherings by the same token oral and narrative proof. In courtroom the worth of narrative proof is higher than narrative proof. Since the law generally requires the best proof oral proof is a proof is a proof which is bound to the words articulation verbal or oral. Where as essential proof is the first report which is introduced to the official courtroom for its review. Direct proof is the best proof to be demonstrated of reality to be demonstrated. However, essential proof in specific cases is the best proof in all cases. There narrative proof avoid and excludes the oral proof and beats the oral proof while submitting the proof in as observers in official courtroom .The individual giving direct proof accessible for interrogation for testing its veracity. Henceforth, that record is composed which is a narrative proof .Sections 91 and 92 absolved oral proof by narrative proof. Oral verification can't be subbed in that frame of mind of composed documents where the composed archive exists in proof of specific exchanges of offense alluded to in Section 91 as composed declaration , more certain and more dependable than oral proof.

## **AN EMPIRICAL ANALYSIS OF EARNINGS QUALITY OF PUBLIC SECTOR BANKS IN INDIA**

**DR. RAMDAS LAD**

Assistant Professor

PDEA's Prof. Ramkrishna More ACS College

Akurdi, Pune, Maharashtra, India

Savitribai Phule Pune University, Pune

### **Abstract:**

The banking sector in India is a largely growing sector. The ability of the banks is judged on the parameter of earning quality. It determines the profitability of the banks. This study analyzed the earning quality of Public Sector Banks in India for 5 years. The research is based on secondary data. Which was used for the study are collected from the websites and annual reports of the public sector banks. Out of the total 20 public sector banks, 18 public sector banks were selected for the study period of the study from 2014 to 2019. The quality of earnings of public sector banks was analyzed using Net Profit Margin, Return on Equity, Interest Income to Total Income ratios with their ranks. The results of the study revealed that Indian Bank was in the first position in Net Profit Margin, State bank of India was in the top rank in Return on Equity, Punjab and Sind Bank come first in Interest Income to Total Income, In average Group Rank State Bank of India has held the first position.

**Keywords:** Earnings Quality, Public Sector Banks, Banks in India, Return on Equity, Net Interest Margin

### **Introduction:**

The Indian banking sector is most likely blooming sector. It is also stated to as the foremost and most commanding industry of the Indian economic system. In this system, more than 75% of market share is hold by the public sector banks. There are 20 public sector banks in India, as on 2019. For analysis of earning quality researcher taken 18 public sector banks excluding Allahabad Bank (Merged in Indian Bank) and Corporation Bank (Amalgamated in Union Bank of India) because of merger.

Sustainable growth of the bank depends on the quality of earnings and the competency of the bank to maintain this quality and earn progressively. It is an indicator of profitability of banks. To increase its stakeholders' profit is an ultimate aim of any bank. A significant part of a bank's revenue is generated through fee-based activities such as business consulting, treasury, investing, etc. The quality of earnings will also aid the bank in executing activities like dividend payment, maintaining adequate level of capital, taking up growth and diversification strategies and maintaining a competitive attitude.

In addition to the sources of earning, following dimensions also decide the financial performance of the banks.

- i. trend, level, and constancy of earnings,
  - ii. quality and sources of earnings.
  - iii. Capability to extend capital through retained earnings.
  - iv. exposure to market risks.
  - v. provisions for credit losses.
- Sound earnings stimulate the confidence of depositors, investors, creditors, and the public at large.

The following ratios measure the Earnings Quality:

**a) Net Profit Margin (NPR):**

Earnings quality in banks is measured by the truly important parameter Net profit margin. Increasing profits is the best index that the bank can pay dividends due to which the share price will be on the rising trend. Stakeholders look at the net profit margin thoroughly because it signifies the quality of the bank that's reflected in its ability in converting revenue into earnings available for shareholders. It's declared as a percentage of income that's subtracted from total bank income after deducting all operating expenditures, interest, taxes, and preferred stock dividends (excluding common stock dividends). A high Net Profit Margin clearly signifies that the bank has stable and steady earnings.

**b) Return on Equity (ROE):**

The return on equity (ROE), also known as return on investment (ROI), is a sound measure of return since it's the product of the operating performance, debt-equity operation, and asset turnover of the bank. ROE measures how much the shareholders earned for their investment in the bank. This ratio indicates how profitable a bank is by comparing its net income to its average shareholder's equity. However, it's suitable to produce fresh earnings that accrue to shareholders as increased equity, If a bank can mobilize deposits at a lower rate and advance these to clients to create higher returns than the cost of deposits.

The higher the ratio percentage, the more efficient the bank is in earnings and utilizing its equity base to create better returns is to investors.

**c) Net Interest Margin (NIM):**

For the performance analysis of banks Net Interest margin is an important parameter. It is the excess of interest income over the interest expended as a

percentage of total assets. It tells about the ability of the bank to keep the interest on deposits low and interest on advance high. It is an important measure of a bank's basic income (income from the lending business). A higher NIM indicates a better result compared to total assets.

**d) Interest Spread (IS):**

Interest spread is the difference between yield and cost of borrowing, where the rate of return is the interest income on the assets that accrue interest, and the cost of the loan is the interest expense that is calculated on the liabilities that accrues interest. The bank does not exceed or meet its interest rate obligations. The higher the margin, the greater the likelihood that the bank will be profitable. The lower the margin, the less profitable the bank is. While the federal rate plays an important role in determining the interest rate at which an institution awards immediate funds, open market activities ultimately shape the interest rate differential.

**e) Interest Income to Total Income Ratio (INTINC/ Tot INC Ratio) :**

Interest Income Over Total Income indicates the bank's ability to generate interest income on its advances. Interest income is an important source of income for banks, so this ratio calculates the percentage of income from loan business to total income. From the bank a year later. Ideally, the bank wants a high index because it shows the regularity of income and represents the bank's income in the context of normal banking activities.

A significant part of a bank's revenue is generated through fee-based activities such as business consulting, treasury, investing, etc. The quality of earnings will also aid the bank in executing activities like dividend payment, maintaining an adequate level of capital, taking up growth and diversification strategies, and maintaining a competitive attitude. The following ratios measure the Earnings Quality of the Public Sector Banks.

**Table No. 1. Net Profit Margin of Public Sector Banks (2015-19):**

Sr.No.	Name of the Bank	2014-15	2015-16	2016-17	2017-18	2018-19	Average	Rank
1	Andhra Bank	3.57	2.81	0.86	-16.77	-13.28	-4.56	9
